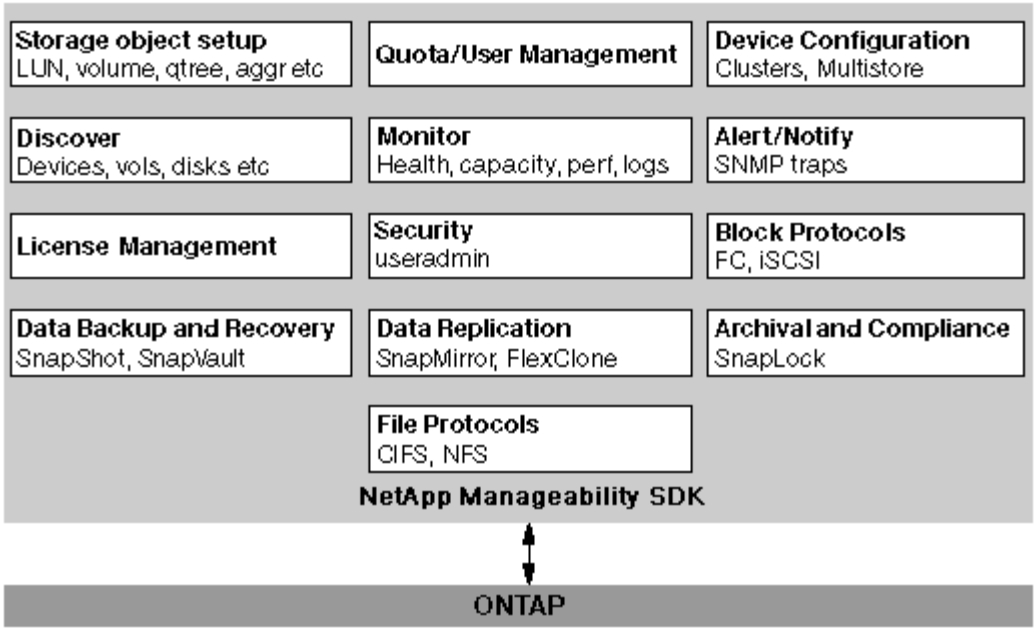
November 2021

Introduction to ONTAP APIs

You can create an application for seamless integration with NetApp solutions by using the ONTAP APIs. ONTAP APIs are available for security management, license management, backup and recovery, data replication, data archiving, and so on (see the following figure).



What is new

This section provides the list of new APIs and APIs with new parameters for ONTAP 9.10.1.

New APIs

There is no change in the APIs and API categories.

Changed parameters

There is no change in parameters for any APIs.

Version Matrix

The version matrix shows the supported ONTAPI for each version of Data ONTAP.

Clicking a particular version number takes you to the documentation for that version of the interface.

Data ONTAP Support	ONTAPI
9.9.1	9.9.1
9.8	9.8
9.7	9.7
9.6	9.6
9.5	9.5
9.4	9.4
9.3	1.130
9.2	1.120
9.1	1.110
9.0	1.100

The SNMP MIB files are present are on the NetApp Support Site. Click here to view.

Introduction to ONTAP

Iterative APIs

Iterative APIs allow you to operate on a large set of objects by dividing that set of objects into manageable sub-sets, repeatedly executing an API call.

To repeatedly call a Data ONTAP 7-Mode API, you can use `*-iter-start`, `*-iter-next`, and `*-iter-end`. In clustered environments, you can use a single API `*-get-iter`.

`*-get-iter` API supports queries, which can be used to return all objects that match the query. The objects are sorted alphabetically (default) in ascending order of the keys. It can be sorted numerically too.

Following are the input elements of an iterative API:

- max-records—determines the maximum objects that can be sent as response, in a one API call.

  Each iterative API, for an API category, has a set upper limit and a default value. This element is supported for all APIs that support queries.
- tag— specifies a value used by the server to identify the next set of records to return.

  If tag value is not specified, the server starts from the first record of the query result.
- query—specifies the query and must be specified for each iteration of an API.

  You can use wildcards and range in a query.
- desired-attributes—specifies the number of elements that can be returned for each record.

  This is an optional value. If it is not specified, elements, which contain values, are returned.

Following are the output elements of an iterative API:

- next-tag—specifies the tag value passed to the tag input element in the next call to the same API.
- num-records—specifies the total number of records returned for the API call.
- attributes-list—specifies the actual list of records in the `*-get-iter` API call.

ONTAP 7G-like API

ONTAP 8.1 and later provides APIs for both cluster and non-cluster nodes. ONTAP 7G-like APIs are APIs for non-cluster environment for those storage systems that have upgraded from Data ONTAP 7-Mode to ONTAP. Upon upgrade, the storage system retains 7-Mode functionality, such as the IP address, and the cluster nodes can be accessed by using Storage Virtual Machine (SVM, formerly known as Vserver) tunneling mechanism.

You can find the list here.

ONTAP White-list API

The Data ONTAP 7-Mode APIs that do not create, modify, or delete a cluster object are called ONTAP White-list APIs. A user in a cluster environment can use these 7-Mode API by using Storage Virtual Machine (SVM, formerly known as Vserver) tunneling.

You can find the list here.

SVM tunneling

The mechanism of accessing 7G-like APIs to a Storage Virtual Machine (SVM, formerly known as Vserver) through a cluster-management interface is called SVM tunneling. This is for storage systems that have been upgraded from Data ONTAP 7-Mode to ONTAP. If you want to access such a system, you have to use the ONTAP 7G-like API set.

ONTAP responds to a tunneled API based on the tunnel destination, target interface and the API family, as described in the following cases:

- ONTAP SVM APIs can be executed if they are sent through a cluster-management LIF to an Admin SVM.
- ONTAP SVM APIs can be executed if they are sent through a SVM-management LIF to a Data SVM.
- ONTAP SVM APIs can be executed if they are sent through a cluster-management LIF to a Data SVM.
- ONTAP clustered APIs can be executed if they are sent through a cluster-management LIF to a Node SVM.

Network and File Access Management concepts

- **Logical interface**

  A logical interface (LIF) is an IP address with associated characteristics, such as a home port, a list of ports for failover, a firewall policy, a routing group. Logical interface is also known as virtual interface. For more information, see Data ONTAP documentation.

  Each logical interface has a role associated with it and must be assigned to the correct type of network port. A logical interface can have any one of the following four roles: node-management, cluster-management, cluster, or data.

  - **Node-management**

    A node-management logical interface provides a dedicated IP address for managing a particular node and is created at the time when a cluster is created or added to the cluster. Node-management logical interfaces can be configured on either node-management ports or data ports.

  - **Cluster-management**

    A cluster-management logical interface provides a single management interface for the entire cluster. Cluster-management logical interfaces can be configured only on data ports.

  - **Cluster**

    A cluster logical interface is used for intracluster traffic. Cluster logical interfaces can be configured only on cluster ports.

  - **Data**

    A data logical interface is used for communicating with clients. Data logical interfaces can be configured only on data ports.

- **SVM**

  In Data ONTAP C-Mode, a virtual server provides network access through unique network addresses, serves data out of a distinct namespace, and administered separately from the rest of the cluster. There are three types of SVMs: admin, data, and node. However, SVM usually refers to data SVM unless there is a specific need to identify different types of SVMs.

  - **Admin SVM**

    A SVM that has overall administrative access to all objects in the cluster, including the objects owned by other SVMs is an Admin SVM. It does not provide data access to clients or hosts.

  - **Node SVM**

    A SVM that is restricted to operation in a single node of the cluster at any one time, and provides administrative access to some objects owned by that node. It does not provide data access to clients or hosts.

  - **Data SVM**

    A virtual server that facilitates data access from the cluster; the hardware and storage resources of the cluster are dynamically shared by data SVMs within a cluster. Also known as a cluster SVM.

  To view information about role-based access on ONTAP, see the System Administration Guide.

ONTAPI Categories

The links below will take you to the documentation for individual API's in each of the categories.

active-directory	Active Directory configuration and management
aggr	Aggregate information and management
audit	Cluster Administrative Audit APIs
autosupport	AutoSupport ZAPIs
cf	cluster-failover operations
cg	consistency group management
cifs	CIFS configuration and management
clock	System timezone and date management
clone	Manages file and sub-file cloning operation.
cluster	Cluster Management APIs
cluster-image	Automated nondisruptive update APIs
cluster-peer	Manages cluster peer relationships.
cluster-switch	Ethernet Switch Information Zapi
config-backup	Configuration Backup Management
coredump	coredump operations
dashboard	This command is removed starting from ONTAP 9.0
diagnosis	Diagnosis zapis
disk	disk-related operations
disk-encrypt	Self-Encrypting Disk ZAPIs
ems	ems APIs
environment	Environment management
exports	Export Ruleset ZAPIs
fc	fibre channel adapter configuration
fcp	fibre channel protocol management
fcport	Fibre Channel port operations that manage the Fibre Channel
feature	feature management
file	supports file system operations
file-directory-security	view/set file/directory security information
fileservice-audit	FileService audit config ZAPIs
flash	Flash Management Module APIs
flash-device	Flash Cache Zapis
flexcache	FlexCache configuration and management.
fpolicy	file policy management and configuration
gpo	Group Policy Object(GPO) ZAPIs
group-mapping	Group Mapping management APIs
ha-interconnect	High-Availability Interconnect Zapis

igroup	initiator group operations
iscsi	iscsi management and monitoring
job	Contains APIs to manage jobs, their schedules and low-level
kerberos	Kerberos configuration and management APIs.
ldap	LDAP configuration and management APIs
license-v2	Manage Data ONTAP licenses.
lock	Lock Information and Management
lun	Manages and monitors LUNs.
metrocluster	
metrocluster-check-connection	MetroCluster check connection APIs
metrocluster-configuration-settings	MetroCluster configuration settings APIs
metrocluster-connection	MetroCluster connection APIs
metrocluster-dr-group	MetroCluster DR-Group management APIs
metrocluster-interface	MetroCluster Interface management APIs
name-mapping	Name Mapping management APIs
nameservice	Name Services Configuration and Management
ndmp	NDMP Zapis
net	Access to ONTAP network management
netgroup	obtains netgroup information
nfs	NFS configuration and management. In Data ONTAP
nis	
ntp-server	auto generated category.
nvme	Manage NVMe Protocol Access
options	manage option values
perf	Manages counters of various system performance objects
platform-cap	Controller platform Zapis
portset	portset operations
qos	Quality of Service management
qtree	qtree management
quota	quota management and editing
secd	Access-Check ZAPI Infrastructure
sectrace	Permission tracing configuration and management
security	Manage system security
security-certificate	Certificate Zapis
security-key-manager	Key Manager Setup Wizard APIs
security-key-manager-key	Encryption Key Information ZAPIs
security-session	Session Management APIs
security-ssl	auto generated category.
service-processor	APIs for Managing the Service Processor
ses	SCSI enclosure services-related operations

sis	Manage volume deduplication and compression.
snapdiff	Generate differences between two snapshots of a volume
snaplock	SnapLock information and management
snapmirror	snapmirror management
snapmirror-policy	SnapMirror Policy Zapis
snapshot	manages snapshots
snapvault	SnapVault management APIs
snmp	SNMP management and retrieving MIB values
storage-acp-firmware	auto generated category.
storage-adapter	storage adapter operations
storage-array	commands to monitor/manipulate back end storage arrays
storage-bridge	System Bridge Zapis
storage-disk	Storage disk related operations.
storage-disk-firmware	auto generated category.
storage-initiator	Commands to monitor/view initiator port traffic.
storage-iscsi-initiator	
storage-pool	Storage Pool Zapis
storage-port	Storage port info
storage-shelf	Storage shelf info
storage-shelf-firmware	auto generated category.
storage-switch	Storage Switch ZAPIs
system	system information
tape-mc-info	Tape MC Info
template-management	Manage Templates
ucm	Unified Connect adapter information and management
useradmin	useradmin configuration and management
virtual-machine	
volume	Volume information and management
vscan	Vscan configuration and managment.
vserver	
vserver-peer	Create or Manage Vserver peer relationships
vserver-peer-transition	Create or Manage transition peer relationships
wafl	Utility functions for agents.

APIs in Category: **active-directory**

active-directory-account-create
active-directory-account-delete
active-directory-account-get-iter
active-directory-account-modify
active-directory-account-password-change
active-directory-account-password-reset

This set of ZAPIs allows creating an Active Directory account and manage them. It is only used when a full CIFS server is not desired or not available.

active-directory-account-create

[top]

Create an Active Directory account for the given Vserver. If a CIFS server already exists for the requested Vserver, then this command will fail. The existing CIFS server should be deleted before retrying again. If joining a domain, this command may take several minutes to complete.

Input Name	Range	Type	Description
account-name		netbios-name	Active Directory account NetBIOS name.
admin-password		string	Administrator password required for Active Directory account creation.
admin-username		string	Administrator username required for Active Directory account creation.
domain		string	Fully qualified domain name.
force-account-overwrite		boolean optional	If true and a machine account with the same name as specified in 'account-name' exists in Active Directory, it will be overwritten and reused. The default value for this field is false.
organizational-unit		string optional	Organizational unit under which the Active Directory account will be created.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
ECIFS_CIFS_SERVER_ALREADY_EXISTS	

active-directory-account-delete

[top]

Delete the Active Directory account. If a CIFS server already exists for the requested Vserver, cifs-server-delete API should be used to delete the machine account.

Input Name	Range	Type	Description
admin-password		string optional	Administrator password required for Active Directory account deletion.
admin-username		string optional	Administrator username required for Active Directory account deletion.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

active-directory-account-get-iter

[top]

Retrieve the list of active directory accounts

Input Name	Range	Type	Description
desired-attributes		active-directory-account-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		active-directory-account-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the active-directory-account object. All active-directory-account objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		active-directory-account-config[] optional	The list of attributes of active-directory-account objects.
next-tag		string optional	Tag for the next call. Not present when there are no more active-directory-account objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

active-directory-account-modify

[top]

Modify the Windows Active Directory domain. If a CIFS server already exists for the requested Vserver,

cifs-server-modify API should be used to modify the Windows Active Directory domain. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

Input Name	Range	Type	Description
admin-password		string optional	Administrator password required for Active Directory account creation in the given domain.
admin-username		string optional	Administrator username required for Active Directory account creation in the given domain.
domain		string optional	Fully qualified domain name.
force-account-overwrite		boolean optional	If true and a machine account with the same name as specified in 'account-name' exists in Active Directory, it will be overwritten and reused. The default value for this field is false.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

active-directory-account-password-change

[top]

Generate a new password for the machine account and change it in the Windows Active Directory domain.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

active-directory-account-password-reset

[top]

Reset the machine account password in the Windows Active Directory domain. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. This operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of.

Input Name	Range	Type	Description
admin-password		string	Administrator password required for Active Directory account password reset.
admin-username		string	Administrator username required for Active Directory account password reset.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **active-directory-account-config**

[top]

Active Directory configuration information for the Vserver. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
account-name		netbios-name optional	Active Directory account NetBIOS name. Attributes: required-for-create, non-modifiable
domain		string optional	Fully qualified domain name. Attributes: required-for-create, modifiable
domain-workgroup		domain-name optional	NetBios domain/workgroup name. Attributes: non-creatable, non-modifiable
organizational-unit		string optional	Organizational unit under which the Active Directory account resides. Attributes: optional-for-create, non-modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **netbios-name**

[top]

Name of a client or a server participating in a NetBIOS Windows File sharing service network. This can be different from the host name.

[none]

Element definition: **domain-name**

[top]

The domain name is an identification label that defines a realm based on Domain Name Service (DNS).

[none]

These APIs allow for full manipulation of Data ONTAP aggregates, and their structural components (plexes and RAID groups).

Aggregates are identified in one of two ways:

Name: The standard printable name for the aggregate, following standard Data ONTAP aggregate naming rules.

UUID: A DCE UUID that is formatted as a 36-character string composed of 32 hexadecimal characters. A UUID is broken up into five groupings that are separated by dashes ('-'). The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is NOT used. Also note that this identifier is exactly equivalent to the standard RAID tree ID. Aggregate UUID values can always be determined by invoking 'aggr-list-info' with no parameters (which returns records for all of the node's aggregates) and examining the values of the returned 'uuid' fields.

When requested from Admin Vserver LIF, aggregate UUID values can be determined by invoking 'aggr-get-iter'

An aggregate identifier may also appear inside a pathname format, especially when specifying a plex or RAID group within the aggregate:

[/vol/]<aggr_name_or_UUID>[<plexinfo>][<groupinfo>]

where <plexinfo> is '/plex{0..n}' and <groupinfo> is '/rg{0..n}'.

Examples include:

my_aggr

9ff6e1ce-d57d-11db-be9c-000100000529

/vol/my_aggr

/vol/9ff6e1ce-d57d-11db-be9c-000100000529

/vol/my_aggr/plex0

/vol/9ff6e1ce-d57d-11db-be9c-000100000529/plex0/rg3

Using UUID has the advantage of being able to access taken-over partner aggregates.

An aggregate has an HA (High Availability) policy, which may be one of: 'cfo' (Controller Failover), or 'sfo' (Storage Failover), or 'none' (Not specified)

Aggregates are allowed to have 'cfo' HA policy in both clustered and unclustered environments while having 'sfo' HA policy is restricted only to clustered environments.

With 'cfo' HA policy, failover is strictly pairwise. When a node fails, its HA partner takes over its storage all at once. When the failed node reboots, its HA partner gives back its storage all at once.

In clustered environments, with 'sfo' HA policy, failover may occur in a pairwise fashion much like 'cfo'. Additional differences from 'sfo'

include that a node which takes over storage on behalf of another node temporarily takes ownership of that storage. Also, when giveback occurs, its storage is not returned all at once. Rather, the aggregates with 'cfo' HA policy, including root, and its disks are returned first, followed by the remaining storage for that node.

An aggregate has a home owner, which is the node to which its disks have been administratively assigned.

In cluster environments, aggregates are identified as the standard printable name for the aggregate. UUID, Plex name and raidgroup name are invalid inputs when requested from Admin Vserver LIF.

aggr-64bit-upgrade-scan-start

[top]

Start the 64-bit upgrade scanner on the specified aggregate. Use the 'aggr-list-info' API to query the status of the 64-bit upgrade scanner. The status is made available in the 'status' element that is part of the 'aggr-64bit-upgrade-info' typedef. Similarly, use the 'd-volume-list-info' API to query the status of the 64-bit upgrade scanner running on each contained flexible volume.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate for which to start the 64-bit upgrade scanner.

Errno	Description
EVOLUMEDOESNOTEXIST	
EVOLUMENAMEINVALID	
EVOLUME_CANT_OBTAIN_VOLREF	
EVOLUMEREADONLY

EOP_DISALLOWED_ON_STRIPED_AGGR	
EAGGR_64BIT_UPGRADE_NOT_IN_PROGRESS	
EOP_64BIT_UPGRADE_SCANNER_DISABLED	

aggr-64bit-upgrade-scan-stop

[top]

Stop the 64-bit upgrade scanner on the specified aggregate. Use the 'aggr-list-info' API to query the status of the 64-bit upgrade scanner. The status is made available in the 'status' element that is part of the 'aggr-64bit-upgrade-info' typedef. Similarly, use the 'd-volume-list-info' API to query the status of the 64-bit upgrade scanner running on each contained flexible volume.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate for which to stop the 64-bit upgrade scanner.

Errno	Description
EVOLUMEDOESNOTEXIST	
EVOLUMENAMEINVALID	
EVOLUME_CANT_OBTAIN_VOLREF	
EVOLUMEREADONLY	
EOP_DISALLOWED_ON_TRAD	
EOP_DISALLOWED_ON_STRIPED_AGGR	
EAGGR_64BIT_UPGRADE_NOT_IN_PROGRESS	

aggr-64bit-upgrade-start

[top]

Trigger upgrade from 32-bit to 64-bit on the specified aggregate without adding disks. This API produces a set of results in the background. These results are not available as output from aggr-64bit-upgrade-start. Use the 'aggr-list-info' and 'volume-list-info' APIs to query the results of the 64-bit upgrade process on the aggregate and contained flexible volumes, respectively.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate for which to trigger 64-bit upgrade.
upgrade-64bit-mode		string optional	Option to specify if and how to grow volumes during the 64-bit upgrade. Legitimate values are "check", "grow_all", "grow_none", and "grow_reserved". If the "check" value is specified, aggr-64bit-upgrade-start produces a summary of the space impact which would result from upgrading the aggregate to 64-bit. This summary includes the space usage of each contained volume after the volume is upgraded to 64-bit and the amount of space that must be added to the volume to successfully complete the 64-bit upgrade. The summary can be obtained by querying the 'aggr-list-info' and 'volume-list-info' APIs. The aggregate's summary is made available in the 'check' element that is part of the 'aggr-64bit-upgrade-info' typedef. The flexible volumes' summary is made available in the 'check' element that is part of the 'volume-64bit-upgrade-info' typedef. This option does not result in an upgrade to 64-bit. If the "grow_all" value is specified, aggr-64bit-upgrade-start upgrades the aggregate to 64-bit. This option allows aggr-64bit-upgrade-start to automatically grow volumes as needed if they run out of space due to the 64-bit upgrade. The volumes will be grown to accommodate all the files within these volumes. This option does not affect volumes which have autosize enabled. If the "grow_none" value is specified, aggr-64bit-upgrade-start upgrades the aggregate to 64-bit. This option does not allow aggr-64bit-upgrade-start to automatically grow volumes if they run out of space due to the 64-bit upgrade. If the "grow_reserved" value is specified, aggr-64bit-upgrade-start upgrades the aggregate to 64-bit. This option allows aggr-64bit-upgrade-start to automatically grow volumes if they run out of space due to the 64-bit upgrade, but only to accommodate the space reserved files within these volumes. This option does not affect volumes which have autosize enabled. The default is "grow_none".

Output Name	Range	Type	Description
upgrade-64bit-cookie		integer	The opaque cookie to uniquely identify this 64-bit upgrade transaction. This cookie can be compared against the cookie returned by aggr-list-info to ensure that the output produced by aggr-list-info corresponds to this 64-bit upgrade transaction. Range: [0..2^64-1].

aggr-add

[top]

Add disks to the specified aggregate. The disks to add are specified in the same way as for "aggr-create". Disks cannot be added to a mirrored aggregate if one or more of the plexes is offline. By the time the API returns, the disk(s) may not yet be completely added. Use 'aggr-list-info' to query the aggregate status to determine when it has finished growing due to the added disk(s). Same can be done using 'aggr-get-iter' when requested from Admin Vserver LIF. When the upgrade-64bit-mode input is provided to this API, the API produces a set of results in the background. These results are not available as output from aggr-add. Use the 'aggr-list-info' and 'volume-list-info' APIs to query the results of the 64-bit upgrade process on the aggregate and flexible volumes, respectively.

Input Name	Range	Type	Description
actual-disk-type		string optional	Actual disk type of disks to use: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, or VMDISK. When this option is used, only disks of the specified type will be selected for use in the aggregate. One of either "disk-type, "actual-disk-type" or "disk-class" is required to be used when converting an existing aggregate to a hybrid one, or when operating on a hybrid aggregate. Otherwise, the option is not required.
aggregate		string	Name or UUID of the aggregate to which the disks will be added. See the synopsis for name/UUID format and restrictions.
allocation-units		integer optional	The spare capacity in terms of number of allocation units to be added to a given aggregate. Number of allocation units available and size of each unit can be found using ZAPI 'storage-pool-capacity-get-iter'. This option works only when 'storage-pool' is specified.

allow-mixed-rpm		boolean optional	Disks in an aggregate are normally required to have the same RPM. This behavior is overridden with this option when it is set to true. Default value is false.
allow-same-carrier		boolean optional	Using two disks from one carrier that houses multiple disks in one RAID group is not desirable. If that happens, Data ONTAP initiates a series of disk copy operations to correct that situation. Sometimes, selection of available spare disks makes it impossible to avoid placing two disks from one carrier in one RAID group. Setting this option to true allows placing two disks from one carrier in one RAID group. This option has an effect only when disks to be used are specified in 'disks'. This option is ignored when 'disk-count' is used.
cache-raid-group-size		integer optional	Specifies the RAID group size of the new SSD RAID groups being created as part of the disk add operation. This option should be used while adding SSD disks for the first time to a hybrid-enabled aggregate. Range : [2..28]
cache-raid-type		string optional	Specifies the raid-type of the new RAID groups being created as part of the disk add operation. This option should be used while adding SSD disks for the first time to a hybrid-enabled aggregate. Possible values: raid4, raid_dp and raid_tec only. If not specified, the default value is the raid-type of the aggregate.
checksum-style		string optional	Specifies the checksum style for the disks to be added to an aggregate. This input is not allowed if a list of disks to use is specified through the "disks" parameter. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block. By default, disks with same checksum style as the aggregate are selected. Use this option to override that behavior and create a mixed checksum aggregate. "zoned" is not supported as one of the possible values as a mixed checksum aggregate can support only block and advanced_zoned checksum styles.
disk-class		string optional	Class of disks to use. Disks are grouped into classes based on their performance characteristics. Disks belonging to the same class are compatible for use in the same aggregate. When this option is used, all disks belonging to the specified disk class are considered eligible for selection. Possible values are: • "capacity" - Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA. • "performance" - Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS. • "archive" - Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA. • "solid-state" - Solid-state drives. Includes disk type SSD and SSD_NVM. • "array" - Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN. • "virtual" - Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK. One of either "disk-type, "actual-disk-type" or "disk-class" is required to be used when converting an existing aggregate to a hybrid one, or when operating on a hybrid aggregate. Otherwise, the option is not required.
disk-count		integer optional	Number of disks to add, including the parity disks. The disks will come from the pool of spare disks. The smallest disks in this pool join the aggregate first, unless the "disk-size" argument is specified. Either the "disk-count" or "disks" argument must be specified. Range : [0..2^31-1].
			The individual disk size in 4KB blocks. For example, a disk-size of 131072000 represents a 500GB drive (131072000 * 4 * 1024 = 500 *

disk-size		integer optional	1024 * 1024 * 1024). Disks with a usable size between 90% and 105% of the specified size are selected. If neither the "disk-size" nor the "disk-size-with-unit" argument is specified, existing groups are appended with disks that are the best match by size for the largest disk in the group. When starting new groups, disks that are the best match by size for the largest disk in the last raidgroup are selected first, then smaller disks, and finally larger disks. This "disk-size" option is ignored if a specific list of disks is specified through the "disks" parameter. Range : [0..2^63-1]. You must only use one of either "disk-size" or "disk-size-with-unit" parameters. If both appear, an error message will be returned.
disk-size-with-unit		string optional	This parameter accepts a disk size in the specified unit. It is a positive integer number followed by unit of "T", "G", "M" or "K". For example, these are accepted: 72G, 36G, 1T and 32M. But "72" will not be accepted. This "disk-size-with-unit" option is ignored if a specific list of disks is specified through the "disks" parameter. You must only use one of either "disk-size" or "disk-size-with-unit" parameters. If both appear, an error message will be returned.
disk-type		string optional	Type of disks to use: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, or VMDISK. When this option is used, disks of the specified type or disks of a compatible type will be selected for use in the aggregate. The ability to mix compatible disk types in one aggregate is controlled by these system options: 'raid.mix.hdd.disktype.capacity' 'raid.mix.hdd.disktype.performance' and 'raid.mix.disktype.solid_state'. One of either "disk-type, "actual-disk-type" or "disk-class" is required to be used when converting an existing aggregate to a hybrid one, or when operating on a hybrid aggregate. Otherwise, the option is not required. This option will be deprecated in a future release. Please use "actual-disk-type" or "disk-class" instead.
disks		disk-info[] optional	Specific list of disks to add to the aggregate. If the aggregate is mirrored and a specific list of disks is supplied, another list ("mirror-disks") must also be supplied with the same number of disks. Either the "disks" or "disk-count" argument must be specified.
force-cache-size		boolean optional	When set to true this parameter forces the addition of SSD disks to hybrid enabled aggregate by skipping the check for total (local + partner) hybrid SSD capacity. This can be used when the partner's cache capacity cannot be retrieved. Default value is false. Warning: If force-cache-size is set to true, the administrator is responsible to ensure that the total limit will not be exceeded.
force-spare-pool		boolean optional	Disks in a plex are not normally permitted to span spare pools. This behavior is overridden with this option when it is set to true. This is a deprecated parameter. Use the allow-mixed-rpm and ignore-pool-checks parameters instead.
group-selection-mode		string optional	Specifies how DATA ONTAP adds the specified disks to raidgroups. Legitimate values are "last", "one", "new" or "all". group-selection-mode is an optional argument, and the behavior when it is not used is selected by value of raid-group. If raid-group is used, the behavior is the same as for group-selection-mode "one". If raid-group is not used, the behavior is the same as for group-selection-mode "last". The raid-group option must be used with group-selection-mode value "one", and it cannot be used with others. If the string value is "last", Data ONTAP adds the specified disks to the existing last RAID group first. After the last RAID group is full, it creates one or more new RAID groups and adds the remaining disks to the new groups. If the string value is "one", Data ONTAP adds the specified disks to the existing RAID group specified by raid-group option until this specified RAID group is full. If the string value is "new", Data ONTAP creates one or more new RAID groups and adds the specified disks to the new groups, even if they would fit into an existing RAID group. The name of new RAID groups are selected automatically. It is not possible to specify the name for the new RAID groups. If the string value is "all", Data ONTAP adds the specified disks to existing RAID groups first. Only after all existing RAID

			groups are full, it creates one or more new RAID groups and adds the remaining disks to the new groups.
ignore-pool-checks		boolean optional	Disks in a plex are normally required to come from the same spare pool. Similarly, disks in different plexes of a mirrored aggregate are required to come from different spare pools. This behavior is overridden with this option when it is set to true. Default value is false.
mirror-disks		disk-info[] optional	Specific list of mirror disks needed to accompany the list in the "disks" parameter. This list must contain the same number of disks as specified in "disks".
pre-check		boolean optional	Only check for the warnings without actually adding the disks. This option cannot be used when "simulate" is specified or "upgrade-64bit-mode" is set to "check". Default value is false.
raid-group		string optional	Specifies the RAID group (for example rg0) to which the indicated disks are to be added. When a RAID group other than the last RAID group is specified, the aggregate can no longer be reverted to a version of Data ONTAP prior to 6.2. In such a case, the "force-spare-pool" option must be specified as well. By default, the filer fills up one RAID group with disks before starting another RAID group. Suppose an aggregate currently has one RAID group of 12 disks and its RAID group size is 14. If you add 5 disks to this aggregate, it will have one RAID group with 14 disks and another RAID group with 3 disks. The filer does not evenly distribute disks among RAID groups.
simulate		boolean optional	Simulates the addition of disks to the given aggregate or UUID of the aggregate. If set to "true", addition of disks won't happen but returns the list of disks that would be automatically selected for the addition of the aggregate. By default, simulate option is set to false.
so-aggr		boolean optional	Specifies that disks are being added to an unmirrored aggregate during Switchover.
storage-pool		string optional	Name of the storage pool from which the capacity will be added. This parameter cannot be used with disk-list or disk-count option.
upgrade-64bit-mode		string optional	Allows the aggregate to grow past 16 TB and begin 64-bit upgrade. If not supplied, adding disks past 16 TB to a 32-bit aggregate will fail. Legitimate values are "check", "grow_all", "grow_none", and "grow_reserved". If the "check" value is specified, aggr-add produces a summary of the space impact which would result from upgrading the aggregate to 64-bit. This summary includes the space usage of each contained volume after the volume is upgraded to 64-bit and the amount of space that must be added to the volume to successfully complete the 64-bit upgrade. The summary can be obtained by querying the 'aggr-list-info' and 'volume-list-info' APIs. The aggregate's summary is made available in the 'check' element that is part of the 'aggr-64bit-upgrade-info' typedef. The flexible volumes' summary is made available in the 'check' element that is part of the 'volume-64bit-upgrade-info' typedef. This option does not result in an upgrade to 64-bit or addition of disks. If the "grow_all" value is specified, "aggr-add" upgrades the aggregate to 64-bit if the total aggregate size after adding the specified disks exceeds 16TB. This option allows "aggr-add" to automatically grow volumes as needed if they run out of space due to the 64-bit upgrade. The volumes will be grown to accommodate all the files within these volumes. This option does not affect volumes which have autosize enabled. If the "grow_none" value is specified, "aggr-add" upgrades the aggregate to 64-bit if the total aggregate size after adding the specified disks exceeds 16TB. This option does not allow "aggr-add" to automatically grow volumes if they run out of space due to the 64-bit upgrade. If the "grow_reserved" value is specified, "aggr-add" upgrades the aggregate to 64-bit if the total aggregate size after adding the specified disks exceeds 16TB. This option allows "aggr-add" to automatically grow volumes if they run out of space due to the 64-bit upgrade, but only to accommodate the space reserved files within these volumes. This option does not affect volumes which have autosize enabled.

Output Name	Range	Type	Description
aggregate-capacity		integer optional	Estimated increase in aggregate capacity (in bytes). This is returned only if simulate option is set to true. Range : [0..2^64-1].
bad-disks		disk-info[] optional	List of disks that were not added. This is only returned if there are bad disks.
is-upgrade-64bit-ignore		boolean optional	"true" if addition of disks does not make the aggregate size exceed 16TB but 'upgrade-64bit-mode' input was "grow-all", "grow-none" or "grow-reserved". This is not present if upgrade-64bit-mode input is not present or if upgrade to 64-bit was triggered.
is-upgrade-64bit-invalid		boolean optional	"true" if aggregate is already 64-bit but 'upgrade-64bit-mode' input was "grow-all", "grow-none" or "grow-reserved". This is not present if upgrade-64bit-mode input is not present or if upgrade to 64-bit was triggered.
nonzeroed-disks		integer optional	Number of disks that need to be zeroed before being added. This is only returned if there are non-zeroed disks.
pre-check-results		warning-code[] optional	Result of the pre-check for possible warnings. Possible warning codes are: • E_WARN_NEW_RAID_GROUP • E_WARN_EXCEEDS_HALF_CLUSTER_SIZE • E_WARN_DISK_DOWNSIZE • E_WARN_LOW_SPARE • E_WARN_NEEDS_PARTITIONING • E_WARN_UNUSED_SPARE_PARTITIONS • ECANT_USE_ALL_DISKS
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string optional	The operation status. Possible values: "succeeded", "in-progress", "failed".
selected-disks		aggr-simulate-disk-info[] optional	List of disks that would be used for the addition of disks to the given aggregate. This is only returned if the simulate option is set to true.
selected-disks-for-shared-pool		aggr-simulate-disk-info[] optional	List of disks that would be added to a storage pool to grow the aggregate. This is only returned if the simulate option is set to true.
selected-mirror-disks		aggr-simulate-disk-info[] optional	List of mirror disks that would be used for the addition of disks to the given aggregate. This is only returned if the simulate option is set to true on the mirrored aggregate.
simulation-result		aggregate-simulate-layout-info optional	Layout of disks selected for addition to the aggregate. This is returned only if simulate option is set to true.
upgrade-64bit-cookie		integer optional	The opaque cookie to uniquely identify this 64-bit upgrade transaction. This cookie can be compared against the cookie returned by aggr-list-info to ensure that the output produced by aggr-list-info corresponds to this 64-bit upgrade transaction. Range: [0..2^64-1].
warning-message		string optional	Warning message returned during aggregate addition.

aggr-autobalance-aggregate-state-get-iter

[top]

Iterate over a list of aggr-autobalance objects.

Input Name	Range	Type	Description
desired-attributes		aggr-autobalance-aggregate-state optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-autobalance-aggregate-state optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-autobalance object. All aggr-autobalance objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-autobalance-aggregate-state[] optional	The list of attributes of aggr-autobalance objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-autobalance objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-autobalance-config-get

[top]

Displays the configuration for Auto Balance Aggregate.

Input Name	Range	Type	Description
desired-attributes		aggr-autobalance-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		aggr-autobalance-config	The attributes of the aggr-autobalance.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

aggr-autobalance-config-modify

[top]

Modifies Auto Balance Aggregate configuration.

Input Name	Range	Type	Description
available-threshold-percent		integer optional	When Auto Balance Aggregate identifies an aggregate that needs to be balanced, it will attempt to identify other target aggregates it can move volumes to. An aggregate will only be considered as a target if its projected space usage after the move is still under this percentage. Auto Balance Aggregate will attempt to move volumes from an unbalanced aggregate until it is under this percentage. The default value is 40%.
hold-duration-after-move		time-interval optional	This value represents the number of seconds that need to have elapsed since the volume was last moved before it will be considered a movable candidate again. The default value is 48 hours.
is-enabled		boolean optional	'true' if Auto Balance Aggregate is enabled. 'false' if Auto Balance Aggregate is disabled.
move-mode		string optional	For all modes, Auto Balance Aggregate will identify the volume moves that will help to balance space usage across the aggregates. The mode dictates what Auto Balance Aggregate will do with the suggested moves. In 'recommend' mode, the suggested moves will be displayed, but no further action will be taken.In 'auto' mode, Auto Balance Aggregate will trigger moves to start. The default mode is 'recommend'.
state-polling-interval		time-interval optional	Polling period, in seconds, used by Auto Balance Aggregate to update volume and aggregate stats. The default value is 3600 seconds (1 hour).
unbalanced-threshold-percent		integer optional	This percentage will indicate the space used threshold that will cause Auto Balance Aggregate to consider this aggregate as unbalanced. The default value is 60%.

volume-activity-threshold		integer optional	The threshold, in number of operations per second preformed on a volume (read/write/internal), that will disqualify the volume from being a candidate to be moved by Auto Balance Aggregate. The default value is 100 operations per second.
volume-inactive-delay-threshold		time-interval optional	This value represents a duration in seconds and designates the amount of time that has to elapse after a volume has exceeded the volume-activity-threshold before it can be considered a movable volume by Auto Balance Aggregate. The default value is 24 hours.

Errno	Description
EOBJECTNOTFOUND

Errno	Description
EINTERNALERROR	

aggr-check-spare-low

[top]

Return true if there is no suitable spare disk available for any filesystem (parity or data) disk.

Input Name	Range	Type	Description
node-name		string optional	Low spare condition checked on the requested node. When requested from Admin Vserver LIF and node name not specified, status for the cluster is returned.

Output Name	Range	Type	Description
is-spare-low		boolean	"true", if system has insufficient spare disk, "false" otherwise. When requested from Admin Vserver LIF, "true" is returned if one or more nodes in the cluster have spare low condition, "false" otherwise.

aggr-create

[top]

Create a new aggregate with the given name. The maximum number of aggregates that can be created on a filer varies by the type of configuration. In a standalone configuration, up to 200 aggregates can be created on a filer. In an HA configuration, this number drops to 100 and to 50 in a C-mode MetroCluster configuration. The aggregate may not yet be operational immediately after the API returns. Use 'aggr-list-info' to query the status of the newly-created aggregate to determine when it is fully operational. Same can be done using

'aggr-get-iter' when requested from Admin Vserver LIF. NOTE: If ECANT_USE_ALL_DISKS is returned, then the requested aggregate was indeed created, just not with all the disks that were specified.

Input Name	Range	Type	Description
actual-disk-type		string optional	Actual type of disks to use: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, or VMDISK. When this option is used, only disks of the specified type will be selected for use in the aggregate. This option is not allowed if a disk type is specified through the "disk-type" option or if a disk class is specified through the "disk-class" option. It is also not allowed if a list of disks to use is specified through the "disks" option.
aggregate		string	Name of the aggregate to create. The aggregate name can contain letters, numbers, and the underscore character(_), but the first character must be a letter or underscore. The maximum length of the aggregate name is 255.
allow-mixed-rpm		boolean optional	Disks in an aggregate are normally required to have the same RPM. This behavior is overridden with this option when it is set to true. Default value is false.
allow-same-carrier		boolean optional	Using two disks from one carrier that houses multiple disks in one RAID group is not desirable. If that happens, Data ONTAP initiates a series of disk copy operations to correct that situation. Sometimes, selection of available spare disks makes it impossible to avoid placing two disks from one carrier in one RAID group. Setting this option to true allows placing two disks from one carrier in one RAID group. This option has an effect only when disks to be used are specified in 'disks'. This option is ignored when 'disk-count' is used.
auto-provision-target-size		integer optional	This field is set to indicate the target size of the aggregate when auto provision is creating it in multiple steps. Range : [0..2^63-1].
autobalance-state		autobalance-aggregate-state optional	The state of the aggregate being balanced. Possible values: • "disabled" - Auto Balance Aggregate is disabled, • "balanced" - Auto Balance Aggregate has determined that the aggregate is below the high-watermark. • "unbalanced" - Auto Balance Aggregate has detected that the aggregate is over the high-watermark but has not initiated any jobs to bring it below the high-watermark., • "ineligible" - Ineligible The states excluded, balanced and unbalanced are available only when Auto Balance Aggregate is enabled. The default value is 'ineligible'
block-type		string optional	The indirect block format that the aggregate can have. The default is 64_bit. With a 64_bit block-type creation of aggregates that can be larger than 16TB is allowed. Possible values: 64_bit
checksum-style		string optional	Specifies the checksum style for the aggregate. This input is not allowed if a list of disks to use is specified through the "disks" parameter. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block,
disk-class		string optional	Class of disks to use. Disks are grouped into classes based on their performance characteristics. Disks belonging to the same class are compatible for use in the same aggregate. When this option is used, all disks belonging to the specified disk class are considered eligible for selection. Possible values are: • "capacity" - Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA. • "performance" - Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS. • "archive" - Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.

			• "solid-state" - Solid-state drives. Includes disk type SSD and SSD_NVM. • "array" - Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN. • "virtual" - Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK. This option is not allowed if a disk type is specified through the "disk-type" or "actual-disk-type" option. It is also not allowed if a list of disks to use is specified through the "disks" option.
disk-count		integer optional	Number of disks to place into the aggregate, including parity disks. The disks in this newly- created aggregate come from the spare disk pool. The smallest disks in this pool join the aggregate first, unless the "disk-size" argument is provided. Range [0..2^31-1]. Either "disk-count" or "disks" must be supplied.
disk-size		integer optional	Disk size in 4KB blocks. Disks that are within 10% of the specified size will be selected for use in the aggregate. If neither "disk-size" nor "disk-size-with-unit" is specified, existing groups are appended with disks that are the best match for the largest disk in the group. When starting new groups, the smallest disks are selected first. This option is ignored if a specific list of disks to use is specified through the "disks" parameter. Range : [0..2^63-1]. You must only use one of either "disk-size" or "disk-size-with-unit" parameters. If both appear, an error message will be returned.
disk-size-with-unit		string optional	Disk size in the specified unit. It is a positive integer number followed by unit of "T", "G", "M" or "K". This "disk-size-with-unit" option is ignored if a specific list of disks is specified through the "disks" parameter. You must only use one of either "disk-size" or "disk-size-with-unit" parameters. If both appear, an error message will be returned.
disk-type		string optional	Type of disks to use: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, or VMDISK. When this option is used, disks of the specified type or disks of a compatible type will be selected for use in the aggregate. The ability to mix compatible disk types in one aggregate is controlled by these system options: 'raid.mix.hdd.disktype.capacity' 'raid.mix.hdd.disktype.performance' and 'raid.mix.disktype.solid_state'. The "disk-type" option is not allowed if a disk type is specified through the "actual-disk-type" option or if a disk class is specified through the "disk-class" option. It is also not allowed if a list of disks to use is specified through the "disks" option. This option will be deprecated in a future release. Please use "actual-disk-type" or "disk-class" instead.
disks		disk-info[] optional	Specific list of disks to use for the new aggregate. To create a "mirrored" aggregate with a specific list of disks, both 'disks' and 'mirror-disks' options must be supplied. Additionally, the same number of disks must be supplied in both lists. This option cannot be used when the 'is-mirrored' option is set to true.
encrypt		boolean optional	Enable encryption for the aggregate being created. Default value is false.
encrypt-with-aggr-key		boolean optional	Enable NetApp Aggregate Encryption for the aggregate being created. The aggregate will support encryption with aggregate keys. Default value is false.
force-small-aggregate		boolean optional	Forces the creation of a 2-disk RAID4 aggregate, or a 3-disk or 4-disk RAID-DP aggregate. The default value is false.
force-spare-pool		boolean optional	Disks in a plex are not normally permitted to span spare pools. This behavior is overridden with this option when it is set to true. This is a deprecated parameter. Use the allow-mixed-rpm and ignore-pool-checks parameters instead.
ha-policy		ha-policy-type optional	Aggregate's HA policy. The only allowed values are "cfo" and "sfo". In clustered environments default value is 'sfo' if not specified. In unclustered environments, it is not allowed to specify this attribute as it is always be 'cfo' internally. EINVALIDINPUTERROR is returned if value is other than "cfo" and "sfo". EOP_CLUSTER_ATTR_DISALLOWED is

			returned if this attribute is used in unclustered environments.
ignore-pool-checks		boolean optional	Disks in a plex are normally required to come from the same spare pool. Similarly, disks in different plexes of a mirrored aggregate are required to come from different spare pools. This behavior is overridden with this option when it is set to true. Default value is false. This option can be used only when 'mirror-disks' is provided.
is-autobalance-eligible		boolean optional	When set to 'true', the aggregate is included in Auto Balance aggregate processing. The default value is false, meaning that the aggregate is included in Auto Balance Aggregate processing.
is-mirrored		boolean optional	Specifies that the new aggregate be mirrored (have two plexes). If set to true, then the indicated disks will be split across the two plexes. By default, the new aggregate will not be mirrored. This option cannot be used when a specific list of disks is supplied with either the 'disks' or 'mirror-disks' options.
is-snaplock		boolean optional	Specifies the creation of a SnapLock aggregate. By default, is-snaplock is not specified. When is-snaplock is "true" the type of snaplock aggregate is determined in the following way - 1> If snaplock-type is set, create the type specified in snaplock-type (see snaplock-type for more details) 2> Otherwise, create a Snaplock enterprise aggregate if a Snaplock enterprise license has been installed. 3> Otherwise, create a Snaplock compliance aggregate. ESERVICENOTLICENSED is returned if the required Snaplock Compliance or Enterprise license is not installed. EONTAPI_EWORMNOCLOCK is returned if SnapLock Compliance Clock is not running. If you need to create a snaplock aggregate, the suggested method is to specify snaplock-type as "compliance" or "enterprise" and not specify is-snaplock at all. If you want to create a non-snaplock aggregate, the suggested method is to specify neither snaplock-type nor is-snaplock.
language-code		string optional	Specifies the language to use for the volume via a language code. The default language is the one used by the filer's root volume. For the full list of available language codes, see 'volume-create'.
mirror-disks		disk-info[] optional	List of mirror disks to use. It must contain the same number of disks specified in 'disks'. This option cannot be used when 'is-mirrored' option is set to true.
nodes		node-name[] optional	Target node to create aggregate. If no node name is provided, aggregate will be created on the local node. If one node name is provided, aggregate(striped or not_striped based on the striping input) will be created on that node.When multiple nodes are specified, striped aggregate will be created across multiple nodes.
pre-check		boolean optional	Only check for the warnings without actually creating the aggregate. This option cannot be used when "simulate" is specified. Default value is false.
raid-size		integer optional	Specifies the maximum number of disks in each RAID group in the aggregate. The maximum value for this parameter is 28. The default value is platform- dependent. The valid range of values is also platform-dependent, but never wider than [2..28].
raid-type		string optional	Specifies the type of RAID groups to use in the new aggregate. Possible values: raid4, raid_dp, raid_tec. The default value is raid4 on most platforms.
requested-uuid		string optional	If this field is set, the aggr will use this value for its uuid if possible.
rpm		integer optional	Rotational speed of disks in revolutions per minute. Possible values are: 5400, 7200, 10000, and 15000. This option is needed only when disks with different rotational speeds are connected to the filer. It is not allowed if a list of disks to use is specified through the "disks" parameter.
simulate		boolean optional	Specifies to return the list of disks getting used to create the new aggregate. If set to "true", new aggregate won't be created but returns the disks that would be automatically selected for the creation of the aggregate. By default, simulate option is set to false.
			Specifies the type of Snaplock aggregate to be created. Possible values -

snaplock-type		string optional	"compliance", "enterprise" or "non-snaplock". ESERVICENOTLICENSED is returned if the necessary Snaplock compliance or enterprise license has not been installed. EINVALIDINPUTERROR is returned if snaplock-type has an illegal value. EONTAPI_EWORMNOCLOCK is returned if SnapLock Compliance Clock is not running.
so-aggr		boolean optional	Specifies creation of an unmirrored aggregate during Switchover.
spare-pool		string optional	Specifies the spare pool from which to select spare disks to use in creation of a new aggregate. This option is not allowed if a list of disks specified through the "disks" parameter. This option cannot be used when "is-mirrored" is set to true. Possible values: • "Pool0" - Disks associated with spare Pool0. • "Pool1" - Disks associated with spare Pool1.
striping		striping-type optional	Specifies the striping information about new aggregate. The only allowed values are "striped" and "not_striped". Default value is "not_striped". "striped" value creates striped aggregate on node. This attribute is not allowed in unclustered environments. EINVALIDINPUTERROR is returned if value is other than "striped" and "not_striped". EOP_CLUSTER_ATTR_DISALLOWED is returned if this attribute is used in unclustered environments. EOP_DISALLOWED_ON_CFO_AGGR is returned if this attribute is set to "striped" when aggregate being created with 'cfo' HA policy.
type		string optional	The type of the aggregate. Possible values: aggr - "aggr" (aggregate contains flexible volumes) If not specified, the default is "aggr."

Output Name	Range	Type	Description
aggregate-capacity		integer optional	Estimated aggregate capacity (in bytes). This is returned only if simulate option is set to true. Range : [0..2^64-1].
bad-disks		disk-info[] optional	List of disks that were not added. This is only returned if there are bad disks.
nonzeroed-disks		integer optional	Number of disks that need to be zeroed before being added. This is only returned if there are non-zeroed disks.
pre-check-results		warning-code[] optional	Result of the pre-check for possible warnings. Possible warning codes are: • E_WARN_EXCEEDS_HALF_CLUSTER_SIZE • E_WARN_DISK_DOWNSIZE • E_WARN_LOW_SPARE • E_WARN_NEEDS_PARTITIONING • E_WARN_UNUSED_SPARE_PARTITIONS • ECANT_USE_ALL_DISKS
selected-disks		aggr-simulate-disk-info[] optional	List of disks that would be used for the creation of the new aggregate. This is only returned if the simulate option is set to true.
selected-disks-for-shared-pool		aggr-simulate-disk-info[] optional	List of disks that would be added to a storage pool to grow the aggregate. This is only returned if the simulate option is set to true.
selected-mirror-disks		aggr-simulate-disk-info[] optional	List of mirror disks that would be used for the creation of the new aggregate. This is only returned if both the simulate option and the is-mirrored option are set to true.
simulation-result		aggregate-simulate-layout-info optional	Layout of disks selected for creation of the aggregate. This is returned only if simulate option is set to true.

warning-message		string optional	Warning message returned during aggregate creation.

aggr-destroy

[top]

Destroys the specified aggregate or plex. If an aggregate is specified, all plexes in the aggregate are destroyed. If a plex is specified, only that plex is destroyed, leaving an unmirrored aggregate containing the remaining plex. The disks in the destroyed object become spare disks. Only offline aggregates and plexes can be destroyed. Note: Offline aggregates will be destroyed even if they contain one or more flexible volumes, which should not typically be the case. From cluster interface only aggregates are supported and plexes are not supported.

Input Name	Range	Type	Description
aggregate		string	Name of the existing aggregate or plex to be destroyed, using the following format: [/vol/][] UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.
plex		string optional	Name of a particular plex to destroy.

aggr-efficiency-cumulated-get

[top]

Display the cumulated efficiency ratio for the specified aggregates

Input Name	Range	Type	Description
aggregates		string[] optional	List of the aggregates to calculate cumulated efficiency.
nodes		string[] optional	List of nodes to calculate cumulated efficiency.

Output Name	Range	Type	Description
aggr-efficiency-cumulated-info		aggr-efficiency-cumulated-info optional	Aggregate Storage Efficiency Information

Errno	Description
ESENOTFOUNDNODE	
ESENOTFOUNDCLUSTER	

aggr-efficiency-get-iter

[top]

Display the all Flash optimized aggregates and their storage efficiency.

Input Name	Range	Type	Description
desired-attributes		aggr-efficiency-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-efficiency-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-efficiency object. All aggr-efficiency objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-efficiency-info[] optional	The list of attributes of aggr-efficiency objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-efficiency objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-get-filer-info

[top]

Get information on what possibilities and parameters exist for aggregates on a given filer.

Input Name	Range	Type	Description
node-name		string	Name of the node (filer)

Output Name	Range	Type	Description
allowed-raidtypes		raidtype-info[]	List of RAID types allowed for aggregates on this filer.
checksum-types		string	Checksum types supported by this filer. The possible values: • "zoned" - if all aggregates are Fixed VBN (this value is no longer supported), • "block" - if all aggregates are Block Appended, • "mixed" - if aggregates are mixed (Fixed VBN, Block Appended and Advanced Zoned), • "none" - if no aggregates have zoned or advanced_zoned checksum (azcs) or block checksums, • "advanced_zoned" - if all aggregates have Advanced Zoned Checksum scheme.
default-raidtype		string	Default type of RAID used to protect against disk failure in aggregates on this filer. Possible values: "raid0", "raid4", "raid_dp", "raid_tec", "mixed_raid_type".
		default-	

default-raidtype-config		raidtype-config-info[] optional	List of the RAID type parameters for each disk size and disk type supported on this filer.
disk-types		string	Sector sizes of disks supported by this filer. Possible values: "512", "520", "4096", "mixed", "none". "512" if all disks are 512 BPS, "520" if all disks are 520 BPS, "4096" if all disks are 4096 BPS, "mixed" if disks are mixed 512, 520 and 4096 BPS, "none" if no disks have 512 or 520 or 4096 BPS.
max-named-disks-per-request		integer	The maximum number of named disks which can be specified to 'storage aggregate add', 'storage aggregate create', or 'storage aggregate mirror' operation. Disk addition process may fail if the specified number of named disk is more than this limit. This value is the maximum number of disk entries which can be specified in 'disks' or 'mirror-disks' argument of 'aggr-create' and 'aggr-add' api. Range : [0..2^31-1].
min-aggr-disk-count		min-aggr-disk-count-info[] optional	Information about the minimum number of disks required in an aggregate.
raidgroup-size		raidgroup-size-info[]	List of the RAID group sizing parameters for each RAID type supported on this filer.
root-volume		string	Current root volume on the filer.
snapshots-max		integer	Maximum number of snapshots available per aggregate on the filer. Range : [0..2^31-1].

Errno	Description
EINTERNALERROR	

aggr-get-iter

[top]

Iterate over a list of aggregate objects.

Input Name	Range	Type	Description
desired-attributes		aggr-attributes optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-attributes optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-attributes[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-get-root-name

[top]

Return the name of the "root" volume on the filer.

Output Name	Range	Type	Description
root-volume		string	Name of the root volume for the filer.

Vfiler-enabled
Yes

aggr-list-info

[top]

Get aggregate status.

Input Name	Range	Type	Description
aggregate		string optional	The aggregate name or UUID to get status for. See the synopsis for name/UUID format. If not supplied, get status of all aggregates owned by the local node.
filter-attrs		filter-attrs-info optional	This input is used as a discriminant when status is required for one or more aggregates. This option will be ignored when an aggregate name is specified. If no argument is supplied, default value is NULL. If this is NULL or all of its elements are not supplied, then this filter has no effect and the behavior is the same as described in the 'aggregate' input description.
verbose		boolean optional	If set to "true", detailed volume and plex information (including all the RAID group and disk information) is returned. If not supplied or set to "false", this extra information is not returned.

Output Name	Range	Type	Description
aggregates		aggr-info[]	List of aggregates and their status.

Errno	Description
EINTERNALERROR	
EVOLUMEDOESNOTEXIST	
ELOWMEMORY	
ENODENOTFOUND	

Vfiler-enabled
Yes

aggr-mediascrub-list-info

[top]

Get the status of media scrubbing on the named aggregate, plex, or RAID group. Status includes percentage complete and the media scrub's status.

Input Name	Range	Type	Description
aggregate		string optional	Name of an existing aggregate, plex, or RAID group, using the following format: [/vol/][][] If no name is given, then status is generated for all RAID groups currently being media-scrubbed.

Output Name	Range	Type	Description
mediascrub-details		mediascrub-detail-info[]	List of RAID groups and their media scrub status.

Errno	Description
EINTERNALERROR	

aggr-mirror

[top]

Turns an unmirrored aggregate into a mirrored aggregate by adding a plex to it. The plex is either newly formed from disks chosen from a spare pool or, if the "victim-aggregate" option is specified, taken from another existing unmirrored aggregate. The named aggregate must currently be unmirrored. Disks may be specified explicitly using the "mirror-disks" list option in the same way as with the "aggr-create" and "aggr-add" commands. The number of disks indicated must match the number present in the existing aggregate. If disks are not specified explicitly, then disks are automatically selected to match those in the aggregate's existing plex.

Input Name	Range	Type	Description
aggregate		string	Name of the existing aggregate to be mirrored. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.
allow-mixed-rpm		boolean optional	Disks in an aggregate are normally required to have the same RPM. This behavior is overridden with this option when it is set to true. Default value is false.
allow-same-carrier		boolean optional	Using two disks from one carrier that houses multiple disks in one RAID group is not desirable. If that happens, Data ONTAP initiates a series of disk copy operations to correct that situation. Sometimes, selection of available spare disks makes it impossible to avoid placing two disks from one carrier in one RAID group. Setting this option to true allows placing two disks from one carrier in one RAID group. This option has an effect only when disks to be used are specified in 'disks'. This option is ignored when 'disk-count' is used.
force		boolean optional	Force the mirroring operation through, past the normal roadblocks that would otherwise cause it to be aborted. For example, disks in a plex are not normally permitted to span spare pools. Also, the victim cannot normally be accepted when it is owned by one or more vfilers. All these safety-driven behaviors are overridden when this option is set to true. This is a deprecated parameter. Use the allow-mixed-rpm and ignore-pool-checks parameters instead.
ignore-pool-checks		boolean optional	Disks in a plex are normally required to come from the same spare pool. Similarly, disks in different plexes of a mirrored aggregate are required to come from different spare pools. This behavior is overridden with this option when it is set to true. Default value is false.
mirror-disks		disk-info[] optional	Specific list of mirror disks to add. This list must match the number of disks present on the existing aggregate. The specified disks are not permitted to span disk pools unless overridden with the "force-spare-pool" option.
override-		boolean	The victim aggregate cannot normally be accepted when it is owned by one

vfiler-ownership		optional	or more vfilers. This option may be set to true in order to override that restriction. The option is ignored if 'victim-aggregate' is not specified.
pre-check		boolean optional	Only check for the warnings without actually mirroring the aggregate. Default value is false.
simulate		boolean optional	Simulates the addition of a new plex to an existing aggregate. If set to "true", new plex won't be added but returns the disks that would be automatically selected for the creation of the new plex. By default, simulate option is set to false.
victim-aggregate		string optional	The "victim" aggregate to cannibalize in order to mirror the named aggregate. The "victim-aggregate" must have been previously joined with the aggregate to be mirrored and then split from it. The resulting mirrored aggregate is otherwise identical to the original aggregate before the operation. The "victim-aggregate" (and all its volumes) is effec- tively destroyed. "victim-aggregate" (and all its volumes) must be offline.

Output Name	Range	Type	Description
aggregate-capacity		integer optional	Estimated increase in aggregate capacity (in bytes). This is returned only if simulate option is set to true. Range : [0..2^64-1].
bad-disks		disk-info[] optional	List of disks that were not added. This is only returned if there are bad disks.
nonzeroed-disks		integer optional	Number of disks that need to be zeroed before being added. This is only returned if there are non-zeroed disks.
pre-check-results		warning-code[] optional	Result of the pre-check for possible warnings. • E_WARN_DISK_DOWNSIZE • E_WARN_LOW_SPARE • E_WARN_NEEDS_PARTITIONING • E_WARN_UNUSED_SPARE_PARTITIONS • ECANT_USE_ALL_DISKS
selected-disks		aggr-simulate-disk-info[] optional	List of disks that would be used to create the new plex of an existing aggregate. This is only returned if the simulate option is set to true.
selected-disks-for-shared-pool		aggr-simulate-disk-info[] optional	List of disks that would be partitioned as part of mirroring an existing aggregate. This is only returned if the simulate option is set to true.
selected-mirror-disks		aggr-simulate-disk-info[] optional	This is a dummy output needed to make aggr mirror disk list processing similar to aggr create and aggr add.
simulation-result		aggregate-simulate-layout-info optional	Layout of disks selected for mirroring the existing aggregate. This is returned only if simulate option is set to true.
warning-message		string optional	Warning message returned during aggr mirror.

aggr-modify-raid-type

[top]

Modify the RAID type for the given aggregate to the specified "raid-type". This API can also selectively change the RAID type of specific raid groups in the aggregate based on the specified "disk-type". The change remains effective even if the filer is rebooted. This API does not support modifying options of a striped aggregate.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate whose option is to be set. See the synopsis for name/UUID format and restrictions.
disk-type		string optional	Type of disks to use : ATA, BSAS, FCAL, FSAS, LUN, SAS, SSD, SSD_NVM, or VMDISK. This option is required if we want to change the raid type of raid groups created out of the specified disks only. Otherwise, if this is not specified then the raid type for all raid groups in the aggregate would change.
			possible values: "raid4","raid_dp","raid_tec" The type of RAID group used for

raid-type		string	this aggregate. The "raid4" setting provides one parity disk per RAID group, while "raid_dp" provides two. Changing this option immediately changes the RAID group type for the RAID groups in the aggregate. When upgrading RAID groups from "raid4" to "raid_dp", each RAID group begins a reconstruction onto a spare disk allocated for the second "dparity" parity disk. Similarly, when upgrading RAID groups from "raid_dp" to "raid_tec", each RAID group begins a reconstruction onto a spare disk allocated for the third "tparity" parity disk.
simulate		boolean optional	Simulates modifying the raid type of the aggregate. If set to "true", raid type will not be changed but, any possible warnings will be returned back. Default value is "false".

Output Name	Range	Type	Description
pre-check-results		warning-code[] optional	Warnings from pre checking of raid type modification. Possible warning codes are: • E_WARN_LOW_SPARE
simulation-result		modify-raid-type-simulate-info optional	Results from simulation of raid type modification.

aggr-object-store-config-create

[top]

Create an object store configuration.

Input Name	Range	Type	Description
access-key		string optional	Access key ID for AWS_S3, SGWS and ONTAP_S3 provider types
			Authentication used to access the object store. Supported values are: • 'key' - Access keys provided by admin • 'CAP' - Access keys and session token retrieved from the C2S Access Portal (CAP) • 'EC2-IAM' - In Cloud Volumes ONTAP access keys and session token

auth-type		string optional	retrieved from the EC2 instance metadata for the IAM role associated with EC2 instance • 'GCP-SA' - In Cloud Volumes ONTAP session token retrieved from the GCP instance metadata for the Service Account associated with GCP instance • 'Azure-MSI' - In Cloud Volumes ONTAP session token retrieved from the Azure Managed Service Identity (MSI) associated with the instance
azure-account		string optional	Azure account
azure-private-key		string optional	Azure access key
cap-url		string optional	URL to request temporary credentials for a C2S account.
check-only		boolean optional	Do not create a config. Only check that create could succeed.
ignore-warning-codes		integer[] optional	Input list with warning codes which can be ignored.
ipspace		string optional	IPspace to use in order to reach the object store.
is-certificate-validation-enabled		boolean optional	Is SSL/TLS certificate validation enabled. The default value is 'true'.
object-store-name		string	Name for the object store configuration to be created. The name can contain letters, numbers, and the underscore character (_), but the first character must be a letter or an underscore.
port		integer optional	Port number of the object store
provider-type		string	Type of object store provider. Allowed values are: • 'AWS_S3' - AWS S3 • 'SGWS' - StorageGRID Webscale • 'Azure_Cloud' - Microsoft Azure Cloud • 'IBM_COS' - IBM Cloud Object Storage • 'AliCloud' - Alibaba Cloud Object Storage Service • 'GoogleCloud' - Google Cloud Storage • 'ONTAP_S3' - ONTAP S3
s3-name		string	Data bucket/container name
secret-password		string optional	Secret access key for AWS_S3, SGWS and ONTAP_S3 provider types
server		string	Fully qualified domain name of the object store
ssl-enabled		boolean optional	SSL/HTTPS enabled or not. The default value is 'true'.
url-style		object-store-url-style optional	URL style used to access S3 bucket.

Output Name	Range	Type	Description
confirm-warning-codes		integer[] optional	Output list with warning codes which have to be confirmed.
confirm-warning-texts		string[] optional	Output list with warning texts which have to be confirmed.

aggr-object-store-config-provider-list

[top]

Returns a list of supported object store providers.

Output Name	Range	Type	Description
available-provider-status		string[] optional	Indicates status (enabled or disabled) of available object store providers
available-providers		string[] optional	List of all available object store providers including those that can be enabled
supported-providers		string[] optional	List of supported object store providers that are enabled

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

aggr-object-store-get-iter

[top]

Display a list of aggregates which object stores are attached to.

Input Name	Range	Type	Description
desired-attributes		object-store-information optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		object-store-information optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-object-store object. All aggr-object-store objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		object-store-information[] optional	The list of attributes of aggr-object-store objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-object-store objects to return.

num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-object-store-get-resync-status-iter

[top]

Display a list of cloud mirrored FabricPools and their mirror object store resync related info. This information is only available when the aggregate is online.

Input Name	Range	Type	Description
desired-attributes		aggr-object-store-resync-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-object-store-resync-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-object-store object. All aggr-object-store objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-object-store-resync-info[] optional	The list of attributes of aggr-object-store objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-object-store objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-object-store-mirror

[top]

Attaches a second object store to a FabricPool aggregate to create a mirror

aggr-object-store-vol-btuuids-get-iter

[top]

Display a list of volume buftree UUIDs in a FabricPool aggregate.

Input Name	Range	Type	Description
desired-attributes		object-store-vol-btuuids-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		object-store-vol-btuuids-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-object-store-vol-btuuids object. All aggr-object-store-vol-btuuids objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		object-store-vol-btuuids-info[] optional	The list of attributes of aggr-object-store-vol-btuuids objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-object-store-vol-btuuids objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-offline

[top]

Take the specified aggregate or plex offline. The operation takes effect before the API returns. Except in maintenance mode, the current root aggregate may not be taken offline. An aggregate marked to become the root aggregate cannot be taken offline. An aggregate containing one or more flexible volumes cannot be taken offline; its contained volumes must first be destroyed. A number of operations being performed on the given aggregate can prevent this operation from succeeding, either at all or for various lengths of time. If such operations are found, the system waits up to one second for them to finish. If they don't, the command is aborted. A check is also made for files in the aggregate opened by internal Data ONTAP processes. The command is aborted if any are found.

Input Name	Range	Type	Description
aggregate		string	Name of the existing aggregate or plex to offline, using the following format: [[/vol]/][] UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions. If the aggregate hosts any online volumes, then the offline request will fail unless the optional "unmount-volumes" argument (see below) appears and is set to TRUE. If we've been cleared to unmount any such online volumes hosted by the aggregate, the caller may also specify the number of seconds to wait should any of those volumes have active CIFS shares through the optional "cifs-delay-seconds" argument (see below). If a plex name is specified, the plex must be part of a mirrored aggregate, and both plexes must be online. Prior to offlining a plex, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online. For ontap-cluster, plexinfo is being deprecated in lieu of the plex parameter.
cifs-delay-seconds		integer optional	The number of seconds to wait before offlining any volumes that are hosted in the given aggregate that have active CIFS shares (if any). A value of 0 means that all such volumes are to be offlined immediately with no warning. CIFS users can lose data if they aren't given a chance to terminate applications gracefully. By default, "cifs-delay-seconds" is 0. NOTE: This argument may ONLY appear if the "unmount-volumes" argument (see above) also appears and is set to "TRUE".
force-offline		boolean optional	An aggregate cannot normally be brought offline if it contains a system volume. This behavior is overridden when this option is set "true". Forcing the aggregate offline might impact cross cluster replication. By default "force-offline" is "false".
plex		string optional	Name of a particular plex to offline. If no plex is specified, then the aggregate will be taken offline. If a plex is specified, the plex must be part of a mirrored aggregate, and both plexes must be online. Prior to offlining a plex, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.
unmount-volumes		boolean optional	If set to "TRUE", this option specifies that all of the volumes hosted by the given aggregate are to be unmounted before the offline operation is executed. By default, the system will reject any attempt to offline an aggregate that hosts one or more online volumes.

Errno	Description
EINTERNALERROR	
EVOLUMEDOESNOTEXIST	
EVOLUMEBUSY	

aggr-online

[top]

Bring the specified aggregate or plex online. This command takes effect immediately. All volumes on the aggregate are brought to whatever state they were in before the aggregate was restricted or taken offline. If there are CIFS shares associated with the any of the aggregate's volumes that were also onlined, they are enabled.

Input Name	Range	Type	Description
			Name of the existing aggregate or plex to online, using the following format: [/vol/][] UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions. If an aggregate is specified, it must currently be offline, restricted, or foreign (consisting of disks moved from another filer, and never having been brought online on the current filer). If the aggregate is foreign, it will be made native before being brought online on the

aggregate		string	current filer. Aggregates that aren't foreign are termed "native". If the aggregate is inconsistent but has not lost data, it is advisable to run WAFL_check or wafliron (or do a "snapmirror initialize" in case of a replica aggregate) prior to bringing it online. Bringing an inconsistent aggregate online increases the risk of further file system corruption. If the aggregate is inconsistent and has experienced possible loss of data, it can't be brought online unless WAFL_check or wafliron (or snapmirror initialize) is run on it. If a plex is specified, it must be part of an online mirrored aggregate. The system initiates resynchro- nization of the plex as part of online processing. For ontap-cluster, plexinfo is being deprecated in lieu of the plex parameter.
force-online		boolean optional	An aggregate can not normally be brought online under the following conditions: 1. It has only 1 plex that is offline and not up-to-date. 2. It is an unmirrored or CFO aggregate that has been switched over to its DR partner as part of an MCC configuration. This behavior is overridden when this option is set "true". By default, "force-online" is "false".
keep-same-uuid		boolean optional	Keep existing foreign raidtree id (aggregate uuid). Normally when a foreign raidtree is onlined, the raidtree rtid (aggregate uuid) is changed to guarantee uniqueness. The behavior is overridden when this option is set "true." By default, "keep-same-uuid" is "false."
plex		string optional	Name of a particular plex to online. If no plex is specified, then the aggregate will be onlined. If a plex is specified, it must be part of an online mirrored aggregate. The system initiates resynchro- nization of the plex as part of online processing.

Errno	Description
EINTERNALERROR	
EVOLUMEDOESNOTEXIST	
ESYNCMIRROR_NO_PLATFORM	
EVOL_ONLINE_LICENSE_CHECK_PENDING	

aggr-options-list-info

[top]

Get the options that have been set for the specified aggregate. This API does not support listing options of striped aggregate.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate whose options to retrieve. See the synopsis for name/UUID format and restrictions.

Output Name	Range	Type	Description
options		aggr-option-info[]	List of options set for this aggregate.

Errno	Description
EINTERNALERROR	
EVOLUMEDOESNOTEXIST	

aggr-relocation

[top]

Aggregate Relocation

Input Name	Range	Type	Description
aggregate-list		string[]	List of aggregate names.
destination-node-name		string	Name of destination node where aggregates are to be relocated.
is-ndo-controller-upgrade		boolean optional	Relocation of aggregates as part of controller upgrade. Aggregate relocation will not change home ownership of the aggregates while relocating as part of controller upgrade. Default: false
is-override-destination-checks		boolean optional	Override checks done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive. Default: false
is-override-vetoes		boolean optional	Override veto checks for relocating an aggregate. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. Default: false
is-relocate-to-higher-version		boolean optional	Relocate to a node running higher major Data ONTAP version. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher Data ONTAP version. This option is not required if the destination is running on higher minor version but the same major version. Default: false
source-node-name		string	Name of the source node in which aggregate resides.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

aggr-relocation-status

[top]

Iterate over the list of aggregate relocation status

Input Name	Range	Type	Description
desired-attributes		aggr-relocation-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-relocation-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-relocation-info[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
	[0..2^32-		

num-records	1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-rename

[top]

Rename the specified aggregate.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate to rename. See the synopsis for name/UUID format and restrictions.
new-aggregate-name		string	The new name desired for the aggregate.

Errno	Description
EINTERNALERROR	
EVOLUMENAMEINVALID	

aggr-restrict

[top]

Restrict the specified aggregate. An aggregate with one or more flexible volumes cannot be restricted; all of its contained volumes must first be destroyed.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate to restrict. See the synopsis for name/UUID format and restrictions.
cifs-delay-seconds		integer optional	The number of seconds to wait before restricting any volumes that are hosted in the given aggregate that have active CIFS shares (if any). A value of 0 means that all such volumes are to be offlined immediately with no warning. CIFS users can lose data if they aren't given a chance to terminate applications gracefully. By default, "cifs-delay-seconds" is 0. NOTE: This argument may ONLY appear if the "unmount-volumes" argument (see above) also appears and is set to "true".
unmount-volumes		boolean optional	If set to "TRUE", this option specifies that all of the volumes hosted by the given aggregate are to be unmounted before the restrict operation is executed. By default, the system will reject any attempt to restrict an aggregate that hosts one or more online volumes.

Errno	Description
EINTERNALERROR	
EVOLUMEBUSY	
EVOLUMEDOESNOTEXIST	

aggr-resync-options-get

[top]

Get aggregate resynchronization options for a node in the cluster

Input Name	Range	Type	Description
desired-attributes		aggr-resync-options-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node		string	Name of the node for which the resynchronization option is defined

Output Name	Range	Type	Description
attributes		aggr-resync-options-info	The attributes of the aggr.

EINTERNALERROR	

aggr-resync-options-get-iter

[top]

Get aggregate resynchronization options for each node in the cluster

Input Name	Range	Type	Description
desired-attributes		aggr-resync-options-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aggr-resync-options-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-resync-options-info[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-resync-options-set

[top]

Modify aggregate resynchronization options for a node in the cluster

Input Name	Range	Type	Description
max-concurrent-resyncs-allowed	**[1..200]**	integer optional	The number of aggregates, owned by the specified node, that are allowed to resync at a time
node		string	Name of the node for which the resynchronization option is defined

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

aggr-scrub-list-info

[top]

Get the status of parity scrubbing on the named aggregate. Status includes percentage complete and the scrub's suspended status (if appropriate). If an aggregate or node is not given, then status is generated for all RAID groups.

Input Name	Range	Type	Description
aggregate		string optional	Name or UUID of the entity to show scrubbing status for. See the synopsis for name/UUID format and restrictions.
node		string optional	Name of the node.
verbose		boolean optional	If set to "true", this operation will be verbose. If not supplied or set to false, normal output levels will be used.

Output Name	Range	Type	Description
scrub-details		scrub-detail-info[] optional	List of RAID groups and their scrub status.

Errno	Description
EINTERNALERROR	

aggr-scrub-resume

[top]

Resume parity scrubbing on the named aggregate, plex, or RAID group. If an aggregate or node is not given, then resume parity scrubbing on all RAID groups for which it has been suspended. Use "aggr-scrub-list-info" to check scrubbing status.

Input Name	Range	Type	Description
aggregate		string optional	Name or UUID of the entity for which scrubbing is to resume. See the synopsis for name/UUID format and restrictions.
node		string optional	Name of node.

plex		string optional	If provided, this specifies the plex name. ex. plex0 Must be used in conjunction with aggregate input.
raidgroup		string optional	If provided, this specifies the RAID group. ex. rg2 Must be used in conjunction with aggregate and plex inputs.

Errno	Description
EINTERNALERROR	

aggr-scrub-start

[top]

Start parity scrubbing on the named aggregate, plex, or RAID group. Parity scrubbing compares the data disks to the parity disk in a RAID group, correcting the parity disk's contents as necessary. If an aggregate or node is not given, then parity scrubbing is started on all online aggregates. If an aggregate name is given, scrubbing is started on all RAID groups in the aggregate. If a plex name is given, scrubbing is started on all RAID groups contained in the plex. If a RAID group name is given, scrubbing is started only on that group. Use "aggr-scrub-list-info" to check scrubbing status. If a node is given, scrubbing is started on all raid groups on that node.

Input Name	Range	Type	Description
aggregate		string optional	Name or UUID of the entity for which scrubbing is to start. See the synopsis for name/UUID format and restrictions.
node		string optional	Name of node.
plex		string optional	If provided, this specifies the plex name. ex. plex0 Must be used in conjunction with aggregate input.
raidgroup		string optional	If provided, this specifies the RAID group. ex. rg2 Must be used in conjunction with aggregate and plex inputs.

Errno	Description
EINTERNALERROR	

aggr-scrub-stop

[top]

Stop parity scrubbing on the named aggregate, plex, or RAID group. If an aggregate or node is not given, scrubbing will stop on all RAID groups currently being scrubbed. Use "aggr-scrub-list-info" to check scrubbing status.

Input Name	Range	Type	Description
aggregate		string optional	Name or UUID of the entity for which scrubbing is to stop. See the synopsis for name/UUID format and restrictions.
node		string optional	Name of node.
plex		string optional	If provided, this specifies the plex name. ex. plex0 Must be used in conjunction with aggregate input.
raidgroup		string optional	If provided, this specifies the RAID group. ex. rg2 Must be used in conjunction with aggregate and plex inputs.

Errno	Description
EINTERNALERROR	

aggr-scrub-suspend

[top]

Suspend parity scrubbing on the named aggregate, plex, RAID group, or node. If an aggregate or node is not given, suspend scrubbing on all RAID groups currently being scrubbed. Use "aggr-scrub-list-info" to check scrubbing status.

Input Name	Range	Type	Description
aggregate		string optional	Name or UUID of the entity for which scrubbing is to suspend. See the synopsis for name/UUID format and restrictions.
node		string optional	Name of node.
plex		string optional	If provided, this specifies the plex name. ex. plex0 Must be used in conjunction with aggregate input.
raidgroup		string optional	If provided, this specifies the RAID group. ex. rg2 Must be used in conjunction with aggregate and plex inputs.

Errno	Description
EINTERNALERROR	

aggr-set-option

[top]

Set the specified option for the given aggregate to "option-value". The change remains effective even if the filer is rebooted. Some options have values that are numbers, and some have values that are "on" (also expressible as "yes", "true", or "1") or "off" (also expressible as "no", "false", or "0"). A mixture of uppercase and lowercase characters may be used when typing an option's value. Note that the "root" option is special in that it doesn't have a corresponding value. This API does not support modifying options of striped aggregate.

Input Name	Range	Type	Description
aggregate		string	Name or UUID of the aggregate whose option to be set. See the synopsis for name/UUID format and restrictions.
			Option name. Possible values: "free_space_realloc" (value: "on" | "off" | "no_redirect") Setting this option to "on" enables free space reallocation (continuous segment cleaning) on a block checksum aggregate. Possible values : on, off, no_redirect "on" : Free space reallocation enabled with automatically starting the redirect scanner "off": Free space reallocate disabled "no_redirect": Free space reallocation enabled without running the redirect scanner The default value for this option is "off" "fs_size_fixed" (value: "on" | "off") Setting this option to "on" causes the file system to remain the same size (and not grow) when the mirror is broken on a SnapMirrored aggregate or when a "storage aggregate add" is performed on it. This option is automatically set to be "on" when an aggregate becomes SnapMirrored. This option allows an embedded aggregate to be SnapMirrored back to the source without needing to add disks to the source aggregate. If the aggregate size is larger than the file system size, turning off this option forces the file system to grow to the size of the aggregate. This option is not supported when the request is sent to the Admin Vserver LIF. "ha_policy" (value: "cfo" | "sfo") This option is used to change the HA policy of given aggregate and restricted to clustered environments. It is not allowed in unclustered environments. Changing the HA policy of an aggregate from SFO to CFO is

allowed only in Maintenance mode. HA policy can not be changed if: 1. aggregate is striped. 2. aggregate contains node volumes. 3. aggregate is root. 4. aggregate is partner aggregate during takeover i.e. when it is not home to local node. EOP_CLUSTER_ATTR_DISALLOWED is returned if this option is used in unclustered environments.
EOP_DISALLOWED_ON_STRIPED_AGGR is returned if this option is used with striped aggregate. EOP_DISALLOWED_ON_AGGR_WITH_NODE_VOLS is returned if this option is used on aggregate which contains node volumes. EOP_DISALLOWED_ON_ROOT_AGGR is returned if this option is used on root aggregate. EOP_DISALLOWED_ON_NOT_HOME_AGGR is returned if this option is used on partner aggregate during takeover.

"ignore_inconsistent" (value: "on" | "off")
This command can only be used in maintenance mode. If this option is set to "on", then the root aggregate may be brought online when booting even if it is marked as inconsistent. The user is cautioned that bringing it online prior to running WAFL_check or wafliron may result in further file system inconsistency. This option is not supported when the request is sent to the Admin Vserver LIF.

"max_write_alloc_blocks" (value: value: < number >)
The maximum number of blocks used for write allocation. Some sequential read workloads may benefit from increasing this value. Default value is 0 which uses the controller-wide default value of 64. The default is optimal for most users. The controller-wide default can be adjusted with the bootarg "wafl-max-write-alloc-blocks"

"striping" (value: "striped" | "not_striped")
This option sets the striping information of given aggregate. It is restricted to clustered environments and not allowed in unclustered environments. When set to true, it marks given aggregate as member of stripe. This option is not allowed if given aggregate is of 'cfo' HA policy.
EOP_CLUSTER_ATTR_DISALLOWED is returned if this option is used in unclustered environments. EOP_DISALLOWED_ON_CFO_AGGR is returned if given aggregate is of 'cfo' HA policy. This option is not supported when the request is sent to the Admin Vserver LIF.

"nosnap" (value: "on" | "off")
Setting this option to "on" disables automatic snapshots on the aggregate.

"raid_cv" (value: "on" | "off")
Setting this option to "off" disables block or advanced_zoned checksum (azcs) protection on the aggregate. The default is "on". The user is cautioned that turning off this option exposes the filesystem(s) contained in the aggregate to inconsistency that could be caused by a misbehaving hardware component in the system.

"raid_lost_write" (value: "on" | "off")
Setting this option to "off" disables RAID Lost Write protection on the aggregate. The default is "on". The user is cautioned that turning off this option may expose the filesystem(s) contained in the aggregate to data loss and data corruption. The option should not be disabled, unless directed to do so by support personnel.

"raidsize" (value: < number >>)
The maximum size of a RAID group within the aggregate. Changing this option doesn't cause existing RAID groups to grow or shrink. Rather, it only affects whether more disks will be added to the last existing RAID group in the future, and how large new RAID groups will be.

"cache_raid_group_size" (value: < number >>)
The current maximum size of a SSD RAID group within the hybrid aggregate. This option can only be modified for hybrid aggregate. Changing

option-name		string	this option doesn't cause existing RAID groups to grow or shrink. Rather, it only affects whether more disks will be added to the existing SSD RAID group in the future, and how large new SSD RAID groups will be. "raidtype" (value: "raid4" | "raid_dp" | "raid_tec" | "raid0") The type of RAID group used for this aggregate. The "raid4" setting provides one parity disk per RAID group, while "raid_dp" provides two and "raid_tec" provides three. Changing this option immediately changes the RAID group type for all RAID groups in the aggregate. When upgrading RAID groups from "raid4" to "raid_dp", each RAID group begins a reconstruction onto a spare disk allocated for the second "dparity" parity disk. Simlarly, when upgrading RAID groups from "raid_dp" to "raid_tec", each RAID group begins a reconstruction onto a spare disk allocated for the third "tparity" parity disk. "resyncsnaptime" (value: < number >) Sets the mirror resynchronization snapshot frequency to be the given number of minutes. The default value is 60 (minutes). "root" (value: < none >) The specified aggregate is to become the root aggregate for the filer on the next reboot. This option can be used only in maintenance mode and on only one aggregate at any given time. The existing root aggregate will become a non-root aggregate after the reboot. Until the system is rebooted, the original aggregate will continue to show root as an option, and the new root aggregate will show diskroot as an option. In general, the aggregate that has the diskroot option is the one that becomes the root aggregate following the next reboot. The only way to remove the root status of an aggregate is to set it on another aggregate. In clustered environments, this option is not allowed with aggregates with 'sfo' HA policy as root has to be an aggregate with 'cfo' HA policy. EOP_DISALLOWED_ON_SFO_AGGR is returned if given aggregate is of 'sfo' HA policy. "snapmirrored" (value : "off") If SnapMirror is enabled, the filer auto- matically sets this option to "on". Set this option to "off" with the "snapmirror" command if SnapMirror should no longer be used to update the mirror. After setting this option to "off", the mirror becomes a regular writable aggregate, and all its volumes are restored to whatever state they were last in. Note that it is not possible to set this option directly through this interface. Rather, it is automatically changed as a side effect of running the appropriate "snapmirror" commands. This option is not supported when the request is sent to the Admin Vserver LIF. "snapshot_autodelete" (value: "on" | "off") Setting this option to "off" disables automatic snapshot deletion on the aggregate. "thorough_scrub" (value: "on" | "off") Setting this option to "on" enables thorough scrub on a block checksum aggregate. That means that a scrub will initialize any zeroed checksum entries that it finds. If there are any checksum entries to be initialized, scrub will run slower than normal. "percent_snapshot_space" (value: < number >) Percentage of total blocks in the aggregate reserved for snapshots. "nearly_full_threshold" (value: < number >) Threshold of used space as a percentage of aggregate size for which to emit aggregate nearly full warning. The default value is 95%. The maximum value for this option is 99%. It must be less than the full_threshold. Setting this threshold to 0 disables the alert.

"full_threshold" (value: < number >)
Threshold of used space as a percentage of aggregate size for which to emit aggregate full warning. The default value is 98%. The maximum value for this option is 100%. It must be greater than the nearly_full_threshold. Setting this threshold to 0 disables the alert.

"is_flash_pool_caching_enabled" (value: "true" | "false")
Setting this option to "false" will disable the caching on the Flash Pool while setting "true" will enable the caching again on the Flash Pool. Changing this option will have no effect on individual caching policies associated with the volumes under this Flash Pool.

"hybrid_enabled" (value: "true" | "false")
Setting this option to "true" would mark the aggregate as hybrid_enabled. That means the aggregate can contain a mix of SSDs and HDDs(Hard Disk Drives, e.g., SAS, SATA, and/or FC). The operation can be forced by using the hybrid_enabled_force option for the aggregates having flexvols which cannot be write cached. EAGGR_CANT_UNDO_HYBRID is returned when we are trying to set the option hybrid_enabled to false on an aggregate that already contains a mix of HDDs and SSDs. EAGGR_HYBRID is returned when we are trying to set option hybrid_enabled to true on an aggregate which is already hybrid. EOP_DISALLOWED_WORM_HYBRID_AGGR is returned when we are trying to set option hybrid_enabled to true on an snaplock aggregate. ERAID_HYA_SUPPORT_DISABLED is returned when the partner node in HA pair is running a version of Data ONTAP which does not support hybrid aggregates. EOP_DISALLOWED_ON_SSD_AGGR is returned if this option is used on aggregates created out of SSD disks. EOP_DISALLOWED_HYA_ON_RAID0_AGGR is returned if this option is used on raid0 aggregates. EOP_DISALLOWED_HYA_ON_ZONED_AGGR is returned if this option is used on aggregates with zoned checksums. EOP_DISALLOWED_HYA_ON_LUNS_AGGR is returned if this option used on aggregates created out of LUNs. EOP_DISALLOWED_ON_COMPOSITE_AGGR is returned if this option is used on composite aggregates.

"hybrid_enabled_force" (value: "true" | "false")
Setting this option to "true" would mark the aggregate as hybrid_enabled. That means the aggregate can contain a mix of SSDs and HDDs(Hard Disk Drives, e.g., SAS, SATA, and/or FC). This option is used for force marking of aggregates having flexvols which cannot be write cached as hybrid enabled. FlexVols in the aggregate marked as hybrid enabled using this option which cannot participate in write-caching only have read-caching enabled. All other flexvols in the aggregate can participate in both read and write caching. EAGGR_CANT_UNDO_HYBRID is returned when we are trying to set the option hybrid_enabled_force to false on an aggregate that already contains a mix of HDDs and SSDs. EAGGR_HYBRID is returned when we are trying to set option hybrid_enabled_force to true on an aggregate which is already hybrid.
EOP_DISALLOWED_WORM_HYBRID_AGGR is returned when we are trying to set option hybrid_enabled_force to true on an snaplock aggregate. ERAID_HYA_SUPPORT_DISABLED is returned when the partner node in HA pair is running a version of Data ONTAP which does not support hybrid aggregates. EOP_DISALLOWED_ON_SSD_AGGR is returned if this option is used on aggregates created out of SSD disks.
EOP_DISALLOWED_HYA_ON_RAID0_AGGR is returned if this option is used on raid0 aggregates. EOP_DISALLOWED_HYA_ON_ZONED_AGGR is returned if this option is used on aggregates with zoned checksums. EOP_DISALLOWED_ON_COMPOSITE_AGGR is returned if this option is used on composite aggregates.

"mirror_resync_priority" (value: "low" | "medium" | "high")
Modifying this option changes the ordering of resynchronization of mirrored aggregates on a node. By default all data aggregates have a "low" priority. Changing it to "high" or "medium" would mean that the aggregate will be

			resynchronized before lower priority aggregates. The "storage aggregate resynchronization options" CLI command, or the aggr-resync-options-set ZAPI, can be used to set the number of aggregates that can be resynchronized concurrently on a node. "enable_cold_data_reporting" (value: "true" | "false") Setting this option to "true" would enable inactive data reporting on the specified aggregate. Setting this option to "false" would disable inactive data reporting. This option can only be set on non-FabricPool aggregates which are FabricPool compatible.
option-value		string	The value to set the named option. It may be the NULL/empty value only in the case of the "root" option.

aggr-space-get-iter

[top]

Display a list of aggregates and a breakup of their used space. This information is only available when the aggregate is online. Some fields are expensive to compute, and if the system is under load, the information may not be returned. Best practice would be to only request the fields needed.

Input Name	Range	Type	Description
desired-attributes		space-information optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20

query		space-information optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr-space object. All aggr-space objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		space-information[] optional	The list of attributes of aggr-space objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr-space objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-space-list-info

[top]

Show the space usage of the aggregate on a per flexible volume basis. This API is deprecated in Data ONTAP 8.2 and later. Use the aggr-space-info attributes in the aggr-list-info API for details related to aggregate space usage. Use volume-space-list-info and volume-footprint-list-info APIs for details related to volume space usage.

Input Name	Range	Type	Description
aggregate		string optional	The aggregate to get the space information for. If not specified the space information for all aggregates is obtained.

Output Name	Range	Type	Description
aggregates		aggr-space-info[]	Various counts describing space usage in the aggregate.

Errno	Description
EINTERNALERROR	

aggr-spare-get-iter

[top]

Iterate over a list of spare disks

Input Name	Range	Type	Description
desired-attributes		aggr-spare-disk-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-**	integer	The maximum number of records to return in this call. Default: 2000

	1]	optional	
query		aggr-spare-disk-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-spare-disk-info[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-split

[top]

Remove the specified plex from a mirrored aggregate and create a new unmirrored aggregate with the specified name that contains the plex. The original mirrored aggregate thus becomes unmirrored. The plex to be split from the original aggregate must be functional (not partial), but it can otherwise be inactive, resyncing, or out-of-date. "Aggr split" can therefore be used to gain access to a plex that isn't up to date with respect to its partner plex if its partner plex is currently failed. If the plex is offline at the time of the split, the resulting aggregate will be offline. Otherwise, the resulting aggregate will be in the same online/offline/restricted state as the original aggregate. A split mirror can be joined back together via the "victim-aggregate" option to "aggr-mirror".

Input Name	Range	Type	Description
aggregate		string	Name of the plex to split out of its aggregate, using the following format: [/vol/][][]
new-aggr-name		string	Name of the new aggregate to create from the split plex.

Errno	Description
EINTERNALERROR	
EVOLUMENAMEINVALID	
EVOLUMEDOESNOTEXIST	

aggr-status-get-iter

[top]

Aggregate enumeration ZAPI. Get status and topology information about one or more aggregates from RAID subsystem.

Input Name	Range	Type	Description
desired-attributes		aggr-status-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 2000
query		aggr-status-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aggr-status-info[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

aggr-verify-list-info

[top]

Get the status of RAID mirror verification on the named aggregate. Status includes percentage complete and whether it's currently suspended.

Input Name	Range	Type	Description
aggregate		string optional	Name of an existing aggregate. If no name is given, then mirror verification status is generated for all aggregates currently being verified. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.

Output Name	Range	Type	Description
verify-details		verify-detail-info[] optional	List of aggregates and their mirror verification status.

Errno	Description
EINTERNALERROR	
EVOLUMEDOESNOTEXIST	

aggr-verify-resume

[top]

Resume RAID mirror verification on the named aggregate. If no name is given, then resume mirror verification on all aggregates that have been suspended.

Input Name	Range	Type	Description
aggregate		string optional	Name of the existing aggregate for which mirror verification is to resume. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.

Errno	Description
EINTERNALERROR	

aggr-verify-start

[top]

Start RAID mirror verification on the named aggregate. Verification compares the data in both plexes of a mirrored aggregate. In the default case, any blocks that differ are logged and no changes are made. The fix-plex option is used to fix any mismatches. It specifies which plex to fix. If no name is given, then mirror verification is started on all online aggregates. Use the "aggr-verify-list-info" API to check mirror verification status. If the fix-plex option is used, then a name must be specified.

Input Name	Range	Type	Description
aggregate		string optional	Name of the mirrored aggregate to verify. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.
fix-plex		integer optional	If provided, this specifies the plex to fix in case the two plexes do not match. The default is to log any discrepancies instead of fixing them.
log-only		boolean optional	If provided, and if the value is "true", then simply log any discrepancies instead of fixing them. The default value is "true". If log-only is "false", then the fix-plex option must also be specified. If log-only is "true" and fix-plex is also specified, then the log-only option will be ignored.

Errno	Description
EINTERNALERROR	

aggr-verify-stop

[top]

Stop RAID mirror verification on the named aggregate. If no name is given, stop mirror verification on all aggregates currently being verified.

Input Name	Range	Type	Description
aggregate		string optional	Name of the aggregate for which we are to stop mirror verification. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.

Errno	Description
EINTERNALERROR	

aggr-verify-suspend

[top]

Suspend RAID mirror verification on the named aggregate. If no name is given, suspend mirror verification on

all aggregates currently being verified.

Input Name	Range	Type	Description
aggregate		string optional	Name of the aggregate for which we are to suspend mirror verification. UUID can be specified instead of aggregate name. See the synopsis for name/UUID format and restrictions.

Errno	Description
EINTERNALERROR	

Element definition: **aggr-attributes**

[top]

Attributes of an aggregate. When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-64bit-upgrade-attributes		aggr-64bit-upgrade-attributes optional	Information related to 64-bit upgrade. After 64-bit upgrade completes, this information is no longer available.
aggr-fs-attributes		aggr-fs-attributes optional	This field contains file system related information about the aggregate. This information will not be returned for a striped aggregate.
aggr-inode-attributes		aggr-inode-attributes optional	This field contains inode related information about the aggregate. This information will not be returned for a striped aggregate.
aggr-ownership-attributes		aggr-ownership-attributes optional	This field contains ownership related information about the aggregate. This information will not be returned for a striped aggregate.
aggr-performance-attributes		aggr-performance-attributes optional	This field contains performance related informtaion about the aggregate.
aggr-raid-attributes		aggr-raid-attributes optional	This field contains RAID specific information of the aggregate
aggr-snaplock-attributes		aggr-snaplock-attributes optional	This field contains snaplock specific information of the aggregate
aggr-snapmirror-attributes		aggr-snapmirror-attributes optional	This field contains snapMirror specific information of the aggregate This information will not be returned for a striped aggregate.
aggr-snapshot-attributes		aggr-snapshot-attributes optional	This field contains snapshot specific information of the aggregate. This information will not be returned for a striped aggregate.

aggr-space-attributes		aggr-space-attributes optional	This field contains space specific information of the aggregate
aggr-striping-attributes		aggr-striping-attributes optional	This field contains striping specific information of the aggregate This information is returned only if aggregate is striped.
aggr-volume-count-attributes		aggr-volume-count-attributes optional	This field contains various counts information of volume in the aggregate.
aggr-wafliron-attributes		aggr-wafliron-attributes optional	This field contains wafliron specific information of the aggregate
aggregate-name		string optional	Name of the aggregate.
aggregate-uuid		string optional	Aggregate's Universal Unique IDentifier. UUIDs are 16-byte quantities that are typically displayed as having five hexadecimal fields separated by hyphens. For example: d2da3566-da53-11d7-a841-000100000529
autobalance-available-threshold-percent	**[0..99]**	integer optional	The threshold when an aggregate is considered balanced by the Auto Balance Aggregate feature.
autobalance-state		autobalance-aggregate-state optional	The state of the aggregate being balanced. Possible values: • "disabled" - Auto Balance Aggregate is disabled, • "balanced" - Auto Balance Aggregate has determined that the aggregate is below the high-watermark. • "unbalanced" - Auto Balance Aggregate has detected that the aggregate is over the high-watermark but has not initiated any jobs to bring it below the high-watermark., • "ineligible" - Ineligible The states excluded, balanced and unbalanced are available only when Auto Balance Aggregate is enabled.
autobalance-state-change-counter		integer optional	The number of times an aggregate has been transitioned from balanced to unbalanced and vice-versa.
autobalance-unbalanced-threshold-percent	**[1..100]**	integer optional	The threshold when an aggregate is considered unbalanced by the Auto Balance Aggregate feature.
inactive-data-reporting-start-timestamp		integer optional	Timestamp at which inactive data reporting was enabled on the aggregate. The time value is in seconds since January 1, 1970. Range : [0..2^32-1].
is-autobalance-eligible		boolean optional	When set to 'true', the aggregate is included in Auto Balance aggregate processing. When set to 'false' the aggregate is excluded from Auto Balance Aggregate processing.
is-cft-precommit		boolean optional	When set to 'true', the aggregate is a 7-mode transitioned aggregate in pre-commit phase.
is-inactive-data-reporting-enabled		boolean optional	"true" if the inactive data reporting is enabled on an aggregate, "false" otherwise.

is-object-store-attach-eligible		boolean optional	When set to 'true', the aggregate is is eligible to have an object store attached to it.
is-transition-out-of-space		boolean optional	When set to 'true', the aggregate is a 7-mode transitioned aggregate that is not yet committed on C-mode, and is currently out of space.
nodes		node-name[] optional	List of node names. If aggregate-name is also specified, then the matching aggregate on given nodes is returned. If not, all aggregates on specified nodes are returned. If this element is omitted when the request is sent to the Admin Vserver LIF, then all matching aggregates in the cluster are returned.
striping-type		string optional	Specifies the striping information about the aggregate. Possible values are "not_striped", "striped", and "unknown"

Element definition: **aggr-autobalance-aggregate-state**

[top]

State related to each aggregate monitored by Auto Balance Aggregate. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
autobalance-threshold		size optional	Threshold used by AutoBalance aggregate to determine if an aggregate is eligible for balancing, in bytes. Attributes: non-creatable, non-modifiable
incoming-volume-size		size optional	Size of volumes that are moving towards the aggregate, in bytes. Attributes: non-creatable, non-modifiable
is-balanceable		boolean optional	Indicates if the aggregate should be balanced. Attributes: non-creatable, non-modifiable
is-considered-for-balance		boolean optional	Indicates if the aggregate should be considered for balancing. Attributes: non-creatable, non-modifiable
is-hybrid		boolean optional	Is a hybrid aggregate. Attributes: non-creatable, non-modifiable
node		node-name optional	Node the aggregate resides on. Attributes: key, non-creatable, non-modifiable
outgoing-volume-size		size optional	Size of volumes that are moving away from the aggregate, in bytes. Attributes: non-creatable, non-modifiable
raidtype		raid-type optional	RAID type of the aggregate. Attributes: non-creatable, non-modifiable
		size	Total size of the aggregate in bytes.

total-size		optional	Attributes: non-creatable, non-modifiable
used-size		size optional	Used size of the aggregate in bytes. Attributes: non-creatable, non-modifiable

Element definition: **aggr-autobalance-config**

[top]

Configuration of Auto Balance Aggregate When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
available-threshold-percent	**[0..99]**	integer optional	When Auto Balance Aggregate identifies an aggregate that needs to be balanced, it will attempt to identify other target aggregates it can move volumes to. An aggregate will only be considered as a target if its projected space usage after the move is still under this percentage. Auto Balance Aggregate will attempt to move volumes from an unbalanced aggregate until it is under this percentage. The default value is 40%. Attributes: non-creatable, modifiable
hold-duration-after-move		time-interval optional	This value represents the number of seconds that need to have elapsed since the volume was last moved before it will be considered a movable candidate again. The default value is 48 hours. Attributes: non-creatable, modifiable
is-enabled		boolean optional	'true' if Auto Balance Aggregate is enabled. 'false' if Auto Balance Aggregate is disabled. Attributes: non-creatable, modifiable
move-mode		string optional	For all modes, Auto Balance Aggregate will identify the volume moves that will help to balance space usage across the aggregates. The mode dictates what Auto Balance Aggregate will do with the suggested moves. In 'recommend' mode, the suggested moves will be displayed, but no further action will be taken .In 'auto' mode, Auto Balance Aggregate will trigger moves to start. The default mode is 'recommend'. Attributes: non-creatable, modifiable Possible values: • "auto" , • "recommend"
state-polling-interval		time-interval optional	Polling period, in seconds, used by Auto Balance Aggregate to update volume and aggregate state. The default value is 3600 seconds. Attributes: non-creatable, modifiable
unbalanced-threshold-percent	**[1..100]**	integer optional	This percentage will indicate the space used threshold that will cause Auto Balance Aggregate to consider this aggregate as unbalanced. The default value is 60%. Attributes: non-creatable, modifiable

volume-activity-threshold	**[0..2^32-1]**	integer optional	The threshold, in number of operations per second preformed on a volume (read/write/internal), that will disqualify the volume from being a candidate to be moved by Auto Balance Aggregate. The default value is 100 operations per second. Attributes: non-creatable, modifiable
volume-inactive-delay-threshold		time-interval optional	This value represents a duration in seconds and designates the amount of time that has to elapse after a volume has exceeded the volume-activity-threshold before it can be considered a movable volume by Auto Balance Aggregate. The default value is 24 hours. Attributes: non-creatable, modifiable

Element definition: **aggr-autobalance-notification**

[top]

Notifications for nodes that need to be balanced. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
notifying-node		node-name optional	The node that contains the aggregate which is considered a candidate for Auto Balance Aggregate. Attributes: key, required-for-create, non-modifiable

Element definition: **aggr-autobalance-volume-state**

[top]

The state related to each volume monitored by Auto Balance Aggregate. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	The aggregate that contains the volume. Attributes: non-creatable, non-modifiable
dsid	**[0..2^64-1]**	integer optional	The dsid of the volume. Attributes: key, non-creatable, non-modifiable
is-volume-moving		boolean optional	Indicates if volume is currently moving.

			Attributes: non-creatable, non-modifiable
is-volume-quiesced		boolean optional	Indicates if volume is currently quiesced. Attributes: non-creatable, non-modifiable
last-time-threshold-exceeded		datetime optional	Timestamp related to when we exceeded the threshold of operations for the volume. Attributes: non-creatable, non-modifiable
last-time-was-placed		datetime optional	Timestamp related to when the volume was last moved. Attributes: non-creatable, non-modifiable
node		node-name optional	The node the volume resides on. Attributes: key, non-creatable, non-modifiable
volume-name		string optional	The name of the volume. Attributes: non-creatable, non-modifiable
volume-total-size		size optional	Total size of the volume, in bytes. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulated-info**

[top]

Aggregate Storage Efficiency Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-efficiency-cumulated-additional-details-info		aggr-efficiency-cumulated-additional-details-info	Additional details related to storage efficiency in the given aggregates.
aggr-efficiency-cumulated-aggr-info		aggr-efficiency-cumulated-aggr-info optional	Storage efficiency achieved at the aggregate level using techniques like data compaction.
aggr-efficiency-cumulated-snapshot-and-flexclone-info		aggr-efficiency-cumulated-snapshot-and-flexclone-info	Aggregated information of storage efficiency of Snapshot copies and FlexClone volumes in the given aggregates.
aggr-efficiency-cumulated-volume-info		aggr-efficiency-cumulated-volume-info optional	Aggregated information of storage efficiency achieved at the volume level using techniques like deduplication, compression, zero detection and FlexClones for files or LUNs.
aggr-efficiency-total-cumulated-info		aggr-efficiency-total-cumulated-info optional	cumulated storage efficiency information from the given aggregates.

Element definition: **aggr-efficiency-info**

[top]

Aggregate Storage Efficiency Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-efficiency-additional-details-info		aggr-efficiency-additional-details-info optional	Additional details related to storage efficiency in this aggregate.
aggr-efficiency-aggr-info		aggr-efficiency-aggr-info optional	Storage efficiency achieved at the aggregate level using techniques like data compaction.
aggr-efficiency-cumulative-info		aggr-efficiency-cumulative-info optional	Cumulative storage efficiency information of an aggregate.
aggr-efficiency-snapshot-and-flexclone-volume-info		aggr-efficiency-snapshot-and-flexclone-volume-info	Aggregated information of storage efficiency of Snapshots and FlexClone volumes in the aggregate.
aggr-efficiency-volume-info		aggr-efficiency-volume-info optional	Aggregated information of storage efficiency achieved at the volume level using techniques like deduplication, compression, zero detection and FlexClones for files or LUNs.
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
node		string optional	Name of the node where the aggregate resides. Attributes: non-creatable, non-modifiable

Element definition: **aggr-info**

[top]

Aggregate status information.

Name	Range	Type	Description
aggr-64bit-upgrade		aggr-64bit-upgrade-info optional	Information related to 64-bit upgrade. After 64-bit upgrade completes, this information is no longer available.
aggregate-space-details		aggregate-space-info optional	Contains all size-related information for the aggr and its set of snapshots.
azcs-read-optimization		string optional	Indicates if azcs read optimization is enabled and available on the aggreagte. This feature is supported only on Cloud ONTAP or FSx. Possible values: "on", "off" • "on" : azcs read optimization is enabled and available

			• "off" : azcs read optimization is disabled. The default value is "on"
azcs-read-optimization-enabled		boolean optional	Is azcs read optimizaion enabled for the aggregate in SDOT ?
block-type		string	The indirect block format that the aggregate can have. The default is 64_bit. With a 64_bit block-type creation of aggregates that can be larger than 16TB is allowed. Possible values: 64_bit
cache-raid-group-size		integer	Current maximum cache RAID group size of hybrid aggregate. Range : [1..28]. RAID group size is the maximum number of disks that can be added to a RAID group. This information will only be returned for hybrid aggregate i.e. for the aggregates whose "is-hybrid" field is set to true.
checksum-status		string	Checksum status. Possible values: "active", "off", "reverting", "none", "unknown", "initializing", "reinitializing", "reinitialized", "upgrading_phase1", "upgrading_phase2"
checksum-style		string	Checksum style. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block, • "mixed" - mixed, • "none" - none, • "unknown" - unknown • "wafl" - wafl, • "zoned" - zoned (this value is no longer supported).
creation-timestamp		integer optional	Timestamp of aggregate creation. Range : [0..2^32-1].
disk-count		integer	Number of disks in the aggregate. Range: [0..2^31-1].
dr-home-dblade-id		string optional	Dblade ID of the DR (disaster recovery) node to which this aggregate's disks have been administratively assigned. This is the UUID equivalent of dr-home-id.
dr-home-id	**[0..2^32-1]**	integer optional	NVRAM ID of the DR (disaster recovery) node to which this aggregate's disks have been administratively assigned. This information is derived from the sanown information for an aggregate's disks. See 'disk-sanown-detail-info'
dr-home-name		string optional	Name of the DR node to which this aggregate's disks have been administratively assigned.
drive-protection-enabled		boolean	Indicates the aggregate is entirely composed of self-encrypting drives with data protection enabled.
effective-disk-type		string optional	Effective type of disks in aggregate: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, VMDISK, unknown. For hybrid aggregate this represents effective disk type of HDD raidgroups.
encrypt-with-aggr-key		boolean optional	If true, returns aggregates supporting encryption with NAE (NetApp Aggregate Encryption).
files-private-used		integer	Number of system (not user-visible) files used. Range: [0..2^64-1].
files-total		integer	Total count of user-visible files. Range: [0..2^64-1].
files-used		integer	Number of user-visible files used. Range: [0..2^64-1].
free-space-realloc		string optional	Indicate if free space reallocation (continuous segment cleaning) is enabled on a specific aggregate. Possible values: on, off, no_redirect "on" (Free space reallocation enabled with automatically starting the redirect scanner) "off" (Free space reallocation disabled) "no_redirect" (Free space reallocation enabled without running the redirect scanner) The default value for this option is "off"
fsid		integer	Aggregate's File System IDentifier. Range: [0..2^32-1]

		optional	
ha-policy		ha-policy-type optional	Aggregate's HA policy. Possible return values: "cfo", "sfo", "none"
has-local-root		boolean	Whether the aggregate contains the local root volume.
has-partner-root		boolean	Whether the aggregate contains the partner's root volume.
home-dblade-id		string optional	Dblade ID of the node to which this aggregate's disks have been administratively assigned. This is the UUID equivalent of home-id.
home-id		integer optional	NVRAM ID of the node to which this aggregate's disks have been administratively assigned. This information is derived from the sanown information for an aggregate's disks. See 'disk-sanown-detail-info' Range : [0..2^32-1].
home-name		string optional	Name of the node to which this aggregate's disks have been administratively assigned.
hybrid-cache-tier-disk-count		integer optional	Disk count of hybrid cache tier if hybrid config. This information will only be returned for hybrid aggregate i.e. for the aggregates whose "is-hybrid" field is set to true.
hybrid-cache-tier-raid-type		string optional	Raid type for hybrid cache tier if hybrid config. This information will only be returned for hybrid aggregate i.e. for the aggregates whose "is-hybrid" field is set to true.
inactive-data-reporting-start-timestamp		integer optional	Timestamp at which inactive data reporting was enabled on the aggregate. The time value is in seconds since January 1, 1970. Range : [0..2^32-1].
inodefile-private-capacity		integer	Number of inodes that can currently be stored on disk for system (not user-visible) files. This number will dynamically increase as more system files are created. Range: [0..2^64-1].
inodefile-public-capacity		integer	Number of inodes that can currently be stored on disk for user-visible files. This number will dynamically increase as more user-visible files are created. Range: [0..2^64-1].
inofile-version		integer	The inofile-version of the aggregate. Range: [0..2^32-1].
is-checksum-enabled		boolean	Is checksumming enabled for the aggregate?
is-composite		boolean optional	If true, aggregate currently contains two tiers of storage.
is-fabricpool-mirrored		boolean optional	If true, aggregate currently contains two copies of the capacity tier.
is-hybrid		boolean optional	If true, aggregate currently contains both SSD and non-SSD RAID groups.
is-hybrid-enabled		boolean optional	If true, aggregate is eligible to contain both SSD and non-SSD RAID groups.
is-inconsistent		boolean	Whether or not the aggregate is inconsistent.
is-mirrored		boolean optional	If true, aggregate is mirrored.
is-nve-capable		boolean optional	If true, the aggregate is capable of supporting NVE.
is-root-aggregate		boolean	Whether this is a root aggregate. This differs from has-local-root and has-partner-root by evaluating true when the aggregate may contain a root volume for any node. The has-local-root and has-partner-root fields only evaluate true when the aggregate contains the active root for the specified node. The is-root-aggregate field will still evaluate true for an offline root aggregate. The has-local-root and has-partner-root fields will evaluate false, since the aggregate has no mounted

			filesystem.
is-snaplock		boolean	Whether or not it's a SnapLock aggregate.
is-transition-out-of-space		boolean	Whether this is a 7-to-C transitioned aggregate that is not yet committed on C-mode, and is currently out of space.
is-transitioned-aggregate		boolean	Whether this is a 7-to-C transitioned aggregate that is not yet committed on C-mode.
licensed-plex-capacity		integer optional	This field represents the sum of the raw sizes of all non-parity disks in an aggregate. This is not necessarily the final capacity licensed for the aggregate. The license manager may double this for a mirrored aggregate or ignore it for a root aggregate. Range : [0..2^64-1]
max-write-alloc-blocks		integer optional	The maximum number of blocks used for write allocation. Some sequential read workloads may benefit from increasing this value. Default value is 0 which uses the controller-wide default value of 64. The default is optimal for most users. The controller-wide default can be adjusted with the bootarg "wafl-max-write-alloc-blocks"
mirror-status		string	Aggregate's mirror status. Possible values: invalid, uninitialized, needs CP count check, CP count check in progress, unmirrored, mirrored, mirror degraded, mirror resynchronizing, failed, limbo, and .
mount-state		string optional	[not settable, always] This field shows the volume's mount state. Possible values: "unmounted", "online", "frozen", "destroying", "creating", "mounting", "unmounting", "inconsistent", "reverted", "quiescing", "quiesced", "iron_restricted"
name		string	Aggregate name.
owner-id		integer optional	NVRAM ID of node which currently owns this aggregate's disks. Normally, home-id matches owner-id. But these may be changed by SFO takeover to match the takeover node, and restored by SFO giveback to match home-id. CFO takeover and giveback do not affect owner-id. This information is derived from the sanown information for an aggregate's disks. See 'disk-sanown-detail-info' Range : [0..2^32-1].
owner-name		string optional	Name of node which currently owns this aggregate's disks. Normally, home-name matches owner-name. But these may be changed by SFO takeover to match the takeover node, and restored by SFO giveback to match home-name. CFO takeover and giveback do not affect owner-name.
plex-count		integer	Number of plexes in the aggregate. This value tells us the size of the returned "plex" array. Range: [0..2^31-1].
plexes		plex-info[]	List of plexes in the aggregate.
primary-checksum-style		string optional	Checksum type of primary tier.
primary-disk-class		string optional	Diskclass of primary tier.
primary-disk-count		integer optional	Disk count of primary tier. For non-hybrid aggregate config, signifies the total disk count. For hybrid config excludes cache-tier count.
primary-raid-type		string optional	Raid type for primary tier.
			State of the RAID Lost Write feature for an aggregate. The possible values are: • "aborted" - The RAID Lost Write scrub is no longer running and was aborted on all RAID groups in this aggregate, possibly due to an error. • "illegal" - The aggregate contains RAID groups with RAID Lost Write disabled and other RAID groups with RAID Lost Write enabled. This is an invalid state. • "inoperative" - The RAID Lost Write scrub is allowed on the aggregate, but it cannot start because the system-wide RAID

raid-lost-write-state		string optional	Lost Write option "raid.lost_write.enable" is set to "off". • "off" - RAID Lost Write protection and scrub are disabled on this aggregate. • "on" - The aggregate is RAID Lost Write protected and that the RAID Lost Write scrub completed successfully on all RAID groups in this aggregate. • "partial" - The RAID Lost Write scrub completed successfully on some of the RAID groups in this aggregate, but was aborted on at least one of the RAID groups. • "unknown" - The RAID Lost Write scrub status could not be determined. • "upgrade_partial" - The RAID Lost Write scrub is still in progress on some of the RAID groups in this aggregate and was aborted on at least one of the RAID groups. • "upgrading" - The RAID Lost Write scrub is still not completed or not yet started on at least one of the RAID groups in this aggregate.
raid-size		integer	Current RAID group size. Range : [0..2^31-1].
raid-status		string	RAID status. Possible values: "copying", "degraded", "foreign", "growing", "hybrid", "hybrid_enabled", "initializing", "invalid", "ironing", "mirror degraded", "mirrored", "mixed_raid_type", "needs check", "normal", "noparity", "out-of-date", "parity uninit'd", "partial", "raid0", "raid4", "raid_dp", "raid_tec", "reconstruct", "resyncing", "tier_unavailable", "verifying". These values may appear by themselves or in combination separated by commas (e.g., "mixed_raid_type, hybrid, normal"). An aggregate could be of only one of the following RAID types: • "raid0" - All the raid groups in the aggregate are of type raid0, • "raid4" - All the raid groups in the aggregate are of type raid4, • "raid_dp" - All the raid groups in the aggregate are of type raid_dp, • "raid_tec" - All the raid groups in the aggregate are of type raid_tec, • "mixed_raid_type" - This aggregate contains RAID groups of different RAID types (raid0, raid4, raid_dp, raid_tec).
size-available		integer	Available bytes in the aggregate. Range: [0..2^64-1].
size-percentage-used		integer optional	Percentage of aggregate used. This value is not returned if the aggregate is unusable (i.e., it's offline). Range : [0..100].
size-total		integer	Aggregate total usable size in bytes, not including WAFL reserve and aggregate snapshot reserve. If the aggregate is restricted or offline, a value of 0 is returned. Range : [0..2^64-1].
size-used		integer	Aggregate bytes used. This value is not returned if the aggregate is unusable (i.e., it's offline). Range: [0..2^64-1].
snaplock-type		string optional	The type of the snaplock aggregate. Possible values - "compliance" or "enterprise" or "non-snaplock"
state		string	Aggregate state. The possible values: "creating", "destroying", "failed", "frozen", "inconsistent", "iron_restricted", "mounting", "offline", "online", "partial", "quiesced", "quiescing", "restricted", "reverted", "unknown", "unmounted", "unmounting".
striping		striping-type optional	Specifies the striping information about the aggregate. Possible values are "striped", "not_striped" and "unknown" In unclustered environments, all aggregates are not striped. In clustered environments, aggregates can be either striped or not striped. When striping information is not known, "unknown" will be returned.
type		string	The type of aggregate. Possible values: aggr "aggr" (for aggregates that can contain flexible volumes)

uses-data-partitions		boolean optional	If true, aggregate is using data partitions.
uses-root-partitions		boolean optional	If true, aggregate is using root partitions.
uses-shared-disks		boolean optional	If true, aggregate is using shared disks.
uuid		string	Aggregate's Universal Unique IDentifier. UUIDs are 16-byte quantities that are typically displayed as having five hexadecimal fields separated by hyphens. For example: d2da3566-da53-11d7-a841-000100000529
volume-count		integer	Number of volumes in the aggregate. Range: [0..2^31-1].
volume-count-collective		integer optional	Number of striped volume constituents in the aggregate which also represent a collective striped volume. This field is for internal use only. Range: [0..2^31-1].
volume-count-mirrors		mirror-count-info optional	Various counts information for mirror volumes in the aggregate. This information is returned only when the aggregate contains mirror volumes.
volume-count-not-online		integer optional	When present, this field indicates the number of volumes that are not online (offline and restricted volumes). Range: [0..2^31-1]
volume-count-quiesced		integer optional	When present, this field indicates the number of quiesced online volumes. Range: [0..2^31-1]
volume-count-striped		integer optional	Number of striped volume constituents in the aggregate. These volumes are also reported in the full volume-count value. This field is for internal use only. Range: [0..2^31-1].
volumes		contained-volume-info[]	List of volumes contained the aggregate.
wafl-reserve-percent		integer optional	Percent of aggr raw capacity that WAFL reserves Range: [0..100].
wafliron		aggr-wafliron-info optional	Information related to wafliron, the online WAFL file system check/repair tool. This information is returned only when wafliron specific information is available.

Element definition: **aggr-object-store-config-info**

[top]

Object Store Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
access-key		string optional	Access key ID for AWS_S3, SGWS and ONTAP_S3 provider types Attributes: optional-for-create, modifiable
			Authentication used to access the object store. Supported values are:

auth-type		string optional	• 'key' - Access keys provided by admin • 'CAP' - Access keys and session token retrieved from the C2S Access Portal (CAP) • 'EC2-IAM' - In Cloud Volumes ONTAP access keys and session token retrieved from the EC2 instance metadata for the IAM role associated with EC2 instance • 'GCP-SA' - In Cloud Volumes ONTAP session token retrieved from the GCP instance metadata for the Service Account associated with GCP instance • 'Azure-MSI' - In Cloud Volumes ONTAP session token retrieved from the Azure Managed Service Identity (MSI) associated with the instance Attributes: optional-for-create, modifiable
azure-account		string optional	Azure account Attributes: optional-for-create, non-modifiable
cap-url		string optional	URL to request temporary credentials for a C2S account. Attributes: optional-for-create, modifiable
ipspace		string optional	IPspace to use in order to reach the object store. Attributes: optional-for-create, modifiable
is-certificate-validation-enabled		boolean optional	Is SSL/TLS certificate validation enabled. The default value is 'true'. Attributes: optional-for-create, modifiable
license-used-percent	**[0..2^32-1]**	integer optional	Percentage of the object store's total licensed capacity used by this config. This field is not returned in MetroCluster configurations or for Cloud Volumes ONTAP. Attributes: non-creatable, non-modifiable
object-store-name		string optional	Name for the object store configuration to be created. The name can contain letters, numbers, and the underscore character (_), but the first character must be a letter or an underscore. Attributes: key, required-for-create, non-modifiable
object-store-uuid		string optional	UUID of the object store configuration Attributes: non-creatable, non-modifiable
port	**[0..65535]**	integer optional	Port number of the object store Attributes: optional-for-create, modifiable
provider-type		string optional	Type of object store provider. Allowed values are: • 'AWS_S3' - AWS S3 • 'SGWS' - StorageGRID Webscale • 'Azure_Cloud' - Microsoft Azure Cloud • 'IBM_COS' - IBM Cloud Object Storage • 'AliCloud' - Alibaba Cloud Object Storage Service • 'GoogleCloud' - Google Cloud Storage • 'ONTAP_S3' - ONTAP S3 Attributes: required-for-create, non-modifiable
s3-name		string optional	Data bucket/container name Attributes: required-for-create, non-modifiable
server		string optional	Fully qualified domain name of the object store Attributes: required-for-create, modifiable
ssl-enabled		boolean optional	SSL/HTTPS enabled or not. The default value is 'true'. Attributes: optional-for-create, modifiable
used-space	**[0..2^63-1]**	integer optional	Capacity used in the object store by this config. Attributes: non-creatable, non-modifiable

Element definition: **aggr-object-store-profiler-info**

[top]

Object Store Profiler Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
node		string optional	Name of the node where the profiler ran. Attributes: key, non-creatable, non-modifiable
object-store-name		string optional	Name for the object store configuration profiled. Attributes: non-creatable, non-modifiable
op-count	**[0..2^64-1]**	integer optional	Number of operations performed. Attributes: non-creatable, non-modifiable
op-failed	**[0..2^64-1]**	integer optional	Number of operations that failed. Attributes: non-creatable, non-modifiable
op-latency-average	**[0..2^64-1]**	integer optional	Average latency for operation in milliseconds. Attributes: non-creatable, non-modifiable
op-latency-maximum	**[0..2^64-1]**	integer optional	Maximum latency for operation in milliseconds. Attributes: non-creatable, non-modifiable
op-latency-minimum	**[0..2^64-1]**	integer optional	Minimum latency for operation in milliseconds. Attributes: non-creatable, non-modifiable
op-name		string optional	Operation name - PUT/GET. Attributes: non-creatable, non-modifiable
op-size	**[0..2^63-1]**	integer optional	Size of operation. Attributes: non-creatable, non-modifiable
op-throughput	**[0..2^63-1]**	integer optional	Throughput per second for the operation. Attributes: non-creatable, non-modifiable
profiler-status		string optional	Profiler status. Attributes: non-creatable, non-modifiable
start-time		string optional	Profiler start time. Attributes: non-creatable, non-modifiable

Element definition: **aggr-object-store-resync-info**

[top]

Object store mirror resync info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
mirror-object-store-		string optional	This field represents the name of the mirror object store used by the FabricPool. Attributes: non-creatable, non-modifiable

name			
primary-object-store-name		string optional	This field represents the name of the primary object store used by the FabricPool. Attributes: non-creatable, non-modifiable
resync-progress	**[0..100]**	integer optional	This field identifies the resync progress (as a percentage) of the mirror object store from the primary object store of a FabricPool. Attributes: non-creatable, non-modifiable

Element definition: **aggr-option-info**

[top]

Option key and value. The possible values are described in the "aggr-set-option" API below.

Name	Range	Type	Description
name		string	Option key.
value		string	Option value.

Element definition: **aggr-relocation-info**

[top]

Aggregate Information When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Aggregate Name Attributes: non-creatable, non-modifiable
destination		string optional	Destination for Relocation Attributes: non-creatable, non-modifiable
relocation-status		string optional	Aggregates Relocation Status Attributes: non-creatable, non-modifiable Possible values include: • Done • Failed • In progress • Not attempted yet • Failed: Migration of the aggregate failed • Failed: Node is being shut down • Failed: Aggregate does not have SFO HA policy • Failed: Aggregate is in failed or limbo state. • Failed to offline the aggregate • Failed: Aggregate is being given back or relocated • Failed: Operation was vetoed • No aggregates to relocate • Performing relocation veto checks • check EMS logs • Failed: Node cannot communicate with the destination node • Failed: Destination node did not online the aggregate on time • Failed: Destination node failed to online the aggregate. Check EMS logs on destination node

			• Failed: Destination cannot receive the aggregate • Failed: Aggregate is restricted • Failed: Aggregate does not have disks • Operation was aborted • Failed: Aggregate is foreign • Failed: Aggregate is offline • Failed: Mirrored aggregate does not have both plexes online • Aborted. Failed to disable background disk firmware updates on the source node. • Aborted. Failed to disable background disk firmware updates on the destination node. • Deferred. Background disk firmware update is in progress on source node. • Deferred. Background disk firmware update is in progress on destination node. • Failed. Migration of a non-SSD aggregate to an All-Flash Optimized destination node is not allowed.
source-node		string optional	Name of the source node in which aggregate resides Attributes: key, non-creatable, non-modifiable

Element definition: **aggr-resync-options-info**

[top]

Aggregate resynchronization options info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
max-concurrent-resyncs-allowed	**[1..200]**	integer optional	The number of aggregates, owned by the specified node, that are allowed to resync at a time Attributes: non-creatable, modifiable
node		string optional	Name of the node for which the resynchronization option is defined Attributes: key, non-creatable, non-modifiable

Element definition: **aggr-simulate-disk-info**

[top]

Information for each disk selected during the simulation of aggregate provisioning operations.

Name	Range	Type	Description
added-to-new-raid-group		boolean optional	Indicates whether disk will be added to new or existing raid group. True if the disk will be added to new raid group. False if the disk will be added to existing raid group.
checksum-type		string optional	Checksum type of the raidgroup to which this disk will be added. Possible values: • "zoned checksum" - (this value is no longer supported) • "wafl checksum" • "block checksum"

			• "advanced_zoned checksum"
disk-type		string optional	Disk type. Possible values: • "ATA" • "BSAS" • "FCAL" • "LUN" • "MSATA" • "SAS" • "SSD" • "SSD_NVM" • "FSAS" • "VMDISK" • "unknown"
file-system-size		integer optional	File system size of disk (in bytes). Range : [0..2^64-1].
is-disk-shared		boolean optional	Indicates whether the disk is a partitioned disk or a physical disk. True if the disk is a partitioned disk. False if the disk is a physical disk.
name		string	Name of a member disk.
physical-size		integer optional	Raw size of disk (in bytes). Range : [0..2^64-1].
position		string optional	Position of disk within raid group. Possible values: • "tparity" • "dparity" • "parity" • "data"
raid-group-number		integer optional	Raid group number to which this disk will be added.
raid-type		string optional	Raid type of the raidgroup to which this disk will be added. Possible values: • "raid0" • "raid4" • "raid_dp" • "raid_tec"
syncmirror-pool		integer optional	SyncMirror pool 0 or 1. Range : [0..1].

Element definition: **aggr-space-info**

[top]

List of aggregates and their space usage information.

Name	Range	Type	Description
aggregate-name		string	Name of the aggregate.
size-asis-used		integer	Space used by A-SIS metafiles. Range : [0..2^64-1]
size-bssm-		integer	Space used by bi-directional Synchronous SnapMirror for NVLOG files. This

nvlog-used		optional	element will be returned only if the value is not zero. Range : [0..2^64-1]
size-free		integer	Total free space in the aggregate Range : [0..2^64-1]
size-image-backup-used		integer	Space used by Image Backup metafiles. Range : [0..2^64-1]
size-metadata		integer	Total space used by aggregates metadata. Range : [0..2^64-1]
size-nominal		integer	Total space contained in the aggreate minus the wafl reserve space. Range : [0..2^64-1]
size-snap-used		integer	Space used by aggregate snapshots. Range : [0..2^64-1]
size-used		integer	The total used space in the aggregate except the space used by snapshots. Range : [0..2^64-1]
size-volume-allocated		integer	Total space allocated to volumes in the aggregate. Range : [0..2^64-1]
size-volume-used		integer	Total space used by volumes in the aggregate. Range : [0..2^64-1]
volume-count		integer	Count of online virtual volumes in the aggregate. Range : [0..2^64-1]
volumes		volume-space-info[]	List of flexible volumes and their allocated space information.

Element definition: **aggr-spare-disk-info**

[top]

Spare disk Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
checksum-style		string optional	An indication of the checksum types that this disk is capable of supporting. Each possible return value represents one or more checksum types. Attributes: non-creatable, non-modifiable Possible values: • "advanced_zoned" - Supports advanced zoned checksum, • "block" - Supports block checksum, • "none" - No checksum support, • "zoned_advanced_zoned" - Supports zoned and advanced zoned checksums
disk		string optional	Name of the spare disk. Attributes: non-creatable, non-modifiable
			Disk class. Disks are grouped into classes based on their performance characteristics. Disks with the same 'disk-class' value are compatible for use in the same aggregate. Attributes: non-creatable, non-modifiable Possible values: • "unknown" - Unknown disk class.,

disk-class		string optional	• "capacity" - Capacity-oriented, near-line disk types. Includes disk types BSAS, FSAS and ATA., • "performance" - Performance-oriented, enterprise class disk types. Includes disk types SAS and FCAL., • "archive" - Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA., • "solid_state" - Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM., • "array" - Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN., • "virtual" - Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK., • "data_center" - Data center grade solid-state drives. Includes the disktype SSD-DC, • "virtual_lun" - Virtual LUNs that is used in the ONTAP Select shared HA, • "virtual_lunssd" - Virtual LUNs of type SSDs that is used in the ONTAP Select shared HA
disk-rpm	**[0..2^32-1]**	integer optional	Rotational speed in revolutions per minute. Possible values are: 5400, 7200, 10000, and 15000. Omitted if information is unavailable, or if the rpm does not apply to this 'disk-type'. Attributes: non-creatable, non-modifiable
disk-type		string optional	Disk interface type Attributes: non-creatable, non-modifiable Possible values: • "ata" - Advanced Technology Attachment, • "bsas" - Bridged Serial Attached SCSI (bridged from SATA), • "fcal" - Fibre Channel Arbitrated Loop, • "fsas" - High-Capacity (Fat) Serial Attached SCSI, • "lun" - SCSI Logical Unit Number (e.g. Array), • "sas" - Serial Attached SCSI, • "msata" - Multiple bridged SATA disks in a single carrier, • "ssd" - Solid-State Disk, • "vmdisk" - Hypervisor Virtual Disk, • "unknown" - unknown, • "ssd_nvm" - Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - Data Center Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - High Capacity Solid-State Disk, • "vmlun" - Hypervisor Virtual LUN, • "vmlun_ssd" - Hypervisor Virtual SSD LUN, • "ssd_zns" - Software Defined Non-Volatile Memory Express Solid-State Disk
effective-disk-rpm	**[0..2^32-1]**	integer optional	Effective rotational speed in revolutions per minute. Disks can report different actual 'rpm', but have the same 'effective-disk-rpm'. Disks with the same 'effective-disk-rpm' are compatible for use within the same aggregate. Omitted if information is unavailable, or excluded by 'desired-attributes'. Attributes: non-creatable, non-modifiable
effective-		string	Effective disk interface type. Disk can report different physical 'disk-type', but the same 'effective-disk-type'. Disk with the same 'effective-disk-type' are compatible for use within the same aggregate. Attributes: non-creatable, non-modifiable Possible values: • "ata" - Advanced Technology Attachment, • "bsas" - Bridged Serial Attached SCSI (bridged from SATA), • "fcal" - Fibre Channel Arbitrated Loop, • "fsas" - High-Capacity (Fat) Serial Attached SCSI, • "lun" - SCSI Logical Unit Number (e.g. Array), • "sas" - Serial Attached SCSI,

disk-type		optional	• "msata" - Multiple bridged SATA disks in a single carrier, • "ssd" - Solid-State Disk, • "vmdisk" - Hypervisor Virtual Disk, • "unknown" - unknown, • "ssd_nvm" - Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - Data Center Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - High Capacity Solid-State Disk, • "vmlun" - Hypervisor Virtual LUN, • "vmlun_ssd" - Hypervisor Virtual SSD LUN, • "ssd_zns" - Software Defined Non-Volatile Memory Express Solid-State Disk
is-disk-left-behind		boolean optional	True if disk is was left behind during giveback/switchback. Attributes: non-creatable, non-modifiable
is-disk-shared		boolean optional	True if disk is a shared disk. Attributes: non-creatable, non-modifiable
is-disk-zeroed		boolean optional	True if disk is pre-zeroed. Attributes: non-creatable, non-modifiable
is-disk-zeroing		boolean optional	True if disk is in process of being zeroed. Attributes: non-creatable, non-modifiable
is-sparecore		boolean optional	True if disk is a sparecore disk. Attributes: non-creatable, non-modifiable
local-usable-data-size	**[0..2^63-1]**	integer optional	Usable spare capacity in bytes present in the data partition of this disk. This field is omitted • If this disk is not a partitioned disk. • If none of the data partitions are assigned to the current node. • If none of the data partitions are spare. If the disk is a root-data1-data2 partitioned disk, both data partitions are assigned to the current node and are spare then this field is sum of usable capacity from both the data partitions. Attributes: non-creatable, non-modifiable
local-usable-data-size-blks	**[0..2^64-1]**	integer optional	Usable spare capacity in number of 4K blocks present in the data partition of this disk. This field is omitted • If this disk is not a partitioned disk. • If none of the data partitions are assigned to the current node. • If none of the data partitions are spare. If the disk is a root-data1-data2 partitioned disk, both data partitions are assigned to the current node and are spare then this field is sum of usable capacity from both the data partitions. Attributes: non-creatable, non-modifiable
local-usable-data1-size	**[0..2^63-1]**	integer optional	Usable spare capacity in bytes present in the first data partition of this disk. This field is omitted • If this disk is not a root-data1-data2 partitioned disk. • If first data partition is not assigned to the current node. • If first data partition is not spare. Attributes: non-creatable, non-modifiable
local-usable-data1-size-blks	**[0..2^64-1]**	integer optional	Usable spare capacity in number of 4K blocks present in the first data partition of this disk. This field is omitted • If this disk is not a root-data1-data2 partitioned disk. • If first data partition is not assigned to the current node. • If first data partition is not spare. Attributes: non-creatable, non-modifiable

local-usable-data2-size	**[0..2^63-1]**	integer optional	Usable spare capacity in bytes present in the second data partition of this disk. This field is omitted • If this disk is not a root-data1-data2 partitioned disk. • If second data partition is not assigned to the current node. • If second data partition is not spare. Attributes: non-creatable, non-modifiable
local-usable-data2-size-blks	**[0..2^64-1]**	integer optional	Usable spare capacity in number of 4K blocks present in the second data partition of this disk. This field is omitted • If this disk is not a root-data1-data2 partitioned disk. • If second data partition is not assigned to the current node. • If second data partition is not spare. Attributes: non-creatable, non-modifiable
local-usable-root-size	**[0..2^63-1]**	integer optional	Usable spare capacity in bytes present in the root partition of this disk. This field is omitted • If this disk is not a partitioned disk. • If root partition is not assigned to the current node • If root partition is not spare Attributes: non-creatable, non-modifiable
local-usable-root-size-blks	**[0..2^64-1]**	integer optional	Usable spare capacity in number of 4K blocks present in the root partition of this disk. This field is omitted • If this disk is not a partitioned disk. • If root partition is not assigned to the current node • If root partition is not spare Attributes: non-creatable, non-modifiable
original-owner		string optional	Node for which the spare information is returned. Attributes: key, non-creatable, non-modifiable
standard-disk-type		standarddisktype optional	Industry standard disk type. Attributes: non-creatable, non-modifiable Possible values: • "sata" - SATA, Serial Advanced Technology Attachment, • "fc" - FC, Fibre Channel, • "nl_sas" - NL-SAS, Near Line SAS, • "lun" - LUN, SCSI Logical Unit Number (e.g. Array), • "sas" - SAS, Serial Attached SCSI, • "scsi" - SCSI, Small Computer System Interface, • "ssd" - SSD, Solid-State Disk, • "vm_disk" - VM Disk, Hypervisor Virtual Disk, • "unknown" - Unknown Disk Type, • "nvme_ssd" - NVMe SSD, Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - DC SSD, Data Center Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - CAP SSD, High Capacity Solid-State Disk, • "vm_lun" - VM LUN, Hypervisor Virtual LUN, • "vm_lun_ssd" - VM SSD LUN, Hypervisor Virtual SSD LUN, • "ssd_zns" - SDF SSD, Non-Volatile Memory Express Solid-State Disk
syncmirror-pool		string optional	SyncMirror Pool to which disk is assigned Attributes: non-creatable, non-modifiable
total-size	**[0..2^63-1]**	integer optional	Total raw capacity of this disk in bytes Attributes: non-creatable, non-modifiable
usable-size	**[0..2^63-1]**	integer optional	Total usable capacity of this disk in bytes Attributes: non-creatable, non-modifiable
usable-	**[0..2^64-**	integer	Total usable capacity of this disk in number of 4K blocks Attributes:

size-blks	**1]**	optional	non-creatable, non-modifiable
zeroing-percent	**[0..100]**	integer optional	If 'is-disk-zeroing' is true, this field indicates the percentage of zeroing that has completed. Attributes: non-creatable, non-modifiable

Element definition: **aggr-status-info**

[top]

Aggregate Status & Topology Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-cksumstyle		string optional	Checksum Style of Aggregate. Attributes: non-creatable, non-modifiable
aggr-plex-list		aggr-plex-info[] optional	Information about the Plex
aggr-raid-status		string optional	RAID Status of Aggregate. Attributes: non-creatable, non-modifiable
aggr-raid-type		string optional	RAID Type of Aggregate. Attributes: non-creatable, non-modifiable
aggr-wafl-status		string optional	WAFL Status of Aggregate. Attributes: non-creatable, non-modifiable
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
aggregate-uuid		string optional	Aggregate's Universal Unique IDentifier. Attributes: non-creatable, non-modifiable
is-mirror-verifying		boolean optional	True if mirror verification is in progress Attributes: non-creatable, non-modifiable
mirror-verification-pct-with-precision		string optional	This field indicates the percentage of mirror verification that has completed, rounded down to two decimal places. Attributes: non-creatable, non-modifiable
mirror-verification-percent	**[0..100]**	integer optional	This field indicates the percentage of mirror verification that has completed. Attributes: non-creatable, non-modifiable
node		string optional	Node hosting the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggregate-simulate-layout-info**

[top]

Aggregate Layout

Name	Range	Type	Description
aggregate-		size[]	Estimated Aggregate Usable Capacity Attributes: non-creatable, non-

capacity		optional	modifiable
checksum-types		checksum-style[] optional	Checksum Type of the RAID Groups to Which Selected Disks Belong Attributes: non-creatable, non-modifiable
disk-physical-sizes		size[] optional	Physical Raw Size of Selected Disks Attributes: non-creatable, non-modifiable
disk-positions		disk-position-type[] optional	Position of Selected Disks within the RAID Groups Attributes: non-creatable, non-modifiable
disk-sizes		size[] optional	FileSystem Size of Selected Disks Attributes: non-creatable, non-modifiable
disk-types		disktype[] optional	Disk Type of Selected Disks Attributes: non-creatable, non-modifiable Possible values: • "ata" - Advanced Technology Attachment, • "bsas" - Bridged Serial Attached SCSI (bridged from SATA), • "fcal" - Fibre Channel Arbitrated Loop, • "fsas" - High-Capacity (Fat) Serial Attached SCSI, • "lun" - SCSI Logical Unit Number (e.g. Array), • "msata" - Multiple bridged SATA disks in a single carrier, • "sas" - Serial Attached SCSI, • "ssd" - Solid-State Disk, • "vmdisk" - Hypervisor Virtual Disk, • "ssd_nvm" - Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - Data Center based Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - High Capacity Solid-State Disk, • "vmlun" - Hypervisor Virtual LUN, • "vmlun_ssd" - Hypervisor Virtual SSD LUN, • "ssd_zns" - Software Defined based Non-Volatile Memory Express Solid-State Disk
disks		disk-name[] optional	List of Selected Disks for Aggregate Create Simulation Attributes: non-creatable, non-modifiable
raid-types		raid-type[] optional	RAID Type of the RAID Groups to Which Selected Disks Belong Attributes: non-creatable, non-modifiable
raidgroups		string[] optional	RAID Groups to Which Selected Disks Belong Attributes: non-creatable, non-modifiable

Element definition: **autobalance-aggregate-state**

[top]

Auto Balance Aggregate state Possible values:

- "disabled" - Auto Balance Aggregate is disabled,
- "balanced" - Auto Balance Aggregate has determined that the aggregate is below the high-watermark.,
- "unbalanced" - Auto Balance Aggregate has detected that the aggregate is over the high-watermark but has not initiated any jobs to bring it below the high-watermark.,
- "ineligible" - Ineligible

[none]

Element definition: **default-raidtype-config-info**

[top]

Default RAID type for each disk size and disk type supported on this filer.

Name	Range	Type	Description
default-raid-type		string optional	Name of the RAID type allowed on this filer. Possible values: raid0, raid4, raid_dp and raid_tec.
disk-type		string optional	Name of the Disk type present on this controller. Possible values include FCAL, ATA, LUN, SAS, SSD, SSD_NVM, BSAS, FSAS, MSATA and VMDISK.
maximum-disk-capacity		size optional	Maximum capacity (in TiB) of the disk for which the raid types are specified. This appears only for SATA family disks of size less than or equal to 4TiB. If this field is not present in output then there is no restriction on maximum disk capacity for given disk type. This will appear for SATA family disks and when the default RAID type is raid_dp.
minimum-disk-capacity		size optional	Minimum capacity (in TiB) of the disk for which the raid types are specified. This appears only for SATA family disks of size greater than 4TiB. If this field is not present in output then there is no restriction on minimum disk capacity for given disk type. This will appear for SATA family disks and when the default RAID type is raid_tec.

Element definition: **disk-info**

[top]

Information for each disk in the plex.

Name	Range	Type	Description
name		string	Name of a member disk.
vbn-end	**[0..2^64-1].**	integer optional	VBN end value of a disk.
vbn-start	**[0..2^64-1].**	integer optional	VBN start value of a disk.

Element definition: **filter-attrs-info**

[top]

List of filters based on attributes of an aggregate.

Name	Range	Type	Description
all		boolean optional	If true, returns all aggregates owned by the local node and also taken over by the local node. Default is false.
is-cfo		boolean optional	If true, returns aggregates with 'cfo' HA policy which includes local and taken over aggregates. Default is false.
is-dr-auxiliary		boolean optional	If true, returns aggregates taken over by the local node but owned by the partner of DR (disaster recovery) partner (i.e. auxiliary partner). Default is false.
is-dr-partner		boolean optional	If true, returns aggregates taken over by the local node but owned by the DR (disaster recovery) partner. Default is false.
is-local		boolean optional	If true, returns aggregates owned by the local node. It includes taken over aggregates with 'sfo' policy. Default is false.
is-partner		boolean optional	If true, returns aggregates taken over by the local node but owned by the partner. Default is false.
is-sfo		boolean optional	If true, returns aggregates with 'sfo' HA policy which includes local and taken over aggregates. Default is false.

Element definition: **ha-policy-type**

[top]

HA Policy of aggregate. It can be controller failover or storage failover or unspecified. Allowed values are:

- "cfo": Controller FailOver
- "sfo": Storage FailOver
- "none": Unspecified

[none]

Element definition: **mediascrub-detail-info**

[top]

Information about media scrubbing.

Name	Range	Type	Description
mediascrub-status		string	Possible values are "suspended", "disabled" and "enabled" "suspended": Media scrub is enabled but temporarily paused because another task is running or it is in the idle cycle of its periodic run. It will resume automatically when the task is done or the idle cycle ends. "disabled": Media scrub feature is turned off. "enabled": Media scrub feature is active.
percentage-complete		integer optional	Media scrubbing percentage complete. Range: [0..100].
raid-group		string	Name of the RAID group.

Element definition: **min-aggr-disk-count-info**

[top]

Minimum number of disks required in an aggregate of a specific RAID type.

Name	Range	Type	Description
minimum-disk-count		integer	Minimum disk count for the aggregate. Range : [1..7] Possible values: • 1 for raid-type raid0 • 3 for raid-type raid4 • 5 for raid-type raid_dp • 7 for raid-type raid_tec
raid-type		string	Name of the RAID type allowed on this filer. Possible values: raid0, raid4, raid_dp, raid_tec.

Element definition: **modify-raid-type-simulate-info**

[top]

Simulation Result

Name	Range	Type	Description
warning-codes		warning-code[] optional	Warning Codes from Simulation of Raid Type Modification Attributes: non-creatable, modifiable

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **object-store-information**

[top]

Object Store info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
aggregate-uuid		string optional	UUID of the aggregate. Attributes: non-creatable, non-modifiable
bin-uuid		string optional	UUID of the capacity tier bin associated with the aggregate. Attributes: non-creatable, modifiable
force-tiering-on-metrocluster		boolean optional	Force tiering on the primary object store, for FabricPool in a MetroCluster configuration. Attributes: non-creatable, modifiable
is-mirror-degraded		boolean optional	This field identifies if the mirror object store is in sync with the primary object store of a FabricPool. Attributes: non-creatable, non-modifiable
license-used-percent	**[0..2^32-1]**	integer optional	Percentage of the object store's total licensed capacity used by this aggregate. This field is not returned for ONTAP Cloud. Attributes: non-creatable, non-modifiable
mirror-type		string optional	Object store mirror type. Attributes: non-creatable, modifiable Possible values: • "primary" - object store is a primary object store, • "mirror" - object store is a mirror object store
object-store-availability		string optional	Availability of the object store. Attributes: non-creatable, non-modifiable Possible values: • "unavailable" - Unavailable, • "available" - Available
object-store-name		string optional	Name of the object store configuration attached to the aggregate. Attributes: key, non-creatable, non-modifiable
object-store-uuid		string optional	UUID of the object store configuration attached to the aggregate. Attributes: non-creatable, non-modifiable
			Type of object store provider. Allowed values are: • 'AWS_S3' - AWS S3

provider-type		string optional	• 'SGWS' - StorageGRID Webscale • 'Azure_Cloud' - Microsoft Azure Cloud • 'ONTAP_S3' - ONTAP S3 Attributes: non-creatable, modifiable
size-limit	**[0..2^63-1]**	integer optional	The maximum amount of space in the object store the aggregate can use. Attributes: non-creatable, modifiable
tiering-fullness-threshold	**[0..100]**	integer optional	Percentage of space in the performance tier which must be used before data is tiered out to the capacity tier. Attributes: non-creatable, modifiable
used-space	**[0..2^63-1]**	integer optional	Capacity used in the object store by this aggregate. Attributes: non-creatable, modifiable

Element definition: **object-store-url-style**

[top]

path-style | virtual-hosted-style Possible values:

- "path_style" ,
- "virtual_hosted_style"

[none]

Element definition: **object-store-vol-btuuids-info**

[top]

Object Store Volume Buftree UUIDs Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Name of the aggregate. Attributes: key, non-creatable, non-modifiable
bin-uuid		string optional	UUID of the capacity tier bin associated with the aggregate. Attributes: non-creatable, non-modifiable
buftree-uuid		string optional	Buftree UUID of the volume. Attributes: key, non-creatable, non-modifiable
cookie	**[0..2^32-1]**	integer optional	Token uniquifier for the entry. Attributes: key, non-creatable, non-modifiable
object-store-name		string optional	Name of the object store configuration attached to the aggregate. Attributes: key, non-creatable, non-modifiable
vol-uuid		string optional	UUID of the volume. Attributes: non-creatable, non-modifiable

[top]

Element definition: **raidgroup-size-info**

Default, minimum and maximum raidgroup size for each RAID type supported on this filer.

Name	Range	Type	Description
default-size		integer	Default size of a RAID group of this type in aggregates. Range : [6..16].
disktype		string optional	Name of the Disk type present on this controller. Possible values include FCAL, ATA, LUN, SAS, SSD, BSAS, FSAS, MSATA and VMDISK.
maximum-disk-capacity		size optional	Maximum capacity (in TB) of the disk for which the raidgroup sizes are specified. This appears only for FSAS family disks of size less than or equal to 4TB. If this field is not present in output then there is no restriction on maximum disk capacity for this raidtype and disktype combination.
maximum-size		integer	Maximum size of a RAID group of this type in aggregates. Range : [6..28].
minimum-disk-capacity		size optional	Minimum capacity (in TB) of the disk for which the raidgroup sizes are specified. This appears only for FSAS family disks of size greater than 4TB. If this field is not present in output then there is no restriction on minimum disk capacity for this raidtype and disktype combination.
minimum-size		integer	Minimum size of a RAID group of this type in aggregates. Possible values: 2, 3, 5, 7.
raidtype		string	Name of the RAID type allowed on this filer. Possible values: raid0, raid4, raid_dp, raid_tec.

Element definition: **raidtype-info**

[top]

RAID types allowed on this filer.

Name	Range	Type	Description
raidtype		string	Name of an allowed RAID type. Possible values: raid0, raid4, raid_dp, raid_tec.

Element definition: **scrub-detail-info**

[top]

Scrubbing information.

Name	Range	Type	Description
is-suspended		boolean	Suspended state of the scrub on that RAID group.
last-scrub-timestamp		integer optional	Time at which the last full scrub completed. If a scrub has never been performed, this value will not be returned. The time value is in seconds since January 1, 1970. Range : [0..2^31-1].
percentage-complete		integer optional	Scrubbing percentage complete. I scrubbing is not active, this value will not be returned. Range : [0..100].
raid-group		string	Name of the RAID group involved in the scrub.

Element definition: **space-information**

[top]

Space configuration info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate		string optional	Name of the aggregate for which the space usage is requested. Attributes: non-creatable, non-modifiable
aggregate-metadata	**[0..2^63-1]**	integer optional	This field represents space used by filesystem metadata of the aggregate. Attributes: non-creatable, non-modifiable
aggregate-metadata-percent	**[0..2^32-1]**	integer optional	Aggregate Metadata Percent Attributes: non-creatable, non-modifiable
aggregate-size	**[0..2^63-1]**	integer optional	This field represents the size of the aggregate in bytes. Attributes: non-creatable, non-modifiable
object-store-logical-used	**[0..2^63-1]**	integer optional	This field represents the total logical amount of space used in the object store (in bytes). Attributes: non-creatable, non-modifiable
object-store-logical-used-percent	**[0..2^32-1]**	integer optional	Logical Used Percentage. Attributes: non-creatable, non-modifiable
object-store-metadata	**[0..2^63-1]**	integer optional	(DEPRECATED) - This field represents the space used by metadata in the object store (in bytes). Attributes: non-creatable, non-modifiable
object-store-metadata-percent	**[0..2^32-1]**	integer optional	(DEPRECATED) - Metadata Percent. Attributes: non-creatable, non-modifiable
object-store-physical-used	**[0..2^63-1]**	integer optional	This field represents the total amount of space used in the object store. Attributes: non-creatable, non-modifiable
object-store-physical-used-percent	**[0..2^32-1]**	integer optional	Used Percentage. Attributes: non-creatable, non-modifiable
object-store-referenced-capacity	**[0..2^63-1]**	integer optional	This field represents the logical space still referenced in the object store (in bytes). Attributes: non-creatable, non-modifiable
object-store-referenced-capacity-percent	**[0..2^32-1]**	integer optional	Referenced Capacity Percentage. Attributes: non-creatable, non-modifiable
object-store-sis-space-saved	**[0..2^63-1]**	integer optional	This field represents the space saved by storage efficiency in the object store. Attributes: non-creatable, non-modifiable
object-store-sis-space-saved-percent	**[0..2^32-1]**	integer optional	Storage efficiency saved percentage. Attributes: non-creatable, non-modifiable
object-store-size	**[0..2^63-1]**	integer optional	This field represents the size of the object store. Attributes: non-creatable, non-modifiable
object-store-unreclaimed-space	**[0..2^63-1]**	integer optional	(DEPRECATED) - This field represents the amount of space that is no longer referenced in the object store. This space has yet to be reclaimed. Attributes: non-creatable, non-modifiable
object-store-unreclaimed-space-percent	**[0..2^32-1]**	integer optional	(DEPRECATED)- Unreclaimed Space Percentage. Attributes: non-creatable, non-modifiable
percent-snapshot-	**[0..100]**	integer	Space Reserved for Snapshot Copies Attributes: non-creatable, non-

space		optional	modifiable
physical-used	**[0..2^63-1]**	integer optional	This field represents physical used space in bytes. This differs from 'total-used' space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies. Attributes: non-creatable, non-modifiable
physical-used-percent	**[0..2^32-1]**	integer optional	Physical Used Percentage Attributes: non-creatable, non-modifiable
snap-size-total	**[0..2^63-1]**	integer optional	This field represents snapshot size in bytes. Attributes: non-creatable, non-modifiable
snapshot-reserve-unusable	**[0..2^63-1]**	integer optional	This field represents snapshot reserve that is not available in bytes. Attributes: non-creatable, non-modifiable
snapshot-reserve-unusable-percent	**[0..2^32-1]**	integer optional	Snapshot Reserve Unusable Percent Attributes: non-creatable, non-modifiable
tier-name		string optional	This field represents the name of the performance or capacity tier. Attributes: non-creatable, non-modifiable
total-provisioned-space	**[0..2^63-1]**	integer optional	This field represents total provisioned space across all the volumes in the aggr. Attributes: non-creatable, non-modifiable
total-provisioned-space-percent	**[0..2^32-1]**	integer optional	This field represents percentage of total provisioned space across all the volumes against aggr's size. Attributes: non-creatable, non-modifiable
used-including-snapshot-reserve	**[0..2^63-1]**	integer optional	This field represents space used by the aggregate including the aggregate's Snapshot reserve in bytes. Attributes: non-creatable, non-modifiable
used-including-snapshot-reserve-percent	**[0..2^32-1]**	integer optional	Total Used Percent Attributes: non-creatable, non-modifiable
volume-footprints	**[0..2^63-1]**	integer optional	This field represents space used by the sum of all data and metadata of all volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-footprints-percent	**[0..2^32-1]**	integer optional	Volume Footprints Percent Attributes: non-creatable, non-modifiable

Element definition: **striping-type**

[top]

Striping information of aggregate. Allowed values are:

- "striped": Member of stripe.
- "not_striped": Not member of stripe.
- "unknown": Not known.

[none]

Element definition: **time-interval**

[top]

Time interval in seconds Range : [0..2^32-1].

[none]

Element definition: **verify-detail-info** [top]

Information about mirror verification.

Name	Range	Type	Description
is-suspended		boolean	Is mirror verification suspended for this aggregate?
name		string	Name of the aggregate.
pct-with-precision		string optional	Mirror verification percentage complete floored to two decimal place. If verification isn't active, this value won't be returned. (e.g. "13.12")
percentage-complete		integer optional	Mirror verification percentage complete. If verification isn't active, this value won't be returned. Range: [0..100].

Element definition: **warning-code** [top]

Warning codes for pre-check mode.

Name	Range	Type	Description
code	**[0..2^64-1]**	integer	Warning code.

Element definition: **aggr-64bit-upgrade-attributes** [top]

Information related to 64-bit upgrade.

Name	Range	Type	Description
aggr-check-attributes		aggr-check-attributes optional	Information returned when upgrade-64bit-mode input in aggr-add API is "check".
aggr-start-attributes		aggr-start-attributes optional	Information returned when upgrade-64bit-mode in aggr-add API is "grow_all", "grow_none", or "grow_reserved".
aggr-status-attributes		aggr-status-attributes	Status information related to 64-bit upgrade. This information includes whether the 64-bit upgrade is in progress.

Element definition: **aggr-64bit-upgrade-info** [top]

Information related to 64-bit upgrade.

Name	Range	Type	Description
check		aggr-64bit-upgrade-check-	Information returned when upgrade-64bit-mode in aggr-add or aggr-64bit-

		info optional	upgrade-start is "check".
start		aggr-64bit-upgrade-start-info optional	Information returned when upgrade-64bit-mode in aggr-add or aggr-64bit-upgrade-start is "grow_all", "grow_none", or "grow_reserved".
status		aggr-64bit-upgrade-status-info	Status information related to 64-bit upgrade. This information includes the block format of the aggregate and the progress of the 64-bit upgrade scanner.

Element definition: **aggr-efficiency-additional-details-info**

[top]

Additional details related to storage efficiency in this aggregate.

Name	Range	Type	Description
number-of-offline-volumes	**[0..2^32-1]**	integer optional	Number of volumes that are offline in the aggregate. Attributes: non-creatable, non-modifiable
number-of-sis-change-log-disabled-volumes	**[0..2^32-1]**	integer optional	Number of volumes on which efficiency change log is disabled in the aggregate. Attributes: non-creatable, non-modifiable
number-of-sis-disabled-volumes	**[0..2^32-1]**	integer optional	Number of volumes on which volume efficiency is disabled in the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-aggr-info**

[top]

Storage efficiency achieved at the aggregate level using techniques like data compaction.

Name	Range	Type	Description
aggr-compaction-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by data compaction and cross volume sharing at the aggregate level. Attributes: non-creatable, non-modifiable
aggr-data-reduction-storage-efficiency-ratio		string optional	Storage efficiency ratio of the aggregate. Attributes: non-creatable, non-modifiable
aggr-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by the aggregate. Attributes: non-creatable, non-modifiable
aggr-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulated-additional-details-info**

[top]

Additional details related to storage efficiency in the given aggregates.

Name	Range	Type	Description
number-of-offline-volumes	**[0..2^32-1]**	integer optional	Number of volumes that are offline in the given aggregates. Attributes: non-creatable, non-modifiable
number-of-sis-change-log-disabled-volumes	**[0..2^32-1]**	integer optional	Number of volumes on which efficiency change log is disabled in the given aggregates. Attributes: non-creatable, non-modifiable

number-of-sis-disabled-volumes	**[0..2^32-1]**	integer optional	Number of volumes on which volume efficiency is disabled in the given aggregates. Attributes: non-creatable, non-modifiable
number-of-skipped-aggregates	**[0..2^32-1]**	integer optional	Number of Skipped aggregates. Attributes: non-creatable, non-modifiable
skipped-aggregates		string[] optional	List of Aggregates skipped Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulated-aggr-info** [top]

Storage efficiency achieved at the aggregate level using techniques like data compaction.

Name	Range	Type	Description
aggr-data-reduction-storage-efficiency-ratio		string optional	Storage efficiency ratio of the given aggregates. Attributes: non-creatable, non-modifiable
aggr-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by the given Aggregates. Attributes: non-creatable, non-modifiable
aggr-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by the given Aggregates. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulated-snapshot-and-flexclone-info** [top]

Aggregated information of storage efficiency of Snapshot copies and FlexClone volumes in the given aggregates.

Name	Range	Type	Description
flexclone-volume-data-reduction-storage-efficiency-ratio		string optional	Flexclone volume data reduction efficiency ratio of the given aggregates. Attributes: non-creatable, non-modifiable
flexclone-volume-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all FlexClone volumes residing in the given aggregates. Attributes: non-creatable, non-modifiable
flexclone-volume-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all FlexClone volumes in the given aggregates. Attributes: non-creatable, non-modifiable
snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio		string optional	Snapshot and FlexClone volume storage efficiency ratio of the given aggregates. Attributes: non-creatable, non-modifiable
snapshot-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all volume Snapshot copies residing in the given aggregates. Attributes: non-creatable, non-modifiable
snapshot-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all volume Snapshot copies residing in the given aggregates. Attributes: non-creatable, non-modifiable
snapshot-volume-data-reduction-storage-efficiency-ratio		string optional	Snapshot volume data reduction efficiency ratio of the given aggregates. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulated-volume-info** [top]

Aggregated information of storage efficiency achieved at the volume level using techniques like deduplication, compression, zero detection and FlexClones for files or LUNs.

Name	Range	Type	Description
volume-compression-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by compressing blocks by all volumes in the given aggregates. Attributes: non-creatable, non-modifiable
volume-data-reduction-storage-efficiency-ratio		string optional	Storage efficiency ratio of all the volumes in the given aggregates. Attributes: non-creatable, non-modifiable
volume-dedupe-zero-pattern-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by volume Deduplication and pattern detection by all the volumes in the given aggregates. Attributes: non-creatable, non-modifiable
volume-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all the volumes in the given aggregates. Attributes: non-creatable, non-modifiable
volume-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all volumes in the given aggregates. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-cumulative-info**

[top]

Cumulative storage efficiency information of an aggregate.

Name	Range	Type	Description
total-data-reduction-efficiency-ratio-wo-snapshots		string optional	total data reduction efficiency ratio excluding snapshots copies. Attributes: non-creatable, non-modifiable
total-data-reduction-efficiency-ratio-wo-snapshots-flexclones		string optional	total data reduction efficiency ratio excluding snapshots copies and flexclones. Attributes: non-creatable, non-modifiable
total-data-reduction-logical-used-wo-snapshots	**[0..2^63-1]**	integer optional	Total Data reduction logical used excluding snapshot copies in the aggregate. Attributes: non-creatable, non-modifiable
total-data-reduction-logical-used-wo-snapshots-flexclones	**[0..2^63-1]**	integer optional	Total Data reduction logical used excluding snapshot copies and flexclones in the aggregate. Attributes: non-creatable, non-modifiable
total-data-reduction-physical-used-wo-snapshots	**[0..2^63-1]**	integer optional	Total Data reduction physical used excluding snapshot copies in the aggregate. Attributes: non-creatable, non-modifiable
total-data-reduction-physical-used-wo-snapshots-flexclones	**[0..2^63-1]**	integer optional	Total Data reduction physical used excluding snapshot copies and flexclones in the aggregate. Attributes: non-creatable, non-modifiable
total-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used in the aggregate. This includes Volumes, Clones and Snapshots in the aggregate. The logical size is computed based on physical usage and savings obatained in the aggregate. Attributes: non-creatable, non-modifiable
total-physical-used	**[0..2^63-1]**	integer optional	This contains the physical size used by the aggregate. Attributes: non-creatable, non-modifiable

total-storage-efficiency-ratio		string optional	Total storage efficiency ratio of the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-snapshot-and-flexclone-volume-info**

[top]

Aggregated information of storage efficiency of Snapshots and FlexClone volumes in the aggregate.

Name	Range	Type	Description
flexclone-volume-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all FlexClone volumes residing in the aggregate. Attributes: non-creatable, non-modifiable
flexclone-volume-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all FlexClone volumes in the aggregate. Attributes: non-creatable, non-modifiable
snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio		string optional	Snapshot and FlexClone volume storage efficiency ratio of the aggregate. Attributes: non-creatable, non-modifiable
snapshot-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all Volume Snapshots residing in the aggregate. Attributes: non-creatable, non-modifiable
snapshot-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all Volume Snapshots residing in the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-total-cumulated-info**

[top]

cumulated storage efficiency information from the given aggregates.

Name	Range	Type	Description
total-data-reduction-efficiency-ratio-wo-snapshots		string optional	total data reduction efficiency ratio excluding snapshots copies. Attributes: non-creatable, non-modifiable
total-data-reduction-efficiency-ratio-wo-snapshots-flexclones		string optional	total data reduction efficiency ratio excluding snapshots copies and flexclones. Attributes: non-creatable, non-modifiable
total-data-reduction-logical-used-wo-snapshots	**[0..2^63-1]**	integer optional	Total Data reduction logical used excluding snapshot copies in the aggregate. Attributes: non-creatable, non-modifiable
total-data-reduction-logical-used-wo-snapshots-flexclones	**[0..2^63-1]**	integer optional	Total Data reduction logical used excluding snapshot copies and flexclones in the aggregate. Attributes: non-creatable, non-modifiable
total-data-reduction-physical-used-wo-snapshots	**[0..2^63-1]**	integer optional	Total Data reduction physical used excluding snapshot copies in the aggregate. Attributes: non-creatable, non-modifiable
total-data-			

reduction-physical-used-wo-snapshots-flexclones	**[0..2^63-1]**	integer optional	Total Data reduction physical used excluding snapshot copies and flexclones in the aggregate. Attributes: non-creatable, non-modifiable
total-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used in the given aggregates. This includes volumes, clones and Snapshot copies in the given aggregates. The logical size is computed based on physical usage and savings obatained in the given aggregates. Attributes: non-creatable, non-modifiable
total-physical-used	**[0..2^63-1]**	integer optional	This contains the physical size used by the given aggregates. Attributes: non-creatable, non-modifiable
total-storage-efficiency-ratio		string optional	Total storage efficiency ratio of the given aggregates. Attributes: non-creatable, non-modifiable

Element definition: **aggr-efficiency-volume-info**

[top]

Aggregated information of storage efficiency achieved at the volume level using techniques like deduplication, compression, zero detection and FlexClones for files or LUNs.

Name	Range	Type	Description
volume-compression-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by compressing blocks by all volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-data-reduction-storage-efficiency-ratio		string optional	Storage efficiency ratio of all the volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-efficiency-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by deduplication and FlexClone for files or LUNs by all volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-logical-used	**[0..2^63-1]**	integer optional	This contains logical size used by all the volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-physical-used	**[0..2^63-1]**	integer optional	This contains physical size used by all volumes in the aggregate. Attributes: non-creatable, non-modifiable
volume-vbn-zero-saved	**[0..2^63-1]**	integer optional	The total disk space that is saved by inline zero pattern detection by all the volumes in the aggregate. Attributes: non-creatable, non-modifiable

Element definition: **aggr-fs-attributes**

[top]

File system specific information about the aggregate.

Name	Range	Type	Description
block-type		string optional	The indirect block format that the aggregate can have. The default is 64_bit. With a 64_bit block-type creation of aggregates that can be larger than 16TB is allowed. Possible values: 64_bit
fsid	**[0..2^32-1]**	integer optional	Aggregate's File System Identifier.
type		string optional	The type of aggregate. Possible values: aggr "aggr" (for aggregates that can contain flexible volumes)

Element definition: **aggr-inode-attributes**

[top]

A structure returning inode-related information for a given aggregate's Active File System (AFS).

Name	Range	Type	Description
files-private-used	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of system (not user-visible) files (inodes) used. If the referenced file system is restricted or offline, a value of 0 is returned.
files-total	**[0..2^64-1]**	integer optional	[settable, online-only] Total user-visible file (inode) count, i.e., maximum number of user-visible files (inodes) that this referenced file system can currently hold. If the referenced file system is restricted or offline, a value of 0 is returned.
files-used	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of user-visible files (inodes) used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
inodefile-private-capacity	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of inodes that can currently be stored on disk for system (not user-visible) files. This number will dynamically increase as more system files are created.
inodefile-public-capacity	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of inodes that can currently be stored on disk for user-visible files. This number will dynamically increase as more user-visible files are created.
inofile-version	**[0..2^32-1]**	integer optional	[not settable, online-only] The inofile-version of the aggregate. If the referenced aggregate is restricted or offline, then a value of 0 is returned.
maxfiles-available	**[0..2^64-1]**	integer optional	[not settable, always] The count of the maximum number of user-visible files currently allowable on the referenced file system.
maxfiles-possible	**[0..2^64-1]**	integer optional	[not settable, always] The largest value to which the maxfiles-available parameter can be increased by reconfiguration, on the referenced file system.
maxfiles-used	**[0..2^64-1]**	integer optional	[not settable, online-only] The number of user-visible files currently in use on the referenced file system.
percent-inode-used-capacity	**[0..100]**	integer optional	[not settable, online-only] The percentage of disk space currently in use based on user-visible file (inode) count on the referenced file system.

Element definition: **aggr-ownership-attributes**

[top]

Ownership information about the aggregate.

Name	Range	Type	Description
cluster		string optional	Name of the cluster which has the node that owns this aggregate.
dr-home-id	**[0..2^32-1]**	integer optional	NVRAM ID of the DR (disaster recovery) node to which this aggregate's disks have been administratively assigned. This information is derived from the sanown information for an aggregate's disks. See 'disk-sanown-detail-info'
dr-home-name		string optional	Name of the DR node to which this aggregate's disks have been administratively assigned.
home-id	**[0..2^32-1]**	integer optional	NVRAM ID of the node to which this aggregate's disks have been administratively assigned. This information is derived from the sanown information for an aggregate's disks. See 'disk-sanown-detail-info'
home-name		string optional	Name of the node to which this aggregate's disks have been administratively assigned.
			NVRAM ID of node to which the aggregate ownership has been assigned.

owner-id	**[0..2^32-1]**	integer optional	Normally, home-id matches owner-id. But these may be changed by SFO takeover to match the takeover node, and restored by SFO giveback to match home-id. CFO takeover and giveback do not affect owner-id.
owner-name		string optional	Name of node to which the aggregate ownership has been assigned. Normally, home-name matches owner-name. But these may be changed by SFO takeover to match the takeover node, and restored by SFO giveback to match home-name. CFO takeover and giveback do not affect owner-name.

Element definition: **aggr-performance-attributes**

[top]

Performance specific attributes of the aggregate

Name	Range	Type	Description
free-space-realloc		string optional	Returns the free space reallocation state of the aggregate. Possible values : "on", "off", "no_redirect" • "on" : Free space reallocation enabled with automatically starting the redirect scanner • "off" : Free space reallocation disabled • "no_redirect" : Free space reallocation enabled without running the redirect scanner The default value is "off"
max-write-alloc-blocks	**[0..1152]**	integer optional	The maximum number of blocks used for write allocation. Some sequential read workloads may benefit from increasing this value. Default value is 0 which uses the controller-wide default value of 64. The default is optimal for most users. The controller-wide default can be adjusted with the bootarg "wafl-max-write-alloc-blocks"
single-instance-data-logging		string optional	Indicates if Single Instance Data Logging is enabled on the aggregate. This feature is supported only on Cloud ONTAP. Possible values : "on", "off" • "on" : Single Instance Data Logging enabled • "off" : Single Instance Data Logging disabled The default value is "off"

Element definition: **aggr-plex-info**

[top]

Information about the Plex

Name	Range	Type	Description
aggr-raidgroup-list		aggr-raidgroup-info[] optional	Information about the RAID Groups
plex-is-online		boolean optional	True if plex is online. Attributes: non-creatable, non-modifiable
plex-is-resyncing		boolean optional	True if plex is resyncing. Attributes: non-creatable, non-modifiable
plex-name		string optional	Name of the plex. Attributes: key, non-creatable, non-modifiable
plex-pool	**[0..1]**	integer optional	SyncMirror Pool associated with the plex. Attributes: non-creatable, non-modifiable

plex-resync-level	**[0..1]**	integer optional	If plex-is-resyncing is true, this field indicates the resync level of the plex. Attributes: non-creatable, non-modifiable
plex-resync-pct-with-precision		string optional	This field indicates percentage of resync that has completed, rounded down to two decimal places. Attributes: non-creatable, non-modifiable
plex-resync-percent	**[0..100]**	integer optional	This field indicates the percentage of resync that has completed. Attributes: non-creatable, non-modifiable
plex-status		string optional	Status of the plex. Attributes: non-creatable, non-modifiable

Element definition: **aggr-raid-attributes**

[top]

RAID specific information of the aggregate

Name	Range	Type	Description
aggregate-type		string optional	Type of aggregate. The possible values: • "hdd" - aggregate consists of only HDDs, • "hybrid" - aggregate consists of both HDDs and SSDs, • "lun" - aggregate consists of only array LUNs, • "ssd" - aggregate consists of only SSDs, • "vmdisk" - aggregate consists of only VMDISKs.
cache-raid-group-size	**[1..28]**	integer optional	Current maximum cache RAID group size of hybrid aggregate. RAID group size is the maximum number of disks that can be added to a RAID group. This information will only be returned for a hybrid aggregate i.e. whose "is-hybrid" field is set to true.
checksum-status		string optional	Checksum status. Possible values: "active", "initializing", "none", "off", "reinitialized", "reinitializing", "reverting", "unknown", "upgrading_phase1", "upgrading_phase2" This information will not be returned for a striped aggregate.
checksum-style		string optional	Checksum style. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block, • "mixed" - mixed, • "none" - none, • "unknown" - unknown • "wafl" - wafl, • "zoned" - zoned (this value is no longer supported).
disk-count	**[0..2^32-1]**	integer optional	Number of disks in the aggregate.
encrypt-with-aggr-key		boolean optional	If true, returns aggregates supporting encryption with NAE (NetApp Aggregate Encryption).
ha-policy		string optional	Aggregate's HA policy. Possible return values: "cfo", "sfo", "none"
has-local-root		boolean optional	Whether the aggregate contains the local root volume. This information will not be returned for a striped aggregate. Default value is false.
has-partner-root		boolean optional	Whether the aggregate contains the partner's root volume. This information will not be returned for a striped aggregate. Default value is false.
is-checksum-enabled		boolean optional	Is checksumming enabled for the aggregate? Default value is false.

is-composite		boolean optional	If true, aggregate currently contains two tiers of storage.
is-fabricpool-mirrored		boolean optional	If true, the aggregate has two external capacity tiers, which are mirrors, each containing a copy of the data.
is-hybrid		boolean optional	If true, aggregate currently contains both SSD and non-SSD RAID groups.
is-hybrid-enabled		boolean optional	If true, aggregate is eligible to contain both SSD and non-SSD RAID groups.
is-inconsistent		boolean optional	Whether or not the aggregate is inconsistent. Default value is false.
is-mirrored		boolean optional	If true, the aggregate is mirrored. Default value is false.
is-nve-capable		boolean optional	If true, the aggregate is capable of supporting NVE.
is-root-aggregate		boolean optional	Whether this is a root aggregate. Default value is false. This differs from has-local-root and has-partner-root by evaluating true when the aggregate may contain a root volume for any node. The has-local-root and has-partner-root fields only evaluate true when the aggregate contains the active root for the specified node. The is-root-aggregate field will still evaluate true for an offline root aggregate. The has-local-root and has-partner-root fields will evaluate false, since the aggregate has no mounted filesystem.
mirror-status		string optional	Aggregate's mirror status. Possible values: "invalid", "uninitialized", "needs CP count check", "CP count check in progress", "unmirrored", "mirrored", "mirror degraded, "mirror resynchronizing", "failed", "limbo" and . This information will not be returned for a striped aggregate.
mount-state		string optional	[not settable, always] This field shows the volume's mount state. Possible values: "creating", "destroying", "frozen", "inconsistent", "iron_restricted", "mounting", "online", "quiescing", "quiesced", "reverted", "unmounted", "unmounting" This information will not be returned for a striped aggregate.
plex-count	**[0..2^32-1]**	integer optional	Number of plexes in the aggregate. This value tells us the size of the returned "plex" array.
plexes		plex-attributes[] optional	List of plexes in the aggregate
raid-lost-write-state		string optional	State of the RAID Lost Write feature for an aggregate. The possible values are: • "aborted" - The RAID Lost Write scrub is no longer running and was aborted on all RAID groups in this aggregate, possibly due to an error. • "illegal" - The aggregate contains RAID groups with RAID Lost Write disabled and other RAID groups with RAID Lost Write enabled. This is an invalid state. • "inoperative" - The RAID Lost Write scrub is allowed on the aggregate, but it cannot start because the system-wide RAID Lost Write option "raid.lost_write.enable" is set to "off". • "off" - RAID Lost Write protection and scrub are disabled on this aggregate. • "on" - The aggregate is RAID Lost Write protected and that the RAID Lost Write scrub completed successfully on all RAID groups in this aggregate. • "partial" - The RAID Lost Write scrub completed successfully on some of the RAID groups in this aggregate, but was aborted on at least one of the RAID groups. • "unknown" - The RAID Lost Write scrub status could not be determined. • "upgrade_partial" - The RAID Lost Write scrub is still in progress on some of the RAID groups in this aggregate and was aborted on

			at least one of the RAID groups. • "upgrading" - The RAID Lost Write scrub is still not completed or not yet started on at least one of the RAID groups in this aggregate.
raid-size	**[0..2^32-1]**	integer optional	Current RAID group size. This information will not be returned for a striped aggregate.
raid-status		string optional	RAID status. Possible values: "copying", "degraded", "foreign", "growing", "hybrid", "hybrid_enabled", "initializing", "invalid", "ironing", "mirror degraded", "mixed_raid_type", "mirrored", "needs check", "normal", "noparity", "out-of-date", "parity uninit'd", "partial", "raid0", "raid4", "raid_dp", "raid_tec", "reconstruct", "resyncing", "verifying". These values may appear by themselves or in combination separated by commas (e.g., "mixed_raid_type, hybrid, normal"). For details on raid-type, refer description of element 'raid-type' below
raid-type		string optional	Possible values: • "raid0" - All the raid groups in the aggregate are of type raid0, • "raid4" - All the raid groups in the aggregate are of type raid4, • "raid_dp" - All the raid groups in the aggregate are of type raid_dp, • "raid_tec" - All the raid groups in the aggregate are of type raid_tec, • "mixed_raid_type" - This aggregate contains RAID groups of different RAID types (raid0, raid4, raid_dp, raid_tec).
state		string optional	Aggregate State Possible values: • "creating" , • "destroying" , • "failed" , • "frozen" , • "inconsistent" , • "iron_restricted" , • "mounting" , • "online" , • "offline" , • "partial" , • "quiesced" , • "quiescing" , • "restricted" , • "reverted" , • "unknown" , • "unmounted" , • "unmounting" , • "relocating"
uses-shared-disks		boolean optional	If true, aggregate is using shared disks.

Element definition: **aggr-snaplock-attributes**

[top]

Snaplock specific information of the aggregate

Name	Range	Type	Description
is-snaplock		boolean optional	Whether or not it's a SnapLock aggregate.

snaplock-type		string optional	The type of the snaplock aggregate. Possible values - "compliance" or "enterprise" or "non-snaplock"

Element definition: **aggr-snapmirror-attributes**

[top]

SnapMirror specific information of the aggregate

Name	Range	Type	Description
dp-snapmirror-destinations	**[0..2^31-1]**	integer optional	When present, this field indicates the number of data protection (dp) snapmirror destination volumes.
ls-snapmirror-destinations	**[0..2^31-1]**	integer optional	When present, this field indicates the number of load sharing (ls) snapmirror destination volumes.
mv-snapmirror-destinations	**[0..2^31-1]**	integer optional	When present, this field indicates the number of move snapmirror destination volumes that are created for volume move operations.

Element definition: **aggr-snapshot-attributes**

[top]

A structure returning consolidated size-related information for all snapshots of the given aggregate.

Name	Range	Type	Description
files-total	**[0..2^64-1]**	integer optional	[settable, online-only] Total file (inode) count, i.e., current maximum number of files (inodes) that this referenced file system can currently hold. If the referenced file system is restricted or offline, a value of 0 is returned.
files-used	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of files (inodes) used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
inofile-version	**[0..2^32-1]**	integer optional	[not settable, online-only] The inofile-version on the referenced file system. A value of 0 is returned if the referenced file system is restricted or offline.
is-snapshot-auto-create-enabled		boolean optional	This option determines if auto snapshot is enabled on the aggregate. Default value is true.
is-snapshot-auto-delete-enabled		boolean optional	This option determines if the snapshot auto delete is currently enabled for the aggregate. Default value is true.
maxfiles-available	**[0..2^64-1]**	integer optional	[not settable, always] The count of the maximum number of files allowable on the referenced file system.
maxfiles-possible	**[0..2^64-1]**	integer optional	[not settable, always] The largest value to which the maxfiles-available parameter can be increased by reconfiguration, on the referenced file system.
maxfiles-used	**[0..2^64-1]**	integer optional	[not settable, online-only] The count of the number of files currently in use on the referenced file system.
percent-inode-used-capacity	**[0..100]**	integer optional	[not settable, online-only] The percentage of disk space currently in use based on file (inode) count on the referenced file system.
percent-used-capacity	**[0..100]**	integer optional	[not settable, online-only] The percentage of disk space currently in use on the referenced file system.
size-available	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of bytes still available in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
	[0..2^64-	integer	[not settable, online-only] Total size (in bytes) of the referenced file

size-total	**1]**	optional	system. If the referenced file system is restricted or offline, a value 0 is returned.
size-used	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of bytes used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
snapshot-reserve-percent	**[0..100]**	integer optional	The percentage of aggregate disk space that has been set aside as reserve for snapshot usage. Default value is 0.

Element definition: **aggr-space-attributes**

[top]

A structure returning space-related information for a given aggregate's Active File System (AFS).

Name	Range	Type	Description
aggregate-metadata		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the aggregate-metadata field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]
capacity-tier-used		integer optional	This field represents total capacity tier physical used space in bytes in a composite aggregate. Range : [0..2^64-1]
data-compacted-count		integer optional	The total physical disk footprint of the compacted data blocks in the referenced file system. Range : [0..2^64-1]
data-compaction-space-saved		integer optional	The total disk space saved due to Data Compaction in the referenced file system. Range : [0..2^64-1]
data-compaction-space-saved-percent		integer optional	The percentage of the used space in the referenced file system that has been saved by Data Compaction. Range : [0..100]
hybrid-cache-size-total	**[0..2^64-1]**	integer optional	[not settable, online-only] Total cache size (in bytes) in a hybrid aggregate. If the referenced aggregate is restricted or offline, or if it is not a hybrid aggregate, a value of 0 is returned.
percent-used-capacity	**[0..100]**	integer optional	[not settable, online-only] The percentage of disk space currently in use on the referenced file system.
performance-tier-inactive-user-data		integer optional	The amount of inactive user data in bytes. Range : [0..2^64-1]
performance-tier-inactive-user-data-percent		integer optional	The percentage of the used space in the referenced file system that is inactive user data. Range : [0..100]
physical-used		integer optional	This field represents physical used space in bytes. This differs from 'total-used' space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies. Range : [0..2^64-1]
physical-used-percent		integer optional	This field represents physical used space in percent. Range : [0..2^64-1]
sis-shared-count		integer optional	The total physical disk footprint of the shared data blocks in the referenced file system achived by data compation and cross-volume inline deduplication. Range : [0..2^64-1]
sis-space-saved		integer optional	The total disk space saved due to Data Compaction and cross-volume inline deduplication in the referenced file system. Range : [0..2^64-1]
sis-space-saved-percent		integer optional	The percentage of the used space in the referenced file system that has been saved by Data Compaction and cross-volume inline deduplication. Range : [0..100]
			[not settable, online-only] Number of bytes still available in the

size-available	**[0..2^64-1]**	integer optional	referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
size-total	**[0..2^64-1]**	integer optional	[not settable, online-only] Total size (in bytes) of the referenced file system . If the referenced file system is restricted or offline, a value of 0 is returned.
size-used	**[0..2^64-1]**	integer optional	[not settable, online-only] Number of bytes used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned.
total-reserved-space	**[0..2^64-1]**	integer optional	[not settable, online-only] The total disk space in bytes that is reserved on the referenced file system. The reserved space is already counted in the used space, so this element can be used to see what portion of the used space represents space reserved for future use.
used-including-snapshot-reserve		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the used-including-snapshot-reserve field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]
volume-footprints		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the volume-footprints field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]

Element definition: **aggr-striping-attributes**

[top]

Striping specific information of a striped aggregate This information will not be returned for the not-striped aggregate.

Name	Range	Type	Description
member-count	**[0..2^32-1]**	integer optional	Number of members in a striped aggregate.

Element definition: **aggr-volume-count-attributes**

[top]

WAFL volume count specific information of the aggregate

Name	Range	Type	Description
flexvol-count	**[0..2^31-1]**	integer	Number of volumes in the aggregate.
flexvol-count-collective	**[0..2^31-1]**	integer optional	Number of striped volume constituents in the aggregate which also represent a collective striped volume. This field is for internal use only.
flexvol-count-not-online	**[0..2^31-1]**	integer optional	When present, this field indicates the number of volumes that are not online (offline and restricted volumes).
flexvol-count-quiesced	**[0..2^31-1]**	integer optional	When present, this field indicates the number of quiesced online volumes.
flexvol-count-striped	**[0..2^31-1]**	integer optional	Number of striped volume constituents in the aggregate. These volumes are also reported in the full volume-count value. This field is for internal use only.

Element definition: **aggr-wafliron-attributes**

[top]

WAFL-iron specific information of the aggregate

Name	Range	Type	Description
last-start-errno		integer optional	The error code of the last attempt to start wafliron on the specific aggregate. This field is present only if 'wafliron start' was previously attempted.
last-start-error-info		string optional	The error information of the last attempt to start wafliron on the specific aggregate. This field is present only if 'wafliron start' was previously attempted.
scan-percentage	**[0..100]**	integer optional	When present, this field indicates the percentage of blocks that have been scanned in the specified aggregate. This field is present only when wafliron is running and its state is "starting" or "scanning".
state		string optional	When wafliron is run, it goes through different stages/states. This field indicates the current state of wafliron on the specified aggregate. Possible values are: "aborting" - wafliron is aborting. "checking_lost_blocks" - wafliron is checking for lost blocks. "checking_lost_inodes" - wafliron is checking link counts. "finishing" - wafliron is cleaning up. "not_running" - wafliron is not running on this aggregate. "scanning" - wafliron is scanning inodes, and/or fixing file system inconsistencies. "starting" - wafliron is starting, allocating, and/or in the initial mounting phase. "unknown" - wafliron state could not be determined.
summary-scan-percentage	**[-1..100]**	integer optional	When present and the value is other than -1, this field indicates the percentage of summary blocks that have been scanned in the specified aggregate. This field is present only when wafliron is running and its state is "starting" or "scanning".

Element definition: **aggr-wafliron-info**

[top]

Information related to wafliron, the online WAFL file system check/repair tool.

Name	Range	Type	Description
last-start-errno		integer optional	The error code of the last attempt to start wafliron on the specific aggregate. This field is present only if 'wafliron start' was previously attempted.
last-start-error-info		string optional	The error information of the last attempt to start wafliron on the specific aggregate. This field is present only if 'wafliron start' was previously attempted.
scan-percentage		integer optional	When present, this field indicates the percentage of blocks that have been scanned in the specified aggregate. This field is present only when wafliron is running and its state is "starting" or "scanning". Range: [0..100]
			When wafliron is run, it goes through different stages/states. This field indicates the current state of wafliron on the specified aggregate.

state		string	Possible values are: "waiting_for_commit" - wafliron is finished on this volume but waiting for the changes to be committed or rejected. "not_running" - wafliron is not running on this aggregate. "starting" - wafliron is starting, allocating, and/or in the initial mounting phase. "scanning" - wafliron is scanning inodes, and/or fixing file system inconsistencies. "checking_lost_blocks" - wafliron is checking for lost blocks. "checking_lost_inodes" - wafliron is checking link counts. "finishing" - wafliron is cleaning up. "aborting" - wafliron is aborting. "unknown" - wafliron state could not be determined.
summary-scan-percentage		integer optional	When present and the value is other than -1, this field indicates the percentage of summary blocks that have been scanned in the specified aggregate. This field is present only when wafliron is running and its state is "starting" or "scanning". Range: [-1..100]

Element definition: **aggregate-space-info**

[top]

A set of two structures returning size-related information for a given aggregate and its set of snapshots.

Name	Range	Type	Description
aggregate-space		fs-space-info	[not settable, online-only] A structure returning size-related information for a given aggregate.
snapshot-space		snapshot-space-info	[not settable, online-only] A structure returning size-related information for a set of snapshots of the given aggregate.

Element definition: **checksum-style**

[top]

Checksum style of the aggregate.

The following are the possible values for checksum type and their meanings.

- 'none' - The data written to the aggregate is not protected by checksum.
- 'block' - Every block of data block has checksum written in the same block.
- 'azcs' - Disk is divided into zones of N blocks and the checksum is written in the middle of zone.
- 'wafl' - The checksum information is maintained in the filesystem layer.
- 'mixed' - This means we have both 'block' and 'zone' checksum styles.
- 'unknown' - The checksum style is unknown.

[none]

[top]

Element definition: **contained-volume-info**

Information about a volume contained in the aggregate.

Name	Range	Type	Description
name		string	Volume name.
vserver		string optional	Name of the vserver to which this volume belongs. This field is returned only when the request is sent to the Admin Vserver LIF.

Element definition: **datetime**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

[none]

Element definition: **disk-name**

[top]

Disk path name

[none]

Element definition: **disk-position-type**

[top]

Disk position type of the aggregate.

The following are the possible values for disk position type of the aggregate and their meanings.

- 'copy' - The disk serves as the destination for sick disk copy.
- 'data' - The disk serves as a data disk in the aggregate.
- 'dparity' - The disk serves as a double parity disk.
- 'tparity' - The disk serves as a triple parity disk.
- 'orphan' - The disk is in the process of being removed from the aggregate.
- 'parity' - The disk serves as a single parity disk.
- 'pending' - The disk is in the process of being added to a RAID group or is in the process of being reconstructed or sick disk copy.
- 'present' - The disk is part of a RAID group in an aggregate.
- 'shared' - The disk is being used as a shared disk.

[none]

Element definition: **disktype**

[top]

ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD Possible values:

- "ata" - Advanced Technology Attachment,

- "bsas" - Bridged Serial Attached SCSI (bridged from SATA),
- "fcal" - Fibre Channel Arbitrated Loop,
- "fsas" - High-Capacity (Fat) Serial Attached SCSI,
- "lun" - SCSI Logical Unit Number (e.g. Array),
- "msata" - Multiple bridged SATA disks in a single carrier,
- "sas" - Serial Attached SCSI,
- "ssd" - Solid-State Disk,
- "vmdisk" - Hypervisor Virtual Disk,
- "ssd_nvm" - Non-Volatile Memory Express Solid-State Disk,
- "ssd_dc" - Data Center based Non-Volatile Memory Express Solid-State Disk,
- "ssd_cap" - High Capacity Solid-State Disk,
- "vmlun" - Hypervisor Virtual LUN,
- "vmlun_ssd" - Hypervisor Virtual SSD LUN,
- "ssd_zns" - Software Defined based Non-Volatile Memory Express Solid-State Disk

[none]

Element definition: **mirror-count-info**

[top]

Various counts information for mirror volumes in the aggregate. This information is returned only when the aggregate contains mirror volumes. Currently, Vfiler owned mirror destination volumes are counted only if those volumes are online.

Name	Range	Type	Description
dp-qtree-snapmirror-destinations		integer optional	When present, this field indicates the number of data protection (dp) qtree snapmirror destination volumes. Range: [0..2^31-1]
dp-snapmirror-destinations		integer optional	When present, this field indicates the number of data protection (dp) snapmirror destination volumes. Range: [0..2^31-1]
ls-snapmirror-destinations		integer optional	When present, this field indicates the number of load sharing (ls) snapmirror destination volumes. Range: [0..2^31-1]
move-snapmirror-destinations		integer optional	When present, this field indicates the number of move snapmirror destination volumes that are created for volume move operations. Range: [0..2^31-1]

Element definition: **plex-info**

[top]

Information for a plex.

Name	Range	Type	Description
is-online		boolean	"true" if the plex is online, "false" otherwise.
is-resyncing		boolean	"true" if the plex is currently resyncing, "false" otherwise.
name		string	Plex name, e.g. /myvol/plex0
plex-resync-		string	If the plex is currently being resynced, then the completion percentage floored

pct-with-precision		optional	to two decimal places. (e.g. "13.12")
plex-status		string optional	Plex status. Possible values: "normal", "failed", "empty", "invalid", "uninitialized", "failed assimilation", "limbo", "active", "inactive", "resyncing", These values may appear by themselves or in combination separated by commas (e.g., "normal,active")
pool	**[0..1]**	integer optional	The pool to which the majority of disks in the plex belong.
raid-groups		raid-group-info[] optional	List of all RAID groups in the plex. This appears only if the "verbose" parameter above is set to "true".
resync-level	**[0..1]**	integer optional	If the plex is currently being resynced, then the resync level.
resyncing-percentage		integer optional	If the plex is currently being resynced, then the completion percentage. Range : [0..100].

Element definition: **raid-type**

[top]

Raid type of the aggregate.

The following are the possible values for RAID type and their meanings.

- 'raid_tec' - The aggregate is composed of RAID groups that can handle triple disk failures (Triple Erasure Code).
- 'raid_dp' - The aggregate is composed of RAID groups that can handle double disk failures (double parity).
- 'raid4' - The aggregate is composed of RAID groups that can can handle a single non-SSD-ZNS disk failure (single parity).
- 'raid_ep' - The aggregate is composed of RAID groups that can can handle a single SSD-ZNS disk failure (single parity) and one or more block failures inside each SSD-ZNS disk.
- 'raid0' - The aggregate does not have parity protection.
- 'mixed_raid_type' - Cache tier in the aggregate has a different RAID type from the capacity tier.

[none]

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **standarddisktype**

[top]

SATA | FC | NL-SAS | LUN | SAS | SCSI | SSD | VM-DISK | NVMe-SSD | SSD-CAP | SSD-ZNS | VM-LUN | VM-LUN-SSDS Possible values:

- "sata" - SATA, Serial Advanced Technology Attachment,
- "fc" - FC, Fibre Channel,
- "nl_sas" - NL-SAS, Near Line SAS,

"lun" - LUN, SCSI Logical Unit Number (e.g. Array),
- "sas" - SAS, Serial Attached SCSI,
- "scsi" - SCSI, Small Computer System Interface,
- "ssd" - SSD, Solid-State Disk,
- "vm_disk" - VM Disk, Hypervisor Virtual Disk,
- "unknown" - Unknown Disk Type,
- "nvme_ssd" - NVMe SSD, Non-Volatile Memory Express Solid-State Disk,
- "ssd_dc" - DC SSD, Data Center Non-Volatile Memory Express Solid-State Disk,
- "ssd_cap" - CAP SSD, High Capacity Solid-State Disk,
- "vm_lun" - VM LUN, Hypervisor Virtual LUN,
- "vm_lun_ssd" - VM SSD LUN, Hypervisor Virtual SSD LUN,
- "ssd_zns" - SDF SSD, Non-Volatile Memory Express Solid-State Disk

[none]

Element definition: **volume-space-info**

[top]

List of flexible volumes in the aggregate and their space usage.

Name	Range	Type	Description
guarantee		string	Type of guarantee option set on this volume. Possible values: none, file, volume
volume-allocated		integer	Total space allocated for this volume in the aggregate. Range : [0..2^64-1]
volume-name		string	Name of the volume
volume-used		integer	Total space used by this volume. Range : [0..2^64-1]

Element definition: **aggr-64bit-upgrade-check-info**

[top]

Information returned when upgrade-64bit-mode in aggr-add or aggr-64bit-upgrade-start is "check".

Name	Range	Type	Description
added-space		integer optional	The effective total space to be added (in bytes), not including blocks used by the 64-bit upgrade of the aggregate and its contained flexible volumes. Range: [0..2^64-1].
cookie		integer optional	The opaque cookie to uniquely identify a 64-bit upgrade transaction previously triggered on the aggregate. Range: [0..2^64-1].
last-errno		integer optional	The error code of the last attempt to check for space usage on the specific aggregate. This field is present only if a 64-bit upgrade check was previously attempted. Possible values: 0 - indicates success EVOLUME_64BIT_UPGRADE_KIREETI_NOT_AVAIL Per-volume upgrade check results may be out of date if last-errno is not 0.
space-estimate-complete		boolean optional	True if the space estimate has completed. Check "last-errno" to find out whether the space estimate was successful.

Element definition: **aggr-64bit-upgrade-start-info**

[top]

Information returned when upgrade-64bit-mode in aggr-add or aggr-64bit-upgrade-start is "grow_all", "grow_none", or "grow_reserved".

Name	Range	Type	Description
last-errno		integer optional	The error code of the last attempt to start 64-bit upgrade on the specific aggregate. This field is present only if 64-bit upgrade was previously attempted. Possible values include: EAGGR_64BIT_UPGRADE_ENOSPC EOP_DISALLOWED_ON_AGGR_WITH_SPARSE_VOL EVOLUME_64BIT_UPGRADE_VVOL_ENOSPC EVOLUME_64BIT_UPGRADE_VVOL_ENOSPC_OVERWRITE EVOLUME_64BIT_UPGRADE_KIREETI_NOT_AVAIL EVOLUME_64BIT_UPGRADE_PREQUAL_NOT_AVAIL EVOLUME_IRON_NON_LOCAL_STATUS
min-space-for-upgrade		integer optional	The minimum additional disk space (in bytes) required to trigger 64-bit upgrade. This field is present when the specified disks do not have sufficient space to upgrade the aggregate and its contained flexible volumes to 64-bit. Range: [0..2^64-1].

Element definition: **aggr-64bit-upgrade-status-info**

[top]

Status information related to 64-bit upgrade. This information includes the block format of the aggregate and the progress of the 64-bit upgrade scanner.

Name	Range	Type	Description
block-format		string	The block format of the aggregate. Can be "32_bit", "64_bit", or "upgrading".
fbn-progress		integer optional	The most recent fbn the 64-bit upgrade scanner is working on. Valid only when the aggregate block format is "upgrading". Range: [0..2^32-1].
inode-progress		integer optional	The most recent inode the 64-bit upgrade scanner is working on. Valid only when the aggregate block format is "upgrading". Value -1 indicates inofile is being scanned. Range: [-1..2^32-2].
percent-complete		integer optional	Estimated percentage of how much of the filesystem has completed the 64-bit upgrade. Valid only when the aggregate block format is "upgrading". Range: [0..100].
scanner-status		string optional	The status of the 64-bit upgrade scanner. Can be "running" or "stopped" if the aggregate block format is "upgrading". Otherwise, no value is returned.
space-progress		string optional	The inode space of the most recent inode the 64-bit upgrade scanner is working on. Can be "public" or "private". Valid only when the aggregate block format is "upgrading".
time-estimate		integer optional	Estimated time to completion of the 64-bit upgrade in seconds. Valid only when the aggregate block format is "upgrading" and scanner status is "running". Value -1 indicates that time estimate is not available. Range: [-1..(2^32-1)/10].
total-inodes		integer optional	The total number of inodes in the file system. Valid only when the aggregate block format is "upgrading". Range: [0..2^32-1].

Element definition: **aggr-check-attributes**

[top]

Information returned when upgrade-64bit-mode in aggr-add API is "check".

Name	Range	Type	Description
added-		integer	The effective total space that would be added (in bytes) to the aggregate. This would not include the blocks used by the 64-bit upgrade of the aggregate and its

space		optional	contained flexible volumes. Range: [0..2^64-1].
check-last-errno		integer optional	The error code of the last attempt to check for space usage on the specific aggregate. This field is present only if a previous 64-bit upgrade check failed. Possible values: 0 - indicates success EVOLUME_64BIT_UPGRADE_KIREETI_NOT_AVAIL Per-volume upgrade check results may be out of date if last-errno is not 0.
cookie		integer optional	The opaque cookie to uniquely identify a 64-bit upgrade transaction previously triggered on the aggregate using aggr-add API. Range: [0..2^64-1].
is-space-estimate-complete		boolean optional	True if the space estimate has completed. Check "check-last-errno" to find out whether the space estimate was successful.

Element definition: **aggr-raidgroup-info**

[top]

Information about the RAID Groups

Name	Range	Type	Description
aggr-disk-list		aggr-disk-info[] optional	Information about the disks
aggr-raidgroup-entity-list		aggr-raidgroup-entity-info[] optional	Information about the individual RAID Groups
storage-pool		string optional	Name of the Storage Pool. Attributes: non-creatable, non-modifiable

Element definition: **aggr-start-attributes**

[top]

Information returned when upgrade-64bit-mode in aggr-add API is "grow_all", "grow_none", or "grow_reserved".

Name	Range	Type	Description
min-space-for-upgrade		integer optional	The minimum additional disk space (in bytes) required to trigger 64-bit upgrade. This field is present when the specified disks do not have sufficient space to upgrade the aggregate and its contained flexible volumes to 64-bit. Range: [0..2^64-1].
start-last-errno		integer optional	The error code of the last attempt to start 64-bit upgrade on the specific aggregate. This field is present only if a previous 64-bit upgrade failed. Possible values include: EAGGR_64BIT_UPGRADE_ENOSPC EVOLUME_64BIT_UPGRADE_VVOL_ENOSPC EVOLUME_64BIT_UPGRADE_VVOL_ENOSPC_OVERWRITE EVOLUME_64BIT_UPGRADE_KIREETI_NOT_AVAIL EVOLUME_64BIT_UPGRADE_PREQUAL_NOT_AVAIL

Element definition: **aggr-status-attributes**

[top]

Status information related to 64-bit upgrade. This information includes whether the 64-bit upgrade is in progress.

Name	Range	Type	Description

is-64-bit-upgrade-in-progress		boolean optional	True if the 64-bit upgrade is in progress.

Element definition: **fs-space-info**

[top]

A structure returning size-related information for a given aggregate.

Name	Range	Type	Description
fs-aggregate-metadata		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the aggregate-metadata field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]
fs-capacity-tier-used		integer optional	This field represents total capacity tier physical used space in bytes in a composite aggregate. Range : [0..2^64-1]
fs-files-private-used		integer	[not settable, online-only] Number of system (not user-visible) files (inodes) used. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
fs-files-total		integer	[settable, online-only] Total user-visible file (inode) count, i.e., maximum number of user-visible files (inodes) that this referenced file system can currently hold. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
fs-files-used		integer	[not settable, online-only] Number of user-visible files (inodes) used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
fs-hybrid-cache-size-total		integer optional	[not settable, online-only] Total cache size (in bytes) in a hybrid aggregate. If the referenced aggregate is restricted or offline, or if it is not a hybrid aggregate, a value of 0 is returned. Range: [0 - 2^64-1]
fs-hybrid-cache-size-used		integer optional	[not settable, online-only] Used cache size (in bytes) in a hybrid aggregate. If the referenced aggregate is restricted or offline, or if it is not a hybrid aggregate, a value of 0 is returned. Range: [0 - 2^64-1]
fs-inodefile-private-capacity		integer	[not settable, online-only] Number of inodes that can currently be stored on disk for system (not user-visible) files. This number will dynamically increase as more system files are created. Range: [0 - 2^64-1]
fs-inodefile-public-capacity		integer	[not settable, online-only] Number of inodes that can currently be stored on disk for user-visible files. This number will dynamically increase as more user-visible files are created. Range: [0 - 2^64-1]
fs-maxfiles-available		integer	[not settable, always] The count of the maximum number of user-visible files currently allowable on the referenced file system. Range: [0 - 2^64-1]
fs-maxfiles-possible		integer	[not settable, always] The largest value to which the fs-maxfiles-available parameter can be increased by reconfiguration, on the referenced file system. Range: [0 - 2^64-1] Range: [0 - 2^64-1]
fs-maxfiles-used		integer	[not settable, online-only] The number of user-visible files currently in use on the referenced file system. Range: [0 - 2^64-1]
fs-percent-inode-used-capacity		integer	[not settable, online-only] The percentage of disk space currently in use based on user-visible file (inode) count on the referenced file system. Range: [0..100]
fs-percent-used-capacity		integer	[not settable, online-only] The percentage of disk space currently in use on the referenced file system. Range: [0..100]

fs-perf-tier-capacity-tier-used		integer optional	This field represents total capacity tier physical used space in bytes in a composite aggregate. Range : [0..2^64-1]
fs-physical-used		integer optional	This field represents physical used space in bytes. This differs from 'total-used' space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies. Range : [0..2^64-1]
fs-sis-percent-saved		integer	[not settable, online-only] The percentage of disk space saved by eliminating the duplicated blocks on the referenced file system. Range: [0..100]
fs-sis-saved-space		integer	[not settable, online-only] The total disk space in bytes that is saved by storing only one copy of the duplicated blocks on the referenced file system. Range: [0 - 2^64-1]
fs-sis-shared-space		integer	[not settable, online-only] The amount of data in bytes that is shared by more than one instance on the referenced file system. Range: [0 - 2^64-1]
fs-size-available		integer optional	[not settable, online-only] Number of bytes still available in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
fs-size-total		integer optional	[not settable, online-only] Total size (in bytes) of the referenced file system . If the referenced file system is restricted or offline, a value 0 is returned. Range: [0 - 2^64-1]
fs-size-used		integer optional	[not settable, online-only] Number of bytes used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
fs-total-reserved-space		integer optional	[not settable, online-only]The total disk space in bytes that is reserved on the referenced file system. The reserved space is already counted in the used space, so this element can be used to see what portion of the used space represents space reserved for future use. Range: [0 - 2^64-1]
fs-used-including-snapshot-reserve		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the used-including-snapshot-reserve field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]
fs-volume-footprints		integer optional	This field is deprecated in Data ONTAP 8.3 and later. Use the volume-footprints field of aggr-space-get-iter instead. This field always returns 0. Range : [0..2^64-1]

Element definition: **plex-attributes**

[top]

Information about a plex.

Name	Range	Type	Description
is-online		boolean optional	"true" if the plex is online, "false" otherwise.
is-resyncing		boolean optional	"true" if the plex is currently resyncing, "false" otherwise.
plex-name		string optional	Name of the plex.
plex-resync-pct-with-precision		string optional	If the plex is currently being resynced, then the completion percentage floored to two decimal places. (e.g. "13.12")
plex-status		string optional	Plex status. Possible values: "normal", "failed", "empty", "invalid", "uninitialized", "failed assimilation", "limbo", "active", "inactive", "resyncing", These values may appear by themselves or in combination

			separated by commas (e.g., "normal,active")
pool	**[0..1]**	integer optional	The pool to which the majority of disks in the plex belong.
raidgroups		raidgroup-attributes[] optional	List of all RAID groups in the plex.
resync-level	**[0..1]**	integer optional	If the plex is currently being resynced, then the resync level.
resyncing-percentage	**[0..100]**	integer optional	If the plex is currently being resynced, then the completion percentage.

Element definition: **raid-group-info**

[top]

Information for a particular RAID group.

Name	Range	Type	Description
checksum-style		string	Checksum style. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block, • "mixed" - mixed, • "none" - none, • "unknown" - unknown, • "wafl" - wafl, • "zoned" - zoned (this value is no longer supported).
cluster-disk-names		disk-info[] optional	List of disks in this plex by their spatial names, if available.
disks		disk-info[]	List of disks in this plex.
is-cache-tier		boolean	"true" if the RAID group is composed of SSDs and the owning aggregate is hybrid (group is not part of usable space).
is-recomputing-parity		boolean	"true" if the RAID group is currently recomputing parity.
is-reconstructing		boolean	"true" if the RAID group is currently reconstructing.
is-scrub-suspended		boolean optional	Suspended state of the scrub on that RAID group.
last-scrub-timestamp		integer optional	Time at which the last full scrub completed. If a scrub has never been performed, this value will not be returned. The time value is in seconds since January 1, 1970. Range : [0..2^31-1].
name		string	RAID group name.
recomputing-parity-percentage		integer optional	The percentage of parity recomputation if is-recomputing-parity is set to true. Range : [0-100]
reconstruction-percentage		integer optional	If reconstruction is going on, the the completion percentage. Range : [0-100]
scrub-percentage-complete		integer optional	Scrub percentage complete. If scrub is not active, this value will not be returned. Range: [0..100].

Element definition: **snapshot-space-info**

[top]

A structure returning consolidated size-related information for all snapshots of the given volume.

Name	Range	Type	Description
snapshot-files-total		integer	[settable, online-only] Total file (inode) count, i.e., current maximum number of files (inodes) that this referenced file system can currently hold. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
snapshot-files-used		integer	[not settable, online-only] Number of files (inodes) used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
snapshot-maxfiles-available		integer	[not settable, always] The count of the maximum number of files allowable on the referenced file system. Range: [0 - 2^64-1]
snapshot-maxfiles-possible		integer	[not settable, always] The largest value to which the maxfiles-available parameter can be increased by reconfiguration, on the referenced file system. Range: [0 - 2^64-1]
snapshot-maxfiles-used		integer	[not settable, online-only] The count of the number of files currently in use on the referenced file system. Range: [0 - 2^64-1]
snapshot-percent-inode-used-capacity		integer	[not settable, online-only] The percentage of disk space currently in use based on file (inode) count on the referenced file system. Range: [0..100]
snapshot-percent-used-capacity		integer	[not settable, online-only] The percentage of disk space currently in use on the referenced file system. Range: [0..100]
snapshot-sis-percent-saved		integer	[not settable, online-only] The percentage of disk space saved by eliminating the duplicated blocks on the referenced file system. Range: [0..100]
snapshot-sis-saved-space		integer	[not settable, online-only] The total disk space in bytes that is saved by storing only one copy of the duplicated blocks on the referenced file system. Range: [0 - 2^64-1]
snapshot-sis-shared-space		integer	[not settable, online-only] The amount of data in bytes that is shared by more than one instance on the referenced file system. Range: [0 - 2^64-1]
snapshot-size-available		integer optional	[not settable, online-only] Number of bytes still available in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]
snapshot-size-total		integer optional	[not settable, online-only] Total size (in bytes) of the referenced file system. If the referenced file system is restricted or offline, a value 0 is returned. Range: [0 - 2^64-1]
snapshot-size-used		integer optional	[not settable, online-only] Number of bytes used in the referenced file system. If the referenced file system is restricted or offline, a value of 0 is returned. Range: [0 - 2^64-1]

Element definition: **aggr-disk-info**

[top]

Information about the disks

Name	Range	Type	Description
copy-percent	**[0..100]**	integer optional	This field indicates the percentage of copying that has completed. Attributes: non-creatable, non-modifiable

disk		disk-name optional	Name of the disk. Attributes: key, non-creatable, non-modifiable
disk-rpm	**[0..2^32-1]**	integer optional	Rotational speed in revolutions per minute. Possible values are: 5400, 7200, 10000, and 15000. Omitted if information is unavailable, or if the rpm does not apply to this 'disk-type'. Attributes: non-creatable, non-modifiable
disk-type		string optional	Disk interface type. Attributes: non-creatable, non-modifiable
effective-disk-rpm	**[0..2^32-1]**	integer optional	Effective rotational speed in revolutions per minute. Disks can report different actual 'rpm', but have the same 'effective-disk-rpm'. Disks with the same 'effective-disk-rpm' are compatible for use within the same aggregate. Omitted if information is unavailable, or excluded by 'desired-attributes'. Attributes: non-creatable, non-modifiable
effective-disk-type		string optional	Effective disk interface type. Disk can report different physical 'disk-type', but the same 'effective-disk-type'. Disk with the same 'effective-disk-type' are compatible for use within the same aggregate. Attributes: non-creatable, non-modifiable
is-cache		boolean optional	True if the disk is being used as cache. Attributes: non-creatable, non-modifiable
is-evacuating		boolean optional	True if the disk is being evacuated. Attributes: non-creatable, non-modifiable
is-failed		boolean optional	True if the disk is marked as failed. Attributes: non-creatable, non-modifiable
is-offline		boolean optional	True if the disk is marked as offline. Attributes: non-creatable, non-modifiable
is-recons-active		boolean optional	True if reconstruction is active on this disk. Attributes: non-creatable, non-modifiable
is-replacing		boolean optional	True if the disk is being replaced. Attributes: non-creatable, non-modifiable
is-sdc-active		boolean optional	True if the sick disk copy is active. Attributes: non-creatable, non-modifiable
is-sick		boolean optional	True if the disk is marked as sick. Attributes: non-creatable, non-modifiable
physical-size		size optional	Total raw capacity of this disk in bytes. Attributes: non-creatable, non-modifiable
position		disk-position-type optional	Position of the disk within aggregate. Attributes: non-creatable, non-modifiable
reconstruction-percent	**[0..100]**	integer optional	This field indicates the percentage of reconstruction that has completed. Attributes: non-creatable, non-modifiable
standard-disk-type		standarddisktype optional	Industry standard disk type. Attributes: non-creatable, non-modifiable Possible values: • "sata" - SATA, Serial Advanced Technology Attachment, • "fc" - FC, Fibre Channel, • "nl_sas" - NL-SAS, Near Line SAS, • "lun" - LUN, SCSI Logical Unit Number (e.g. Array), • "sas" - SAS, Serial Attached SCSI, • "scsi" - SCSI, Small Computer System Interface, • "ssd" - SSD, Solid-State Disk, • "vm_disk" - VM Disk, Hypervisor Virtual Disk, • "unknown" - Unknown Disk Type, • "nvme_ssd" - NVMe SSD, Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - DC SSD, Data Center Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - CAP SSD, High Capacity Solid-State Disk, • "vm_lun" - VM LUN, Hypervisor Virtual LUN, • "vm_lun_ssd" - VM SSD LUN, Hypervisor Virtual SSD

			LUN, • "ssd_zns" - SDF SSD, Non-Volatile Memory Express Solid-State Disk
syncmirror-pool		string optional	SyncMirror Pool to which disk is assigned. Attributes: non-creatable, non-modifiable
usable-size		size optional	Total usable capacity of this disk in bytes. Attributes: non-creatable, non-modifiable

Element definition: **aggr-raidgroup-entity-info**

[top]

Information about the individual RAID Groups

Name	Range	Type	Description
is-rg-recomputing-parity		boolean optional	True if the RAID Group is recomputing parity. Attributes: non-creatable, non-modifiable
is-rg-reconstructing		boolean optional	True if the RAID Group is reconstructing. Attributes: non-creatable, non-modifiable
is-scrub-active		boolean optional	This field indicates if scrub is currently active. Attributes: non-creatable, non-modifiable
raidgroup		string optional	Name of the Raid Group. Attributes: key, non-creatable, non-modifiable
rg-cksumstyle		checksum-style optional	Checksum Style of RAID Group. Attributes: non-creatable, non-modifiable
rg-raidtype		raid-type optional	RAID Type of RAID Group. Attributes: non-creatable, non-modifiable
rg-recons-percent	**[0..100]**	integer optional	This field indicates the percentage of reconstruction that has completed. Attributes: non-creatable, non-modifiable
rg-reparity-percent	**[0..100]**	integer optional	This field indicates the percentage of parity recomputation that has completed. Attributes: non-creatable, non-modifiable
rg-status		string optional	Status of the RAID Group. Attributes: non-creatable, non-modifiable
scrub-percent-complete	**[0..100]**	integer optional	This field indicates the percentage of scrubbing that has completed. Attributes: non-creatable, non-modifiable

Element definition: **checksum-style**

[top]

Checksum style of the aggregate.

The following are the possible values for checksum type and their meanings.

- 'none' - The data written to the aggregate is not protected by checksum.
- 'block' - Every block of data block has checksum written in the same block.
- 'azcs' - Disk is divided into zones of N blocks and the checksum is written in the middle of zone.
- 'wafl' - The checksum information is maintained in the filesystem layer.
- 'mixed' - This means we have both 'block' and 'zone' checksum styles.
- 'unknown' - The checksum style is unknown.

[none]

Element definition: **disk-info**

[top]

Information for each disk in the plex.

Name	Range	Type	Description
name		string	Name of a member disk.
vbn-end	**[0..2^64-1].**	integer optional	VBN end value of a disk.
vbn-start	**[0..2^64-1].**	integer optional	VBN start value of a disk.

Element definition: **disk-name**

[top]

Disk path name

[none]

Element definition: **disk-position-type**

[top]

Disk position type of the aggregate.

The following are the possible values for disk position type of the aggregate and their meanings.

- 'copy' - The disk serves as the destination for sick disk copy.
- 'data' - The disk serves as a data disk in the aggregate.
- 'dparity' - The disk serves as a double parity disk.
- 'tparity' - The disk serves as a triple parity disk.
- 'orphan' - The disk is in the process of being removed from the aggregate.
- 'parity' - The disk serves as a single parity disk.
- 'pending' - The disk is in the process of being added to a RAID group or is in the process of being reconstructed or sick disk copy.
- 'present' - The disk is part of a RAID group in an aggregate.
- 'shared' - The disk is being used as a shared disk.

[none]

Element definition: **raid-type**

[top]

Raid type of the aggregate.

The following are the possible values for RAID type and their meanings.

- 'raid_tec' - The aggregate is composed of RAID groups that can handle triple disk failures (Triple Erasure Code).
- 'raid_dp' - The aggregate is composed of RAID groups that can handle double disk failures (double parity).
- 'raid4' - The aggregate is composed of RAID groups that can can handle a single non-SSD-ZNS disk

failure (single parity).
- 'raid_ep' - The aggregate is composed of RAID groups that can can handle a single SSD-ZNS disk failure (single parity) and one or more block failures inside each SSD-ZNS disk.
- 'raid0' - The aggregate does not have parity protection.
- 'mixed_raid_type' - Cache tier in the aggregate has a different RAID type from the capacity tier.

[none]

Element definition: **raidgroup-attributes**

[top]

Information about a raidgroup.

Name	Range	Type	Description
checksum-style		string optional	Checksum style for the RAID group. The possible values are: • "none" • "block" • "wafl" • "unknown" • "advanced_zoned"
is-cache-tier		boolean optional	"true" if the RAID group is composed of SSDs and the owning aggregate is hybrid (group is not part of usable space).
is-recomputing-parity		boolean optional	"True" if the RAID group is currently recomputing parity.
is-reconstructing		boolean optional	"true" if the RAID group is currently reconstructing.
raidgroup-name		string optional	Name of the RAID group.
recomputing-parity-percentage		integer optional	The percentage of parity recomputation completed, if is-recomputing-parity is true. Range : [0-100]
reconstruction-percentage	**[0..100]**	integer optional	If reconstruction is going on, then the completion percentage.

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **standarddisktype**

[top]

SATA | FC | NL-SAS | LUN | SAS | SCSI | SSD | VM-DISK | NVMe-SSD | SSD-CAP | SSD-ZNS | VM-LUN | VM-LUN-SSDS Possible values:

- "sata" - SATA, Serial Advanced Technology Attachment,
- "fc" - FC, Fibre Channel,
- "nl_sas" - NL-SAS, Near Line SAS,
- "lun" - LUN, SCSI Logical Unit Number (e.g. Array),
- "sas" - SAS, Serial Attached SCSI,

- "scsi" - SCSI, Small Computer System Interface,
- "ssd" - SSD, Solid-State Disk,
- "vm_disk" - VM Disk, Hypervisor Virtual Disk,
- "unknown" - Unknown Disk Type,
- "nvme_ssd" - NVMe SSD, Non-Volatile Memory Express Solid-State Disk,
- "ssd_dc" - DC SSD, Data Center Non-Volatile Memory Express Solid-State Disk,
- "ssd_cap" - CAP SSD, High Capacity Solid-State Disk,
- "vm_lun" - VM LUN, Hypervisor Virtual LUN,
- "vm_lun_ssd" - VM SSD LUN, Hypervisor Virtual SSD LUN,
- "ssd_zns" - SDF SSD, Non-Volatile Memory Express Solid-State Disk

[none]

APIs in Category: **audit**

audit-log-config-get
audit-log-config-modify
audit-log-get
audit-log-get-iter

APIs for managing administrative audit settings for the cluster. Audit logging can be enabled/disabled separately for 'get' (read-only) requests, for each of the following access modes: CLI (Command-Line Interface), SNMP, HTTP, and the Data ONTAP API (ONTAPI, ZAPI). The state of these flags is represented via the audit-info typedef.

audit-log-config-get

[top]

Get the cluster administrative audit settings

Input Name	Range	Type	Description
desired-attributes		audit-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		audit-info	The attributes of the audit.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

audit-log-config-modify

[top]

Modify the cluster administrative audit settings

Input Name	Range	Type	Description
cli-get		boolean optional	Enable Auditing of CLI Get Operations
http-get		boolean optional	Enable Auditing of HTTP Get Operations
ontapi-get		boolean optional	Enable Auditing of Data ONTAP API Get Operations
snmp-get		boolean optional	Enable Auditing of SNMP Get Operations

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

audit-log-get

[top]

Get the cluster administrative audit settings

Input Name	Range	Type	Description
desired-attributes		audit-log-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node		node-name	Node that logged the entry.
seq	**[0..2^64-1]**	integer optional	Used as a tie-breaker for line entries with the same timestamp.
timestamp	**[0..2^31-1]**	integer	Timestamp of the log entry.

Output Name	Range	Type	Description
attributes		audit-log-info	The attributes of the audit.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

audit-log-get-iter

[top]

Iterate of audit log entries

Input Name	Range	Type	Description
desired-attributes		audit-log-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		audit-log-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the audit object. All audit objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		audit-log-info[]	The list of attributes of audit objects.

		optional	
next-tag		string optional	Tag for the next call. Not present when there are no more audit objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

Element definition: **audit-info**

[top]

Audit logging can be enabled/disabled separately for 'get' (read-only) requests, for each of the following access modes: CLI (Command-Line Interface), SNMP, HTTP, and the Data ONTAP API (ONTAPI, ZAPI). The state of these flags is represented via the audit-info typedef. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cli-get		boolean optional	Enable Auditing of CLI Get Operations Attributes: non-creatable, modifiable
http-get		boolean optional	Enable Auditing of HTTP Get Operations Attributes: non-creatable, modifiable
ontapi-get		boolean optional	Enable Auditing of Data ONTAP API Get Operations Attributes: non-creatable, modifiable
snmp-get		boolean optional	Enable Auditing of SNMP Get Operations Attributes: non-creatable, modifiable

Element definition: **audit-log-info**

[top]

View the audit log When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description

entry		string optional	The actual log message from the audit log file. Attributes: non-creatable, non-modifiable
node		node-name optional	Node that logged the entry. Attributes: key, non-creatable, non-modifiable
seq	**[0..2^64-1]**	integer optional	Used as a tie-breaker for line entries with the same timestamp. Attributes: key, non-creatable, non-modifiable
timestamp	**[0..2^31-1]**	integer optional	Timestamp of the log entry. Attributes: key, non-creatable, non-modifiable

This set of ZAPIs provides visibility into the AutoSupport infrastructure of the system. The AutoSupport tool collects valuable information on the state of each node in the cluster, which aids in the diagnosis of hardware and software failures.The APIs are divided into the following major features:

- Configuration: manage AutoSupport general settings
- Destinations: view the current AutoSupport delivery destinations
- Triggers: manage what is collected for each AutoSupport trigger
- Manifest: view detailed collection information for a particular AutoSupport
- History: view a log of previously generated AutoSupports
- Budgets: manage AutoSupport collection size and time limits

autosupport-budget-get

[top]

Get AutoSupport time and size limits for the given node and subsystem.

Input Name	Range	Type	Description
desired-attributes		autosupport-budget-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-name		string	The name of a filer on which the AutoSupport tool is running.
			The name of a subsystem from which AutoSupport collects data. Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node,

subsystem		asup-subsystems	• "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information

Output Name	Range	Type	Description
attributes		autosupport-budget-info	The attributes of the autosupport-budget.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-budget-get-iter

[top]

Get AutoSupport time and size limits per subsystem for all nodes.

Input Name	Range	Type	Description
desired-attributes		autosupport-budget-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-budget-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-budget object. All autosupport-budget objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-budget-info[] optional	The list of attributes of autosupport-budget objects.
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-budget objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-budget-get-total-records

[top]

Return the total number of records.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of autosupport-budget objects.

autosupport-budget-modify

[top]

Modify AutoSupport time and size limits per subsystem.

Input Name	Range	Type	Description
diagnostic-size-limit	**[0..2^63-1]**	integer optional	The maximum allowable diagnostic content collection size (in bytes) for the subsystem.
diagnostic-time-limit		string optional	The maximum allowable diagnostic content collection time (in seconds) for the subsystem.
node-name		string	The name of a filer on which the AutoSupport tool is running.
size-limit	**[0..2^63-1]**	integer optional	The maximum allowable basic and troubleshooting content collection size (in bytes) for the subsystem.
subsystem		asup-subsystems	The name of a subsystem from which AutoSupport collects data. Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node,

			"san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
time-limit		string optional	The maximum allowable basic and troubleshooting content collection time (in seconds) for the subsystem.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-check-iter

[top]

Get Current Status of AutoSupport Subsystem for all nodes.

Input Name	Range	Type	Description
desired-attributes		autosupport-check-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-check-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-check object. All autosupport-check objects matching this query up to 'max-records' will be returned.

tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-check-info[] optional	The list of attributes of autosupport-check objects.
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-check objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-compliant-get

[top]

Get AutoSupport compliance hash mapping

Input Name	Range	Type	Description
desired-attributes		autosupport-compliant-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node		node-name	Node
plaintext		string	Plaintext

Output Name	Range	Type	Description
attributes		autosupport-compliant-info	The attributes of the autosupport-compliant.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-compliant-get-iter

[top]

Get AutoSupport compliance hash mapping

Input Name	Range	Type	Description
desired-attributes		autosupport-compliant-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
	[1..2^32-	integer	The maximum number of records to return in this call. Default:

max-records	**1]**	optional	20
query		autosupport-compliant-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-compliant object. All autosupport-compliant objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-compliant-info[] optional	The list of attributes of autosupport-compliant objects.
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-compliant objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-compliant-get-total-records

[top]

Return the total number of records.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of autosupport-compliant objects.

autosupport-config-get

[top]

Get AutoSupport configuration settings for the given node.

Input Name	Range	Type	Description
desired-attributes		autosupport-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-name		string	The name of the filer that owns the AutoSupport configuration.

Output Name	Range	Type	Description
attributes		autosupport-config-info	The attributes of the autosupport-config.

Errno	Description
EOBJECTNOTFOUND	

Errno	Description
EINTERNALERROR	

autosupport-config-get-iter

[top]

Get AutoSupport configuration settings for all nodes.

Input Name	Range	Type	Description
desired-attributes		autosupport-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-config-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-config object. All autosupport-config objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-config-info[] optional	The list of attributes of autosupport-config objects.
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-config objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-config-get-total-records

[top]

Return the total number of records.

Output Name	Range	Type	Description
count	[0..2^64-1]	integer	The total number of autosupport-config objects.

autosupport-config-modify

[top]

Modify AutoSupport configuration settings for the given node.

Input Name	Range	Type	Description
from		mail-address optional	The e-mail address of the local administrator, used as the sender of the AutoSupport message. To generate node-specific 'from' addresses, use the 'node-specific-from' (privilege: advanced) parameter.
is-enabled		boolean optional	Specifies whether the AutoSupport daemon is enabled. When this setting is disabled, delivery of all AutoSupport messages is turned off.
is-local-collection-enabled		boolean optional	Used to enable / disable collection of AutoSupport data when the AutoSupport daemon is disabled. When this setting is true, collection of AutoSupport data will still be done if is-enabled is false.
is-nht-data-enabled		boolean optional	Used to enable / disable collection of disk health data.
is-node-in-subject		boolean optional	Specifies whether the filer's hostname should be part of an AutoSupport message's subject field.
is-ondemand-download-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Download feature is enabled. Default is true.
is-ondemand-enabled		boolean optional	Specifies whether AutoSupport OnDemand is enabled. Default is true.
is-ondemand-remote-diag-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Remote Diagnostics feature is enabled. Default is true.
is-perf-data-enabled		boolean optional	Used to enable / disable collection of Performance AutoSupport data.
is-private-data-removed		boolean optional	Used to enable / disable removal of customer-supplied data.
is-reminder-enabled		boolean optional	Specifies whether to enable / disable AutoSupport reminders.
is-support-enabled		boolean optional	Specifies whether AutoSupport notification to technical support is enabled.
is-throttle-enabled		boolean optional	Specifies whether to enable / disable throttling to prevent a potential avalanche of AutoSupport messages.
mail-hosts		string[] optional	The name of the mail server(s) used to deliver AutoSupport messages via SMTP. Both host names and IP addresses may be used as valid input. One can optionally specify a username/password for authentication with the mailserver(rfc4954).
max-download-rate	**[0..2^63-1]**	integer optional	Maximum download rate (in bytes per second). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or in the range 20480 (20KBps)- 10737418240 (10GBps).
max-http-size	**[0..2^63-1]**	integer optional	Delivery size limit for the HTTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB).
max-smtp-size	**[0..2^63-1]**	integer optional	Delivery size limit for the SMTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB).
			Maximum upload rate (in bytes per second). As of Data ONTAP

max-upload-rate	**[0..2^63-1]**	integer optional	8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 20480 (20KBps).
minimum-private-data-length	**[2..1024]**	integer optional	Minimum Length for Sensitive Data
node-name		string	The name of the filer that owns the AutoSupport configuration.
node-specific-from		boolean optional	Specifies whether to generate a node-specific 'from' address by prepending the node name to the 'from' email address. Default is false.
noteto		mail-address[] optional	(DEPRECATED) Specifies up to five recipients of short AutoSupport e-mail messages.
ondemand-polling-interval	**[0..2^32-1]**	integer optional	The AutoSupport OnDemand Client polling rate in minutes. As of Data ONTAP 8.3.1, this value should be in the range 5-2880.
ondemand-server-url		string optional	The AutoSupport OnDemand Server URL.
partner-address		mail-address[] optional	Specifies up to five partner vendor recipients of full AutoSupport e-mail messages.
payload-format		compression-format optional	The format used to compress the AutoSupport message payload. Possible values: • "7z" - 7-Zip Archive, • "tgz" - Zipped Tarball
periodic-tx-window		string optional	The transmission window (seconds).
post-url		string optional	The URL used to deliver AutoSupport messages via HTTP POST.
proxy-url		string optional	Optional proxy host for AutoSupport message delivery via HTTP.
put-url		string optional	The URL used to deliver AutoSupport messages via HTTP PUT.
retry-count	**[0..2^32-1]**	integer optional	The maximum number of delivery attempts for an AutoSupport message. As of Data ONTAP 8.3.1, this value should be in the range 5-30.
retry-interval		string optional	The number of seconds to wait, after a failed delivery attempt, prior to re-transmitting an AutoSupport message.
support-address		mail-address[] optional	The e-mail address of Support.
to		mail-address[] optional	Specifies up to five recipients of full AutoSupport e-mail messages.
transport		asup-transport optional	The name of the transport protocol used to deliver AutoSupport messages. Possible values: • "smtp" , • "http" , • "https"
validate-digital-certificate		boolean optional	Validate Digital Certificate Received

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-destinations-get

[top]

Get the list of AutoSupport destinations for the given node.

Input Name	Range	Type	Description
desired-attributes		autosupport-destinations-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-name		string	The name of the filer that owns this destination configuration.

Output Name	Range	Type	Description
attributes		autosupport-destinations-info	The attributes of the autosupport-destinations.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-destinations-get-iter

[top]

Get the list of AutoSupport destinations for all nodes.

Input Name	Range	Type	Description
desired-attributes		autosupport-destinations-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-destinations-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-destinations object. All autosupport-destinations objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-destinations-info[]	The list of attributes of autosupport-destinations objects.

		optional	
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-destinations objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-destinations-get-total-records

[top]

Return the total number of records. This sould be equal to the number of nodes in the cluster.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of autosupport-destinations objects.

autosupport-download-get

[top]

Get a download record for the given AutoSupport.

Input Name	Range	Type	Description
desired-attributes		autosupport-download-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
id	**[0..2^64-1]**	integer	The download ID.
node-name		string	The name of the filer that performed the download.

Output Name	Range	Type	Description
attributes		autosupport-download-info	The attributes of the autosupport-download.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-download-get-iter

[top]

Get the download records.

Input Name	Range	Type	Description

desired-attributes		autosupport-download-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-download-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-download object. All autosupport-download objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-download-info[] optional	The list of attributes of autosupport-download objects.
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-download objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-history-cancel

[top]

Cancel an AutoSupport Transmission.

Input Name	Range	Type	Description
destination		asup-destination optional	Destination for This AutoSupport Possible values: • "smtp" - Transmitted via SMTP, • "http" - Transmitted via HTTP or HTTPS, • "noteto" - (DEPRECATED) noteto destination, • "retransmit" - Transmitted to a specified URI destination
node-name		string	Node
seq-num	**[0..2^64-1]**	integer	AutoSupport Sequence Number

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-history-get

[top]

Get a history record for the given AutoSupport.

Input Name	Range	Type	Description
desired-attributes		autosupport-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
destination		asup-destination	The transport protocol for this AutoSupport message's destination. Possible values: • "smtp" - Transmitted via SMTP, • "http" - Transmitted via HTTP or HTTPS, • "noteto" - (DEPRECATED) noteto destination, • "retransmit" - Transmitted to a specified URI destination
node-name		string	The name of the filer where the AutoSupport message was previously generated.
seq-num	**[0..2^64-1]**	integer	The AutoSupport message sequence number.

Output Name	Range	Type	Description
attributes		autosupport-history-info	The attributes of the autosupport-history.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

autosupport-history-get-iter

[top]

Get the history records for the last 50 AutoSupport messages.

Input Name	Range	Type	Description
desired-attributes		autosupport-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		autosupport-history-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the autosupport-history object. All autosupport-history objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		autosupport-history-info[]	The list of attributes of autosupport-history objects.

		optional	
next-tag		string optional	Tag for the next call. Not present when there are no more autosupport-history objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

autosupport-history-get-total-records

[top]

Return the total number of records.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of autosupport-history objects.

autosupport-history-retransmit

[top]

Selectively retransmit a previously collected AutoSupport message.

Input Name	Range	Type	Description
node-name		string	The name of the filer on which the AutoSupport message will be retransmitted.
seq-num	**[0..2^64-1]**	integer	The AutoSupport message sequence number.
size-limit	**[0..2^63-1]**	integer optional	The maximum allowed size for the retransmitted AutoSupport.
uri		string	The destination for the retransmitted AutoSupport.

Errno	Description
E_ASUP_CHECK_INVALID_GENERIC_URI_SCHEME	

autosupport-invoke

[top]

Generate a new AutoSupport message

Input Name	Range	Type	Description
force		boolean optional	Force generation, even if AutoSupport is disabled in the system. The default value is false.
message		string optional	Text to include as part of the subject of the AutoSupport message.
node-name		string	The name of the filer on which the AutoSupport message will be generated.

type		asup-invoke-style	The type of AutoSupport to generate. Possible values: • "test" - Test AutoSupport send and receive only, • "performance" - Generate a Performance AutoSupport as requested by technical support, • "all" - Send all AutoSupport data without time or size limit, as requested by technical support
uri		string optional	Alternate destination for the AutoSupport. If this field is omitted, the AutoSupport will be delivered to the currently configured destinations.

Output Name	Range	Type	Description
seq-num	**[0..2^64-1]**	integer optional	The AutoSupport message sequence number.

Errno	Description
E_ASUP_COLLECTION_DISABLED	
E_ASUP_TRIGGER_DISABLED	
E_ASUP_TRIGGER_THROTTLED	

autosupport-invoke-core-upload

[top]

Generate and send an AutoSupport message with an existing core file.

Input Name	Range	Type	Description
case-number		string optional	Support case number to associate with this core file.
core-filename		string	Existing core file to be included in this AutoSupport.
force		boolean optional	Force generation, even if AutoSupport is disabled in the system. The default value is false.
message		string optional	Text to include as part of the subject of the AutoSupport message.
node-name		string	The name of the filer on which the AutoSupport message will be generated.
uri		string optional	Alternate destination for the AutoSupport. If this field is omitted, the AutoSupport will be delivered to the currently configured destinations. Supported schemes are file, http & https. As of Data ONTAP 9.3, the file scheme is not supported.

Output Name	Range	Type	Description

autosupport-invoke-diagnostic

[top]

Generate and send an AutoSupport message with diagnostic content from specified subsystems.

Input Name	Range	Type	Description
force		boolean optional	Force collection and delivery, even if Diagnostic AutoSupport is disabled in the system. The default value is false.
message-subject		string optional	Text to include as part of the subject of the AutoSupport message.
node-name		string	The name of the filer on which the AutoSupport message will be generated.
			List of subsystems whose diagnostic content is to be included in this AutoSupport. Specify up to 4 subsystems. Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot,

subsystems		asup-subsystems[]	"splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information

autosupport-invoke-diagnostic-iter

[top]

Generate and send an AutoSupport message with diagnostic content from specified subsystems.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple autosupport objects match a given query. If set to true, the API will continue with the next matching autosupport even when the operation fails for the autosupport. If set to false, the API will return on the first failure. Default: false
force		boolean optional	Force collection and delivery, even if Diagnostic AutoSupport is disabled in the system. The default value is false.
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed operations before the server gives up and returns. If set, the API will continue with the next matching autosupport even when the operation on a previous matching autosupport fails, and do so until the total number of objects failed to be operated on reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of autosupport objects to be operated in this call. Default: 20
message-subject		string optional	Text to include as part of the subject of the AutoSupport message.
query		autosupport-config-info	If operating on a specific autosupport, this input element must specify all keys. If operating on autosupport objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of autosupport objects (just keys) that were not operated on due to some error. If set to false, the list of autosupport objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of autosupport objects (just keys) that were successfully operated on. If set to false, the list of autosupport objects operated on will not be returned. Default: true
			List of subsystems whose diagnostic content is to be included in this AutoSupport. Specify up to 4 subsystems. Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node,

subsystems		asup-subsystems[]	• "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific

			information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.
uri		string optional	The destination for the AutoSupport. If this field is omitted, the AutoSupport will be delivered to the currently configured destinations.

Output Name	Range	Type	Description
failure-list		autosupport-invoke-diagnostic-iter-info[] optional	Information about autosupport objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching autosupport objects to be operated on.
num-failed	**[0..2^32-1]**	integer optional	The number of autosupport objects that matched the query, but were not operated on due some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of autosupport objects that matched the query and were successfully processed.
success-list		autosupport-invoke-diagnostic-iter-info[] optional	The autosupport objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

Element definition: **asup-destination**

[top]

smtp|http|noteto|retransmit Possible values:

- "smtp" - Transmitted via SMTP,
- "http" - Transmitted via HTTP or HTTPS,
- "noteto" - (DEPRECATED) noteto destination,
- "retransmit" - Transmitted to a specified URI destination

[none]

Element definition: **asup-invoke-style**

[top]

test|performance|all Possible values:

- "test" - Test AutoSupport send and receive only,
- "performance" - Generate a Performance AutoSupport as requested by technical support,
- "all" - Send all AutoSupport data without time or size limit, as requested by technical support

[none]

Element definition: **asup-subsystems**

[top]

subsys1,subsys2,... Possible values:

- "platform" - Hardware information about the node,
- "mhost" - User Space application information for a node,

- "log_files" - Log files for a node,
- "performance" - Performance statistics for a node (event and weekly),
- "performance_asup" - Performance statistics for a node (hourly),
- "nht" - This subsystem gathers the /mroot/etc/log/nht_info content,
- "san" - SAN specific information for a node,
- "snapvault" - SnapVault specific information for a node,
- "snapmirror" - Snapmirror specific information for a node,
- "dedupe" - Dedupe specific information for a node,
- "nfs" - NFS specific information for a node,
- "wafl" - WAFL specific information for a node,
- "mot" - MOT specific information for a node,
- "ha" - HA specific information for a node,
- "networking" - Networking specific information for a node,
- "cifs" - CIFS specific information for a node,
- "fpolicy" - Fpolicy specific information for a node,
- "multistore" - Multistore specific information for a node,
- "raid" - RAID specific information for a node,
- "storage" - Storage specific information for a node,
- "asup_ems" - ASUP EMS specific information for a node,
- "tape" - Tape specific information for a node,
- "kernel" - kernel specific information for a node,
- "secd" - Security Daemon specific information for a node,
- "metrocluster" - Metrocluster specific information for a node,
- "mandatory" - Mandatory Basic information for a node,
- "repository" - Repository specific information for a node,
- "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally,
- "splog_latest" - Up-to-date Service Processor log from Service Processor firmware ,
- "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot,
- "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down,
- "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW,
- "splog_rnode" - On demand collected remote SP logs,
- "hm" - Health Monitor Alerts specific information,
- "kcs" - Kernel Cluster Services information for a node,
- "av" - Antivirus specific information for a node,
- "vserver_dr" - Vserver disaster recovery,
- "nwd" - Node Watchdog specific information for a node,
- "vscan" - Vscan specific information for a node,
- "san_ffdc" - SAN specific trace dumps for a node,
- "cluster_peer" - Cluster peering specific dumps for a node,
- "crs" - Config Replication Service information,
- "cps" - Cluster Persistency Storage information,
- "memevt" - MemEVT gathered data from a node,
- "san_fcp" - FCP target driver related information for a node,
- "ndmp" - NDMP information,
- "ndu" - NDU specific information,
- "name_services" - Name Services specific information,
- "san_vdom" - SAN VDOM specific information for a node,
- "snaplock" - SnapLock specific information for a node,
- "key_manager" - Key Manager specific information,
- "appdm" - Application DM,
- "corefile" - Corefile to upload,
- "flexcache" - FlexCache,
- "nvmf" - NVMF specific information,
- "snapshot" - Snapshots specific information,
- "rdma" - RDMA driver and OFED layer specific information,
- "ndo" - NDO specific information,
- "metroclustertcp" - MetroCluster TCP specific information for a node,
- "metroclusterstats" - MetroCluster statistics for data analytics,
- "object_store_server" - Object store server specific information for a node,

"storage_stats" - Storage statistics for data analytics,
- "ipsec" - IPsec specific information,
- "hm_switch" - Ethernet switch health monitoring information,
- "arw" - Anti-ransomware specific information,
- "svm_migrate" - Vserver migrate information,
- "nic" - NIC driver specific information

Element definition: **autosupport-budget-info**

[top]

AutoSupport budget data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
def-diagnostic-size-limit	**[0..2^63-1]**	integer optional	The default setting for diagnostic content collection size (in bytes) for the subsystem. Attributes: non-creatable, non-modifiable
def-diagnostic-time-limit		string optional	The default setting for diagnostic content collection time (in seconds) for the subsystem. Attributes: non-creatable, non-modifiable
def-size-limit	**[0..2^63-1]**	integer optional	The default setting for basic and troubleshooting content collection size (in bytes) for the subsystem. Attributes: non-creatable, non-modifiable
def-time-limit		string optional	The default setting for basic and troubleshooting content collection time (in seconds) for the subsystem. Attributes: non-creatable, non-modifiable
diagnostic-size-limit	**[0..2^63-1]**	integer optional	The maximum allowable diagnostic content collection size (in bytes) for the subsystem. Attributes: non-creatable, modifiable
diagnostic-time-limit		string optional	The maximum allowable diagnostic content collection time (in seconds) for the subsystem. Attributes: non-creatable, modifiable

node-name		string optional	The name of a filer on which the AutoSupport tool is running. Attributes: key, non-creatable, non-modifiable
size-limit	**[0..2^63-1]**	integer optional	The maximum allowable basic and troubleshooting content collection size (in bytes) for the subsystem. Attributes: non-creatable, modifiable
subsystem		asup-subsystems optional	The name of a subsystem from which AutoSupport collects data. Attributes: key, non-creatable, non-modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information,

			• "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
time-limit		string optional	The maximum allowable basic and troubleshooting content collection time (in seconds) for the subsystem. Attributes: non-creatable, modifiable

Status of AutoSupport Subsystem When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
check-category		string optional	Category of AutoSupport Check Attributes: key, non-creatable, non-modifiable Possible values: • "http_https" - AutoSupport HTTP/HTTPS Destination, • "smtp" - AutoSupport SMTP Destination, • "on_demand" - AutoSupport OnDemand Destination, • "configuration" - AutoSupport Configuration
			Type of AutoSupport Check Attributes: key, non-creatable, non-

check-type		string optional	modifiable Possible values: • "rollup_status" - Overall Status for a category, • "http_put_destination" - HTTP/HTTPS PUT Destination, • "http_post_destination" - HTTP/HTTPS POST Destination, • "mail_server" - AutoSupport MailServer, • "ondemand_server" - AutoSupport OnDemand Server, • "configuration" - AutoSupport Configuration
corrective-action		string optional	Action to correct the error seen as the result of this check. Attributes: non-creatable, non-modifiable
error-detail		string optional	Detailed Error String for this AutoSupport Check. Attributes: non-creatable, non-modifiable
node-name		string optional	The name of the filer on which the check is being performed. Attributes: key, non-creatable, non-modifiable
status		asup-check-status optional	Status of this AutoSupport Check. Attributes: non-creatable, non-modifiable Possible values: • "ok" - The Status of the AutoSupport check is ok., • "warning" - Please verify the intended behavior., • "failed" - AutoSupport check failed., • "not_run" - AutoSupport check could not be run.

Element definition: **autosupport-compliant-info**

[top]

Compliant AutoSupport has data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
hash		string optional	hash Attributes: non-creatable, non-modifiable
last-used-sequence		seqnum optional	Last AutoSupport that used this hash Attributes: non-creatable, non-modifiable
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
plaintext		string optional	Plaintext Attributes: key, non-creatable, non-modifiable

Element definition: **autosupport-config-info**

[top]

AutoSupport configuration data When returned as part of the output, all elements of this typedef are

reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
from		mail-address optional	The e-mail address of the local administrator, used as the sender of the AutoSupport message. To generate node-specific 'from' addresses, use the 'node-specific-from' (privilege: advanced) parameter. Attributes: non-creatable, modifiable
is-enabled		boolean optional	Specifies whether the AutoSupport daemon is enabled. When this setting is disabled, delivery of all AutoSupport messages is turned off. Attributes: non-creatable, modifiable
is-local-collection-enabled		boolean optional	Used to enable / disable collection of AutoSupport data when the AutoSupport daemon is disabled. When this setting is true, collection of AutoSupport data will still be done if is-enabled is false. Attributes: non-creatable, modifiable
is-nht-data-enabled		boolean optional	Used to enable / disable collection of disk health data. Attributes: non-creatable, modifiable
is-node-in-subject		boolean optional	Specifies whether the filer's hostname should be part of an AutoSupport message's subject field. Attributes: non-creatable, modifiable
is-ondemand-download-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Download feature is enabled. Default is true. Attributes: non-creatable, modifiable
is-ondemand-enabled		boolean optional	Specifies whether AutoSupport OnDemand is enabled. Default is true. Attributes: non-creatable, modifiable
is-ondemand-remote-diag-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Remote Diagnostics feature is enabled. Default is true. Attributes: non-creatable, modifiable
is-perf-data-enabled		boolean optional	Used to enable / disable collection of Performance AutoSupport data. Attributes: non-creatable, modifiable
is-private-data-removed		boolean optional	Used to enable / disable removal of customer-supplied data. Attributes: non-creatable, modifiable
is-reminder-enabled		boolean optional	Specifies whether to enable / disable AutoSupport reminders. Attributes: non-creatable, modifiable
is-support-enabled		boolean optional	Specifies whether AutoSupport notification to technical support is enabled. Attributes: non-creatable, modifiable
is-throttle-enabled		boolean optional	Specifies whether to enable / disable throttling to prevent a potential avalanche of AutoSupport messages. Attributes: non-creatable, modifiable
last-subject		string optional	The subject field of the last generated AutoSupport message. Attributes: non-creatable, non-modifiable

last-timestamp	**[0..2^31-1]**	integer optional	The timestamp of the last generated AutoSupport message. The time value is in seconds since January 1, 1970 UTC. Attributes: non-creatable, non-modifiable
mail-hosts		string[] optional	The name of the mail server(s) used to deliver AutoSupport messages via SMTP. Both host names and IP addresses may be used as valid input. One can optionally specify a username/password for authentication with the mailserver(rfc4954). Attributes: non-creatable, modifiable
max-download-rate	**[0..2^63-1]**	integer optional	Maximum download rate (in bytes per second). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or in the range 20480 (20KBps)- 10737418240 (10GBps). Attributes: non-creatable, modifiable
max-http-size	**[0..2^63-1]**	integer optional	Delivery size limit for the HTTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB). Attributes: non-creatable, modifiable
max-smtp-size	**[0..2^63-1]**	integer optional	Delivery size limit for the SMTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB). Attributes: non-creatable, modifiable
max-upload-rate	**[0..2^63-1]**	integer optional	Maximum upload rate (in bytes per second). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 20480 (20KBps). Attributes: non-creatable, modifiable
minimum-private-data-length	**[2..1024]**	integer optional	Minimum Length for Sensitive Data Attributes: non-creatable, modifiable
node-name		string optional	The name of the filer that owns the AutoSupport configuration. Attributes: key, non-creatable, non-modifiable
node-specific-from		boolean optional	Specifies whether to generate a node-specific 'from' address by prepending the node name to the 'from' email address. Default is false. Attributes: non-creatable, modifiable
noteto		mail-address[] optional	(DEPRECATED) Specifies up to five recipients of short AutoSupport e-mail messages. Attributes: non-creatable, modifiable
ondemand-polling-interval	**[0..2^32-1]**	integer optional	The AutoSupport OnDemand Client polling rate in minutes. As of Data ONTAP 8.3.1, this value should be in the range 5-2880. Attributes: non-creatable, modifiable
ondemand-server-url		string optional	The AutoSupport OnDemand Server URL. Attributes: non-creatable, modifiable
partner-address		mail-address[] optional	Specifies up to five partner vendor recipients of full AutoSupport e-mail messages. Attributes: non-creatable, modifiable
payload-format		compression-format optional	The format used to compress the AutoSupport message payload. Attributes: non-creatable, modifiable Possible values: • "7z" - 7-Zip Archive, • "tgz" - Zipped Tarball
periodic-tx-window		string optional	The transmission window (seconds). Attributes: non-creatable, modifiable
post-url		string optional	The URL used to deliver AutoSupport messages via HTTP POST. Attributes: non-creatable, modifiable
proxy-url		string optional	Optional proxy host for AutoSupport message delivery via HTTP. Attributes: non-creatable, modifiable

put-url		string optional	The URL used to deliver AutoSupport messages via HTTP PUT. Attributes: non-creatable, modifiable
retry-count	**[0..2^32-1]**	integer optional	The maximum number of delivery attempts for an AutoSupport message. As of Data ONTAP 8.3.1, this value should be in the range 5-30. Attributes: non-creatable, modifiable
retry-interval		string optional	The number of seconds to wait, after a failed delivery attempt, prior to re-transmitting an AutoSupport message. Attributes: non-creatable, modifiable
support-address		mail-address[] optional	The e-mail address of Support. Attributes: non-creatable, modifiable
to		mail-address[] optional	Specifies up to five recipients of full AutoSupport e-mail messages. Attributes: non-creatable, modifiable
transport		asup-transport optional	The name of the transport protocol used to deliver AutoSupport messages. Attributes: non-creatable, modifiable Possible values: • "smtp" , • "http" , • "https"
validate-digital-certificate		boolean optional	Validate Digital Certificate Received Attributes: non-creatable, modifiable

Element definition: **autosupport-destinations-info**

[top]

AutoSupport destination summary When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
destinations		string[] optional	A comma separated list of destinations used to deliver AutoSupport messages. Attributes: non-creatable, non-modifiable
node-name		string optional	The name of the filer that owns this destination configuration. Attributes: key, non-creatable, non-modifiable

Element definition: **autosupport-download-info**

[top]

AutoSupport OnDemand download data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it

shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
download-type		aod-download optional	The type of the download. Attributes: non-creatable, non-modifiable Possible values: • "licensing" - Download licenses for a node or cluster
error		string optional	The error string recorded for this download. This string may be empty. Attributes: non-creatable, non-modifiable
id	**[0..2^64-1]**	integer optional	The download ID. Attributes: key, non-creatable, non-modifiable
last-modification-timestamp	**[0..2^31-1]**	integer optional	The timestamp of the last update to this download record. The time value is in seconds since January 1, 1970 UTC. Attributes: non-creatable, non-modifiable
node-name		string optional	The name of the filer that performed the download. Attributes: key, non-creatable, non-modifiable
result		string optional	The path to the downloaded results on the filer. Attributes: non-creatable, non-modifiable
status		aod-download-status optional	The status for this download. Attributes: non-creatable, non-modifiable Possible values: • "initialized" - Download request is ready to be transmitted to the AutoSupport OnDemand server, • "request_failed" - Download request could not be transmitted, • "not_supported" - Download request type is not known by the AutoSupport OnDemand server, • "transferring" - Requested data is being downloaded, • "completed" - Download has completed successfully, • "cancelled" - Download was cancelled, • "failed" - Download failed to complete

Element definition: **autosupport-history-info**

[top]

AutoSupport history data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
attempt-count	**[0..2^32-1]**	integer optional	The number of attempted deliveries for this AutoSupport message. Attributes: non-creatable, non-modifiable

decompressed-size		size optional	The decompressed size in bytes of the Autosupport message. Attributes: non-creatable, non-modifiable
destination		asup-destination optional	The transport protocol for this AutoSupport message's destination. Attributes: key, non-creatable, non-modifiable Possible values: • "smtp" - Transmitted via SMTP, • "http" - Transmitted via HTTP or HTTPS, • "noteto" - (DEPRECATED) noteto destination, • "retransmit" - Transmitted to a specified URI destination
generation-timestamp	**[0..2^31-1]**	integer optional	The timestamp of the original generation (collection) of this AutoSupport message. The time value is in seconds since January 1, 1970 UTC. Attributes: non-creatable, non-modifiable
last-modification-timestamp	**[0..2^31-1]**	integer optional	The timestamp of the last update to this history record. The time value is in seconds since January 1, 1970 UTC. Attributes: non-creatable, non-modifiable
node-name		string optional	The name of the filer where the AutoSupport message was previously generated. Attributes: key, non-creatable, non-modifiable
percent-complete	**[0..100]**	integer optional	The perentage of the AutoSupport message transmitted successfully. Attributes: non-creatable, non-modifiable
seq-num	**[0..2^64-1]**	integer optional	The AutoSupport message sequence number. Attributes: key, non-creatable, non-modifiable
size		size optional	The compressed size in bytes of the AutoSupport message. Attributes: non-creatable, non-modifiable
status		asup-status optional	The delivery status for this AutoSupport message. Attributes: non-creatable, non-modifiable Possible values: • "initializing" - ASUP request is being processed, • "collection_failed" - The AutoSupport Collection failed. See 'Last Error' for more information, • "collection_in_progress" - The AutoSupport Collection is in progress, • "queued" - ASUP is queued for delivery, • "transmitting" - ASUP transmission is in progress, • "sent_successful" - ASUP was successfully sent, • "ignore" - ASUP was processed successfully but has no destinations configured, • "re_queued" - ASUP transmission failed and has been re-queued, • "transmission_failed" - ASUP transmission has failed and the retry limit has been exceeded, • "ondemand_ignore" - ASUP was processed successfully but ASUP OnDemand has declined delivery, • "cancelled" - ASUP transmission cancelled
subject		string optional	The subject field of this AutoSupport message. Attributes: non-creatable, non-modifiable
time-remaining		time-interval optional	The estimate of the amount of time for the AutoSupport Message to be fully transmitted. Attributes: non-creatable, non-modifiable
total-time	**[0..2^64-1]**	integer optional	The total collection time in msec of the Autosupport message. Attributes: non-creatable, non-modifiable
trigger		string optional	The name of the EMS event that triggered this AutoSupport message. Attributes: non-creatable, non-modifiable
		byte-rate	The approximate rate in bytes per second of the AutoSupport

upload-rate		optional	Message upload. Attributes: non-creatable, non-modifiable
uri		string optional	The URI used to deliver this AutoSupport message. Attributes: non-creatable, non-modifiable

Element definition: **autosupport-invoke-diagnostic-iter-info**

[top]

Information about the operation that was attempted/performed against autosupport object.

Name	Range	Type	Description
autosupport-key		autosupport-config-info	The keys for the autosupport object to which the operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
seq-num	**[0..2^64-1]**	integer optional	The AutoSupport message sequence number.

Element definition: **autosupport-invoke-iter-info**

[top]

Information about the operation that was attempted/performed against autosupport object.

Element definition: **autosupport-manifest-info**

[top]

AutoSupport manifest data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
body-file		string optional	The AutoSupport Content Filename for this Data Attributes: non-creatable, non-modifiable
cmd		string optional	Actual Data Being Collected Attributes: non-creatable, non-modifiable
cmd-tgt		autosupport-cmd-tgt optional	Execution Domain for Command Attributes: non-creatable, non-modifiable Possible values: • "bsd" - Command executed by BSD, • "smf_table" - Command selects SMF table, • "file" - Command indicates file to collect, • "dblade" - Collect from dbladecli, • "dblade_file" - Collect a file from dblade. Could be partner file, • "zapi_xml" - Response in XML format, • "custom_fx" - Collect custom function output file
content-type		asup-content-type optional	AutoSupport Content Type for this Data Attributes: non-creatable, non-modifiable Possible values: • "basic" - ASUP will contain minimal set of data for this subsystem, • "troubleshooting" - ASUP will contain detailed collection of data for this subsystem, • "diagnostic" - ASUP will contain diagnostic data for this subsystem
error		string optional	Textual Description of Error Attributes: non-creatable, non-modifiable
node-name		string optional	Node Attributes: key, non-creatable, non-modifiable
orig-size-collected	**[0..2^63-1]**	integer optional	Initial Number of Bytes Collected Attributes: non-creatable, non-modifiable
prio-num	**[0..2^32-1]**	integer optional	Priority Order of Collection Attributes: key, non-creatable, non-modifiable
query		string optional	Table Query for XML Collection Attributes: non-creatable, non-modifiable
seq-num	**[0..2^64-1]**	integer optional	AutoSupport Sequence Number Attributes: key, non-creatable, non-modifiable

size-collected	**[0..2^63-1]**	integer optional	Number of Bytes Collected Attributes: non-creatable, non-modifiable
size-compressed	**[0..2^63-1]**	integer optional	Compressed Size Attributes: non-creatable, non-modifiable
status		asup-manifest-status optional	Status of this Data Item Attributes: non-creatable, non-modifiable Possible values: • "requested" - ASUP request has been added to the queue and is waiting processing by the collector, • "working" - ASUP Collector is actively gathering the needed data, • "file_not_found" - ASUP collection failed, a needed file is missing, • "no_such_table" - ASUP collection was unable to find the requested SMF table, • "collection_truncated_size_limit" - ASUP collection truncated due to size limits and partial data is available, • "collection_skipped_size_limit" - ASUP collection skipped due to size limits and no data is available, • "collection_truncated_time_limit" - ASUP collection truncated due to time limits and partial data is available, • "collection_skipped_time_limit" - ASUP collection skipped due to time limits and no data is available, • "delivery_skipped_size_limit" - ASUP data was skipped at delivery time due to size limits, • "general_error" - ASUP collection failed, additional information if any will be in the Error String field, • "completed" - ASUP collection is complete, ready for delivery, • "content_not_collected_mode" - ASUP content was not collected, incompatible operational mode, • "content_not_collected_precheck" - ASUP content was not collected, pre-check function violation, • "content_not_collected_privacy" - ASUP content was not collected, the operation is disabled in privacy mode, • "content_empty" - ASUP content was collected successfully, but output was empty, • "collection_aborted" - ASUP collection aborted, additional information if any, will be in available in the Error field, • "collection_truncated_file_size_limit" - ASUP file truncated due to size limits and partial data is available, • "collection_skipped_trigger_time_limit" - ASUP collection was skipped due to trigger time limit, • "collection_incomplete" - ASUP content collection incomplete, • "collection_skipped_trigger_size_limit" - ASUP collection was skipped due to trigger size limit, • "collection_truncated_age" - ASUP file truncated due to age and partial data is available
			Subsystem Attributes: non-creatable, non-modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly),

subsystem		asup-subsystems optional	• "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information,

			"ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
time-collected	**[0..2^64-1]**	integer optional	Collection Time for this Data Item (ms) Attributes: non-creatable, non-modifiable

Element definition: **autosupport-trigger-info**

[top]

AutoSupport trigger data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
additional-content		asup-content-type[] optional	Additional Content Flag Attributes: non-creatable, non-modifiable Possible values: • "basic" - ASUP will contain minimal set of data for this subsystem, • "troubleshooting" - ASUP will contain detailed collection of data for this subsystem, • "diagnostic" - ASUP will contain diagnostic data for this subsystem
			Additional Subsystems Reporting Basic Info Attributes: non-creatable, modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node,

basic-additional		asup-subsystems[] optional	"snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific

			information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
		asup-	Default Subsystems Reporting Basic Info Attributes: non-creatable, non-modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when

basic-default		subsystems[] optional	ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
node-name		string optional	Node Attributes: key, non-creatable, non-modifiable
noteto-enabled		string optional	(DEPRECATED) Deliver to AutoSupport -noteto Addresses. Possible values are: enabled or disabled. Attributes: non-creatable, modifiable
size-limit		size optional	The data collection size budget for this trigger. Content not collected will be marked as collection-truncated-size-limit in the manifest. Attributes: non-creatable, modifiable
time-limit		string optional	The data collection time budget for this trigger (in seconds). Content not collected will be marked as collection-truncated-time-limit in the manifest. Attributes: non-creatable, modifiable
to-enabled		string	Deliver to AutoSupport -to Addresses. Possible values are:

		optional	enabled or disabled. Attributes: non-creatable, modifiable
trigger		string optional	EMS Message Attributes: key, non-creatable, non-modifiable
troubleshooting-additional		asup-subsystems[] optional	Additional Subsystems Reporting Troubleshooting Info Attributes: non-creatable, modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node, • "storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node,

			• "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information, • "svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information
			Default Subsystems Reporting Troubleshooting Info Attributes: non-creatable, non-modifiable Possible values: • "platform" - Hardware information about the node, • "mhost" - User Space application information for a node, • "log_files" - Log files for a node, • "performance" - Performance statistics for a node (event and weekly), • "performance_asup" - Performance statistics for a node (hourly), • "nht" - This subsystem gathers the /mroot/etc/log/nht_info content, • "san" - SAN specific information for a node, • "snapvault" - SnapVault specific information for a node, • "snapmirror" - Snapmirror specific information for a node, • "dedupe" - Dedupe specific information for a node, • "nfs" - NFS specific information for a node, • "wafl" - WAFL specific information for a node, • "mot" - MOT specific information for a node, • "ha" - HA specific information for a node, • "networking" - Networking specific information for a node, • "cifs" - CIFS specific information for a node, • "fpolicy" - Fpolicy specific information for a node, • "multistore" - Multistore specific information for a node, • "raid" - RAID specific information for a node,

troubleshooting-default		asup-subsystems[] optional	"storage" - Storage specific information for a node, • "asup_ems" - ASUP EMS specific information for a node, • "tape" - Tape specific information for a node, • "kernel" - kernel specific information for a node, • "secd" - Security Daemon specific information for a node, • "metrocluster" - Metrocluster specific information for a node, • "mandatory" - Mandatory Basic information for a node, • "repository" - Repository specific information for a node, • "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally, • "splog_latest" - Up-to-date Service Processor log from Service Processor firmware , • "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot, • "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down, • "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW, • "splog_rnode" - On demand collected remote SP logs, • "hm" - Health Monitor Alerts specific information, • "kcs" - Kernel Cluster Services information for a node, • "av" - Antivirus specific information for a node, • "vserver_dr" - Vserver disaster recovery, • "nwd" - Node Watchdog specific information for a node, • "vscan" - Vscan specific information for a node, • "san_ffdc" - SAN specific trace dumps for a node, • "cluster_peer" - Cluster peering specific dumps for a node, • "crs" - Config Replication Service information, • "cps" - Cluster Persistency Storage information, • "memevt" - MemEVT gathered data from a node, • "san_fcp" - FCP target driver related information for a node, • "ndmp" - NDMP information, • "ndu" - NDU specific information, • "name_services" - Name Services specific information, • "san_vdom" - SAN VDOM specific information for a node, • "snaplock" - SnapLock specific information for a node, • "key_manager" - Key Manager specific information, • "appdm" - Application DM, • "corefile" - Corefile to upload, • "flexcache" - FlexCache, • "nvmf" - NVMF specific information, • "snapshot" - Snapshots specific information, • "rdma" - RDMA driver and OFED layer specific information, • "ndo" - NDO specific information, • "metroclustertcp" - MetroCluster TCP specific information for a node, • "metroclusterstats" - MetroCluster statistics for data analytics, • "object_store_server" - Object store server specific information for a node, • "storage_stats" - Storage statistics for data analytics, • "ipsec" - IPsec specific information, • "hm_switch" - Ethernet switch health monitoring information, • "arw" - Anti-ransomware specific information,

			"svm_migrate" - Vserver migrate information, • "nic" - NIC driver specific information

Element definition: **compression-format**

[top]

7z|tgz Possible values:

- "7z" - 7-Zip Archive,
- "tgz" - Zipped Tarball

[none]

Element definition: **mail-address**

[top]

E-mail Address

[none]

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **aod-download**

[top]

aod_download Possible values:

- "licensing" - Download licenses for a node or cluster

[none]

Element definition: **aod-download-status**

[top]

aod_download_status Possible values:

- "initialized" - Download request is ready to be transmitted to the AutoSupport OnDemand server,
- "request_failed" - Download request could not be transmitted,
- "not_supported" - Download request type is not known by the AutoSupport OnDemand server,
- "transferring" - Requested data is being downloaded,
- "completed" - Download has completed successfully,
- "cancelled" - Download was cancelled,
- "failed" - Download failed to complete

[none]

Element definition: **asup-check-status**

[top]

ok|warning|failed|not-run Possible values:

- "ok" - The Status of the AutoSupport check is ok.,
- "warning" - Please verify the intended behavior.,
- "failed" - AutoSupport check failed.,
- "not_run" - AutoSupport check could not be run.

[none]

Element definition: **asup-content-type**

[top]

Type of AutoSupport content Possible values:

- "basic" - ASUP will contain minimal set of data for this subsystem,
- "troubleshooting" - ASUP will contain detailed collection of data for this subsystem,
- "diagnostic" - ASUP will contain diagnostic data for this subsystem

[none]

Element definition: **asup-destination**

[top]

smtp|http|noteto|retransmit Possible values:

- "smtp" - Transmitted via SMTP,
- "http" - Transmitted via HTTP or HTTPS,
- "noteto" - (DEPRECATED) noteto destination,
- "retransmit" - Transmitted to a specified URI destination

[none]

Element definition: **asup-manifest-status**

[top]

AutoSupport manifest collection status Possible values:

- "requested" - ASUP request has been added to the queue and is waiting processing by the collector,
- "working" - ASUP Collector is actively gathering the needed data,
- "file_not_found" - ASUP collection failed, a needed file is missing,
- "no_such_table" - ASUP collection was unable to find the requested SMF table,
- "collection_truncated_size_limit" - ASUP collection truncated due to size limits and partial data is available,
- "collection_skipped_size_limit" - ASUP collection skipped due to size limits and no data is available,
- "collection_truncated_time_limit" - ASUP collection truncated due to time limits and partial data is available,
- "collection_skipped_time_limit" - ASUP collection skipped due to time limits and no data is available,
- "delivery_skipped_size_limit" - ASUP data was skipped at delivery time due to size limits,
- "general_error" - ASUP collection failed, additional information if any will be in the Error String field,
- "completed" - ASUP collection is complete, ready for delivery,
- "content_not_collected_mode" - ASUP content was not collected, incompatible operational mode,
- "content_not_collected_precheck" - ASUP content was not collected, pre-check function violation,
- "content_not_collected_privacy" - ASUP content was not collected, the operation is disabled in privacy mode,
- "content_empty" - ASUP content was collected successfully, but output was empty,
- "collection_aborted" - ASUP collection aborted, additional information if any, will be in available in the Error field,
- "collection_truncated_file_size_limit" - ASUP file truncated due to size limits and partial data is available,
- "collection_skipped_trigger_time_limit" - ASUP collection was skipped due to trigger time limit,
- "collection_incomplete" - ASUP content collection incomplete,
- "collection_skipped_trigger_size_limit" - ASUP collection was skipped due to trigger size limit,
- "collection_truncated_age" - ASUP file truncated due to age and partial data is available

[none]

Element definition: **asup-status**

[top]

AutoSupport general status Possible values:

- "initializing" - ASUP request is being processed,
- "collection_failed" - The AutoSupport Collection failed. See 'Last Error' for more information,
- "collection_in_progress" - The AutoSupport Collection is in progress,
- "queued" - ASUP is queued for delivery,
- "transmitting" - ASUP transmission is in progress,
- "sent_successful" - ASUP was successfully sent,
- "ignore" - ASUP was processed successfully but has no destinations configured,
- "re_queued" - ASUP transmission failed and has been re-queued,
- "transmission_failed" - ASUP transmission has failed and the retry limit has been exceeded,

"ondemand_ignore" - ASUP was processed successfully but ASUP OnDemand has declined delivery,
- "cancelled" - ASUP transmission cancelled

[none]

Element definition: **asup-subsystems**

[top]

subsys1,subsys2,... Possible values:

- "platform" - Hardware information about the node,
- "mhost" - User Space application information for a node,
- "log_files" - Log files for a node,
- "performance" - Performance statistics for a node (event and weekly),
- "performance_asup" - Performance statistics for a node (hourly),
- "nht" - This subsystem gathers the /mroot/etc/log/nht_info content,
- "san" - SAN specific information for a node,
- "snapvault" - SnapVault specific information for a node,
- "snapmirror" - Snapmirror specific information for a node,
- "dedupe" - Dedupe specific information for a node,
- "nfs" - NFS specific information for a node,
- "wafl" - WAFL specific information for a node,
- "mot" - MOT specific information for a node,
- "ha" - HA specific information for a node,
- "networking" - Networking specific information for a node,
- "cifs" - CIFS specific information for a node,
- "fpolicy" - Fpolicy specific information for a node,
- "multistore" - Multistore specific information for a node,
- "raid" - RAID specific information for a node,
- "storage" - Storage specific information for a node,
- "asup_ems" - ASUP EMS specific information for a node,
- "tape" - Tape specific information for a node,
- "kernel" - kernel specific information for a node,
- "secd" - Security Daemon specific information for a node,
- "metrocluster" - Metrocluster specific information for a node,
- "mandatory" - Mandatory Basic information for a node,
- "repository" - Repository specific information for a node,
- "splog_downcontroller" - Service Processor log saved when ONTAP is down abnormally,
- "splog_latest" - Up-to-date Service Processor log from Service Processor firmware ,
- "splog_before_spreboot" - Up-to-date Service Processor log from Service Processor firmware before SP reboot,
- "splog_rnode_down" - Remote SPLOG saved when ONTAP is abnormal down,
- "splog_rnode_latest" - Up-to-date SPLOG from Remote Service Processor FW,
- "splog_rnode" - On demand collected remote SP logs,
- "hm" - Health Monitor Alerts specific information,
- "kcs" - Kernel Cluster Services information for a node,
- "av" - Antivirus specific information for a node,
- "vserver_dr" - Vserver disaster recovery,
- "nwd" - Node Watchdog specific information for a node,
- "vscan" - Vscan specific information for a node,
- "san_ffdc" - SAN specific trace dumps for a node,
- "cluster_peer" - Cluster peering specific dumps for a node,
- "crs" - Config Replication Service information,
- "cps" - Cluster Persistency Storage information,
- "memevt" - MemEVT gathered data from a node,
- "san_fcp" - FCP target driver related information for a node,

- "ndmp" - NDMP information,
- "ndu" - NDU specific information,
- "name_services" - Name Services specific information,
- "san_vdom" - SAN VDOM specific information for a node,
- "snaplock" - SnapLock specific information for a node,
- "key_manager" - Key Manager specific information,
- "appdm" - Application DM,
- "corefile" - Corefile to upload,
- "flexcache" - FlexCache,
- "nvmf" - NVMF specific information,
- "snapshot" - Snapshots specific information,
- "rdma" - RDMA driver and OFED layer specific information,
- "ndo" - NDO specific information,
- "metroclustertcp" - MetroCluster TCP specific information for a node,
- "metroclusterstats" - MetroCluster statistics for data analytics,
- "object_store_server" - Object store server specific information for a node,
- "storage_stats" - Storage statistics for data analytics,
- "ipsec" - IPsec specific information,
- "hm_switch" - Ethernet switch health monitoring information,
- "arw" - Anti-ransomware specific information,
- "svm_migrate" - Vserver migrate information,
- "nic" - NIC driver specific information

smtp|http|https Possible values:

- "smtp" ,
- "http" ,
- "https"

[none]

Element definition: **autosupport-cmd-tgt**

[top]

Execution domain of AutoSupport content Possible values:

- "bsd" - Command executed by BSD,
- "smf_table" - Command selects SMF table,
- "file" - Command indicates file to collect,
- "dblade" - Collect from dbladecli,
- "dblade_file" - Collect a file from dblade. Could be partner file,
- "zapi_xml" - Response in XML format,
- "custom_fx" - Collect custom function output file

[none]

Element definition: **autosupport-config-info**

[top]

AutoSupport configuration data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
from		mail-address optional	The e-mail address of the local administrator, used as the sender of the AutoSupport message. To generate node-specific 'from' addresses, use the 'node-specific-from' (privilege: advanced) parameter. Attributes: non-creatable, modifiable
is-enabled		boolean optional	Specifies whether the AutoSupport daemon is enabled. When this setting is disabled, delivery of all AutoSupport messages is turned off. Attributes: non-creatable, modifiable
is-local-collection-enabled		boolean optional	Used to enable / disable collection of AutoSupport data when the AutoSupport daemon is disabled. When this setting is true, collection of AutoSupport data will still be done if is-enabled is false. Attributes: non-creatable, modifiable
is-nht-data-enabled		boolean optional	Used to enable / disable collection of disk health data. Attributes: non-creatable, modifiable
is-node-in-subject		boolean optional	Specifies whether the filer's hostname should be part of an AutoSupport message's subject field. Attributes: non-creatable, modifiable
is-ondemand-download-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Download feature is enabled. Default is true. Attributes: non-creatable, modifiable
is-ondemand-enabled		boolean optional	Specifies whether AutoSupport OnDemand is enabled. Default is true. Attributes: non-creatable, modifiable
is-ondemand-remote-diag-enabled		boolean optional	Specifies whether the AutoSupport OnDemand Remote Diagnostics feature is enabled. Default is true. Attributes: non-creatable, modifiable
is-perf-data-enabled		boolean optional	Used to enable / disable collection of Performance AutoSupport data. Attributes: non-creatable, modifiable
is-private-data-removed		boolean optional	Used to enable / disable removal of customer-supplied data. Attributes: non-creatable, modifiable
is-reminder-enabled		boolean optional	Specifies whether to enable / disable AutoSupport reminders. Attributes: non-creatable, modifiable
is-support-enabled		boolean optional	Specifies whether AutoSupport notification to technical support is enabled. Attributes: non-creatable, modifiable

is-throttle-enabled		boolean optional	Specifies whether to enable / disable throttling to prevent a potential avalanche of AutoSupport messages. Attributes: non-creatable, modifiable
last-subject		string optional	The subject field of the last generated AutoSupport message. Attributes: non-creatable, non-modifiable
last-timestamp	**[0..2^31-1]**	integer optional	The timestamp of the last generated AutoSupport message. The time value is in seconds since January 1, 1970 UTC. Attributes: non-creatable, non-modifiable
mail-hosts		string[] optional	The name of the mail server(s) used to deliver AutoSupport messages via SMTP. Both host names and IP addresses may be used as valid input. One can optionally specify a username/password for authentication with the mailserver(rfc4954). Attributes: non-creatable, modifiable
max-download-rate	**[0..2^63-1]**	integer optional	Maximum download rate (in bytes per second). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or in the range 20480 (20KBps)- 10737418240 (10GBps). Attributes: non-creatable, modifiable
max-http-size	**[0..2^63-1]**	integer optional	Delivery size limit for the HTTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB). Attributes: non-creatable, modifiable
max-smtp-size	**[0..2^63-1]**	integer optional	Delivery size limit for the SMTP transport protocol (in bytes). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 2097152 (2MB). Attributes: non-creatable, modifiable
max-upload-rate	**[0..2^63-1]**	integer optional	Maximum upload rate (in bytes per second). As of Data ONTAP 8.3.1, this value should be either 0 (for unlimited) or greater than or equal to 20480 (20KBps). Attributes: non-creatable, modifiable
minimum-private-data-length	**[2..1024]**	integer optional	Minimum Length for Sensitive Data Attributes: non-creatable, modifiable
node-name		string optional	The name of the filer that owns the AutoSupport configuration. Attributes: key, non-creatable, non-modifiable
node-specific-from		boolean optional	Specifies whether to generate a node-specific 'from' address by prepending the node name to the 'from' email address. Default is false. Attributes: non-creatable, modifiable
noteto		mail-address[] optional	(DEPRECATED) Specifies up to five recipients of short AutoSupport e-mail messages. Attributes: non-creatable, modifiable
ondemand-polling-interval	**[0..2^32-1]**	integer optional	The AutoSupport OnDemand Client polling rate in minutes. As of Data ONTAP 8.3.1, this value should be in the range 5-2880. Attributes: non-creatable, modifiable
ondemand-server-url		string optional	The AutoSupport OnDemand Server URL. Attributes: non-creatable, modifiable
partner-address		mail-address[] optional	Specifies up to five partner vendor recipients of full AutoSupport e-mail messages. Attributes: non-creatable, modifiable
payload-format		compression-format optional	The format used to compress the AutoSupport message payload. Attributes: non-creatable, modifiable Possible values: • "7z" - 7-Zip Archive, • "tgz" - Zipped Tarball
periodic-tx-window		string optional	The transmission window (seconds). Attributes: non-creatable, modifiable

post-url		string optional	The URL used to deliver AutoSupport messages via HTTP POST. Attributes: non-creatable, modifiable
proxy-url		string optional	Optional proxy host for AutoSupport message delivery via HTTP. Attributes: non-creatable, modifiable
put-url		string optional	The URL used to deliver AutoSupport messages via HTTP PUT. Attributes: non-creatable, modifiable
retry-count	**[0..2^32-1]**	integer optional	The maximum number of delivery attempts for an AutoSupport message. As of Data ONTAP 8.3.1, this value should be in the range 5-30. Attributes: non-creatable, modifiable
retry-interval		string optional	The number of seconds to wait, after a failed delivery attempt, prior to re-transmitting an AutoSupport message. Attributes: non-creatable, modifiable
support-address		mail-address[] optional	The e-mail address of Support. Attributes: non-creatable, modifiable
to		mail-address[] optional	Specifies up to five recipients of full AutoSupport e-mail messages. Attributes: non-creatable, modifiable
transport		asup-transport optional	The name of the transport protocol used to deliver AutoSupport messages. Attributes: non-creatable, modifiable Possible values: • "smtp" , • "http" , • "https"
validate-digital-certificate		boolean optional	Validate Digital Certificate Received Attributes: non-creatable, modifiable

cf-aggregate-giveback-status

[top]

Returns giveback status of all the aggregates in the cluster which are taken over or were given back.

Input Name	Range	Type	Description
desired-attributes		cf-aggregate-giveback-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..100]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cf-aggregate-giveback-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cf object. All cf objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cf-aggregate-giveback-info[]	The list of attributes of cf objects.

		optional	
next-tag		string optional	Tag for the next call. Not present when there are no more cf objects to return.
num-records	**[0..100]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cf-force-takeover

[top]

Forces one filer to take over its partner even though the filer detects an error that would otherwise prevent a takeover. For example, normally, if a detached or faulty interconnect cable between the filers causes the filers' NVRAM contents to be unsynchronized, takeover is disabled. However, this will allow the filer to take over its partner despite the unsynchronized NVRAM contents. cf-force-takeover is dangerous and can lead to data corruption; in almost all cases, use cf-takeover instead.

Input Name	Range	Type	Description
disaster		boolean optional	When set to true, forces a filer to take over its partner in all cases where a force-takeover would. In addition it will force a takeover even if some partner mailbox disks are inaccessible. It can only be used when remotesyncmirror is licensed. This option is very dangerous. Not only can it cause data corruption, if not used carefully, it can also lead to a situation where both the filer and it's partner are operational (split brain). As such, it should only be used as a means of last resort when the takeover and force-takeover operations are unsuccessful in achieving a takeover. The operator must ensure that the partner filer does not become operational at any time while a filer is in a takeover mode initiated by the use of this operation. In conjunction with RAID mirroring, it can allow recovery from a disaster when the two filers are setup in a MetroCluster configuration.
node		string	This parameter is the name of the node which is doing a takeover of its partner.

cf-get-iter

[top]

Iterate over a list of cf objects.

Input Name	Range	Type	Description
desired-attributes		storage-failover-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		storage-failover-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cf object. All cf objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		storage-failover-info[] optional	The list of attributes of cf objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cf objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cf-get-partner

[top]

Get the host name of the partner. If the name is unknown, It will return partner-unknown.

Input Name	Range	Type	Description
node		string	The node name is passed as an argument

Output Name	Range	Type	Description
partner		string	Host name of the partner or partner-unknown, if the host name is not known.

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

cf-giveback

[top]

Initiates a giveback of partner resources. Once the giveback is complete, the automatic takeover capability is disabled until the partner is rebooted. A giveback fails if outstanding CIFS sessions, active system dump processes, or other filer operations makes a giveback dangerous or disruptive.

Input Name	Range	Type	Description
force		boolean optional	When set to true, this allows a giveback to proceed even if there are outstanding CIFS sessions, active system dump processes, or other filer operations which makes a giveback dangerous or disruptive as long as it would not result in data corruption or filer error. When set to false, this does not allow a giveback to proceed if there are outstanding CIFS sessions, active system dump processes, or other filer operations which makes a giveback dangerous or disruptive. The default value is false.
node		string	This parameter is the name of the node which performs giveback to its partner.
only-cfo-aggregates		boolean optional	When set to true, only the CFO HA-style aggregates (which includes the root aggregate) will be given back. This may be needed in the case when the partner node's VLDB and other such management applications are not properly working (they are required to be online for the SFO HA-style aggregates to start serving data), so it might not be possible to giveback SFO HA-style aggregates. When set to false, all the aggregates (CFO HA-style aggregates + SFO HA-style aggregates) will be given back. The default value is false.
override-vetoes		boolean optional	Some conditions cause attempts to giveback aggregates to be vetoed. When set to true, this allows the process of giveback of the aggregates to be initiated even in the face of such vetoes. When set to false, this does not allow the process of giveback of the aggregates to proceed if there are any vetoes. The default value is false.
require-partner-waiting		boolean optional	When set to true, this ensures that the process of giveback of the aggregates is not initiated if the partner is not up and waiting to receive them. When set to false, this allows the process of giveback of the aggregates to proceed even if the partner is not up and waiting to receive them. The default value is true.

cf-hwassist-stats

[top]

Get useful information about statistics of hardware assisted takeover functionality.

Input Name	Range	Type	Description

Input Name	Range	Type	Description
node		string	Node name of the filer for which the API is requested.

Output Name	Range	Type	Description
hwassist-stats-abnormal-reboot		string optional	Number of abnormal_reboot alerts received
hwassist-stats-bad-nvram-id		string optional	Number of bad NVRAM id alerts received
hwassist-stats-dimm-uecc-error		string optional	Number of dimm_uecc_error alerts received
hwassist-stats-keep-alive		string optional	Number of keep_alive alerts received
hwassist-stats-loss-of-heartbeat		string optional	Number of loss_of_heartbeat alerts received
hwassist-stats-post-error		string optional	Number of post_error alerts received
hwassist-stats-power-cycle-via-rlm		string optional	Number of power_cycle_via_rlm alerts received
hwassist-stats-power-cycle-via-sp		string optional	Number of power_cycle_via_sp alerts received
hwassist-stats-power-loss		string optional	Number of power_loss alerts received
hwassist-stats-power-off-via-rlm		string optional	Number of power_off_via_rlm alerts received
hwassist-stats-power-off-via-sp		string optional	Number of power off alerts received from service processor (power_off_via_sp alert).
hwassist-stats-reset-via-rlm		string optional	Number of reset_via_rlm alerts received
hwassist-stats-reset-via-sp		string optional	Number of reset_via_sp alerts received
hwassist-stats-ss-mismatch		string optional	Number of shared secret key mismatch alerts received
hwassist-stats-test		string optional	Number of test alerts received
hwassist-stats-times-throttled		string optional	Number of times hardware assist alerts were throttled. Alerts are throttled when too many are received in a short interval.
hwassist-stats-unknown-alerts		string optional	Number of unknown alerts received
hwassist-stats-watchdog-reset		string optional	Number of l2_watchdog_reset alerts received
no-stats		string optional	If no hardware assist statistics are available, this is set to "Cannot determine hwassist stats".

Errno	Description
EINTERNALERROR	

cf-hwassist-stats-clear

[top]

Get useful information about stats of hw_assist functionality.

Input Name	Range	Type	Description

node		string	Node name of the filer for which the API is requested.

Errno	Description
EINTERNALERROR	

cf-hwassist-status

[top]

Get useful information about the status of hw_assist functionality.

Input Name	Range	Type	Description
node		string	Node name of the filer for which the API is requested.

Output Name	Range	Type	Description
keep-alive-status		string optional	Possible values are: • healthy • missed_keep_alive_alerts
local-hwassist-inactive-corrective-action		string optional	Indicates the corrective action if status is inactive.
local-hwassist-inactive-reason		string optional	Indicates the reason if status is inactive.
local-hwassist-ipaddr		string optional	If set, Ip address; 0.0.0.0 otherwise
local-hwassist-port		integer optional	If set, port; 0 otherwise
local-hwassist-status		string optional	Local node hw_assist status Possible values are: • active: If functionality is active. • inactive: If functionality is inactive
no-status		string optional	Set if no hw_assist status is avaliable. Either this or the remaining fields will be set,hence they are optional.
partner-hwassist-inactive-corrective-action		string optional	Indicates the corrective action if status is inactive.
partner-hwassist-inactive-reason		string optional	Indicates the reason if status is inactive.
partner-hwassist-ipaddr		string optional	If set, Ip address, 0.0.0.0 otherwise
partner-hwassist-port		integer optional	If set, current port, 0 otherwise
partner-hwassist-status		string optional	partner node hw_assist status Possible values are: • active: If functionality is active. • inactive: If functionality is inactive

Errno	Description
EINTERNALERROR	

cf-hwassist-test

[top]

Validates the hardware-assisted takeover configuration. functionality.

Input Name	Range	Type	Description
node		string	Node name of the filer for which the API is requested.

Output Name	Range	Type	Description
hwassist-test-result		string	This string corresponds to the result of the test. The possible outcomes are: Hwassist is not initialized No hw_assist hardware found. Partner is throttling alerts. Resource busy. Try again after some time. Hwassist hardware returned error. No response from partner. Timed out. Unexpected abort. Partner has taken over. Interconnect is down between nodes. Make sure partner is booted up.Run 'storage failover hwassist show' for details.

Errno	Description
EINTERNALERROR	

cf-mode-set

[top]

Enable or disable the high-availability (HA) for this node. A reboot of the node is required for the HA mode to become effective.

Input Name	Range	Type	Description
mode		string	HA mode. Possible values: • 'ha' - Enable high-availability(HA). After HA is enabled, giveback and and takeover are available. • 'non_ha' - Disable high-availability(HA). After HA is disabled, the giveback and takeover are not available. Note that changing the mode to non_ha requires disabling the takeover facility by calling cf-service-disable.
node		node-name	Node name

Errno	Description
ESERVICEENABLED	
EINTAKEOVER	
EINTERNALERROR	

cf-modify-iter

[top]

Modify the attributes of cf or a group of cf objects.

Input Name	Range	Type	Description
attributes		options-related-info-modify	Specify at least one modifiable element. Do not specify any other element.
continue-on-failure		boolean optional	This input element is useful when multiple cf objects match a given query. If set to true, the API will continue modifying the next matching cf even when modification of a previous cf fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed modify operations before the server gives up and returns. If set, the API will continue modifying the next matching cf even when the modification of a previous matching cf fails, and do so until the total number of objects failed to be modified reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed modify operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of objects to be modified in this call. Default: 20
query		options-related-info-modify	If modifying a specific cf, this input element must specify all keys. If modifying cf objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of cf objects (just keys) that were not modified due to some error. If set to false, the list of cf objects not modified will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of cf objects (just keys) that were successfully updated. If set to false, the list of cf objects modified will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
failure-list		cf-modify-iter-info[] optional	Information about cf objects that were not modified due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching cf objects to be modified.
num-failed	**[0..2^32-1]**	integer optional	Number of cf objects that matched the query, but were not modified due to some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of cf objects that matched the query and were successfully updated.
success-list		cf-modify-iter-info[] optional	The cf objects that were successfully updated. This element will be returned only if input element 'return-success-list' is true

Errno	Description

Errno	Description
EINTERNALERROR	

cf-negotiated-failover-disable

[top]

Disables negotiated failover. disk_shelf is the negotiated failover module currently supported.

Input Name	Range	Type	Description
module		string	Module currently supported is 'disk_shelf'.

Errno	Description
EINTERNALERROR	

cf-negotiated-failover-enable

[top]

Enables negotiated failover. disk_shelf is the negotiated failover module currently supported.

Input Name	Range	Type	Description
module		string	Module currently supported is 'disk_shelf'.

Errno	Description
EINTERNALERROR	

cf-negotiated-failover-status

[top]

Returns the status of the negotiated failover module. Negotiated failover is a general facility which supports negotiated failover on the basis of decisions made by various modules.

Input Name	Range	Type	Description
module		string	Module currently supported is 'disk_shelf'

Output Name	Range	Type	Description
is-enabled		boolean	True, if storage failover for this module is enabled, false otherwise.

Errno	Description
EINTERNALERROR	

cf-service-disable

[top]

Disables the takeover capability of this filer in the cluster.

Input Name	Range	Type	Description
node		string	This parameter is the name of the node on which service is to be disabled

Errno	Description
ESERVICENOTINITIALIZED	
ESERVICENOTLICENSED	
ESERVICENOTENABLED	
EREVERTINPROGRESS	
EINTERNALERROR	

cf-service-enable

[top]

Enables the takeover capability of this filer in the cluster. This spawns a process to enable the service

Input Name	Range	Type	Description
node		string	This parameter is the name of the node on which service is to be enabled

Errno	Description
ESERVICENOTINITIALIZED	
ESERVICEENABLED	
EREVERTINPROGRESS	
EMBOXUNKNOWN	
EINTERNALERROR	

cf-status

[top]

Get useful information about the status of the high availability service. If the monitor is not initialized, this returns an error.

Input Name	Range	Type	Description
node		string	This parameter is the name of the node for which High Availability service status is being requested

Output Name	Range	Type	Description
backup-io-times		mailbox-io-times-info optional	Backup mailbox IO times. Not returned if state is "waiting_for_root_aggr".
backup-mailbox-status		mailbox-status-info[] optional	Backup mailbox status information, represented as a list of strings. Not returned if state is "waiting_for_root_aggr".
booting-received		integer	time booting notification received, in milliseconds.
control-partner-		boolean	True, if we control one or more partner aggregates.

aggregates			
current-giveback-module		string optional	The current module giveback process is in
current-mode		string optional	Current HA mode
current-resource-table-entry		string optional	If we're doing takeover processing, the name of the current entry in the resource table.
current-resource-table-entry-index		integer optional	If we're doing takeover processing, the index of the current entry in the resource table.
current-takeover-module		string optional	The current module takeover process is in. e.g. WAFL
current-time		integer	Current time on the filer
fanta-reloc-aggr-count		integer optional	Number of partner homed aggregates owned by local node.
firmware-received		integer	time firmware notification received, in milliseconds.
giveback-failure-reason		string optional	If a giveback failed this is the reason for the giveback failure. Possible values are: • aggr_relocation_in_progress - aggregate relocation is in progress • shutdown_in_progress - shutdown is in progress • testpoint - a giveback failure was simulated with a testpoint • cannot_giveback_partner_subsystem - node failed to giveback one of partner's subsystems • bck_mbx_update_error - node could not update its backup mailbox • disaster_recovery_in_progress - disaster recovery operation is in progress • partner_disaster_recovery_in_progress - disaster recovery operation is in progress on the partner node
			Giveback state of the node. Possible values are: • nothing_to_gb - No partner aggregates owned by local node • not_attempted_yet - Local node owns partner aggregates and a giveback has not been attempted yet • giveback_in_progress - Giveback is in progress. Refer to current-giveback-module field to get the current module, the giveback process is in. • giveback_failed_autogiveback_disabled - Previous giveback failed and auto giveback is disabled. Refer to current-giveback-module to get the module in which giveback process failed. • giveback_failed_autogiveback_scheduled - Previous giveback failed and an auto giveback is scheduled. Refer to current-giveback-module to get the module in which giveback process failed. Refer time-until-autogiveback field to check time remaining before an auto giveback is initiated. • previous_giveback_failed - Previous giveback failed. Refer to current-giveback-module to get the module in which giveback process failed. • giveback_vetoed_no_di - Normal giveback not possible as

giveback-state		string optional	disk inventory from partner has not yet been received • giveback_vetoed_missing_disks - Normal giveback not possible as the partner is missing some of its files system disks • autogiveback_scheduled - An auto giveback is scheduled Refer time-until-autogiveback field to check time remaining before an auto giveback is initiated. • autogiveback_deferred - Auto giveback is deferred because the partner node was not ready to receive aggregates when the auto giveback timer expired. An auto giveback will be initiated as soon as the partner node is up and ready to receive aggregates. • node_upgrade_in_progress - Local node owns partner's aggregates as part of node upgrade process • sfo_aggr_giveback_failed - Giveback of SFO aggregates failed. Call cf-aggregate-giveback-status API for more information regarding giveback failure. • sfo_aggr_giveback_in_progress - Giveback of SFO aggregates is in progress. Call cf-aggregate-giveback-status API for more information regarding giveback status. • partial_giveback - Local node owns partner SFO aggregates • partner_spare_disks_giveback_pending - Local node owns partner's spare disks
ha-type		string optional	HA type Possible values are: • none - None • shared_storage - Shared storage HA configuration • non_shared_storage - Non-shared storage HA configuration ***** typedefs *****
interconnect-links		string optional	States of the individual interconnect links e.g. VIA Interconnect is down (link 0 down, link 1 down) VIA Interconnect is up (link 0 down, link 1 up) VIA Interconnect is up (link 0 up, link 1 down)
interconnect-type		string optional	Type and Vendor of the interconnect e.g. Infiniband (Mellanox Sinai) FCVI (Qlogic 2462)
is-enabled		boolean	True, if the storage failover facility is enabled, false otherwise. Note that the facility can be enabled but takeover may not be possible due to various reason.
is-interconnect-up		boolean	True, if high availability interconnect is up
kill-packets		boolean	True, if we issue ic kill messages during takeover.
local-firmware-progress		integer optional	A counter to indicate that the local node is progressing in the current firmware state The range of possible values is [0..2^31-1]
			Local firmware state that will be communicated through interconnect to the partner • SF_OPERATOR_EXIT - operator completed • SF_DEBUG_EXIT - debugger completed • SF_PROGRESS - progress counter • SF_IOERROR - I/O error • SF_BADCKSUM - bad checksum • SF_RESERVED - reserved • SF_UNKNOWN - unknown • SF_OPEN - initializing • SF_POST - in power-on self test • SF_BOOTING - booting

local-firmware-state		string optional	• SF_FAIL - boot failed • SF_WAITING - waiting • SF_OS_BOOTED - kernel loaded • SF_UP - up • SF_DEBUG - in debugger • SF_OPERATOR - waiting for operator input • SF_DUMPCORE - dumping core • SF_HALT - halted • SF_REBOOT - rebooting • SF_GIVEWAIT - waiting for giveback • SF_MBWAIT - waiting for HA mailbox release • SF_SPARECORE - dumping sparecore and ready to be taken-over • SF_MDP - multi-disk panic • SF_TO - in takeover • SF_NOTO - takeover disabled • SF_CLUSTERWAIT - waiting for cluster apps
local-in-headswap		boolean optional	True, if the local node is being replaced by a new node.
local-mailbox-disks		sf-disk-info[] optional	List of local mailbox disks. Not returned if state is "waiting_for_root_aggr".
local-missing-disks		sf-disk-info[] optional	List of disks that the local node is missing but the partner node is able to view.
logs-unsynced-count		integer	Number of times the log was unsynchronized.
max-resource-table-index		integer optional	The maximum resource table index.
mode		string optional	High-availability (HA) mode for this node Possible values: • 'ha' - High-availability is enabled. • 'non_ha' - High-availability is disabled.
name		string	Hostname of the dblade.
new-partner-sysid	**[0..2^32-1]**	integer optional	The new partner system ID recieved via HA interconnect. The value is zero if partner is not in headswap.
			State of the storage failover of the node. Possible values are: • connected - Partner is available for takeover • takeover_scheduled - Partner is down and takeover is scheduled • takeover_started - Takeover process has begun • takeover - Currently controlling partner's resources. • takeover_failed - Failed to takeover the partner • giveback_partial_waiting - This node controls partner aggregates even though the node is not in takeover. And we're waiting for a connection to the partner. • giveback_partial_connected - This node controls partner aggregates even though the node is not in takeover. The partner is available to receive the aggregates. • waiting_for_root_aggr - Partner is controlling dblade's root aggregate If we're in this state, many other optional fields are not returned. • waiting - Waiting for a connection to partner. Generally happens while partner is rebooting.

node-state		string optional	• in_maintenance_mode - node is in maintenance mode. In the mode it is not possible to determine more detailed information (e.g. takeover or not). • pending_shutdown - starting a takeover/giveback is inhibited due to a pending system shutdown. • relocating_aggrs_before_takeover - node is relocating its SFO aggregates to its partner prior to a negotiated takeover. • sfo_takeover_phase_done - Node is done with the SFO phase of takeover. • sfo_takenover_phase_done - This node has relocated its SFO aggregates to its partner during an optimized negotiated takeover by its partner. • sfo_takeover_phase_aborted - The SFO phase of takeover has been aborted. Refer to takeover-failure-reason field to check the reason. • sfo_takenover_phase_aborted - This node has aborted the relocation of its SFO aggregates to its partner, during an optimized negotiated takeover by its partner. • in_non_HA_mode - Node is not in HA mode • cfo_takeover_failed - CFO phase of takeover failed • sfo_takeover_phase - SFO phase of takeover of partner is in progress • relocated_aggrs_before_takeover - node has relocated its SFO aggregates to its partner prior to a negotiated takeover. • giving_back - Giveback is in progress. Refer to current-giveback-module field to get the current module, the giveback process is in. • giveback_failed_autogiveback_disabled - Previous giveback failed and auto giveback is disabled. Refer to current-giveback-module to get the module in which giveback process failed. • giveback_failed_autogiveback_scheduled - Previous giveback failed and an auto giveback is scheduled. Refer to current-giveback-module to get the module in which giveback process failed. Refer to time-until-autogiveback field to check time remaining before an auto giveback is initiated. • previous_giveback_failed - Previous giveback failed. Refer to current-giveback-module to get the module in which giveback process failed. • takeover_disk_inventory_not_received - Local node is in takeover. A normal giveback is not possible as disk inventory from partner has not yet been received. • takeover_partner_missing_disks - Local node is in takeover. A normal giveback is not possible as the patner is missing some of its file system disks. • takeover_autogiveback_scheduled - Local node in takeover. An auto giveback is scheduled. Refer time-until-autogiveback field to check time remaining before an auto giveback is initiated. • takeover_network_failure - Local node in takeover. The partner was taken over due to network failure. • takeover_autogiveback_deferred - Local node in takeover. Auto giveback is deferred because the partner node was not ready to receive aggregates when the auto giveback timer expired. An auto giveback will be initiated as soon as the partner node is up and ready to receive aggregates. • automatic_takeover_disabled_connected - Automatic takeover is disabled. Local node is connected to partner via HA interconnect. This happens only in debug builds when

			raid.panic.missing.disks is turned on from node CLI. • automatic_takeover_disabled_waiting - Automatic takeover is disabled. Local node is waiting for partner node on HA interconnect. This happens only in debug builds when raid.panic.missing.disks is turned on from node CLI. • ndo_upgrade_in_progress - Local node owns partner's aggregates as part of node upgrade process. • own_aggr_non_local_connected - Local node owns aggregates of some other node in the cluster. Local node is connected to partner via HA interconnect. This is possible only during NDO double hop controller upgrade. • own_aggr_non_local_waiting - Local node owns aggregates of some other node in the cluster. Local node is waiting for partner on HA interconnect. This is possible only during NDO double hop controller upgrade. • clusterwait_connected - Connected to partner via HA interconnect. Local node waiting for cluster applications to come online. • clusterwait_waiting - Waiting for partner on HA interconnect. Local node waiting for cluster applications to come online. • dr_op_in_progress - MetroCluster disaster recovery operation is in progress. • error - There is an error with the system User have to compare the return values case-insensitively.
nvram-id	**[0..2^32-1]**	integer	NVRAM identifier
partner		string	Hostname of the partner. If the partner is unknown, returns an empty string.
partner-firmware-progress		integer optional	A counter to indicate that the partner node is progressing in the current firmware state The range of possible values is [0..2^31-1]
partner-firmware-state		string optional	Partner firmware state as communicated by the partner through interconnect • SF_OPERATOR_EXIT - operator completed • SF_DEBUG_EXIT - debugger completed • SF_PROGRESS - progress counter • SF_IOERROR - I/O error • SF_BADCKSUM - bad checksum • SF_RESERVED - reserved • SF_UNKNOWN - unknown • SF_OPEN - initializing • SF_POST - in power-on self test • SF_BOOTING - booting • SF_FAIL - boot failed • SF_WAITING - waiting • SF_OS_BOOTED - kernel loaded • SF_UP - up • SF_DEBUG - in debugger • SF_OPERATOR - waiting for operator input • SF_DUMPCORE - dumping core • SF_HALT - halted • SF_REBOOT - rebooting • SF_GIVEWAIT - waiting for giveback • SF_MBWAIT - waiting for HA mailbox release • SF_SPARECORE - dumping sparecore and ready to be taken-over • SF_MDP - multi-disk panic • SF_TO - in takeover

			• SF_NOTO - takeover disabled • SF_CLUSTERWAIT - waiting for cluster apps
partner-in-headswap		boolean optional	True, if partner node is being replaced by a new node.
partner-mailbox-disks		sf-disk-info[] optional	List of partner mailbox disks as this dblade sees them. Not returned if state is "waiting_for_root_aggr".
partner-missing-disks		sf-disk-info[] optional	List of disks that the partner node is missing but the local node is able to view.
partner-name		string optional	Hostname of the partner. Not returned if unknown.
partner-nvram-id	**[0..2^32-1]**	integer optional	Partner NVRAM identifier. Not returned if unknown.
primary-io-times		mailbox-io-times-info optional	Primary mailbox IO times. Not returned if state is "waiting_for_root_aggr".
primary-mailbox-status		mailbox-status-info[] optional	Primary mailbox statusPrimary mailbox status information, represented as a list of strings. Not returned if state is "waiting_for_root_aggr".
resource-table		resource-table-info[] optional	The failover monitor resource table.Pre-rsrctbl information will be prep-ended to this output.
sf-options		sf-options-info optional	Options for debugging purpose. The actual interface is via the options mechanism. Not returned if state is "waiting_for_root_aggr".
state		string optional	connected - Partner is available for takeover takeover_scheduled - Partner is down and takeover is scheduled takeover_started - Takeover process has begun takeover - Currently controlling partner's resources. taken over - Partner is controlling filer's resources takeover_failed - Failed to takeover the partner sfo_takeover_phase - This node has asked its partner to relocate its SFO aggregates in preparation for takeover. This occurs when a user has initiated an optimized negotiated takeover. relocating_aggrs_before_takeover - This node is relocating its SFO aggregates to its partner during an optimized negotiated takeover by its partner. sfo_takeover_phase_done - This node is done with the SFO phase of an optimized negotiated takeover. sfo_takenover_phase_done - This node has relocated its SFO aggregates to its partner during an optimized negotiated takeover by its partner. sfo_takeover_phase_aborted - The SFO phase of takeover is aborted on this node during an optimized negotiated takeover of its partner. sfo_takenover_phase_aborted - This node has aborted the relocation of its SFO aggregates to its partner, during an optimized negotiated takeover by its partner. giving_back - Sendhome process in progress giveback_partial_waiting - This node controls partner aggregates even though the node is not in takeover. And we're waiting for a connection to the partner. giveback_partial_connected - This node controls partner aggregates even though the node is not in takeover. The partner is available to receive the aggregates. waiting_for_root_aggr - Partner is controlling dblade's root aggregate If we're in this state, many other optional fields are not

			returned. waiting - Waiting for a connection to partner. Generally happens while partner is rebooting. in_maintenance_mode - node is in maintenance mode. In the mode it is not possible to determine more detailed information (e.g. takeover or not). pending_shutdown - starting a takeover/sendhome is inhibited due to a pending system shutdown. error - There is an error with the system User have to compare the return values case-insensitively.
takeover-by-partner-not-possible-reason		takeover-info[] optional	If takeover by the partner is not possible, list of one or more reasons why. Note that in for non-verbose command output the first reason returned is the one that should be displayed.
takeover-by-partner-possible		boolean optional	True, if storage failover takeover is currently possible by the partner, false otherwise. Note that this is the local node's view of partner.
takeover-failure-reason		string optional	If state equals "takeover_failed", this is the reason for the takeover failure. Possible values are: • shutdown_in_progress - shutdown is in progress • aggr_relocation_in_progress - aggregate relocation is in progress • giveback_in_progress - giveback is in progress • takeover_in_progress - takeover is in progress • unknown_partner_id - node could not detect its partner's system ID • conflicting_sysid - node has the same system ID as its partner • pri_mbx_update_error - node could not update its primary mailbox • takeover_disabled_by_partner - partner has disabled takeover • cannot_takeover_partner_subsystem - node failed to takeover one of partner's subsystems • non_etc_or_rc_boot - it is not possible to takeover in a non-etc/rc boot • bck_mbx_update_error - node could not update its backup mailbox • partner_taking_over - partner is taking over local node • revert_in_progress - revert is in progress • disaster_recovery_in_progress - disaster recovery operation is in progress • headswap_in_progress - headswap is in progress • destination_check_failed - destination check failed • communication_failed - communication with destination failed • operation_aborted - operation was aborted • aggr_not_online - destination node did not online the aggregate being relocated in time • sfo_disabled - storage failover service is not enabled • partner_taking_over - partner is taking over local node • bdfu_not_disabled_source - failed to disable background disk firmware update (BDFU) on local node • bdfu_not_disabled_dest - failed to disable background disk firmware update (BDFU) on partner node • partner_shutting_down - shutdown is in progress on the partner node • partner_aggr_relocation_in_progress - aggregate relocation is in progress on the partner node • partner_giveback_in_progress - giveback is in progress on the partner node • partner_revert_in_progress - revert is in progress on the

			partner node • partner_disaster_recovery_in_progress - disaster recovery operation is in progress on the partner node • partner_in_headswap - headswap is in progress on the partner node
takeover-of-partner-not-possible-reason		takeover-info[] optional	If is-enabled is false, list of one or more reasons why. Note that in for non-verbose command output the first reason returned is the one that should be displayed.
takeover-possible		boolean	True, if storage failover takeover is currently possible, false otherwise.
takeover-reason		string optional	Reason for triggering a takeover of partner.
takeover-state		string optional	Takeover state of the node. Possible values are: • takeover_failed - Takeover Failed • sfo_takeover_in_progress - SFO phase of takeover of partner is in progress • relocating_aggrs_before_takeover - Relocating aggregates to partner as a takeover was initiated by partner • cfo_takeover_scheduled - CFO phase of takeover is scheduled • relocated_aggrs_before_takeover - Relocated aggregates to partner after a takeover was initiated by partner • takeover_by_partner_failed - A takeover attempt by partner failed. Refer to takeover-failure-reason field to check the reason for takeover failure. • in_takeover - Node is in takeover • takeover_started - A takeover is in progress • takeover_scheduled - A takeover of partner is scheduled. Refer to time-until-takeover field to check time remaining till takeover. • not_in_takeover - Local node is not in takeover
time-since-takeover		integer optional	Time in milliseconds since the local node has taken over partner.
time-until-auto-giveback		integer optional	If state == takeover this is the countdown time in seconds until auto-giveback is started. The range of possible values is [0..2^31-1]. This attribute will be absent on output when the value is 0.
time-until-takeover		integer optional	if state == takeover_scheduled, this is the countdown time in seconds until state == takeover_started.
timeouts		timeout-info	Various failover monitor timeouts.
transit-event-time		integer	Time at which last takeover/giveback event occurred, in milliseconds.

Errno	Description
ENODENOTFOUND	

Vfiler-enabled
Yes

cf-takeover

[top]

Initiates a takeover of the storage partner. Takeover is done asynchronously; status may be monitored by calling the cf-status API and examining the state field. If automatic giveback is enabled then control will be returned to storage partner once it boots up.

Input Name	Range	Type	Description
allow-disk-inventory-mismatch		boolean optional	This allows takeover if disk inventory information is mismatched for non root volume disks. If mismatched, local node performance could degrade as what appears to be missing disks are rebuilt. NOTE:: When using this option and if some of partner's file system disks are not visible to local node, then after giveback those missing disks can create new failed aggregate with same name. So, if any aggregate is offline after giveback with same name then using "zapi_aggr_destroy", you have to destroy that offline aggregate.
bypass-optimization		boolean optional	The bypass-optimization option determines whether or not an optimized negotiated takeover is run. Optimized negotiated takeover refers to the serial relocation of SFO aggregates to the taking over node, prior to a negotiated takeover. This is an optimization because it reduces per-aggregate client outage times. If the bypass-optimization option is set to true, then the takeover optimization is bypassed, and the normal takeover code path is executed. The default value for this option is false.
force		boolean optional	It forces a node to take over its storage partner even though the node detects an error that would otherwise prevent a takeover. For example, normally, if a detached or faulty interconnect cable between the nodes(ha pair) causes the nodes NVRAM contents to be unsynchronized, takeover is disabled. However, this will allow the node to take over its storage partner despite the unsynchronized NVRAM contents. cf-force-takeover is dangerous and can lead to data corruption; in almost all cases, use cf-takeover instead.
halt		boolean optional	This parameter specifies whether the node being taken over should be halted. If the value is true, then the node being taken over is halted. If the value is false, then the node being taken over is shutdown and might be rebooted if AUTOBOOT is set to true. This parameter defaults to false.
ignore-quorum-warnings		boolean optional	This option ignores errors that would be returned due to a takeover of the epsilon node or causing an out of quorum. The default value is `false` and thuse the default behavior is to fail on quorum-warnings.
immediate		boolean optional	This causes takeover to be initiated immediately. The taken over node, if up, does not get to shut things down in an orderly manner so the takeover of the resources takes longer.
node		string	This parameter is the name of the node which is doing a takeover of its partner.
override-vetoes		boolean optional	The override-vetoes option ignores any vetoes occuring as part of a negotiated takeover and allows the takeover operation to continue. The default value is `false` which means the operation fails by default if a veto is encountered.
skip-lif-migration		boolean optional	This option results in migration of LIFs to be skipped prior to a takeover. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default value is `false` and hence the default behavior is to synchronously migrate data and cluster management LIFs away from the node prior to its takeover.
version-mismatch-ok		boolean optional	This allows takeover if the partner was running an incompatible operating system version and was cleanly halted. This option is used for non-disruptive upgrade(NDU).

cf-takeover-status

[top]

Get the takeover status of a node and the takeover status of all its partner aggregates, for all nodes in a cluster.

Input Name	Range	Type	Description
desired-attributes		takeover-status optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..100]**	integer optional	The maximum number of records to return in this call. Default: 20
query		takeover-status optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the aggr object. All aggr objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		takeover-status[] optional	The list of attributes of aggr objects.
next-tag		string optional	Tag for the next call. Not present when there are no more aggr objects to return.
num-records	**[0..100]**	integer	The number of records returned in this call.

Element definition: **cf-aggregate-giveback-info**

[top]

Giveback status of an aggregate When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-giveback-error		string optional	Failure reason, incase giveback of this aggregate failed. Possible values include: • "sfo_am_shutdown" - Node is being shutdown • "sfo_am_not_homed_partner" - Aggregate not owned by partner • "sfo_am_not_sfo" - Aggregate does not have SFO policy • "sfo_am_failed_limbo" - Aggregate in failed or limbo state • "sfo_am_offline_failed" - Aggregate could not be offlined during giveback • "sfo_am_migrating" - Aggregate is being migrated • "sfo_am_veto" - Giveback was vetoed. • "sfo_am_communication_err" - Giveback failed because node cannot communicate with the partner • "sfo_am_online_timeout" - Aggregate did not come online after giveback • "sfo_am_online_failed" - Failed to online the aggregate after giveback • "sfo_am_hdd_to_aff_dest" - Migration of a non-SSD aggregate to an All-Flash Optimized destination is not allowed Attributes: non-creatable, non-modifiable
aggr-giveback-module		string optional	If giveback is in progress, then this is set to the module which is currently running. If giveback was failed or vetoed by a certain module then this is set to the first module which failed the giveback. Example: WAFL. Attributes: non-creatable, non-modifiable

aggr-giveback-state		string optional	Giveback status of the aggregate Possible values include: • "sfo_am_done" - Giveback done • "sfo_am_failed" - Giveback failed • "sfo_am_inprog" - Giveback in progress • "sfo_am_not_started" - Giveback not started • "sfo_am_nothing_to_gb" - No aggregates to giveback • "sfo_disk_inventory_not_exchanged" - Auto giveback failed because disk inventory was not exchanged between HA partners • "sfo_disk_inventory_mismatch" - Auto giveback failed because there was mismatch in disk inventory • "sfo_am_failed_bdfu_source" - Giveback failed as failed to disable background disk firmware update on source node. • "sfo_am_failed_bdfu_dest" - Giveback failed as failed to disable background disk firmware update on destination node. • "sfo_am_delayed_bdfu_source" - Giveback delayed as disk firmware update is in progress on source node. • "sfo_am_delayed_bdfu_dest" - Giveback delayed as disk firmware update is in progress on destination node. • "sfo_am_running_checks" - Performing veto checks. Attributes: non-creatable, non-modifiable
aggregate		string optional	Aggregate name Attributes: non-creatable, non-modifiable
destination-node		string optional	Node to which the aggregate is being given back Attributes: non-creatable, non-modifiable
node		node-name optional	Node performing the giveback of aggregate Attributes: key, non-creatable, non-modifiable

Element definition: **cf-modify-iter-info**

[top]

Information about the modify operation that was attempted/performed against cf object.

Name	Range	Type	Description
cf-key		options-related-info-modify	The keys for the cf object to which the modify operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the modify operation caused an error.
error-message		string optional	Error description, if the modify operation caused an error.

Element definition: **mailbox-io-times-info**

[top]

Mailbox IO times

Name	Range	Type	Description
normal		integer	Maximum IO time in milliseconds, normal
transition		integer	Maximum IO time in milliseconds, transition

Element definition: **mailbox-status-info**

[top]

Mailbox status info.

Name	Range	Type	Description
mailbox-status		string	representation of mailbox status bit. Possible values: mbx_status_nodisks mbx_status_uncertain mbx_status_stale mbx_status_conflicted mbx_status_old_version mbx_status_not_found mbx_status_wrong_state mbx_status_backup

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **options-related-info-modify**

[top]

Storage Failover Options to Modify

Name	Range	Type	Description
auto-giveback-enabled		boolean optional	True, if auto-giveback is enabled, false otherwise. Default: true. Attributes: non-creatable, modifiable
failover-enabled		boolean optional	True, if the storage failover facility is enabled, false otherwise. Note that the facility can be enabled but takeover may not be possible due to various reasons. Attributes: non-creatable, modifiable
ha-mode		hamode optional	Specifies whether the node is set up in high-availability mode or stand-alone mode. Attributes: non-creatable, modifiable Possible values: • "ha" , • "non_ha"
node		node-name optional	Node name Attributes: key, non-creatable, non-modifiable
sfo-advanced-options-info-modify		advanced-options-modify optional	Advanced Options to Modify
sfo-giveback-options-info-modify		giveback-options-modify optional	Giveback Options to Modify
sfo-takeover-		takeover-options-	Takeover Options to Modify

options-info-modify		modify optional	

Element definition: **resource-table-info**

[top]

A failover monitor resource table entry.

Name	Range	Type	Description
fail		string	Entry failure code, represented as a string: ok fail fail_always hang panic veto
name		string	Name of the entry
state		string	Entry state, represented as a string: up start_running start_done start_failed stop_running stop_failed takeover_barrier only_when_initd
time-delta		integer optional	Amount of time spent in this element, in milliseconds.

Element definition: **sf-disk-info**

[top]

Disk information.

Name	Range	Type	Description
disk-cluster-name		string optional	A cluster unique name for a disk. Disks take the form 'stack-id'.'shelf'.'bay'. Disks on multi-disk carriers take the form 'stack-id'.'shelf'.'bay'.'lun'. Virtual disks take the form 'prefix'.'number' where prefix is the storage array's prefix and number is a unique ascending number. Omitted if Shelf Enclosure Service is not enabled for this device, information is unavailable, or excluded by 'desired-attributes'.
disk-uid		string	Disk unique identifier. Maximum length of 90 characters. XXX should use same typedef as storage ZAPI. Note sure where it is defined.
name		string optional	Name of the disk, e.g. v1.1
physical-location		integer optional	Name of the location where the disk is physically present. This can be local, partner or mediator.

Element definition: **sf-options-info**

[top]

Options for debugging purpose.

Name	Range	Type	Description
aggregate-migration-timeout		integer optional	Number of seconds the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 40 seconds.
bypass-takeover-		boolean	If true, then optimized negotiated takeover is bypassed. If false, negotiated takeover will be optimized. The default value for this

optimization		optional	option is false. This option will be available starting with Data ONTAP 8.2.
giveback-auto		boolean	Indicates if the automatic giveback is enabled. Same as send-home-auto.
hwassist-enable		boolean	Indicate if hardware assist takeover is enabled.
hwassist-health-check-interval		integer	Hardware assist h/w sends a heartbeat every '-health-check-interval' seconds.
hwassist-partner-ip		string	Hardware assist Ip address of the partner.
hwassist-partner-port		integer	Port number on which hwassist receives alerts.
hwassist-retry-count		integer	Number of times we repeat sending an alert.
mode		string optional	HA mode in registry
node-status-in-mailbox-disks		boolean	Indicates if we propagate node status via mailbox disks.
node-status-in-mailbox-disks-read-interval		integer	Rate in seconds at which we read node status from mailbox disks.
node-status-in-mailbox-disks-write-interval		integer	Rate in seconds at which we write node status to mailbox disks.
send-home-auto		boolean	Indicates if the automatic send-home facility enabled.
send-home-auto-attempts		integer	The number of times we'll try to do an automatic giveback within send-home-auto-minutes
send-home-auto-attempts-minutes		integer	The number of minutes in which we should not exeeced send-home-auto-attempts automatic send-home attempts.
send-home-auto-delay-seconds		integer	The number of seconds of delay before initiating automatic send-home. This will be the minimum time a node will be in takeover state before performing auto sendhome.
send-home-check-partner-waiting		boolean	Indicates if we require the partner to be waiting for a send-home in order to do a send-home.
takeover-detection-time		integer	Takeover detection time in seconds.
takeover-on-failure		boolean	Indicates if we will automatically takeover upon partner failure.
takeover-on-panic		boolean	Indicates if we will automatically takeover upon partner panic.
takeover-on-reboot		boolean	Indicates if we will automatically takeover upon partner reboot.
takeover-on-short-uptime		boolean	Indicates if we will automatically takeover if the partner fails within 60 seconds of booting.

Element definition: **storage-failover-info**

[top]

Storage Failover Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
sfo-giveback-info		giveback-related-info optional	Giveback related Info
sfo-interconnect-info		interconnect-related-info optional	Interconnect Info
sfo-node-info		node-related-info optional	Node Info
sfo-options-info		options-related-info optional	Options Info
sfo-storage-info		storage-related-info optional	Storage Info
sfo-takeover-info		takeover-related-info optional	Takeover related Info

Element definition: **takeover-info**

[top]

Takeover info.

Name	Range	Type	Description
reason		string	reason we can't takeover: • not_initialized - Controller Failover not initialized • non_ha_mode - Controller is in non-HA mode • disabled - Controller Failover takeover disabled • mailbox_invalid - Partner mailbox disks not accessible or invalid • mailbox_uninit - Partner mailbox status uninitialized • fm_version_mismatch - Failover monitor version mismatch • partner_disabled - Takeover disabled by partner • operator_deny - Takeover disabled by operator • nvram_mismatch - NVRAM size mismatch • version - Version mismatch • ic_error - Interconnect error • booting - Partner booting • shelf_hot - Disk shelf is too hot • partner_revert_in_progress - Partner is performing revert • local_revert_in_progress - Revert is in progress • partner_takeover - Partner is attempting takeover • local_takeover - Already in takeover mode • halt_no_takeover - Partner halted in notakeover mode • log_unsync - NVRAM log unsynchronized • unknown - No takeover due to unknown reason • waiting_for_partner - Waiting for partner to recover • low_memory - Low memory condition • halting - Local halt in progress • mailbox_uncertain - Status of partner mailbox is uncertain • no_auto_takeover - Automatic takeover is disabled • disk_inventory_not_exchanged - Disk inventory information not received

			from partner • disk_inventory_mismatch_local - Local node missing some of partner node's file system disks • pending_shutdown - Local node is shutting down • dr_in_progress - metrocluster disaster recovery operation is in progress. • mcc_node_object_limit - This node or partner node is in switchover state and MetroCluster config option node-object-limit is off in the DR group of this node.

Element definition: **takeover-status**

[top]

Takeover status of a node and all of its partner aggregates. When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, assuming that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate-takeover-status		string	Takeover status of the partner aggregate. This includes the reason for the failure of takeover of an aggregate. If takeover is in progress in a particular module, or if takeover was vetoed by a particular module, that is also indicated. Possible values include: • Done • Failed • In progress, Module: wafl • Not attempted yet • Failed: Operation was vetoed, Module: example. The aggregate will be taken over during CFO phase of takeover. • Failed: Aggregate does not have SFO HA policy. The aggregate will be taken over during CFO phase of takeover. • Failed: Aggregate is in failed or limbo state. The aggregate will be taken over during CFO phase of takeover. • Failed to offline the aggregate. The aggregate will be taken over during CFO phase of takeover. • No aggregates to relocate • Failed: Node cannot communicate with the destination node. To takeover the remaining aggregates, run the "storage failover takeover -ofnode -bypass-optimization true" command. To giveback the relocated aggregates, run the "storage failover giveback -ofnode " command. • Failed: Destination node did not online the aggregate on time. To takeover the remaining aggregates, run the "storage failover takeover -ofnode -bypass-optimization true" command. To giveback the relocated aggregates, run the "storage failover giveback -ofnode " command. • Failed: Destination node failed to online the aggregate. To takeover the remaining aggregates, run the "storage failover takeover -ofnode -bypass-optimization true" command. To giveback the relocated aggregates, run the "storage failover giveback -ofnode " command.

			Failed: Destination cannot receive the aggregate. To takeover the remaining aggregates, run the "storage failover takeover -ofnode -bypass-optimization true" command. To giveback the relocated aggregates, run the "storage failover giveback -ofnode " command. • Failed: Aggregate is restricted. The aggregate will be taken over during CFO phase of takeover. • Failed: Aggregate does not have disks. The aggregate will be taken over during CFO phase of takeover. • Failed: Aggregate is foreign. The aggregate will be taken over during CFO phase of takeover. • Failed: Aggregate is offline. The aggregate will be taken over during CFO phase of takeover. • Failed: Mirrored aggregate does not have both plexes online. The aggregate will be taken over during CFO phase of takeover. • Failed, could not disable firmware updates on . Attributes: non-creatable, non-modifiable
node		string	Name of the node. Attributes: key, non-creatable, non-modifiable
node-takeover-status		string	Takeover status of the node. Attributes: non-creatable, non-modifiable
taken-over-aggregate		string	Name of the taken over aggregate. Attributes: non-creatable, non-modifiable

Element definition: **timeout-info**

[top]

Failover monitor timeouts.

Name	Range	Type	Description
booting		integer	booting timeout, in milliseconds
connect		integer	connect timeout, in milliseconds
dumpcore		integer	dumpcore timeout, in milliseconds
fast		integer	fast timeout, in milliseconds
firmware		integer	firmware timeout, in milliseconds
mailbox		integer	mailbox timeout, in milliseconds
operator		integer	operator timeout, in milliseconds
reboot		integer optional	reboot timeout, in milliseconds
slow		integer	slow timeout, in milliseconds
transit		integer	transit timeout, in milliseconds
transit-timer-enabled		boolean	True, if the transit timer is enabled

Element definition: **advanced-options-modify**

[top]

Advanced Options to Modify

Name	Range	Type	Description

aggregate-migration-timeout	**[30..300]**	integer optional	Specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. Default: 120 seconds. Attributes: non-creatable, modifiable
cifs-ndo-duration		cifsndoduration optional	Specifies failover outage durations to allow CIFS NDO lite customers to tune the NVlog size. A value of 'default' uses the maximum NVRAM possible. Attributes: non-creatable, modifiable Possible values: • "default" , • "medium" , • "low"
propagate-mailbox-enabled		boolean optional	Specifies whether storage-failover status is communicated via mailbox disks. Default: true Attributes: non-creatable, modifiable
read-interval	**[1..120]**	integer optional	Specifies how frequently, in seconds, the node reads its partner's status from the mailbox disks. Default: 5 seconds Attributes: non-creatable, modifiable
write-interval	**[1..120]**	integer optional	Specifies how frequently, in seconds, the node writes its status to the mailbox disks. Default: 5 seconds Attributes: non-creatable, modifiable

Element definition: **giveback-options-modify**

[top]

Giveback Options to Modify

Name	Range	Type	Description
auto-giveback-after-panic-enabled		boolean optional	Specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation Attributes: non-creatable, modifiable
auto-giveback-enabled		boolean optional	True, if auto-giveback is enabled, false otherwise. Default: true. Attributes: non-creatable, modifiable
auto-giveback-override-vetoes-enabled		boolean optional	Specifies whether long-running operations (for instance, NDMP dump/restoration, volume verification, etc.) are terminated and partner veto votes are overriden when an automatic giveback operation is initiated. Attributes: non-creatable, modifiable
autogiveback-delay	**[0..600]**	integer optional	Specifies the minimum time, in seconds, that a node will stay in takeover state prior to performing an automatic giveback. Default: 600 seconds Attributes: non-creatable, modifiable
check-partner-enabled		boolean optional	Specifies whether the node checks that its partner is waiting-for-giveback before initiating a giveback. If check-partner is false, aggregates will be given back even if the partner is not up and ready potentially leading to longer outage. Default: true Attributes: non-creatable, modifiable
giveback-attempts-count	**[2..10]**	integer optional	Specifies the number of times the node attempts an automatic giveback within the time period specified by giveback-attempts-interval. Default: 2 Attributes: non-creatable, modifiable
giveback-attempts-interval	**[1..90]**	integer optional	Specifies the time period, in minutes, used by the giveback-attempts-count parameter Default: 60 minutes Attributes: non-creatable, modifiable

Element definition: **giveback-related-info**

[top]

Giveback related Info

Name	Range	Type	Description
giveback-failure-reason		string optional	This is the reason for the giveback failure. Possible values are: • aggr_relocation_in_progress - aggregate relocation is in progress • shutdown_in_progress - shutdown is in progress • testpoint - a giveback failure was simulated with a testpoint • cannot_giveback_partner_subsystem - node failed to giveback one of partner's subsystems • bck_mbx_update_error - node could not update its backup mailbox • disaster_recovery_in_progress - disaster recovery operation is in progress • partner_disaster_recovery_in_progress - disaster recovery operation is in progress on the partner node Attributes: non-creatable, non-modifiable
giveback-module		string optional	The current module giveback process is in. e.g. WAFL Attributes: non-creatable, non-modifiable
giveback-state		string optional	Giveback state of the node. Possible values are: • nothing_to_gb • not_attempted_yet • giveback_in_progress • giveback_failed_autogiveback_disabled • giveback_failed_autogiveback_scheduled • previous_giveback_failed • giveback_vetoed_no_di • giveback_vetoed_missing_disks • autogiveback_scheduled • autogiveback_deferred • node_upgrade_in_progress • sfo_aggr_giveback_failed • sfo_aggr_giveback_in_progress • partial_giveback • partner_spare_disks_giveback_pending Attributes: non-creatable, non-modifiable

Element definition: **hamode**

[top]

High availability mode Possible values:

- "ha" ,
- "non_ha"

[none]

Element definition: **interconnect-related-info**

[top]

Interconnect Info

Name	Range	Type	Description
interconnect-links		string optional	States of the individual interconnect links. Attributes: non-creatable, non-modifiable
interconnect-type		string optional	Type and Vendor of the interconnect. Attributes: non-creatable, non-modifiable
is-interconnect-up		boolean optional	True, if storage failover interconnect is up. Attributes: non-creatable, non-modifiable

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **node-related-info**

[top]

Node Info

Name	Range	Type	Description
current-mode		hamode optional	Current HA Mode Attributes: non-creatable, modifiable Possible values: • "ha" , • "non_ha"
ha-type		hatype optional	Specifies the type of high-availability configuration. Possible values are: • none - none • shared_storage - shared storage high-availability configuration • non_shared_storage - non-shared storage high-availability configuration Attributes: non-creatable, non-modifiable Possible values: • "none" - None, • "shared_storage" - Shared storage HA configuration, • "non_shared_storage" - Non-shared storage HA configuration
local-firmware-progress	**[0..2^32-1]**	integer optional	A counter to indicate that the local node is progressing in the current firmware state. If the counter is not progressing the node may be unresponsive or down. Attributes: non-creatable, non-modifiable
			Local firmware state that will be communicated through interconnect

local-firmware-state		string optional	to the partner. Possible values are: • SF_OPERATOR_EXIT - operator completed • SF_DEBUG_EXIT - debugger completed • SF_PROGRESS - progress counter • SF_IOERROR - I/O error • SF_BADCKSUM - bad checksum • SF_RESERVED - reserved • SF_UNKNOWN - unknown • SF_OPEN - initializing • SF_POST - in power-on self test • SF_BOOTING - booting • SF_FAIL - boot failed • SF_WAITING - waiting • SF_OS_BOOTED - kernel loaded • SF_UP - up • SF_DEBUG - in debugger • SF_OPERATOR - waiting for operator input • SF_DUMPCORE - dumping core • SF_HALT - halted • SF_REBOOT - rebooting • SF_GIVEWAIT - waiting for giveback • SF_MBWAIT - waiting for cluster mailbox release • SF_SPARECORE - dumping sparecore and ready to be taken-over • SF_MDP - multi-disk panic • SF_TO - in takeover • SF_NOTO - takeover disabled • SF_CLUSTERWAIT - waiting for cluster apps Attributes: non-creatable, non-modifiable
node		node-name optional	Node name Attributes: key, non-creatable, non-modifiable
			Storage failover status of the node. Possible values are: • connected - Partner is available for takeover. • takeover_scheduled - Partner is down and takeover is scheduled. • takeover_started - Takeover process has begun. • takeover - Currently controlling partner's resources. • takeover_failed - Failed to takeover the partner. • giveback_partial_waiting - This node controls partner aggregates even though the node is not in takeover. And we're waiting for a connection to the partner. • giveback_partial_connected - This node controls partner aggregates even though the node is not in takeover. The partner is available to receive the aggregates. • waiting_for_root_aggr - Partner is controlling dblade's root aggregate If we're in this state, many other optional fields are not returned. • waiting - Waiting for a connection to partner. Generally happens while partner is rebooting. • in_maintenance_mode - Node is in maintenance mode. In the mode it is not possible to determine more detailed information (e.g. cluster or not; takeover or not, etc). • pending_shutdown - Starting a takeover/giveback is inhibited due to a pending system shutdown. • relocating_aggrs_before_takeover - Node is relocating its SFO aggregates to its partner prior to a negotiated takeover. • sfo_takeover_phase_done - Node is done with the SFO phase of takeover.

node-state		string optional	sfo_takenover_phase_done - This node has relocated its SFO aggregates to its partner during an optimized negotiated takeover by its partner. • sfo_takeover_phase_aborted - The SFO phase of takeover has been aborted. Refer to takeover-failure-reason field to check the reason. • sfo_takenover_phase_aborted - This node has aborted the relocation of its SFO aggregates to its partner, during an optimized negotiated takeover by its partner. • in_non_HA_mode - Node is not in HA mode • cfo_takeover_failed - CFO phase of takeover failed • sfo_takeover_phase - SFO phase of takeover of partner is in progress • relocated_aggrs_before_takeover - Node has relocated its SFO aggregates to its partner prior to a negotiated takeover. • giving_back - Giveback is in progress. Refer to current-giveback-module field to get the current module, the giveback process is in. • giveback_failed_autogiveback_disabled - Previous giveback failed and auto giveback is disabled. Refer to current-giveback-module to get the module in which giveback process failed. • giveback_failed_autogiveback_scheduled - Previous giveback failed and an auto giveback is scheduled. Refer to current-giveback-module to get the module in which giveback process failed. Refer to time-until-autogiveback field to check time remaining before an auto giveback is initiated. • previous_giveback_failed - Previous giveback failed. Refer to current-giveback-module to get the module in which giveback process failed. • takeover_disk_inventory_not_received - Local node is in takeover. A normal giveback is not possible as disk inventory from partner has not yet been received. • takeover_partner_missing_disks - Local node is in takeover. A normal giveback is not possible as the patner is missing some of its file system disks. • takeover_autogiveback_scheduled - Local node in takeover. An auto giveback is scheduled. Refer time-until-autogiveback field to check time remaining before an auto giveback is initiated. • takeover_network_failure - Local node in takeover. The partner was taken over due to network failure. • takeover_autogiveback_deferred - Local node in takeover. Auto giveback is deferred because the partner node was not ready to receive aggregates when the auto giveback timer expired. An auto giveback will be initiated as soon as the partner node is up and ready to receive aggregates. • automatic_takeover_disabled_connected - Automatic takeover is disabled. Local node is connected to partner via HA interconnect. This happens only in debug builds when raid.panic.missing.disks is turned on from node CLI. • automatic_takeover_disabled_waiting - Automatic takeover is disabled. Local node is waiting for partner node on HA interconnect. This happens only in debug builds when raid.panic.missing.disks is turned on from node CLI. • ndo_upgrade_in_progress - Local node owns partner's aggregates as part of node upgrade process. • own_aggr_non_local_connected - Local node owns aggregates of some other node in the cluster. Local node is connected to partner via HA interconnect. This is possible only during NDO double hop controller upgrade.

			own_aggr_non_local_waiting - Local node owns aggregates of some other node in the cluster. Local node is waiting for partner on HA interconnect. This is possible only during NDO double hop controller upgrade. • clusterwait_connected - Connected to partner via HA interconnect. Local node waiting for cluster applications to come online. • clusterwait_waiting - Waiting for partner on HA interconnect. Local node waiting for cluster applications to come online. • dr_op_in_progress - MetroCluster disaster recovery operation is in progress. • SF_OPERATOR_EXIT - operator completed • SF_DEBUG_EXIT - debugger completed • SF_PROGRESS - progress counter • SF_IOERROR - I/O error • SF_BADCKSUM - bad checksum • SF_RESERVED - reserved • SF_UNKNOWN - unknown • SF_OPEN - initializing • SF_POST - in power-on self test • SF_BOOTING - booting • SF_FAIL - boot failed • SF_WAITING - waiting • SF_OS_BOOTED - kernel loaded • SF_UP - up • SF_DEBUG - in debugger • SF_OPERATOR - waiting for operator input • SF_DUMPCORE - dumping core • SF_HALT - halted • SF_REBOOT - rebooting • SF_GIVEWAIT - waiting for giveback • SF_MBWAIT - waiting for cluster mailbox release • SF_SPARECORE - dumping sparecore and ready to be taken-over • SF_MDP - multi-disk panic • SF_TO - in takeover • SF_NOTO - takeover disabled • SF_CLUSTERWAIT - waiting for cluster apps Attributes: non-creatable, non-modifiable
nvram-id	**[0..2^32-1]**	integer optional	NVRAM identifier Attributes: non-creatable, non-modifiable
partner-firmware-progress	**[0..2^32-1]**	integer optional	A counter to indicate that the partner node is progressing in the current firmware state. If the counter is not progressing the partner node may be unresponsive or down. Attributes: non-creatable, non-modifiable
partner-			Partner firmware state as communicated by the partner through interconnect. Possible values are: • SF_OPERATOR_EXIT - operator completed • SF_DEBUG_EXIT - debugger completed • SF_PROGRESS - progress counter • SF_IOERROR - I/O error • SF_BADCKSUM - bad checksum • SF_RESERVED - reserved • SF_UNKNOWN - unknown • SF_OPEN - initializing • SF_POST - in power-on self test • SF_BOOTING - booting • SF_FAIL - boot failed • SF_WAITING - waiting

firmware-state		string optional	• SF_OS_BOOTED - kernel loaded • SF_UP - up • SF_DEBUG - in debugger • SF_OPERATOR - waiting for operator input • SF_DUMPCORE - dumping core • SF_HALT - halted • SF_REBOOT - rebooting • SF_GIVEWAIT - waiting for giveback • SF_MBWAIT - waiting for cluster mailbox release • SF_SPARECORE - dumping sparecore and ready to be taken-over • SF_MDP - multi-disk panic • SF_TO - in takeover • SF_NOTO - takeover disabled • SF_CLUSTERWAIT - waiting for cluster apps Attributes: non-creatable, non-modifiable
partner-name		string optional	Storage failover partner node name Attributes: non-creatable, non-modifiable
partner-nvram-id	**[0..2^32-1]**	integer optional	Partner NVRAM identifier Attributes: non-creatable, non-modifiable
state-description		string optional	A detailed description of the storage failover state of the node. Attributes: non-creatable, non-modifiable

Element definition: **options-related-info**

[top]

Options Info

Name	Range	Type	Description
auto-giveback-enabled		boolean optional	True, if auto-giveback is enabled, false otherwise. Default: true. Attributes: non-creatable, modifiable
failover-enabled		boolean optional	True, if the storage failover facility is enabled, false otherwise. Note that the facility can be enabled but takeover may not be possible due to various reasons. Attributes: non-creatable, modifiable
ha-mode		hamode optional	Specifies whether the node is set up in high-availability mode or stand-alone mode. Attributes: non-creatable, modifiable Possible values: • "ha" , • "non_ha"
sfo-advanced-options-info		advanced-options optional	Advanced Options
sfo-giveback-options-info		giveback-options optional	Giveback Options
sfo-takeover-options-info		takeover-options optional	Takeover Options

Element definition: **storage-related-info**

[top]

Storage Info

Name	Range	Type	Description
local-mailbox-state		mailbox-state[] optional	Primary mailbox status information, represented as a list of strings. Not returned if node-state is waiting_for_root_aggr. Attributes: non-creatable, non-modifiable
local-missing-disks		disk-uid[] optional	List of disks that the local node is missing but the partner node is able to view. Attributes: non-creatable, non-modifiable
mailbox-disks-local		disk-uid[] optional	List of local mailbox disks. Not returned if node-state is waiting_for_root_aggr. Attributes: non-creatable, non-modifiable
mailbox-disks-partner		disk-uid[] optional	List of partner mailbox disks as this dblade sees them. Not returned if partner's node-state is waiting_for_root_aggr. Attributes: non-creatable, non-modifiable
partner-mailbox-state		mailbox-state[] optional	Backup mailbox status information, represented as a list of strings. Not returned if partner's node-state is waiting_for_root_aggr. Attributes: non-creatable, non-modifiable
partner-missing-disks		disk-uid[] optional	List of disks that the partner node is missing but the local node is able to view. Attributes: non-creatable, non-modifiable

Element definition: **takeover-options-modify**

[top]

Takeover Options to Modify

Name	Range	Type	Description
bypass-takeover-optimization-enabled		boolean optional	Specifies if manual takeover is optimized. If optimized SFO aggregates will be relocated serially to the node that is taking over prior to takeover. This reduces client outage. Default: false Attributes: non-creatable, modifiable
short-uptime-duration	**[0..86400]**	integer optional	Specifies the time period, in seconds, used by the takeover-onshort-uptime-enabled parameter. Default: 60 seconds. Attributes: non-creatable, modifiable
takeover-detection-interval	**[10..180]**	integer optional	Specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Default: 15 seconds. Attributes: non-creatable, modifiable
takeover-onfailure-enabled		boolean optional	A master option that specifies whether the node takes over on any partner failure. When false, all takeovers are disabled; when true the other take over specific options are checked. Default: true Attributes: non-creatable, modifiable
takeover-onpanic-enabled		boolean optional	Specifies whether the node automatically takes over if the partner node panics. Changing this parameter on one node automatically makes the same change on its partner node. Default: true Attributes: non-creatable, modifiable
takeover-onreboot-enabled		boolean optional	Specifies whether the node automatically takes over if its partner reboots. Default: true Attributes: non-creatable, modifiable

takeover-onshort-uptime-enabled		boolean optional	Specifies whether the node takes over if the partner node fails within short-uptime-duration seconds of starting up. Default: true Attributes: non-creatable, modifiable

Element definition: **takeover-related-info**

[top]

Takeover related Info

Name	Range	Type	Description
takeover-by-partner-not-possible-reason		reason-takeover-not-possible[] optional	It list of one or more reasons why takeover by partner is not possible. Attributes: non-creatable, non-modifiable
takeover-by-partner-possible		boolean optional	True, if storage failover takeover is currently possible. by the partner, false otherwise. Note that this is the local node's view of partner. Attributes: non-creatable, non-modifiable
takeover-enabled		boolean optional	True, if the storage failover facility is enabled, false otherwise. Note that the facility can be enabled but takeover may not be possible due to various reasons. Attributes: non-creatable, modifiable
takeover-failure-reason		string optional	This is the reason for the takeover failure. Possible values are: • shutdown_in_progress - shutdown is in progress • aggr_relocation_in_progress - aggregate relocation is in progress • giveback_in_progress - giveback is in progress • takeover_in_progress - takeover is in progress • unknown_partner_id - node could not detect its partner's system ID • conflicting_sysid - node has the same system ID as its partner • pri_mbx_update_error - node could not update its primary mailbox • takeover_disabled_by_partner - partner has disabled takeover • cannot_takeover_partner_subsystem - node failed to takeover one of partner's subsystems • non_etc_or_rc_boot - it is not possible to takeover in a non-etc/rc boot • bck_mbx_update_error - node could not update its backup mailbox • partner_taking_over - partner is taking over local node • revert_in_progress - revert is in progress • disaster_recovery_in_progress - disaster recovery operation is in progress • headswap_in_progress - headswap is in progress • destination_check_failed - destination check failed • communication_failed - communication with destination failed • operation_aborted - operation was aborted • aggr_not_online - destination node did not online the aggregate being relocated in time • sfo_disabled - storage failover service is not enabled

			partner_taking_over - partner is taking over local node • bdfu_not_disabled_source - failed to disable background disk firmware update (BDFU) on local node • bdfu_not_disabled_dest - failed to disable background disk firmware update (BDFU) on partner node • partner_shutting_down - shutdown is in progress on the partner node • partner_aggr_relocation_in_progress - aggregate relocation is in progress on the partner node • partner_giveback_in_progress - giveback is in progress on the partner node • partner_revert_in_progress - revert is in progress on the partner node • partner_disaster_recovery_in_progress - disaster recovery operation is in progress on the partner node • partner_in_headswap - headswap is in progress on the partner node Attributes: non-creatable, non-modifiable
takeover-module		string optional	The current module takeover process is in. e.g. WAFL Attributes: non-creatable, non-modifiable
takeover-of-partner-not-possible-reason		reason-takeover-not-possible[] optional	If takeover-possible field is false, it lists of one or more reasons why takeover of partner is not possible. Attributes: non-creatable, non-modifiable
takeover-of-partner-possible		boolean optional	True, if storage failover takeover is currently possible, false otherwise. Attributes: non-creatable, non-modifiable
takeover-reason		takeover-reason	List of reasons why a takeover can happen. Possible values are: • none - Not in takeover • takeover_normal - Operator initiated takeover • takeover_immediate - Operator initiated forced takeover • takeover_ndu - Takeover initiated as part of NDU • takeover_forced - Operator initiated forced takeover, possible data loss • takeover_early - Takeover occuring during bootup of a filer • takeover_operator_exp - Takeover occuring after operator timeout expired • takeover_post_failed - Takeover occuring on POST failure • takeover_panic - Takeover on panic • takeover_shortuptime - Takeover after quick toggling between up & down states • • takeover_sparecore_exp - Takeover on panic timeout expiry • takeover_reboot_exp - Takeover on reboot timer expiry • takeover_booting_exp - Takeover on booting timer expiry • takeover_nfo_shutdown - Takeover on negotiated failover shutdown • takeover_nfo_timer - Takeover on negotiated failover timer expiry • takeover_mdp - Takeover on multi-disk panic • takeover_reboot - Takeover on reboot • takeover_halt - Takeover on halt • takeover_clam - CLAM triggered takeover • takeover_hwassist - H/w assisted takeover Attributes: non-creatable, non-modifiable Possible values:

		optional	• "takeover_none" - None, • "takeover_immediate" - Immediate takeover, • "takeover_ndu" - NDU Takeover, • "takeover_forced" - Forced Takeover, • "takeover_disaster" - Disaster Takeover, • "takeover_early" - Early Takeover, • "takeover_operator_exp" - Takeover Operator Timeout, • "takeover_post_failed" - Takeover POST Failed, • "takeover_panic" - Takeover On Panic, • "takeover_shortuptime" - Takeover On Short Uptime, • "takeover_sparecore_exp" - Takeover On Sparecore Timeout, • "takeover_reboot_exp" - Takeover On Reboot Timeout, • "takeover_booting_exp" - Takeover On Booting Timeout, • "takeover_firmware_exp" - Takeover On Firmware Timeout, • "takeover_nfo_shutdown" - Takeover On Negotiated Failover, • "takeover_nfo_timer" - Takeover On Negotiated Failover Timeout, • "takeover_mdp" - Takeover On MDP, • "takeover_reboot" - Takeover On Reboot, • "takeover_halt" - Takeover On Halt, • "takeover_clam" - CLAM Initiated Takeover, • "takeover_hwassist" - H/w assisted Takeover, • "takeover_normal" - Operator initiated takeover, • "takeover_comm_err" - Takeover On Communication Error
takeover-state		string optional	Takeover state of the node. Possible values are: • takeover_failed - Takeover Failed • sfo_takeover_in_progress - SFO phase of takeover of partner is in progress • relocating_aggrs_before_takeover - Relocating aggregates to partner as a takeover was initiated by partner • cfo_takeover_scheduled - CFO phase of takeover is scheduled • relocated_aggrs_before_takeover - Relocated aggregates to partner after a takeover was initiated by partner • takeover_by_partner_failed - A takeover attempt by partner failed. Refer to takeover-failure-reason field to check the reason for takeover failure. • in_takeover - Node is in takeover • takeover_started - A takeover is in progress • takeover_scheduled - A takeover of partner is scheduled Refer to time-until-takeover field to check time remaining till takeover. • not_in_takeover - Local node is not in takeover Attributes: non-creatable, non-modifiable
time-since-takeover	**[0..2^32-1]**	integer optional	Time in milliseconds since the local node has taken over partner. Attributes: non-creatable, non-modifiable
time-until-takeover	**[0..2^32-1]**	integer optional	This is the countdown time in seconds until takeover is started. Attributes: non-creatable, non-modifiable

[top]

Element definition: **advanced-options**

Advanced Options

Name	Range	Type	Description
aggregate-migration-timeout	**[30..300]**	integer optional	Specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. Default: 120 seconds. Attributes: non-creatable, modifiable
cifs-ndo-duration		cifsndoduration optional	Specifies failover outage durations to allow CIFS NDO lite customers to tune the NVlog size. A value of 'default' uses the maximum NVRAM possible. Attributes: non-creatable, modifiable Possible values: • "default" , • "medium" , • "low"
propagate-mailbox-enabled		boolean optional	Specifies whether storage-failover status is communicated via mailbox disks. Default: true Attributes: non-creatable, modifiable
read-interval	**[1..120]**	integer optional	Specifies how frequently, in seconds, the node reads its partner's status from the mailbox disks. Default: 5 seconds Attributes: non-creatable, modifiable
write-interval	**[1..120]**	integer optional	Specifies how frequently, in seconds, the node writes its status to the mailbox disks. Default: 5 seconds Attributes: non-creatable, modifiable

Element definition: **cifsndoduration**

[top]

CIFS NDO outage duration Possible values:

- "default" ,
- "medium" ,
- "low"

[none]

Element definition: **disk-uid**

[top]

Disk Unique Identifier

[none]

Element definition: **giveback-options**

[top]

Giveback Options

Name	Range	Type	Description
auto-giveback-after-panic-enabled		boolean optional	Specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation Attributes: non-creatable, modifiable
auto-giveback-enabled		boolean optional	True, if auto-giveback is enabled, false otherwise. Default: true. Attributes: non-creatable, modifiable
auto-giveback-override-vetoes-enabled		boolean optional	Specifies whether long-running operations (for instance, NDMP dump/restoration, volume verification, etc.) are terminated and partner veto votes are overriden when an automatic giveback operation is initiated. Attributes: non-creatable, modifiable
autogiveback-delay	**[0..600]**	integer optional	Specifies the minimum time, in seconds, that a node will stay in takeover state prior to performing an automatic giveback. Default: 600 seconds Attributes: non-creatable, modifiable
check-partner-enabled		boolean optional	Specifies whether the node checks that its partner is waiting-for-giveback before initiating a giveback. If check-partner is false, aggregates will be given back even if the partner is not up and ready potentially leading to longer outage. Default: true Attributes: non-creatable, modifiable
giveback-attempts-count	**[2..10]**	integer optional	Specifies the number of times the node attempts an automatic giveback within the time period specified by giveback-attempts-interval. Default: 2 Attributes: non-creatable, modifiable
giveback-attempts-interval	**[1..90]**	integer optional	Specifies the time period, in minutes, used by the giveback-attempts-count parameter Default: 60 minutes Attributes: non-creatable, modifiable

Element definition: **hamode**

[top]

High availability mode Possible values:

- "ha" ,
- "non_ha"

[none]

Element definition: **hatype**

[top]

none|shared_storage|non_shared_storage Possible values:

- "none" - None,
- "shared_storage" - Shared storage HA configuration,
- "non_shared_storage" - Non-shared storage HA configuration

[none]

Element definition: **mailbox-state**

[top]

State of mailbox disks owned by the node. Possible values are:

- mbx_status_nodisks
- mbx_status_uncertain
- mbx_status_stale
- mbx_status_conflicted
- mbx_status_old_version
- mbx_status_not_found
- mbx_status_wrong_state
- mbx_status_backup

[none]

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **reason-takeover-not-possible**

[top]

Reason why takeover is not possible.

- not_initialized - Controller Failover not initialized
- non_ha_mode - Controller is in non-HA mode
- disabled - Controller Failover takeover disabled
- mailbox_invalid - Partner mailbox disks not accessible or invalid
- mailbox_uninit - Partner mailbox status uninitialized
- fm_version_mismatch - Failover monitor version mismatch
- partner_disabled - Takeover disabled by partner
- operator_deny - Takeover disabled by operator
- nvram_mismatch - NVRAM size mismatch
- version - Version mismatch
- ic_error - Interconnect error
- booting - Partner booting
- shelf_hot - Disk shelf is too hot
- partner_revert_in_progress - Partner is performing revert
- local_revert_in_progress - Revert is in progress
- partner_takeover - Partner is attempting takeover
- local_takeover - Already in takeover mode
- halt_no_takeover - Partner halted in notakeover mode
- log_unsync - NVRAM log unsynchronized
- unknown - No takeover due to unknown reason
- waiting_for_partner - Waiting for partner to recover
- low_memory - Low memory condition
- halting - Local halt in progress
- mailbox_uncertain - Status of partner mailbox is uncertain

no_auto_takeover - Automatic takeover is disabled
- disk_inventory_not_exchanged - Disk inventory information not received - from partner
- disk_inventory_mismatch_local - Local node missing some of partner node's file system disks
- pending_shutdown - Local node is shutting down

[none]

Element definition: **takeover-options**

[top]

Takeover Options

Name	Range	Type	Description
bypass-takeover-optimization-enabled		boolean optional	Specifies if manual takeover is optimized. If optimized SFO aggregates will be relocated serially to the node that is taking over prior to takeover. This reduces client outage. Default: false Attributes: non-creatable, modifiable
short-uptime-duration	**[0..86400]**	integer optional	Specifies the time period, in seconds, used by the takeover-onshort-uptime-enabled parameter. Default: 60 seconds. Attributes: non-creatable, modifiable
takeover-detection-interval	**[10..180]**	integer optional	Specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Default: 15 seconds. Attributes: non-creatable, modifiable
takeover-onfailure-enabled		boolean optional	A master option that specifies whether the node takes over on any partner failure. When false, all takeovers are disabled; when true the other take over specific options are checked. Default: true Attributes: non-creatable, modifiable
takeover-onpanic-enabled		boolean optional	Specifies whether the node automatically takes over if the partner node panics. Changing this parameter on one node automatically makes the same change on its partner node. Default: true Attributes: non-creatable, modifiable
takeover-onreboot-enabled		boolean optional	Specifies whether the node automatically takes over if its partner reboots. Default: true Attributes: non-creatable, modifiable
takeover-onshort-uptime-enabled		boolean optional	Specifies whether the node takes over if the partner node fails within short-uptime-duration seconds of starting up. Default: true Attributes: non-creatable, modifiable

Element definition: **takeover-reason**

[top]

FM Takeover Reason Possible values:

- "takeover_none" - None,
- "takeover_immediate" - Immediate takeover,
- "takeover_ndu" - NDU Takeover,
- "takeover_forced" - Forced Takeover,
- "takeover_disaster" - Disaster Takeover,
- "takeover_early" - Early Takeover,
- "takeover_operator_exp" - Takeover Operator Timeout,
- "takeover_post_failed" - Takeover POST Failed,

- "takeover_panic" - Takeover On Panic,
- "takeover_shortuptime" - Takeover On Short Uptime,
- "takeover_sparecore_exp" - Takeover On Sparecore Timeout,
- "takeover_reboot_exp" - Takeover On Reboot Timeout,
- "takeover_booting_exp" - Takeover On Booting Timeout,
- "takeover_firmware_exp" - Takeover On Firmware Timeout,
- "takeover_nfo_shutdown" - Takeover On Negotiated Failover,
- "takeover_nfo_timer" - Takeover On Negotiated Failover Timeout,
- "takeover_mdp" - Takeover On MDP,
- "takeover_reboot" - Takeover On Reboot,
- "takeover_halt" - Takeover On Halt,
- "takeover_clam" - CLAM Initiated Takeover,
- "takeover_hwassist" - H/w assisted Takeover,
- "takeover_normal" - Operator initiated takeover,
- "takeover_comm_err" - Takeover On Communication Error

[none]

APIs in Category: **cg**

cg-commit
cg-delete
cg-start

cg-commit

[top]

Commits the snapshots that were started during the preceeding cg-start call that returned the cg-id key, and unfences the volumes that were fenced. If cg-commit API times out, then it means that either too many volumes were specified to the cg-start api or the timeout value for the cg-start api was very small. In this situation, the caller should try to perform the cg-start operation by specifying lesser volumes or by specifying higher timeout value.

Input Name	Range	Type	Description
cg-id		integer	Key to identify the ongoing cg operation.

Errno	Description
EONTAPI_EINVAL	
EVOLUMENOTONLINE	
ECGOFF	
ECGSNAPERR

EOP_DISALLOWED_DURING_GIVEBACK	
EAGGRFAILINGOVER	
EHALTING	

Vfiler-enabled
Yes

cg-delete

[top]

Deletes the snaps associated with a CG checkpoint in this filer. This API is deprecated as of Data ONTAP 8.2. Applications using this API should transition to snapshot-multidelete API as appropriate.

Input Name	Range	Type	Description
snapshot		string	The name of the snapshot that is deleted in each volume.
volume-uuids		UUID[]	The identities of the volumes in which to create the snapshot. The volume identity string is its 128-bit universally-unique identifier (UUID) or its DSID. UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used. Here is an example of an actual UUID: 49e370d6-5b5a-11d9-9eb5-000100000529
volumes		volume-name[]	A list of volumes in this filer that is part of this CG operation.

Errno	Description
ECGOFF	
EONTAPI_EINVAL	
EVOLUMENOTONLINE	
ECGSNAPDELERR	
ECGERROR	

cg-start

[top]

Starts the checkpoint cycle for externally synchronized checkpoints in the filer. This operation fences the specified volumes and returns "success" (if successful). If the API returns "success", the call starts a snapshot create operation in these volumes. If the API returns "success", this operation SHOULD be followed by a call to cg-commit (below).

This API is not supported on Infinite Volume.

Input Name	Range	Type	Description
incoming-cg-id		integer optional	This is the common cg-id which the M-host generates internally to keep track of all the D-blades on which this API is executed. When this field is not present, D-blade will generates its own cg-id.
snapmirror-label		string optional	A human readable SnapMirror label to be attached with the consistency group snapshot copies. Size of the label can be at most 31 characters. This label will be applied as an attribute to the snapshots that are created and will be used by the vaulting system to identify a vaulting scheme.
snapshot		string	The provided name of the snapshot that is created in each volume. This name is the unique identifier by which the calling agent identifies the snapshots that constitute a checkpoint. The maximum length is 255 characters. (= MAXNAMLEN)
snapshot-tags		d-snapshot-tag-info[] optional	The new tags to be set on the given consistency group snapshot copies.

timeout		string optional	Timeout selector. Possible vaules are "urgent", "medium" or "relaxed". If no value is specified, the default value is "medium". Following are the timeout values: "urgent" : 5 seconds "medium" : 7 seconds "relaxed" : 20 seconds
user-timeout		integer optional	User specified timeout value in seconds. This option can be set if the user wants to specify timeout value other than the default timeouts. The API will return failure if both 'timeout' and 'user-timeout' are specified. The minimum value for this field is equal to the "urgent" timeout. The maximum timeout which can be specified is 120 seconds.
volume-uuids		UUID[]	The identities of the volumes in which to create the snapshot. The volume identity string is its 128-bit universally-unique identifier (UUID) or its DSID. UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used. Here is an example of an actual UUID: 49e370d6-5b5a-11d9-9eb5-000100000529
volumes		volume-name[]	A list of volumes in this filer that is part of this CG operation.

Output Name	Range	Type	Description
cg-id		integer	Identifier of the started cg-start operation. This identifier is used in the succeeding cg-commit call to identify the operation to be commited.
no-fence		boolean optional	This option disables volume fencing. The default value is "false"

Element definition: **UUID**

[top]

The 128-bit universally-unique identifier (UUID). UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

An example of an actual UUID is: 73a010ec-3d28-11df-84e8-123478563412

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

cifs-branchcache-create

[top]

Create and setup the BranchCache service.

Input Name	Range	Type	Description
hash-store-max-size		size optional	Maximum size the hash store can grow to.
hash-store-path		string	Path to the directory where hash files are stored.
operating-mode		string optional	The mode in which the BranchCache service will operate.
return-record		boolean optional	If set to true, returns the cifs-branchcache on successful creation. Default: false
server-key		string optional	BranchCache server key.
versions		cifs-bc-version-control[] optional	Versions of the BranchCache protocol that are supported.

Output Name	Range	Type	Description
result		cifs-branchcache optional	The cifs-branchcache created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

cifs-branchcache-flush

[top]

Flush (delete) all the BranchCache hashes that have been generated for a Vserver.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-branchcache-get

[top]

Retrieve information about the BranchCache service.

Input Name	Range	Type	Description
desired-attributes		cifs-branchcache optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cifs-branchcache	The attributes of the cifs-branchcache.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-branchcache-get-iter

[top]

Retrieve the per-Vserver BranchCache configurations for the cluster.

Input Name	Range	Type	Description
desired-attributes		cifs-branchcache optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-branchcache optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-branchcache object. All cifs-branchcache objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-branchcache[] optional	The list of attributes of cifs-branchcache objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-branchcache objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-branchcache-hash

[top]

Force the generation of BranchCache hashes for a file or path.

Input Name	Range	Type	Description
path		string	Path of File or Directory to Hash
recurse		boolean optional	If set to 'true', hashes will be recursively computed for all files in the directory

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-branchcache-hash-stat

[top]

Display the CIFS BranchCache statistics

Input Name	Range	Type	Description
include-filesize-stats		boolean optional	If true, it shows BranchCache hash stats of file sizes for which hashes were requested for. File sizes are <10K, 11K-100K, 101K-250K, 251K-1M, 1.1M-10M, 11M-100M, >100M. The default value of this is false.
include-flush-stats		boolean optional	If true, returns BranchCache hash stats like how many hashes were flushed in multiples of BranchCache hash timeout duration. The default value of this field is false.

Output Name	Range	Type	Description
filesize-more-than-100mb		integer optional	Number of files of size more than 100mb.
filesize-range-0kb-to-10kb		integer optional	Number of files of size less than equal to 10k for which hashes were asked for.
filesize-range-100kb-to-250kb		integer optional	Number of files of size more than 100kb and less than equal to 250kb for which hashes were asked for.
filesize-range-10kb-to-100kb		integer optional	Number of files of size more than 10kb and less than equal to 100kb for which hashes were asked for.
filesize-range-10mb-to-100mb		integer optional	Number of files of size more than 10mb and less than equal to 100mb for which hashes were asked for.
filesize-range-1mb-to-10mb		integer optional	Number of files of size more than 1mb and less than equal to 10mb for which hashes were asked for.
filesize-range-250kb-to-1mb		integer optional	Number of files of size more than 250kb and less than equal to 1mb for which hashes were asked for.
hashes-flashed-post-fifth-timeout		integer optional	Number of hashes flushed after fifth timeout.
hashes-flashed-post-first-timeout		integer optional	Number of hashes flushed in between first and second timeout.
hashes-flashed-post-fourth-timeout		integer optional	Number of hashes flushed in between fourth and fifth timeout.
hashes-flashed-post-second-timeout		integer optional	Number of hashes flushed in between second and third timeout.
hashes-flashed-post-third-timeout		integer optional	Number of hashes flushed in between third and fourth timeout.

cifs-branchcache-modify

[top]

Modify the CIFS BranchCache service settings

Input Name	Range	Type	Description
flush-hashes		boolean optional	Delete Existing Hashes
hash-store-max-size		size optional	Maximum Size of the Hash Store
hash-store-path		string optional	Path to Hash Store
operating-mode		string optional	CIFS BranchCache Operating Modes
server-key		string optional	Encryption Key Used to Secure the Hashes
versions		cifs-bc-version-control[] optional	Supported BranchCache Versions

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-branchcache-remove

[top]

Remove the BranchCache service

Input Name	Range	Type	Description
flush-hashes		boolean	Delete Existing Hashes

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-branchcache-set-key

[top]

Sets the server secret for BranchCache.

Input Name	Range	Type	Description
server-secret		string	A binary string that provides cryptographic data used by the BranchCache content server to generate hashes. Content servers that are serving the same data and are expected to provide the same hash values must use the same key. After changing this value, any existing cached content will be identified as stale and retrieved from the content server again.

Errno	Description
EVSERVER_OPERATION_NOT_PERMITTED	

cifs-character-mapping-create

[top]

Create a character mapping. This API is not supported for FlexGroups or Vservers with Infinite Volume.

Input Name	Range	Type	Description
mapping		string[]	The mapping for invalid characters in the format XX:XXXX.
return-record		boolean optional	If set to true, returns the cifs-character-mapping on successful creation. Default: false
volume		string	The name of the volume for which character mapping needs to be applied.

Output Name	Range	Type	Description
result		cifs-character-mapping optional	The cifs-character-mapping created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

cifs-character-mapping-destroy

[top]

Delete a character mapping. This API is not supported for FlexGroups or Vservers with Infinite Volume.

Input Name	Range	Type	Description
volume		string	The name of the volume for which character mapping needs to be applied.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

cifs-character-mapping-get-iter

[top]

Display a character mapping

Input Name	Range	Type	Description
desired-		cifs-character-	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If

attributes		mapping optional	present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-character-mapping optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-character-mapping object. All cifs-character-mapping objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-character-mapping[] optional	The list of attributes of cifs-character-mapping objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-character-mapping objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR

cifs-check-server-get-iter

[top]

Display the Status of Connectivity from Each Node to the CIFS Server for the Given Vserver

Input Name	Range	Type	Description
desired-		cifs-check-	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If

attributes		info optional	present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-check-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the check-server object. All check-server objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.
vserver		string	Vserver For Checking the CIFS Server.

Output Name	Range	Type	Description
attributes-list		cifs-check-info[] optional	The list of attributes of check-server objects.
cifs-status		string	CIFS Server Status.
netbios-name		string	The NetBIOS Name of the CIFS Server.
next-tag		string optional	Tag for the next call. Not present when there are no more check-server objects to return.
node		string optional	The Node on Which the Command Will Be Run.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.
server		string	The FQDN of the DC, CIFS Server Belongs to.
server-ip		string	The IP address of the DC, CIFS Server Belongs to.
site		string	The Site CIFS Server Belongs to.
status		string	Status of NETLOGON Connection from Node to the CIFS Server.
status-details		string	Time for Establishing NETLOGON Connection from Node to the CIFS Server.

Errno	Description

EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-homedir-path-get-for-user

[top]

Return path to the user's CIFS home directory if it exists.

Input Name	Range	Type	Description
user-name		string	Name of the user. If the filer is using the "mapped" CIFS home directory naming style, then a mapped Unix name is provided. For the domain naming style, a domain/user is provided. Otherwise the filer will expect the NT name for the user. The filer's CIFS home directory naming style can be obtained with the "options-get" api, using input parameter "name cifs.home_dir_namestyle".

Output Name	Range	Type	Description
homedir-path-user		string optional	A Unix-style path to the user's CIFS homedir directory, if it exists, for example: /vol/volName/users/joe.

cifs-homedir-paths-set

[top]

Provides a list of CIFS home directory paths for the filer. Replaces the current list of paths in use by the filer. Note that supplying an empty path list causes the filer to delete any current entries.

Input Name	Range	Type	Description
force		boolean optional	If true, the new set of homedir paths will be put into use even if some user homedir connections will be broken. This can cause users with open files in their home directories to lose access to the files. A user can lose data if there are updates not yet committed to disk.
homedir-paths		homedir-path-info[] optional	An array, one entry per each cifs home directory path. note: homedir-path-info defined above

Output Name	Range	Type	Description
path-error		path-error-info[] optional	An array, one entry for each homedir path error detected. Note that normally the API will complete sucessfully and activate as many paths as possible even if some paths cannot be activated.

cifs-list-config

[top]

This ZAPI is used to display the CIFS configuration.

Output Name	Range	Type	Description
AD-site		string optional	Active Directory site that the filer is in.
DC-connection		connection-info[]	Information on the Domain Controller's connection.

		optional	
DNS-domainname		string optional	FQDN of DNS domain.
LDAP-connection		connection-info[] optional	Information on the LDAP connection.
NetBIOS-domainname		string optional	NetBIOS domain name.
NetBIOS-servername		string	NetBIOS name of the server
Windows-type		string optional	Windows type: "NT4"
auth-type		string	String specifying the type of authentication, such as: "ad" Active Directory "nt4" Windows NT4 "workgroup" Workgroup "passwd" Password file, NIS or LDAP
domain-controller-functionality		cifs-functional-level optional	Domain controller functionality indicates the functional level of the DC.
domain-functionality		cifs-functional-level optional	Domain functionality enables features that will affect the entire domain and that domain only. It indicates the functional level of the domain.
forest-functionality		cifs-functional-level optional	Forest functionality enables features across all the domains within your forest. It indicates the functional level of the forest.
security-style		string	String specifying the security style, such as: "ntfs" NTFS "multiprotocol" Multiple Protocol

cifs-nbtstat-get-iter

[top]

Retrieve the NetBIOS Name Service statistics for Vservers in cluster.

Input Name	Range	Type	Description
desired-attributes		cifs-nbtstat optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-nbtstat optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the NetBIOS statistics object. All NetBIOS statistics objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-nbtstat[] optional	The list of attributes of NetBIOS statistics objects.
next-tag		string optional	Tag for the next call. Not present when there are no more NetBIOS statistics objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-options-get-iter

[top]

Iterate over a list of cifs-options objects.

Input Name	Range	Type	Description
desired-attributes		cifs-options optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-options optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-options object. All cifs-options objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-options[] optional	The list of attributes of cifs-options objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-options objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

cifs-options-modify

[top]

Modify the attributes of cifs-options object.

Input Name	Range	Type	Description
client-session-timeout	**[0..2^32-1]**	integer optional	This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected
default-unix-group		string optional	The default UNIX group used if the identity of a CIFS group cannot be mapped using normal group mapping rules.
default-unix-user		string optional	The default UNIX user used if the identity of a CIFS user cannot be mapped using normal user mapping rules.
		cifs-	This optional parameter specifies the size of file system sector in bytes reported to SMB Clients. Possible values:

file-system-sector-size		filesystem-sector-size optional	• "512" - Reported file system sector size to SMB clients is 512 bytes, • "4096" - Reported file system sector size to SMB clients is 4096 bytes
grant-unix-group-perms-to-others		boolean optional	This optional parameter specifies whether UNIX group permissions should be granted to others when Windows clients access files on a UNIX security-style Volume/Qtree as well as mixed security style Volume/Qtree, as long as the effective security style on the file is UNIX. The default value for this parameter is false.
guest-unix-user		string optional	This optional parameter specifies that a guest user coming from any untrusted domain can be mapped to specified UNIX user.
is-admin-users-mapped-to-root-enabled		boolean optional	This optional parameter specifies that if name-mapping is not present for members of BUILTIN\Administrators group then whether they can be mapped to Unix User 'root'. The default value for this parameter is true.
is-advanced-sparse-file-support-enabled		boolean optional	This optional parameter specifies whether advanced sparse file capabilities, such as Query Allocated Ranges and Set Zero Data, are enabled on the CIFS server.
is-advertise-dfs-enabled		boolean optional	(DEPRECATED) This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is true.
is-client-dup-detection-enabled		boolean optional	This optional parameter specifies whether the CIFS server should detect duplicate sessions coming from the same SMB 1.0 client with VcNumber of zero (0). The default value for this parameter is true.
is-client-version-reporting-enabled		boolean optional	This optional parameter specifies whether to report the client version through ASUP. The default value for this parameter is true.
is-copy-offload-direct-copy-enabled		boolean optional	This optional parameter specifies whether the Direct-Copy Copy Offload mechanism is enabled or not. Default value for this parameter is true.
is-copy-offload-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing copy offload operation. The default value for this parameter is true.
is-dac-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports Dynamic Access Control. The default value for this parameter is false.
is-exportpolicy-enabled		boolean optional	This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.
is-fake-open-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports fake open requests. The default value for this parameter is true.
is-fsctl-file-level-trim-enabled		boolean optional	This optional parameter specifies whether trim requests (FSCTL_FILE_LEVEL_TRIM) are supported on the cifs server. The default value for this parameter is true.
is-hide-dotfiles-		boolean optional	This optional parameter specifies whether the CIFS server should hide files and directories beginning with a dot '.' during directory enumeration. The default

enabled			value for this parameter is false.
is-inherit-modebits-with-nfsv4acl-enabled		boolean optional	This option Enables setting Modebits on file created by cifs user if it inherits nfs4acl. The default value for this parameter is false.
is-large-mtu-enabled		boolean optional	This optional parameter specifies that the SMB 2.1 Large MTU feature is supported. The default value for this parameter is true.
is-local-auth-enabled		boolean optional	This optional parameter specifies whether CIFS local users can authenticate.
is-local-users-and-groups-enabled		boolean optional	This optional parameter specifies whether the CIFS local users and groups feature is enabled on the cluster.
is-multichannel-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports Multichannel or not. The default value for this parameter is false.
is-nbns-enabled		boolean optional	This optional parameter specifies that NBNS (port 137) is enabled or not. The default value for this parameter is false.
is-netbios-over-tcp-enabled		boolean optional	This optional parameter specifies that the use of NetBIOS over TCP (port 139) is enabled or not. The default value for this parameter is true.
is-path-component-cache-enabled		boolean optional	This optional parameter specifies whether the CIFS path component cache is enabled for SMB2 or not. The default value for this parameter is true.
is-path-component-cache-symlink-enabled		boolean optional	This optional parameter specifies whether the CIFS symlink resolution for path component cache is enabled for SMB2 or not. The default value for this parameter is true.
is-read-only-delete-enabled		enable optional	This optional parameter specifies that a file can be deleted using UNIX delete semantics when the DOS read-only bit is enabled. Possible values: • "enabled" , • "disabled"
is-referral-enabled		boolean optional	This optional parameter specifies whether the CIFS server refers clients to more optimal data access paths (LIFs). The default value for this parameter is false.
is-search-short-names-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports searching short names. The default value for this parameter is false.
is-shadowcopy-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing shadow copy operations. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.
is-share-enum-permission-check-enabled		boolean optional	This option is used to control whether the NetShareEnum call should only respond with the shares the user has access to or with all shares. The default value is false which means it will respond with all shares.

is-smb1-enabled		boolean optional	(DEPRECATED) This optional parameter specifies whether the CIFS server negotiates the SMB1 versions of the CIFS protocol. The default value for this parameter is true for Vservers with Infinite Volume. For other data Vservers, the default value is false.
is-smb2-enabled		boolean optional	This optional parameter specifies whether the CIFS server negotiates the SMB2 versions of the CIFS protocol. The default value for this parameter is true.
is-smb3-enabled		boolean optional	This optional parameter specifies whether the CIFS server negotiates the SMB3 version of the CIFS protocol. The default value for this parameter is true.
is-smb31-enabled		boolean optional	This optional parameter specifies whether the CIFS server negotiates the SMB3.1 version of the CIFS protocol. The default value for this parameter is true.
is-trusted-domain-enum-search-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing enumeration of trusted domains and search to map a UNIX user to a Windows user.
is-unix-extensions-enabled		boolean optional	This optional parameter specifies whether CIFS server is capable of supporting UNIX Extensions. The default value for this parameter is false.
is-unix-nt-acl-enabled		boolean optional	This optional parameter specifies whether NT ACLs can be set on a volume with UNIX security-style.
is-use-junctions-as-reparse-points-enabled		boolean optional	This optional parameter specifies whether the CIFS server exposes junction points as reparse points to Windows clients.
map-sid-to-uid-on-set-owner		boolean optional	This option is used to control whether to map Windows SIDs to Unix UIDs when setting or restoring the owner SID. The default is true. Set this value to false to avoid performance-impacting SID lookups. It should be set true if your workflow involves converting the storage security style from 'ntfs' or 'mixed' to 'unix'.
max-connections-per-session	**[2..1024]**	integer optional	This optional parameter specifies the maximum number of connections allowed per Multichannel session. The default value for this parameter is 32.
max-credits	**[2..8192]**	integer optional	This optional parameter controls the maximum number of outstanding requests on a CIFS connection. The default value is 128.
max-file-write-zero-length	**[2^12..2^25]**	integer optional	This optional parameter specifies the maximum length of data in bytes that the CIFS server can write zero with one CIFS request. This parameter accepts data lengths between 4 KB and 32 MB. The default value for this option is 32 MB.
max-lifs-per-session	**[1..256]**	integer optional	This optional parameter specifies the maximum number of network interfaces advertised per Multichannel session. The default value for this parameter is 256.
max-mpx	**[2..65535]**	integer optional	This option controls maximum simultaneous operations the CIFS server reports it can process per TCP connection. The default value for this option is 255.
max-opens-same-file-per-tree	**[0..2^32-1]**	integer optional	This option controls maximum existing opens on the same file per CIFS Tree. The default value for this option is 1000.
max-same-tree-connect-	**[0..2^32-1]**	integer	This option controls maximum simultaneous CIFS connections to the same share per CIFS session. The

per-session		optional	default value for this option is 5000.
max-same-user-sessions-per-connection	**[0..2^32-1]**	integer optional	This option controls maximum simultaneous sessions by the same user per TCP connection. The default value for this option is 2500.
max-watches-set-per-tree	**[0..2^32-1]**	integer optional	This option controls maximum watches that can be set per CIFS Tree. The default value for this option is 500.
path-component-cache-entry-exp-time	**[5000..3600000]**	integer optional	This optional parameter controls the time in milliseconds when the path component cache entry would be considered fresh. The default value for this parameter is 300000 milliseconds.
path-component-cache-max-entries	**[1000..1000000]**	integer optional	This optional parameter control the maximum number of cache entries in one instance of path component cache. The default value for this parameter is 100000.
path-component-cache-max-session-token-size	**[500..10000]**	integer optional	This optional parameter specifies maximum session token size for path component cache for SMB2. The default value for this parameter is 1000.
path-component-cache-symlink-exp-time	**[5000..3600000]**	integer optional	This optional parameter controls the time in milliseconds when the path component cache entry that is symlink would be considered fresh. The default value for this parameter is 300000 milliseconds.
read-grants-execute		enable optional	On a file with UNIX Style security effective on it, if the file has read permission on it, a CIFS user would be allowed to execute permissions if this option is enabled. Possible values: • "enabled" , • "disabled"
restrict-anonymous		anonymous-restriction-level optional	This optional parameter specifies what level of access will a non authenticated user get Possible values: • "no_restriction" - No Access Restriction for Anonymous User., • "no_enumeration" - Only Enumeration Is Restricted., • "no_access" - Access Restricted for Anonymous User.
shadowcopy-dir-depth	**[0..2^32-1]**	integer optional	This optional parameter specifies the maximum depth of directories to shadow copy. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy.
smb1-max-buffer-size	**[4356..65535]**	integer optional	This optional parameter specifies the maximum buffer size used for SMB1 message that the server can receive. The default value for this parameter is 65535.
widelink-as-reparse-point-versions		cifs-dialects[] optional	This optional parameter specifies for which CIFS protocol versions widelink will be reported as reparse points. The default value for this parameter is SMB1. Possible values: • "smb1" - SMB 1.0, • "smb2" - SMB 2.0,

			• "smb2_1" - SMB 2.1, • "smb3" - SMB 3.0, • "smb3_1" - SMB 3.1
win-name-for-null-user		string optional	This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.
wins-servers		inet-address[] optional	List of Windows Internet Name Service (WINS) IP addresses. The Vserver will send NetBIOS name resolution requests to these addresses.

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

cifs-password-change

[top]

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

Errno	Description
E_CIFS_OPERATION_NOT_SUPPORTED_IN_WORKGROUP_MODE	
E_CIFS_OPERATION_NOT_SUPPORTED_IN_REALM_MODE	

cifs-password-reset

[top]

Reset the CIFS server's machine account password in the Windows Active Directory domain. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. This operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of.

Input Name	Range	Type	Description
admin-password		string	Account password for the admin-username.
admin-username		string	Username of a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This user is expected to be part of the same Windows Active Directory domain as the CIFS server. If the specified username is not part of the same domain but part of a domain that has a trust relationship with the CIFS server's domain, the username can be specified as ' @ ' where FQDN is the fully qualified domain name of the domain of which the user is a member.

Errno	Description
E_CIFS_OPERATION_NOT_SUPPORTED_IN_WORKGROUP_MODE	
E_CIFS_OPERATION_NOT_SUPPORTED_IN_REALM_MODE	

cifs-preferred-dc-check-get-iter

[top]

Display the Status of the Preferred-DCs configured for the Given Vserver

Input Name	Range	Type	Description
desired-attributes		cifs-preferred-dc-check-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-preferred-dc-check-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-preferred-dc-check object. All cifs-preferred-dc-check objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.
vserver		string	Vserver

Output Name	Range	Type	Description
attributes-list		cifs-preferred-dc-check-info[] optional	The list of attributes of cifs-preferred-dc-check objects.
domain		string[]	Domain Name
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-preferred-dc-check objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.
server-ip		string[]	DC Address
status		service-state[]	DC Status
status-details		string[]	Status Details

cifs-privilege-add-privilege

[top]

Add privileges to a local or Active Directory user or group

Input Name	Range	Type	Description
privileges		cifs-privilege-entries[]	Privileges
user-or-group-name		cifs-name	User or Group Name

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-privilege-get-iter

[top]

Retrieve the list of local groups

Input Name	Range	Type	Description
desired-attributes		cifs-privilege optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-privilege optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-privilege object. All cifs-privilege objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-privilege[] optional	The list of attributes of cifs-privilege objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-privilege objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-privilege-remove-privilege

[top]

Remove privileges from a local or Active Directory user or group

Input Name	Range	Type	Description
privileges		cifs-privilege-entries[]	Privileges
user-or-group-name		cifs-name	User or Group Name

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-privilege-reset-privilege

Input Name	Range	Type	Description
user-or-group-name		cifs-name	User or Group Name

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-security-get-iter

[top]

Iterate over a list of cifs-security objects.

Input Name	Range	Type	Description
desired-attributes		cifs-security optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-security optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-security object. All cifs-security objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-security[] optional	The list of attributes of cifs-security objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-security objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

cifs-security-modify

[top]

Modify the security configuration of a CIFS server.

Input Name	Range	Type	Description
admin-password		string optional	The password of the account with administrative privilege for the Active Directory domain to which the CIFS server is joined. This part of the credential may need to be supplied if the AES encryption is being enabled or disabled.
admin-username		string optional	The username of the account with administrative privilege for the Active Directory domain to which the CIFS server is joined. This part of the credential may need to be supplied if the AES encryption is being enabled or disabled.
aes-enabled-for-netlogon-channel		boolean optional	This parameter determines whether to use AES session key as part of NetLogon secure channel establishment. By default this option is false.
encryption-required-for-dc-connections		boolean optional	This parameter determines if encryption is required for connections to domain controllers.
is-aes-encryption-enabled		boolean optional	This parameter determines whether AES-128 and AES-256 encryption mechanisms are enabled for Kerberos-related CIFS communication. By default this option is true.
is-password-complexity-required		boolean optional	This parameter determines whether password complexity is required for local users. By default this option is true.
is-signing-required		boolean optional	This parameter determines whether signing is required for incoming CIFS traffic. By default this option is false.
is-smb-encryption-required		boolean optional	This parameter determines whether SMB encryption is required for incoming CIFS traffic. By default this option is false.
kerberos-clock-skew	**[0..2^32-1]**	integer optional	The clock skew in minutes is the tolerance for accepting tickets with time stamps that do not exactly match the host's system clock.
kerberos-kdc-timeout	**[0..2^32-1]**	integer optional	This parameter determines the timeout value in seconds for KDC connections.
kerberos-renew-age	**[0..2^32-1]**	integer optional	This parameter determines the maximum amount of time in days for which a ticket can be renewed.
kerberos-ticket-age	**[0..2^32-1]**	integer optional	This parameter determines the maximum amount of time in hours that a user's ticket may be used for the purpose of Kerberos authentication.
lm-compatibility-level		lm-compatibility-level optional	This parameter determines the LM compatibility level. By default this option is 'LM, NTLM, NTLMv2 and Kerberos'. Possible values: • "lm_ntlm_ntlmv2_krb" - Accepts LM, NTLM, NTLMv2 and Kerberos, • "ntlm_ntlmv2_krb" - Accepts NTLM, NTLMv2 and Kerberos, • "ntlmv2_krb" - Accepts NTLMv2 and Kerberos, • "krb" - Accepts Kerberos only
referral-enabled-for-		boolean optional	This parameter determines whether LDAP referral chasing is enabled or not for AD LDAP connections. By default this option

ad-ldap			is false.
session-security-for-ad-ldap		ldap-security optional	This parameter determines the level of security required for LDAP communications. By default this option is none. Possible values: • "none" - No Signing or Sealing., • "sign" - Sign LDAP traffic., • "seal" - Seal and Sign LDAP traffic
smb1-enabled-for-dc-connections		system-default-bool optional	(DEPRECATED) This parameter determines if SMB version 1 is used for connections to domain controllers. Possible values: • "false" , • "true" , • "system_default"
smb2-enabled-for-dc-connections		system-default-bool optional	This parameter determines if SMB version 2 is used for connections to domain controllers. Possible values: • "false" , • "true" , • "system_default"
try-channel-binding-for-ad-ldap		boolean optional	This parameter determines whether to try channel binding for AD LDAP connections. By default this option is true.
use-ldaps-for-ad-ldap		boolean optional	This parameter determines whether to use LDAPS for Secure Active Directory LDAP connections. By default this option is false.
use-start-tls-for-ad-ldap		boolean optional	This parameter determines whether to use start_tls for AD LDAP connections. By default this option is false.

cifs-server-add-netbios-aliases

[top]

Add NetBIOS aliases for the CIFS server name

Input Name	Range	Type	Description
netbios-aliases		netbios-name[]	List of NetBIOS Aliases

Errno	Description
ENBALIASMAXNUMREACHED	

cifs-server-create

[top]

Configure and setup CIFS services on a Vserver. If joining a domain, this command may take several minutes to complete.

Input Name	Range	Type	Description
admin-password		string optional	The password for the account used to add this CIFS server to the Active Directory.
admin-username		string optional	The username of the account used to add this CIFS server to the Active Directory.
administrative-status		service-state optional	CIFS Server Administrative Status Possible values: • "down" , • "up"
cifs-server		netbios-name	The NetBIOS name of the CIFS server.
comment		string optional	CIFS Server Description
default-site		string optional	The default site used by LIFs that do not have a site membership.
domain		string optional	The fully qualified domain name of the Windows Active Directory this CIFS server belongs to.
force-account-overwrite		boolean optional	If this is set and a machine account with the same name as specified in 'cifs-server' exists in the Active Directory, it will be overwritten and reused. The default value for this field is false.
keytab-uri		uri optional	Kerberos Keytab File URI
netbios-aliases		netbios-name[] optional	List of NetBIOS Aliases
organizational-unit		string optional	The Organizational Unit (OU) within the Windows Active Directory this CIFS server belongs to.
realm		string optional	The Kerberos realm this CIFS server belongs to.
workgroup		netbios-name optional	The name of the workgroup this CIFS server belongs to

cifs-server-delete

[top]

Delete a CIFS server. If the admin-username and admin-password are not specified, the CIFS server's machine account will not be deleted from the Windows Active Directory domain. The deletion of the CIFS server will also delete the CIFS shares associated with it.

Input Name	Range	Type	Description
admin-password		string optional	Account password for the admin-username.
admin-username		string optional	A user account name that has sufficient privileges in the Windows Active Directory domain to delete the CIFS server's machine account.
force-account-delete		boolean optional	If this is set, the local CIFS configuration will be deleted irrespective of any communication errors. The default value for this field is false.
keytab-uri		uri optional	Kerberos Keytab File URI

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-server-get-iter

[top]

Retrieve the list of CIFS servers on the cluster and their basic configurations.

Input Name	Range	Type	Description
desired-attributes		cifs-server-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-server-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-server object. All cifs-server objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-server-config[] optional	The list of attributes of cifs-server objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-server objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-server-modify

[top]

Modify the basic properties of a CIFS server. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

Input Name	Range	Type	Description
admin-password		string optional	The password for the account used to add this CIFS server to the Active Directory. This part of the credential only needs to be supplied if the domain is being modified.
admin-username		string optional	The username of the account used to add this CIFS server to the Active Directory. This part of the credential only needs to be supplied if the domain is being modified.
administrative-status		service-state optional	CIFS Server Administrative Status. Possible values: • "down" , • "up"
cifs-server		netbios-name optional	The name of the CIFS server (up to 15 characters).
comment		string optional	CIFS Server Description
default-site		string optional	The default site used by LIFs that do not have a site membership.
domain		string optional	The fully qualified domain name of the Windows Active Directory this CIFS server belongs to. Example: cifs.domain.com
force-account-overwrite		boolean optional	If this is set and the domain is being modified, and a machine account with the same name as the current Vserver's CIFS server name exists in the Active Directory, it will be overwritten and reused. The default value for this field is false.
keytab-uri		uri optional	Kerberos Keytab File URI
ou		string optional	The organizational unit within the Active Directive domain to associate with the CIFS server.
workgroup		netbios-name optional	The name of the workgroup this CIFS server belongs to. If this input is not specified, it is not modified.

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_MODIFY_IN_DOMAIN_MODE	

cifs-server-remove-netbios-aliases

[top]

Remove NetBIOS aliases

Input Name	Range	Type	Description
netbios-aliases		netbios-name[]	List of NetBIOS Aliases

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-server-start

[top]

Start a CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, use cifs-server-create.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-server-stop

[top]

Stop a CIFS server on the specified Vserver. Note that established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-session-close

[top]

Close an open CIFS session

Input Name	Range	Type	Description
address		ip-address optional	The ip address of the workstation from which the session is opened.
auth-mechanism		auth-mechanism optional	The authentication mechanism used to establish the session.
connection-id		integer optional	The connection that is used to establish the session.
continuously-available		cifs-ca-protection optional	The type of continuous avalability protection provided to the session.
is-session-signed		boolean optional	The status of SMB signing that is happening over the CIFS session.
lif-address		ip-address optional	The data lif that is used to establish the session.
node		node-name	The name of the node on which the session listing is done.

protocol-version		cifs-dialects optional	The CIFS protocol version that is used to establish the session.
session-id		integer optional	The unique identifier for the session.
smb-encryption-status		smb-encryption optional	The status of SMB encryption that is happening over the CIFS session.
unix-user		string optional	The name of the UNIX user for which the session is established.
windows-user		string optional	The name of the CIFS user for which the session is established.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-session-file-close

[top]

Close an open CIFS file.

Input Name	Range	Type	Description
connection-id		integer optional	The connection that is used to open the file.
file-id		integer optional	The unique identifier for the opened file.
node		node-name	The name of the node on which the file listing is done.
session-id		integer optional	The session under which file is opened.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-session-file-get-iter

[top]

Retrieve the list of the opened CIFS files.

Input Name	Range	Type	Description
desired-attributes		cifs-session-file optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-session-file optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-session-file object. All cifs-session-file objects matching this query up to 'max-records' will be returned.

tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-session-file[] optional	The list of attributes of cifs-session-file objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-session-file objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-session-get-iter

[top]

Retrieve the list of the established CIFS sessions.

Input Name	Range	Type	Description
desired-attributes		cifs-session optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-session optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-session object. All cifs-session objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-session[] optional	The list of attributes of cifs-session objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-session objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-session-list-iter-end

[top]

Terminate a list iteration and clean up any saved info.

Input Name	Range	Type	Description
tag		string	Tag from a previous cifs-session-list-iter-start.

Vfiler-enabled
Yes

License
cifs

cifs-session-list-iter-next

[top]

Returns items from a previous call to cifs-session-list-iter-start.

Input Name	Range	Type	Description
maximum		integer	The maximum number of entries to retrieve.
tag		string	Tag from a previous cifs-session-list-iter-start.

Output Name	Range	Type	Description
cifs-sessions		cifs-session-info[]	An array, one entry per each cifs session.
records		integer	This tells you how many records are being returned from this particular call to cifs-session-list-iter-next. When this value is 0, you have retrieved everything. Range: [0..2^32-1].

Vfiler-enabled
Yes

License
cifs

cifs-session-list-iter-start

[top]

Gives information on current CIFS activity. Without arguments, it returns a summary of information about the filer and lists the users who are connected to the filer.

Input Name	Range	Type	Description
host		string optional	IP address/machine name of the user's client machine.
			Filters the information on the basis of protocol version specified. When

protocol		string optional	'smb' is specified as the argument, this API retrieves information about only SMB 1.0 sessions. When 'smb2' is specified as the argument, this API retrieves information about only SMB 2.0 sessions. If this option is not specified, then information about both SMB 1.0 and SMB 2.0 sessions is retrieved.
user		string optional	User name. If user is specified , this api returns information about the specified user, along with the names and access level of files that the user has opened. This api returns information about all the users, if the user is specified as '*' or is not specified.

Output Name	Range	Type	Description
records		integer	Number which tells you how many items have been saved for future retrieval with cifs-session-list-iter-next.
tag		string	Tag to be used in subsequent calls to cifs-session-list-iter-next.

cifs-setup

[top]

Configures the filer's CIFS service. The CIFS service will start automatically once this call completes successfully.

Input Name	Range	Type	Description
auth-type		string	The authentication style that determines the method by which clients will be authenticated when connecting to this CIFS server. These styles are subject to change in a future release. Possible values: ad, nt4, workgroup, passwd Note: The domain-name, login-user and login-password fields are optional unless the auth-type is ad.
domain-name		string optional	The name of the domain that the CIFS server will join. This can be the NetBIOS or fully qualified domain name. Examples: cifsdomain, cifs.domain.com
login-password		string optional encrypted	The password for login-user.
login-user		string optional	The name of a domain user that has the ability to add the CIFS server to the domain given in domain-name. Examples: username (assumes domain-name is the user's domain), cifsdomain\username, cifs.domain.com\username
ou-name		string optional	The distinguished name of the organizational unit that the CIFS service will become a member of. This value must be one of the cifs-setup-ous retrieved from a call to the cifs-setup-container-list-iter APIs. By default, the filer will join the 'CN=Computers' organizational unit. Note:

			This information is only used when the auth-type is 'ad'.
pdc-ip-address		ip-address optional	If this value is defined, CIFS will attempt to communicate with the domain controller directly using this address. Note: This information is only used when the auth-type is 'nt4'.
security-style		string	The security style determines whether or not the CIFS service will support multiprotocol access. These styles are subject to change in a future release. Possible values: ntfs, multiprotocol
server-name		string	The resulting CIFS server name.
site-name		string optional	The name of the site that the CIFS service will become a member of. This value must be one of the cifs-setup-sites retrieved from a call to the cifs-setup-container-list-iter APIs. If a default-site was returned, it is the recommended choice. Sites will be ignored if this value is left blank. Note: This information is only used when the auth-type is 'ad'.

For more information regarding Active Directory sites and their use, please reference Microsoft's Active Directory documentation.

Input Name	Range	Type	Description
domain-name		string	The name of the domain that the CIFS server will join. Examples: cifsdomain, cifs.domain.com
login-password		string encrypted	The password for login-user.
login-user		string	The name of a domain user that has the ability to add the CIFS server to the domain given in domain-name. Examples: username (assumes domain-name is the user's domain), cifsdomain\username, cifs.domain.com\username

Output Name	Range	Type	Description
default-site		string optional	If this subnet is part of a pre-defined site in Active Directory, this is the site name that would be used by default unless one of the other sites in cifs-setup-sites are specified instead.
records		integer	Number which tells you how many items have been saved for future retrieval with cifs-setup-site-list-iter-next.
tag		string	Tag to be used in subsequent calls to cifs-setup-site-list-iter-next.

cifs-setup-verify-name

[top]

Determines whether or not a particular CIFS server name is already in use on the network and a specified domain.

Input Name	Range	Type	Description
auth-type		string	The authentication style that will be used in a subsequent call to cifs-setup. These styles are subject to change in a future release. Possible values: ad, nt4, workgroup, passwd Note: The domain-name, login-user and login-password fields are optional unless the auth-type is ad.
domain-name		string	The name of the domain that the CIFS server will join. Examples: cifsdomain, cifs.domain.com
login-password		string optional encrypted	The password for login-user.
login-user		string optional	The name of a domain user that has the ability to add the CIFS server to the domain given in domain-name. Examples: username (assumes domain-name is the user's domain), cifsdomain\username, cifs.domain.com\username
pdc-ip-address		ip-address optional	If this value is defined, CIFS will attempt to communicate with the domain controller directly using this address. Note: This information is only used when the auth-type is 'nt4'.
server-name		string	The NetBIOS CIFS server name that will be verified. Example: cifsserver

Output Name	Range	Type	Description
is-in-domain		boolean	Returns 'true' if the name exists in the domain, otherwise returns 'false'. For 'ad'-style domains, if an entry exists a warning should be provided. For 'nt4'-style domains, an entry must exist or cifs-setup will fail.
is-in-use		boolean	Returns 'true' if the name is in use on the network, otherwise returns 'false'.

cifs-setup-verify-passwd-and-group

[top]

Determines whether or not the /etc/passwd and /etc/group files exist, which would be used in the event that the configured CIFS authentication method fails.

Output Name	Range	Type	Description
group-file-exists		boolean	Returns 'true' if the /etc/group file exists, otherwise returns 'false'.
passwd-file-exists		boolean	Returns 'true' if the /etc/passwd file exists, otherwise returns 'false'.
required		boolean	Returns 'true' if the /etc/passwd and /etc/group files would be required before running the cifs-setup API. cifs-setup will require these files if neither LDAP nor NIS are enabled, as they will be used as a backup authentication method should the primary method (i.e. domain authentication) become unavailable.

cifs-share-access-control-create

[top]

Add permissions for a user or group for a defined CIFS share.

Input Name	Range	Type	Description
permission		cifs-access-perms	The access rights that the user or group has on the defined CIFS share. Possible values: • "no_access" - No access, • "read" - Read, • "change" - Change, • "full_control" - Full Control, • "custom" - Custom

return-record		boolean optional	If set to true, returns the cifs-share-access-control on successful creation. Default: false
share		string	The CIFS share for which the permissions are defined.
user-group-type		string optional	The type of user for which ACL is configured. Default value is windows. Possible values: • "windows" - Windows User or Group., • "unix_user" - Unix User., • "unix_group" - Unix Group.
user-or-group		string	The user or group name for which the permissions are listed.
winsid		windows-sid optional	The Windows SID for the user or group for which the permission is defined.

Output Name	Range	Type	Description
result		cifs-share-access-control optional	The cifs-share-access-control created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

cifs-share-access-control-delete

[top]

Remove permissions for a user or group on a defined CIFS share.

Input Name	Range	Type	Description
share		string	The CIFS share for which the permissions are defined.
user-group-type		string optional	The type of user for which ACL is configured. Default value is windows. Possible values: • "windows" - Windows User or Group., • "unix_user" - Unix User., • "unix_group" - Unix Group.
user-or-group		string	The user or group name for which the permissions are listed.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-share-access-control-get-iter

[top]

Retrieve the list of permissions on defined CIFS shares.

Input Name	Range	Type	Description

desired-attributes		cifs-share-access-control optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-share-access-control optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-share-access-control object. All cifs-share-access-control objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-share-access-control[] optional	The list of attributes of cifs-share-access-control objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-share-access-control objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-share-access-control-modify

[top]

Modify the permissions for a user or group on a defined CIFS share.

Input Name	Range	Type	Description
permission		cifs-access-perms optional	The access rights that the user or group has on the defined CIFS share. Possible values: • "no_access" - No access, • "read" - Read, • "change" - Change, • "full_control" - Full Control, • "custom" - Custom
share		string	The CIFS share for which the permissions are defined.
user-group-type		string optional	The type of user for which ACL is configured. Default value is windows. Possible values: • "windows" - Windows User or Group., • "unix_user" - Unix User., • "unix_group" - Unix Group.
user-or-		string	The user or group name for which the permissions are listed.

group			
winsid		windows-sid optional	The Windows SID for the user or group for which the permission is defined.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cifs-share-ace-delete

[top]

Deletes the access control entry of the given share or the unix group. This API is equivalent to "cifs access [-g] " CLI.

Input Name	Range	Type	Description
is-unixgroup		boolean optional	This filter is used to tell that the access rights of the unix group have to be deleted. If its value is true, uinx-group-name needs to be provided. Otherwise it fails with the reason "group-name missing". The default value of this is false.
share-name		string	CIFS share name. It specifies name of the share of which the access rights have to be deleted. This is a case insensitive field. The maximum size of the share name is 256 characters.
unix-group-name		string optional	Name of the unix group. This field specifies the unix group of which the access rights to be deleted. The format of this field . This is a case sensitive field. If the specified group name does not exist, it fails with the reason "Unknown Unix group "
user-name		string optional	Name of the user. This API deletes the access rights of the specified user. This is a case sensitive field. The format of the field is . If specified user does not exist, It fails with the reason "Unknown user ".

cifs-share-ace-set

[top]

Sets the ace to the share for the given user or unix group. This API is equivalent to "cifs access [-g] " CLI.

Input Name	Range	Type	Description

access-rights		string	Access rights to be set to the above share and user. The format of the rights can be Unix-style combinations of r w x - or NT-style "No Access", "Read", "Change", and "Full Control"
is-unixgroup		boolean optional	This filter is used to tell that the access rights are to be set to the unix group. If its value is true, unix-group-name needs to be provided. Otherwise API fails with the reason "group-name missing". The default value of this is false.
share-name		string	CIFS share name. It specifies name of the share to which the access rights have to be set. This is a case insensitive field. The maximum size of the share name is 256 characters.
unix-group-name		string optional	Name of the unix group. This field specifies the unix group to which the access rights are to be set. The format of this field . This is a case sensitive field. If the specified group name does not exist, it fails with the reason "Unknown Unix group : ".
user-name		string optional	Name of the user. This API sets the access rights to the specified user. This is a case sensitive field. The format of the field . If specified user does not exist, It fails with the reason "Unknown user: ".

cifs-share-add

[top]

Creates a new CIFS share rooted at the specified path.

Input Name	Range	Type	Description
caching		string optional	If specified, the following is done based on the value of the string: "no_caching": disallow Windows clients from caching any files on this share. This is the default value. "auto_document_caching": allow Windows clients to cache user documents on this share. "auto_program_caching": allow Windows clients to cache programs on this share. The actual caching behavior depends on the Windows client. "branchcache": clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office.
comment		string optional	If specified, gives description of the new share. CIFS clients see this description when browsing the filer's shares. If not specified, the description is blank.
dir-umask		integer optional	If specified, sets file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created directory. For directories, this mask overrides one set with "umask".
file-umask		integer optional	If specified, sets file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created file. For files, this mask overrides one set with "umask".
forcegroup		string optional	If specified, provides name of the group to which files to be created in the share belong. The groupname is the name of a group in the UNIX group database. If it is an empty string or else not specified, then files to be created in the share do not belong to a particular UNIX group. That is, each file belongs to the same group as the owner of the file.
is-access-based-enum		boolean optional	If true Access Based Enumeration (ABE) is enabled, else it is disabled. ABE filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
is-browse		boolean optional	If true or not specified, shares are visible to browsing clients and can be enumerated (e.g. "net view", SrvMgr, AD).
is-namespace-caching-allowed		boolean optional	If true, namespace caching is enabled on the share. If namespace caching is enabled on a share, clients are allowed to cache the directory enumeration results for better performance.
is-symlink-strict-security		boolean optional	If true or not specified, strict symlink security is enabled. If false, allows clients to follow symbolic links to destinations on this filer but outside of the current share. It is not checked if the client is authenticated to the symbolic link's destination.
is-vscan		boolean optional	If true or not specified, virus scan is done when clients open files on this share, else no virus scan is done.
is-vscanread		boolean optional	If true or not specified, virus scan is done when clients open files on this share for read access, else no virus scan is done for read access on this share.
is-widelink		boolean optional	If true, allows clients to follow absolute symbolic links outside of this share, subject to NT security. This feature requires an entry in the /etc/symlink.translations file and it requires that the client supports Microsoft's Distributed File System (DFS). If false or not specified,

			widelinks in the share are disabled.
maxusers		integer optional	If specified, gives the maximum number of simultaneous connections to the new share. It must be a positive number. If not specified, the filer does not impose a limit on the number of connections to the share.
path		string	Full path name of the directory on the filer corresponding to the root of the new share.
share-name		string	Name of the share to be added. The name cannot exceed 12 characters for DOS-style shares and 256 characters for others.
umask		integer optional	If specified, sets file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created file or directory. If not specified, the file mode creation mask of the share is 0. This field is ignored when both dir-umask and file-umask are present.

cifs-share-change

[top]

Changes settings of one or more CIFS shares at any time, even if the shares are in use.

Input Name	Range	Type	Description
caching		string optional	If specified, the following is done based on the value of the string: "no_caching": disallow Windows clients from caching any files on this share. This is the default value. "auto_document_caching": allow Windows clients to cache user documents on this share. "auto_program_caching": allow Windows clients to cache programs on this share. The actual caching behavior depends on the Windows client. "manual_caching": allow users on Windows clients to manually select files to be cached. "branchcache": clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office.
		string	If specified, changes description of the share. CIFS clients see this

comment		optional	description when browsing the filer's shares. Specifying an empty string clears the previous description.
dir-umask		integer optional	If specified, changes file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created directory. For directories, this mask overrides one set with "umask". Specifying an empty string resets (removes) this dir-umask.
file-umask		integer optional	If specified, changes file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created file. For files, this mask overrides one set with "umask". Specifying an empty string resets (removes) this file-umask.
forcegroup		string optional	If specified, changes name of the group to which files to be created in the share belong. The groupname is the name of a group in the UNIX group database. If the string is empty, files to be created in the share do not belong to a particular UNIX group. That is, each file belongs to the same group as the owner of the file.
is-access-based-enum		boolean optional	If true Access Based Enumeration (ABE) is enabled, if false it is disabled. ABE filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
is-browse		boolean optional	If true or undefined, share is visible to browsers and can be enumerated.
is-namespace-caching-allowed		boolean optional	If true, namespace caching is enabled on the share. If false, namespace caching is disabled on the share. If namespace caching is enabled on a share, clients are allowed to cache the directory enumeration results for better performance.
is-symlink-strict-security		boolean optional	If true, strict symlink security is enabled. If false, allows clients to follow symbolic links to destinations on this filer but outside of the current share. It is not checked if the client is authenticated to the symbolic link's destination.
is-vscan		boolean optional	If true, virus scan is done when clients open files on this share, else virus scan is not done.
is-vscanread		boolean optional	If true, virus scan is done when clients open files on this share for read access, else virus scan is not done for read access.
is-widelink		boolean optional	If true, allows clients to follow absolute symbolic links outside of this share, subject to NT security. This feature requires an entry in the /etc/symlink.translations file and it requires that the client supports Microsoft's Distributed File System (DFS). If false, widelinks in the share are disabled.
maxusers		integer optional	If specified, changes the maximum number of simultaneous connections to the new share. It must be a positive number or else zero, in which case no limit is imposed on the number of connections to the share.
share-name		string	If fully specified, it's the name of the existing share to be changed. If the name contains the wildcard characters * or ?, then all the shares matching the specified name are to be changed.
umask		integer optional	If specified, changes file mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created file or directory. Specifying a zero value resets (removes) the file mode creation mask. This field is ignored when both dir-umask and file-umask are present.

cifs-share-create

[top]

Creates a new CIFS share rooted at the specified path.

Input Name	Range	Type	Description
attribute-cache-ttl	**[0..2^32-1]**	integer optional	The lifetime of an entry in the file attribute cache, in seconds. This value is used if the share has the 'attributecache' property set, which improves the performance of certain metadata operations in common workloads. The default is 10 seconds. Raising this value may improve performance, but the likelihood that stale metadata will be served increases as well. The value of this field must be in the range of 1 to 86400.
comment		string optional	This string gives a description of the CIFS share. CIFS clients see this description when browsing the Vserver's CIFS shares.
dir-umask	**[0..777]**	integer optional	The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created directory. The input value is a numeric mode comprising of one to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values.
file-umask	**[0..777]**	integer optional	The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created file. The input value is a numeric mode comprising of one to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values.
force-group-for-create		string optional	If specified, all files created by CIFS users in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. By default this option will be disabled.
is-path-validation-		boolean	This optional parameter specifies whether the CIFS Share Path validation is enabled or not. The default value for this parameter

enabled		optional	is true.
max-connections-per-share	**[1..2^32-1]**	integer optional	If specified, gives the maximum number of simultaneous connections to the new share. It must be a positive number. The default value is 4294967295.
offline-files-mode		string optional	Mode of the offline file for the CIFS share. The default value is manual. Possible values: • "none" - Clients are not permitted to cache files for offline access., • "manual" - Clients may cache files that are explicitly selected by the user for offline use., • "documents" - Clients may automatically cache files that are used by the user for offline access., • "programs" - Clients may automatically cache files that are used by the user for offline access and may use those files in an offline mode even if the share is available.
path		string	The file system path that is shared through this CIFS share.
return-record		boolean optional	If set to true, returns the cifs-share on successful creation. Default: false
share-name		string	The name of the CIFS share. The CIFS share name is a UTF-8 string with the following characters being illegal: control characters from 0x00 to 0x1F, both inclusive, 0x22 (double quotes) and the characters \/[]:|<>+=;,?"*
share-properties		cifs-share-properties[] optional	The list of properties for this CIFS share. Possible values: • "oplocks" - This specifies that opportunistic locks (client-side caching) are enabled on this share., • "browsable" - This specifies that the share can be browsed by Windows clients., • "showsnapshot" - This specifies that Snapshots can be viewed and traversed by clients., • "changenotify" - This specifies that CIFS clients can request for change notifications for directories on this share. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support Change Notify., • "homedirectory" - This specifies that the share is added and enabled as part of the CIFS home directory feature. The configuration of this share should be done using CIFS home directory feature interface. This property can only be set during the create process and cannot be altered later. • "attributecache" - This specifies that connections through this share are caching attributes for a short time to improve performance. • "branchcache" - This specifies that clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office. • "continuously_available" - This specifies that clients connecting to this share can open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This property is not supported for FlexGroups. • "shadowcopy" - This specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share. • "access_based_enumeration" - This specifies that Access

			Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access. • "namespace_caching" - This specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers. • "encrypt_data" - This specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share. • "show_previous_versions" - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.
symlink-properties		cifs-share-symlink-properties[] optional	This flag controls whether the symlinks under this shared directory are hidden (option 'hide'), accessible (option 'enable') or are accessible as read-only (option 'read-only' along with option 'enable'). It controls whether only symlinks which have targets on this server can be resolved by a CIFS client (option 'symlinks') or if all symlinks can be resolved (option 'symlinks_and_widelinks'). It controls whether symlinks can have targets outside the client's share (option 'no_strict_security'). It controls whether no symlinks can be resolved (option 'disable'). Possible values: • "enable" (DEPRECATED) Enable both local symlinks and wide links for read-write, • "hide" (DEPRECATED) Hide both symlinks and wide links, • "read_only" (DEPRECATED) Enable symlinks for read-only, • "symlinks" Enable symlinks only for read-write, DFS is not advertised, • "symlinks_and_widelinks" Enable both local symlinks and wide links, DFS is advertised, • "disable" Disable both local symlinks and wide links, DFS is not advertised • "no_strict_security" Allow clients to follow symlinks beyond share boundaries
vscan-fileop-profile		vscan-fileop-profile optional	Profile-set of file-ops to which Vscan On-Access scanning is applicable. The default value is standard. Possible values: • "no_scan" - Virus scans are never triggered for accesses to this share, • "standard" - Virus scans can be triggered by open, close, and rename operations, • "strict" - Virus scans can be triggered by open, read, close, and rename operations, • "writes_only" - Virus scans can be triggered only when a file that has been modified is closed.

Output Name	Range	Type	Description

cifs

cifs-share-list-iter-start

[top]

Gives information about one or more shares, the results of which are retrieved by using cifs-share-list-iter-next.

Input Name	Range	Type	Description
share-name		string optional	Cifs share name. If share-name is specified, only information about that share is returned. If share-name is not specified, then information about all the shares is returned. If the name contains the wildcard characters * or ?, then all the shares matching the specified name are listed.

Output Name	Range	Type	Description
records		integer	Number which tells you how many items have been saved for future retrieval with cifs-share-list-iter-next.
tag		string	Tag to be used in subsequent calls to cifs-share-list-iter-next.

cifs-share-modify

[top]

Modifies settings of a CIFS share, even if the shares are in use.

Input Name	Range	Type	Description
attribute-cache-ttl	**[0..2^32-1]**	integer optional	The lifetime of an entry in the file attribute cache, in seconds. This value is used if the share has the 'attributecache' property set, which improves the performance of certain metadata operations in common workloads. The default is 10 seconds. Raising this value may improve performance, but the likelihood that stale metadata will be served increases as well. The value of this field must be in the range of 1 to 86400.
comment		string optional	This string gives a description of the CIFS share. CIFS clients see this description when browsing the Vserver's CIFS shares.
			The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created directory. The input value is a numeric mode comprising of one

dir-umask	**[0..777]**	integer optional	to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values.
file-umask	**[0..777]**	integer optional	The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created file. The input value is a numeric mode comprising of one to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values.
force-group-for-create		string optional	This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. You can disable this option by passing a null string "".
is-path-validation-enabled		boolean optional	This optional parameter specifies whether the CIFS Share Path validation is enabled or not.
max-connections-per-share	**[1..2^32-1]**	integer optional	If specified, gives the maximum number of simultaneous connections to the new share. It must be a positive number.
offline-files-mode		string optional	Mode of the offline file for the CIFS share. The default value is manual. Possible values: • "none" - Clients are not permitted to cache files for offline access., • "manual" - Clients may cache files that are explicitly selected by the user for offline use., • "documents" - Clients may automatically cache files that are used by the user for offline access., • "programs" - Clients may automatically cache files that are used by the user for offline access and may use those files in an offline mode even if the share is available.
path		string optional	The file system path that is shared through this CIFS share.
share-name		string	The name of the CIFS share. The CIFS share name is a UTF-8 string with the following characters being illegal: control characters from 0x00 to 0x1F, both inclusive, 0x22 (double quotes) and the characters \/[]:|<>+=;,?"*
			The list of properties for this CIFS share. Possible values: • "oplocks" - This specifies that opportunistic locks (client-side caching) are enabled on this share., • "browsable" - This specifies that the share can be browsed by Windows clients., • "showsnapshot" - This specifies that Snapshots can be viewed and traversed by clients., • "changenotify" - This specifies that CIFS clients can request for change notifications for directories on this share. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not

share-properties		cifs-share-properties[] optional	support Change Notify., • "homedirectory" - This specifies that the share is added and enabled as part of the CIFS home directory feature. The configuration of this share should be done using CIFS home directory feature interface. This property cannot be added or removed from existing share. • "attributecache" - This specifies that connections through this share are caching attributes for a short time to improve performance. • "branchcache" - This specifies that clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office. • "continuously_available" - This specifies that clients connecting to this share can open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This property is not supported for FlexGroups. • "shadowcopy" - This specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share. • "access_based_enumeration" - This specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access. • "namespace_caching" - This specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers. • "encrypt_data" - This specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share. • "show_previous_versions" - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.
symlink-properties		cifs-share-symlink-properties[] optional	This flag controls whether the symlinks under this shared directory are hidden (option 'hide'), accessible (option 'enable') or are accessible as read-only (option 'read-only' along with option 'enable'). It controls whether only symlinks which have targets on this server can be resolved by a CIFS client (option 'symlinks') or if all symlinks can be resolved (option 'symlinks_and_widelinks'). It controls whether symlinks can have targets outside the client's share (option 'no_strict_security'). It controls whether no symlinks can be resolved (option 'disable'). Possible values: • "enable" (DEPRECATED) Enable both local symlinks and wide links for read-write, • "hide" (DEPRECATED) Hide both symlinks and wide links, • "read_only" (DEPRECATED) Enable symlinks for read-only, • "symlinks" Enable symlinks only for read-write, DFS is not advertised, • "symlinks_and_widelinks" Enable both local symlinks and wide links, DFS is advertised, • "disable" Disable both local symlinks and wide links, DFS is not advertised • "no_strict_security" Allow clients to follow symlinks beyond share boundaries

vscan-fileop-profile		vscan-fileop-profile optional	Profile-set of file-ops to which Vscan On-Access scanning is applicable. Possible values: • "no_scan" - Virus scans are never triggered for accesses to this share, • "standard" - Virus scans can be triggered by open, close, and rename operations, • "strict" - Virus scans can be triggered by open, read, close, and rename operations, • "writes_only" - Virus scans can be triggered only when a file that has been modified is closed.

Errno	Description

cifs-symlink-create

[top]

Create a new CIFS symbolic link path mapping from a UNIX symlink to a target CIFS path. This symbolic link path mapping will be effective on symbolic links that have a prefix match with the value of 'unix-path'. e.g.: if the value of 'unix-path' is '/usr/local/' and there exists a symbolic link on the file system at '/home/user/link' which points to '/usr/local/share/dest'. If a CIFS client accesses the symbolic link 'link', this entry of path mapping would have a prefix match '/usr/local/'. The CIFS client would be redirected to the location pointed to by this path mapping's 'cifs-server', 'share-name' and 'cifs-path' fields.

Input Name	Range	Type	Description
cifs-path		string	This field specifies the CIFS path on the destination to which the symbolic link maps. The final path is generated by concatenating the CIFS server name, the share name, the cifs-path and the remaining path in the symbolic link left after the prefix match. This value is specified by using a UNIX-style path name. The trailing forward slash is required for the full path name to be properly interpreted. This is a UTF-8 string and supports localization.

cifs-server		string optional	This field specifies the destination CIFS server name for the mapping to which the symbolic link is mapped. The default is the local CIFS server. The field needs to be specified if the locality of the symbolic link is 'widelink'. This can be either a DNS name, NetBIOS name or an IP address. If a DNS name or a NetBIOS name are specified, the CIFS client configuration should be such that it is capable of resolving the CIFS server name to the correct IP address.
home-directory		boolean optional	This field specifies whether the destination share is a home directory. If the value of this field is true, wildcard path elements in the destination path are replaced with specific values for the user accessing the symbolic link. Wildcard %w is replaced by the user's Windows name. Wildcard %u is replaced by the user's mapped Unix name. Wildcard %d is replaced by the domain to which the user belongs. The default value is false.
locality		cifs-symlink-locality optional	This field specifies whether the CIFS symbolic link is a local link, free link or wide link. A local symbolic link maps to the local CIFS share. A free symlink maps to the local vserver. A wide symbolic link maps to any CIFS share on the network. If the CIFS server matches the VServer's NetBIOS name then the default value is local otherwise wide link. The symlink option 'freelink' is obsolete. Possible values: • "local" - Share on This VServer, • "widelink" - Share on Another CIFS Server, • "freelink" - Anywhere on This VServer (OBSOLETE)
return-record		boolean optional	If set to true, returns the cifs-symlink on successful creation. Default: false
share-name		string optional	This field specifies the CIFS share name on the destination CIFS server to which the symbolic link is mapped. This is a UTF-8 string and supports localization.
unix-path		string	This field specifies the UNIX path prefix to be matched for the mapping. If the prefix of the target path in the symbolic link matches against this field, this entry of symbolic link path mapping would be used. The path is a UTF-8 string and supports localization. The path must start and end with a forward slash ('/'). For example '/usr/local/'.

Output Name	Range	Type	Description
result		cifs-symlink optional	The cifs-symlink created (keys or the entire object if requested)

cifs-symlink-get-iter

[top]

Retrieve the list of CIFS symbolic link path mappings.

Input Name	Range	Type	Description
desired-attributes		cifs-symlink optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cifs-symlink optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cifs-symlink object. All cifs-symlink objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cifs-symlink[] optional	The list of attributes of cifs-symlink objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cifs-symlink objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cifs-symlink-modify

[top]

Modify a CIFS symbolic link path mapping parameters.

Input Name	Range	Type	Description
			This field specifies the CIFS path on the destination to which the symbolic

cifs-path		string optional	link maps. The final path is generated by concatenating the CIFS server name, the share name, the cifs-path and the remaining path in the symbolic link left after the prefix match. This value is specified by using a UNIX-style path name. The trailing forward slash is required for the full path name to be properly interpreted. This is a UTF-8 string and supports localization.
cifs-server		string optional	This field specifies the destination CIFS server name for the mapping to which the symbolic link is mapped. The default is the local CIFS server. The field needs to be specified if the locality of the symbolic link is 'widelink'. This can be either a DNS name, NetBIOS name or an IP address. If a DNS name or a NetBIOS name are specified, the CIFS client configuration should be such that it is capable of resolving the CIFS server name to the correct IP address.
home-directory		boolean optional	This field specifies whether the destination share is a home directory. If the value of this field is true, wildcard path elements in the destination path are replaced with specific values for the user accessing the symbolic link. Wildcard %w is replaced by the user's Windows name. Wildcard %u is replaced by the user's mapped Unix name. Wildcard %d is replaced by the domain to which the user belongs. The default value is false.
locality		cifs-symlink-locality optional	This field specifies whether the CIFS symbolic link is a local link, free link or wide link. A local symbolic link maps to the local CIFS share. A free symlink maps to the local vserver. A wide symbolic link maps to any CIFS share on the network. If the CIFS server matches the VServer's NetBIOS name then the default value is local otherwise wide link. The symlink option 'freelink' is obsolete. Possible values: • "local" - Share on This VServer, • "widelink" - Share on Another CIFS Server, • "freelink" - Anywhere on This VServer (OBSOLETE)
share-name		string optional	This field specifies the CIFS share name on the destination CIFS server to which the symbolic link is mapped. This is a UTF-8 string and supports localization.
unix-path		string	This field specifies the UNIX path prefix to be matched for the mapping. If the prefix of the target path in the symbolic link matches against this field, this entry of symbolic link path mapping would be used. The path is a UTF-8 string and supports localization. The path must start and end with a forward slash ('/'). For example '/usr/local/'.

- "no_access" - No access,
- "read" - Read,
- "change" - Change,
- "full_control" - Full Control,
- "custom" - Custom

[none]

Element definition: **cifs-bc-version-control**

[top]

Versions of CIFS BranchCache that are currently supported.

[none]

Element definition: **cifs-branchcache**

[top]

CIFS BranchCache configuration When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
hash-store-max-size		size optional	Maximum size the hash store can grow to. Attributes: optional-for-create, modifiable
hash-store-path		string optional	Path to the directory where hash files are stored. Attributes: required-for-create, modifiable
operating-mode		string optional	The mode in which the BranchCache service will operate. Attributes: optional-for-create, modifiable
server-key		string optional	BranchCache server key. Attributes: optional-for-create, modifiable
versions		cifs-bc-version-control[] optional	Versions of the BranchCache protocol that are supported. Attributes: optional-for-create, modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-ca-protection**

[top]

The list of possible protection levels. Open files are "Continuously Available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions. Note: The CA protection levels depicts the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but will not appear continuously available as clients do not open them that way by design. These protection levels are applicable to the sessions/files on read/write volumes on SFO aggregates. Possible values:

- "No" - The open file is not continuously available. For sessions, it contains one or more open files but none of them are continuously available.
- "Yes" - The open file is continuously available. For sessions, it contains one or more open files and all of them are continuously available.
- "Partial" - This value is used for sessions only. It contains at least one continuously available open file but other open files that are not.

[none]

Element definition: **cifs-cache-settings-info**

[top]

Contains CIFS name and SID cache configuration information of a SVM When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s

description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-enabled		boolean optional	Is Cache Enabled? Attributes: optional-for-create, modifiable
is-negative-cache-enabled		boolean optional	Is Negative Cache Enabled? Attributes: optional-for-create, modifiable
is-propagation-enabled		boolean optional	Is Propagation Enabled? Attributes: optional-for-create, modifiable
negative-ttl		time-interval optional	Negative Time to Live Attributes: optional-for-create, modifiable
ttl		time-interval optional	Time to Live Attributes: optional-for-create, modifiable
vserver-name		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-character-mapping**

[top]

Display a character mapping When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
mapping		string[] optional	The mapping for invalid characters in the format XX:XXXX. Attributes: required-for-create, modifiable
volume		string optional	The name of the volume for which character mapping needs to be applied. Attributes: key, required-for-create, non-modifiable
vserver		string optional	Vserver Name on which the volume exists. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-check-info**

[top]

Basic configuration information for the CIFS Server. When returned as part of the output, all elements

of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cifs-domain-ip-addr		string optional	The IP address of the DC, CIFS Server Belongs to. Attributes: non-creatable, non-modifiable
cifs-domain-name		string optional	The FQDN of the DC, CIFS Server Belongs to. Attributes: non-creatable, non-modifiable
cifs-netbios-name		string optional	The NetBIOS Name of the CIFS Server. Attributes: non-creatable, non-modifiable
cifs-server-site		string optional	The Site CIFS Server Belongs to. Attributes: non-creatable, non-modifiable
cifs-server-status		string optional	CIFS Server Status. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The Node on Which the Command Will Be Run. Attributes: key, non-creatable, non-modifiable
status		service-state optional	Status of NETLOGON Connection from Node to the CIFS Server. Attributes: non-creatable, non-modifiable Possible values: • "down" , • "up"
status-details		string optional	Time for Establishing NETLOGON Connection from Node to the CIFS Server. Attributes: non-creatable, non-modifiable
vserver-name		string optional	Vserver For Checking the CIFS Server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-connection**

[top]

Displays established CIFS connections When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
connection-id	**[0..2^32-1]**	integer optional	The unique identifier for the connection. Attributes: key, optional-for-create, non-modifiable

lif-ip		ip-address optional	The data lif that is used to establish the connection. Attributes: non-creatable, non-modifiable
network-context-id	**[0..2^32-1]**	integer optional	The network context id associated with the connection. Attributes: non-creatable, non-modifiable
node		node-name optional	The name of the node on which the connection listing is done. Attributes: key, required-for-create, non-modifiable
session-id	**[0..2^64-1]**	integer[] optional	The sessions that are associated with this connection. Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	The Vserver name on which the connection listing is done. Attributes: key, required-for-create, non-modifiable
workstation-ip		ip-address optional	The ip address of the workstation from which the connection is established. Attributes: non-creatable, non-modifiable
workstation-port	**[0..2^32-1]**	integer optional	The TCP port of the workstation through which the connection is established. Attributes: non-creatable, non-modifiable

Element definition: **cifs-dialects**

[top]

The list of possible known dialects Dialects negotiated by CIFS servers. Possible values:

- "SMB1" - SMB 1.0
- "SMB2" - SMB 2.0
- "SMB2_1" - SMB 2.1
- "SMB3" - SMB 3.0

[none]

Element definition: **cifs-domain-discovered-servers**

[top]

List of servers discovered by the cluster. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
address		inet-address optional	The IP address of the server that was discovered. Attributes: key, non-creatable, non-modifiable
			DC Functional Level Attributes: non-creatable, non-modifiable Possible values: • "win2000" - WIN2000,

dc-functional-level		cifs-domain-discovered-server-funclvl optional	• "unknown" - The DC functionality level is unknown, • "win2003" - WIN2003, • "win2008" - WIN2008, • "win2008r2" - WIN2008R2, • "win2012" - WIN2012, • "win2012r2" - WIN2012R2, • "win2016" - WIN2016, • "winthreshold" - WINTHRESHOLD
domain		string optional	The Active Directory domain that the discovered server is a member of. Attributes: key, non-creatable, non-modifiable
is-dc-read-only		boolean optional	Is DC Read Only Attributes: non-creatable, non-modifiable
name		string optional	The hostname of the server that was discovered. Attributes: key, non-creatable, non-modifiable
node		node-name optional	The name of the node on which server discovery was done. Attributes: key, non-creatable, non-modifiable
prefer-type		cifs-domain-server-prefer-type optional	The preference level of the server that was discovered. Attributes: non-creatable, non-modifiable Possible values: • "unknown" - The preference level of this server is unknown., • "preferred" - This server was administratively marked as a preferred server due to its presence in the list of preferred servers., • "favored" - This server was marked as favored by the server discovery process by virtue of site membership., • "adequate" - This server was discovered by the server discovery process and can be used, but has no preference associated with it.
server-type		cifs-domain-discovered-server-type optional	The type of the server that was discovered. Attributes: key, non-creatable, non-modifiable Possible values: • "unknown" - The server type is not known, • "kerberos" - Kerberos server, • "ms_ldap" - Microsoft Lightweight Directory Access Protocol (LDAP) server, • "ms_dc" - Microsoft Domain Controller, • "ldap" - Lightweight Directory Access Protocol (LDAP) server
status		cifs-domain-discovered-server-status optional	The status of the connection to the server that was discovered. Attributes: non-creatable, non-modifiable Possible values: • "ok" - The connection to this server is usable., • "unavailable" - This server is currently unavailable for use., • "slow" - The connection to this server is usable but slow., • "expired" - The connection to this server has expired., • "undetermined" - A connection to this server has not been attempted., • "unreachable" - This server is currently unreachable.
vserver		vserver-name optional	The name of the Vserver which scopes the discovered servers. Attributes: key, non-creatable, non-modifiable

[top]

Element definition: **cifs-domain-name-mapping-search**

List of trusted domains, organized by Vserver. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
trusted-domains		realm-name[] optional	The list of trusted domains used for name-mapping. Attributes: required-for-create, modifiable
vserver		vserver-name optional	Vserver containing the CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-domain-password-schedule**

[top]

CIFS domain password schedule parameters When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-schedule-enabled		boolean optional	Value of this field indicates whether domain account password change schedule is enabled or not. Value of true indicates schedule is enabled. Attributes: non-creatable, modifiable
schedule-day-of-week		cron-day-of-week optional	This field specifies the day of week when the scheduled domain account password change occurs Attributes: non-creatable, modifiable
schedule-randomized-minute	**[1..180]**	integer optional	This field specifies the minutes within which the scheduled domain account password start time can be randomized beginning schedule-time-of-day Attributes: non-creatable, modifiable
schedule-time-of-day		time-of-day optional	This field specifies the time in HH:MM:SS at which the scheduled domain account password change starts Attributes: non-creatable, modifiable
schedule-weekly-interval	**[1..52]**	integer optional	This field specifies the number of weeks after which the scheduled domain account password change must occur Attributes: non-creatable, modifiable
vserver		vserver-name	Vserver Attributes: key, non-creatable, non-modifiable

		optional	

Element definition: **cifs-domain-preferred-dc**

[top]

List of preferred domain controllers associated with an Active Directory domain, organized by Vserver. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
domain		string optional	The fully qualified domain name of the Active Directory domain to which the domain controllers in the list belong. Attributes: key, required-for-create, non-modifiable
preferred-dc		inet-address[] optional	The list of preferred domain controller IP addresses. Attributes: required-for-create, non-modifiable
vserver		vserver-name optional	Vserver containing the CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-domain-server-discovery-mode**

[top]

The mode of server discovery. Possible values:

- "all" - Discover all the servers in the domain.,
- "site" - Discover the servers local to the site.,
- "none" - Discover nothing. Expect admins to configure pref-dcs.

[none]

Element definition: **cifs-domain-server-discovery-mode-info**

[top]

CIFS domain server discovery mode When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
mode		cifs-domain-server-discovery-mode optional	Server discovery mode Attributes: required-for-create, modifiable Possible values: • "all" - Discover all the servers in the domain., • "site" - Discover the servers local to the site., • "none" - Discover nothing. Expect admins to configure pref-dcs.
vserver		vserver-name optional	Vserver name Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-domain-trusts**

[top]

List of trusted domains discovered. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
home-domain		realm-name optional	The fully-qualified domain name of the Active Directory domain the CIFS server is joined to. Attributes: non-creatable, non-modifiable
node		node-name optional	The name of the node on which discovery was done. Attributes: key, non-creatable, non-modifiable
trusted-domain		realm-name[] optional	A domain that has a trust relationship with the home domain. Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	The name of the Vserver which scopes the discovered trusted domains. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-filesystem-sector-size**

[top]

CIFS File System Sector sizes reported to SMB Clients (in bytes). Possible values:

- "512" - Reported file system sector size to SMB clients is 512 bytes,
- "4096" - Reported file system sector size to SMB clients is 4096 bytes

[none]

Element definition: **cifs-functional-level**

[top]

Possible values are:

- "windows_2000"
- "windows_2003_with_mixed_domain"
- "windows_2003"
- "windows_2008"
- "windows_2008R2"
- "windows_8"

[none]

Element definition: **cifs-home-directory**

[top]

Handle cifs home directory related configuration When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-home-dirs-access-for-admin-enabled		boolean optional	Is home directory access is enabled to admin. Default value is true. Attributes: optional-for-create, modifiable
is-home-dirs-access-for-public-enabled		boolean optional	Is home directory access is enabled to public. Default value is false. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver containing the CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-home-directory-search-path**

[top]

This is a list of CIFS Home Directory search paths. When a CIFS client connects to a home directory share, these paths are searched in the order indicated by the 'position' field to find the user's home directory. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
path		string optional	The file system path that will be searched for finding a CIFS user's home directory. Attributes: key, required-for-create, non-modifiable
position	**[1..1024]**	integer optional	The position of this entry in the list of paths that will be searched for finding a CIFS user's home directory. Attributes: key, non-creatable, non-modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-local-group**

[top]

List of local groups, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
description		string optional	The description of the local group Attributes: optional-for-create, modifiable
group-name		cifs-name optional	The name of the local group Attributes: key, required-for-create, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-local-group-members**

[top]

List of local groups, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
group-name		cifs-name optional	The name of the local group Attributes: key, non-creatable, non-modifiable
member		cifs-name optional	The member of a local group Attributes: non-creatable, non-modifiable

vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-local-user**

[top]

List of local users, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
description		string optional	The description of the local user Attributes: optional-for-create, modifiable
full-name		string optional	Full name of the local user Attributes: optional-for-create, modifiable
is-account-disabled		boolean optional	The user account is disabled Attributes: optional-for-create, modifiable
user-name		cifs-name optional	The name of the local user Attributes: key, required-for-create, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-local-user-membership**

[top]

List of local users' membership information, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
membership		cifs-name optional	The membership of the local user Attributes: non-creatable, non-modifiable
user-name		cifs-name optional	The name of the local user Attributes: key, non-creatable, non-modifiable
vserver		vserver-name	Vserver Attributes: key, non-creatable, non-modifiable

		optional	

Element definition: **cifs-name**

[top]

[none]

Element definition: **cifs-nbtstat**

[top]

Display NetBIOS Statistics. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
nbt-mode		string optional	Mode in which the NetBIOS Name Service is configured. Possible values: 'p' - Point to Point, 'h' - Hybrid, 'm' - Mixed or 'b' - Broadcast. Attributes: non-creatable, non-modifiable
nbt-name-state		string optional	Registration State of NetBIOS Name. Possible values: 'must_register', 'must_unregister', 'wins', 'broadcast', 'name_released', 'wins_conflict', 'broadcast_conflict. Attributes: non-creatable, non-modifiable
nbt-scope		string optional	Scope is used as a name for the set of NetBIOS nodes that participate in an NBT virtual LAN. Attributes: non-creatable, non-modifiable
netbios-name		string optional	NetBIOS Name. Attributes: key, non-creatable, non-modifiable
netbios-suffix		string optional	A NetBIOS suffix is the 16th character of the 16-character NetBIOS name. The NetBIOS suffix is used by Microsoft Networking software to identify functionality installed on the registered device. Attributes: key, non-creatable, non-modifiable
node		string optional	The name of the node on which nbtstat was done. Attributes: key, non-creatable, non-modifiable
registered-addresses		ip-address[] optional	List of interface IP Addresses for which the NetBIOS Name is registered. Attributes: non-creatable, non-modifiable
registered-type		string optional	Name registration type. Possible values: 'registered', 'active', 'permanent', 'group'. Attributes: non-creatable, non-modifiable
registration-time-left-minutes	**[0..2^32-1]**	integer optional	Time left in minutes for a name registered with WINS. Attributes: non-creatable, non-modifiable
vserver		string optional	The Vserver name on which nbtstat was done. Attributes: key, non-creatable, non-modifiable
		wins-	

wins-entries		entry-info[] optional	Windows Internet Name Server (WINS) information

Element definition: **cifs-options**

[top]

The CIFS specific tunables that can be set on a Vserver. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
client-session-timeout	**[0..2^32-1]**	integer optional	This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected Attributes: optional-for-create, modifiable
default-unix-group		string optional	The default UNIX group used if the identity of a CIFS group cannot be mapped using normal group mapping rules. Attributes: optional-for-create, modifiable
default-unix-user		string optional	The default UNIX user used if the identity of a CIFS user cannot be mapped using normal user mapping rules. Attributes: optional-for-create, modifiable
file-system-sector-size		cifs-filesystem-sector-size optional	This optional parameter specifies the size of file system sector in bytes reported to SMB Clients. Attributes: optional-for-create, modifiable Possible values: • "512" - Reported file system sector size to SMB clients is 512 bytes, • "4096" - Reported file system sector size to SMB clients is 4096 bytes
grant-unix-group-perms-to-others		boolean optional	This optional parameter specifies whether UNIX group permissions should be granted to others when Windows clients access files on a UNIX security-style Volume/Qtree as well as mixed security style Volume/Qtree, as long as the effective security style on the file is UNIX. The default value for this parameter is false. Attributes: optional-for-create, modifiable
guest-unix-user		string optional	This optional parameter specifies that a guest user coming from any untrusted domain can be mapped to specified UNIX user. Attributes: optional-for-create, modifiable
is-admin-users-mapped-to-root-enabled		boolean optional	This optional parameter specifies that if name-mapping is not present for members of BUILTIN\Administrators group then whether they can be mapped to Unix User 'root'. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-advanced-sparse-file-support-		boolean optional	This optional parameter specifies whether advanced sparse file capabilities, such as Query Allocated Ranges and Set Zero Data, are enabled on the CIFS server.

enabled			Attributes: optional-for-create, modifiable
is-advertise-dfs-enabled		boolean optional	(DEPRECATED) This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-client-dup-detection-enabled		boolean optional	This optional parameter specifies whether the CIFS server should detect duplicate sessions coming from the same SMB 1.0 client with VcNumber of zero (0). The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-client-version-reporting-enabled		boolean optional	This optional parameter specifies whether to report the client version through ASUP. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-copy-offload-direct-copy-enabled		boolean optional	This optional parameter specifies whether the Direct-Copy Copy Offload mechanism is enabled or not. Default value for this parameter is true. Attributes: optional-for-create, modifiable
is-copy-offload-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing copy offload operation. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-dac-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports Dynamic Access Control. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-exportpolicy-enabled		boolean optional	This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-fake-open-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports fake open requests. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-fsctl-file-level-trim-enabled		boolean optional	This optional parameter specifies whether trim requests (FSCTL_FILE_LEVEL_TRIM) are supported on the cifs server. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-hide-dotfiles-enabled		boolean optional	This optional parameter specifies whether the CIFS server should hide files and directories beginning with a dot '.' during directory enumeration. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-inherit-modebits-with-nfsv4acl-enabled		boolean optional	This option Enables setting Modebits on file created by cifs user if it inherits nfs4acl. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-large-mtu-enabled		boolean optional	This optional parameter specifies that the SMB 2.1 Large MTU feature is supported. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-local-auth-enabled		boolean optional	This optional parameter specifies whether CIFS local users can authenticate. Attributes: optional-for-create, modifiable
is-local-users-and-		boolean	This optional parameter specifies whether the CIFS

groups-enabled		optional	local users and groups feature is enabled on the cluster. Attributes: optional-for-create, modifiable
is-multichannel-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports Multichannel or not. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-nbns-enabled		boolean optional	This optional parameter specifies that NBNS (port 137) is enabled or not. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-netbios-over-tcp-enabled		boolean optional	This optional parameter specifies that the use of NetBIOS over TCP (port 139) is enabled or not. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-path-component-cache-enabled		boolean optional	This optional parameter specifies whether the CIFS path component cache is enabled for SMB2 or not. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-path-component-cache-symlink-enabled		boolean optional	This optional parameter specifies whether the CIFS symlink resolution for path component cache is enabled for SMB2 or not. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-read-only-delete-enabled		enable optional	This optional parameter specifies that a file can be deleted using UNIX delete semantics when the DOS read-only bit is enabled. Attributes: optional-for-create, modifiable Possible values: • "enabled" , • "disabled"
is-referral-enabled		boolean optional	This optional parameter specifies whether the CIFS server refers clients to more optimal data access paths (LIFs). The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-search-short-names-enabled		boolean optional	This optional parameter specifies whether the CIFS server supports searching short names. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-shadowcopy-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing shadow copy operations. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy. Attributes: optional-for-create, modifiable
is-share-enum-permission-check-enabled		boolean optional	This option is used to control whether the NetShareEnum call should only respond with the shares the user has access to or with all shares. The default value is false which means it will respond with all shares. Attributes: optional-for-create, modifiable
is-smb1-enabled		boolean optional	(DEPRECATED) This optional parameter specifies whether the CIFS server negotiates the SMB1 versions of the CIFS protocol. The default value for this parameter is true for Vservers with Infinite Volume. For other data Vservers, the default value is false. Attributes: optional-for-create, modifiable
is-smb2-		boolean	This optional parameter specifies whether the CIFS server negotiates the SMB2 versions of the CIFS

enabled		optional	protocol. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-smb3-enabled		boolean optional	This optional parameter specifies whether the CIFS server negotiates the SMB3 version of the CIFS protocol. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-smb31-enabled		boolean optional	This optional parameter specifies whether the CIFS server negotiates the SMB3.1 version of the CIFS protocol. The default value for this parameter is true. Attributes: optional-for-create, modifiable
is-trusted-domain-enum-search-enabled		boolean optional	This optional parameter specifies whether the CIFS server is capable of performing enumeration of trusted domains and search to map a UNIX user to a Windows user. Attributes: optional-for-create, modifiable
is-unix-extensions-enabled		boolean optional	This optional parameter specifies whether CIFS server is capable of supporting UNIX Extensions. The default value for this parameter is false. Attributes: optional-for-create, modifiable
is-unix-nt-acl-enabled		boolean optional	This optional parameter specifies whether NT ACLs can be set on a volume with UNIX security-style. Attributes: optional-for-create, modifiable
is-use-junctions-as-reparse-points-enabled		boolean optional	This optional parameter specifies whether the CIFS server exposes junction points as reparse points to Windows clients. Attributes: optional-for-create, modifiable
map-sid-to-uid-on-set-owner		boolean optional	This option is used to control whether to map Windows SIDs to Unix UIDs when setting or restoring the owner SID. The default is true. Set this value to false to avoid performance-impacting SID lookups. It should be set true if your workflow involves converting the storage security style from 'ntfs' or 'mixed' to 'unix'. Attributes: optional-for-create, modifiable
max-connections-per-session	**[2..1024]**	integer optional	This optional parameter specifies the maximum number of connections allowed per Multichannel session. The default value for this parameter is 32. Attributes: optional-for-create, modifiable
max-credits	**[2..8192]**	integer optional	This optional parameter controls the maximum number of outstanding requests on a CIFS connection. The default value is 128. Attributes: optional-for-create, modifiable
max-file-write-zero-length	**[2^12..2^25]**	integer optional	This optional parameter specifies the maximum length of data in bytes that the CIFS server can write zero with one CIFS request. This parameter accepts data lengths between 4 KB and 32 MB. The default value for this option is 32 MB. Attributes: optional-for-create, modifiable
max-lifs-per-session	**[1..256]**	integer optional	This optional parameter specifies the maximum number of network interfaces advertised per Multichannel session. The default value for this parameter is 256. Attributes: optional-for-create, modifiable
max-mpx	**[2..65535]**	integer optional	This option controls maximum simultaneous operations the CIFS server reports it can process per TCP connection. The default value for this option is 255. Attributes: optional-for-create, modifiable
max-opens-			This option controls maximum existing opens on the

same-file-per-tree	**[0..2^32-1]**	integer optional	same file per CIFS Tree. The default value for this option is 1000. Attributes: optional-for-create, modifiable
max-same-tree-connect-per-session	**[0..2^32-1]**	integer optional	This option controls maximum simultaneous CIFS connections to the same share per CIFS session. The default value for this option is 5000. Attributes: optional-for-create, modifiable
max-same-user-sessions-per-connection	**[0..2^32-1]**	integer optional	This option controls maximum simultaneous sessions by the same user per TCP connection. The default value for this option is 2500. Attributes: optional-for-create, modifiable
max-watches-set-per-tree	**[0..2^32-1]**	integer optional	This option controls maximum watches that can be set per CIFS Tree. The default value for this option is 500. Attributes: optional-for-create, modifiable
path-component-cache-entry-exp-time	**[5000..3600000]**	integer optional	This optional parameter controls the time in milliseconds when the path component cache entry would be considered fresh. The default value for this parameter is 300000 milliseconds. Attributes: optional-for-create, modifiable
path-component-cache-max-entries	**[1000..1000000]**	integer optional	This optional parameter control the maximum number of cache entries in one instance of path component cache. The default value for this parameter is 100000. Attributes: optional-for-create, modifiable
path-component-cache-max-session-token-size	**[500..10000]**	integer optional	This optional parameter specifies maximum session token size for path component cache for SMB2. The default value for this parameter is 1000. Attributes: optional-for-create, modifiable
path-component-cache-symlink-exp-time	**[5000..3600000]**	integer optional	This optional parameter controls the time in milliseconds when the path component cache entry that is symlink would be considered fresh. The default value for this parameter is 300000 milliseconds. Attributes: optional-for-create, modifiable
read-grants-execute		enable optional	On a file with UNIX Style security effective on it, if the file has read permission on it, a CIFS user would be allowed to execute permissions if this option is enabled. Attributes: optional-for-create, modifiable Possible values: • "enabled" , • "disabled"
restrict-anonymous		anonymous-restriction-level optional	This optional parameter specifies what level of access will a non authenticated user get Attributes: optional-for-create, modifiable Possible values: • "no_restriction" - No Access Restriction for Anonymous User., • "no_enumeration" - Only Enumeration Is Restricted., • "no_access" - Access Restricted for Anonymous User.
shadowcopy-dir-depth	**[0..2^32-1]**	integer optional	This optional parameter specifies the maximum depth of directories to shadow copy. Directories and files within a FlexGroup will not be shadow copied because FlexGroups do not support shadow copy. Attributes: optional-for-create, modifiable

smb1-max-buffer-size	**[4356..65535]**	integer optional	This optional parameter specifies the maximum buffer size used for SMB1 message that the server can receive. The default value for this parameter is 65535. Attributes: optional-for-create, modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable
widelink-as-reparse-point-versions		cifs-dialects[] optional	This optional parameter specifies for which CIFS protocol versions widelink will be reported as reparse points. The default value for this parameter is SMB1. Attributes: optional-for-create, modifiable Possible values: • "smb1" - SMB 1.0, • "smb2" - SMB 2.0, • "smb2_1" - SMB 2.1, • "smb3" - SMB 3.0, • "smb3_1" - SMB 3.1
win-name-for-null-user		string optional	This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session. Attributes: optional-for-create, modifiable
wins-servers		inet-address[] optional	List of Windows Internet Name Service (WINS) IP addresses. The Vserver will send NetBIOS name resolution requests to these addresses. Attributes: optional-for-create, modifiable

Element definition: **cifs-preferred-dc-check-info**

[top]

Basic configuration information for the Preferred DC. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
dc-ip-addr		string[] optional	DC Address Attributes: key, non-creatable, non-modifiable
domain-name		string[] optional	Domain Name Attributes: non-creatable, non-modifiable
status		service-state[] optional	DC Status Attributes: non-creatable, non-modifiable Possible values: • "down" , • "up"
status-details		string[] optional	Status Details Attributes: non-creatable, non-modifiable
vserver-		string	

name		optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-privilege**

[top]

List of privileges assigned to local or Active Directory users or groups, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
privileges		cifs-privilege-entries[] optional	The privileges associated with a local or Active Directory user or group Attributes: non-creatable, non-modifiable Possible values: • "setcbprivilege" - Act as part of the operating system, • "sebackupprivilege" - Back up files and directories, overriding any ACLs, • "serestoreprivilege" - Restore files and directories, overriding any ACLs, • "setakeownershipprivilege" - Take ownership of files or other objects, • "sesecurityprivilege" - Manage auditing and viewing/dumping/clearing the security log, • "sechangenotifyprivilege" - Bypass traverse checking
user-or-group-name		cifs-name optional	The name of the local or Active Directory user or group Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-privilege-entries**

[top]

Privilege Possible values:

- "setcbprivilege" - Act as part of the operating system,
- "sebackupprivilege" - Back up files and directories, overriding any ACLs,
- "serestoreprivilege" - Restore files and directories, overriding any ACLs,
- "setakeownershipprivilege" - Take ownership of files or other objects,
- "sesecurityprivilege" - Manage auditing and viewing/dumping/clearing the security log,
- "sechangenotifyprivilege" - Bypass traverse checking

[none]

Element definition: **cifs-security**

[top]

CIFS security tunable parameters. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aes-enabled-for-netlogon-channel		boolean optional	This parameter determines whether to use AES session key as part of NetLogon secure channel establishment. By default this option is false. Attributes: non-creatable, modifiable
encryption-required-for-dc-connections		boolean optional	This parameter determines if encryption is required for connections to domain controllers. Attributes: non-creatable, modifiable
is-aes-encryption-enabled		boolean optional	This parameter determines whether AES-128 and AES-256 encryption mechanisms are enabled for Kerberos-related CIFS communication. By default this option is true. Attributes: non-creatable, modifiable
is-password-complexity-required		boolean optional	This parameter determines whether password complexity is required for local users. By default this option is true. Attributes: non-creatable, modifiable
is-signing-required		boolean optional	This parameter determines whether signing is required for incoming CIFS traffic. By default this option is false. Attributes: non-creatable, modifiable
is-smb-encryption-required		boolean optional	This parameter determines whether SMB encryption is required for incoming CIFS traffic. By default this option is false. Attributes: non-creatable, modifiable
kerberos-clock-skew	**[0..2^32-1]**	integer optional	The clock skew in minutes is the tolerance for accepting tickets with time stamps that do not exactly match the host's system clock. Attributes: non-creatable, modifiable
kerberos-kdc-timeout	**[1..23]**	integer optional	This parameter determines the timeout value in seconds for KDC connections. Attributes: non-creatable, modifiable
kerberos-renew-age	**[0..2^32-1]**	integer optional	This parameter determines the maximum amount of time in days for which a ticket can be renewed. Attributes: non-creatable, modifiable
kerberos-ticket-age	**[0..2^32-1]**	integer optional	This parameter determines the maximum amount of time in hours that a user's ticket may be used for the purpose of Kerberos authentication. Attributes: non-creatable, modifiable
lm-compatibility-level		lm-compatibility-level optional	This parameter determines the LM compatibility level. By default this option is 'LM, NTLM, NTLMv2 and Kerberos'. Attributes: non-creatable, modifiable Possible values: • "lm_ntlm_ntlmv2_krb" - Accepts LM, NTLM, NTLMv2 and Kerberos, • "ntlm_ntlmv2_krb" - Accepts NTLM, NTLMv2 and Kerberos, • "ntlmv2_krb" - Accepts NTLMv2 and Kerberos, • "krb" - Accepts Kerberos only

referral-enabled-for-ad-ldap		boolean optional	This parameter determines whether LDAP referral chasing is enabled or not for AD LDAP connections. By default this option is false. Attributes: non-creatable, modifiable
session-security-for-ad-ldap		ldap-security optional	This parameter determines the level of security for LDAP communications. By default this option is none. Attributes: non-creatable, modifiable Possible values: • "none" - No Signing or Sealing., • "sign" - Sign LDAP traffic., • "seal" - Seal and Sign LDAP traffic
smb1-enabled-for-dc-connections		system-default-bool optional	(DEPRECATED) This parameter determines if SMB version 1 is used for connections to domain controllers. Attributes: non-creatable, modifiable Possible values: • "false" , • "true" , • "system_default"
smb2-enabled-for-dc-connections		system-default-bool optional	This parameter determines if SMB version 2 is used for connections to domain controllers. Attributes: non-creatable, modifiable Possible values: • "false" , • "true" , • "system_default"
try-channel-binding-for-ad-ldap		boolean optional	This parameter determines whether to try channel binding for AD LDAP connections. By default this option is true. Attributes: non-creatable, modifiable
use-ldaps-for-ad-ldap		boolean optional	This parameter determines whether to use LDAPS(port 636) for Secure Active Directory LDAP connections. By default this option is false. Attributes: non-creatable, modifiable
use-start-tls-for-ad-ldap		boolean optional	This parameter determines whether to use start_tls for AD LDAP connections. By default this option is false. Attributes: non-creatable, modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-server-config**

[top]

Basic configuration information for the CIFS Server. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
			CIFS Server Administrative Status. Attributes: optional-for-create,

administrative-status		service-state optional	modifiable Possible values: • "down" , • "up"
auth-style		cifs-auth-style optional	The authentication style to be used for CIFS clients connecting to this CIFS server. Attributes: non-creatable, non-modifiable Possible values: • "domain" - DOMAIN, • "workgroup" - WORKGROUP, • "realm" - KERBEROS REALM
cifs-server		netbios-name optional	The NetBIOS name of the CIFS server. Attributes: required-for-create, modifiable
comment		string optional	CIFS Server Description. Attributes: optional-for-create, modifiable
default-site		string optional	The default site used by LIFs that do not have a site membership. Attributes: optional-for-create, modifiable
domain		string optional	The Fully Qualified Domain Name of the Windows Active Directory this CIFS server belongs to. Attributes: optional-for-create, modifiable
domain-workgroup		domain-name optional	The NetBIOS name of the domain or workgroup this CIFS server belongs to. Attributes: non-creatable, non-modifiable
netbios-aliases		netbios-name[] optional	List of NetBIOS Aliases Attributes: optional-for-create, non-modifiable
organizational-unit		string optional	The Organizational Unit (OU) within the Windows Active Directory this CIFS server belongs to. Attributes: optional-for-create, modifiable
realm		string optional	The Kerberos realm this CIFS server belongs to. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver containing the CIFS server. Attributes: key, non-creatable, non-modifiable
workgroup		netbios-name optional	The name of the workgroup this CIFS server belongs to. Attributes: optional-for-create, modifiable

Element definition: **cifs-session**

[top]

Displays the established CIFS sessions When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
address		ip-address optional	The ip address of the workstation from which the session is opened. Attributes: non-creatable, non-modifiable

auth-mechanism		auth-mechanism optional	The authentication mechanism used to establish the session. Attributes: non-creatable, non-modifiable Possible values: • "none" , • "ntlmv1" , • "ntlmv2" , • "kerberos" , • "anonymous"
connected-time		elapsed-time-ext optional	The time duration since the session was established. Attributes: non-creatable, non-modifiable
connection-count	**[0..2^32-1]**	integer optional	The number of CIFS connections associated with the CIFS session. Attributes: non-creatable, non-modifiable
connection-id	**[0..2^32-1]**	integer optional	The connection that is used to establish the session. Attributes: key, optional-for-create, non-modifiable
continuously-available		cifs-ca-protection optional	The type of continuous avalability protection provided to the session. Attributes: non-creatable, non-modifiable Possible values: • "no" - The open file is not continuously available. For sessions, it contains one or more open file but none of them are continuously available., • "yes" - The open file is continuously available. For sessions, it contains one or more open files and all of them are continuously available., • "partial" - This value is used for sessions only. It contains at least one continuously available open file but other open files that are not.
files	**[0..2^64-1]**	integer optional	The number of the regular files that are opened under the session. Attributes: non-creatable, non-modifiable
idle-time		elapsed-time-ext optional	The time duration since there was last activity on the session. Attributes: non-creatable, non-modifiable
is-large-mtu-enabled		boolean optional	This optional parameter specifies the status of the Large MTU over the CIFS session. Attributes: non-creatable, non-modifiable
is-session-signed		boolean optional	Displays if a CIFS session is SMB Signed. If true, the CIFS session is signed. If false, the CIFS session is not signed. Attributes: non-creatable, non-modifiable
lif-address		ip-address optional	The data lif that is used to establish the session. Attributes: non-creatable, non-modifiable
netbios-name		string optional	Displays the NetBIOS name client used for connecting to the share. Attributes: non-creatable, non-modifiable
node		string optional	The name of the node on which the session listing is done. Attributes: key, required-for-create, non-modifiable
other	**[0..2^64-1]**	integer optional	The number of the special files that are opened under the session. Attributes: non-creatable, non-modifiable
protocol-version		cifs-dialects optional	The CIFS protocol version that is used to establish the session. Attributes: non-creatable, non-modifiable Possible values: • "smb1" - SMB 1.0, • "smb2" - SMB 2.0, • "smb2_1" - SMB 2.1, • "smb3" - SMB 3.0, • "smb3_1" - SMB 3.1
	[0..2^64-	integer	The unique identifier for the session. Attributes: key, optional-

session-id	**1]**	optional	for-create, non-modifiable
shares	**[0..2^32-1]**	integer optional	The number of the CIFS shares that are opened under the session. Attributes: non-creatable, non-modifiable
smb-encryption-status		smb-encryption optional	Displays the status of SMB encryption that is happening over the CIFS session. Attributes: non-creatable, non-modifiable Possible values: • "unencrypted" - CIFS session is not encrypted., • "encrypted" - CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session., • "partially_encrypted" - CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.
unix-user		string optional	The name of the UNIX user for which the session is established. Attributes: non-creatable, non-modifiable
user-type		string optional	The Classification of the Authenticated user. Attributes: non-creatable, non-modifiable Possible values: • "local_user" , • "domain_user" , • "guest_user" , • "anonymous_user"
vserver		string optional	The Vserver name on which the session listing is done. Attributes: key, non-creatable, non-modifiable
win-unix-creds		string optional	Display the Windows and UNIX credentials. This field is not returned by default and must be requested via desired-attributes. Attributes: non-creatable, non-modifiable
windows-user		string optional	The name of the CIFS user for which the session is established. Attributes: non-creatable, non-modifiable

Element definition: **cifs-session-file**

[top]

Displays the opened CIFS files When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
connection-count	**[0..2^32-1]**	integer optional	The number of CIFS connections associated with the CIFS session. Attributes: non-creatable, non-modifiable
connection-id	**[0..2^32-1]**	integer optional	The connection that is used to open the file. Attributes: key, optional-for-create, non-modifiable
			The type of continuous availability protection provided to the file. Attributes: non-creatable, non-modifiable Possible values:

continuously-available		cifs-ca-protection optional	"no" - The open file is not continuously available. For sessions, it contains one or more open file but none of them are continuously available., • "yes" - The open file is continuously available. For sessions, it contains one or more open files and all of them are continuously available., • "partial" - This value is used for sessions only. It contains at least one continuously available open file but other open files that are not.
file-id	**[0..2^64-1]**	integer optional	The unique identifier for the opened file. Attributes: key, optional-for-create, non-modifiable
file-type		cifs-file-type optional	The type of opened file. Attributes: non-creatable, non-modifiable Possible values: • "regular" , • "symlink" , • "stream" , • "directory"
flexgroup-msid	**[0..2^64-1]**	integer optional	The FlexGroup MSID of the volume on which the file resides. Attributes: non-creatable, non-modifiable
hosting-aggregate		aggr-name optional	The name of the aggregate on which the file resides. Attributes: non-creatable, non-modifiable
hosting-volume		volume-name optional	The name of the volume on which the file resides. Attributes: non-creatable, non-modifiable
node		string optional	The name of the node on which the file listing is done. Attributes: key, required-for-create, non-modifiable
open-mode		cifs-open-mode optional	The mode in which the file is opened. Attributes: non-creatable, non-modifiable Possible values: • "r" - Read, • "w" - Write, • "d" - Delete
path		string optional	The path of the file. Attributes: non-creatable, non-modifiable
range-locks	**[0..2^32-1]**	integer optional	The number of range locks granted on the file. Attributes: non-creatable, non-modifiable
reconnected		string optional	The state that represents if the file was opened after network disconnect. Attributes: non-creatable, non-modifiable
session-id	**[0..2^64-1]**	integer optional	The session under which file is opened. Attributes: key, optional-for-create, non-modifiable
share		cifs-share-name optional	The share name where the file resides. Attributes: non-creatable, non-modifiable
share-mode		cifs-open-mode optional	The share mode used to open the file. Attributes: non-creatable, non-modifiable Possible values: • "r" - Read, • "w" - Write, • "d" - Delete
vserver		string optional	The Vserver name on which the file listing is done. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-session-info**

[top]

Information about a single cifs session.

Name	Range	Type	Description
change-notifies		integer	Number of active ChangeNotify requests.
dirs		integer	Number of open directories.
files		integer	Number of open files.
host-ip		ip-address	IP address, in dotted-decimal format, of the CIFS client.
host-name		string optional	NetBios name of the CIFS client. This may be unavailable in certain situations. In such cases, the ONTAPI element 'host-ip' alone provides identity of the host.
shares		integer	Number of open shares.
user		string optional	Name of the user.
volumes-list		volumes-list-info[]	List of volumes being accessed during the session.

Element definition: **cifs-share**

[top]

CIFS share configuration. When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
acl		string[] optional	This string list gives the applicable Access Control list for the CIFS share. Each list entry is a '/' separated pair of the User or Group name and the effective permissions. The permission could be 'Full Control', Change', 'Read' or 'No access'. e.g.: If the group is 'Everyone' and the effective permission for this group is 'Change', the entry would be 'Everyone / Change'. Attributes: non-creatable, non-modifiable
attribute-cache-ttl	**[0..2^32-1]**	integer optional	The lifetime of an entry in the file attribute cache, in seconds. This value is used if the share has the 'attributecache' property set, which improves the performance of certain metadata operations in common workloads. The default is 10 seconds. Raising this value may improve performance, but the likelihood that stale metadata will be served increases as well. The value of this field must be in the range of 1 to 86400. Attributes: optional-for-create, modifiable
cifs-server		string optional	The NetBIOS name of the CIFS server that owns this share. Attributes: non-creatable, non-modifiable
comment		string optional	This string gives a description of the CIFS share. CIFS clients see this description when browsing the Vserver's CIFS shares. Attributes: optional-for-create, modifiable
dir-umask	**[0..777]**	integer optional	The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created directory. The input value is a numeric mode comprising of one to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values. Attributes: optional-for-create, modifiable
file-umask	**[0..777]**	integer optional	The value of this field controls the file mode creation mask for the CIFS share in qtrees with UNIX or Mixed security styles. The mask restricts the initial permissions setting of a newly created file. The input value is a numeric mode comprising of one to three octal digits (0-7), derived by adding up the bits with values 4, 2, and 1. The first digit selects permissions for the user who owns the file: read (4), write (2), and execute (1); the second selects permissions for other users in the file's group, with the same values; and the third for other users not in the file's group, with the same values. Attributes: optional-for-create, modifiable
force-group-for-create		string optional	This option specifies a predefined UNIX group name for which all files created by CIFS users in that share will be assigned group owenership to. Attributes: optional-for-create, modifiable
max-connections-per-share	**[1..2^32-1]**	integer optional	The maximum number of simultaneous connections allowed to the share. Attributes: optional-for-create, modifiable
offline-files-mode		string optional	Mode of the offline file for the CIFS share. The default value is manual. Possible values: • "none" - Clients are not permitted to cache files for offline access., • "manual" - Clients may cache files that are explicitly selected by the user for offline use., • "documents" - Clients may automatically cache files that are used by the user for offline access.,

			• "programs" - Clients may automatically cache files that are used by the user for offline access and may use those files in an offline mode even if the share is available.
path		string optional	The file system path that is shared through this CIFS share. The path is the full, user visible path relative to the vserver root, and it might be crossing junction mount points. The path is in UTF8 and uses forward slash as directory separator. Attributes: required-for-create, modifiable
share-name		string optional	The name of the CIFS share. The CIFS share name is a UTF-8 string with the following characters being illegal: control characters from 0x00 to 0x1F, both inclusive, 0x22 (double quotes) and the characters \/[]:|<>+=;,?"* Attributes: key, required-for-create, non-modifiable
share-properties		cifs-share-properties[] optional	The list of properties for this CIFS share. Attributes: optional-for-create, modifiable Possible values: • "oplocks" - This specifies that opportunistic locks (client-side caching) are enabled on this share., • "browsable" - This specifies that the share can be browsed by Windows clients., • "showsnapshot" - This specifies that Snapshots can be viewed and traversed by clients., • "changenotify" - This specifies that CIFS clients can request for change notifications for directories on this share. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support Change Notify., • "homedirectory" - This specifies that the share is added and enabled as part of the CIFS home directory feature. The configuration of this share should be done using CIFS home directory feature interface., • "attributecache" - This specifies that connections through this share are caching attributes for a short time to improve performance. • "branchcache" - This specifies that clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office. • "continuously_available" - This specifies that clients connecting to this share can open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This property is not supported for FlexGroups. • "shadowcopy" - This specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share. • "access_based_enumeration" - This specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access. • "namespace_caching" - This specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers. • "encrypt_data" - This specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share. • "show_previous_versions" - This property specifies that the

			previous version can be viewed and restored from the client. This property is enabled by default.
symlink-properties		cifs-share-symlink-properties[] optional	This flag controls whether the symlinks under this shared directory are hidden (option 'hide'), accessible (option 'enable') or are accessible as read-only (option 'read-only' along with option 'enable'). It controls whether only symlinks which have targets on this server can be resolved by a CIFS client (option 'symlinks') or if all symlinks can be resolved (option 'symlinks_and_widelinks'). It controls whether symlinks can have targets outside the client's share (option 'no_strict_security'). It controls whether no symlinks can be resolved (option 'disable'). Attributes: optional-for-create, modifiable Possible values: • "enable" (DEPRECATED) Enable both local symlinks and wide links for read-write, • "hide" (DEPRECATED) Hide both symlinks and widelinks, • "read_only" (DEPRECATED) Enable symlinks for read-only, • "symlinks" Enable symlinks only for read-write, DFS is not advertised, • "symlinks_and_widelinks" Enable both local symlinks and wide links, DFS is advertised, • "disable" Disable both local symlinks and wide links, DFS is not advertised • "no_strict_security" Allow clients to follow symlinks beyond share boundaries
volume		string optional	The name of the volume where the root of the CIFS share resides.
vscan-fileop-profile		vscan-fileop-profile optional	Profile-set of file-ops to which Vscan On-Access scanning is applicable. The default value is standard. Possible values: • "no_scan" - Virus scans are never triggered for accesses to this share, • "standard" - Virus scans can be triggered by open, close, and rename operations, • "strict" - Virus scans can be triggered by open, read, close, and rename operations, • "writes_only" - Virus scans can be triggered only when a file that has been modified is closed.
vserver		string optional	The name of the Vserver. Attributes: key, required-for-create, non-modifiable

Element definition: **cifs-share-access-control**

[top]

The permissions that users and groups have to a CIFS share. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
permission		cifs-access-perms optional	The access rights that the user or group has on the defined CIFS share. Attributes: required-for-create, modifiable Possible values: • "no_access" - No access, • "read" - Read, • "change" - Change, • "full_control" - Full Control, • "custom" - Custom
share		string optional	The CIFS share for which the permissions are defined. Attributes: key, required-for-create, non-modifiable
user-group-type		string optional	The type of user for which ACL is configured. Default value is windows. Attributes: key, optional-for-create, non-modifiable Possible values: • "windows" - Windows User or Group., • "unix_user" - Unix User., • "unix_group" - Unix Group.
user-or-group		string optional	The user or group name for which the permissions are listed. Attributes: key, required-for-create, non-modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable
winsid		windows-sid optional	The Windows SID for the user or group for which the permission is defined. Attributes: optional-for-create, modifiable

Element definition: **cifs-share-acl-info**

[top]

Information about single share.

Name	Range	Type	Description
share-name		string	Name of the share.
user-acl-info		access-rights-info[]	List of users or Unix groups that have access to this share.

Element definition: **cifs-share-info**

[top]

Information about a single cifs share.

Name	Range	Type	Description
caching		string optional	String specifying the type of caching: "no_caching", "auto_document_caching", "auto_program_caching" and "manual_caching".
description		string optional	description of the share.
dir-umask		integer optional	File mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created directory. This mask overrides one set with "umask".

file-umask		integer optional	File mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of a newly created file. This mask overrides one set with "umask".
forcegroup		string optional	name of the group to which files to be created in the share belong to.
is-access-based-enum		boolean optional	If true Access Based Enumeration (ABE) is enabled, else it is disabled. ABE filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access. Its value is returned only if it is non-default value. Its default value is false.
is-browse		boolean optional	if true, this share can be browsed. Its values is returned only if it is non-default value. Its default value is true.
is-namespace-caching-allowed		boolean optional	If true, namespace caching is enabled on the share. If false or not specified, namespace caching is disabled. If namespace caching is enabled on a share, clients are allowed to cache the directory enumeration results for better performance.
is-symlink-strict-security		boolean optional	If true or not specified, strict symlink security is enabled. If false, allows clients to follow symbolic links to destinations on this filer but outside of the current share. Its value is returned only if it is non-default value. Its default value is true.
is-vol-offline		boolean optional	If true, volume is offline and the shares are not available. Its value is returned only if it is non-default value. Its default value is false.
is-vscan		boolean optional	If true or not specified, virus scan is done when clients open files on this share. Its value is returned only if it is non-default value. Its default value is true.
is-vscanread		boolean optional	If true or not specified, virus scan is done when clients open files on this share for read access. Its value is returned only if it is non-default value. Its defalut value is true.
is-widelink		boolean optional	If true, allows clients to follow absolute symbolic links outside of this share, subject to NT security. Its value is returned only if it is non-default value. Its default value is false.
maxusers		integer optional	max no. of simultaneous connections to the share.
mount-point		string	mount point of the share.
share-name		string	name of the cifs share.
umask		integer optional	File mode creation mask for a share in qtrees with Unix or mixed security styles. The mask restricts the initial permissions setting of newly created files and directories. This field is ignored when both dir-umask and file-umask are present.

Element definition: **cifs-share-properties**

[top]

The list of properties on a CIFS share. Possible values:

- "oplocks" - This specifies that opportunistic locks (client-side caching) are enabled on this share.,
- "browsable" - This specifies that the share can be browsed by Windows clients.,
- "showsnapshot" - This specifies that Snapshots can be viewed and traversed by clients.,
- "changenotify" - This specifies that CIFS clients can request for change notifications for directories on this share. If the path of the share is within a FlexGroup, change notifications are not sent because FlexGroups do not support Change Notify.,
- "homedirectory" - This specifies that the share is added and enabled as part of the CIFS home directory feature. The configuration of this share should be done using CIFS home directory

feature interface.,
- "attributecache" - This specifies that connections through this share are caching attributes for a short time to improve performance.
- "branchcache" - This specifies that clients connecting to this share can make requests using BranchCache technology that allows them to cache the content in an attempt to reduce WAN utilization from a remote office.
- "continuously_available" - This specifies that clients connecting to this share can open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback.
- "shadowcopy" - This specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share.
- "access_based_enumeration" - This specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- "namespace_caching" - This specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- "encrypt_data" - This specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.
- "show_previous_versions" - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

enable|hide|read-only|symlinks|symlinks-and-widelinks|disable|no-strict-security Possible values:

- "enable" - (DEPRECATED)-Enable both local symlinks and wide links for read-write,
- "hide" - (DEPRECATED)-Hide both symlinks and wide links,
- "read_only" - (DEPRECATED)-Enable symlinks for read-only,
- "symlinks" - Enable symlinks only for read-write, DFS is not advertised,
- "symlinks_and_widelinks" - Enable both local symlinks and wide links, DFS is advertised,
- "disable" - Disable both local symlinks and wide links, DFS is not advertised,
- "no_strict_security" - Allow clients to follow symlinks outside share boundaries

[none]

Element definition: **cifs-symlink**

[top]

CIFS symbolic link path mapping configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cifs-path		string optional	This field specifies the CIFS path on the destination to which the symbolic link maps. The final path is generated by concatenating the CIFS server name, the share name, the cifs-path and the remaining path in the symbolic link left after the prefix match. This value is specified by using a UNIX-style path name. The trailing forward slash is required for the full path name to be properly interpreted. This is a UTF-8 string and supports localization. Attributes: required-for-create, modifiable
cifs-server		string optional	This field specifies the destination CIFS server name for the mapping to which the symbolic link is mapped. The default is the local CIFS server. The field needs to be specified if the locality of the symbolic link is 'widelink'. This can be either a DNS name, NetBIOS name or an IP address. If a DNS name or a NetBIOS name are specified, the CIFS client configuration should be such that it is capable of resolving the CIFS server name to the correct IP address. Attributes: optional-for-create, modifiable
home-directory		boolean optional	This field specifies whether the destination share is a home directory. If the value of this field is true, wildcard path elements in the destination path are replaced with specific values for the user accessing the symbolic link. Wildcard %w is replaced by the user's Windows name. Wildcard %u is replaced by the user's mapped Unix name. Wildcard %d is replaced by the domain to which the user belongs. The default value is false. Attributes: optional-for-create, modifiable
locality		cifs-symlink-locality optional	This field specifies whether the CIFS symbolic link is a local link, free link or wide link. A local symbolic link maps to the local CIFS share. A free symlink maps to the local vserver. A wide symbolic link maps to any CIFS share on the network. If the CIFS server matches the VServer's NetBIOS name then the default value is local otherwise wide link. The symlink option 'freelink' is obsolete. Attributes: optional-for-create, modifiable Possible values: • "local" - Share on This VServer, • "widelink" - Share on Another CIFS Server, • "freelink" - Anywhere on This VServer (OBSOLETE)
share-name		string optional	This field specifies the CIFS share name on the destination CIFS server to which the symbolic link is mapped. This is a UTF-8 string and supports localization. Attributes: optional-for-create, modifiable
unix-path		string optional	This field specifies the UNIX path prefix to be matched for the mapping. If the prefix of the target path in the symbolic link matches against this field, this entry of symbolic link path mapping would be used. The path is a UTF-8 string and supports localization. The path must start and end with a forward slash ('/'). For example '/usr/local/'. Attributes: key, required-for-create, non-modifiable
vserver		vserver-name optional	The name of the Vserver associated with this CIFS server. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-symlink-locality**

[top]

Locality of the destination where this symbolic link points. Possible values:

- "local" - Share on This VServer,
- "widelink" - Share on Another CIFS Server,
- "freelink" - Anywhere on This VServer (OBSOLETE)

[none]

Element definition: **cifs-top-info**

[top]

Information about a single cifs top.

Name	Range	Type	Description
ops-per-sec		integer	The number of operations of any type per second.
read-ops		integer	The number of read requests.
read-size		integer	The size in kbytes per second of data of read requests.
suspicious-per-sec		integer	The number of "suspicious" events per second due to the following conditions: ACCESS-DENIED returned for FindFirst ACCESS-DENIED returned for Open/CreateFile ACCESS-DENIED returned for DeleteFile SUCCESS returned for DeleteFile SUCCESS returned for TruncateFile
user-info		string	Information on the client with its IP address and user account.
write-ops		integer	The number of write requests.
write-size		integer	The size in kbytes per second of data of write requests.

Element definition: **cifs-user-home-directory-path**

[top]

This commands finds the home directory of a user specified in the command in all the home directory search path configured. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
path		string optional	The path of home directory for the specified user name. Attributes: non-creatable, non-modifiable
share-name		string optional	The expanded share name for the user. Attributes: non-creatable, non-modifiable
username		string optional	Output User Name Attributes: non-creatable, non-modifiable
vserver		vserverid optional	The name of the Vserver in which home directory for a user has to be searched. Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-users-and-group-local-group-members**

[top]

List of local groups, organized by Vserver When returned as part of the output, all elements of this

typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
group-name		cifs-name optional	The name of the local group Attributes: key, non-creatable, non-modifiable
member		cifs-name[] optional	The member of a local group Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **cifs-users-and-group-local-user-membership**

[top]

List of local users' membership information, organized by Vserver When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
membership		cifs-name[] optional	The membership of the local user Attributes: non-creatable, non-modifiable
user-name		cifs-name optional	The name of the local user Attributes: key, non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **connection-info**

[top]

Structure containing information on the connection.

Name	Range	Type	Description
connected-address		address-info[] optional	An address list of currently connected servers.
favored-address		address-info[] optional	An address list of favored servers.

other-address		address-info[] optional	An address list of other servers.
preferred-address		address-info[] optional	An address list of preferred servers.

Element definition: **cron-day-of-week** [top]

Job Manager cron scheduling day of week. Zero represents Sunday. -1 represents all days of a week and only supported for cron schedule create and modify. Range : [-1..6].

[none]

Element definition: **enable** [top]

'enabled' or 'disabled'

[none]

Element definition: **homedir-path-info** [top]

path to user home directory paths Unix style path to user home directories, example: /vol/vol1/users1 The paths are listed in the same order that the filer will use to evaluate whether a user has a cifs home directory.

[none]

Element definition: **ldap-security**

[top]

The list of possible values for LDAP Security. Possible values:

- "none" - No Signing or Sealing.
- "sign" - Sign LDAP traffic.
- "seal" - Seal and Sign LDAP traffic.

[none]

Element definition: **lm-compatibility-level**

[top]

LM compatibility level. Possible values:

- "lm_ntlm_ntlmv2_krb" - Accepts LM, NTLM, NTLMv2 and Kerberos,
- "ntlm_ntlmv2_krb" - Accepts NTLM, NTLMv2 and Kerberos,
- "ntlmv2_krb" - Accepts NTLMv2 and Kerberos,
- "krb" - Accepts Kerberos only

[none]

Element definition: **nbalias-name-info**

[top]

NetBIOS alias for the filer

[none]

Element definition: **netbios-name**

[top]

Name of a client or a server participating in a NetBIOS Windows File sharing service network. This can be different from the host name.

[none]

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **path-error-info**

[top]

Error description

Name	Range	Type	Description
error-path		string	Homedir path, if any, which had the error. This value is set to NULL if there is no path associated with the error.
error-path-desc		string	A description of the error.

Element definition: **realm-name**

[top]

[none]

Element definition: **service-state**

[top]

down|up Possible values:

- "up"

[none]

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **smb-encryption**

[top]

The list of possible values for SMB Encryption status. Possible values:

- "unencrypted" - CIFS session is not encrypted.
- "encrypted" - CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- "partially_encrypted" - CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

[none]

Element definition: **system-default-bool** [top]

false|true|system-default Possible values:

- "false" ,
- "true" ,
- "system_default"

[none]

Element definition: **time-interval** [top]

Time interval in seconds Range : [0..2^32-1].

[none]

Element definition: **time-of-day** [top]

Time of day in HH::MM::SS

[none]

Element definition: **uri** [top]

[none]

Element definition: **volume-name** [top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However,

two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

[none]

Element definition: **vscan-fileop-profile**

[top]

Profile-set of file-ops to which Vscan On-Access scanning is applicable. Possible values:

- "no_scan" - Virus scans are never triggered for accesses to this share,
- "standard" - Virus scans can be triggered by open, close, and rename operations,
- "strict" - Virus scans can be triggered by open, read, close, and rename operations,
- "writes_only" - Virus scans can be triggered only when a file that has been modified is closed.

[none]

Element definition: **windows-sid**

[top]

Unique Windows Security Identifier that identifies a User or Group or Machine account.

[none]

Element definition: **access-rights-info**

[top]

Access rights of single user or single Unix group.

Name	Range	Type	Description
access-rights		string	User access rights. The format of the rights can be Unix-style combinations of r w x - or NT-style "No Access", "Read", "Change", and "Full Control".
unix-group-name		string optional	Name of the Unix group.
user-name		string optional	Name of the user.

Element definition: **address-info**

[top]

Structure containing address information of servers.

Name	Range	Type	Description
has-nossl		boolean optional	If true, the protocol SSL is not supported.
hostname		string	The resolved hostname of the IP address.

		optional	
ip-address		string optional	The IP address in canonical form.
is-broken		boolean optional	If true, the address is not responding.
is-multihomed		boolean optional	If true, the address is a multi-homed server.
is-primary		boolean optional	If true, the address is a primary server.

Element definition: **aggr-name**

[top]

Name of the aggregate

[none]

Element definition: **anonymous-restriction-level**

[top]

Classification of the CIFS null user restriction. Possible values:

- "no_restriction" - No Access Restriction for Anonymous User.,
- "no_enumeration" - Only Enumeration Is Restricted.,
- "no_access" - Access Restricted for Anonymous User.

[none]

Element definition: **auth-mechanism**

[top]

The list of possible known authentication mechanisms supported by the CIFS server. Possible values:

- "None" - None
- "NTLMv1" - NTLMv1
- "NTLMv2" - NTLMv2
- "Kerberos" - Kerberos
- "Anonymous" - Anonymous

[none]

access rights Possible values:

- "no_access" - No access,

- "read" - Read,
- "change" - Change,
- "full_control" - Full Control,
- "custom" - Custom

[none]

Element definition: **cifs-auth-style**

[top]

domain|workgroup|realm Possible values:

- "domain" - DOMAIN,
- "workgroup" - WORKGROUP,
- "realm" - KERBEROS REALM

[none]

Element definition: **cifs-bc-version-control**

[top]

Versions of CIFS BranchCache that are currently supported.

[none]

Element definition: **cifs-ca-protection**

[top]

The list of possible protection levels. Open files are "Continuously Available" if they are opened from an SMB 3 client through a share with the "continuously_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions. Note: The CA protection levels depicts the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but will not appear continuously available as clients do not open them that way by design. These protection levels are applicable to the sessions/files on read/write volumes on SFO aggregates. Possible values:

- "No" - The open file is not continuously available. For sessions, it contains one or more open files but none of them are continuously available.
- "Yes" - The open file is continuously available. For sessions, it contains one or more open files and all of them are continuously available.
- "Partial" - This value is used for sessions only. It contains at least one continuously available open file but other open files that are not.

[none]

Element definition: **cifs-dialects**

[top]

The list of possible known dialects Dialects negotiated by CIFS servers. Possible values:

- "SMB1" - SMB 1.0
- "SMB2" - SMB 2.0
- "SMB2_1" - SMB 2.1
- "SMB3" - SMB 3.0

[none]

Element definition: **cifs-domain-discovered-server-funclvl**

[top]

win2000|unknown|win2003|win2008|win2008r2|win2012|win2012r2|win2016|winthreshold Possible values:

- "win2000" - WIN2000,
- "unknown" - The DC functionality level is unknown,
- "win2003" - WIN2003,
- "win2008" - WIN2008,
- "win2008r2" - WIN2008R2,
- "win2012" - WIN2012,
- "win2012r2" - WIN2012R2,
- "win2016" - WIN2016,
- "winthreshold" - WINTHRESHOLD

[none]

Element definition: **cifs-domain-discovered-server-status**

[top]

Classification of server based on the status of the connection. Possible values:

- "ok" - The connection to this server is usable.,
- "unavailable" - This server is currently unavailable for use.,
- "slow" - The connection to this server is usable but slow.,
- "expired" - The connection to this server has expired.,
- "undetermined" - A connection to this server has not been attempted.,
- "unreachable" - This server is currently unreachable.

[none]

Element definition: **cifs-domain-discovered-server-type**

[top]

The classification of servers based on service provided. Possible values:

- "unknown" - The server type is not known,
- "kerberos" - Kerberos server,
- "ms_ldap" - Microsoft Lightweight Directory Access Protocol (LDAP) server,
- "ms_dc" - Microsoft Domain Controller,
- "ldap" - Lightweight Directory Access Protocol (LDAP) server

[none]

Element definition: **cifs-domain-server-discovery-mode**

[top]

The mode of server discovery. Possible values:

- "all" - Discover all the servers in the domain.,
- "site" - Discover the servers local to the site.,
- "none" - Discover nothing. Expect admins to configure pref-dcs.

[none]

Element definition: **cifs-domain-server-prefer-type**

[top]

The preference level of the server either set due to configuration or due to the site membership determined by server discovery. Possible values:

- "unknown" - The preference level of this server is unknown.,
- "preferred" - This server was administratively marked as a preferred server due to its presence in the list of preferred servers.,
- "favored" - This server was marked as favored by the server discovery process by virtue of site membership.,
- "adequate" - This server was discovered by the server discovery process and can be used, but has no preference associated with it.

[none]

Element definition: **cifs-file-type**

[top]

The list of possible types of files opened through CIFS servers. Possible values:

- "Regular" - Regular file
- "Symlink" - Symlink file
- "Stream" - Stream file
- "Directory" - Directory

[none]

Element definition: **cifs-filesystem-sector-size**

[top]

CIFS File System Sector sizes reported to SMB Clients (in bytes). Possible values:

- "512" - Reported file system sector size to SMB clients is 512 bytes,
- "4096" - Reported file system sector size to SMB clients is 4096 bytes

[none]

Element definition: **cifs-name**

[top]

[none]

Element definition: **cifs-open-mode**

[top]

The list of possible modes used when opening files over CIFS servers. Possible values:

- "R" - The file opened for read operation.
- "W" - The file opened for write operation.
- "D" - The file opened for delete operation.

[none]

Element definition: **cifs-share-name**

[top]

The name of the CIFS share. The CIFS share name is a Unicode string with the following characters being illegal: control characters from 0x00 to 0x1F, both inclusive, 0x22 (double quotes) and the characters \/[]:|<>+=;,?

[none]

Element definition: **domain-name**

[top]

The domain name is an identification label that defines a realm based on Domain Name Service (DNS).

[none]

Element definition: **elapsed-time-ext**

[top]

The difference between the two points in time.

[none]

Element definition: **volumes-list-info** [top]

Information about a single volume.

Name	Range	Type	Description
volume		string	Name of the volume.

Element definition: **vserver-name** [top]

The name of the Vserver.

[none]

Element definition: **vserverid** [top]

Vserver Id

[none]

Element definition: **wins-entry-info** [top]

Windows Internet Name Server (WINS) information

Name	Range	Type	Description
wins-address		ip-address optional	Windows Internet Name Service (WINS) Server address. Attributes: non-creatable, non-modifiable
wins-state		string optional	WINS Server State. Possible values: 'active', 'inactive'. Attributes: non-creatable, non-modifiable

Element definition: **ip-address** [top]

IPv4 and IPv6 address

[none]

APIs in Category: **clock**

clock-get-clock
clock-get-timezone
clock-set-clock
clock-set-timezone

These APIs allow for manipulation of timezone and date on the filer. Timezone and date can be set on the filer as well as we can get the current date, timezone and compliance clock time on the filer.

clock-get-clock

[top]

gets current date and time from filer.

Input Name	Range	Type	Description
is-compliance-clock		boolean optional	If true, then local-time and utc-time are values for the compliance clock, otherwise they are values for the local clock. Default is false. Note: This field is deprecated in Data ONTAP 8.1 and later. If true, the operation will fail with error EOPNOTSUPPORTED. Clients should use the API snaplock-get-system-compliance-clock or snaplock-get-volume-compliance-clock as applicable to get the compliance clock time.

Output Name	Range	Type	Description
local-time	**[-43200..2^31-1]**	integer	Local date and time of the filer in seconds since Midnight, 1/1/1970. Depending on the time zone and clock settings, this might be negative by up to 12 hours.
utc-time	**[0..2^31-1]**	integer	Current date and time of the filer in seconds since Midnight, 1/1/1970.

Errno	Description
EINTERNALERROR	
EOPNOTSUPPORTED	

clock-get-timezone

[top]

Gets current timezone and timezone file version.

Output Name	Range	Type	Description
timezone		string	Current timezone name where the storage system is operating. A timezone can have one of the two formats: 1. "Using a location string specified in Arthur David Olsen's public domain time zone database. For example, "Americas/New_York" represents most of the Eastern Time Zone."; 2. "A traditional time zone abbreviation incorporating default rules for daylight savings time. For example, "EST5EDT" for the US Eastern

			Time Zone.";
timezone-UTC		string	Current timezone of the storage system in UTC +/-hhmm format. This indicates that the local time zone is hh hours and mm minutes ahead or behind UTC. For example, Central European Time(CET) is +0100 and U.S./Canadian Eastern Standard Time(EST) is -0500.
timezone-version		string	Version of the time zone database. "YYYY" is the year the data base was released and "v" is the version within that year. "YYYY" will be four decimal digits and "v" will be an ASCII letter starting with "a" and increasing with each version. For example, the second 2007 version is "2007b".

Errno	Description
ENOTIMEZONESET	
ENOTIMEZONEVERSION	

clock-set-clock

[top]

Set current date and time to the specified date and time.

Input Name	Range	Type	Description
is-utc-clock		boolean	If this is true, then clock is given in UTC (universal time) instead of local time.
time	**[-43200..2^31-1]**	integer	Actual value of the date and time which has to be set as the current date and time on filer. Value will be seconds since Midnight, 1/1/1970. Depending on the time zone and clock settings, this might be negative by up to 12 hours.

Errno	Description
EINVALIDINPUTERROR

clone-token-delete
clone-token-get
clone-token-get-iter
clone-token-modify-expiry-limit

The cloning feature is based on constant time sis cloning storage (SIS) implementation and is the the block sharing infrastructure provided by Data ONTAP. The feature allows for the cloning from a file, LUN or NVMe namespace. Also the user can clone the entire file, LUN, or NVMe namespace (full range) or a portion of the file, LUN, or NVMe namespace (sub range). In case of full range cloning, a new file/LUN/NVMe namespace will always be created in the same volume where the source file/LUN/NVMe namespace exists. In case of sub range cloning, the destination file can either be same as the source file/LUN/NVMe namespace or can be a different file/LUN/NVMe namespace within the same volume where the source file/LUN/NVMe namespace exists. In case of sub range cloning, the LBA block size of a LUN or NVMe namespace is derived from the LUN or NVMe namespace's block size. Sub range cloning is supported only between LUNs or NVMe namespaces with equal block sizes and is supported from source LUN to destination NVMe namespace and from source NVMe namespace to destination LUN. Constant time SIS cloning supersedes the implementation of cloning in versions older than Data ONTAP 8.1. In Data ONTAP 8.0 the cloning implementation is an asynchronous operation. The clone-start API is used to start a clone operation. It returns an clone-id which is used for polling to get the status of the clone operation using the clone-list-status API. If this API returns success, the user can consider that clone operation has completed; if it returns failure, the user should clear the status of clone operation using clone-clear API. A clone operation in progress can be aborted using the clone-stop API. In Data ONTAP 8.1 the cloning implementation is a synchronous operation. The APIs to manage ongoing synchronous operations are deprecated, but retained for backwards compatibility.

clone-autodelete

[top]

Enable autodelete on a file, LUN, or NVMe namespace clone. This command is only supported for flexible volumes.

Input Name	Range	Type	Description
clone-path		string	Path of the file, LUN, or NVMe namespace inside the volume. It's relative if the volume name is specified; otherwise it's absolute.
enable		boolean	If this field is true, autodelete will be allowed to delete the clone in try/disrupt mode. and if it is false, autodelete will not be allowed to delete the clone in try/disrupt mode. Note that this will be done only if the clone entry is already present in the clone auto delete metafile.
force		boolean optional	If this field is true, autodelete will be enabled on specified file, LUN, or NVMe namespace by adding an entry in the clone auto delete metafile if it is not there, even if the specified file, LUN, or NVMe namespace is not a clone. By default value is false.
volume		string optional	Name of the volume where the clone file, LUN, or NVMe namespace resides.

clone-create

[top]

Create a file/sub file, LUN/sub LUN, or NVMe namespace/sub NVMe namespace clone. This command is only supported for flexible volumes.

Input Name	Range	Type	Description
autodelete		boolean optional	Mark file, LUN, or NVMe namespace clones for auto deletion. When set to true, file, LUN, or NVMe namespace clones will be autodeleted to reclaim space when the volume runs out of space. By default value is false.
			List of block ranges for sub-file/sub-LUN/sub-NVMe namespace cloning. For sub-LUN or sub-NVMe namespace cloning the block range specified will be considered as LBA range. If only one block range is supplied, the source and destination range must not overlap and both ranges must not extend past the end of the file. If multiple block ranges are specified in one operation, the user must ensure all source and destination ranges do not overlap, otherwise the result is undefined. In case of sub-LUN cloning, the API will copy data in case the LBAs are not block aligned. In

block-ranges		block-range[] optional	case of sub-LUN/sub-NVMe namespace cloning, the LBA block size of a LUN or NVMe namespace is derived from the LUN or NVMe namespace's block size. Sub range cloning is supported only between LUNs or NVMe namespaces with equal block sizes, and the API returns an error if the block sizes do not match. Sub range cloning is supported from source LUN to destination NVMe namespace and from source NVMe namespace to destination LUN. If the user provides LBAs such that actual number of blocks to be cloned is zero, then API will return error. The API will fail if the source range overlaps with the destination range or if the source and the destination ranges overlap amongst themselves. If block range is not provided then the file/LUN/NVMe namespace is fully cloned.
destination-exists		boolean optional	Allow clone creation if the destination exists. By default value is false.
destination-path		string optional	Full path of the destination file, LUN, or NVMe namespace relative to the volume. The destination file must be in same volume as "source-path". If not specified, a sub-range clone of the source file, LUN, or NVMe namespace will be performed on itself. Either "destination-path" or "block-ranges" must be specified. For sub-file clone operation from snapshot copy, "destination-path" is mandatory.
destination-volume		string optional	Name of the volume where the destination file resides. This option is supported only for Metawafl volumes, where the source and destination volumes for the clone operation can be different.
ignore-locks		boolean optional	Clone even if (advisory/mandatory) byte_range locks or share_mode locks exist on the source or destination. By default value is false.
ignore-streams		boolean optional	Clone only the base file and ignore streams on source or destination. By default value is false so streams are also cloned from source and existing destination streams are deleted.
is-backup		boolean optional	This option is only to be used with full-file clone creates for backups, where source file gets periodically modified and clone file is not modified. By default, value is false.
qos-adaptive-policy-group-name		string optional	QoS adaptive policy group defines measurable Service Level Objectives (SLOs) that adjust based on the flexclone file's allocated space or used space. This field is available in Data ONTAP 9.4 and later
qos-policy-group-name		string optional	QoS policy group defines measurable Service Level Objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a flexclone file, the system will not monitor and control the traffic to it. This field is available in Data ONTAP 8.2 and later
snapshot-name		string optional	Snapshot name from which to clone the source file, LUN, or NVMe namespace. If not specified, the contents of the active filesystem will be used.
source-path		string	Relative path of the source file, LUN, or NVMe namespace inside the volume.
space-reserve		boolean optional	Set the space reservation of the destination clone. By default space reservation is inherited from source. The API errors out if used in conjunction with block range arguments, since space reservations cannot be set for a block range.
token-uuid		string optional	Use the split load reserved by the token to create file, LUN, or NVMe namespace clones. This will guarantee clone create requests from not getting throttled. If this option is not specified, available split load in the node will be used for clone creation.
volume		string	Name of the volume where the source and destination files, LUNs, or NVMe namespaces reside.

clone-start

[top]

In Data ONTAP 8.0 and earlier this API starts a file/LUN/NVMe namespace or sub-file/sub-LUN/sub-NVMe namespace clone operation asynchronously. If clone operation starts successfully, a unique clone-id is returned. User is supposed to poll clone-list-status specifying clone-id to get the status of the clone operation. When clone-list-status returns status as completed, user can consider that the clone operation has been completed successfully. If user gets status as failed, user is responsible for doing clone-clear which will clean the status of the clone operation. In Data ONTAP 8.1 and later, this API performs a file/LUN/NVMe namespace or sub-file/sub-LUN/sub-NVMe namespace clone operation synchronously. When this API returns successfully, the destination file is ready for use.

Input Name	Range	Type	Description
autodelete		boolean optional	Mark file, LUN, or NVMe namespace clones for auto deletion. When set to true, file, LUN, or NVMe namespace clones will be autodeleted to reclaim space when the volume runs out of space. By default value is false.
block-ranges		block-range[] optional	List of block ranges for sub-file/sub-LUN/sub-NVMe namespace cloning. The number of block ranges is limited to 32. For sub-LUN/sub-NVMe namespace cloning the block range specified will be considered as LBA range. If only one block range is supplied, the source and destination range must not overlap and both ranges must not extend past the end of the file If multiple block ranges are specified in one operation, the user must ensure all source and destination ranges do not overlap, otherwise the result is undefined. In case of sub-LUN/sub-NVMe namespace cloning, the API will copy data in case the LBAs are not block aligned. If the user provides LBAs such that actual number of blocks to be cloned is zero, then API will return error. If the source and destination block sizes do not match for sub-LUN/sub-NVMe namespace cloning, then API will return error. The API will fail if the source range overlaps with the destination range or if the source and the destination ranges overlap amongst themselves. If block range is not provided then the file/LUN/NVMe namespace is fully cloned.
change-log		boolean optional	If this option is "true", fingerprints of data blocks of the destination file/block ranges created will be change logged to the change log file if A-SIS is enabled on the volume. With change logging clone operation will be slow, as to get fingerprints all the data blocks will be read. Without change logging clone operation deals with only indirect blocks without reading data blocks. Without change logging, fingerprints of the clone blocks are not recorded. The clone blocks are shared with the source blocks, but as later the source blocks are modified, corresponding clone blocks will no longer be shared. If change logging option is not used, clone blocks, which could be involved in sharing with rest of the file system, can not be shared in next sis operation. The only option, in case user had not used change logging while creating clone, will be to start sis from beginning using "sis start -s" to gather fingerprints of clone blocks. In Data ONTAP 8.1 and later, this field is accepted for backwards compatibility and is ignored.
destination-		boolean	Allow clone creation if the destination exists. By default value is false.

exists		optional	
destination-path		string optional	Full path of the Destination file, LUN, or NVMe namespace in //file-path format. Destination path should be in same flexible volume as "source-path". If not specified, a sub-range clone of the source file, LUN, or NVMe namespace will be performed on itself. Either "destination-path" or "block-ranges" must be specified. For sub-file/sub-LUN/sub-NVMe namespace clone operation from snapshot copy, "destination-path" is mandatory.
destination-volume		string optional	Name of the volume where the destination files resides. This option is supported only for Metawafl volumes, where the source and destination volumes for the clone operation can be different.
ignore-locks		boolean optional	Clone even if (advisory/mandatory) byte_range locks or share_mode locks exist on the source or destination. By default value is false.
ignore-streams		boolean optional	Clone only the base file and ignore streams on source or destination. By default value is false so streams are also cloned from source and existing destination streams are deleted.
is-backup		boolean optional	This option is only to be used with full-file clone creates for backups, where source file gets periodically modified, and clone file is not modified. By default, value is false.
no-snap		boolean optional	If no-snap is FALSE or unspecified, then a temporary snapshot will be taken and source file locked in snapshot will be considered for cloning. So that the clone operation does not get affected by writes to the source file in parallel to the clone operation. User will get atomic point in time copy of the source. Irrespective of clone operation completes successfully or unsuccessfully, any temporary snapshot taken for cloning will be deleted automatically. If no-snap is "true", then the source file in AFS will be used for cloning. In this case user may get random data in clone if source file is modified while clone operation is in progress. This option should only be used when user is assured that the source file will remain consistent during the clone operation. Destination file is not protected against any modification while clone operation is in progress. User should use the destination file or destination block ranges after clone operation is finished. In Data ONTAP 8.1 and later, this field is accepted for backwards compatibility and is ignored.
snapshot-name		string optional	Snapshot name from which to clone the source file, LUN, or NVMe namespace. If not specified, the contents of in the active filesystem will be used. This field is available in Data ONTAP 8.1 or later
source-path		string	Full path of the source file, LUN, or NVMe namespace in //file-path format.
space-reserve		boolean optional	Set the space reservation of the destination clone. By default space reservation is inherited from source. The API errors out if used in conjunction with block range arguments, since space reservations cannot be set for a block range.
token-uuid		string optional	Use the split load reserved by the token to create file, LUN, or NVMe namespace clones. This will guarantee clone create requests from not getting throttled. If this option is not specified, available split load in the node will be used for clone creation.

Output Name	Range	Type	Description
clone-id		clone-id-info	Unique ID information for the clone operation returned if clone operation starts successfully. This field is deprecated in Data ONTAP 8.1 and later, the returned value is guaranteed to be a completed clone operation if supplied to clone-list-info.

clone-token-create

[top]

Create a token to reserve available split load on a node. This token can be used with clone-create api to use up the reserved split load. This will to allow clone creates from getting throttled.

Input Name	Range	Type	Description
expiry-limit		integer optional	The duration (in seconds) for which the reserved token is valid.
node		node-name	Node name on which split load is reserved.
reserve-size		size	Available reserve in split load reserved by token where split load is the number of bytes reserved for creation of clones.

Output Name	Range	Type	Description
token-uuid		string	Token UUID for which the split load is reserved.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

clone-token-delete

[top]

Delete token(s) to increase the allowed split load by a node.

Input Name	Range	Type	Description
node		node-name	Node name on which split load is reserved.
token-uuid		string optional	Token UUID for which the split load is reserved.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

clone-token-get

[top]

Get the information about a specified token.

Input Name	Range	Type	Description
node		node-name	Node name on which split load is reserved.
token-uuid		string	Token UUID for which the split load is reserved.

Output Name	Range	Type	Description
clone-token-info		clone-token-info	Information about token reserved for file or LUN clone creates.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

clone-token-get-iter

[top]

Get the information about all reserved tokens.

Input Name	Range	Type	Description
desired-attributes		clone-token-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
node		node-name	Node name on which split load is reserved.
query		clone-token-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the clone object. All clone objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		clone-token-info[] optional	The list of attributes of clone objects.
next-tag		string optional	Tag for the next call. Not present when there are no more clone objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description

EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

clone-token-modify-expiry-limit

[top]

Modify the allowed expiry limit for token(s).

Input Name	Range	Type	Description
node		node-name	Node name on which split load is reserved.
reservation-duration-limit	**[0..2^64-1]**	integer	The duration (in seconds) for which the reserved token is valid.
token-uuid		string optional	Token UUID for which the split load is reserved.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

Element definition: **block-range**

[top]

Structure containing source and destination block range for sub-file/sub-LUN/sub-NVMe namespace cloning.

Name	Range	Type	Description
block-count	**[1..2^27]**	integer	Number of blocks to be cloned.
destination-block-number	**[0..2^63-1]**	integer	Starting file block number of destination block range.
source-block-number	**[0..2^63-1]**	integer	Starting file block number of source block range. Block size is 4096 bytes.

Element definition: **clone-autodelete-info**

[top]

Information about file or LUN clone autodeletion. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-autodelete-enabled		boolean optional	If this field is true, autodelete will delete the clone in try/disrupt mode. If it is false, autodelete will delete the clone only in destroy mode. Attributes: non-creatable, non-modifiable

Element definition: **clone-deletion-info**

[top]

Structure containing the clone deletion information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
extension-info-list		extension-info[] optional	List of file extensions that needs to be added/removed for clone-delete
minimum-size		string optional	Minimum size of the file(s) to be deleted using the clone-delete. The format to use is: < number > k|m|g|t. Where 'k' means kilobytes, 'm' means mega bytes, 'g' means gigabytes and 't' mean terabytes. If the trailing unit character doesn't appear, then < number > is interpreted as the number of bytes Attributes: non-creatable, modifiable
volume		volume-name optional	Volume Name Attributes: key, non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Name Attributes: key, non-creatable, non-modifiable

Element definition: **clone-id-info**

[top]

Structure containing clone ID information.

Name	Range	Type	Description
clone-op-id	**[0..2^63-1]**	integer	ID of the clone operation.
volume-uuid		string	uuid of the volume.

Element definition: **clone-split-info**

[top]

Information about unsplit file or LUN clones. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of

desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
unsplit-clone-count	**[0..2^32-1]**	integer optional	Number of file clones or LUN clones present in the the volume that are not split. Attributes: non-creatable, non-modifiable
unsplit-size		size optional	Total size (in bytes) of file or LUN clones in the volume that are not split. Attributes: non-creatable, non-modifiable

Element definition: **clone-split-load-info**

[top]

Information about load on the node due to file or LUN clone split operations. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
available-split-load		size optional	Remaining allowable load on the node. Load is specified in number of bytes. Attributes: non-creatable, non-modifiable
current-split-load		size optional	Current clone split load on the node. Load is specified in number of bytes. Attributes: non-creatable, non-modifiable
max-split-load		size optional	Maximum clone split load allowed on the node. Load is specified in number of bytes. Attributes: non-creatable, modifiable
node		node-name optional	Node name for which the clone split load is required. Attributes: key, non-creatable, non-modifiable
token-reserved-load		size optional	Load reserved by tokens on the node for clone creation. Load is specified in number of bytes. Attributes: non-creatable, non-modifiable

Element definition: **clone-token-info**

[top]

Information about token reserved for file or LUN clone creates. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
expiry-limit	**[0..2^64-1]**	integer optional	The duration (in seconds) for which the reserved token is valid. Attributes: optional-for-create, modifiable
node		node-name optional	Node name on which split load is reserved. Attributes: key, required-for-create, non-modifiable
reserve-size		size optional	Available reserve in split load reserved by token where split load is the number of bytes reserved for creation of clones. Attributes: required-for-create, non-modifiable
time-left	**[0..2^64-1]**	integer optional	The remaining duration (in seconds) for which the reserved token is valid. Attributes: non-creatable, non-modifiable
token-uuid		string optional	Token UUID for which the split load is reserved. Attributes: key, required-for-create, non-modifiable

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

[none]

Element definition: **extension-info**

[top]

File extensions for clone-delete

Name	Range	Type	Description
extensions		string optional	Supported file extensions for clone-delete Attributes: non-creatable, non-modifiable

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

This set of APIs allows managing the cluster and its attributes.

cluster-add-node

[top]

Use this API to add new nodes to cluster. Provide only one of node-count, node-ip, or cluster-ips. To watch the progress use cluster-add-node-status-get-iter API. A job will be spawned to operate on the cluster and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
cluster-ips		ip-address[] optional	Use this option to add a set of nodes based on their cluster IP addresses.
discovery-timeout		integer optional	Max Time to Discover Nodes to Be Added (in Secs)
node-count		integer optional	Use this option to discover and add new nodes. It is only supported on non-shared architecture platforms. This parameter has been deprecated in Data ONTAP 9.4.

node-ip		ip-address optional	Use this option to add a specific node based on its cluster IP address. This parameter has been deprecated in Data ONTAP 9.4.
node-names		string[] optional	Use this option to specify the names to use for the nodes added using the cluster-ips argument.
node-uuids		uuid[] optional	List of Node UUIDs
retry		boolean optional	Retry a failed cluster add-node operation

Output Name	Range	Type	Description
job-id		integer optional	Job ID of Node Add
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string	The operation status. Possible values: "succeeded", "in_progress", "failed".

Errno	Description
EINTERNALERROR	
E_UNSUPPORTED_PLATFORM	

cluster-add-node-status-get-iter

[top]

Get Progress of Cluster Create or Node Add Operation

Input Name	Range	Type	Description
desired-attributes		cluster-create-add-node-status-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-create-add-node-status-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster object. All cluster objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-		cluster-create-add-node-	

list		status-info[] optional	The list of attributes of cluster objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-contact-get

[top]

Returns the contact information.

Input Name	Range	Type	Description
desired-attributes		cluster-contact optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-contact	The attributes of the cluster-contact.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-contact-modify

[top]

Modifies the contact information.

EINTERNALERROR	

cluster-create

[top]

Start the process to create a cluster using this node. Use cluster-add-node-status-get-iter to track the status of the operation. A job will be spawned to operate on the cluster and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
cluster-ips		ip-address[] optional	Use this option to specify the nodes in the cluster based on their cluster IP addresses.
cluster-name		string	Use this parameter to specify the name of the cluster you are creating. The cluster name must begin with a letter and cannot be more than 44 characters in length.
discovery-timeout		integer optional	Max Time to Discover Nodes to Be Added (in Secs)
keep-precluster-cert		boolean optional	Keep Precluster Certificate
license		license-code-v2 optional	The base cluster license obtain with the hardware or from NetApp professional services. This parameter has been deprecated in Data ONTAP 9.2.
node-count		integer optional	Use this parameter to specify the number of nodes in the cluster you are creating. It is only supported on non-shared architecture platforms. This parameter has been deprecated in Data ONTAP 9.4.
node-names		string[] optional	Use this option to specify the names to use for the nodes specified using the cluster-ips argument.
node-uuids		uuid[] optional	List of Node UUIDs

retry		boolean optional	Retry a failed cluster create operation
single-node-cluster		boolean optional	The Cluster Is a Single Node Cluster

Output Name	Range	Type	Description
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string	The operation status. Possible values: "succeeded", "in_progress", "failed".

Errno	Description
EINVALIDACCESS	
E_NODE_ALREADY_IN_CLUSTER	
E_CLUSTER_CREATE_JOIN_FAILED	

cluster-create-join-progress-get

[top]

Once the cluster create or cluster join operation has been started on this node, use this ZAPI to get the current status of the operation. During cluster join, there is a 1 to 5 second window where the network connection will be unavailable while web services restart. The caller will have to periodically retry until this ZAPI becomes available.

Input Name	Range	Type	Description
desired-attributes		cluster-create-join-progress-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-create-join-progress-info	The attributes of the cluster.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-identity-get

[top]

Returns the cluster identity information.

Input Name	Range	Type	Description
desired-attributes		cluster-identity-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-identity-info	The attributes of the cluster.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-identity-modify

[top]

Modifies the cluster identity information.

Input Name	Range	Type	Description
cluster-contact		string optional	The contact information for the cluster
cluster-location		string optional	The location of the cluster
cluster-name		cluster-name-simple optional	The textual name of the cluster

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-join

[top]

Start the process of joining this node to a cluster. Join can be done by Cluster IP Address. Only one join operation is supported at a time. Use cluster-create-join-progress-get to track the status of the operation. This API is deprecated as of Data ONTAP 9.2, and the cluster-add-node API should be used instead.

Input Name	Range	Type	Description
cluster-ip-address		ip-address optional	IP Address of a Cluster Interface from a Node in the Cluster
cluster-name		string optional	(DEPRECATED)-Cluster Name of the Cluster to Join

Errno	Description

E_INVALID_OPERATION	
E_NODE_ALREADY_IN_CLUSTER	
E_CLUSTER_INTERFACE_REQUIRED	
EAPIMISSINGARGUMENT	
E_MULTIPLE_CLUSTERS_OF_SAME_NAME_EXIST	
E_CLUSTER_CREATE_JOIN_FAILED	

cluster-log-forward-create

[top]

Create a log forwarding configuration

Input Name	Range	Type	Description
destination		remote-inet-address	Destination address that the log messages will be forwarded to. Can be a hostname or IP address.
facility		syslog-facility optional	Facility code used to indicate the type of software that generated the message. Possible values: • "kern" - kernel messages, • "user" - user-level messages, • "local0" - local use 0, • "local1" - local use 1, • "local2" - local use 2, • "local3" - local use 3, • "local4" - local use 4, • "local5" - local use 5, • "local6" - local use 6, • "local7" - local use 7
force		boolean optional	Skip the Connectivity Test
port	**[1..65535]**	integer optional	The destination port used to forward the message.
protocol		log-fwd-proto optional	Log Forwarding Protocol Possible values: • "udp_unencrypted" - UDP unencrypted, • "tcp_unencrypted" - TCP unencrypted, • "tcp_encrypted" - TCP encrypted
return-record		boolean optional	If set to true, returns the log forwarding info on successful creation. Default: false
verify-server		boolean optional	Verify Destination Server Identity

Output Name	Range	Type	Description
result		cluster-log-forward-info optional	The log forwarding info created (keys or the entire object if requested)

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-destroy

[top]

Delete a log forwarding configuration

Input Name	Range	Type	Description
destination		remote-inet-address	Destination address that the log messages will be forwarded to. Can be a hostname or IP address.
port	**[1..65535]**	integer	The destination port used to forward the message.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-get

[top]

Get information about log forwarding

Input Name	Range	Type	Description
desired-attributes		cluster-log-forward-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
destination		remote-inet-address	Destination address that the log messages will be forwarded to. Can be a hostname or IP address.
port	**[1..65535]**	integer	The destination port used to forward the message.

Output Name	Range	Type	Description
attributes		cluster-log-forward-info	The attributes of the log forwarding info.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-get-iter

[top]

Get information about log forwarding

Input Name	Range	Type	Description
desired-attributes		cluster-log-forward-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-log-forward-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the log forwarding info object. All log forwarding info objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-log-forward-info[] optional	The list of attributes of log forwarding info objects.
next-tag		string optional	Tag for the next call. Not present when there are no more log forwarding info objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-modify

[top]

Modify the log forwarding configuration

Input Name	Range	Type	Description
destination		remote-inet-address	Destination address that the log messages will be forwarded to. Can be a hostname or IP address.
facility		syslog-facility optional	Facility code used to indicate the type of software that generated the message. Possible values: • "kern" - kernel messages, • "user" - user-level messages, • "local0" - local use 0, • "local1" - local use 1, • "local2" - local use 2, • "local3" - local use 3, • "local4" - local use 4, • "local5" - local use 5, • "local6" - local use 6,

			• "local7" - local use 7
port	**[1..65535]**	integer	The destination port used to forward the message.
verify-server		boolean optional	Verify Destination Server Identity

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-statistics-get

[top]

Get information about log forwarding statistics

Input Name	Range	Type	Description
desired-attributes		cluster-log-forward-statistics optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
destination		remote-inet-address	Destination Host
index	**[0..2^32-1]**	integer	Destination Index
log		string	Log Name
node		node-name	Node
port	**[1..65535]**	integer	Destination Port

Output Name	Range	Type	Description
attributes		cluster-log-forward-statistics	The attributes of the log forwarding statistics.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-log-forward-statistics-get-iter

[top]

Get information about log forwarding statistics

Input Name	Range	Type	Description

desired-attributes		cluster-log-forward-statistics optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-log-forward-statistics optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the log forwarding statistics object. All log forwarding statistics objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-log-forward-statistics[] optional	The list of attributes of log forwarding statistics objects.
next-tag		string optional	Tag for the next call. Not present when there are no more log forwarding statistics objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-node-get

[top]

Returns information about a node in a cluster.

Input Name	Range	Type	Description
desired-attributes		cluster-node-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-name		node-name	The textual name of a node.

Output Name	Range	Type	Description
attributes		cluster-node-info	The attributes of the cluster.

Errno	Description
EOBJECTNOTFOUND	

Errno	Description
EINTERNALERROR	

cluster-node-get-iter

[top]

Returns information about nodes in a cluster.

Input Name	Range	Type	Description
desired-attributes		cluster-node-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-node-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster object. All cluster objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-node-info[] optional	The list of attributes of cluster objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-node-modify

[top]

Modifies state of a node in a cluster.

Input Name	Range	Type	Description
is-node-eligible		boolean optional	This parameter states nodes that are eligible to participate in the cluster. A boolean value of true means the node is eligible.
is-node-epsilon		boolean optional	You can designate a node as epsilon to add weight to its voting in a cluster with an even number of nodes. In a cluster, only one node can be designated as epsilon at any given time. A boolean value of true means the node is epsilon.
node-name		node-name	The textual name of a node.
skip-			

quorum-check-before-eligible		boolean optional	Skip quorum checks when setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.
skip-quorum-check-before-ineligible		boolean optional	Skip quorum checks when setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-remove-node

[top]

Removes a node from the cluster. A job will be spawned to operate on the cluster and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
cluster-ip		ip-address optional	IP Address of a Cluster Interface of Node to Unjoin
force		boolean optional	Force Node to Unjoin
node		filer-id optional	Node to Unjoin
node-uuid		uuid optional	Node UUID to Unjoin
skip-epsilon-transition-before-unjoin		boolean optional	Skip Epsilon Transition Prior to Unjoin
skip-last-low-version-node-check		boolean optional	Skip the Check That Prevents Unjoining the Last Low Versioned Node
skip-quorum-check-before-unjoin		boolean optional	Skip quorum checks when removing a node. The operation will continue even if there is a possible data outage due to a quorum issue.

Output Name	Range	Type	Description
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string	The operation status. Possible values: "succeeded", "in_progress", "failed".

Errno	Description
E_CLUSTER_CREATE_JOIN_UNJOIN_NODE_NOT_IN_CLUSTER	

E_CLUSTER_CREATE_JOIN_UNJOIN_SINGLE_NODE_CLUSTER	
E_CLUSTER_CREATE_JOIN_UNJOIN_ON_SAME_NODE	
E_UNJOIN_JOB_UPGRADE_PREVENT_UNJOIN	
E_CLUSTER_CREATE_JOIN_NODE_OFFLINE	
E_JOB_UNJOIN_JOB_ERROR	
E_CLUSTER_WARNING_FOR_GOING_TO_NO_QUORUM	

cluster-zoneinfo-get

[top]

Get zoneinfo information

Input Name	Range	Type	Description
desired-attributes		zoneinfo-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		zoneinfo-info	The attributes of the Zoneinfo info.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-zoneinfo-load-from-uri

[top]

This commands loads a new set of timezone zoneinfo data to replace the version installed in the cluster.

Releases of Data ONTAP software contain the timezone data that is current at the time of release. If a change is made to the timezone between Data ONTAP releases, then an update can be made to the installed data.

For instance, if a change is made to when daylight saving time is observed for a country then an update to cluster zoneinfo data may be required.

Only zoneinfo files provided for use in Data ONTAP should be used with this command.

To update the zoneinfo database do the following:

- Download the required zoneinfo file from the support website.
- Place the file on a local web server accessible without password from the cluster.
- Execute this command, passing the Universal Resource Identifier (URI) of the file as parameter.

The command need only be executed once for the cluster. The data will be distributed to each node of the cluster.

Input Name	Range	Type	Description
uri		uri	Universal Resource Identifier (URI) of the zoneinfo data to load. HTTP and FTP schemes are supported.

Errno	Description
EINVALIDINPUTERROR	
E_ZONEINFO_DOWNLOAD_FAILED	
E_ZONEINFO_UNSUPPORTED_FILE_TYPE	
E_ZONEINFO_UNZIP_FAILED	
E_ZONEINFO_UNTAR_FAILED	
E_ZONEINFO_INVALID_FILE	
E_ZONEINFO_FILESYSTEM_ERROR	

Element definition: **cluster-contact**

[top]

Administrator contact information for the cluster. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
address		string optional	Business Address Attributes: non-creatable, modifiable
business-name		string optional	Business Name Attributes: non-creatable, modifiable
city		string optional	City Where Business Resides Attributes: non-creatable, modifiable
			2-Character Country Code Attributes: non-creatable, modifiable Possible values: • "99" - Unknown, • "ad" - Andorra, • "ae" - United Arab Emirates, • "af" - Afghanistan, • "ag" - Antigua and Barbuda, • "ai" - Anguilla, • "al" - Albania, • "am" - Armenia, • "an" - Netherlands Antilles, • "ao" - Angola, • "aq" - Antarctia, • "ar" - Argentina, • "as" - American Samoa, • "at" - Austria, • "au" - Australia, • "aw" - Aruba, • "az" - Azerbaijan, • "ba" - Bosnia and Herzegovina, • "bb" - Barbados, • "bd" - Bangladesh, • "be" - Belgium,

primary-alt-phone		string optional	Alternate Phone Number of Primary Contact Attributes: non-creatable, modifiable
primary-email		string optional	Email Address or User ID of Primary Contact Attributes: non-creatable, modifiable
primary-name		string optional	Name of Primary Contact Attributes: non-creatable, modifiable
primary-phone		string optional	Phone Number of Primary Contact Attributes: non-creatable, modifiable
secondary-alt-phone		string optional	Alternate Phone Number of Secondary Contact Attributes: non-creatable, modifiable
secondary-email		string optional	Email Address or User ID of Secondary Contact Attributes: non-creatable, modifiable
secondary-name		string optional	Name of Secondary Contact Attributes: non-creatable, modifiable
secondary-phone		string optional	Phone Number of Secondary Contact Attributes: non-creatable, modifiable

state		string optional	State Where Business Resides Attributes: non-creatable, modifiable
zip-code		string optional	Postal Code Where Business Resides Attributes: non-creatable, modifiable

Element definition: **cluster-create-add-node-status-info**

[top]

Information that identifies the state of a cluster create or node add operation When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cluster-ip		ip-address optional	IP Address of a Cluster Interface of Node Attributes: non-creatable, non-modifiable
failure-msg		string optional	Error Reason Attributes: non-creatable, non-modifiable
job-id	**[0..2^64-1]**	integer optional	Job ID of Join Job Attributes: non-creatable, non-modifiable
node-name		string optional	Node Name Attributes: key, non-creatable, non-modifiable
node-uuid		uuid optional	Node UUID Attributes: key, non-creatable, non-modifiable
status		cluster-op-status optional	The Status of Current Task Being Performed Attributes: non-creatable, non-modifiable Possible values: • "none" - None, • "starting_job" - Starting Add-Node Job, • "node_discovery" - Node Discovery, • "remote_join_started" - Job Started Remote Join Op, • "node_initialization" - Node Initialization, • "joining_cluster" - Joining Cluster, • "service_startup" - Service Startup, • "post_cluster_setup" - Post Cluster Setup, • "success" - Task Completed, • "failure" - Task Failed

Element definition: **cluster-create-join-progress-info**

[top]

Information that identifies the state or a create or join operation When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it

shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
current-status-message		string optional	The current status of the create or join operation being performed. Attributes: non-creatable, non-modifiable
is-complete		boolean optional	If this is true, it means that the operation has been successfully completed. If it is false, the state of the operation is determined by the status field Attributes: non-creatable, non-modifiable
status		cluster-op-enum-result optional	This field helps to determine the state of the operation when 'complete' is false. When complete is false and the status is success it indicates the operation hasn't started yet. Attributes: non-creatable, non-modifiable Possible values: • "failed" - Operation failed, • "success" - Operation was successful, • "ongoing" - Operation is active

Element definition: **cluster-identity-info**

[top]

Information that identifies a given cluster. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cluster-contact		string optional	The contact information for the cluster Attributes: non-creatable, modifiable
cluster-location		string optional	The location of the cluster Attributes: non-creatable, modifiable
cluster-name		cluster-name-simple optional	The textual name of the cluster Attributes: non-creatable, modifiable
cluster-serial-number		cluster-serial-number optional	Serial number of the cluster in the form x-xx-xxxxxx Attributes: non-creatable, non-modifiable
cluster-uuid		uuid optional	The 128-bit universally-unique identifier, that designates the cluster forever, assigned during cluster creation Attributes: non-creatable, non-modifiable
rdb-uuid		uuid optional	The 128-bit universally-unique identifier for the RDB Attributes: non-creatable, non-modifiable

Element definition: **cluster-log-forward-info**

[top]

Log file forwarding configuration When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
destination		remote-inet-address optional	Destination address that the log messages will be forwarded to. Can be a hostname or IP address. Attributes: key, required-for-create, non-modifiable
facility		syslog-facility optional	Facility code used to indicate the type of software that generated the message. Attributes: optional-for-create, modifiable Possible values: • "kern" - kernel messages, • "user" - user-level messages, • "local0" - local use 0, • "local1" - local use 1, • "local2" - local use 2, • "local3" - local use 3, • "local4" - local use 4, • "local5" - local use 5, • "local6" - local use 6, • "local7" - local use 7
force		boolean optional	Skip the Connectivity Test Attributes: optional-for-create, non-modifiable
port	**[1..65535]**	integer optional	The destination port used to forward the message. Attributes: key, optional-for-create, non-modifiable
protocol		log-fwd-proto optional	Log Forwarding Protocol Attributes: optional-for-create, non-modifiable Possible values: • "udp_unencrypted" - UDP unencrypted, • "tcp_unencrypted" - TCP unencrypted, • "tcp_encrypted" - TCP encrypted
verify-server		boolean optional	Verify Destination Server Identity Attributes: optional-for-create, modifiable

Element definition: **cluster-log-forward-statistics**

[top]

Log file forwarding statistics When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired

attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
destination		remote-inet-address optional	Destination Host Attributes: key, non-creatable, non-modifiable
dropped-count	**[0..2^64-1]**	integer optional	Count of Dropped Messages Attributes: non-creatable, non-modifiable
facility		syslog-facility optional	Syslog Facility Attributes: non-creatable, non-modifiable Possible values: • "kern" - kernel messages, • "user" - user-level messages, • "local0" - local use 0, • "local1" - local use 1, • "local2" - local use 2, • "local3" - local use 3, • "local4" - local use 4, • "local5" - local use 5, • "local6" - local use 6, • "local7" - local use 7
failure-count	**[0..2^64-1]**	integer optional	Count of Forwarding Failures Attributes: non-creatable, non-modifiable
index	**[0..2^32-1]**	integer optional	Destination Index Attributes: key, non-creatable, non-modifiable
last-error		string optional	Last Failure Reason Attributes: non-creatable, non-modifiable
last-success-time		datetimewithtz optional	Time of Last Message Forwarded Attributes: non-creatable, non-modifiable
log		string optional	Log Name Attributes: key, non-creatable, non-modifiable
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
port	**[1..65535]**	integer optional	Destination Port Attributes: key, non-creatable, non-modifiable
queue-size	**[0..2^64-1]**	integer optional	Number of Messages in the Queue Attributes: non-creatable, non-modifiable
success-count	**[0..2^64-1]**	integer optional	Count of Forwarding Successes Attributes: non-creatable, non-modifiable
total-tx-failures	**[0..2^64-1]**	integer optional	Total Transmission Failures Attributes: non-creatable, non-modifiable

Element definition: **cluster-name-simple**

[top]

Name of the Cluster

[none]

Element definition: **cluster-node-info**

[top]

Information that identifies state of nodes in a cluster. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-node-eligible		boolean optional	This parameter states nodes that are eligible to participate in the cluster. A boolean value of true means the node is eligible. Attributes: non-creatable, modifiable
is-node-epsilon		boolean optional	You can designate a node as epsilon to add weight to its voting in a cluster with an even number of nodes. In a cluster, only one node can be designated as epsilon at any given time. A boolean value of true means the node is epsilon. Attributes: non-creatable, modifiable
is-node-healthy		boolean optional	This parameter is used to determine health of a node in a cluster. A boolean value of true means the node is healthy. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The textual name of a node. Attributes: key, non-creatable, non-modifiable
node-uuid		node-uuid optional	The 128-bit universally-unique identifier, that designates a node forever, assigned during node creation. Attributes: non-creatable, non-modifiable

Element definition: **country-code**

[top]

Country Code Possible values:

- "99" - Unknown,
- "ad" - Andorra,
- "ae" - United Arab Emirates,
- "af" - Afghanistan,
- "ag" - Antigua and Barbuda,
- "ai" - Anguilla,
- "al" - Albania,
- "am" - Armenia,
- "an" - Netherlands Antilles,
- "ao" - Angola,
- "aq" - Antarctia,
- "ar" - Argentina,
- "as" - American Samoa,
- "at" - Austria,

"au" - Australia,
- "aw" - Aruba,
- "az" - Azerbaijan,
- "ba" - Bosnia and Herzegovina,
- "bb" - Barbados,
- "bd" - Bangladesh,
- "be" - Belgium,
- "bf" - Burkina Faso,
- "bg" - Bulgaria,
- "bh" - Bahrain,
- "bi" - Burundi,
- "bj" - Benin,
- "bm" - Bermuda,
- "bn" - Brunei Darussalem,
- "bo" - Bolivia,

[none]

Element definition: **filer-id**

[top]

Filer UUID

[none]

Element definition: **ip-address** [top]

IPv4 and IPv6 address

[none]

Element definition: **license-code-v2** [top]

License Code V2

[none]

Element definition: **log-fwd-proto** [top]

udp-unencrypted|tcp-unencrypted|tcp-encrypted Possible values:

- "udp_unencrypted" - UDP unencrypted,
- "tcp_unencrypted" - TCP unencrypted,
- "tcp_encrypted" - TCP encrypted

[none]

Element definition: **node-name** [top]

The node's name

[none]

Element definition: **remote-inet-address** [top]

IPv4 Address, IPv6 Address or Host Name

[none]

Element definition: **syslog-facility** [top]

The syslog facility.

[none]

Element definition: **uri**

[top]

[none]

Element definition: **uuid**

[top]

The 128-bit universally-unique identifier (UUID).

UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

[none]

Element definition: **zoneinfo-info**

[top]

Timezone Zoneinfo Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
version		string optional	Version of the timezone database in the form YYYYv. \"YYYY\" is the year the database was released and \"v\" is the version within that year. \"YYYY\" will be four decimal digits and \"v\" will be an ASCII letter starting with \"a\" and increasing with each version. For example, the second 2017 version is \"2017b\". Attributes: non-creatable, modifiable

Element definition: **cluster-op-enum-result**

[top]

cluster_op_enum_result Possible values:

- "failed" - Operation failed,
- "success" - Operation was successful,

"ongoing" - Operation is active

[none]

Element definition: **cluster-op-status**

[top]

Cluster Operation Status Possible values:

- "none" - None,
- "starting_job" - Starting Add-Node Job,
- "node_discovery" - Node Discovery,
- "remote_join_started" - Job Started Remote Join Op,
- "node_initialization" - Node Initialization,
- "joining_cluster" - Joining Cluster,
- "service_startup" - Service Startup,
- "post_cluster_setup" - Post Cluster Setup,
- "success" - Task Completed,
- "failure" - Task Failed

[none]

Element definition: **cluster-serial-number**

[top]

Assigned Cluster serial-number during cluster create

[none]

Element definition: **datetimewithtz**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

[none]

Element definition: **node-uuid**

[top]

The 128-bit universally-unique identifier (UUID).

UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

cluster-image-update-pause
cluster-image-update-progress-get-iter
cluster-image-update-progress-info
cluster-image-update-resume
cluster-image-validate

This set of APIs enable automated nondisruptive update of a cluster.

cluster-image-get

[top]

Get the attributes of the cluster-image.

Input Name	Range	Type	Description
desired-attributes		cluster-image-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-id		node-name	Node

Output Name	Range	Type	Description
attributes		cluster-image-info	The attributes of the cluster-image.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-image-get-download-progress

[top]

Check the progress of current image download started by the cluster-image-package-download ZAPI.

Output Name	Range	Type	Description
failure-reason		string optional	Reason for download failure. This field is deprecated in Data ONTAP 9.0.0 and may be removed in a future release.

progress-details		string optional	Download progress details
progress-status		cluster-image-download-status	Download Progress Status

Errno	Description
E_PRIMARY_STORE_UNAVAILABLE	
EINTERNALERROR	

cluster-image-get-iter

[top]

Iterate over a list of cluster-image objects.

Input Name	Range	Type	Description
desired-attributes		cluster-image-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-image-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-image object. All cluster-image objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-image-info[] optional	The list of attributes of cluster-image objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-image objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-image-get-upgrade-plan

[top]

The cluster-image-get-upgrade-plan API generates an Upgrade Plan and Backout Plan for the specified target image. The target package-version must be provided.

Input Name	Range	Type	Description
package-version		string	Specifies the target package version.

Output Name	Range	Type	Description
backout-phase-info-list		phase-info[] optional	List of revert or downgrade plan phases.
backout-plan-head		string optional	Backout plan heading.
upgrade-phase-info-list		phase-info[] optional	List of upgrade plan phases.
upgrade-plan-head		string optional	Upgrade plan heading.

Errno	Description
E_CONF_NOT_SUPPORTED	
E_IMAGES_UNAVAILABLE	
E_RULES_XML_ERROR	
E_GET_PLAN_FAILED	
E_PACKAGE_IMAGE_COMPONENT_NOT_FOUND	
E_PACKAGE_STORE_IS_EMPTY	
E_UPGRADE_PLAN_WITH_REVERT_IMAGE	

cluster-image-metrocluster-update-progress-info-get

[top]

Get information on cluster image update progress for MetroCluster

Input Name	Range	Type	Description
desired-attributes		metrocluster-ndu-progress-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		metrocluster-ndu-progress-info	The attributes of the cluster-image.

Errno	Description
EINTERNALERROR	
E_UPDATE_NOT_IN_PROGRESS	

cluster-image-node-update-progress-info

[top]

Get information on a node's image update progress

Input Name	Range	Type	Description
desired-attributes		node-update-progress-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node-name		string	Node name.

Output Name	Range	Type	Description
attributes		node-update-progress-info	The attributes of the cluster-image.

Errno	Description
EINTERNALERROR	
EAPIMISSINGARGUMENT	

cluster-image-package-delete

[top]

The cluster-image-package-delete API removes the given package from the cluster image package repository.

Input Name	Range	Type	Description
package-version		string	The package version to be deleted. Example of package versions - 8.3

Errno	Description
E_VALIDATION_IN_PROGRESS	
E_UPDATE_IN_PROGRESS	
E_PACKAGE_SYNCH_IN_PROGRESS	
E_PACKAGE_IMAGE_COMPONENT_NOT_FOUND	
E_PACKAGE_STORE_IS_EMPTY	

cluster-image-package-download

[top]

The cluster-image-package-download API downloads the specified package. This API is asynchronous and returns immediately after the download is started. The download progress can be monitored by calling cluster-image-get-download-progress ZAPI. The package-url string must be provided.

Input Name	Range	Type	Description
package-url		string	Specifies the package URL.

Errno	Description
E_CAPABILITY_NOT_CLUSTERWIDE	
E_CAPABILITY_CHECK_FAILED	
E_PACKAGE_EXISTS	
E_INVALID_URL	
E_PACKAGE_PROCESS_ERROR	
E_PRIMARY_STORE_UNAVAILABLE	
E_INSUFFICIENT_STORES	

cluster-image-package-download-abort

[top]

Abort an ongoing package download operation.

Errno	Description
EINTERNALERROR	
E_PKG_DOWNLOAD_NOTRUNNING	

cluster-image-package-local-get

[top]

The cluster-image-package-local-get API retrieves detailed information about a package located in the cluster image package repository.

Input Name	Range	Type	Description
desired-attributes		cluster-image-package-local-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
package-version		string	Package version.

Output Name	Range	Type	Description

attributes		cluster-image-package-local-info	The attributes of the cluster-image.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-image-package-local-get-iter

[top]

Get multiple locally available package records

Input Name	Range	Type	Description
desired-attributes		cluster-image-package-local-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-image-package-local-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-image object. All cluster-image objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-image-package-local-info[] optional	The list of attributes of cluster-image objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-image objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-image-update

[top]

The cluster-image update API validates, installs prerequisite component updates, and installs Data ONTAP to all specified nodes within a cluster in a nondisruptive manner. Since validation, which is run as part of update, requires a minimum of 30 seconds, the API should be called with sufficient timeout value.

Input Name	Range	Type	Description
estimate-only		boolean optional	Generates an estimate of the time required for the overall update operation for the specified package. No update is performed when this option is used. Default: false.
force-rolling		boolean optional	Force a rolling upgrade on the cluster. This option is not applicable for a single-node cluster and for a two-node MetroCluster. Default: false.
ignore-validation-warning		boolean optional	Allows the update to continue if warnings are encountered during the validation phase. Default: false.
nodes		node-name[] optional	List of nodes to be updated, the nodes have to be a part of a HA Pair.
package-version		string	Specifies the package version.
pause-after		non-disruptive-update-pause-after optional	One or more pause options can be specified. Possible values: none, all.

stabilize-minutes		integer optional	Number of minutes needed to stabilize node before update. This option is not applicable for single-node cluster. Default: 8.

Output Name	Range	Type	Description
estimated-post-update-duration		integer optional	Estimated post-update checks duration, in seconds. Available only if estimate-only is true.
estimated-pre-update-duration		integer optional	Estimated pre-update checks duration, in seconds. Available only if estimate-only is true.
estimated-update-duration		integer optional	Estimated ontap updates duration, in seconds. Available only if estimate-only is true.

Errno	Description
E_CAPABILITY_NOT_CLUSTERWIDE	
E_CAPABILITY_CHECK_FAILED	
E_UPDATE_IN_PROGRESS	
E_INVALID_HA_PAIR_LIST	
E_VALIDATION_CHECKS_FAILED_WITH_WARNING	
E_VALIDATION_CHECKS_FAILED_WITH_ERROR	
EINTERNALERROR	
E_DOUBLE_HOP_NODES_UNSUPPORTED	

cluster-image-update-cancel

[top]

The cluster-image-update-cancel API cancels a package update that is currently in progress. The update will stop and be canceled at the end of the current logical operation. Logical operations are: - After the cluster validation, or prerequisite update phase - After the update of each HA pair - Immediately, if the update is currently paused After the successful completion of this command the update will be removed from the package update queue. The cancellation will be logged in the update history.

Errno	Description
E_UPDATE_NOT_IN_PROGRESS	
E_CANCEL_NOT_POSSIBLE	

cluster-image-update-history-get-iter

[top]

Get multiple update history records.

Input Name	Range	Type	Description
desired-attributes		cluster-update-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-update-history-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-image object. All cluster-image objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-update-history-info[] optional	The list of attributes of cluster-image objects.

next-tag		string optional	Tag for the next call. Not present when there are no more cluster-image objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-image-update-log-get-iter

[top]

Get multiple update logs

Input Name	Range	Type	Description
desired-attributes		cluster-update-transaction-log-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-update-transaction-log-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-image object. All cluster-image objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-update-transaction-log-info[] optional	The list of attributes of cluster-image objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-image objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-image-update-pause

[top]

The cluster-image-update-pause API pauses an update that is in progress. The update will pause at the end of the current logical operation. Logical operations include: - After the cluster validation, or prerequisite update phase - After the update of each node After the successful completion of this command the currently running update will be paused at the end of the current logical operation.

Errno	Description
E_UPDATE_NOT_IN_PROGRESS	
E_PAUSE_NOT_POSSIBLE	

cluster-image-update-progress-get-iter

[top]

This API provides the status of all phases of update that is in progress.

Input Name	Range	Type	Description
desired-attributes		cluster-image-ndu-phase-list-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-image-ndu-phase-list-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-image object. All cluster-image objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-image-ndu-phase-list-info[] optional	The list of attributes of cluster-image objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-image objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-image-update-progress-info

[top]

Get information on cluster image update progress

Input Name	Range	Type	Description
desired-attributes		ndu-progress-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		ndu-progress-info	The attributes of the cluster-image.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-image-update-resume

[top]

The cluster-image-update-resume API resumes a package update that is currently paused. If the update is not in the paused state the API call will fail. After the successful completion of this command the current paused update will resume from the last successful operation completed.

Input Name	Range	Type	Description
ignore-post-update-checks-failures		boolean optional	Ignore post-update-check phase failures, if any. Default: false.

Errno	Description

E_UPDATE_NOT_IN_PROGRESS	
E_RESUME_NOT_POSSIBLE	
E_PUC_NOT_IN_PROGRESS	

cluster-image-validate

[top]

The cluster-image-validate API validates the various logical and physical components of a cluster to ensure that a nondisruptive update can occur. Since validation requires a minimum of 30 seconds, the API should be called with sufficient timeout value.

Input Name	Range	Type	Description
nodes		node-name[] optional	Nodes
package-version		string	Specifies the package version.

Output Name	Range	Type	Description
cluster-image-validation-report-list		cluster-image-validation-report-list-info[] optional	Lists the status and required actions for each NDU check involved in the update process.

Errno	Description
E_VERSION_NOT_SUPPORTED	
E_CAPABILITY_NOT_CLUSTERWIDE	
E_CAPABILITY_CHECK_FAILED	
E_VALIDATION_IN_PROGRESS	
E_PACKAGE_DELETE_IN_PROGRESS	
E_IMAGES_UNAVAILABLE	
E_MISSING_PARTNER_ERROR	
E_UPDATE_IN_PROGRESS

Element definition: **cluster-image-info**

[top]

Information to manage cluster images for Non disruptive-update. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
current-version		string optional	Current Version Attributes: non-creatable, non-modifiable
date-installed		datetime optional	Date Installed Attributes: non-creatable, non-modifiable
node-id		node-name optional	Node Attributes: key, non-creatable, non-modifiable

Element definition: **cluster-image-ndu-phase-list-info**

[top]

Status and required recovery action for each phase of update process When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
duration		string optional	The estimated duration for phases not completed and actual duration for those completed in seconds. Attributes: non-creatable, non-modifiable
ndu-phase		non-disruptive-update-phase optional	Update phase Attributes: key, non-creatable, non-modifiable Possible values: • "validation" - NDU validation phase, • "prereq_updates" - NDU prerequisite phase, • "ontap_updates" - Data ONTAP update phase, • "package_management" - Package management operations phase, • "default_phase" - Default Phase, • "post_update_checks" - Post update checks phase
phase-comments		string optional	If an error has occurred the required recovery action. If the phase is completed the duration of the phase will be provided. Attributes: non-creatable, non-modifiable
phase-status		non-disruptive-update-status optional	Phase status Attributes: non-creatable, non-modifiable Possible values: • "in_progress" - Upgrade phase is in progress, • "waiting" - Upgrade phase is waiting, • "paused_by_user" - Upgrade phase paused by user, • "paused_on_error" - Upgrade phase paused due to error, • "completed" - Upgrade phase completed, • "canceled" - Upgrade phase canceled, • "failed" - Upgrade phase failed, • "pause_pending" - Upgrade phase pause pending, • "cancel_pending" - Upgrade phase cancel pending

Element definition: **cluster-image-package-local-info**

[top]

Detailed information on the local package When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
package-build-time		datetime optional	Package build time. Attributes: non-creatable, non-modifiable
package-details		package-details-info[] optional	Lists detailed on the local packages located in the cluster image package repository
package-version		string optional	Package version. Attributes: key, non-creatable, non-modifiable

Element definition: **cluster-image-validation-report-list-info**

[top]

Lists the status and required actions for each NDU check involved in the update process. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ndu-check		string optional	Type of NDU check Attributes: key, non-creatable, non-modifiable
ndu-status		string optional	Phase status Possible values: ok failed warning Attributes: non-creatable, non-modifiable
required-action		required-action-info optional	If the NDU check failed or warned. Provides detailed information on how to recover from the infraction, or in case of a warning list side effects of performing update

Element definition: **cluster-update-history-info**

[top]

Detailed report for each update When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
completion-time		datetime optional	Date and time update completed. Attributes: non-creatable, non-modifiable
component-id		string optional	Component ID Attributes: key, non-creatable, non-modifiable
component-name		string optional	Component name Attributes: non-creatable, non-modifiable
package-version		string optional	Installed package version. Attributes: non-creatable, non-modifiable
previous-version		string optional	Previous version of firmware or software Attributes: non-creatable, non-modifiable
start-time		datetime optional	Date and time update started. Attributes: key, non-creatable, non-modifiable
update-status		non-disruptive-update-history-status optional	Update status. Attributes: non-creatable, non-modifiable Possible values: • "successful" - Update completed successfully, • "canceled" - Update was canceled, • "back_out" - A back-out occurred do to a unrecoverable error

updated-version		string optional	Updated version of firmware or software Attributes: non-creatable, non-modifiable

Element definition: **cluster-update-transaction-log-info**

[top]

Detailed report for each update transaction When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
component-id		node-name optional	Component ID. Attributes: key, non-creatable, non-modifiable
detailed-transaction-status		string optional	Includes sub-transaction name and detailed status Attributes: non-creatable, non-modifiable
start-date-time		datetime optional	Date and time update started Attributes: non-creatable, non-modifiable
transaction-id	**[0..2^64-1]**	integer optional	Unique transaction ID. Attributes: key, non-creatable, non-modifiable
transaction-name		non-disruptive-update-task-name optional	Transaction name. Attributes: key, non-creatable, non-modifiable Possible values: • "initialize" - Initialization, • "mount_image" - Mount an image, • "restart_hm" - Restart Health Monitor, • "get_health" - Obtain System Health, • "run_scripts" - Run validation sctipts, • "unmount_image" - Unmount image, • "clear_alert" - Clear Alerts, • "post_restart_hm" - Post validation restart Health Monitor, • "cleanup_rdb" - Removes all rows for a given phase, • "synch_image" - Synchronize Secondary Store with Primary, • "process_package" - Process the package retrieved from external source, • "cleanup_package" - Removes the packages not currently in the image table, • "do_download_job" - Downloads the image to the boot device, • "do_failover_job" - Do the takeover, • "do_giveback_job" - Do the giveback, • "check_progress" - Check the progress of any running tasks, • "complete_validation" - Generate the final validation report, • "invalid_task" - Used by state machine when a valid task cannot be found, • "default_task" - Default Task, • "do_postupdate_checks_job" - Do the post update checks, • "do_disruptive_update_task" - Do disruptive update of node
transaction-phase		non-disruptive-update-phase optional	Transaction phase Attributes: key, non-creatable, non-modifiable Possible values: • "validation" - NDU validation phase, • "prereq_updates" - NDU prerequisite phase, • "ontap_updates" - Data ONTAP update phase, • "package_management" - Package management operations phase, • "default_phase" - Default Phase, • "post_update_checks" - Post update checks phase
transaction-status		non-disruptive-update-log-status optional	Update status Attributes: non-creatable, non-modifiable Possible values: • "waiting" - Transaction is waiting, • "started" - Transaction was started, • "completed" - Transaction has completed, • "paused_on_error" - Transaction has been paused due to an error, • "paused_by_user" - Transaction has been paused by user,

			• "pause_pending" - Transaction has a pending pause request, • "cancel_pending" - Transaction has a pending cancel request, • "canceled" - Transaction has been canceled by user, • "failed" - Transaction has failed

Element definition: **metrocluster-ndu-progress-info**

[top]

Nondisruptive Update Progress Info of MetroCluster When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
completed-node-count	**[0..2^32-1]**	integer optional	Number of Completed Nodes Attributes: non-creatable, non-modifiable
dr-validation-reports		dr-validation-report-info[] optional	DR cluster Validation Report Info
intermediate-version		string optional	The intermediate-version for two-stage upgrade. Attributes: non-creatable, non-modifiable
is-two-stage-upgrade		boolean optional	If upgrade is two-stage. Attributes: non-creatable, non-modifiable
is-validation-done-by-update		boolean optional	Is the validation done as part of update operation. Attributes: non-creatable, non-modifiable
metrocluster		cluster-image-metrocluster-info optional	MetroCluster Information
ndu-node-update-list		ndu-node-update-info[] optional	Nondisruptive Update Progress Info of Node
node-estimated-duration	**[0..2^32-1]**	integer optional	Estimated amount of time, in seconds, required for the update of a node. Attributes: non-creatable, non-modifiable
overall-elapsed-duration	**[0..2^32-1]**	integer optional	Overall elapsed amount of time, in seconds, used for the update. Attributes: non-creatable, non-modifiable
overall-estimated-duration	**[0..2^32-1]**	integer optional	Overall estimated amount of time, in seconds, required for the update. Attributes: non-creatable, non-modifiable
overall-status		string optional	Status of overall update. Attributes: non-creatable, non-modifiable Possible values: • "in_progress" - Upgrade phase is in progress, • "waiting" - Upgrade phase is waiting, • "paused_by_user" - Upgrade phase paused by user, • "paused_on_error" - Upgrade phase paused due to error, • "completed" - Upgrade phase completed, • "canceled" - Upgrade phase canceled, • "failed" - Upgrade phase failed, • "pause_pending" - Upgrade phase pause pending, • "cancel_pending" - Upgrade phase cancel pending
package-version		string optional	The package version. Attributes: non-creatable, non-modifiable
paused-node-count	**[0..2^32-1]**	integer optional	Number of Paused Nodes Attributes: non-creatable, non-modifiable
phase-comments		phase-comment-info optional	Overall comment info
progress-detail		string optional	Failure details Attributes: non-creatable, non-modifiable

progress-summary		string optional	Progress info Attributes: non-creatable, non-modifiable
source-version		string optional	The source version for two-stage upgrade. Attributes: non-creatable, non-modifiable
target-version		string optional	The target version for two-stage upgrade. Attributes: non-creatable, non-modifiable
total-node-count	**[0..2^32-1]**	integer optional	Number of Nodes Attributes: non-creatable, non-modifiable
upgrade-stage	**[1..2]**	integer optional	Stage of upgrade (1: First stage - source-version to intermediate-version, 2: Second stage - intermediate-version to target-version). Attributes: non-creatable, non-modifiable
validation-reports		validation-report-info[] optional	Local cluster Validation Report Info

Element definition: **ndu-progress-info**

[top]

Nondisruptive Update Progress Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
completed-node-count	**[0..2^32-1]**	integer optional	Number of nodes that have completed update. Attributes: non-creatable, non-modifiable
intermediate-version		string optional	The intermediate-version for two-stage upgrade. Attributes: non-creatable, non-modifiable
is-two-stage-upgrade		boolean optional	If upgrade is two-stage. Attributes: non-creatable, non-modifiable
is-validation-done-by-update		boolean optional	Is the validation done as part of update operation. Attributes: non-creatable, non-modifiable
ndu-node-update-list		ndu-node-update-info[] optional	Nondisruptive Update Progress Info of a Node
node-estimated-duration	**[0..2^32-1]**	integer optional	Estimated amount of time, in seconds, required for the update of a node. Attributes: non-creatable, non-modifiable

waiting|started|completed|paused-on-error|paused-by-user|pause-pending|cancel-pending|canceled|failed Possible values:

- "waiting" - Transaction is waiting,
- "started" - Transaction was started,
- "completed" - Transaction has completed,

- "paused_on_error" - Transaction has been paused due to an error,
- "paused_by_user" - Transaction has been paused by user,
- "pause_pending" - Transaction has a pending pause request,
- "cancel_pending" - Transaction has a pending cancel request,
- "canceled" - Transaction has been canceled by user,
- "failed" - Transaction has failed

[none]

Element definition: **non-disruptive-update-phase**

[top]

validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks Possible values:

- "validation" - NDU validation phase,
- "prereq_updates" - NDU prerequisite phase,
- "ontap_updates" - Data ONTAP update phase,
- "package_management" - Package management operations phase,
- "default_phase" - Default Phase,
- "post_update_checks" - Post update checks phase

[none]

Element definition: **non-disruptive-update-status**

[top]

in-progress|waiting|paused-by-user|paused-on-error|completed|canceled|failed|pause-pending|cancel-pending Possible values:

- "in_progress" - Upgrade phase is in progress,
- "waiting" - Upgrade phase is waiting,
- "paused_by_user" - Upgrade phase paused by user,
- "paused_on_error" - Upgrade phase paused due to error,
- "completed" - Upgrade phase completed,
- "canceled" - Upgrade phase canceled,
- "failed" - Upgrade phase failed,
- "pause_pending" - Upgrade phase pause pending,
- "cancel_pending" - Upgrade phase cancel pending

[none]

Element definition: **non-disruptive-update-task-name**

[top]

initialize|mount-image|restart-hm|get-health|run-scripts|unmount-image|clear-alert|post-restart-hm|cleanup-rd|synch-image|do-download-job|do-failover-job|do-giveback-job|check-progress|complete-validation|invalid-task|default-task|do-postupdate-checks-task Possible values:

- "initialize" - Initialization,
- "mount_image" - Mount an image,
- "restart_hm" - Restart Health Monitor,
- "get_health" - Obtain System Health,
- "run_scripts" - Run validation sctipts,
- "unmount_image" - Unmount image,
- "clear_alert" - Clear Alerts,
- "post_restart_hm" - Post validation restart Health Monitor,
- "cleanup_rdb" - Removes all rows for a given phase,
- "synch_image" - Synchronize Secondary Store with Primary,
- "process_package" - Process the package retrieved from external source,

- "cleanup_package" - Removes the packages not currently in the image table,
- "do_download_job" - Downloads the image to the boot device,
- "do_failover_job" - Do the takeover,
- "do_giveback_job" - Do the giveback,
- "check_progress" - Check the progress of any running tasks,
- "complete_validation" - Generate the final validation report,
- "invalid_task" - Used by state machine when a valid task cannot be found,
- "default_task" - Default Task,
- "do_postupdate_checks_job" - Do the post update checks,
- "do_disruptive_update_task" - Do disruptive update of node

[none]

Element definition: **package-details-info**

[top]

Lists detailed on the local packages located in the cluster image package repository

Name	Range	Type	Description
component-name		string optional	Name of the given component. Attributes: non-creatable, non-modifiable
component-version		string optional	The software version number of the given component. Attributes: non-creatable, non-modifiable

Element definition: **phase-comment-info**

[top]

Overall comment

Name	Range	Type	Description
post-update-checks-phase-comments		string optional	Post Update Check Phase Comments Attributes: non-creatable, non-modifiable
update-phase-comments		string optional	Summary of update operation. Attributes: non-creatable, non-modifiable
validation-phase-comments		string optional	Summary of validation operation. Attributes: non-creatable, non-modifiable

Element definition: **required-action-info**

[top]

If the NDU check failed or warned. Provides detailed information on how to recover from the infraction, or in case of a warning list side effects of performing update

Name	Range	Type	Description
action		string optional	Recovery action for error. Attributes: non-creatable, non-modifiable
advice		string optional	Advice for handling the error. Attributes: non-creatable, non-modifiable
error		string optional	Error description. Attributes: non-creatable, non-modifiable

Element definition: **step-info**

[top]

A prepare step, upgrade/revert step or post upgrade step based on the phase.

Name	Range	Type	Description
step-command		string optional	A CLI command associated with the step.
step-detail		string optional	Step details.
step-example		string optional	An example associated with the step.
step-name		string optional	Step heading or name.
step-notes		string optional	Any notes associated with the step.

Element definition: **validation-report-info**

[top]

Validation Info

Name	Range	Type	Description
update-check-action		string optional	Local cluster recovery action for error. Attributes: non-creatable, non-modifiable
update-check-advice		string optional	Local cluster advice for handling the error. Attributes: non-creatable, non-modifiable
update-check-error		string optional	Local cluster error details. Attributes: non-creatable, non-modifiable
update-check-name		string optional	Local cluster update check Attributes: non-creatable, non-modifiable
update-check-status		string optional	Local cluster update check status possible values: ok failed warning Attributes: non-creatable, non-modifiable

Element definition: **datetime**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

[none]

Element definition: **non-disruptive-update-task-status**

[top]

created|ready-to-run|running|completed|failed|pause_req|paused|paused-error|cancel_req|canceled|resume_req|default_status Possible values:

- "created" - Task has been created,
- "ready_to_run" - Task ready to run,
- "running" - Task has started and is running,
- "completed" - Task is completed,
- "failed" - Task failed to complete,
- "pause_req" - Request for task to be paused,
- "paused" - Task is paused,
- "paused_error" - Task is paused because of an error,
- "cancel_req" - Request for task to be cancelled,
- "canceled" - Task is canceled,
- "resume_req" - Request for paused task to be resumed,

"default_status" - Defaiult Status,
- "abort_req" - Request for task to be aborted

[none]

Element definition: **timeticks**

[top]

Time, in seconds Range : [0..2^32-1].

[none]

APIs in Category: **cluster-peer**

cluster-peer-authn-offer-cancel
cluster-peer-authn-offer-get
cluster-peer-authn-offer-get-iter
cluster-peer-authn-offer-modify
cluster-peer-connection-destroy
cluster-peer-connections-get
cluster-peer-connections-get-iter
cluster-peer-create
cluster-peer-delete
cluster-peer-get
cluster-peer-get-iter
cluster-peer-health-info-get
cluster-peer-health-info-get-iter
cluster-peer-modify
cluster-peer-modify-local-name
cluster-peer-ping-iter
cluster-peer-policy-get
cluster-peer-policy-modify

This set of ZAPIs allows management of cluster peer relationships. Cluster peer relationships are required to allow multiple Data ONTAP clusters to exchange data with other Data ONTAP clusters and request operations to be executed by other Data ONTAP clusters.

cluster-peer-authn-offer-cancel

[top]

Cancel the outstanding offer to authenticate with a peer cluster

Input Name	Range	Type	Description
peer-cluster-name		string	Peer Cluster Name

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-authn-offer-get

[top]

Return the specified peer cluster relationship authentication offer information

Input Name	Range	Type	Description
desired-attributes		cluster-peer-authn-offer optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
peer-cluster-name		string	Peer Cluster Name

Output Name	Range	Type	Description
attributes		cluster-peer-authn-offer	The attributes of the cluster-peer-authn-offer.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-authn-offer-get-iter

[top]

Returns a list of cluster peer relationship authentication offers

Input Name	Range	Type	Description
desired-attributes		cluster-peer-authn-offer optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-peer-authn-offer optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-peer-authn-offer object. All cluster-peer-authn-offer objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-peer-authn-offer[] optional	The list of attributes of cluster-peer-authn-offer objects.
next-tag		string	Tag for the next call. Not present when there are no more cluster-

		optional	peer-authn-offer objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-peer-authn-offer-modify

[top]

Modifies the cluster peer relationship authentication offer, as created by the cluster-peer-create or cluster-peer-modify APIs.

Input Name	Range	Type	Description
initial-allowed-vserver-peers		vserver-name[] optional	Vservers Initially Allowed for Peering
offer-expiration		expiration optional	The expiration time of the authentication offer.
peer-cluster-name		string	The name of the peer cluster to modify.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-connection-destroy

[top]

Terminate a current peering connection

Input Name	Range	Type	Description
connection-type		cluster-peer-connection-type	The type of connection for cluster peering.
file-descriptor	**[0..2^64-1]**	integer	The index value for the connection.
node-name		node-name	The name of the node that has the connections involved.
peer-cluster-name		string	The name of the peer cluster.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-connections-get

[top]

Return information about the specified connection to the specified cluster peer

Input Name	Range	Type	Description
connection-type		cluster-peer-connection-type	The type of connection for cluster peering.
desired-attributes		cluster-peer-connections optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
file-descriptor	**[0..2^64-1]**	integer	The index value for the connection.
node-name		node-name	The name of the node that has the connections involved.
peer-cluster-name		string	The name of the peer cluster.

Output Name	Range	Type	Description
attributes		cluster-peer-connections	The attributes of the cluster-peer-connections.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-connections-get-iter

[top]

Returns a list of connections to cluster peers

Input Name	Range	Type	Description
desired-attributes		cluster-peer-connections optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-peer-connections optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-peer-connections object. All cluster-peer-connections objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-peer-connections[] optional	The list of attributes of cluster-peer-connections objects.

next-tag		string optional	Tag for the next call. Not present when there are no more cluster-peer-connections objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-peer-create

[top]

Create a cluster peer relationship and, optionally, an offer to authenticate with a peer. Initiate an authenticated relationship, and an offer to authenticate with a peer, by including the passphrase parameter. Initiate an unauthenticated relationship by omitting the passphrase and, optionally, including a user-name and password.

Input Name	Range	Type	Description
address-family		cluster-peer-address-family optional	The address family (IPv4/IPv6) of the peer cluster connection. If not provided and ambiguity between IPv4 and IPv6 exists, the peer connection address family will default to IPv4. Default: ipv4
applications		vserver-peer-permission-application[] optional	List of peering applications for initial allowed vservers.
encryption-protocol-proposed		cluster-peer-crypt optional	Encryption protocol to be used for inter-cluster communication. Default: tls-psk when authentication is used, otherwise none
generate-passphrase		boolean optional	Use System-Generated passphrase
initial-allowed-vserver-peers		vserver-name[] optional	Vservers allowed for auto peering
ipspace-name		string optional	IPspace in which the LIFs for this relationship are to be found. Default: the Default IPspace
local-name		cluster-name-simple optional	Local name for remote cluster. Default: Remote cluster name
offer-expiration		expiration optional	If a passphrase is provided, the expiration time of the authentication offer. Should not be provided otherwise. Default: one hour into the future
passphrase		string optional	The arbitrary passphrase that matches the one given to the peer cluster.
password		string optional	The password required to authenticate with the peer cluster. This value is only used at peer creation time and not stored.
peer-addresses		remote-inet-address[] optional	The remote intercluster addresses and hostnames of the peer cluster.
rpc-connect-timeout		integer optional	The timeout for RPC Connect attempts to the peer cluster in seconds. Default: 10
		integer	The timeout for operations in the peer cluster in seconds. Default:

timeout		optional	15
update-ping-timeout		integer optional	The timeout used by ICMP pings while updating peer cluster information in seconds. Default: 5
user-name		string optional	The user name required to authenticate with the peer cluster. This value is only used at peer creation time and not stored.

Output Name	Range	Type	Description
passphrase-info		cluster-peer-passphrase-info optional	Cluster Peer Create Passphrase Information

cluster-peer-delete

[top]

Delete a cluster peer relationship as well as any an offer to authenticate with the peer cluster.

Input Name	Range	Type	Description
cluster-name		string	The name of the peer cluster.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-peer-get

[top]

Return the specified peer cluster relationship information

Input Name	Range	Type	Description
cluster-name		string	The name of the peer cluster. Available in the local cluster.
desired-attributes		cluster-peer-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-peer-info	The attributes of the cluster-peer.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-get-iter

[top]

Returns a list of cluster peer relationships

Input Name	Range	Type	Description
		cluster-	Specify the attributes that should be returned. If not present, all

desired-attributes		peer-info optional	attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-peer-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-peer object. All cluster-peer objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-peer-info[] optional	The list of attributes of cluster-peer objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-peer objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-peer-health-info-get

[top]

Get the health of the specified peer node

Input Name	Range	Type	Description
desired-attributes		cluster-peer-health-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
destination-cluster		cluster-name	The name of the peer cluster.
destination-node		peer-node-name	The name of the node in the peer cluster.
originating-node		node-name	The name of the local node.

Output Name	Range	Type	Description
attributes		cluster-peer-health-info	The attributes of the cluster-peer.

Errno	Description

EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-health-info-get-iter

[top]

Get the health of all local and peer nodes sequentially

Input Name	Range	Type	Description
desired-attributes		cluster-peer-health-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-peer-health-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-peer object. All cluster-peer objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-peer-health-info[] optional	The list of attributes of cluster-peer objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-peer objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-peer-modify

[top]

Modifies a cluster peer relationship, optionally also creating an offer to authenticate with a peer.

Input Name	Range	Type	Description
address-family		address-family optional	The address family of the peer-addresses of the relationship. If not specified, either the specified peer-address or the current peer-address is used to derive the address family.
		cluster-peer-	

auth-status-admin		auth-status-admin optional	The desired state of authentication for the relationship. If not specified, the desired state is not modified.
cluster-name		string	The name of the peer cluster to modify.
encryption-protocol-proposed		cluster-peer-crypt optional	Encryption protocol to be used for inter-cluster communication. If not specified, the encryption-protocol attribute is not modified.
generate-passphrase		boolean optional	Use system-generated passphrase
ipspace-name		string optional	IPspace in which the LIFs for this relationship exist. If not specified, the IPspace for the relationship is not modified.
offer-expiration		expiration optional	For auth-status-admin 'use-authentication', the expiration time of the authentication offer. Should not be provided otherwise.
passphrase		string optional	For auth-status-admin 'use-authentication', this must be provided as the arbitrary passphrase that matches the one given to the peer cluster. Should not be provided otherwise.
peer-addresses		remote-inet-address[] optional	The Remote IP address or host name of the peer cluster. If not specified, the peer-addresses are not modified.
rpc-connect-timeout		integer optional	The timeout for RPC Connect calls to the peer cluster in seconds. If not specified, the timeout is not modified.
timeout		integer optional	The timeout for operations in the peer cluster in seconds. If not specified, the timeout is not modified.
update-ping-timeout		integer optional	The timeout for pings to the peer cluster in seconds. If not specified, the timeout is not modified.

Output Name	Range	Type	Description
passphrase-info		cluster-peer-passphrase-info-modify optional	Cluster Peer Create Passphrase Information

cluster-peer-modify-local-name

[top]

Modify the local name for a cluster peer.

Input Name	Range	Type	Description
cluster-name		string	The name of the peer cluster to modify.
new-name		cluster-name-simple	The new local name for the peer cluster.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-peer-ping-iter

[top]

Ping the specified peer nodes. Ping operations take place between a node in a cluster and a node in a remote cluster. The originating node is the node which initiates the ping operation and the destination cluster and node specify the remote node which is the target of the ping.

Input Name	Range	Type	Description
desired-attributes		cluster-peer-ping-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-peer-ping-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the cluster-peer-ping object. All cluster-peer-ping objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-peer-ping-info[] optional	The list of attributes of cluster-peer-ping objects.
next-tag		string optional	Tag for the next call. Not present when there are no more cluster-peer-ping objects to return.

num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-peer-policy-get

[top]

Return the cluster peering policy configuration.

Input Name	Range	Type	Description
desired-attributes		cluster-peer-policy optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-peer-policy	The attributes of the cluster-peer-policy.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	

cluster-peer-policy-modify

[top]

Modify the cluster peering policy configuration.

Input Name	Range	Type	Description
is-unauthenticated-access-permitted		boolean optional	Whether unauthenticated communication between cluster peers is permitted. If true, unauthenticated communication between cluster peers is permitted.
is-unencrypted-access-permitted		boolean optional	Whether unencrypted communication between cluster peers is permitted. If true, unencrypted communication between cluster peers is permitted.
passphrase-minlength		integer optional	Minimum length for a passphrase, integer in [0..1500].

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EINVALIDINPUTERROR	
EPEER_POLICY_CANNOT_REQUIRE_ENCRYPTION	

Element definition: **address-family** [top]

ipv4|ipv6|all Possible values:

- "ipv6" - Lookup for ipv6 addresses,
- "all" - Lookup for both ipv4 and ipv6 addresses

[none]

Element definition: **cluster-name** [top]

Name of the Peer Cluster

[none]

Element definition: **cluster-name-simple** [top]

Name of the Cluster

[none]

Element definition: **cluster-peer-address-family** [top]

The address family (IPv4/IPv6) of the cluster peer relationship. Possible values:

- "ipv4" ,
- "ipv6"

[none]

Element definition: **cluster-peer-auth-status-admin** [top]

Cluster Peering Desired Authentication State

[none]

Element definition: **cluster-peer-authn-offer** [top]

Authentication Offers to Cluster Peers. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
auth-status-admin		cluster-peer-auth-status-admin optional	Authentication Status Administrative Attributes: non-creatable, non-modifiable
auth-status-operational		cluster-peer-auth-status-operational optional	Authentication Status Operational Attributes: non-creatable, non-modifiable
encryption-protocol-proposed		cluster-peer-crypt optional	Encryption Protocol to Be Used For the Relationship Attributes: non-creatable, non-modifiable Possible values: • "none" - Encryption Off, • "tls_psk" - Use TLS With PSK
initial-allowed-vserver-peers		vserver-name[] optional	Vservers Initially Allowed for Peering Attributes: non-creatable, modifiable
offer-creation		datetime optional	Authentication Offer Creation Time Attributes: non-creatable, non-modifiable
offer-expiration		expiration optional	Authentication Offer Expiration Time Attributes: non-creatable, modifiable
peer-cluster-name		string optional	Peer Cluster Name Attributes: key, non-creatable, non-modifiable
peer-cluster-uuid		uuid optional	Cluster UUID Attributes: non-creatable, non-modifiable

Element definition: **cluster-peer-connection-type**

[top]

Type of Connection for Cluster Peering

[none]

Element definition: **cluster-peer-connections**

[top]

Connections Established to Cluster Peers. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
address		ip-address optional	The remote network address for this connection. Attributes: non-creatable, non-modifiable
auth-status-admin		cluster-peer-auth-status-admin optional	The desired status for the authentication of the peer relationship, according to this cluster. Attributes: non-creatable, non-modifiable
auth-status-operational		cluster-peer-auth-status-operational optional	The actual status of the authentication interaction with the peer cluster. Attributes: non-creatable, non-modifiable
authenticated		boolean optional	Whether the client has authenticated itself to the peer cluster on this connection. Attributes: non-creatable, non-modifiable
connection-type		cluster-peer-connection-type optional	The type of connection for cluster peering. Attributes: key, non-creatable, non-modifiable
file-descriptor	**[0..2^64-1]**	integer optional	The index value for the connection. Attributes: key, non-creatable, non-modifiable
idle-time		time-interval optional	The time since the most recent call, in seconds. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The name of the node that has the connections involved. Attributes: key, non-creatable, non-modifiable
peer-cluster-name		string optional	The name of the peer cluster. Attributes: key, non-creatable, non-modifiable
peer-cluster-uuid		uuid optional	The UUID of the peer cluster. Attributes: non-creatable, non-modifiable
port	**[0..2^32-1]**	integer optional	The Internet port to which this file descriptor provides service. Attributes: non-creatable, non-modifiable
psk-algorithm		cluster-peer-keyalgo optional	Algorithm that produced the PSK. Attributes: non-creatable, non-modifiable Possible values: • "akep2" - akep2, • "jpake" - j-pake
rpc-procedure	**[0..2^32-1]**	integer optional	The number of the RPC procedure called most recently on this file descriptor. Attributes: non-creatable, non-modifiable
rpc-program	**[0..2^32-1]**	integer optional	The RPC program number to which this file descriptor provides service. Attributes: non-creatable, non-modifiable
rpc-version	**[0..2^32-1]**	integer optional	The version of the RPC program number to which this file descriptor provides service. Attributes: non-creatable, non-modifiable
tls-type		conn-kind optional	The kind of TLS connection. Attributes: non-creatable, non-modifiable Possible values: • "unk" - State unknown, • "none" - No TLS, • "psk" - TLS based on a Pre-Shared Key, • "cert" - TLS based on a Certificate
uniquifier	**[0..2^64-1]**	integer optional	The uniquifier of the associated session. Attributes: non-creatable, non-modifiable

Element definition: **cluster-peer-crypt**

[top]

none|tls-psk Possible values:

- "none" - Encryption Off,
- "tls_psk" - Use TLS With PSK

[none]

Element definition: **cluster-peer-health-info**

[top]

Cluster Peer Health Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
bypass-cache		boolean optional	When false, do not use cached results. Cached results may not be current, but they may be retrieved quickly. Attributes: non-creatable, non-modifiable
data-ping		peer-ping-status optional	The status of the data ping operation. Possible values are (interface-reachable, unreachable). Attributes: non-creatable, non-modifiable Possible values: • "unknown_node" - Unknown Node, • "internal_error" - Internal Error, • "unreachable" - Unreachable, • "session_reachable" - Session Reachable, • "interface_reachable" - Interface Reachable, • "address_family_mismatch" - Address Family Mismatch
destination-cluster		cluster-name optional	The name of the peer cluster. Attributes: key, non-creatable, non-modifiable
destination-cluster-uuid		string optional	The UUID of the peer cluster. Attributes: non-creatable, non-modifiable
destination-node		peer-node-name optional	The name of the node in the peer cluster. Attributes: key, non-creatable, non-modifiable
		peer-	The status of ICMP ping operation. Possible values are (interface-reachable, unreachable). Attributes: non-creatable, non-modifiable Possible values: • "unknown_node" - Unknown Node,

icmp-ping		ping-status optional	• "internal_error" - Internal Error, • "unreachable" - Unreachable, • "session_reachable" - Session Reachable, • "interface_reachable" - Interface Reachable, • "address_family_mismatch" - Address Family Mismatch
is-cluster-healthy		boolean optional	The status of peer cluster health. Attributes: non-creatable, non-modifiable
is-destination-node-available		boolean optional	True implies that the destination node is available for intercluster communication. Attributes: non-creatable, non-modifiable
is-node-healthy		boolean optional	The RDB health of the node. True means the node is in quorum. Attributes: non-creatable, non-modifiable
last-updated		datetime optional	The date and time when the health information for this node was last updated. Attributes: non-creatable, non-modifiable
originating-node		node-name optional	The name of the local node. Attributes: key, non-creatable, non-modifiable

Element definition: **cluster-peer-info**

[top]

Contains information about the cluster peer. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
active-addresses		remote-inet-address[] optional	The active IP addresses of the peer cluster. Available in the local cluster from a cache. Attributes: non-creatable, non-modifiable
address-family		cluster-peer-address-family optional	The address family of the peer cluster connection. Attributes: non-creatable, non-modifiable Possible values: • "ipv4" , • "ipv6"
auth-status-admin		cluster-peer-auth-status-admin optional	The desired status for the authentication of the peer relationship, according to this cluster. Available in the local cluster. Attributes: non-creatable, non-modifiable
auth-status-operational		cluster-peer-auth-status-operational optional	The actual status of the authentication interaction with the peer cluster. Available in the local cluster from a cache. Attributes: non-creatable, non-modifiable

availability		cluster-peer-avail optional	The status of the peer cluster connection. Available in the local cluster from a cache. Attributes: non-creatable, non-modifiable Possible values: • "unavailable" , • "available" , • "partial" , • "pending" , • "unidentified"
cluster-name		string optional	The name of the peer cluster. Available in the local cluster. Attributes: key, non-creatable, non-modifiable
cluster-uuid		string optional	The UUID of the peer cluster. Available in the local cluster. Attributes: non-creatable, non-modifiable
encryption-protocol		cluster-peer-crypt optional	Encryption used in the communication for this relationship. Available in the local cluster. Attributes: non-creatable, non-modifiable Possible values: • "none" - Encryption Off, • "tls_psk" - Use TLS With PSK
encryption-protocol-proposed		cluster-peer-crypt optional	Proposed encryption for inter-cluster communication. Default: tls-psk if authentication is used, otherwise none Available in the local cluster. Attributes: non-creatable, non-modifiable Possible values: • "none" - Encryption Off, • "tls_psk" - Use TLS With PSK
ipspace-name		string optional	IPspace in which the LIFs for this relationship are to be found. Default: The Default IPspace Available in the local cluster. Attributes: non-creatable, non-modifiable
is-cluster-healthy		boolean optional	The status of peer cluster health. Available in the local cluster from a cache. Attributes: non-creatable, non-modifiable
last-updated		datetime optional	The last time that an attempt was made to contact this cluster and its status information was updated. Attributes: non-creatable, non-modifiable
peer-addresses		remote-inet-address[] optional	The remote IP address or host name of the peer cluster. Available in the local cluster. Attributes: non-creatable, non-modifiable
psk-algorithm		cluster-peer-keyalgo optional	Algorithm by which the pre-shared key was derived. Available in the local cluster. Attributes: non-creatable, non-modifiable Possible values: • "akep2" - akep2, • "jpake" - j-pake
remote-cluster-name		string optional	The current name of the peer cluster. Fetched remotely. Generally, use the 'cluster' name instead. Attributes: non-creatable, non-modifiable
remote-cluster-nodes		peer-node-name[] optional	The list of all the nodes in the peer cluster. Available in the local cluster. Attributes: non-creatable, non-modifiable
rpc-connect-timeout	**[5..30]**	integer optional	The timeout for RPC Connect calls to the peer cluster in seconds. Default: 10 Attributes: non-creatable, non-modifiable
serial-number		cluster-serial-number	This is an assigned serial number of peer cluster. It is assigned at the time of cluster create. Available in the local cluster from a

		optional	cache. Attributes: non-creatable, non-modifiable
timeout	**[25..180]**	integer optional	The timeout for operations in the peer cluster in seconds. Default: 15 Available in the local cluster. Attributes: non-creatable, non-modifiable
unreachable-local-nodes		peer-node-name[] optional	List of local nodes not contactable from the node on which the command is executed. Available in the local cluster from a cache. Attributes: non-creatable, non-modifiable
update-ping-timeout	**[1..10]**	integer optional	The timeout for pings to the peer cluster in seconds. Default: 5 Attributes: non-creatable, non-modifiable

Element definition: **cluster-peer-passphrase-info**

[top]

Cluster Peer Create Passphrase Information

Name	Range	Type	Description
authentication		cluster-peer-auth-status-operational optional	Authentication Status Administrative Attributes: non-creatable, non-modifiable
availability		cluster-peer-avail optional	Availability of the Remote Cluster Attributes: non-creatable, non-modifiable Possible values: • "unavailable" , • "available" , • "partial" , • "pending" , • "unidentified"
cluster		string optional	Peer Cluster Name Attributes: non-creatable, non-modifiable
initial-allowed-vserver-peers		vserver-name[] optional	Vservers allowed for auto peering Attributes: optional-for-create, non-modifiable
ip-address		remote-inet-address optional	Intercluster LIF IP Address Attributes: non-creatable, non-modifiable
ipspace		string optional	IPspace in which the LIFs for this relationship are to be found. Default: the Default IPspace Attributes: optional-for-create, non-modifiable
offer-expiration		expiration optional	If a passphrase is provided, the expiration time of the authentication offer. Should not be provided otherwise. Default: one hour into the future Attributes: optional-for-create, non-modifiable
passphrase		string optional	The arbitrary passphrase that matches the one given to the peer cluster. Attributes: optional-for-create, non-modifiable
reciprocal-status		cluster-peer-status	Reciprocal Peering Status Attributes: non-creatable, non-modifiable Possible values: • "non_reciprocal" - Non reciprocal peer, • "reciprocal_connect_success" - Reciprocal peer connection create success, • "reciprocal_connect_failure" - Reciprocal peer connection

		optional	create failure, • "reciprocal_passphrase_success" - Reciprocal passphrase creation success, • "reciprocal_passphrase_failure" - Reciprocal passphrase creation failure

Element definition: **cluster-peer-passphrase-info-modify**

[top]

Cluster Peer Create Passphrase Information

Name	Range	Type	Description
cluster		string optional	The name of the peer cluster. Available in the local cluster. Attributes: key, required-for-create, non-modifiable
ip-address		remote-inet-address optional	Intercluster LIF IP Address Attributes: non-creatable, non-modifiable
ipspace		string optional	IPspace in which the LIFs for this relationship are to be found. Default: The Default IPspace Available in the local cluster. Attributes: optional-for-create, non-modifiable
offer-expiration		expiration optional	When the offer to match passphrases will expire. Default: one hour into the future Available in the local cluster. Attributes: optional-for-create, non-modifiable
passphrase		string optional	Authentication Passphrase Attributes: optional-for-create, non-modifiable

Element definition: **cluster-peer-ping-info**

[top]

Cluster Peer Ping Configuration When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
count	**[1..255]**	integer optional	The total number of times to ping. Attributes: key, non-creatable, non-modifiable
current-count	**[0..2^32-1]**	integer optional	The current ping count. Attributes: key, non-creatable, non-modifiable
destination-address		ip-address optional	The active IP address of the node. Attributes: key, non-creatable, non-modifiable
destination-cluster		cluster-name	The name of the destination cluster. Attributes: key, non-creatable, non-modifiable

		optional	
destination-cluster-uuid		string optional	The UUID of the destination cluster. Attributes: non-creatable, non-modifiable
destination-node		string optional	The name of the destination node. Attributes: key, non-creatable, non-modifiable
originating-node		node-name optional	The name of the originating node. Attributes: key, non-creatable, non-modifiable
ping-status		peer-ping-status optional	The status of the ping operation. Attributes: non-creatable, non-modifiable Possible values: • "unknown_node" - Unknown Node, • "internal_error" - Internal Error, • "unreachable" - Unreachable, • "session_reachable" - Session Reachable, • "interface_reachable" - Interface Reachable, • "address_family_mismatch" - Address Family Mismatch
round-trip	**[0..2^64-1]**	integer optional	The roundtrip response time of ping operation in microseconds. Attributes: non-creatable, non-modifiable
time-to-live	**[0..2^32-1]**	integer optional	The time to live (remaining hops). Attributes: non-creatable, non-modifiable
timeout	**[0..2^32-1]**	integer optional	The timeout to use when pinging the peer cluster in seconds. Default: 15 Attributes: non-creatable, non-modifiable
type		peer-ping-protocol optional	The network protocol to use when performing the ping operation. Attributes: non-creatable, non-modifiable Possible values: • "data" - Data Ping, • "icmp" - ICMP Ping

Element definition: **cluster-peer-policy**

[top]

Policy Configuration of the Cluster Peer Facility. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-unauthenticated-access-permitted		boolean optional	Whether unauthenticated communication between cluster peers is permitted. If true, unauthenticated communication between cluster peers is permitted. Default: false Attributes: non-creatable, modifiable
is-unencrypted-access-permitted		boolean optional	Whether unencrypted communication between cluster peers is permitted. If true, unencrypted communication between cluster peers is permitted. Default: true Attributes: non-creatable, modifiable
passphrase-	**[0..1500]**	integer	Minimum required length for a passphrase. Default: 8

minimum-length		optional	Attributes: non-creatable, modifiable

Element definition: **expiration** [top]

Expiration in MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW

[none]

Element definition: **node-name** [top]

The node's name

[none]

Element definition: **peer-node-name** [top]

The name of a node in a peer cluster

[none]

Element definition: **remote-inet-address** [top]

IPv4 Address, IPv6 Address or Host Name

[none]

Element definition: **vserver-name** [top]

The name of the Vserver.

[none]

Element definition: **vserver-peer-permission-application** [top]

Intercluster application for Vserver peer permission Possible values:

- "snapmirror" - SnapMirror,
- "flexcache" - FlexCache

[none]

Element definition: **cluster-name** [top]

Name of the Peer Cluster

[none]

Element definition: **cluster-peer-address-family** [top]

The address family (IPv4/IPv6) of the cluster peer relationship. Possible values:

- "ipv4" ,
- "ipv6"

[none]

Element definition: **cluster-peer-auth-status-admin** [top]

Cluster Peering Desired Authentication State

[none]

Element definition: **cluster-peer-auth-status-operational** [top]

Cluster Peering Operational Authenticated State

The following are the possible values for the operational authentication state and their meanings.

- 'ok' - The clusters have reached agreement on a shared secret and are using it in ongoing communication (both sides use-authentication, among other attributes),
- 'absent' - The clusters agree that neither side requires authentication of the other (both sides no-authentication),
- 'pending' - This cluster has an outstanding offer to authenticate with the other cluster, but agreement has not yet been reached,
- 'expired' - This cluster's offer to authenticate with the other cluster expired before agreement was reached,
- 'revoked' - This cluster has revoked any authentication agreement (this side revoked),
- 'declined' - The other cluster has revoked our communication attempts and is declining to peer with this cluster,
- 'refused' - The other cluster actively refuses our communication attempts; perhaps its part of the peering relationship has been deleted,
- 'ok_and_offer' - The clusters agree on a shared secret and are using it. In addition, this cluster

has an outstanding offer to re-authenticate with the other cluster,
- 'absent_but_offer' - The clusters currently agree that neither side requires authentication of the other, but this cluster has an outstanding offer to authenticate,
- 'revoked_but_offer' - The cluster has revoked any authentication agreement, but it has an outstanding offer to authenticate,
- 'intent_mismatch' - The two sides disagree on whether authentication is required,
- 'key_mismatch' - The two clusters both believe that they are authenticated, but one of the shared secrets has become corrupted,
- 'incapable' - The other cluster is no longer running a version of Data ONTAP that supports authenticated cluster peering.

[none]

Element definition: **cluster-peer-avail**

[top]

The availability of the peer cluster. Possible values:

- "unavailable" ,
- "available" ,
- "partial" ,
- "pending" ,
- "unidentified"

[none]

Element definition: **cluster-peer-connection-type**

[top]

Type of Connection for Cluster Peering

[none]

Element definition: **cluster-peer-crypt**

[top]

none|tls-psk Possible values:

- "none" - Encryption Off,
- "tls_psk" - Use TLS With PSK

[none]

Element definition: **cluster-peer-keyalgo**

[top]

akep2|jpake Possible values:

- "akep2" - akep2,
- "jpake" - j-pake

[none]

Element definition: **cluster-peer-status**

[top]

non-reciprocal|reciprocal-status Possible values:

- "non_reciprocal" - Non reciprocal peer,
- "reciprocal_connect_success" - Reciprocal peer connection create success,
- "reciprocal_connect_failure" - Reciprocal peer connection create failure,
- "reciprocal_passphrase_success" - Reciprocal passphrase creation success,
- "reciprocal_passphrase_failure" - Reciprocal passphrase creation failure

[none]

Element definition: **cluster-serial-number**

[top]

Assigned Cluster serial-number during cluster create

[none]

Element definition: **conn-kind**

[top]

unknown|none|PSK|Cert Possible values:

- "unk" - State unknown,
- "none" - No TLS,
- "psk" - TLS based on a Pre-Shared Key,
- "cert" - TLS based on a Certificate

[none]

Element definition: **datetime**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

[none]

Element definition: **ip-address**

[top]

IPv4 and IPv6 address

[none]

Element definition: **peer-ping-protocol**

[top]

The network protocol to use when performing the ping operation. Possible values:

- "data" - Data Ping,
- "icmp" - ICMP Ping

[none]

Element definition: **peer-ping-status**

[top]

The status of the ping operation. Possible values:

- "unknown_node" - Unknown Node,
- "internal_error" - Internal Error,
- "unreachable" - Unreachable,
- "session_reachable" - Session Reachable,
- "interface_reachable" - Interface Reachable,
- "address_family_mismatch" - Address Family Mismatch

[none]

Element definition: **time-interval**

[top]

Time interval in seconds Range : [0..2^32-1].

[none]

Element definition: **uuid**

[top]

The 128-bit universally-unique identifier (UUID).

UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

[none]

APIs in Category: **cluster-switch**

cluster-switch-configure-health-monitor
cluster-switch-create
cluster-switch-delete
cluster-switch-get-iter
cluster-switch-modify
cluster-switch-poll-get
cluster-switch-poll-modify

This interface is used to access information about the Ethernet switches in the cluster.

cluster-switch-configure-health-monitor

[top]

Ethernet switch health monitor configuration file setup

Input Name	Range	Type	Description
node		node-name	Node
package-url		string	Package URL

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-switch-create

[top]

Add information about an Ethernet switch (cluster, management or storage).

Input Name	Range	Type	Description
address		ip-address	IP Address
community-or-username		string optional	Community String or SNMPv3 Username
device		string	Device Name
is-monitoring-enabled-admin		true-false optional	Enable Switch Monitoring
model		switch-model	Model Number
snmp-version		sm-snmpversion optional	SNMP Version
type		switch-type	Switch Network

Errno	Description
EINTERNALERROR	

cluster-switch-delete

[top]

Delete information about an Ethernet switch (cluster, management or storage).

Input Name	Range	Type	Description
device		string	Device Name
force		boolean optional	Force Delete

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-switch-get-iter

[top]

(cluster-swt-get-iter is now deprecated. Use cluster-switch-get-iter instead.) Display the configuration for Ethernet switch (cluster, management or storage).

Input Name	Range	Type	Description
desired-attributes		cluster-switch-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		cluster-switch-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Ethernet Switch Information object. All Ethernet Switch Information objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		cluster-switch-info[] optional	The list of attributes of Ethernet Switch Information objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Ethernet Switch Information objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

cluster-switch-modify

[top]

Modify information about an Ethernet switch's configuration.

Input Name	Range	Type	Description
		ip-address	

address		optional	IP Address
community-or-username		string optional	Community String or SNMPv3 Username
device		string	Device Name
is-monitoring-enabled-admin		true-false optional	Enable Switch Monitoring
model		switch-model optional	Model Number
snmp-version		sm-snmpversion optional	SNMP Version
type		switch-type optional	Switch Network

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-switch-poll-get

[top]

Return Ethernet switch polling interval information.

Input Name	Range	Type	Description
desired-attributes		cluster-switch-poll-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		cluster-switch-poll-info	The attributes of the Ethernet switch polling interval information.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

cluster-switch-poll-modify

[top]

Modify Ethernet switch polling interval information.

Input Name	Range	Type	Description
polling-interval	**[2..120]**	integer	Polling interval for monitoring Ethernet switch health.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **cluster-switch-info**

[top]

Ethernet Switch Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
address		ip-address optional	IP Address Attributes: required-for-create, modifiable
device		string optional	Device Name Attributes: key, required-for-create, non-modifiable
is-monitoring-enabled-operational		true-false optional	Is Monitored ? Attributes: non-creatable, non-modifiable
model		switch-model optional	Model Number Attributes: required-for-create, non-modifiable Possible values: • "nx5010" - N5K-C5010P-BF, • "nx5020" - N5K-C5020P-BF, • "cat2960" - cisco WS-C2960-24TT-L, • "other" , • "nx5596" - N5K-C5596UP, • "cn1610" - CN1610, • "cn1601" - CN1601, • "nx3132" - N3K-C3132Q-40GX, • "nx5548" - N5K-C5548UP, • "nx3132v" - N3K-C3132Q-V, • "ot9332" , • "nx3132xl" - N3K-C3132Q-XL, • "nx3232c" - N3K-C3232C
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
reason		string optional	Reason For Not Monitoring Attributes: non-creatable, non-modifiable
serial-number		string optional	Serial Number of the Device Attributes: non-creatable, non-modifiable
sw-version		string optional	Software Version Attributes: non-creatable, non-modifiable
type		switch-type optional	Switch Network Attributes: required-for-create, modifiable Possible values: • "cluster_network" , • "management_network" , • "storage_network"
version-source		string optional	Source Of Switch Version Attributes: non-creatable, non-modifiable

Element definition: **cluster-switch-poll-info**

APIs in Category: **config-backup**

config-backup-copy
config-backup-create
config-backup-delete
config-backup-download
config-backup-info-get
config-backup-info-get-iter
config-backup-rename
config-backup-settings-get
config-backup-settings-modify
config-backup-settings-password-set
config-backup-upload

This set of ZAPIs allow managing configuration backups. Configuration backups are automatically created based on three job schedules. These job schedules are '8hour', 'daily' and 'weekly'. These job schedules are pre-programmed to create 'scheduled backups'. Configuring different job schedules other than the programmed ones is not supported. Scheduled backups are uploaded to remote URL destination if it is configured. This set of ZAPIs support configuring the remote destination by specifying URL, username and password. Scheduled backups will be distributed to some nodes within the cluster and latest backups will be kept in the cluster. This set of ZAPIs allow configuring the number of latest backups to keep in the cluster per job schedule. Scheduled backups are of type 'cluster backup'. A cluster backup contains cluster-wide replicas in addition to 'node backup' of each node in the cluster. A 'node backup' contains only node-specific configuration such as configuration files on the root volume and the boot variables. Configuration backups can also be created 'on demand' by using this set of ZAPIs. These ZAPIs support creating node backups and cluster backups on demand. Backup management operations such as delete backup, copy backup to another node in cluster, rename backup, download backup from URL and upload backup to URL are supported by this set of ZAPIs. ZAPIs for delete, copy, rename, download and upload operations are applicable for any type of backups, i.e. scheduled backups and on demand backups, node backups and cluster backups.

config-backup-copy

[top]

Copy a configuration backup. A job will be queued to copy the configuration backup. A job will be spawned to operate on the config-backup and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
backup-name		string	The name of the configuration backup.
from-node		string	The source node to copy the configuration backup from. This is the node that has the backup file on its root volume.
to-node		string	The destination node to copy the configuration backup to.

Output Name	Range	Type	Description
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
			The operation status. Possible values: "succeeded", "in_progress",

result-status		string	"failed".

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-create

[top]

Create a configuration backup. A job will be queued to create the configuration backup in the background. Creation of configuration backup may take several minutes. This ZAPI creates an on demand backup. A job will be spawned to operate on the config-backup and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
backup-name		string optional	The name of the configuration backup. It must be a valid file name. An extension of .7z will be added if the given backup-name doesn't have that extension. If backup-name is not provided, software will generate the name for configuration backup.
backup-type		backup-type optional	Indicates if the backup is a node or a cluster backup. A node backup contains only node-specific configuration of a particular node in the cluster. A cluster backup contains cluster-wide replicas in addition to node backup of each node in the cluster. Possible values: • "node" - Node Backup, • "cluster" - Cluster Backup
node		string	The node to own the configuration backup. This is the node that will have the backup file on its root volume.

Output Name	Range	Type	Description
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string	The operation status. Possible values: "succeeded", "in_progress", "failed".

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-delete

[top]

Delete a configuration backup.

Input Name	Range	Type	Description

backup-name		string	The name of the configuration backup.
node		string	The node that owns the configuration backup. This is the node that has the backup file on its root volume.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-download

[top]

Download a configuration backup from a URL.

Input Name	Range	Type	Description
backup-name		string optional	The name of the configuration backup. It must be a valid file name. An extension of .7z will be added if the given backup-name doesn't have that extension. If backup-name is not provided, software will generate a name for configuration backup.
node		string	The node to own the configuration backup. The backup file will be downloaded to the root volume of this node.
source-url		string	The source URL. URL is specified following the syntax described in RFC 3986. Only 'ftp', 'http' and 'https' protocols are supported.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-info-get

[top]

Return information about a specified configuration backup.

Input Name	Range	Type	Description
backup-name		string	The name of the configuration backup.
desired-attributes		config-backup-info-type optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node		string	The node that owns the configuration backup. This is the node that has the backup file on its root volume.

Output Name	Range	Type	Description
attributes		config-backup-info-type	The attributes of the config-backup-info.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-info-get-iter

[top]

Return a list of configuration backups in the cluster.

Input Name	Range	Type	Description
desired-attributes		config-backup-info-type optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		config-backup-info-type optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the config-backup-info object. All config-backup-info objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		config-backup-info-type[] optional	The list of attributes of config-backup-info objects.
next-tag		string optional	Tag for the next call. Not present when there are no more config-backup-info objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

config-backup-rename

[top]

Rename a configuration backup. Renamed backup stays on the same node.

Input Name	Range	Type	Description
backup-name		string	The name of the configuration backup.
new-backup-		string	The new name for the configuration backup. It must be a valid file name. An extension of .7z will be added if the given new-name doesn't have that

name			extension.
node		string	The node that owns the configuration backup. This is the node that has the backup file on its root volume.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-settings-get

[top]

Return information about the configuration backup settings.

Input Name	Range	Type	Description
desired-attributes		config-backup-settings-type optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		config-backup-settings-type	The attributes of the config-backup-settings.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-settings-modify

[top]

Modify the settings for configuration backup operations.

Input Name	Range	Type	Description
backup-count1	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 1.
backup-count2	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 2.
backup-count3	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 3.
destination-url		string optional	The destination URL for uploading the configuration backups. URL is specified following the syntax described in RFC 3986. Only 'ftp', 'http' and 'https' protocols are supported.
username-for-destination-url		string optional	The username for the destination URL.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-settings-password-set

[top]

Modify the password for destination URL.

Input Name	Range	Type	Description
password-for-destination-url		string optional	Password for the destination URL.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

config-backup-upload

[top]

Upload a configuration backup to a URL.

Input Name	Range	Type	Description
backup-name		string	The name of the configuration backup.
destination-url		string	The destination URL. URL is specified following the syntax described in RFC 3986. Only 'ftp', 'http' and 'https' protocols are supported.
node		string	The node that owns the configuration backup. This is the node that has the backup file on its root volume.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **backup-type**

[top]

The type of a configuration backup. Possible values:

- "node" - Node Backup,
- "cluster" - Cluster Backup

[none]

Element definition: **config-backup-info-type**

[top]

Configuration Backup Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
backup-creation-time	**[0..2^31-1]**	integer optional	The time of the configuration backup creation. The time value is in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable
backup-name		string optional	The name of the configuration backup. Attributes: key, required-for-create, non-modifiable
backup-size	**[0..2^63-1]**	integer optional	The size of configuration backup file in number of bytes. Attributes: non-creatable, non-modifiable
backup-type		backup-type optional	Indicates if the backup is a node or a cluster backup. A node backup contains only node-specific configuration of a particular node in the cluster. A cluster backup contains cluster-wide replicas in addition to node backup of each node in the cluster. If backup-type is not provided, cluster backup is assumed by default. Attributes: non-creatable, non-modifiable Possible values: • "node" - Node Backup, • "cluster" - Cluster Backup
cluster-name		string optional	The name of the cluster which the configuration backup was created for. This field is set only for cluster backups. For node backups, the nodes-in-backup field indicates the name of the node. Attributes: non-creatable, non-modifiable
cluster-uuid		string optional	The UUID of the cluster which the configuration backup was created for. This field is set only for cluster backups. Attributes: non-creatable, non-modifiable
is-auto		boolean optional	True indicates that configuration backup is a scheduled backup that was created automatically by a schedule. False indicates that configuration backup was created on demand. Attributes: non-creatable, non-modifiable
node		string optional	The node that owns the configuration backup. This is the node that has the backup file on its root volume. Attributes: key, required-for-create, non-modifiable
nodes-in-backup		string[] optional	The names of the nodes included in the configuration backup. Attributes: non-creatable, non-modifiable
schedule		string optional	The name of the job schedule for scheduled backups. Possible values are: '8hour', 'daily', and 'weekly'. This field is not set for on demand backups created via management CLI or ZAPI. Attributes: non-creatable, non-modifiable
version		string optional	The software version which the configuration backup was created with. Attributes: non-creatable, non-modifiable

Element definition: **config-backup-settings-type**

[top]

Configuration Backup Settings When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
backup-count1	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 1. Attributes: non-creatable, modifiable
backup-count2	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 2. Attributes: non-creatable, modifiable
backup-count3	**[1..4]**	integer optional	The number of configuration backups to keep in the cluster for schedule 3. Attributes: non-creatable, modifiable
destination-url		string optional	The destination URL for uploading the configuration backups. URL is specified following the syntax described in RFC 3986. Only 'ftp', 'http' and 'https' protocols are supported. Attributes: non-creatable, modifiable
job-schedule1		string optional	The name of the first job schedule for generating configuration backups. It is pre-programmed to be '8hour'. Attributes: non-creatable, non-modifiable
job-schedule2		string optional	The name of the second job schedule for generating configuration backups. It is pre-programmed to be 'daily'. Attributes: non-creatable, non-modifiable
job-schedule3		string optional	The name of the third job schedule for generating configuration backups. It is pre-programmed to be 'weekly'. Attributes: non-creatable, non-modifiable
username-for-destination-url		string optional	The username for the destination URL. Attributes: non-creatable, modifiable

Element definition: **backup-type**

[top]

The type of a configuration backup. Possible values:

- "node" - Node Backup,
- "cluster" - Cluster Backup

[none]

APIs in Category: **coredump**

coredump-configure
coredump-list-cores-iter-next
coredump-list-cores-iter-start
coredump-list-info
coredump-remove
coredump-save
coredump-trigger

coredump-configure

[top]

Setup some coredump options. If not invoked, the default settings are: sparsecore is true, minfree is zero, and dump-attempts is two.

Input Name	Range	Type	Description
dump-attempts		integer	The number of times coredump should attempt to dump a core when faced with disk errors that prevent writes from completing. When set to zero, no cores will be dumped. Range : [0..10].
minfree		integer	The number of bytes that need to be left in the root filesystem after coredump has finished saving a core. If this amount of space will not be left, save attempts will be aborted. If a core is already being saved, this setting will not take affect until savecore starts saving another core. Range : [0..2^63-1].
save-attempts		integer	The number of times coredump should attempt to save a core before requiring the force flag to be set to true in the coredump-save interface. This is a safeguard built into coredump to prevent coredump from causing a panic loop. Range : [0..10].
sparsecore		boolean	Controls whether or not coredump should dump sparse cores. Sparse cores do not include wafl buffers that contain only user data.

Errno	Description
EINTERNALERROR	

coredump-list-cores-iter-next

[top]

Obtain a list of cores on this system

Input Name	Range	Type	Description
maximum		integer	Maximum number of directory entries to retrieve.
tag		string	Tag from a previous 'coredump-list-cores-iter-start' or 'coredump-list-cores-iter-next'.

Output Name	Range	Type	Description

core-details		core-detail-info[]	Information about every core on this system, both saved and unsaved.
next-tag		string	The tag value to supply to the next invocation of 'coredump-list-cores-iter-next'.
records		integer	The number of cores being returned by this call. When this value reaches zero, all cores have been retrieved.

Errno	Description
EINTERNALERROR	
ELOWMEMORY	
ECOREDUMPBUSY	

coredump-list-cores-iter-start

[top]

Start an iteration through the core files on this system. This interface will return an error unless the state returned by coredump-list-info is idle, nocore, or waitdump.

Output Name	Range	Type	Description
next-tag		string	Tag to be used in next call to 'coredump-list-cores-iter-next'.

Errno	Description
EINTERNALERROR	
ECOREDUMPNOTINITIALIZED	
ECOREDUMPBUSY	

coredump-list-info

[top]

Gather info about state of coredump

Output Name	Range	Type	Description
config-details		config-detail-info optional	This provides information about the disks available to coredump. Information includes whether or not unsaved cores are on the disks, how many blocks are available to dump a core, and what kind of dump would be done, if the system were to panic right now. This is only returned if state is nocore, idle, or waitdump.
fs-avail-bytes		integer optional	The number of free bytes available in the root filesystem for saving cores. This will only be returned if state is nocore, idle, or waitdump. -1 will be returned if errors occurred while determining the value. Range : [-1..2^63-1].
fs-bytes-needed		integer optional	The maximum number of free bytes needed in the root filesystem for saving all unsaved cores. This will only be returned if state is idle. Range : [0..2^63-1].
fs-minfree-bytes		integer optional	The minimum number of bytes that must be left free in the root filesystem when savecore has finished saving a core. Any core that has a chance to reduce free space below this amount will not be saved. This will only be returned if state is nocore, idle, or waitdump. -1 will be returned if errors occurred while determining the value. Range :

			[-1..2^63-1].
progress-details		progress-detail-info optional	Progress savecore has made saving the current core. This is only returned if state is saving.
state		string	The current state of savecore. Possible values: nocore, idle, init, saving, mini, waitdump

Errno	Description
EINTERNALERROR	
ENOTWHILEWAITINGFORGIVEBACK	
ENOTINMAINTMODE	
ENOTINREADONLYMODE	
ECOREDUMPNOTINITIALIZED	

coredump-remove

[top]

Removes saved or unsaved cores from this system.

Input Name	Range	Type	Description
coreid		integer optional	The id of the core that should be deleted. If not provided, all cores will be deleted. Range : [0..2^63-1].
remove-saved		boolean optional	Set to true if cores that have already been saved should be deleted. Otherwise, only unsaved cores will be deleted. Default: false

Errno	Description
EBADCOREID	
EINTERNALERROR	
ENOTWHILEWAITINGFORGIVEBACK	
ENOTINMAINTMODE	
ENOTINREADONLYMODE	

coredump-save

[top]

Start saving any unsaved cores

Input Name	Range	Type	Description
coreid		integer optional	The id of the core that should be saved. If not provided, all cores will be saved. Range : [0..2^63-1].
force		boolean optional	Set to true to allow savecore to save cores that have had too many failed save attempts in the past. Default: false

Errno	Description
EINTERNALERROR	
ENOTWHILEWAITINGFORGIVEBACK	
ENOTINMAINTMODE	

ENOTINREADONLYMODE	

coredump-trigger

[top]

Trigger a coredump via the Service Processor

Input Name	Range	Type	Description
node		node-name	Node whose core dump is required

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **config-detail-info**

[top]

Disk configuration information related to coredump

Name	Range	Type	Description
async-blocks		integer	The total number of 4KB blocks available to coredump on the disks that support the spraycore mode of coredump. Range : [0..2^31-1].
async-disks		integer	The number of unused disks available to coredump that support spraycore. Range : [0..2^31-1].
dumptype		string	This is the type of dump that will be done if the machine panics right now. Possible values: compressed, sprayed, spare
needed-blocks		integer	The total number of 4KB disk blocks needed for coredump to spray a core if a panic were to happen right now. Range : [0..2^31-1].
needed-disks		integer	The minimum number of disks needed to spray a core. Range : [0..2^31-1].
no-spares		boolean	True if no spare disks are available. If no spares are available, and the dumptype is spare, no core can be dumped.
partial-disks		integer	The number of disks that contain unsaved partial cores. Partial cores are missing one or more disks. Range : [0..2^31-1].
partial-dumps		integer	The number of unsaved partial cores. Partial cores are missing one or more disks. Range : [0..2^31-1].
supports-spraycore		boolean	True if this platform supports spraying cores, and false otherwise.
total-disks		integer	The total number of disks available to coredump. Range : [0..2^31-1].
used-disks		integer	Number of disks that already contain portions of unsaved cores. This only includes cores that are not missing any disks. Range : [0..2^31-1].
used-dumps		integer	The number of unsaved cores that are not missing any disks. Range : [0..2^31-1].

Element definition: **core-detail-info**

[top]

All important information about a single core in the system.

Name	Range	Type	Description
ancillary-segment-directory		string	The directory holding ancillary kernel core segments belonging to this panic.
attempts		integer optional	The number of attempts that have been made to save an unsaved core. This is only returned if saved is false. Range : [0..2^31-1].
coreid		integer	A handle that can be used with coredump-remove or coredump-save to remove/save specific cores. Range : [0..2^63-1].
corename		string	The name of the core file. For unsaved cores, this is the name the core file will have once the core is saved.
fs-bytes-needed		integer optional	The maximum number of bytes needed in the root filesystem to save this core. This is only returned if saved is false. Range : [0..2^63-1].
is-partial		boolean optional	True if the core is a partial core. Partial cores are missing disks. This is only returned if saved is false.
is-saved		boolean	True if this core has already been saved.
md5-data-chksum		string	The MD5 checksum of the compressed data of this core.
os-version		string	The version of Data ONTAP that generated this core.
panic-string		string	The panic string for the panic that generated this core.
panic-time		integer	The time of the panic that generated this core. It is specified in seconds since the epoch. Range : [0..2^31-1].
size		integer optional	The size of core (bytes). Range : [0..2^63-1].
sysid		integer	The system id of the system that generated this core. Range : [0..2^31-1].

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **progress-detail-info**

[top]

Savecore progress info

Name	Range	Type	Description
corename		string	Name of the core being saved
saved-blocks		integer	Number of blocks that have already been saved in the core that is being saved
total-blocks		integer	Total number of blocks of data in the core that is being saved.

APIs in Category: **dashboard**

dashboard-alarm-get
dashboard-alarm-get-iter
dashboard-alarm-get-total-records
dashboard-alarm-threshold-get
dashboard-alarm-threshold-get-iter
dashboard-alarm-threshold-get-total-records
dashboard-alarm-threshold-modify

Note: This command is removed starting from ONTAP 9.0.

This set of APIs provides visibility into the Alarm Dashboard feature of the system. The Alarm Dashboard allows the system administrator to proactively monitor the health of each node in the cluster by exposing various storage and performance metrics. The administrator may configure this dashboard to alert users in the event a performance metric crosses a predetermined threshold. The following metrics are monitored by the Alarm Dashboard:

- average client latency (performance of NFS and CIFS operations)
- CPU utilization
- data network health (ratio of packet errors over total packets)
- data port utilization
- storage space utilization

The APIs are divided into the following major features:

- Alarms: view storage and performance metrics
- Alarm Thresholds: manage warning / critical thresholds, polling intervals, and user notifications

dashboard-alarm-get

[top]

This command is removed starting from ONTAP 9.0.

Input Name	Range	Type	Description
dashboard-metric-type		dashboard-metric-type	The type of metric being monitored. Possible values: • "cpu_busy" - CPU Utilization, • "port_util" - Port Utilization, • "op_latency" - Average Client Latency of NFS and CIFS operations, • "aggregate_used" - Storage Aggregate Utilization, • "port_problems" - Packet Error Ratio
desired-attributes		dashboard-alarm-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
node		string	Name of the node associated with the alarm metrics.
object-name		string	Name associated with the object being monitored. For example, the object-name is the name of the node if the dashboard-metric-type is cpu-busy.

Output Name	Range	Type	Description
		dashboard-	

attributes		alarm-info	The attributes of the dashboard-alarm.

Errno	Description
EAPIUNSUPPORTEDVERSION	

dashboard-alarm-get-iter

[top]

This command is removed starting from ONTAP 9.0.

Input Name	Range	Type	Description
desired-attributes		dashboard-alarm-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		dashboard-alarm-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the dashboard-alarm object. All dashboard-alarm objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		dashboard-alarm-info[] optional	The list of attributes of dashboard-alarm objects.
next-tag		string optional	Tag for the next call. Not present when there are no more dashboard-alarm objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EAPIUNSUPPORTEDVERSION	

dashboard-alarm-get-total-records

[top]

This command is removed starting from ONTAP 9.0.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of dashboard-alarm objects.

dashboard-alarm-threshold-get

[top]

This command is removed starting from ONTAP 9.0.

Input Name	Range	Type	Description
dashboard-metric-type		dashboard-metric-type	The type of metric being monitored. Possible values: • "cpu_busy" - CPU Utilization, • "port_util" - Port Utilization, • "op_latency" - Average Client Latency of NFS and CIFS operations, • "aggregate_used" - Storage Aggregate Utilization, • "port_problems" - Packet Error Ratio
desired-attributes		dashboard-alarm-threshold-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		dashboard-alarm-threshold-info	The attributes of the dashboard-alarm-threshold.

Errno	Description
EAPIUNSUPPORTEDVERSION	

dashboard-alarm-threshold-get-iter

[top]

This command is removed starting from ONTAP 9.0.

Input Name	Range	Type	Description
desired-attributes		dashboard-alarm-threshold-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		dashboard-alarm-threshold-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the dashboard-alarm-threshold object. All dashboard-alarm-threshold objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description

attributes-list		dashboard-alarm-threshold-info[] optional	The list of attributes of dashboard-alarm-threshold objects.
next-tag		string optional	Tag for the next call. Not present when there are no more dashboard-alarm-threshold objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EAPIUNSUPPORTEDVERSION	

dashboard-alarm-threshold-get-total-records

[top]

This command is removed starting from ONTAP 9.0.

Output Name	Range	Type	Description
count	**[0..2^64-1]**	integer	The total number of dashboard-alarm-threshold objects.

dashboard-alarm-threshold-modify

[top]

This command is removed starting from ONTAP 9.0.

Input Name	Range	Type	Description
critical-threshold		string optional	The threshold value that must be reached to generate a critical alarm for this type of metric. Get request is returned with % sign for percent values and ms for milliseconds value. Example : 95%, 500ms
dashboard-metric-type		dashboard-metric-type	The type of metric being monitored. Possible values: • "cpu_busy" - CPU Utilization, • "port_util" - Port Utilization, • "op_latency" - Average Client Latency of NFS and CIFS operations, • "aggregate_used" - Storage Aggregate Utilization, • "port_problems" - Packet Error Ratio
is-user-notification-enabled		boolean optional	Specifies whether user notifications are enabled.
polling-interval	**[60..6000]**	integer optional	The refresh interval for the alarm dashboard metrics (in seconds).
threshold-units		threshold-unit optional	Threshold Units Possible values: • "none" - none, • "ms" - milliseconds, • "percent" - percent

warning-threshold		string optional	The threshold value that must be reached to generate a warning alarm for this type of metric. Get request is returned with % sign for percent values and ms for milliseconds value. Example : 85%, 200ms

Errno	Description
EAPIUNSUPPORTEDVERSION	

Element definition: **dashboard-alarm-info**

[top]

Alarm monitoring data When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
dashboard-metric-type		dashboard-metric-type optional	The type of metric being monitored. Attributes: key, non-creatable, non-modifiable Possible values: • "cpu_busy" - CPU Utilization, • "port_util" - Port Utilization, • "op_latency" - Average Client Latency of NFS and CIFS operations, • "aggregate_used" - Storage Aggregate Utilization, • "port_problems" - Packet Error Ratio
high-value		string optional	The highest value recorded so far for this metric. Attributes: non-creatable, non-modifiable
last-value		string optional	The last value recorded for this metric. Attributes: non-creatable, non-modifiable
node		string optional	Name of the node associated with the alarm metrics. Attributes: key, non-creatable, non-modifiable
object-name		string optional	Name associated with the object being monitored. For example, the object-name is the name of the node if the dashboard-metric-type is cpu-busy. Attributes: key, non-creatable, non-modifiable
state		alarm-state optional	The current alarm state of the object being monitored. Attributes: non-creatable, non-modifiable Possible values: • "ok" , • "warning" , • "critical"

Element definition: **dashboard-alarm-threshold-info**

[top]

Alarm threshold configuration settings When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

This set of Zapis is used for monitoring and diagnosing system health.

diagnosis-alert-definition-get

[top]

Return alert definition

Input Name	Range	Type	Description
alert-id		string	Alert identification.
desired-attributes		diagnosis-alert-definition-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.

Output Name	Range	Type	Description
attributes		diagnosis-alert-definition-info	The attributes of the Alert Definition.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-alert-definition-get-iter

[top]

Iterate over a list of Alert Definition objects.

Input Name	Range	Type	Description
desired-attributes		diagnosis-alert-definition-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		diagnosis-alert-definition-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Alert Definition object. All Alert Definition objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		diagnosis-alert-definition-info[] optional	The list of attributes of Alert Definition objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Alert Definition objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

diagnosis-alert-get

[top]

Return a subsystem alert

Input Name	Range	Type	Description
alert-id		string	Alert identification.
alerting-resource		string	Unique name of resource that generated the alert.
desired-attributes		diagnosis-alert-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.

Output Name	Range	Type	Description
attributes		diagnosis-alert-info	The attributes of the Alert Information.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-alert-get-iter

[top]

Iterate over a list of Alert Information objects.

Input Name	Range	Type	Description
desired-attributes		diagnosis-alert-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		diagnosis-alert-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Alert Information object. All Alert Information objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		diagnosis-alert-info[] optional	The list of attributes of Alert Information objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Alert Information objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

diagnosis-alert-modify

[top]

Acknowledge/suppress an alert

Input Name	Range	Type	Description
acknowledge		boolean optional	Acknowledge the alert condition.
acknowledger		string optional	Person who acknowledged this alert
alert-id		string	Alert identification.
alerting-resource		string	Unique name of resource that generated the alert.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.
suppress		boolean optional	Suppress this alert.
suppressor		string optional	Person who suppressed this alert

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-config-get

[top]

Return the system health framework configuration

Input Name	Range	Type	Description
desired-attributes		diagnosis-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.

Output Name	Range	Type	Description
attributes		diagnosis-config-info	The attributes of the Health Monitor Configuration.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-config-get-iter

[top]

Iterate over a list of Health Monitor Configuration objects.

Input Name	Range	Type	Description

desired-attributes		diagnosis-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		diagnosis-config-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Health Monitor Configuration object. All Health Monitor Configuration objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		diagnosis-config-info[] optional	The list of attributes of Health Monitor Configuration objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Health Monitor Configuration objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

diagnosis-delete-alert

[top]

Delete subsystem alert

Input Name	Range	Type	Description
alert-id		string	Alert identification.
alerting-resource		string	Unique name of resource that generated the alert.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-policy-definition-get

[top]

Return policy definition

Input Name	Range	Type	Description
desired-attributes		diagnosis-policy-definition-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.
policy-id		string	Policy identifier.

Output Name	Range	Type	Description
attributes		diagnosis-policy-definition-info	The attributes of the Policy Definition.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-policy-definition-get-iter

[top]

Iterate over a list of Policy Definition objects.

Input Name	Range	Type	Description
desired-attributes		diagnosis-policy-definition-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		diagnosis-policy-definition-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Policy Definition object. All Policy Definition objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		diagnosis-policy-definition-info[] optional	The list of attributes of Policy Definition objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Policy Definition objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

diagnosis-policy-modify

[top]

Enable/disable policy

Input Name	Range	Type	Description
enable		boolean optional	Enable/disable this policy.
is-autosupport-enabled		boolean optional	Enable AutoSupport for this alert.
monitor		hm-type	Type of health monitor (e.g. node_connect, system_connect, system).
node		string	Node hosting this health monitor.
policy-id		string	Policy identifier.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-status-get

[top]

Return the overall system health

Input Name	Range	Type	Description
desired-attributes		diagnosis-status optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		diagnosis-status	The attributes of the System Health Status.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-subsystem-config-get

[top]

Get the attributes of the Health Monitor Subsystem Status.

Input Name	Range	Type	Description
desired-attributes		diagnosis-subsystem-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
subsystem		hm-subsystem	Type of subsystem being monitored Possible values: • 'sas_connect', • 'ha_health',

Output Name	Range	Type	Description
attributes		diagnosis-subsystem-config-info	The attributes of the Health Monitor Subsystem Status.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

diagnosis-subsystem-config-get-iter

[top]

Iterate over a list of Health Monitor Subsystem Status objects.

Input Name	Range	Type	Description
desired-attributes		diagnosis-subsystem-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		diagnosis-subsystem-config-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Health Monitor Subsystem Status object. All Health Monitor Subsystem Status objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		diagnosis-subsystem-config-info[] optional	The list of attributes of Health Monitor Subsystem Status objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Health Monitor Subsystem Status objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

diagnosis-subsystem-config-modify

[top]

Modify system health subsystem

Input Name	Range	Type	Description
refresh-interval	**[0..2^32-1]**	integer optional	Subsystem Refresh Interval in Minutes.
subsystem		hm-subsystem	Type of subsystem being monitored Possible values: • 'sas_connect', • 'ha_health',

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **diagnosis-alert-definition-info**

[top]

System Health Alert Definition When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
additional-information		string optional	Additional information about the alert. Attributes: non-creatable, non-modifiable
alert-id		string optional	Alert identification. Attributes: key, non-creatable, non-modifiable
alert-type		hm-alert-type optional	Type of alert (other,communications,quality-of-service,processing-error,device,environmental,model-change,security). Attributes: non-creatable, non-modifiable
corrective-actions		string optional	Recommended actions to correct the problem reported by alert. Attributes: non-creatable, non-modifiable
monitor		hm-type optional	Type of health monitor (e.g. node_connect, system_connect, system). Attributes: key, non-creatable, non-modifiable
node		string optional	Node hosting this health monitor. Attributes: key, non-creatable, non-modifiable
		hm-	Severity of alert

perceived-severity		perceived-sev optional	(Unknown,Other,Information,Degraded,Minor,Major,Critical,Fatal). Attributes: non-creatable, non-modifiable
possible-effect		string optional	Detailed description of the possible effect of the condition. Attributes: non-creatable, non-modifiable
probable-cause		hm-probable-cause optional	Probable cause for alert generation. Attributes: non-creatable, non-modifiable
probable-cause-description		string optional	Detailed description of probable cause for alert generation. Attributes: non-creatable, non-modifiable
subsystem		hm-subsystem optional	Type of subsystem being monitored (e.g. sas_connect). Attributes: non-creatable, non-modifiable

Element definition: **diagnosis-alert-info**

[top]

System Health Alert When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
acknowledge		boolean optional	Acknowledge the alert condition. Attributes: non-creatable, modifiable
acknowledger		string optional	Person who acknowledged this alert Attributes: non-creatable, modifiable
additional-info		string[] optional	Additional information from the resource that generated this alert Attributes: non-creatable, non-modifiable
alert-id		string optional	Alert identification. Attributes: key, non-creatable, non-modifiable
alerting-resource		string optional	Unique name of resource that generated the alert. Attributes: key, non-creatable, non-modifiable
alerting-resource-name		string optional	Display name of resource that generated the alert. Attributes: non-creatable, non-modifiable
corrective-actions		string optional	Recommended actions to correct the problem reported by alert. Attributes: non-creatable, non-modifiable
indication-time		date optional	Time of alert generation. Attributes: non-creatable, non-modifiable
monitor		hm-type optional	Type of health monitor (e.g. node_connect, system_connect, system). Attributes: key, non-creatable, non-modifiable
node		string optional	Node hosting this health monitor. Attributes: key, non-creatable, non-modifiable
perceived-severity		hm-perceived-sev optional	Severity of alert. Attributes: non-creatable, non-modifiable

policy		string optional	Policy rule responsible for creating this alert. Attributes: non-creatable, non-modifiable
possible-effect		string optional	Possible effect seen due to this problem. Attributes: non-creatable, non-modifiable
probable-cause		hm-probable-cause optional	Probable cause for alert generation. Attributes: non-creatable, non-modifiable
probable-cause-description		string optional	Detailed description of probable cause for alert generation. Attributes: non-creatable, non-modifiable
subsystem		hm-subsystem optional	Type of subsystem being monitored (e.g. sas_connect). Attributes: non-creatable, non-modifiable
suppress		boolean optional	Suppress this alert. Attributes: non-creatable, modifiable
suppressor		string optional	Person who suppressed this alert Attributes: non-creatable, modifiable

Element definition: **diagnosis-config-info**

[top]

System Health Config When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregator		hm-type optional	Aggregating health monitor that aggregates status from this health monitor. Attributes: non-creatable, non-modifiable Possible values: • "node_connect" ... node scope health monitor , • "system_connect" ... cluster scope health monitor , • "system" ... aggregator of health monitor status ,
context		hm-scope optional	Scope of health monitor (node-context, cluster-context). Attributes: non-creatable, non-modifiable Possible values: • "node_context" , • "cluster_context"
health		hm-status optional	Status of health monitor (ok, ok-with-suppressed, degraded). Attributes: non-creatable, non-modifiable Possible values: • "ok" , • "ok_with_suppressed" , • "degraded" , • "unreachable" , • "unknown"
			Subsystem initialization state of health monitor Attributes: non-

init-state		hm-subsystem-discovery-state optional	creatable, non-modifiable Possible values: • "invalid" , • "initializing" , • "initialized" , • "start_discovery" , • "start_rediscovery" , • "discovered_partially" , • "discovery_done" , • "discovery_max"
mon-version		string optional	Health Monitor version. Attributes: non-creatable, non-modifiable
monitor		hm-type optional	Type of health monitor. Attributes: key, non-creatable, non-modifiable Possible values: • "node_connect" , • "system_connect" , • "system"
node		string optional	Node hosting this health monitor. Attributes: key, non-creatable, non-modifiable
pol-version		string optional	Policy file version. Attributes: non-creatable, non-modifiable
resources		string[] optional	Resources monitored by this health monitor. Attributes: non-creatable, non-modifiable
sub-pol-versions		string optional	Subordinate policy file versions. Attributes: non-creatable, non-modifiable
subsystem		hm-subsystem[] optional	Type of subsystem being monitored (e.g. sas_connect). Attributes: non-creatable, non-modifiable Possible values: • "sas_connect" , • "ha_health" ,

Element definition: **diagnosis-policy-definition-info**

[top]

System Health Policy Definition When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
alert-count	**[0..2^32-1]**	integer optional	Count of alerts created as a result of this policy. Attributes: non-creatable, non-modifiable
alert-id		string optional	Alert identifier for alert to be generated on policy rule match. Attributes: non-creatable, non-modifiable
creation-time		datetime optional	Time when the previous alert was created due to this policy. Attributes: non-creatable, non-modifiable
		boolean	

enable		optional	Enable/disable this policy. Attributes: non-creatable, modifiable
is-autosupport-enabled		boolean optional	Enable AutoSupport for this alert. Attributes: non-creatable, modifiable
monitor		hm-type optional	Type of health monitor (e.g. node_connect, system_connect, system). Attributes: key, non-creatable, non-modifiable
node		string optional	Node hosting this health monitor. Attributes: key, non-creatable, non-modifiable
policy-id		string optional	Policy identifier. Attributes: key, non-creatable, non-modifiable
responsible-resource-info		string optional	The resource responsible for creating this alert Attributes: non-creatable, non-modifiable
rule-expression		string optional	Arithmetic expression which defines alerts to be created as a result of this policy. Attributes: non-creatable, non-modifiable
where		string optional	Where clause of Arithmetic expression. Attributes: non-creatable, non-modifiable

Element definition: **diagnosis-status**

[top]

System Health Status When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
status		hm-status optional	Overall system health (ok,ok-with-suppressed,degraded,unreachable) as determined by the diagnosis framework. Attributes: non-creatable, non-modifiable

Element definition: **diagnosis-subsystem-config-info**

[top]

System Health Subsystem Status When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
			Health of Subsystem. Attributes: non-creatable, non-modifiable Possible values:

health		hm-status optional	• "ok" , • "ok_with_suppressed" , • "degraded" , • "unreachable" , • "unknown"
init-state		hm-subsystem-discovery-state optional	Initialization State of Subsystem. Attributes: non-creatable, non-modifiable Possible values: • "invalid" , • "initializing" , • "initialized" , • "start_discovery" , • "start_rediscovery" , • "discovered_partially" , • "discovery_done" , • "discovery_max"
node		string[] optional	Node hosting this health monitor. Attributes: non-creatable, non-modifiable
outstanding-alert-count	**[0..2^32-1]**	integer optional	Number of outstanding alerts. Attributes: non-creatable, non-modifiable
refresh-interval	**[0..2^32-1]**	integer[] optional	Subsystem Refresh Interval in Minutes. Attributes: non-creatable, modifiable
subsystem		hm-subsystem optional	Type of subsystem being monitored Possible values: • 'sas_connect', • 'ha_health', Attributes: key, non-creatable, non-modifiable
suppressed-alert-count	**[0..2^32-1]**	integer optional	Number of suppressed alerts. Attributes: non-creatable, non-modifiable

disk-fail

[top]

Fail a file system disk. Removes the specified file system disk from the RAID configuration, spinning the disk down when removal is complete. disk fail is used to remove a file system disk that may be logging excessive errors and requires replacement. Note that if optional input parameter 'is-immediate' is true, the specified disk will be immediately failed out, and the RAID group to which the disk belongs will enter degraded mode (meaning a disk is missing from the RAID group). If a spare disk at least as large as the disk being removed is available, the contents of the disk being removed will be reconstructed onto that spare disk. If 'is-immediate' options is false or not specified, system will prefail the disk and its content will be copied to a replacement disk if a suitable spare disk is available, and afterwards the prefailed disk will be failed out. This process can be observed by polling disk-list-info for this disk and tracking values of elements copy-destination and copy-percent. Same can be done using 'storage-disk-get-iter' when requested from Admin Vserver LIF. The disk being failed is marked as ``broken'', so that if it remains in the disk shelf, it will not be used by the filer as a spare disk. If the disk is moved to another filer, that filer will use it as a spare. This is not a recommended course of action, as the reason that the disk was failed may have been because it needed to be replaced. NOTE: Data ONTAP 7.0 and earlier releases don't indicate failure code properly.

Input Name	Range	Type	Description
disk		string	Name of the disk. e.g. "1.1.3" or "NET-1.1" for a virtual disk.
is-immediate		boolean optional	Specify 'true' if disk is to be failed out immediately. If disk is to be prefailed, specify 'false'. Default value is 'false'.

disk-release-all-reservations

[top]

Release reservations on all reserved disks. When invoked from maintenance mode, all reservations are released on all disks until the system is rebooted. When not in maintenance mode, then the system will automatically re-issue reservations for disks it owns. In sanown environment the system will reserve its disks everu 30 seconds.

Errno	Description
ERESERVATIONSDISABLED	
EUNABLETORELEASE	

disk-remove

[top]

Remove a spare disk. Removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete. You can use disk remove to remove a spare disk so that it can be used by another filer (as a replacement for a failed disk or to expand file system space). NOTE: Data ONTAP 7.0 and earlier releases don't indicate failure code properly.

Input Name	Range	Type	Description
disk		string	Name of the disk to remove. e.g. "1.1.3" or "NET-1.1" for a virtual disk.
force		boolean optional	Allow a container disk in a Dually carrier to be removed if the remove reason is "admin removed". This feature is currently disabled.
remove-reason		string optional	The reason for failing the disk. Possible values are: • "admin_removed" - Admin removed disk. • "evacuation" - Disk is marked for evacuation. The default value is "admin_removed". The failure disk will be recorded with "admin removed" as the failure reason by default. If the remove reason is "evacuation", the failure reason of the disk will be recorded as "evacuated".

disk-replace-start

[top]

Initiate replacing a file system disk with an appropriate spare disk. Uses Rapid RAID Recovery to copy data from the source file system disk to the destination spare disk. Roles of disks are reversed at the end of that process. The spare disk will replace the file system disk in the RAID group and the file system disk will become a spare. This interface returns as soon as possible while disk replace starts in the background. This process can be observed by polling disk-list-info for this disk and tracking values of elements copy-destination and copy-percent. Note: The operation performs limited error checking. Disk replace starts asynchronously in the background, and it can fail even if ZAPI reports success.

Input Name	Range	Type	Description
allow-same-carrier		boolean optional	Using two disks from one carrier that houses multiple disks in one RAID group is not desirable. If that happens, Data ONTAP initiates a series of disk copy operations to correct that situation. Sometimes, selection of available spare disks makes it impossible to avoid placing two disks from one carrier in one RAID group. Setting this option to true allows placing two disks from one carrier in one RAID group.
disk		string	Name of the file system disk to replace.
force		boolean optional	Allow replacement-disk to come from the opposite spare pool. Also allow replacement-disk not matching rotational speed of majority of disks in the aggregate.
replace-reason		string optional	The reason for replacing the disk. Possible values are: • "evacuation" - Disk is marked for evacuation. • "layout_optimization" - Disk is marked for layout optimization. • "shared_disk_replacement"- Disk is marked for replacement. • "none" The default value is "none". If the replace reason is "none" or "shared_disk_replacement", the replaced disk will become a non-zeroed spare after disk copy. If the replace reason is "evacuation", the replaced disk will be failed after disk copy, and the "evacuated" failure reason will be recorded for that disk. If the replace reason is "layout_optimization", the replaced disk will become zeroed spare.
replacement-disk		string	Name of the spare disk to use as a replacement.

disk-sanown-assign

[top]

Assigns ownership of a disk. The normal usage is when the disk is unowned, or to assign a disk to a pool.

Input Name	Range	Type	Description
all		boolean optional	Assign all unowned visible disks to the specified node-name. The node-name parameter is mandatory. Other than node-name and copy-owner-from is not allowed with this option. If copy-owner-from parameter is specified with parameter node-name node assign disk ownership based on copy-owner-from else it assign ownership of disks based on node-name.
auto		boolean optional	Auto-assign unowned disks which are on loops where only 1 filer owns the disks and the pool information is the same, to the specified node. The node parameter is mandatory. No other parameter is allowed with this option.
checksum		string	Assign checksum type to disk. Option may only be specified on a RAID array LUNs. Possible values are: • "block"

		optional	• "zoned" • "advanced_zoned"
copy-owner-from		string optional	Assign ownership of this disk to be the same as the owner of the disk specified
disk		string optional	Name of disk to assign. Wildcarding for disk string is supported. Either of owner, owner-id or copy-owner-from is mandatory. The node parameter is not allowed with this option.
disk-count		integer optional	Assign specified count of disks. Either of owner, owner-id or copy-owner-from is mandatory. The node parameter is not allowed with this option.
disk-type		string optional	Assign specified type of disk(or set of disks). The disk-count parameter is mandatory. Type of disk: ATA, BSAS, FCAL, FSAS, LUN, MSATA, SAS, SSD, SSD_NVM, VMDISK, or unknown.
disklist		disk-info[] optional	Names of disks
force		boolean optional	Force flag need to be set to 'true' if assigning disks which are already owned a Filer. However, if that Filer is up and has put a reservation on the disk, even the force option won't work.
is-data-partition		boolean optional	Used only with disk parameter. It specifies if the assign command must be executed on the data partition of a root-data partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data1-partition' and 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', or 'is-data2-partition' are specified or are all false, and disk is partitioned, then ownership of container disk is changed. The default value is false.
is-data1-partition		boolean optional	Used only with disk parameter. It specifies if the assign command must be executed on the data1 partition of a root-data1-data2 partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data-partition' and 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', or 'is-data2-partition' are specified or are all false, and disk is partitioned, then ownership of container disk is changed. The default value is false.
is-data2-partition		boolean optional	Used only with disk parameter. It specifies if the assign command must be executed on the data2 partition of a root-data1-data2 partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data-partition' and 'is-data1-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', or 'is-data2-partition' are specified or are all false, and disk is partitioned, then ownership of container disk is changed. The default value is false.
is-root-partition		boolean optional	Used only with disk parameter. It specifies if the assign command must be executed on the root partition of the disk. This field is mutually exclusive with 'is-data-partition', 'is-data1-partition' and 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', or 'is-data2-partition' are specified or are all false, and disk is partitioned, then ownership of container disk is changed. The default value is false.
is-spatial-disk-name-format		boolean optional	It specifies if the disk name is in spatial format. This parameter is used only by the CLI backend code to tell D-Blade ZAPI whether to select a disk name in spatial format while matching with a wild-card pattern. The default value is false.
node-name		string optional	Used only with auto or all parameter. It specifies the node to which autoassignment or assignment of all unowned disks must be done. When this is specified with copy-owner-from option assignment of selected disk will happen based on disk ownership present for disk specified for copy-owner-from parameter.
		string	Assign disk to specific owner (node name). Either of owner,owner-id or

owner		optional	copy-owner-from is mandatory.
owner-id		integer optional	Assign disk to specific owner ID (NVRAM ID or serial number). Either of owner,owner-id or copy-owner-from is mandatory Range : [0..2^32-1].
pool		integer optional	Assign disk to specific pool, e.g. '0' or '1'.

EDISKFAILED	

disk-sanown-remove-ownership

[top]

Removes ownership information on a disks provided by disk-list.

Input Name	Range	Type	Description
disk-list		disk-name[] optional	List of disks to remove ownership information from. e.g. "1.1.1 1.1.2" or "NET-1.1 NET-1.2" for virtual disks.
force		boolean optional	If 'true' override the RAID checks. Eg: Disk is part of aggregate. Otherwise defaults to false.
is-data-partition		boolean optional	Used only with disk parameter. It specifies if the remove-ownership command must be executed on the data partition of a root-data partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data1-partition', 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', 'is-data2-partition' are specified or are all false and disk is partitioned, then ownership of container disk is removed. The default value is false.

is-data1-partition		boolean optional	Used only with disk parameter. It specifies if the remove-ownership command must be executed on the data1 partition of a root-data1-data2 partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data-partition', 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', 'is-data2-partition' are specified or are all false and disk is partitioned, then ownership of container disk is removed. The default value is false.
is-data2-partition		boolean optional	Used only with disk parameter. It specifies if the remove-ownership command must be executed on the data2 partition of a root-data1-data2 partitioned disk. This field is mutually exclusive with 'is-root-partition', 'is-data-partition', 'is-data1-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', 'is-data2-partition' are specified or are all false and disk is partitioned, then ownership of container disk is removed. The default value is false.
is-root-partition		boolean optional	Used only with disk parameter. It specifies if the remove-ownership command must be executed on the root partition of a root-data or root-data1-data2 partitioned disk. This field is mutually exclusive with 'is-data-partition', 'is-data1-partition', 'is-data2-partition' fields. When none of 'is-root-partition', 'is-data-partition', 'is-data1-partition', 'is-data2-partition' are specified or are all false and disk is partitioned, then ownership of container disk is removed. disk-unfail

[top]

Unfail a disk in the broken pool, by clearing its FDR (Failed Disk Registry) entry and unfailing it at the Storage Layer, as necessary. If the "make-spare" option is set to B_TRUE, the disk is returned to the spare pool. Otherwise, label assimilation will bring the disk back according to its on-disk labels, with one of four possible outcomes. 1. Disk becomes a spare. This is the common case. The disk becomes a spare upon unfail, because its parent volume is complete and online. 2. Disk is assimilated into former volume. This is a recovery scenario. The disk is brought back into an existing volume, which may result in this volume coming back online. 3. Disk is assimilated into a new partial volume. This may occur in the rare case that the disk's former volume was destroyed or moved. 4. Disk returned to broken pool. This is the case if a fatal error occurs in process of unfailing the disk.

Input Name	Range	Type	Description
disk		string	Name of the disk. e.g. "1.1.3" or "NET-1.1" for a virtual disk.
make-spare		boolean optional	Specify 'true' to force the disk to become a spare upon unfail. Default value is 'false'.

disk-update-disk-fw

[top]

Start disk firmware download process to update firmware on disks. This operation is asynchronous, and therefore returns no errors that might occur during the download process. This operation will only update firmware on disks that do not have the latest firmware revision. The firmware revision on the disk can be monitored via the disk-list-info API.

Input Name	Range	Type	Description
disk-list		disk-name[] optional	List of disks to be updated. If not specified, all disks are updated. e.g. "1.1.1 1.1.2 1.1.3" or "NET-1.1 NET-1.2" for virtual disks.
node-name		string	This field is only valid when the request is sent to the Admin Vserver LIF. This is the storage system name the command will be executed on.

Errno	Description
EINTERNALERROR	
EDISKNOTFOUND	

EINVALIDINPUTERROR	
ENODENOTFOUND	

disk-zero-spares

[top]

Set up all non-zeroed spares owned by the filer to start zeroing. This operation is asynchronous, and therefore returns no errors that might occur when the zeroing operation actually starts, which could be several seconds after this API operation completes. Zeroing progress can be monitored via the disk-list-info API. Same can be done using 'storage-disk-get-iter' when requested from Admin Vserver LIF. The "zeroing-percent" element of disk-detail-info is returned if disk zeroing has started, and "is-zeroed" returns TRUE once the zeroing has completed (or, if zeroing wasn't necessary in the first place).

Input Name	Range	Type	Description
node-name		string optional	Name of the node on which spare disks to be zeroed When requested from Admin Vserver LIF and node name is not specified, spare disks from all nodes in the cluster will be zeroed.
use-physical-zeroing		boolean optional	If set to true, the ZAPI will not use fast zeroing, even if the nodes(s) owning the disks have the feature enabled. This will usually lead to much longer completion times.

Errno	Description
EINTERNALERROR	

Element definition: **disk-info**

[top]

Information for each disk in the plex.

Name	Range	Type	Description
name		string	Name of a member disk.
vbn-end	**[0..2^64-1].**	integer optional	VBN end value of a disk.
vbn-start	**[0..2^64-1].**	integer optional	VBN start value of a disk.

Element definition: **disk-name**

[top]

Disk path name

[none]

Element definition: **disk-sanown-detail-info**

[top]

Disk sanown information.

Name	Range	Type	Description
checksum		string optional	Only returned on RAID array LUNs. The possible values: • "advanced_zoned" - advanced_zoned checksum (azcs), • "block" - block, • "zoned" - zoned (this value is no longer supported).
dr-home-id	**[0..2^32-1].**	integer optional	ID (NVRAM ID) of home owner of a disk in switchover state when there is a disaster. Before disaster switchover, the value of this field is zero. At the time of switchover, it would be changed so as to keep track of whom to give the disks to, at the time of switchback. If the disk has no dr home id, this will not be returned.
dr-home-owner		string optional	This is the name of home owner of a disk in switchover state when there is a disaster. Before disaster switchover, the value of this field is a NULL string. At the time of switchover, it would be changed so as to keep track of whom to give the disks to, at the time of switchback. If the disk has no dr home owner, this will not be returned.
home		string optional	The home of the disk. On NG will be different than owner if the home node has been taken over. On Classic this will be the same as owner. If the disk has no owner, this will not be returned.
home-id		integer optional	ID (NVRAM ID) of disk home. Range : [0..2^32-1].
is-failed		boolean	'true' if the disk is failed, 'false' otherwise.
name		string	Name of the disk, e.g. v1.1 Wildcarding for disk string is suuported, e.g. v1.*
owner		string optional	Current owner of the disk. If disk has no owner, this will not be returned.
owner-id		integer optional	ID (NVRAM ID) of owner if there is one. Range : [0..2^32-1].
pool		integer optional	Pool the disk belongs to, if it has a owner.
reserved-by		integer	ID (NVRAM ID) of node with the reservation on this disk, 0 if there is none. Range : [0..2^32-1].
serial-no		string	Serial number of the disk.
type		string optional	Indicates the type of disk or device being being reported. Values are one of following: "FCAL", "D_ATA", "LUN", "MSATA", "SSD", "UNKNOWN"

Element definition: **disk-sanown-filer-detail-info**

[top]

Disk sanown filer information.

Name	Range	Type	Description
filer-id		integer	ID (NVRAM ID) of owner. Range : [0..2^32-1].
filer-name		string optional	Name of the filer. If the filer name hasn't been written to the disks, this will not be returned.

APIs in Category: **disk-encrypt**

disk-encrypt-get
disk-encrypt-get-iter
disk-encrypt-modify
disk-encrypt-modify-iter
disk-encrypt-sanitize
disk-encrypt-sanitize-iter
disk-encrypt-status-get
disk-encrypt-status-get-iter

This set of disk-encrypt ZAPIs allows management of the encryption parameters of self-encrypting disks, either SEDs or FIPS drives, on systems that support them. When properly set, these controls protect data at rest on the disk media. For FIPS-certified devices, these controls place the drives into compliance with their FIPS PUB 140-2 level 2 ("FIPS") certification. The authentication keys (AKs) are passphrases that allow the system to manipulate these controls.

To provide the maximum protection of disk data, set the data AK (using its corresponding key ID) to a key other than the default AK. The default AK can be either the manufacture secure ID (MSID, key ID 0x0) or a null AK (key ID displayed as blank). When a nondefault value is set as the data AK, the system automatically enables power-cycle protection, so that if a drive is removed or power-cycled, the current data AK must be presented to the device before it will transfer any data.

For FIPS-certified drives, also set the FIPS AK to place the drives into FIPS-compliance mode. In SAS FIPS drives, setting a nondefault FIPS key automatically engages firmware download protection so that the FIPS AK must be presented to the SED at each firmware download. NVMe drives use a drive-validated secure signature to prove the firmware is valid rather than requiring the FIPS key.

disk-encrypt-get

[top]

Return data key ID, FIPS key ID and protection mode of a self-encrypting disk.

Input Name	Range	Type	Description
desired-attributes		disk-encrypt-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
disk-name		string	Name of the self-encrypting disk.

Output Name	Range	Type	Description
attributes		disk-encrypt-info	The attributes of the disk-encrypt.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

disk-encrypt-get-iter

[top]

Return data key ID, FIPS key ID and protection mode of one or more self-encrypting disks.

Input Name	Range	Type	Description
desired-attributes		disk-encrypt-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 2000
query		disk-encrypt-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the disk-encrypt object. All disk-encrypt objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		disk-encrypt-info[] optional	The list of attributes of disk-encrypt objects.
next-tag		string optional	Tag for the next call. Not present when there are no more disk-encrypt objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description

The disk-encrypt-modify-iter API alters encryption parameters on one or more self-encrypting disks (SEDs).

The API output <results status="passed"> indicates only that the operation has started. Monitor operation progress using the disk-encrypt-status-get or disk-encrypt-status-get-iter API.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple disk-encrypt objects match a given query. If set to true, the API will continue with the next matching disk-encrypt even when the operation fails for the disk-encrypt. If set to false, the API will return on the first failure. Default: false
data-key-id		string optional	Key ID of the New Data Authentication Key
fips-key-id		string optional	Key ID of the New Authentication Key for FIPS Compliance
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed operations before the server gives up and returns. If set, the API will continue with the next matching disk-encrypt even when the operation on a previous matching disk-encrypt fails, and do so until the total number of objects failed to be operated on reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of disk-encrypt objects to be operated in this call. Default: 20
query		disk-encrypt-info	If operating on a specific disk-encrypt, this input element must specify all keys. If operating on disk-encrypt objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of disk-encrypt objects (just keys) that were not operated on due to some error. If set to false, the list of disk-encrypt objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of disk-encrypt objects (just keys) that were successfully operated on. If set to false, the list of disk-encrypt objects operated on will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		disk-encrypt-modify-iter-info[] optional	Information about disk-encrypt objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.

next-tag		string optional	Tag for the next call. Not present when there are no more matching disk-encrypt objects to be operated on.
num-failed	**[0..2^32-1]**	integer optional	The number of disk-encrypt objects that matched the query, but were not operated on due some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of disk-encrypt objects that matched the query and were successfully processed.
success-list		disk-encrypt-modify-iter-info[] optional	The disk-encrypt objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

Errno	Description
EINTERNALERROR	

disk-encrypt-sanitize

[top]

The disk-encrypt-sanitize API cryptographically erases a self-encrypting disk (SED) that is in the spare or broken state.

The API output <results status="passed"> indicates only that the operation has started. Monitor operation progress using the disk-encrypt-status-get or disk-encrypt-status-get-iter API.

Input Name	Range	Type	Description
disk-name		string	The name specifier of the self-encrypting disks (SEDs).

Element definition: **disk-encrypt-info**

[top]

Self-Encrypting Disk parameters. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
data-key-id		string optional	Key ID of the data authentication key. Attributes: non-creatable, non-modifiable
disk-name		string optional	Name of the self-encrypting disk. Attributes: key, non-creatable, non-modifiable
fips-key-id		string optional	Key ID of the FIPS authentication key. Attributes: non-creatable, non-modifiable
is-fips-certified		boolean optional	Whether drive is FIPS-certified. Attributes: non-creatable, non-modifiable
is-sed		boolean optional	Is self-encrypting disk? Attributes: non-creatable, non-modifiable
protection-mode		string optional	Protection mode of the device. Possible values are: • 'open' ... disk is unprotected, • 'data' ... data protection only without FIPS compliance, • 'part' ... partial protection with FIPS compliance only, • 'full' ... full data and FIPS compliance protection, and • 'miss' ... protection information is not available Attributes: non-creatable, non-modifiable
type		string optional	Disk Type Attributes: non-creatable, non-modifiable Possible values: • "ata" - Advanced Technology Attachment, • "bsas" - Bridged Serial Attached SCSI (bridged from SATA), • "fcal" - Fibre Channel Arbitrated Loop, • "fsas" - High-Capacity (Fat) Serial Attached SCSI, • "lun" - SCSI Logical Unit Number (e.g. Array), • "sas" - Serial Attached SCSI, • "msata" - Multiple bridged SATA disks in a single carrier, • "ssd" - Solid-State Disk, • "vmdisk" - Hypervisor Virtual Disk, • "unknown" - unknown, • "ssd_nvm" - Non-Volatile Memory Express Solid-State Disk, • "ssd_dc" - Data Center Non-Volatile Memory Express Solid-State Disk, • "ssd_cap" - High Capacity Solid-State Disk,

			• "vmlun" - Hypervisor Virtual LUN, • "vmlun_ssd" - Hypervisor Virtual SSD LUN, • "ssd_zns" - Software Defined Non-Volatile Memory Express Solid-State Disk

Element definition: **disk-encrypt-modify-iter-info**

[top]

Information about the operation that was attempted/performed against disk-encrypt object.

Name	Range	Type	Description
disk-encrypt-key		disk-encrypt-info	The keys for the disk-encrypt object to which the operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **disk-encrypt-sanitize-iter-info**

[top]

Information about the operation that was attempted/performed against disk-encrypt object.

Name	Range	Type	Description
disk-encrypt-key		disk-encrypt-info	The keys for the disk-encrypt object to which the operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **disk-encrypt-show-status-info**

[top]

Information about storage encryption disk operations When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
disk-done-count	**[0..2^32-1]**	integer optional	Number of drives that finished the operation, whether successful or not. Attributes: non-creatable, non-modifiable

disk-start-count	**[0..2^32-1]**	integer optional	Number of drives that started the operation. Attributes: non-creatable, non-modifiable
disk-success-count	**[0..2^32-1]**	integer optional	Number of drives that successfully completed the operation. Attributes: non-creatable, non-modifiable
is-fips-support		boolean optional	Value is 'true' if the node supports FIPS-certified Self-Encrypting Drives. Attributes: non-creatable, non-modifiable
latest-op		string optional	Latest operation. Attributes: non-creatable, non-modifiable Possible values: • "unknown" - Operation unknown/unspecified, • "destroy" - Cryptograpically destroy encrypting drive, • "modify" - Change encrypting drive parameters, • "revert_original" - Revert drive to as-manufactured state, • "sanitize" - Cryptographically sanitize encrypting drive, • "show" - Show encrypting drive parameters, • "status" - Display the status of encryption operations
node-name		string optional	The node reporting this status. Attributes: key, non-creatable, non-modifiable
op-execute-time	**[0..2^32-1]**	integer optional	Execution time of the operation. Attributes: non-creatable, non-modifiable
op-start-time	**[0..2^31-1]**	integer optional	Date and time the operation started. Attributes: non-creatable, non-modifiable

The Event Management System (EMS) is a mechanism in the Data ONTAP kernel that supports creation, forwarding, and consumption of event indications. Ems events are generated by ONTAP when errors occur or to log status. These event indications are logged to /etc/log/ems and, depending on the event and its severity, to the syslog/console. If an event has a SNMP definition, SNMP traps will also be generated by the event indication.

ems-autosupport-log

[top]

This API is used by SnapDrive to log SnapDrive specific events occurring on a host system to the the appliance and optionally use the appliance to generate an autosupport message. This event information will be encapsulated in an app.log.x EMS event based on error level. If auto-support is true, an autosupport message will be sent from the filer.

Input Name	Range	Type	Description
app-version		string	Version of application invoking the API.
auto-support		boolean validate	If 'true', an AutoSupport message will be generated.
category		string	Application defined category of the event.
computer-name		string	Host name invoking the API.
event-description		string	Description of event to log. An application defined message to log.
event-id		integer validate	ID of event. A user defined event-id, range [0..2^32-2].
event-source		string	Name of the application invoking the API.
log-level		integer validate	Log level. Accepted values are 0 for 'emergency', 1 for 'alert', 2 for 'critical', 3 for 'error', 4 for 'warning', 5 for 'notice', 6 for 'info', and 7 for 'debug'. As of Data ONTAP 9.0, log-level's 2 and 4 are no longer supported. Specifying 2 or 4 would be equivalent to specifying 3 or 5, respectively.

Errno	Description

ems-config-get

[top]

Return the EMS Configuration.

Input Name	Range	Type	Description
desired-attributes		ems-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		ems-config-info	The attributes of the ems-config.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ems-config-modify

[top]

Modify the EMS Configuration.

Input Name	Range	Type	Description
auto-suppress-exempt-filter		string optional	Name of event filter exempt from auto-suppression
console		boolean optional	Whether console logging should be used.
console-log-level		emsseverity optional	Console logging level. Possible values: • "node_fault" - A data corruption has been detected or the node is unable to provide client service, • "svc_fault" - A temporary loss of service has been detected, typically a transient software fault, • "node_error" - A hardware error has been detected which is not immediately fatal, • "svc_error" - A software error has been detected which is not immediately fatal, • "warning" - A high-priority message, does not indicate a fault, • "notice" - A normal-priority message,

			does not indicate a fault, • "info" - A low-priority message, does not indicate a fault, • "debug" - A debugging message, typically suppressed from customer, • "var" - Message has variable severity, selected at runtime
duplicate-suppression-duration	**[0..2^32-1]**	integer optional	Duration in seconds for suppression of identical messages
log-rotation-size		size optional	Log file size (in bytes) needed to trigger rotation
mail-from		mail-address optional	The from address of ems mail.
mail-server		string optional	The mail server to use when sending mail.
max-destination-count	**[0..2^32-1]**	integer optional	Maximum number of event notification destinations in system.
max-filter-count	**[0..2^32-1]**	integer optional	Maximum number of event filters in system.
max-filter-rule-count	**[0..2^32-1]**	integer optional	Maximum number of event filter rules in system.
max-log-show-size	**[1..10000]**	integer optional	Maximum number of events to show.
max-notification-count	**[0..2^32-1]**	integer optional	Maximum number of event notifications in system.
max-target-event-bytes	**[10..134217728]**	integer optional	Maximum bytes per event per week. Used by autosuppression to control growth of log file size.
max-target-log-size	**[1048576..134217728]**	integer optional	The target upper limit of the event log file size in bytes. Used by autosuppression to control growth of log file size.
proxy-url		string optional	HTTP/HTTPS proxy URL to use when sending to REST API destinations.
proxy-user		string optional	User name to use for the HTTP/HTTPS proxy when sending to REST API destinations.
rest-delivery-timeout	**[1..1000]**	integer optional	REST API URL delivery timeout in seconds.
suppression		boolean optional	Whether suppression should be used.
trace-log-size	**[1..10000]**	integer optional	Maximum number of traces kept.

ems-destination-create

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Creates an EMS destination.

Input Name	Range	Type	Description
hide-parameters		boolean optional	Hide parameter values?
mail		mail-address[] optional	The e-mail address to which events are sent.
name		string	The name of the EMS destination.
return-record		boolean optional	If set to true, returns the ems-destination on successful creation. Default: false
snmp		remote-ip[] optional	The SNMP addresses to which traps are sent.
snmp-community		string optional	The SNMP community name.
syslog		remote-ip[] optional	The remote syslog servers to which messages are sent.
syslog-facility		syslog-facility optional	The syslog logging facility.

Output Name	Range	Type	Description
result		ems-destination-info optional	The ems-destination created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

ems-destination-destroy

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Deletes the specified EMS destination.

Input Name	Range	Type	Description
name		string	The name of the EMS destination.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ems-destination-destroy-iter

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Deletes several EMS destinations.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple ems-destination objects match a given query. If set to true, the API will continue deleting the next matching ems-destination even when the deletion of a previous ems-destination fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed deletions before the server gives up and returns. If set, the API will continue deleting the next matching ems-destination even when the deletion of a previous matching ems-destination fails, and do so until the total number of objects failed to be deleted reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed deletions. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of ems-destination objects to delete in this call. Default: 20
query		ems-destination-info	If deleting a specific ems-destination, this input element must specify all keys. If deleting multiple ems-destination objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-destination objects (just keys) that were not deleted due to some error. If set to false, the list of ems-destination objects not deleted will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of ems-destination objects (just keys) that were successfully deleted. If set to false, the list of ems-destination objects deleted will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-destination-destroy-iter-info[] optional	Information about ems-destination objects that were not deleted due to some error. This element will be returned only if input element 'return-failure-list' is true.
		string	Tag for the next call. Not present when there are no more

next-tag		optional	matching ems-destination objects to be deleted.
num-failed	**[0..2^32-1]**	integer optional	Number of ems-destination objects that matched the query, but were not deleted due to some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of ems-destination objects that matched the query and were successfully deleted.
success-list		ems-destination-destroy-iter-info[] optional	The ems-destination objects that were successfully deleted. This element will be returned only if input element 'return-success-list' is true

Errno	Description
EINTERNALERROR	

ems-destination-get

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Return the specified EMS destination information.

Input Name	Range	Type	Description
desired-attributes		ems-destination-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
name		string	The name of the EMS destination.

Output Name	Range	Type	Description
attributes		ems-destination-info	The attributes of the ems-destination.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ems-destination-get-iter

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Return information on EMS destinations.

Input Name	Range	Type	Description
desired-attributes		ems-destination-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20

query		ems-destination-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ems-destination object. All ems-destination objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ems-destination-info[] optional	The list of attributes of ems-destination objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ems-destination objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ems-destination-modify

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Modifies the specified EMS destination.

Input Name	Range	Type	Description
hide-parameters		boolean optional	Hide parameter values?
mail		mail-address[] optional	The e-mail address to which events are sent.
name		string	The name of the EMS destination.
snmp		remote-ip[] optional	The SNMP addresses to which traps are sent.
snmp-community		string optional	The SNMP community name.
syslog		remote-ip[] optional	The remote syslog servers to which messages are sent.
syslog-facility		syslog-facility optional	The syslog logging facility.

ems-destination-modify-iter

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Modifies

several EMS destinations.

Input Name	Range	Type	Description
attributes		ems-destination-info	Specify at least one modifiable element. Do not specify any other element.
continue-on-failure		boolean optional	This input element is useful when multiple ems-destination objects match a given query. If set to true, the API will continue modifying the next matching ems-destination even when modification of a previous ems-destination fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed modify operations before the server gives up and returns. If set, the API will continue modifying the next matching ems-destination even when the modification of a previous matching ems-destination fails, and do so until the total number of objects failed to be modified reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed modify operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of objects to be modified in this call. Default: 20
query		ems-destination-info	If modifying a specific ems-destination, this input element must specify all keys. If modifying ems-destination objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-destination objects (just keys) that were not modified due to some error. If set to false, the list of ems-destination objects not modified will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of ems-destination objects (just keys) that were successfully updated. If set to false, the list of ems-destination objects modified will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-destination-modify-iter-info[] optional	Information about ems-destination objects that were not modified due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching ems-destination objects to be modified.
num-failed	**[0..2^32-1]**	integer optional	Number of ems-destination objects that matched the query, but were not modified due to some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of ems-destination objects that matched the query and were successfully updated.
success-list		ems-destination-modify-iter-info[] optional	The ems-destination objects that were successfully updated. This element will be returned only if input element 'return-success-list' is true

Errno	Description
EINTERNALERROR	

ems-event-catalog-get-iter

[top]

Return information on several EMS messages.

Input Name	Range	Type	Description
desired-attributes		event-catalog-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		event-catalog-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ems-event-catalog object. All ems-event-catalog objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		event-catalog-info[] optional	The list of attributes of ems-event-catalog objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ems-event-catalog objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ems-event-filter-copy

[top]

Copy an Event filter including all its rules

Input Name	Range	Type	Description
filter-name		string	Event Filter Name.
new-filter-name		string	New Event Filter Name.

Errno	Description

ems-event-filter-destroy-iter

[top]

Delete one or more existing event filters. To delete the event notifications associated with the filter as well, set the force flag.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple ems-event-filter objects match a given query. If set to true, the API will continue with the next matching ems-event-filter even when the operation fails for the ems-event-filter. If set to false, the API will return on the first failure. Default: false
force-delete-notification		boolean optional	If true, delete the event notifications that have the specified filter. The default is false.
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed operations before the server gives up and returns. If set, the API will continue with the next matching ems-event-filter even when the operation on a previous matching ems-event-filter fails, and do so until the total number of objects failed to be operated on reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of ems-event-filter objects to be operated in this call. Default: 20
query		event-	If operating on a specific ems-event-filter, this input element must specify all keys. If operating on ems-event-filter objects based on

		filter	query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-event-filter objects (just keys) that were not operated on due to some error. If set to false, the list of ems-event-filter objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of ems-event-filter objects (just keys) that were successfully operated on. If set to false, the list of ems-event-filter objects operated on will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-event-filter-destroy-iter-info[] optional	Information about ems-event-filter objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching ems-event-filter objects to be operated on.
num-failed	**[0..2^32-1]**	integer optional	The number of ems-event-filter objects that matched the query, but were not operated on due some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of ems-event-filter objects that matched the query and were successfully processed.
success-list		ems-event-filter-destroy-iter-info[] optional	The ems-event-filter objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

ems-event-filter-get-iter

[top]

Iterate over a list of event filters.

Input Name	Range	Type	Description
desired-attributes		event-filter optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-**	integer	The maximum number of records to return in this call. Default: 20

	1]	optional	
query		event-filter optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ems-event-filter object. All ems-event-filter objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		event-filter[] optional	The list of attributes of ems-event-filter objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ems-event-filter objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ems-event-filter-rename

[top]

Rename an Event filter

ems-event-notification-destination-check

[top]

Check connectivity to an event notification destination

Input Name	Range	Type	Description
destination-name		string	Event Notification Destination Name
node		node-name	Node

Output Name	Range	Type	Description
check-passed		boolean	Connectivity Check Passed?
result-log		string	Provides the result information after trying to connect to the given destination.

Errno	Description

EOBJECTNOTFOUND	
EINTERNALERROR	

ems-event-notification-destination-create

[top]

Create an event notification destination

Input Name	Range	Type	Description
certificate-authority		string optional	Use this field and certificate-serial to specify the client certificate to use when being authenticated by the REST API server.
certificate-serial		string optional	Use this field and certificate-authority to specify the client certificate to use when being authenticated by the REST API server.
email		string optional	Use this field to specify an email destination. Note: Each destination name can only be associated with either an email destination or a syslog destination. SNMP destinations can be created/updated only through the 'system snmp traphost' command and they are associated with the default destination name 'snmp-traphost'. The format of the email destination is as per RFC standard.
name		string	Destination Name.The name must start and end with an alphanumeric and must be in the length of 2 to 64 characters. The allowed special characters are _(underscore) and -(hyphen).
rest-api-url		string optional	Use this field to specify REST API server URL to which event notifications will be sent. Enter the full URL, which must start either with an http:// or https:// prefix.
return-record		boolean optional	If set to true, returns the ems-event-notification-destination on successful creation. Default: false
syslog		string optional	Use this field to specify a syslog destination. Note: Each destination name can only be associated with either an email destination or a syslog destination. SNMP destinations can be created/updated only through the 'system snmp traphost' command and they are associated with the default destination name 'snmp-traphost'.

Output Name	Range	Type	Description
result		event-notification-destination optional	The ems-event-notification-destination created (keys or the entire object if requested)

ems-event-notification-destination-destroy-iter

[top]

Delete one or more existing event destinations

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple ems-event-notification-destination objects match a given query. If set to true, the API will continue with the next matching ems-event-notification-destination even when the operation fails for the ems-event-notification-destination. If set to false, the API will return on the first failure. Default: false
force-delete-notification		boolean optional	If true, delete the event notifications that have the specified destination as the only destination as well. The default is false.
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed operations before the server gives up and returns. If set, the API will continue with the next matching ems-event-notification-destination even when the operation on a previous matching ems-event-notification-destination fails, and do so until the total number of objects failed to be operated on reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of ems-event-notification-destination objects to be operated in this call. Default: 20
query		event-notification-destination	If operating on a specific ems-event-notification-destination, this input element must specify all keys. If operating on ems-event-notification-destination objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-event-notification-destination objects (just keys) that were not operated on due to some error. If set to false, the list of ems-event-notification-destination objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of ems-event-notification-destination objects (just keys) that were successfully operated on. If set to false, the list of ems-event-notification-destination objects operated on will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-event-notification-destination-destroy-iter-info[] optional	Information about ems-event-notification-destination objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.

next-tag		string optional	Tag for the next call. Not present when there are no more matching ems-event-notification-destination objects to be operated on.
num-failed	**[0..2^32-1]**	integer optional	The number of ems-event-notification-destination objects that matched the query, but were not operated on due some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of ems-event-notification-destination objects that matched the query and were successfully processed.
success-list		ems-event-notification-destination-destroy-iter-info[] optional	The ems-event-notification-destination objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

Return EMS messages sent to a destination.

Input Name	Range	Type	Description
desired-attributes		event-notification-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
destination		string	The destination name.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		event-notification-history-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ems-event-notification-history object. All ems-event-notification-history objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		event-notification-history-info[] optional	The list of attributes of ems-event-notification-history objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ems-event-notification-history objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ems-event-notification-modify-iter

[top]

Modify one or more event notifications

Input Name	Range	Type	Description
attributes		event-notification	Specify at least one modifiable element. Do not specify any other element.
continue-on-failure		boolean optional	This input element is useful when multiple ems-event-notification objects match a given query. If set to true, the API will continue modifying the next matching ems-event-notification even when modification of a previous ems-event-notification fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed modify operations before the server gives up and returns. If set, the API will continue modifying the next matching ems-event-notification even when the modification of a previous matching ems-event-notification fails, and do so until the total number of objects failed to be modified reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed modify operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of objects to be modified in this call. Default: 20
query		event-notification	If modifying a specific ems-event-notification, this input element must specify all keys. If modifying ems-event-notification objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-event-notification objects (just keys) that were not modified due to some error. If set to false, the list of ems-event-notification objects not modified will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of ems-event-notification objects (just keys) that were successfully updated. If set to false, the list of ems-event-notification objects modified will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-event-notification-modify-iter-info[] optional	Information about ems-event-notification objects that were not modified due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching ems-event-notification objects to be modified.
num-failed	**[0..2^32-1]**	integer optional	Number of ems-event-notification objects that matched the query, but were not modified due to some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of ems-event-notification objects that matched the query and were successfully updated.
		ems-event-notification-	The ems-event-notification objects that were successfully

success-list		modify-iter-info[] optional	updated. This element will be returned only if input element 'return-success-list' is true

E_EMS_DESTINATIONS_REQUIRED	
E_EMS_DESTINATION_NOT_PRESENT	

ems-invoke

[top]

Invoke an ems event. This functionality is intended for use in testing syslog parsers or upper level SNMP management software. The event will be forwarded to the ems log at /etc/log/ems and optionally to the syslog or SNMP trap generator. Invoked events in /etc/log/ems will have the attribute 'inv' set to "1". This is to allow auto-support to differentiate between real and invoked events. Syslog entries resulting from invoked events will contain the text "invoked event:" so that they aren't confused with real events. Invoked events by default are only logged to the /etc/log/ems log. To have an event go to the syslog or generate an snmp trap, the 'syslog' and/or 'snmp' flags need to be set.

Input Name	Range	Type	Description
event-id		string	Name of the event to invoke. Each ems event has a unique identifier (event-id) that can be used by this api to 'fake' an event. Example event-id's: kern.syslog.msg kern.uptime.filer raid.cksum.replay.nvram raid.cksum.replay.summary raid.fsm.commitStateTransit
event-version		integer optional	If set, specifies the version of the event to invoke. By default, the latest version is used. Accepted values are [1..n]. Event-version is only used when multiple versions of an event exist simultaneously within a given build of ONTAP. Most events have an event-version of 1.
params		param[] optional	
severity		string optional	For events with variable severity, specfies the severity to invoke the event at. Shouldn't be set for events that don't have variable severity. Possible Values: debug info notice warning svc_error node_error svc_fault node_fault
snmp		boolean optional	If set, and event has an SNMP definition, generate SNMP trap for event. Invoked messages by default do not generate SNMP traps.
syslog		boolean optional	If set, and the event has a syslog format definition, forward invoked message to syslog. Invoked messages are by default not forwarded to syslog

EINTERNALERROR	

ems-mail-history-destroy-iter

[top]

(This interface has been deprecated. It may be removed from a future release of Data ONTAP)-Delete mail history entries.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple ems-mail-history objects match a given query. If set to true, the API will continue deleting the next matching ems-mail-history even when the deletion of a previous ems-mail-history fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed deletions before the server gives up and returns. If set, the API will continue deleting the next matching ems-mail-history even when the deletion of a previous matching ems-mail-history fails, and do so until the total number of objects failed to be deleted reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed deletions. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of ems-mail-history objects to delete in this call. Default: 20
query		ems-mail-history-info	If deleting a specific ems-mail-history, this input element must specify all keys. If deleting multiple ems-mail-history objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of ems-mail-history objects (just keys) that were not deleted due to some error. If set to false, the list of ems-mail-history objects not deleted will not be returned. Default: true

return-success-list		boolean optional	If set to true, the API will return the list of ems-mail-history objects (just keys) that were successfully deleted. If set to false, the list of ems-mail-history objects deleted will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		ems-mail-history-destroy-iter-info[] optional	Information about ems-mail-history objects that were not deleted due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching ems-mail-history objects to be deleted.
num-failed	[0..2^32-1]	integer optional	Number of ems-mail-history objects that matched the query, but were not deleted due to some error.
num-succeeded	[0..2^32-1]	integer optional	The number of ems-mail-history objects that matched the query and were successfully deleted.
success-list		ems-mail-history-destroy-iter-info[] optional	The ems-mail-history objects that were successfully deleted. This element will be returned only if input element 'return-success-list' is true

EINTERNALERROR	

Element definition: **ems-config-info**

[top]

EMS Configuration Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
auto-suppress-exempt-filter		string optional	Name of event filter exempt from auto-suppression Attributes: non-creatable, modifiable
console		boolean optional	Whether console logging should be used. Attributes: non-creatable, modifiable
console-log-level		emsseverity optional	Console logging level. Attributes: non-creatable, modifiable Possible values: • "node_fault" - A data corruption has been detected or the node is unable to provide client service, • "svc_fault" - A temporary loss of service has been detected, typically a transient software fault, • "node_error" - A hardware error has been detected which is not immediately fatal, • "svc_error" - A software error has been detected which is not immediately fatal, • "warning" - A high-priority message, does not indicate a fault, • "notice" - A normal-priority message, does not indicate a fault,

			• "info" - A low-priority message, does not indicate a fault, • "debug" - A debugging message, typically suppressed from customer, • "var" - Message has variable severity, selected at runtime
duplicate-suppression-duration	**[0..2^32-1]**	integer optional	Duration in seconds for suppression of identical messages Attributes: non-creatable, modifiable
log-rotation-size		size optional	Log file size (in bytes) needed to trigger rotation Attributes: non-creatable, modifiable
mail-from		mail-address optional	The from address of ems mail. Attributes: non-creatable, modifiable
mail-server		string optional	The mail server to use when sending mail. Attributes: non-creatable, modifiable
max-destination-count	**[0..2^32-1]**	integer optional	Maximum number of event notification destinations in system. Attributes: non-creatable, modifiable
max-filter-count	**[0..2^32-1]**	integer optional	Maximum number of event filters in system. Attributes: non-creatable, modifiable
max-filter-rule-count	**[0..2^32-1]**	integer optional	Maximum number of event filter rules in system. Attributes: non-creatable, modifiable
max-log-show-size	**[1..10000]**	integer optional	Maximum number of events to show. Attributes: non-creatable, modifiable
max-notification-count	**[0..2^32-1]**	integer optional	Maximum number of event notifications in system. Attributes: non-creatable, modifiable
max-target-event-bytes	**[10..134217728]**	integer optional	Maximum bytes per event per week. Used by autosuppression to control growth of log file size. Attributes: non-creatable, modifiable
max-target-log-size	**[1048576..134217728]**	integer optional	The target upper limit of the event log file size in bytes. Used by autosuppression to control growth of log file size. Attributes: non-creatable, modifiable
proxy-url		string optional	HTTP/HTTPS proxy URL to use when sending to REST API destinations. Attributes: non-creatable, modifiable
proxy-user		string optional	User name to use for the HTTP/HTTPS proxy when sending to REST API destinations. Attributes: non-creatable, modifiable
rest-delivery-timeout	**[1..1000]**	integer optional	REST API URL delivery timeout in seconds. Attributes: non-creatable, modifiable
suppression		boolean optional	Whether suppression should be used. Attributes: non-creatable, modifiable
trace-log-size	**[1..10000]**	integer optional	Maximum number of traces kept. Attributes: non-creatable, modifiable

Element definition: **ems-destination**

[top]

EMS destination

[none]

Element definition: **ems-destination-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against ems-destination object.

Name	Range	Type	Description
ems-destination-key		ems-destination-info	The keys for the ems-destination object to which the deletion applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-destination-info**

[top]

EMS Destination Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
hide-parameters		boolean optional	Hide parameter values? Attributes: optional-for-create, modifiable
mail		mail-address[] optional	The e-mail address to which events are sent. Attributes: optional-for-create, modifiable
name		string optional	The name of the EMS destination. Attributes: key, required-for-create, non-modifiable
snmp		remote-ip[] optional	The SNMP addresses to which traps are sent. Attributes: optional-for-create, modifiable
snmp-community		string optional	The SNMP community name. Attributes: optional-for-create, modifiable
syslog		remote-ip[] optional	The remote syslog servers to which messages are sent. Attributes: optional-for-create, modifiable
syslog-facility		syslog-facility optional	The syslog logging facility. Attributes: optional-for-create, modifiable

Element definition: **ems-destination-modify-iter-info**

[top]

Information about the modify operation that was attempted/performed against ems-destination object.

Name	Range	Type	Description
ems-destination-key		ems-destination-info	The keys for the ems-destination object to which the modify operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the modify operation caused an error.
error-message		string optional	Error description, if the modify operation caused an error.

Element definition: **ems-event-filter-destroy-iter-info**

[top]

Information about the operation that was attempted/performed against ems-event-filter object.

Name	Range	Type	Description
ems-event-filter-key		event-filter	The keys for the ems-event-filter object to which the operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-event-notification-destination-destroy-iter-info**

[top]

Information about the operation that was attempted/performed against ems-event-notification-destination object.

Name	Range	Type	Description
ems-event-notification-destination-key		event-notification-destination	The keys for the ems-event-notification-destination object to which the operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-event-notification-destination-modify-iter-info**

[top]

Information about the modify operation that was attempted/performed against ems-event-notification-destination object.

Name	Range	Type	Description
ems-event-notification-destination-key		event-notification-destination	The keys for the ems-event-notification-destination object to which the modify operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the modify operation caused an error.
error-message		string optional	Error description, if the modify operation caused an error.

Element definition: **ems-event-notification-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against ems-event-notification object.

Name	Range	Type	Description
ems-event-notification-key		event-notification	The keys for the ems-event-notification object to which the deletion applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-event-notification-modify-iter-info**

[top]

Information about the modify operation that was attempted/performed against ems-event-notification object.

Name	Range	Type	Description
ems-event-notification-key		event-notification	The keys for the ems-event-notification object to which the modify operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the modify operation caused an error.
error-message		string optional	Error description, if the modify operation caused an error.

Element definition: **ems-id**

[top]

EMS Id

[none]

Element definition: **ems-mail-history-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against ems-mail-history object.

Name	Range	Type	Description
ems-mail-history-key		ems-mail-history-info	The keys for the ems-mail-history object to which the deletion applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-mail-history-info**

[top]

EMS Mail History Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
drops-since-previous-time	**[0..2^32-1]**	integer optional	Number of drops since previous transmission. Attributes: non-creatable, non-modifiable
mail-address		mail-address[] optional	The mail address. Attributes: non-creatable, non-modifiable
message		string optional	The alert message. Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The emitted message's name. Attributes: non-creatable, non-modifiable
node		node-name optional	Node emitting the EMS message. Attributes: key, required-for-create, non-modifiable
previous-time		datetime optional	Previous transmission time. Attributes: non-creatable, non-modifiable
seq-num		seqnum optional	The message sequence number. Attributes: key, required-for-create, non-modifiable
time		datetime optional	The mail transmission time. Attributes: non-creatable, non-modifiable

Element definition: **ems-message-info**

[top]

EMS Message Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ems-severity		emsseverity optional	Message EMS severity. Attributes: non-creatable, non-modifiable Possible values: • "node_fault" - A data corruption has been detected or the node is unable to provide client service, • "svc_fault" - A temporary loss of service has been detected, typically a transient software fault, • "node_error" - A hardware error has been detected which is not immediately fatal, • "svc_error" - A software error has been detected which is not immediately fatal, • "warning" - A high-priority message, does not indicate a fault, • "notice" - A normal-priority message, does not indicate a fault, • "info" - A low-priority message, does not indicate a fault, • "debug" - A debugging message, typically suppressed from customer, • "var" - Message has variable severity, selected at runtime
event		string optional	The EMS event. Attributes: non-creatable, non-modifiable
event-xml-len	**[0..2^32-1]**	integer optional	EMS event XML length in bytes. Attributes: non-creatable, non-modifiable
filter-name		string optional	Name of the filter to apply on events. Attributes: non-creatable, non-modifiable
kernel-gen	**[0..2^64-1]**	integer optional	The emitted message's kernel generation number. Attributes: non-creatable, non-modifiable
kernel-seq-num	**[0..2^64-1]**	integer optional	The emitted message's kernel sequence number. Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The emitted message's name. Attributes: non-creatable, non-modifiable
node		node-name optional	Node emitting the EMS message. Attributes: key, non-creatable, non-modifiable
num-suppressed-since-last	**[0..2^32-1]**	integer optional	Number of times suppressed since last time the event was logged. Attributes: non-creatable, non-modifiable
parameters		parameter[] optional	Event parameter's name and value.
seq-num		seqnum optional	The message sequence number. Attributes: key, non-creatable, non-modifiable
severity		eventseverity optional	Message severity. As of Data ONTAP 9.0, 'critical' and 'warning' severities are no longer supported. Attributes: non-creatable, non-modifiable Possible values: • "emergency" - Disruption, • "alert" - Single point of failure, • "critical" - Critical condition, • "error" - Degradation,

			• "warning" - Warning condition, • "notice" - Information, • "informational" - Information, • "debug" - Debug information
source		string optional	The emitted message's source. Attributes: non-creatable, non-modifiable
time		datetime optional	The time of message emission. Attributes: non-creatable, non-modifiable
version	**[0..2^32-1]**	integer optional	Version number of the event. Attributes: non-creatable, non-modifiable

Element definition: **ems-routing-info**

[top]

EMS Routing Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
action		string optional	The corrective action. Attributes: non-creatable, non-modifiable
description		string optional	The event description. Attributes: non-creatable, non-modifiable
destinations		ems-destination[] optional	The event destinations. Attributes: non-creatable, modifiable
frequency-threshold	**[0..2^32-1]**	integer optional	Number of times an event occurs before a repeat notification of the event is sent. Attributes: non-creatable, modifiable
message-name		ems-id optional	The name of the EMS message. Attributes: key, non-creatable, non-modifiable
severity		eventseverity optional	The event severity. As of Data ONTAP 9.0, 'critical' and 'warning' severities are no longer supported. Attributes: key, non-creatable, non-modifiable Possible values: • "emergency" - Disruption, • "alert" - Single point of failure, • "critical" - Critical condition, • "error" - Degradation, • "warning" - Warning condition, • "notice" - Information, • "informational" - Information, • "debug" - Debug information
snmp-support		boolean optional	Indicates whether or not the event supports SNMP traps. Attributes: non-creatable, non-modifiable
time-threshold	**[0..2^32-1]**	integer optional	Minimum number of seconds between repeat notifications of an event. Attributes: non-creatable, modifiable

Element definition: **ems-routing-modify-iter-info**

[top]

Information about the modify operation that was attempted/performed against ems-routing object.

Name	Range	Type	Description
ems-routing-key		ems-routing-info	The keys for the ems-routing object to which the modify operation applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the modify operation caused an error.
error-message		string optional	Error description, if the modify operation caused an error.

Element definition: **ems-snmp-history-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against ems-snmp-history object.

Name	Range	Type	Description
ems-snmp-history-key		ems-snmp-history-info	The keys for the ems-snmp-history object to which the deletion applies.
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

Element definition: **ems-snmp-history-info**

[top]

EMS SNMP History Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
drops-since-previous-time	**[0..2^32-1]**	integer optional	Number of drops since previous transmission. Attributes: non-creatable, non-modifiable
message		string optional	The alert message. Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The emitted message's name. Attributes: non-creatable, non-modifiable

node		node-name optional	Node emitting the EMS message. Attributes: key, required-for-create, non-modifiable
previous-time		datetime optional	Previous transmission time. Attributes: non-creatable, non-modifiable
seq-num		seqnum optional	The message sequence number. Attributes: key, required-for-create, non-modifiable
snmp-address		string[] optional	The SNMP client address. Attributes: non-creatable, non-modifiable
time		datetime optional	The SNMP transmission time. Attributes: non-creatable, non-modifiable

Element definition: **ems-status-info**

[top]

EMS Message Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
accumulated-bytes	**[0..2^32-1]**	integer optional	The total number of bytes the event has accumulated in the log file. Attributes: non-creatable, non-modifiable
change-since		boolean optional	The algorithm to determine which events are considered chatter is run periodically. The change-since parameter indicates whether the event has been posted since the last time the chatter determination algorithm has run. Attributes: non-creatable, non-modifiable
drops	**[0..2^32-1]**	integer optional	Number of times the event has been dropped. An event is dropped if it is suppressed or has exceeded incoming rate limits. Attributes: non-creatable, non-modifiable
indications	**[0..2^32-1]**	integer optional	Number of times the event has been posted. Attributes: non-creatable, non-modifiable
is-chatter		boolean optional	Whether the event is considered chatter, and therefore subject to autosuppression. Attributes: non-creatable, non-modifiable
last-day-histogram	**[0..2^64-1]**	integer[] optional	24-hour histogram. Number of times the event was posted in the last day. The histogram is divided into 24 buckets, each bucket collecting one hour. The buckets are displayed in reverse chronological order (most recent first). Attributes: non-creatable, non-modifiable
last-hour-histogram	**[0..2^64-1]**	integer[] optional	60-minute histogram. Number of times the event was posted in the last hour. The histogram is divided into sixty buckets, each bucket collecting one minute. The buckets are displayed in reverse chronological order (most recent first). Attributes: non-creatable, non-modifiable
last-time-dropped		datetime optional	Time the event was most recently posted and suppressed. Attributes: non-creatable, non-modifiable

last-time-occurred		datetime optional	Time the event was most recently posted. Attributes: non-creatable, non-modifiable
last-time-processed		datetime optional	Time the event was most recently posted and not suppressed. Attributes: non-creatable, non-modifiable
last-week-histogram	**[0..2^64-1]**	integer[] optional	7-day histogram. Number of times the event was posted in the last week. The histogram is divided into 7 buckets, each bucket collecting one day. The buckets are displayed in reverse chronological order (most recent first). Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The message name. Attributes: key, non-creatable, non-modifiable
node		node-name optional	Node emitting the EMS message. Attributes: key, non-creatable, non-modifiable
num-asup-dropped	**[0..2^64-1]**	integer optional	Number of times the event destined for AutoSupport has been dropped. Attributes: non-creatable, non-modifiable
num-autosuppressed	**[0..2^32-1]**	integer optional	Number of times the event has been autosuppressed. Attributes: non-creatable, non-modifiable
num-console-dropped	**[0..2^64-1]**	integer optional	Number of times the event destined for console output has been dropped. Attributes: non-creatable, non-modifiable
num-dup-suppressed	**[0..2^32-1]**	integer optional	Number of times the event has been duplicate suppressed. Attributes: non-creatable, non-modifiable
num-dup-suppressed-after-120s	**[0..2^64-1]**	integer optional	Number of times the event has been duplicate suppressed because an identical event was generated after 120 seconds of its previous occurrence. Attributes: non-creatable, non-modifiable
num-dup-suppressed-in-120s	**[0..2^64-1]**	integer optional	Number of times the event has been duplicate suppressed because an identical event was generated within 120 seconds of its previous occurrence. Attributes: non-creatable, non-modifiable
num-dup-suppressed-in-30s	**[0..2^64-1]**	integer optional	Number of times the event has been duplicate suppressed because an identical event was generated within 30 seconds of its previous occurrence. Attributes: non-creatable, non-modifiable
num-dup-suppressed-in-60s	**[0..2^64-1]**	integer optional	Number of times the event has been duplicate suppressed because an identical event was generated within 60 seconds of its previous occurrence. Attributes: non-creatable, non-modifiable
num-dup-suppressed-in-90s	**[0..2^64-1]**	integer optional	Number of times the event has been duplicate suppressed because an identical event was generated within 90 seconds of its previous occurrence. Attributes: non-creatable, non-modifiable
num-email-dropped	**[0..2^64-1]**	integer optional	Number of times the event destined for an email destination has been dropped. Attributes: non-creatable, non-modifiable
num-logger-dropped	**[0..2^32-1]**	integer optional	Number of times the event has been dropped by the logger. Attributes: non-creatable, non-modifiable
num-mgwd-dropped	**[0..2^64-1]**	integer optional	Number of times the event destined for Management Gateway has been dropped. Attributes: non-creatable, non-modifiable
num-rate-limited	**[0..2^32-1]**	integer optional	Number of times the event has been rate limited. Attributes: non-creatable, non-modifiable
num-router-dropped	**[0..2^64-1]**	integer optional	Number of times the event has been dropped by the EMS router. Attributes: non-creatable, non-modifiable
num-suppressed-since-last	**[0..2^32-1]**	integer optional	Number of times suppressed since last time logged. Attributes: non-creatable, non-modifiable

num-timer-suppressed	**[0..2^32-1]**	integer optional	Number of times the event has been timer suppressed. Attributes: non-creatable, non-modifiable
probability	**[0..100]**	integer optional	Probability of an event being suppressed via autosuppress. Attributes: non-creatable, non-modifiable
severity		emsseverity optional	The severity of the event. Attributes: non-creatable, non-modifiable Possible values: • "node_fault" - A data corruption has been detected or the node is unable to provide client service, • "svc_fault" - A temporary loss of service has been detected, typically a transient software fault, • "node_error" - A hardware error has been detected which is not immediately fatal, • "svc_error" - A software error has been detected which is not immediately fatal, • "warning" - A high-priority message, does not indicate a fault, • "notice" - A normal-priority message, does not indicate a fault, • "info" - A low-priority message, does not indicate a fault, • "debug" - A debugging message, typically suppressed from customer, • "var" - Message has variable severity, selected at runtime
stat-starting-time		datetime optional	Time the event was first posted. Attributes: non-creatable, non-modifiable

Element definition: **emsseverity**

[top]

NODE_FAULT|SVC_FAULT|NODE_ERROR|SVC_ERROR|WARNING|NOTICE|INFO|DEBUG|VAR Possible values:

- "node_fault" - A data corruption has been detected or the node is unable to provide client service,
- "svc_fault" - A temporary loss of service has been detected, typically a transient software fault,
- "node_error" - A hardware error has been detected which is not immediately fatal,
- "svc_error" - A software error has been detected which is not immediately fatal,
- "warning" - A high-priority message, does not indicate a fault,
- "notice" - A normal-priority message, does not indicate a fault,
- "info" - A low-priority message, does not indicate a fault,
- "debug" - A debugging message, typically suppressed from customer,
- "var" - Message has variable severity, selected at runtime

[none]

Element definition: **event-catalog-info**

[top]

Event catalog information. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
action		string optional	The corrective action. Attributes: non-creatable, non-modifiable
deprecated		boolean optional	The flag that indicates whether or not the event is deprecated. Attributes: non-creatable, non-modifiable
description		string optional	The event description. Attributes: non-creatable, non-modifiable
filter-name		string optional	Filter Name Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The name of the EMS message. Attributes: key, non-creatable, non-modifiable
severity		string optional	Severity Possible values: • 'emergency' - Disruption, • 'alert' - Single point of failure, • 'error' - Degradation, • 'notice' - Information, • 'informational' - Information, • 'debug' - Debug information Attributes: non-creatable, non-modifiable
snmp-trap-type		snmptraptypes optional	The type of SNMP trap. Attributes: non-creatable, non-modifiable Possible values: • "standard" - Standard SNMP traps, • "built_in" - Built-in SNMP traps, • "severity_based" - Severity based SNMP traps

Element definition: **event-filter**

[top]

Event filter creation. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
event-filter-		event-filter-rule-	List of rules added to each filter.

rule		info[] optional	
filter-name		string optional	Filter Name. The name must start and end with an alphanumeric and must be in the length of 2 to 64 characters. The allowed special characters are _(underscore) and -(hyphen). Attributes: key, required-for-create, non-modifiable

Element definition: **event-notification**

[top]

Event notifications. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
destinations		string[] optional	List of Event Notification Destinations Attributes: required-for-create, modifiable
filter-name		string optional	Event Filter Name Attributes: required-for-create, modifiable
id	**[0..2^32-1]**	integer optional	Event Notification ID Attributes: key, required-for-create, non-modifiable

Element definition: **event-notification-destination**

[top]

Event notification destinations. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
certificate-authority		string optional	Use this field and certificate-serial to specify the client certificate to use when being authenticated by the REST API server. Attributes: optional-for-create, modifiable
certificate-serial		string optional	Use this field and certificate-authority to specify the client certificate to use when being authenticated by the REST API server. Attributes: optional-for-create, modifiable
		string	Use this field to specify an email destination. Note: Each destination name can only be associated with either an email destination or a syslog destination. SNMP destinations can be created/updated only through the

email		optional	'system snmp traphost' command and they are associated with the default destination name 'snmp-traphost'. The format of the email destination is as per RFC standard. Attributes: optional-for-create, modifiable
name		string optional	Destination Name.The name must start and end with an alphanumeric and must be in the length of 2 to 64 characters. The allowed special characters are _(underscore) and -(hyphen). Attributes: key, required-for-create, non-modifiable
rest-api-url		string optional	Use this field to specify REST API server URL to which event notifications will be sent. Enter the full URL, which must start either with an http:// or https:// prefix. Attributes: optional-for-create, modifiable
syslog		string optional	Use this field to specify a syslog destination. Note: Each destination name can only be associated with either an email destination or a syslog destination. SNMP destinations can be created/updated only through the 'system snmp traphost' command and they are associated with the default destination name 'snmp-traphost'. Attributes: optional-for-create, modifiable

Element definition: **event-notification-destination-info**

[top]

Event notification destinations. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
certificate-authority		string optional	Issuing Certificate Authority (CA) of client certificate. Attributes: non-creatable, non-modifiable
certificate-serial		string optional	Serial number of certificate in hexadecimal format. Attributes: non-creatable, non-modifiable
destination		string[] optional	An output field to view the destination. Attributes: non-creatable, non-modifiable
is-certificate-valid		boolean optional	This field indicates whether the client certificate specified by the certificate-authority and certificate-serial fields is valid. If not, and if the REST API server requires client authentication, event messages will not be sent to the server. Attributes: non-creatable, non-modifiable
is-server-ca-present		boolean optional	This field indicates whether certificates of the server-ca type exist in the system. If not, event messages will not be sent to a rest-api type destination having an HTTPS URL. Attributes: non-creatable, non-modifiable
name		string optional	Destination Name.The name must start and end with an alphanumeric and must be in the length of 2 to 64 characters. The allowed special characters are _(underscore) and -(hyphen). Attributes: key, non-creatable, non-modifiable
			An output field to view the type of the destination. The type could be one of email, syslog, REST API server URL or SNMP. SNMP destinations are displayed under the default destination name 'snmp-traphost'. The SNMP destinations associated with 'snmp-traphost' can be created/updated only

type		string optional	through the 'system snmp traphost' command. Attributes: non-creatable, non-modifiable Possible values: • "snmp" - SNMP destination, • "email" - Email destination, • "syslog" - Syslog Destination, • "rest_api" - REST API URL Destination

Element definition: **event-notification-history-info**

[top]

Event notification history info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
event		string optional	The EMS event. Attributes: non-creatable, non-modifiable
message-name		ems-id optional	The emitted message's name. Attributes: non-creatable, non-modifiable
node		node-name optional	Node emitting the EMS message. Attributes: key, non-creatable, non-modifiable
seq-num		seqnum optional	The message sequence number. Attributes: key, non-creatable, non-modifiable
severity		string optional	Severity Possible values: • 'emergency' - Disruption, • 'alert' - Single point of failure, • 'error' - Degradation, • 'notice' - Information, • 'informational' - Information, • 'debug' - Debug information Attributes: non-creatable, non-modifiable
time		datetime optional	The time of message emission. Attributes: non-creatable, non-modifiable

Element definition: **event-rule-type**

Element definition: **ems-destination-info** [top]

EMS Destination Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
hide-parameters		boolean optional	Hide parameter values? Attributes: optional-for-create, modifiable
mail		mail-address[] optional	The e-mail address to which events are sent. Attributes: optional-for-create, modifiable
name		string optional	The name of the EMS destination. Attributes: key, required-for-create, non-modifiable
snmp		remote-ip[] optional	The SNMP addresses to which traps are sent. Attributes: optional-for-create, modifiable
snmp-community		string optional	The SNMP community name. Attributes: optional-for-create, modifiable
syslog		remote-ip[] optional	The remote syslog servers to which messages are sent. Attributes: optional-for-create, modifiable
syslog-facility		syslog-facility optional	The syslog logging facility. Attributes: optional-for-create, modifiable

Element definition: **ems-id**

[top]

EMS Id

[none]

Element definition: **ems-routing-info**

[top]

EMS Routing Info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
action		string optional	The corrective action. Attributes: non-creatable, non-modifiable

description		string optional	The event description. Attributes: non-creatable, non-modifiable
destinations		ems-destination[] optional	The event destinations. Attributes: non-creatable, modifiable
frequency-threshold	**[0..2^32-1]**	integer optional	Number of times an event occurs before a repeat notification of the event is sent. Attributes: non-creatable, modifiable
message-name		ems-id optional	The name of the EMS message. Attributes: key, non-creatable, non-modifiable
severity		eventseverity optional	The event severity. As of Data ONTAP 9.0, 'critical' and 'warning' severities are no longer supported. Attributes: key, non-creatable, non-modifiable Possible values: • "emergency" - Disruption, • "alert" - Single point of failure, • "critical" - Critical condition, • "error" - Degradation, • "warning" - Warning condition, • "notice" - Information, • "informational" - Information, • "debug" - Debug information
snmp-support		boolean optional	Indicates whether or not the event supports SNMP traps. Attributes: non-creatable, non-modifiable
time-threshold	**[0..2^32-1]**	integer optional	Minimum number of seconds between repeat notifications of an event. Attributes: non-creatable, modifiable

Element definition: **event-filter-rule-info**

[top]

List of rules added to each filter.

Name	Range	Type	Description
message-name		string optional	Message Name Attributes: non-creatable, non-modifiable
position	**[0..2^32-1]**	integer optional	Rule Position Attributes: non-creatable, non-modifiable
severity		string[] optional	Severity Possible values: • 'emergency' - Disruption, • 'alert' - Single point of failure, • 'error' - Degradation, • 'notice' - Information, • 'informational' - Information, • 'debug' - Debug information, • '*' - All of the above Default:* Attributes: non-creatable, non-modifiable
snmp-trap-type		string[] optional	SNMP Trap Type Possible values: • 'standard' - Standard SNMP traps, • 'built-in' - Built-in SNMP traps,

			• 'severity-based' - Severity based SNMP traps • '*' - All of the above Default: * Attributes: non-creatable, non-modifiable
type		event-rule-type optional	Rule Type Attributes: non-creatable, non-modifiable Possible values: • "include" - Event(s) matching this rule is included in the specified filter, • "exclude" - Event(s) matching this rule is excluded in the specified filter

Element definition: **event-rule-type**

APIs in Category: **environment**

environment-sensors-get-iter	Environmental subsystem is a module to monitor the system's environmental states by reading the hardware sensors on various components. According to the states of the sensors, the subsystem will take actions based on a predefined environmental policy. This category contains the APIs for the environmental subsystem.

environment-sensors-get-iter

[top]

Returns the sensors information from the environmental subsystem.

Input Name	Range	Type	Description
desired-attributes		environment-sensors-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
discrete-sensor-state		sensor-state-enum optional	Discrete-valued sensor state
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 300
query		environment-sensors-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the environment object. All environment objects matching this query up to 'max-records' will be returned.
sensor-name		string optional	Name of the sensor in the environmental subsystem. The maximum length of the sensor name is 32
sensor-type		sensor-type-enum optional	Type of the sensor. See sensor-type-enum for possible values
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.
threshold-sensor-state		sensor-state-enum optional	Threshold-based sensor state

Output Name	Range	Type	Description
attributes-list		environment-sensors-info[] optional	The list of attributes of environment objects.
next-tag		string optional	Tag for the next call. Not present when there are no more environment objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

Element definition: **environment-sensors-info**

[top]

Environment Sensor Info. The environmental subsystem monitors a set of hardware sensors in the system. Each sensor represents a pair of state and value that can be measured to reflect the physical state of device(s). Based on the values the sensors represent, the sensors can be grouped to discrete-valued sensors and threshold-based sensors. The discrete-valued sensors have a set of discrete values that represent states of sensors. The threshold-based sensors have a numeral value that represnts a value on an axis, and may have a set of thresholds (points on that axis) are used to define the state of the sensor (ranging from critically low to critically high). This typedef defines the information for both groups of sensors. When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
critical-high-threshold	**[-2^31..2^31-1]**	integer optional	Critical high threshold Attributes: non-creatable, non-modifiable
critical-low-threshold	**[-2^31..2^31-1]**	integer optional	Critical low threshold Attributes: non-creatable, non-modifiable
discrete-sensor-state		sensor-state-enum optional	Discrete-valued sensor state Attributes: non-creatable, non-modifiable Possible values: • "normal" - The device is normal, • "warn-low" - The device state is lower than the warning low threshold and higher than the critical low threshold, • "warn-high" - The device state is higher than the warning high threshold and lower than the critical high threshold, • "crit-low" - The device state is lower than the critical low threshold, • "crit-high" - The device state is higher than the critical higher threshold, • "disabled" - The sensor is disabled, only available for SP-based filers, • "uninitialized" - The sensor is not yet initialized, only available for SP-based filers, • "init-failed" - The sensor failed to initialize, only available for SP-based filers, • "not-available" - The sensor is temporarily not able to report status, only available for SP-based filers, • "invalid" - The status returned from the sensor is not valid, only available for SP-based filers, • "retry" - The sensor is in the rety state, only available for non SP-based filers, • "bad" - The device is bad, only available for non SP-based filers, • "not-present" - The device is not present, only available for

			non SP-based filers, • "failed" - The sensor failed to report status, • "ignored" - The sensor state is ignored, only available for SP-based filers, • "unknown" - The sensor state is uknown
discrete-sensor-value		string optional	Discrete-valued sensor value Attributes: non-creatable, non-modifiable
node-name		node-name optional	Node name the sensor is associated with Attributes: key, non-creatable, non-modifiable
sensor-name		string optional	Name of the sensor in the environmental subsystem. The maximum length of the sensor name is 32 Attributes: non-creatable, non-modifiable
sensor-type		sensor-type-enum optional	Type of the sensor Attributes: non-creatable, non-modifiable Possible values: • "fan" - FAN RPM sensors, • "thermal" - Temerature sensors, • "voltage" - Voltage measurement sensors, • "current" - Current measurement sensors, • "battery-life" - Sensors report battery life, • "discrete" - Discrete sensors, • "fru" - FRU sensors, • "nvmem" - Sensors on the NVMEM module, • "counter" - Sensors report in counters, • "minutes" - Sensors report by minutes, • "percent" - Sensors report in percentage, • "agent" - Sensors on or throught the Agent device, • "unknown" - Unknown sensors
threshold-sensor-state		sensor-state-enum optional	Threshold-based sensor state Attributes: non-creatable, non-modifiable Possible values: • "normal" - The device is normal, • "warn-low" - The device state is lower than the warning low threshold and higher than the critical low threshold, • "warn-high" - The device state is higher than the warning high threshold and lower than the critical high threshold, • "crit-low" - The device state is lower than the critical low threshold, • "crit-high" - The device state is higher than the critical higher threshold, • "disabled" - The sensor is disabled, only available for SP-based filers, • "uninitialized" - The sensor is not yet initialized, only available for SP-based filers, • "init-failed" - The sensor failed to initialize, only available for SP-based filers, • "not-available" - The sensor is temporarily not able to report status, only available for SP-based filers, • "invalid" - The status returned from the sensor is not valid, only available for SP-based filers, • "retry" - The sensor is in the rety state, only available for non SP-based filers, • "bad" - The device is bad, only available for non SP-based filers, • "not-present" - The device is not present, only available for non SP-based filers,

			• "failed" - The sensor failed to report status, • "ignored" - The sensor state is ignored, only available for SP-based filers, • "unknown" - The sensor state is uknown
threshold-sensor-value	**[-2^31..2^31-1]**	integer optional	Threshold-based sensor value Attributes: non-creatable, non-modifiable
value-units		string optional	The units of the threshold-based sensor value. More than 90 possible unit types. Refer to the "Sensor Unit Type Codes" in the IPMI spec for possible types. Attributes: non-creatable, non-modifiable
warning-high-threshold	**[-2^31..2^31-1]**	integer optional	Warning high threshold Attributes: non-creatable, non-modifiable
warning-low-threshold	**[-2^31..2^31-1]**	integer optional	Warning low threshold Attributes: non-creatable, non-modifiable

client-match		string optional	List of client match specifications for Export rule. The clients specified are enforced with this Export rule. The rule with the higher rule index value takes precedence.
export-chown-mode		exportchownmode optional	Change ownership mode. Possible values are 'restricted', 'unrestricted'. Default value is 'restricted'.
export-ntfs-unix-security-ops		exportntfsunixsecops optional	Ignore/Fail unix security operations on NTFS volumes. Possible values are 'ignore', 'fail'. Default value is 'fail'.
is-allow-dev-is-		boolean	If 'true', the NFS server will allow creation of devices.

enabled		optional	Default value is 'true'.
is-allow-set-uid-enabled		boolean optional	If 'true', NFS server will honor SetUID bits in SETATTR operation. Default value is 'true'.
policy-name		export-policy-name	Export policy name.
protocol		access-protocol[] optional	Client access protocol. Default value is 'any'.
ro-rule		security-flavor[] optional	Rule for read-only access.
rule-index	**[0..2^32-1]**	integer	Export rule index.
rw-rule		security-flavor[] optional	Rule for read-write access.
super-user-security		security-flavor[] optional	Security flavors for the superuser. Default value is 'none'.

EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

export-rule-remove-clientmatches

[top]

Remove clientmatch strings from an existing export-policy rule

Input Name	Range	Type	Description
clientmatches		string	List of Clientmatch Strings to Remove
policy-name		export-policy-name	Export policy name.
rule-index	**[0..2^32-1]**	integer	Export policy rule index.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

export-rule-set-index

[top]

Move a rule to the specified index

Input Name	Range	Type	Description
new-rule-index	**[0..2^32-1]**	integer	New ruleindex value for the Export rule. The rule will be inserted into the rule-index position in the export-rule table.
policy-name		export-policy-name	Export policy name.

rule-index	**[0..2^32-1]**	integer	Export policy rule index.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

exports-access-cache-all-vservers-get

[top]

Get the NFS Exports Access Cache Refresh Periods.This API is deprecated in Data ONTAP 9.0.0 and later.

Input Name	Range	Type	Description
desired-attributes		access-cache-attributes-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		access-cache-attributes-info	The attributes of the NFS Exports Access Cache.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

exports-access-cache-all-vservers-modify

[top]

Modify the NFS Exports Access Cache Refresh Periods. This API is deprecated in Data ONTAP 9.0.0 and later.

Input Name	Range	Type	Description
harvest-timeout	**[60..2592000]**	integer optional	Harvest Timeout (Secs)
refresh-period-negative	**[60..86400]**	integer optional	TTL For Negative Entries (Secs)
refresh-period-positive	**[300..86400]**	integer optional	TTL For Positive Entries (Secs)

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

exports-access-cache-config-get

[top]

Get the exports access cache configuration for the given Vserver.

Input Name	Range	Type	Description
desired-attributes		exports-access-cache-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		exports-access-cache-config-info	The attributes of the Exports Access Cache Configuration.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

exports-access-cache-config-get-iter

[top]

Iterate over the list of Vservers for exports access cache configuration.

Input Name	Range	Type	Description
desired-attributes		exports-access-cache-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		exports-access-cache-config-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Exports Access Cache Configuration object. All Exports Access Cache Configuration objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-		exports-access-cache-	

list		config-info[] optional	The list of attributes of Exports Access Cache Configuration objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Exports Access Cache Configuration objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

exports-access-cache-config-modify

[top]

Modify the exports access cache configuration for the given Vserver.

Input Name	Range	Type	Description
harvest-timeout	**[60..2592000]**	integer optional	The timeout in seconds after which unused access cache entries will be deleted. Default value is 36000 seconds
ttl-failure	**[1..60]**	integer optional	TTL in seconds for access cache entries that failed to fetch export rules from management gateway. Default value is 5 seconds
ttl-negative	**[60..86400]**	integer optional	TTL in seconds for access cache entries that deny access. Default value is 3600 seconds
ttl-positive	**[300..86400]**	integer optional	TTL in seconds for access cache entries that allow access. Default value is 3600 seconds

Element definition: **access-cache-attributes-info**

[top]

NFS Exports Access Cache Attributes When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
harvest-timeout	**[60..2592000]**	integer optional	Harvest Timeout (Secs) Attributes: non-creatable, non-modifiable

refresh-period-negative	**[60..86400]**	integer optional	TTL For Negative Entries (Secs) Attributes: non-creatable, non-modifiable
refresh-period-positive	**[300..86400]**	integer optional	TTL For Positive Entries (Secs) Attributes: non-creatable, non-modifiable

Element definition: **access-protocol**

[top]

Client Access Protocol Possible values:

- "any" - Any,
- "nfs2" - NFS Version 2,
- "nfs3" - NFS Version 3,
- "nfs" - Any Version of NFS,
- "cifs" - CIFS,
- "nfs4" - NFS Version 4,
- "flexcache" - Flexcache,
- "nfs4_1" - NFS Version 4.1,
- "nfs4_2" - NFS Version 4.2

[none]

Element definition: **export-access-rights**

[top]

read|read-write|denied Possible values:

- "read" - Read,
- "read_write" - Read-Write,
- "denied" - Denied

[none]

Element definition: **export-check-info**

[top]

Information about the client access. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
			Access Rights Attributes: non-creatable, non-modifiable Possible values:

access		export-access-rights optional	• "read" - Read, • "read_write" - Read-Write, • "denied" - Denied
access-type		export-access-rights optional	Access Rights to Check for Attributes: key, non-creatable, non-modifiable Possible values: • "read" - Read, • "read_write" - Read-Write, • "denied" - Denied
authentication-method		security-flavor optional	Authentication Method Attributes: key, non-creatable, non-modifiable Possible values: • "any" - Any, • "none" - Anonymous Access Allowed If Security Type Not Already Listed, • "never" - Never, • "krb5" - Kerberos 5 Authentication, • "krb5i" - Kerberos 5 Authentication With Data Integrity Protection, • "krb5p" - Kerberos 5 Authentication With Data Privacy Protection, • "ntlm" - CIFS NTLM, • "sys" - NFS AUTH_SYS
client-ip		ip-address optional	Client IP Address Attributes: key, non-creatable, non-modifiable
path		string optional	Path Attributes: non-creatable, non-modifiable
policy		string optional	Export Policy Attributes: non-creatable, non-modifiable
policy-owner		string optional	Export Policy Owner Attributes: non-creatable, non-modifiable
policy-owner-type		policy-owner-type optional	Type of Export Policy Owner Attributes: non-creatable, non-modifiable Possible values: • "volume" - Volume, • "qtree" - Qtree
protocol		access-protocol optional	Protocol Attributes: key, non-creatable, non-modifiable Possible values: • "any" - Any, • "nfs2" - NFS Version 2, • "nfs3" - NFS Version 3, • "nfs" - Any Version of NFS, • "cifs" - CIFS, • "nfs4" - NFS Version 4, • "flexcache" - Flexcache, • "nfs4_1" - NFS Version 4.1, • "nfs4_2" - NFS Version 4.2
rule-index	**[0..2^32-1]**	integer optional	Export Policy Rule Index Attributes: non-creatable, non-modifiable
volume		volume-name optional	Volume Name Attributes: key, non-creatable, non-modifiable
vserver		vserver-name	Vserver Name Attributes: key, non-creatable, non-

		optional	modifiable

Element definition: **export-policy-info** [top]

Information about the Export policy configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
policy-id	**[0..2^64-1]**	integer optional	Export policy id. Attributes: non-creatable, non-modifiable
policy-name		export-policy-name optional	Export policy name. Attributes: key, required-for-create, non-modifiable
vserver		string optional	Vserver name. Attributes: key, non-creatable, non-modifiable

Element definition: **export-policy-name** [top]

The name of the export policy

[none]

Element definition: **export-rule-info** [top]

Information about the Export rule configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
anonymous-user-id		string optional	User name or ID to which anonymous users are mapped. Default value is '65534'. Attributes: optional-for-create, modifiable

client-match		string optional	List of client match specifications for Export rule. The clients specified are enforced with this Export rule. The rule with the higher rule index value takes precedence. Attributes: required-for-create, modifiable
export-chown-mode		exportchownmode optional	Change ownership mode. Possible values are 'restricted', 'unrestricted'. Default value is 'restricted'. Attributes: optional-for-create, modifiable Possible values: • "restricted" , • "unrestricted"
export-ntfs-unix-security-ops		exportntfsunixsecops optional	Ignore/Fail unix security operations on NTFS volumes. Possible values are 'ignore', 'fail'. Default value is 'fail'. Attributes: optional-for-create, modifiable Possible values: • "ignore" , • "fail"
is-allow-dev-is-enabled		boolean optional	If 'true', the NFS server will allow creation of devices. Default value is 'true'. Attributes: optional-for-create, modifiable
is-allow-set-uid-enabled		boolean optional	If 'true', NFS server will honor SetUID bits in SETATTR operation. Default value is 'true'. Attributes: optional-for-create, modifiable
policy-name		export-policy-name optional	Export policy name. Attributes: key, required-for-create, non-modifiable
protocol		access-protocol[] optional	Client access protocol. Default value is 'any'. Attributes: optional-for-create, modifiable Possible values: • "any" - Any, • "nfs2" - NFS Version 2, • "nfs3" - NFS Version 3, • "nfs" - Any Version of NFS, • "cifs" - CIFS, • "nfs4" - NFS Version 4, • "flexcache" - Flexcache, • "nfs4_1" - NFS Version 4.1, • "nfs4_2" - NFS Version 4.2
ro-rule		security-flavor[] optional	Rule for read-only access. Attributes: required-for-create, modifiable Possible values: • "any" - Any, • "none" - Anonymous Access Allowed If Security Type Not Already Listed, • "never" - Never, • "krb5" - Kerberos 5 Authentication, • "krb5i" - Kerberos 5 Authentication With Data Integrity Protection, • "krb5p" - Kerberos 5 Authentication With Data Privacy Protection, • "ntlm" - CIFS NTLM, • "sys" - NFS AUTH_SYS
rule-index	**[0..2^32-1]**	integer optional	Export rule index. Attributes: key, optional-for-create, non-modifiable
			Rule for read-write access. Attributes: required-for-create, modifiable Possible values:

rw-rule		security-flavor[] optional	• "any" - Any, • "none" - Anonymous Access Allowed If Security Type Not Already Listed, • "never" - Never, • "krb5" - Kerberos 5 Authentication, • "krb5i" - Kerberos 5 Authentication With Data Integrity Protection, • "krb5p" - Kerberos 5 Authentication With Data Privacy Protection, • "ntlm" - CIFS NTLM, • "sys" - NFS AUTH_SYS
super-user-security		security-flavor[] optional	Security flavors for the superuser. Default value is 'none'. Attributes: optional-for-create, modifiable Possible values: • "any" - Any, • "none" - Anonymous Access Allowed If Security Type Not Already Listed, • "never" - Never, • "krb5" - Kerberos 5 Authentication, • "krb5i" - Kerberos 5 Authentication With Data Integrity Protection, • "krb5p" - Kerberos 5 Authentication With Data Privacy Protection, • "ntlm" - CIFS NTLM, • "sys" - NFS AUTH_SYS
vserver-name		string optional	Vserver name. Attributes: key, non-creatable, non-modifiable

Element definition: **exportchownmode**

[top]

restricted|unrestricted Possible values:

- "restricted" ,
- "unrestricted"

[none]

Element definition: **exportntfsunixsecops**

[top]

Element definition: **ip-address**

[top]

IPv4 and IPv6 address

[none]

Element definition: **security-flavor**

[top]

authentication method Possible values:

- "any" - Any,
- "none" - Anonymous Access Allowed If Security Type Not Already Listed,
- "never" - Never,
- "krb5" - Kerberos 5 Authentication,
- "krb5i" - Kerberos 5 Authentication With Data Integrity Protection,
- "krb5p" - Kerberos 5 Authentication With Data Privacy Protection,
- "ntlm" - CIFS NTLM,
- "sys" - NFS AUTH_SYS

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

[none]

Element definition: **access-protocol**

[top]

Client Access Protocol Possible values:

- "any" - Any,
- "nfs2" - NFS Version 2,
- "nfs3" - NFS Version 3,
- "nfs" - Any Version of NFS,
- "cifs" - CIFS,
- "nfs4" - NFS Version 4,
- "flexcache" - Flexcache,
- "nfs4_1" - NFS Version 4.1,
- "nfs4_2" - NFS Version 4.2

[none]

[top]

read|read-write|denied Possible values:

- "read" - Read,
- "read_write" - Read-Write,
- "denied" - Denied

[none]

Element definition: **export-policy-name**

[top]

The name of the export policy

[none]

Element definition: **policy-owner-type**

[top]

volume|qtree Possible values:

- "volume" - Volume,
- "qtree" - Qtree

[none]

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

APIs in Category: **fc**

fc-config-adapter-disable
fc-config-adapter-enable
fc-config-list-info
fc-config-list-iter-end
fc-config-list-iter-next
fc-config-list-iter-start
fc-config-set-adapter-fc-type

Data ONTAP supports three separate functions with Fibre channel controllers:

- Initiator mode for FC storage loops, FC TapeSAN, and OPR functionality
- Target mode for SAN attach (FCP/Blocks access) functionality
- FC-VI mode for MetroCluster/SlideRuler interconnect functionality

These three functions are controlled by separate drivers. As DOT boots, the device driver attached to each FC adapter determines which function an adapter will support.

The fc-config interface provides a user programmable mechanism to configure the personality of Fibre channel adapters by changing what driver attached to the adapter. Not all Fibre channel adapters support FC configuration.

For more information refer to the "fcadmin config" CLI.

fc-config-adapter-disable

[top]

Call the corresponding adapter driver disable function to bring the adapter offline. Under some circumstances an adapter can not be put offline. (e.g. when the adapter is being used by the RAID sub-system to provide disks in a volume). In some cases, manual intervention is required. When this happens, an appropriate error messages is returned.

Input Name	Range	Type	Description
adapter-name		string	FC adapter name (e.g. 0a)
node-name		string	This field is only valid when the request is sent to the Admin Vserver LIF. This is the storage system name the command will be executed on.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
ENOTSTARTED	
EONTAPI_EINVAL	
ENODENOTFOUND	

fc-config-adapter-enable

[top]

Call the corresponding adapter driver enable function to bring the adapter online. Under some circumstances an adapter can not be brought online. (e.g. when that adapter is in the UNCONFIGURED

state, or when there is no cable attached to the adapter port). When this happens, an appropriate error messages is returned.

Input Name	Range	Type	Description
adapter-name		string	FC adapter name (e.g 0a)
node-name		string	This field is only valid when the request is sent to the Admin Vserver LIF. This is the storage system name the command will be executed on.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
ENOTSTARTED	
EONTAPI_EINVAL	
ENODENOTFOUND	

fc-config-list-info

[top]

Iterate over a list of fc objects.

Input Name	Range	Type	Description
desired-attributes		fc-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fc-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the fc object. All fc objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fc-config[] optional	The list of attributes of fc objects.
next-tag		string optional	Tag for the next call. Not present when there are no more fc objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EONTAPI_ENOENT	
EONTAPI_EINVAL	
EINTERNALERROR	
EADAPTERNOTFOUND	

EADAPTERINVALIDTYPE	
ENOTSTARTED	
ENODENOTFOUND	

fc-config-list-iter-end

[top]

Terminate the fc-config-list iteration

Input Name	Range	Type	Description
tag		string	Tag from a previous fc-config-list-iter-start.

Errno	Description
EONTAPI_ENOENT	

fc-config-list-iter-next

[top]

Obtain a list of FC adapter configuration information. Only provides information for adapters that are configurable.

Input Name	Range	Type	Description
maximum		integer	Maximum number of entries to retrieve.
tag		string	Tag from a previous fc-config-list-iter-start.

Output Name	Range	Type	Description
adapter-info		fc-config-info[]	List of adapter information
records		integer	This tells you how many records are being returned. When this value is 0, you have retrieved everything.

Errno	Description
EONTAPI_ENOENT	

fc-config-list-iter-start

[top]

Start iteration through the list of adapter configuration information.

Output Name	Range	Type	Description
records		integer	Number of items that have been saved for future retrieval with fc-config-list-iter-next.
tag		string	Tag to be used in subsequent iterations.

Errno	Description
EINTERNALERROR	

EOPNOTSUPPORTED	

fc-config-set-adapter-fc-type

[top]

fc-config-set-adapter-fc-type changes the adapter driver and/or configuration state. Each configurable adapter has an adapter-type and adapter-state. The adapter-type indicates which driver is attached to the adapter, the adapter-state indicates what the configuration state of the adapter is. The fc-type is used to modify both the adapter-type and the adapter-state. After setting the adapter fc-type a filer reboot is sometimes needed to make the change effective. Use fc-config-list-info to determine if a filer reboot is needed.

Input Name	Range	Type	Description
adapter-name		string	FC adapter name (e.g 0a)
fc-type		string	Sets the type and state of the adapter. Possible inputs: "unconfigured" - set adapter-type to "initiator" and adapter-state to UNCONFIGURED "initiator" - set adapter-type to "initiator" and adapter-state to CONFIGURED "target" - set adapter-type to "target" and adapter-state to CONFIGURED "vi" - set adapter-type to "vi" and adapter-state to CONFIGURED
node-name		string optional	This field is only valid when the request is sent to the Admin Vserver LIF. This is the storage system name the command will be executed on.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
EOPNOTSUPPORTED	
EONTAPI_EINVAL	
ENODENOTFOUND	

Element definition: **fc-config**

[top]

fc config When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
adapter-name		string optional	Adapter name Attributes: key, non-creatable, non-modifiable

adapter-state		string optional	Adapter current state Attributes: non-creatable, non-modifiable
adapter-status		string optional	Adapter online status Attributes: non-creatable, non-modifiable
adapter-type		string optional	Adaptaer type Attributes: non-creatable, non-modifiable
node-name		string optional	Node name Attributes: key, non-creatable, non-modifiable
pending-fc-type		string optional	Pending reason Attributes: non-creatable, non-modifiable

Element definition: **fc-config-info**

[top]

Name	Range	Type	Description
adapter-name		string	FC adapter name (e.g. 0c)
adapter-state		string	Indicates what the adapter configuration state is. Possible values: "UNDEFINED" - The default state. The adapter has never been configured. "CONFIGURED" - The adapter port is configured and the adapter is operational. "UNCONFIGURED" - The adapter is unconfigured. The initiator driver is attached, but the adapter is not operational. "PENDING" - The adapter is waiting for a filer reboot to effect an fc-type change. While in the PENDING state the adapter can not be used
adapter-status		string	Possible values: "online" - adapter driver is enabled "offline" - adapter driver is disabled
adapter-type		string	Indicates which driver is attached to the adapter. Possible values: "initiator" - the storage Initiator driver (default) "vi" - the FC-VI cluster interconnect driver "target" - the FCP Target driver
pending-fc-type		string optional	If adapter-state is PENDING, this value tells what the last fc-config-set-adapter-fc-type command was.

fcp-zone-get-iter

fcp-adapter-clear-partner

[top]

Removes the name of the partner adapter which the local adapter should takeover. Partner adapter setting is obsolete and this operation is no longer supported.

Input Name	Range	Type	Description
fcp-adapter		string	Local FC adapter.

Errno	Description
EOPNOTSUPPORTED	

fcp-adapter-config-down

[top]

Bring a Fibre Channel target adapter offline. The adapter may not be offline immediately after the call returns, it may take up to a few seconds for the adapter to change state. In Data ONTAP 7-Mode, if the FCP service is not running then all adapters are automatically offlined. They cannot be brought online again until FCP service is started. adapter to change state. In Data ONTAP Cluster-Mode, offlining an adapter will operationally disable all FCP logical interfaces (LIFs) hosted by the adapter.

Input Name	Range	Type	Description
fcp-adapter		string	FC adapter to bring offline.
node		string	The name of the storage system node where the adapter is installed.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
EADAPTERPARTNER	
ENOTSTARTED	
ENTAPI_EINVAL	

fcp-adapter-config-media-type

[top]

Sets the link type on the Fibre Channel target adapter. It can be configured to establish a point-to-point link, a loop configuration or to automatically sense whether the connection type is a point-to-point or loop link. Setting the link to point-to-point in a loop configuration can prevent the loop from coming up properly. If the adapter is online, it must be brought offline and then online in order for a new mediatype to take effect. This may temporarily disrupt fcp service on the target adapter.

Input Name	Range	Type	Description
fcp-adapter		string	FC adapter to bring offline.

media-type		string	Media type to set. Valid values are point-to-point ("ptp"), loop configuration ("loop"), or automatic ("auto").

Errno	Description

fcp-adapter-get-iter

[top]

Iterate over the list of physical FC adapters.

Input Name	Range	Type	Description
desired-attributes		fcp-config-adapter-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-config-adapter-	A query that specifies which objects to return. A query could be specified on any number of attributes in the FC Adapter object. All

		info optional	FC Adapter objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-config-adapter-info[] optional	The list of attributes of FC Adapter objects.
next-tag		string optional	Tag for the next call. Not present when there are no more FC Adapter objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-adapter-initiators-list-info

[top]

Get the list of initiators currently connected to the specified Fibre Channel target adapter, or if none specified, a list of initiators connected to any FC target adapter. Information returned for each initiator includes the portname of initiators that are currently logged in with the the FC target adapters. If the portname is in an initiator group, then the group name is also included. Also the Fibre Channel host address and the nodename/portname of the initiators are included as well. Connectivity of adapters running on behalf of partners are not included in the list when requesting for all adapters. If listing for all adapters and an error occurred for while retrieving connection status for an adapter, status for that adapter will not be returned, and the API will continue on with the rest of the adapters without erroring out. You can get the error message for that adapter, by specifically specifying that adapter.

Input Name	Range	Type	Description
fcp-adapter		string optional	Adapter to get initiator list for. If no adapter is specified, information is returned for all initiators connected through any fcp adapter in the system.

Output Name	Range	Type	Description
fcp-adapters		fcp-adapter-initiators-info[]	A list of FC adapters containing list of initiators and their aliases.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	

Vfiler-enabled
Yes

fcp-adapter-list-info

[top]

Gets information such as nodename/portname and link state about the specified Fibre Channel target adapter, or if no adapter is specified, about all the FC target adapters.

Input Name	Range	Type	Description
fcp-adapter		string optional	FC target Adapter to get config information for. If no adapter is specified, information is returned for all FC target Adapters.
partner-only		boolean optional	This field is obsolete and no longer used beginning with Data ONTAP 8.0.
verbose		boolean optional	If specified with "true", additional adapter info is returned. Look at description of output for what additions.

Output Name	Range	Type	Description
fcp-config-adapters		fcp-config-adapter-info[]	List of adapter configuration information.

Errno	Description
EINTERNALERROR

fcp-adapter-nameserver-list-iter-end

[top]

Terminate a list iteration and clean up any saved info.

Input Name	Range	Type	Description
tag		string	Tag from a previous fcp-adapter-nameserver-list-iter-start.

Vfiler-enabled
Yes

fcp-adapter-nameserver-list-iter-next

[top]

Return items from a previous call to fcp-adapter-nameserver-list-iter-start Information returned for each nameserver entry include the port identifier, port type, port name, node name, symbolic port name, symbolic node name, fabric port name, class of service, and registered FC4 types.

Input Name	Range	Type	Description

maximum		integer	The maximum number of entries to retrieve.
tag		string	Tag from a previous fcp-adapter-nameserver-list-iter-start.

Output Name	Range	Type	Description
fcp-adapter-nameserver-objects		fcp-adapter-nameserver-object-info[]	List of nameserver objects.
records		integer	This tells you how many records are being returned from this particular call to fcp-adapter-nameserver-list-iter-next When this value is 0, you have retrieved everything.

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fcp-adapter-nameserver-list-iter-start

[top]

Get the fabric nameserver objects the results of which are retrieved by using fcp-adapter-nameserver-list-iter-next. Connectivity of adapters running on behalf of partners are not included in the list when requesting for all adapters. If listing for all adapters and an error occurs while retrieving connection status for an adapter, status for that adapter will not be returned and the API will continue on with the rest of the adapters without erroring out. You can get the error message for that adapter, by specifically specifying that adapter.

Input Name	Range	Type	Description
fcp-adapter		string optional	Adapter to get nameserver objects for. If no adapter is specified, information is returned for all fcp adapter.
zoned		boolean optional	If true, returns only devices that are zoned to the target adapter. Otherwise, all devices in the fabric are returned. Default is false.

Output Name	Range	Type	Description
records		integer	Number which tells you how many items have been saved for future retrieval with fcp-adapter-nameserver-list-iter-next.
tag		string	Tag to be used in subsequent calls to fcp-adapter-nameserver-list-iter-next.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	

Vfiler-enabled
Yes

fcp-adapter-reset-stats

[top]

Resets the stats for the specified Fibre Channel Target Adapter. If none specified, reset stats for all FC adapters.

Input Name	Range	Type	Description
fcp-adapter		string optional	FC Target adapter.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	

fcp-adapter-set-partner

[top]

Sets the name of the partner adapter which the local adapter should takeover. Partner adapter setting is obsolete and this operation is no longer supported.

Input Name	Range	Type	Description
fcp-adapter		string	Local FC adapter.
partner-adapter		string	Partner FC adapter to takeover.

Errno	Description
EOPNOTSUPPORTED	

fcp-adapter-set-speed

[top]

Sets the speed on the Fibre Channel target adapter. It can be configured to run at 1Gb, 2Gb, 4Gb, 8Gb, 10Gb, 16Gb or to auto negotiate. The 10Gb adapter only supports the 10Gb speed. The 16Gb adapter only supports speeds of 16Gb, 8Gb, and 4Gb. The 8Gb adapter only supports speeds of 8Gb, 4Gb, and 2Gb. The 4Gb adapter only supports speeds of 4Gb, 2Gb, and 1Gb. If the adapter is online it must be brought offline before setting the speed, and then online in order for a new speed to take effect. This may temporarily disrupt fcp service on the target adapter.

Input Name	Range	Type	Description
fcp-adapter		string	FC Target adapter
node		string	The name of the storage system node where the adapter is installed.
speed		string	Link speed (in Gb). Possible values: "1", "2", "4", "8", "10", "16" or "auto" (auto negotiate speed).

fcp-adapter-stats-get-iter

[top]

Iterate over a list of fcp objects.

Input Name	Range	Type	Description
desired-attributes		fcp-adapter-stats-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-adapter-stats-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the fcp object. All fcp objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-adapter-stats-info[] optional	The list of attributes of fcp objects.
next-tag		string optional	Tag for the next call. Not present when there are no more fcp objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-adapter-stats-list-info

[top]

Get statistics about the Fibre Channel target adapters. Statistics of adapters running on behalf of partners are not included in the list when requesting stats for all adapters. If listing stats for all adapters and an error occurred for while retrieving stats for an adapter, stats for that adapter will not be returned, and the API will continue on with the rest of the adapters without erroring out. You can get the error message for that adapter, by specifically specifying that adapter.

Input Name	Range	Type	Description
fcp-adapter		string optional	FC target Adapter. If no adapter is specified, statistics for all the adapters are returned.

Output Name	Range	Type	Description
fcp-adapter-		fcp-adapter-	List of statistics for FC adapters.

stats		stats-info[]	

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	

fcp-adapter-topology-list-iter-end

[top]

Terminate a list iteration and clean up any saved info.

Input Name	Range	Type	Description
tag		string	Tag from a previous fcp-adapter-topology-list-iter-start.

Vfiler-enabled
Yes

fcp-adapter-topology-list-iter-next

[top]

Return items from a previous call to fcp-adapter-topology-list-iter-start Information returned for each switch includes the nodename, logical name, domain identifier, vendor, release version, and port information. If a port has devices attached to it, then information about each attached device is included as well.

Input Name	Range	Type	Description
maximum		integer	The maximum number of entries to retrieve.
tag		string	Tag from a previous fcp-adapter-topology-list-iter-start.

Output Name	Range	Type	Description
fcp-adapter-topology-switches		fcp-adapter-topology-switch-info[]	Information about the connected FC switch.
records		integer	This tells you how many records are being returned from this particular call to fcp-adapter-topology-list-iter-next When this value is 0, you have retrieved everything.

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fcp-adapter-topology-list-iter-start

[top]

Get the fabric topology for one or more switches the results of which are retrieved by using fcp-adapter-topology-list-iter-next. Connectivity of adapters running on behalf of partners are not included in the list when requesting for all adapters. If listing for all adapters and an error occurs while retrieving connection status for an adapter, information for that adapter will not be returned and the API will continue on with the rest of the adapters without erroring out. You can get the error message for that adapter, by specifically specifying that adapter.

Input Name	Range	Type	Description
fcp-adapter		string optional	Adapter to get topology information for. If no adapter is specified, information is returned for all fcp adapter.
verbose		boolean optional	If true, returns verbose information including port information about each switch in the fabric. Default is true.
zoned		boolean optional	If true, returns only devices in the fabric that are zoned to the target adapter. Default is false.

Output Name	Range	Type	Description
records		integer	Number which tells you how many items have been saved for future retrieval with fcp-adapter-topology-list-iter-next.
tag		string	Tag to be used in subsequent calls to fcp-adapter-topology-list-iter-next.

Errno	Description
EINTERNALERROR	
EADAPTERNOTFOUND	

Vfiler-enabled
Yes

fcp-adapter-zone-list-iter-end

[top]

Terminate a list iteration and clean up any saved info.

Input Name	Range	Type	Description
tag		string	Tag from a previous fcp-adapter-zone-list-iter-start.

Vfiler-enabled
Yes

fcp-adapter-zone-list-iter-next

[top]

Return items from a previous call to fcp-adapter-zone-list-iter-start Information returned for each zone entry include the active zone set name, the zone name, and the zone members.

Input Name	Range	Type	Description
maximum		integer	The maximum number of entries to retrieve. Range: [0..2^32-1]
tag		string	Tag from a previous fcp-adapter-zone-list-iter-start.

Output Name	Range	Type	Description
fcp-adapter-zones		fcp-adapter-zone-info[]	List of zone entries.
records		integer	This tells you how many records are being returned from this particular call to fcp-adapter-zone-list-iter-next When this value is 0, you have retrieved everything. Range: [0..2^32-1]

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fcp-adapter-zone-list-iter-start

[top]

Get the active zone set information from the zone server. The results can then be retrieved by using fcp-adapter-zone-list-iter-next. Connectivity of adapters running on behalf of partners is not included in the list when requesting for all adapters. If listing for all adapters and an error occurs while retrieving connection status for an adapter, status for that adapter will not be returned and the API will continue on with the rest of the adapters without erroring out. You can get the error message for that adapter, by specifically specifying that adapter.

Input Name	Range	Type	Description
fcp-adapter		string optional	Adapter to get zone information for. If no adapter is specified, information is returned for all fcp adapter.

Output Name	Range	Type	Description
records		integer	Number which tells you how many items have been saved for future retrieval with fcp-adapter-zone-list-iter-next. Range: [0..2^32-1]
tag		string	Tag to be used in subsequent calls to fcp-adapter-zone-list-iter-next.

Errno	Description

Errno	Description
EINTERNALERROR	
ENOTCLUSTERED	

fcp-initiator-get-iter

[top]

List all initiators connected to FCP target LIFs.

Input Name	Range	Type	Description
desired-attributes		fcp-adapter-initiators-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-adapter-initiators-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the connected FCP initiator object. All connected FCP initiator objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-adapter-initiators-info[] optional	The list of attributes of connected FCP initiator objects.
next-tag		string optional	Tag for the next call. Not present when there are no more connected FCP initiator objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-interface-get-iter

[top]

Iterate over a list of FCP Target Logical Interfaces (LIF).

Input Name	Range	Type	Description
desired-attributes		fcp-interface-info	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is

		optional	available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-interface-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the FCP data LIF object. All FCP data LIF objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-interface-info[] optional	The list of attributes of FCP data LIF objects.
next-tag		string optional	Tag for the next call. Not present when there are no more FCP data LIF objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-nameserver-get-iter

[top]

Iterates over the list of entries in the fabric name server database.

Input Name	Range	Type	Description
desired-attributes		fcp-nameserver-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-nameserver-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Shows entries in the fabric name server database. object. All Shows entries in the fabric name server database. objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-nameserver-info[] optional	The list of attributes of Shows entries in the fabric name server database. objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Shows entries in the fabric name server database. objects to

			return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-node-get-name

[top]

Get the current FCP World Wide Node Name (WWNN). This WWNN name is in the form XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit. In Data ONTAP 7-Mode, this is the WWNN of the individual storage system. In "single_image" cfmode, the WWNN of the system and its high availability partner will be the same. In Data ONTAP Cluster-Mode, this is the WWNN of the Vserver FCP Service.

Output Name	Range	Type	Description
node-name		string	Current FCP World Wide Node Name (WWNN).

Errno	Description
EINTERNALERROR	
EOPNOTSUPPORTED	

fcp-node-set-name

[top]

Set the current FCP World Wide Node Name (WWNN). This WWNN is in the form XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit. The provided WWNN must also be within one of the allowed vendor-registered namespaces unless the force parameter is specified. In Data ONTAP 7-Mode, all Fibre Channel adapters must be offline. The allowed vendor namespace is "50:0a:09:80:8X:XX:XX". Changes will take place when the adapters are brought online. In Data ONTAP Cluster-Mode, the FCP service must be offline. The allowed vendor namespace is one of following:

- 2X:XX:00:a0:98:XX:XX:XX
- 2X:XX:00:a0:b8:XX:XX:XX
- 2X:XX:d0:39:ea:XX:XX:XX

Changes will take place when the service is brought online.

Input Name	Range	Type	Description
force		boolean optional	If true, allow setting the WWNN to a value outside the vendor's registered namespace for the current mode. If false or not present, the request will fail unless the supplied WWNN is inside the correct namespace.
node-name		string	FCP World Wide Node Name.

fcp-ping-igroup-view-get-iter

[top]

Iterate over a list of FCP ping igroup results objects.

Input Name	Range	Type	Description
desired-attributes		fcp-ping-igroup-status-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-ping-igroup-status-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the FCP ping igroup results object. All FCP ping igroup results objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
		fcp-	

attributes-list		ping-igroup-status-info[] optional	The list of attributes of FCP ping igroup results objects.
next-tag		string optional	Tag for the next call. Not present when there are no more FCP ping igroup results objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-ping-info

[top]

Send an ELS ECHO frame to a Fibre Channel address or WWPN. The API pings the address or WWPN count times and returns the number of successful pings and times. EHOSTNOTFOUND is returned if the WWPN cannot be resolved. EONTAPI_EHOSTDOWN is returned if the address cannot be pinged. The interval between ping attempts is 1 second.

Input Name	Range	Type	Description
fcp-adapter		string	Adapter to send the ping request from.
payload		string optional	Additional data to send in the payload of the ELS ECHO frame. The payload can be up to 248 characters long.
ping-count		integer optional	The number of pings. Default is 3. Range: [1..16]
port-id-or-wwpn		string	The Fibre Channel address or the WWPN to ping. The format of a Fibre channel address is a hexadecimal or numeric value with the range [0..2^24-1]. The format of a WWPN is XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

Output Name	Range	Type	Description
frames-received		integer optional	The number of frames received. The number of frames lost is the frames-transmitted minus frames-received. Range: [0..16]
frames-transmitted		integer optional	Number of frames transmitted. Should be equal to ping-count. Range: [1..16]
round-trip-maximum-time		integer optional	Maximum time in microseconds for a round trip between the target adapter and the destination if frames-received is greater than zero. Range: [0..2^31-1]
round-trip-mean-time		integer optional	Mean time in microseconds for a round trip between the target adapter and the destination if frames-received is greater than zero. Range: [0..2^31-1]
round-trip-minimum-time		integer optional	Minimum time in microseconds for a round trip between the target adapter and the destination if frames-received is greater than zero. Range: [0..2^31-1]

EINTERNALERROR	

fcp-port-name-get-iter

[top]

Iterate over the list of valid Fibre Channel target port names on a Vserver's FCP LIFs.

Input Name	Range	Type	Description
desired-attributes		fcp-port-name-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
		fcp-	

query		port-name-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Fibre Channel target port name object. All Fibre Channel target port name objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-port-name-info[] optional	The list of attributes of Fibre Channel target port name objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Fibre Channel target port name objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-port-name-list-info

[top]

Get the list of valid Fibre Channel target port names on a filer's local adapters. The filer needs to be in standby or single_image cfmode.

Input Name	Range	Type	Description
verbose		boolean optional	If specified with "true", unused port names are also reported. Default value is "false".

Output Name	Range	Type	Description
fcp-port-names		fcp-port-name-info[]	List of valid local port names and associated adapters.

Errno	Description
EOPNOTSUPPORTED	
EADAPTERNOTFOUND	

fcp-port-name-set

[top]

Set a valid but unused port name on a Fibre Channel target interface.

Input Name	Range	Type	Description
fcp-adapter		string	FCP target interface to set the WWPN on. In Data ONTAP 7-Mode, the name of a local adapter in standby single_image cfmode. In Data ONTAP Cluster-Mode, the name of an FCP data LIF in the vserver.

port-name		string	WWPN to be set on the interface. It has to be a valid and unused one.

Errno	Description
EOPNOTSUPPORTED	
EONTAPI_EINVAL	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
EINTERNALERROR	
EALREADYSTARTED	
E_SAN_NOT_READY	

fcp-port-name-swap

[top]

Swap port names of two local Fibre Channel target adapters.

Input Name	Range	Type	Description
fcp-adapter-1		string	One of the adapters to swap their port names. It has to be a local adapter in standby or single_image cfmode.
fcp-adapter-2		string	One of the adapters to swap their port names. It has to be a local adapter in standby or single_image cfmode.

Errno	Description
EOPNOTSUPPORTED	
EONTAPI_EINVAL	
EADAPTERNOTFOUND	
EADAPTERINVALIDTYPE	
EINTERNALERROR	
EALREADYSTARTED	
E_SAN_NOT_READY	

fcp-service-create

[top]

Create an FCP Service in a Vserver. Each Vserver requires an online FCP Service in order to serve data via the Fibre Channel protocol.

Input Name	Range	Type	Description
force-node-name		boolean optional	If true, allow setting the WWNN to a value outside the vendor's registered namespaces. If false, the node-name must match one of the following namespaces: • 2X:XX:00:a0:98:XX:XX:XX • 2X:XX:00:a0:b8:XX:XX:XX • 2X:XX:d0:39:ea:XX:XX:XX . The default i false.
node-name		string optional	The FCP World Wide Node Name (WWNN) for the FCP service. If not provided, one will be auto-generated.

start		boolean optional	Determine the initial state of the FCP Service. If true, the service will be automatically started after creation completes. If false, the service will be left in the stopped state and the caller must subsequently call fcp-service-start to start the service. The default is true.

Output Name	Range	Type	Description
node-name		string	The world-wide node name (WWNN) of the FCP target in the Vserver.

Errno	Description
EINTERNALERROR	
EONTAPI_EINVAL	
EVDISK_ERROR_DUPLICATE_TARGET_NAME	
EONTAPI_EEXIST	
EVSERVERNOTRUNNING	
E_SAN_NOT_READY	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

License
FCP

fcp-service-destroy

[top]

Destroy the FCP Service in a Vserver.

Errno	Description
E_SAN_NOT_READY	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

License
FCP

fcp-service-get-iter

[top]

Iterate over the list of FCP Services.

Input Name	Range	Type	Description
desired-attributes		fcp-service-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
		fcp-	A query that specifies which objects to return. A query could be

query		service-info optional	specified on any number of attributes in the FCP Service object. All FCP Service objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-service-info[] optional	The list of attributes of FCP Service objects.
next-tag		string optional	Tag for the next call. Not present when there are no more FCP Service objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-service-start

[top]

Starts FCP service. When FCP service is started, the adapters are brought online. The service will be available once the call returns with success. The adapters however, may not be available immediately after the call, it may take up to a few seconds for the adapters to initialize.

Errno	Description
EINTERNALERROR	
EALREADYSTARTED	
VDISK_ERROR_CFMODE_MISMATCH	
VDISK_ERROR_PARTNER_NOT_REACHABLE	
EREVERTINPROGRESS	
VDISK_ERROR_PARTNER_WWNN_MISMATCH_FOR_SSI	
EVSERVERNOTRUNNING	
E_SAN_NOT_READY	

fcp-service-status

[top]

Get status of the FCP service, whether or not it is running.

Output Name	Range	Type	Description
is-available		boolean	"true" if FCP service is running, "false" otherwise.

Errno	Description
EINTERNALERROR	

fcp-service-stop

[top]

Stops FCP service. When FCP service is stopped, the adapters are brought offline. The service will be unavailable once the call returns with success.

Errno	Description
EINTERNALERROR	
ENOTSTARTED	
E_SAN_NOT_READY	

fcp-set-cfmode

[top]

Set the current cfmode setting for the system. This setting controls how the cluster behaves during a takeover/giveback. It also controls if the filer should use multiple virtual target adapters per physical target adapter. fcp service must be stopped before executing this API. The only valid value for cfmode is 'single_image' If cfmode is set to 'single_image' the filer connects to the FC fabric in ptp mode by default but is configurable, and all luns in the cluster are visible on all FC target ports. In this mode all hosts require multipathing software. When setting the cfmode to 'single_image' configuration checks are performed. If these checks fail an EPERM error will be returned. See the lun-config-check-single-image-info API for more information.

Input Name	Range	Type	Description
fcp-cfmode		string	Set current cfmode setting. Possible values: single_image
force		boolean optional	Forcibly change the cfmode, overriding cluster partner checks. Obsolete.

Errno	Description
ENOTCLUSTERED	
ESERVICENOTSTOPPED	
EINTERNALERROR	
EONTAPI_EINVAL	
EONTAPI_EPERM	
EVDISK_ERROR_PARTNER_NOT_REACHABLE	
EVDISK_ERROR_IN_TAKEOVER	

fcp-tdz-get-iter

[top]

Iterates over the list of entries in the tdz database.

Input Name	Range	Type	Description
desired-attributes		fcp-tdz-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-tdz-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Shows entries in the fabric tdz database. object. All Shows entries in the fabric tdz database. objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-tdz-info[] optional	The list of attributes of Shows entries in the fabric tdz database. objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Shows entries in the fabric tdz database. objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-topology-get-iter

[top]

Iterates over the list of FCP topology interconnect elements.

Input Name	Range	Type	Description
desired-attributes		fcp-topology-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-topology-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Show FCP topology interconnect elements. object. All Show FCP topology interconnect elements. objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-topology-info[] optional	The list of attributes of Show FCP topology interconnect elements. objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Show FCP topology interconnect elements. objects to return.
num-records	**[0..2^32-**	integer	The number of records returned in this call.

	1]		

Errno	Description
EINTERNALERROR	

fcp-topology-port-get-iter

[top]

Iterates over the list of entries in the fabric name server database.

Input Name	Range	Type	Description
desired-attributes		fcp-topology-port-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fcp-topology-port-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Shows FCP topology interconnect elements per adapter. object. All Shows FCP topology interconnect elements per adapter. objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-topology-port-info[] optional	The list of attributes of Shows FCP topology interconnect elements per adapter. objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Shows FCP topology interconnect elements per adapter. objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-wwpnalias-get-alias-info

[top]

Get the list of WWPN for a given alias or an alias for for a given WWPN or complete list of all current alias- WWPN mappings.

Input Name	Range	Type	Description
alias		string optional	Alias for a WWPN is the 32-character alias that may contain A-Z, a-z, 0-9, _,-,.,{,} and no spaces. When supplied, the alias with the corresponding WWPN will be returned. Otherwise, all aliases with their

			WWPNs present in the system will be returned.
wwpn		string optional	WWPN for which all aliases will be returned. When supplied all aliases for that WWPN will be returned. Otherwise, all aliases with their WWPNs present in the system will be returned.

Output Name	Range	Type	Description
aliases		aliases-info[]	A list of alias-WWPN mappings

Errno	Description
EVDISK_ERROR_WWPN_ALIASES_NOT_SET	
EVDISK_ERROR_WWPN_ALIAS_INVALID	
EVDISK_ERROR_WWPN_ALIAS_NOT_FOUND	
EVDISK_ERROR_NOT_VALID_FC_WWN	
EVDISK_ERROR_WWPN_ALIAS_REMOVE_INVALID_NUM_ARGS	

Vfiler-enabled
Yes

fcp-wwpnalias-get-iter

[top]

Iterate over the list of assigned World Wide Port Name (WWPN) aliases.

Input Name	Range	Type	Description
desired-attributes		aliases-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		aliases-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the WWPN aliases object. All WWPN aliases objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		aliases-info[] optional	The list of attributes of WWPN aliases objects.
next-tag		string optional	Tag for the next call. Not present when there are no more WWPN aliases objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fcp-wwpnalias-remove

[top]

Remove an alias for a World Wide Port Name of an initiator. Either the alias or the wwpn argument must be provided.

Input Name	Range	Type	Description
alias		string optional	WWPN Alias to be removed. Either the alias or the wwpn argument must be provided.
wwpn		string optional	WWPN for which all aliases are to be removed. Either the wwpn or the alias argument must be provided.

Errno	Description
EVDISK_ERROR_WWPN_ALIAS_NOT_FOUND	
EVDISK_ERROR_WWPN_NOT_FOUND	
EVDISK_ERROR_WWPN_ALIAS_REMOVE_INVALID_NUM_ARGS	

fcp-wwpnalias-set

[top]

Set an alias for a World Wide Port Name of an initiator that might login to the target.

Input Name	Range	Type	Description
alias		string	Alias to be set for the given WWPN ("wwpn"); The alias can be 32-characters long and may contain: A-Z, a-z, 0-9, _,-,.,{,} and no spaces
force		boolean optional	When set to true, the WWPN associated with the alias will be over-written. Default value is false.
wwpn		string	WWPN for which alias is being set

Errno	Description
EVDISK_ERROR_WWPN_ALIASES_TOO_MANY	
EVDISK_ERROR_WWPN_ALIAS_INVALID	
EVDISK_ERROR_NOT_VALID_FC_WWN	
EVDISK_ERROR_WWPN_ALIAS_ALREADY_SET	

fcp-zone-get-iter

[top]

Iterates over the list of entries in the fabric name server database.

Input Name	Range	Type	Description
desired-attributes		fcp-zone-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20

query		fcp-zone-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Shows the active zone set information. object. All Shows the active zone set information. objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fcp-zone-info[] optional	The list of attributes of Shows the active zone set information. objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Shows the active zone set information. objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

Element definition: **aliases-info**

[top]

A list of WWPNs and their aliases generated according to the input - alias, WWPN or nothing.

Name	Range	Type	Description
aliases-alias		string	The 32-character alias for a given FCP WWPN
aliases-wwpn		string	The FCP WWPN for which the alias is given
vserver		string optional	Vserver containing the alias

Element definition: **fcp-adapter-initiators-info**

[top]

A list of initiators currently connected to the FC adapter or FCP data LIF.

Name	Range	Type	Description
adapter		string	In Data ONTAP 7-Mode, the name of the physical FC adapter. In Data ONTAP Cluster-Mode, the name of the FC data LIF.
data-protocol		fcp-adapter-data-protocol optional	The data protocol of the LIF. This field is available in Data ONTAP 9.4 and later.
fcp-connected-initiators		fcp-connected-initiator-info[]	Information about the connected initiators
vserver		string optional	Vserver of the FCP LIF.

Element definition: **fcp-adapter-nameserver-object-info**

[top]

Information about a nameserver object entry.

Name	Range	Type	Description
adapter		string	The adapter this nameserver object is visible through.
class-service		string optional	Registered class of services as defined in the FC-FS standard. This element is omitted if the device has not registered a class of service. Comma separated possible values: "F", "1", "2", "3", "4", and "6".
fabric-port-name		string optional	Fabric world wide port name (WWPN) of this entry. This element is omitted if the fabric WWPN is not registered.
fc4-type		string optional	Registered FC4 Types. This element is omitted if the device has not registered an FC4 Type. Comma separated possible values: "llc/snap", "ipfc", "fcp", "gpp", "ipi-3m", "ipi-3s", "ipi-3p", "sbccs-ch", "sbccs-cu", "fc-sb-3_ch2cu", "fc-sb-3_cu2ch", "fc-gs", "fc-sw", "fc-al", "snmp", "hippi-fp", "mil-std-1553", "asm", "fc-vi", and "fc-av".
node-name		string optional	World wide node name (WWNN) of this entry. This element is omitted if the device has not registered a WWNN.
port-id		integer	Assigned port identifier of this entry. Range: [0..2^24-1]
port-name		string optional	World wide port name (WWPN) of this entry. This element is omitted if the device has not registered a WWPN.
port-type		string	Port type of this entry. Possible values: "n-port", "nl-port", "fnl-port", "nx-port", "f-port", "fl-port", "e-port", "b-port", "nv-port", "fv-port", "sd-port", "te-port", "tl-port", and "none".
symbolic-node-name		string optional	Registered symbolic node name. If the device has not registered one, this element will be omitted.
symbolic-port-name		string optional	Registered symbolic port name. If the device has not registered one, this element will be omitted.

Element definition: **fcp-adapter-stats-info**

[top]

Statistics for one FC adapter. Starting Data ONTAP 8.3, the SFP related attributes have been superseded by the same attributes in type fcp-config-adapter-info, and are retained in here for compatibility only.

Name	Range	Type	Description
adapter		string	Which FC adapter.
adapter-resets		integer	Number of adapter resets occurred.
crc-errors		integer	Total CRC errors occurred.
discarded-frames		integer	Number of frames discarded by the target HBA. Range [0..2^31-1]
frame-overruns		integer	Number of frame overruns detected by the adapter during write requests.
frame-underruns		integer	Number of frame underruns detected by the adapter during read requests.
initiators-		integer	Total number of initiators connected to this target adapter.

connected			
invalid-xmit-words		integer	Number of invalid words transmitted. Range [0..2^31-1]
is-sfp-diagnostics-internally-calibrated		boolean optional	Indicates if the SFP diagnostics are internally calibrated or not. The optional SFP rx/tx fields are invalid (and therefore not provided) if the SFP diagnostics are not internally calibrated.
is-sfp-optical-transceiver-valid		boolean	Validity of the optical transceiver. Until Data ONTAP 8.0.0, this field was incorrectly named "is-spf-optical-transceiver-valid". While that field is also returned for backward compatibility, all new applications must use the current version.
is-sfp-rx-power-in-range		boolean optional	Flag to indicate received optical power is in range.
is-sfp-tx-power-in-range		boolean optional	Flag to indicate transmitted optical power is in range.
link-breaks		integer	Number of times that the link breaks.
lip-resets		integer	Number of times that a selective Reset LIP (Loop Initialization Primitive) occurred. LIP reset is used to preform a vendor-specific reset at the loop port specified by the AL-PA value.
lr-received		integer	Number of LRs (Link Reset) received by the target HBA. Range [0..2^31-1]
lr-sent		integer	Number of LRs (Link Reset) sent from the target HBA. Range [0..2^31-1]
node		node-name	The name of the node where the adapter is installed.
nos-received		integer	Number of NOSs (Not_Operational Primitive Sequence)received by the target HBA. Range [0..2^31-1]
ols-received		integer	Number of OLSs (Offline Primitive Sequence) received by the target HBA. Range [0..2^31-1]
protocol-errors		integer	Number of protocol errors occurred. Range [0..2^31-1]
queue-depth		integer	Counts the queue depth on the target HBA.
scsi-requests-dropped		integer	Number of SCSI requests being dropped.
sfp-connector		string optional	Connector used with the optical transceiver.
sfp-date-code		string optional	Date code for the optical transceiver.
sfp-encoding		string optional	Encoding used with the optical transceiver. Possible values ["8B10B", "?????"]
sfp-fc-speedcapabilities		string optional	FC speed capabilities for the optical transceiver. Possible values [1, 2, 4, 8 in Gbps]
sfp-formfactor		string optional	Form factor of the optical transceiver. Possible values: "SFP" (for Small FormFactor).
sfp-part-number		string optional	Part number for the optical transceiver.
sfp-rev		string optional	Revision for the optical transceiver.
sfp-rx-power		string optional	SFP received optical power, reported to tenth decimal in uWatts.
sfp-serial-number		string optional	Serial number for the optical transceiver.
sfp-tx-power		string optional	SFP transmitted optical power, reported to tenth decimal in uWatts.
		string	

sfp-vendor-name		optional	Vendor name for the optical transceiver.
sfp-vendor-oui		string optional	Vendor OUI (The IEEE Organizationally Unique Identifier) for the optical transceiver.
sfp-wavelength		integer optional	Wavelength for the optical transceiver. Measured in nanometers. Range [830..860]
spurious-interrupts		integer	Count of spurious interrupts.
total-logins		integer	Counts the times of initiators added. Each time a new initiator is added, the total logins is incremented by 1. Each time an initiator is removed, the total logouts is incremented by 1.
total-logouts		integer	Counts the times of initiators removed. Each time a new initiator is added, the total logins is incremented by 1. Each time an initiator is removed, the total logouts is incremented by 1.

Element definition: **fcp-adapter-topology-switch-info**

[top]

Information about an FC switch connected to an FC adapter.

Name	Range	Type	Description
adapter		string	The name of the adapter this switch is visible through.
domain		integer	The domain identifier of the FC switch. Range: [1..255]
fcp-adapter-topology-switch-ports		fcp-adapter-topology-switch-port-info[] optional	List of ports for the FC switch. This is only returned if verbose is set to true.
logical-name		string	The logical name of the FC switch. The maximum length is 64.
node-name		string	Node name of the FC switch. The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.
port-count		integer	The number of ports discovered on the FC switch. Range: [0..2^32-1]
release		string	The release version of the FC switch. The maximum length is 64.
vendor		string	The name of the FC switch vendor. The maximum length is 64.

Element definition: **fcp-adapter-zone-info**

[top]

Information about a zone.

Name	Range	Type	Description
adapter		string	The adapter this zone is visible through.
fcp-adapter-zone-members		fcp-adapter-zone-member-info	List of zone members.

zone-name		string	The name of the zone. The maximum length is 64.
zone-set-name		string	The name of the zone set containing this zone. The maximum length is 64.

Element definition: **fcp-config-adapter-info**

[top]

Configuration information for one FC adapter When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
adapter		string optional	Adapter Attributes: key, non-creatable, non-modifiable
connection-established		fcp-connection optional	Connection Established Attributes: non-creatable, non-modifiable Possible values: • "loop" , • "ptp"
data-link-rate	**[0..2^32-1]**	integer optional	Data Link Rate (Gbit) Attributes: non-creatable, non-modifiable
data-protocols-supported		fcp-adapter-data-protocol[] optional	Data Protocols Supported Attributes: non-creatable, non-modifiable Possible values: • "fcp" , • "fc_nvme"
fabric-established		boolean optional	Fabric Established Attributes: non-creatable, non-modifiable
fabric-name		string optional	Fabric Name Attributes: non-creatable, non-modifiable
firmware-rev		string optional	Firmware Revision Attributes: non-creatable, non-modifiable
hardware-rev		string optional	Hardware Revision Attributes: non-creatable, non-modifiable
info-name		string optional	Description Attributes: non-creatable, non-modifiable
is-sfp-diagnostics-internally-calibrated		boolean optional	Is Internally Calibrated Attributes: non-creatable, non-modifiable
is-sfp-optical-transceiver-valid		boolean optional	Validity Of Transceiver Attributes: non-creatable, non-modifiable
is-sfp-rx-in-los		boolean optional	Is Receiver In LOS Attributes: non-creatable, non-modifiable
is-sfp-rx-power-in-range		boolean optional	Is Received Power In Range Attributes: non-creatable, non-modifiable
is-sfp-tx-in-disable		boolean	Is Xmit Disabled Attributes: non-creatable, non-

		optional	modifiable
is-sfp-tx-in-fault		boolean optional	Is Xmit In Fault Attributes: non-creatable, non-modifiable
is-sfp-tx-power-in-range		boolean optional	Is Xmit Power In Range Attributes: non-creatable, non-modifiable
max-speed		integer optional	Maximum Speed Attributes: non-creatable, non-modifiable
media-type		string optional	Mediatype Attributes: non-creatable, non-modifiable
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
node-name		string optional	Adapter WWNN Attributes: non-creatable, non-modifiable
physical-protocol		string optional	Physical Protocol Attributes: non-creatable, non-modifiable
port-address	**[0..2^32-1]**	integer optional	Host Port Address Attributes: non-creatable, non-modifiable
port-name		string optional	Adapter WWPN Attributes: non-creatable, non-modifiable
sfp-connector		string optional	Connector Used Attributes: non-creatable, non-modifiable
sfp-date-code		string optional	Date Code Of Transceiver Attributes: non-creatable, non-modifiable
sfp-ddm-capabilities		string optional	Status Monitoring Available Attributes: non-creatable, non-modifiable
sfp-ddm-status-control	**[0..2^32-1]**	integer optional	DDM Status Attributes: non-creatable, non-modifiable
sfp-diagnostic-monitoring-type	**[0..2^32-1]**	integer optional	Diagnostic Monitoring Type Attributes: non-creatable, non-modifiable
sfp-encoding		string optional	Encoding Used Attributes: non-creatable, non-modifiable
sfp-fc-speedcapabilities		string optional	FC Capabilities Of Transceiver Attributes: non-creatable, non-modifiable
sfp-formfactor		string optional	Form Factor Of Transceiver Attributes: non-creatable, non-modifiable
sfp-part-number		string optional	Part Number Of Transceiver Attributes: non-creatable, non-modifiable
sfp-rev		string optional	Revision Of Transceiver Attributes: non-creatable, non-modifiable
sfp-rx-power		string optional	Received Optical Power Attributes: non-creatable, non-modifiable
sfp-serial-number		string optional	Serial Number Of Transceiver Attributes: non-creatable, non-modifiable
sfp-sff8472-compliance	**[0..2^32-1]**	integer optional	SFF-8472 Compliance Attributes: non-creatable, non-modifiable
sfp-tx-power		string optional	SFP Transmitted Optical Power Attributes: non-creatable, non-modifiable
sfp-vendor-name		string optional	Vendor Name Of Transceiver Attributes: non-creatable, non-modifiable
sfp-vendor-oui		string optional	Vendor OUI Of Transceiver Attributes: non-creatable, non-modifiable
sfp-wavelength	**[0..65535]**	integer optional	Wavelength In Nanometers Attributes: non-creatable, non-modifiable
		string	Link speed Attributes: non-creatable, non-

speed		optional	modifiable
state		string optional	Operational Status Attributes: non-creatable, non-modifiable
status-admin		fcp-adapter-state optional	Administrative Status Attributes: non-creatable, modifiable Possible values: • "down" , • "up"
status-extended		string optional	Extended Status Attributes: non-creatable, non-modifiable
switch-port		string optional	Switch Port Attributes: non-creatable, non-modifiable

Element definition: **fcp-interface-info**

[top]

Information about a single FCP Logical Interface (LIF). When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
current-node		string optional	Node currently hosting the LIF. Attributes: non-creatable, non-modifiable
current-port		string optional	FC Adapter currently hosting the LIF. Attributes: non-creatable, non-modifiable
interface-name		string optional	Name of the LIF. Attributes: key, non-creatable, non-modifiable
node-name		string optional	World Wide Node Name (WWNN) of the LIF. All LIFs in a Vserver have the same WWNN as the Vserver's FCP service. Attributes: non-creatable, non-modifiable
port-address		string optional	Host port address of LIF. Attributes: non-creatable, non-modifiable
port-name		string optional	World Wide Port Name (WWPN) of the LIF. Attributes: non-creatable, non-modifiable
relative-port-id		integer optional	The SCSI Relative Target Port Identifier of the LIF. Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver hosting the LIF. Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-nameserver-info**

[top]

FCP name server entry for the adapter When returned as part of the output, all elements of this typedef

are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
fabric-port-wwn		string optional	Fabric world wide port name (WWPN) of the lif Attributes: non-creatable, non-modifiable
fc4-type		string optional	Registered FC4 Type Attributes: non-creatable, non-modifiable
lif		string optional	LIF Name Attributes: key, non-creatable, non-modifiable
node-wwn		string optional	World Wide Node Name (WWNN) of the lif Attributes: non-creatable, non-modifiable
port-id	**[0..2^32-1]**	integer optional	Assigned port identifier of the lif Attributes: key, non-creatable, non-modifiable
port-type		string optional	Port type of the lif Attributes: non-creatable, non-modifiable
port-wwn		string optional	World Wide Port Name (WWPN) of the lif Attributes: non-creatable, non-modifiable
service-class		string optional	Registered class of services as defined in the FC-FS standard Attributes: non-creatable, non-modifiable
switch-port		string optional	Name of switch port connected to target array Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Vserver hosting the FCP LIF Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-ping-igroup-status-info**

[top]

FCP Ping result When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ext-status		string optional	Extended Status Attributes: non-creatable, non-modifiable
igroup		string optional	Igroup Name Attributes: key, non-creatable, non-modifiable
lif		string optional	LIF Name Attributes: key, non-creatable, non-modifiable

node		string optional	Node Attributes: non-creatable, non-modifiable
portset		string optional	Portset Attributes: non-creatable, non-modifiable
status		string optional	Ping Status Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable
wwpn		string optional	FCP initiator WWPN Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-ping-status-info**

[top]

Connectivity check between FCP initiator and FCP LIF When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ext-status		string optional	Extended Status Attributes: non-creatable, non-modifiable
lif		string optional	LIF Name Attributes: key, non-creatable, non-modifiable
node		string optional	Node Attributes: non-creatable, non-modifiable
status		string optional	Ping Status Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable
wwpn		string optional	Remote WWPN Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-port-name-info**

[top]

Information for one valid local port name.

Name	Range	Type	Description
fcp-adapter		string optional	Only if this WWPN is being used by a Fibre Channel interface, the name of the interface is returned. In Data ONTAP 7-Mode, the name of a local adapter. In Data ONTAP Cluster-Mode, the name of an FCP data LIF.
is-used		boolean	This indicates whether this WWPN is being used by a Fibre Channel target interface.
port-			A Fibre Channel WWPN in the form XX:XX:XX:XX:XX:XX:XX:XX where X is a

name		string	hexadecimal digit.
vserver		string	Vserver containing this port name

Element definition: **fcp-service-info**

[top]

FCP target service configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-available		boolean optional	true if the FCP Service is running, false otherwise. Attributes: non-creatable, non-modifiable
node-name		string optional	The world-wide node name (WWNN) of the FCP target in the Vserver. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver hosting the FCP service. Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-tdz-info**

[top]

FCP tdz entry for the adapter When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
lif		string optional	LIF Name Attributes: key, non-creatable, non-modifiable
peer-zone-name		string optional	Peer Zone Name Attributes: key, non-creatable, non-modifiable
principal-wwn		string optional	Principal Member WWN Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable
zone-wwpns		string optional	Zone Members Attributes: non-creatable, non-modifiable

Element definition: **fcp-topology-info**

[top]

FCP topology interconnect When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
domain-id	**[0..2^32-1]**	integer optional	Domain Identifier Attributes: key, non-creatable, non-modifiable
lif		string optional	LIF Name Attributes: key, non-creatable, non-modifiable
logical-name		string optional	Logical Name Attributes: non-creatable, non-modifiable
port-count	**[0..2^32-1]**	integer optional	Port Count Attributes: non-creatable, non-modifiable
release		string optional	Release Attributes: non-creatable, non-modifiable
vendor		string optional	Vendor Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable
wwn		string optional	World Wide Name Attributes: non-creatable, non-modifiable

Element definition: **fcp-topology-port-info**

[top]

FCP topology interconnect elements for the adapter When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
adapter		string optional	Adapter name Attributes: key, non-creatable, non-modifiable
domain-id	**[0..2^32-1]**	integer optional	Domain Id Attributes: key, non-creatable, non-modifiable
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable

port-attached-id		string optional	Attached Port Id Attributes: non-creatable, non-modifiable
port-attached-visible		string optional	Visible Attributes: non-creatable, non-modifiable
port-attached-wwpn		string optional	Attached Port WWPN Attributes: non-creatable, non-modifiable
port-count	**[0..2^32-1]**	integer optional	Port Count Attributes: non-creatable, non-modifiable
port-slot		string optional	Port Slot Attributes: non-creatable, non-modifiable
port-state		fcpportstate optional	Port State Attributes: non-creatable, non-modifiable Possible values: • "unknown" , • "online" , • "offline" , • "testing" , • "fault"
port-type		fcporttype optional	Port Type Attributes: non-creatable, non-modifiable Possible values: • "none" , • "n_port" , • "nl_port" , • "fnl_port" , • "nx_port" , • "f_port" , • "fl_port" , • "e_port" , • "b_port" , • "tnp_port" , • "tf_port" , • "nv_port" , • "fv_port" , • "sd_port" , • "te_port" , • "tl_port"
port-wwpn		string optional	Port WWPN Attributes: key, non-creatable, non-modifiable
switch-name		string optional	Switch Name Attributes: non-creatable, non-modifiable
switch-release		string optional	Switch Release Attributes: non-creatable, non-modifiable
switch-vendor		string optional	Switch Vendor Attributes: non-creatable, non-modifiable
switch-wwn		string optional	Switch WWN Attributes: non-creatable, non-modifiable

Element definition: **fcp-zone-info**

[top]

FCP active zone set entry for the adapter When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of

desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
adapter		string optional	Adapter name Attributes: key, non-creatable, non-modifiable
contents		string optional	Member Contents Attributes: non-creatable, non-modifiable
domain-id	**[0..2^32-1]**	integer optional	Member Domain Id Attributes: non-creatable, non-modifiable
node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
port	**[0..2^32-1]**	integer optional	Member Port Attributes: non-creatable, non-modifiable
port-id	**[0..2^32-1]**	integer optional	Member Port Id Attributes: non-creatable, non-modifiable
type	**[0..2^32-1]**	integer optional	Member Type Attributes: non-creatable, non-modifiable
type-name		string optional	Member Type Name Attributes: non-creatable, non-modifiable
unique	**[0..2^32-1]**	integer optional	Unique Attributes: key, non-creatable, non-modifiable
wwn		string optional	Member WWN Attributes: non-creatable, non-modifiable
zone-count	**[0..2^32-1]**	integer optional	Zone Count Attributes: non-creatable, non-modifiable
zone-member-count	**[0..2^32-1]**	integer optional	Zone Member Count Attributes: non-creatable, non-modifiable
zone-name		string optional	Zone Name Attributes: key, non-creatable, non-modifiable
zoneset-name		string optional	Zoneset Name Attributes: key, non-creatable, non-modifiable

Element definition: **fcp-adapter-topology-switch-port-info**

[top]

Information about the FC switch port.

Name	Range	Type	Description
fcp-adapter-topology-attached-ports		fcp-adapter-topology-attached-port-info[]	List of devices attached to this port.
port-name		string	World wide port name (WWPN) of the port. The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.
port-number		integer	Port index number. Range: [0..2^32-1]
port-state		string	Port state. Possible values: "online", "offline", "testing", "fault", and "unknown".
port-type		string	Port type. Possible values: "n-port", "nl-port", "fnl-port", "nx-port", "f-port", "fl-port", "e-port", "b-port", "nv-port", "fv-port", "sd-port", "te-port", "tl-port", and "none".

Element definition: **fcp-adapter-zone-member-info**

[top]

Information about a zone member.

Name	Range	Type	Description
domain-id		integer optional	Domain identifier of the switch. This element is returned if the zone-member-type is "domain-id-port". Range: [0..2^32-1]
fabric-port-name		string optional	World wide port name (WWPN) of the fabric port. This element is returned if the zone-member-type is "fabric-port-name". The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.
node-name		string optional	World wide node name (WWNN) of the N-port. This element is returned if the zone-member-type is "node-name". The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.
port		integer optional	Port number on the switch. This element is returned if the zone-member-type is "domain-id-port". Range: [0..2^32-1]
port-id		integer optional	Assigned port identifier. This element is returned if the zone-member-type is "port-id". Range: [0..2^24-1]
port-name		string optional	World wide port name (WWPN) of the N-port. This element is returned if the zone-member-type is "port-name". The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

zone-member-type		string	The type of zone member. Possible values are: "port-name", "domain-id-port", "port-id", "node-name", "fabric-port-name", and "unknown".
zone-member-value		integer optional	Uninterpreted value. This element is returned if the zone-member-type is "unknown". Range: [0..2^32-1]

Element definition: **fcp-connected-initiator-info**

[top]

Information about an initiator connected to an FC adapter.

Name	Range	Type	Description
initiator-group-list		initiator-group-list-info[] optional	List of initiator groups this initiator belongs to.
node-name		string	World Wide Node Name (WWNN) of initiator.
port-address	**[0..2^32-1]**	integer	Fibre Channel host address it is connected to.
port-name		string	World Wide Port Name (WWPN) of the initiator.
portname-alias-list		portname-alias-name[] optional	List of aliases for the WWPN.

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

Element definition: **fcp-adapter-topology-attached-port-info**

[top]

Information about the attached device.

Name	Range	Type	Description
is-visible		boolean	Visibility of this device through this adapter from a zoning perspective.
port-id		integer	Assigned port identifier of the attached device. A value of 0 indicates no value has been assigned. Range: [0..2^24-1]

port-name		string	World wide port name (WWPN) of the attached device. The format is: XX:XX:XX:XX:XX:XX:XX:XX where X is a hexadecimal digit.

Element definition: **initiator-group-list-info**

[top]

The initiator group this initiator belongs to.

Name	Range	Type	Description
initiator-group-name		string	Name of initiator group.

Element definition: **portname-alias-name**

[top]

Aliases for this WWPN

Name	Range	Type	Description
portname-alias		string	Alias for the WWPN

APIs in Category: **fcport**

fcport-get-link-state
fcport-reset-dev
fcport-send-lip
fcport-set-offline
fcport-set-online

fcport-get-link-state

[top]

Get the link state of a specific adapter on this system.

Input Name	Range	Type	Description
adapter-name		string	The adapter name is either a slot number, or, if a port letter is also presented, a slot number and port letter concatenated into a single name -- for example, "8a" or "11b". If adapter-name is not supplied, the command will return EAPIMISSINGARGUMENT.
node-name		string	This field is only valid when the request is sent to the Admin Vserver LIF. This is the storage system name the command will be executed on.

Output Name	Range	Type	Description
adapter-link-state		link-state-info[]	adapter link state info
adapter-name		string	The adapter name is either a slot number, or, if a port letter is also presented, a slot number and port letter concatenated into a single name.

Errno	Description
EAPIMISSINGARGUMENT	
EOPNOTSUPPORTED	
EINVALIDINPUTERROR	
EINTERNALERROR	

fcport-reset-dev

[top]

When invoked the device will be reset. The device will be temporarily suspended while it is reset, after which it will resume processing device operations. This command should be used with care as it can have adverse effects, for instance pending commands to the device will be aborted when issuing this command.

Input Name	Range	Type	Description
device-id		string	The device id is presented as a slot number followed by the port letter concatenated with the device-id. These two parts are separated by a period. For example 6b.5 If the device-id is omitted EAPIMISSINGARGUMENT will

			be returned. If the device-id is invalid EINVALIDINPUTERROR will be returned.

Errno	Description
EAPIMISSINGARGUMENT	
EINVALIDINPUTERROR	
EOPNOTSUPPORTED	

fcport-send-lip

[top]

This will initiate a loop initialization on the specified fibrechannel loop port. The loop will be temporarily suspended while it is initialized, after which it will resume processing loop operations. This command should be used with care, because it can have adverse effects, like pending commands will be aborted when issuing this command.

Input Name	Range	Type	Description
loop-id		string	The loop id is presented as a slot number and port letter concatenated (for example 6a). If the loop-id is omitted EAPIMISSINGARGUMENT will be returned. If the loop-id is invalid EINVALIDINPUTERROR will be returned.

Errno	Description
EAPIMISSINGARGUMENT	
EINVALIDINPUTERROR	
ELOOPUNAVAILABLE	

fcport-set-offline

[top]

Offline a specific adapter on this system. This API should be used with care, as it can have adverse side effects, which you lose access to all devices of that port. The operation of offlining the already offlined adapter will be considered success.

Input Name	Range	Type	Description
adapter-name		string	The adapter name is either a slot number, or, if a port letter is also presented, a slot number and port letter concatenated into a single name -- for example, "8a" or "11b". If adapter-name is not supplied, the command will return EAPIMISSINGARGUMENT.

Errno	Description
EAPIMISSINGARGUMENT	
EOPNOTSUPPORTED	
EINVALIDINPUTERROR	
EINTERNALERROR	

fcport-set-online

[top]

Online a specific adapter on this system. The operation of onlining the already onlined adapter will be considered success.

Input Name	Range	Type	Description
adapter-name		string	The adapter name is either a slot number, or, if a port letter is also presented, a slot number and port letter concatenated into a single name -- for example, "8a" or "11b". If adapter-name is not supplied, the command will return EAPIMISSINGARGUMENT.

Errno	Description
EAPIMISSINGARGUMENT	
EOPNOTSUPPORTED	
EINVALIDINPUTERROR	
EINTERNALERROR	

Element definition: **link-state-info**

[top]

list link-state info of a specific adapter channel

Name	Range	Type	Description
adapter-name		string	The adapter name is either a slot number, or, if a port letter is also presented, a slot number and port letter concatenated into a single name.
fc-port-info		fc-ports optional	fiber channel port information. Present only when link-state field value is "up".
link-state		string	Possible values: "initing", "down", "up", "offline-physical", "offline-logical", or "zombified", which the adapter has stopped sending I/O and is ignoring link events. This state may occur when shelf firmware is being updated.
node-name		string optional	This field is only valid when the request is sent to the Admin Vserver LIF, in which case it is the storage system name.

Element definition: **fc-ports**

[top]

Information about the ports belonging to the fiber channel adapter

Name	Range	Type	Description
port-number		string optional	This represents the physical port number of the FC port. Field is not present when port-type is "l-port"
port-type		string	Type of port. Possible values: "l-port", loop port, node port used to connect a node to a Fibre Channel loop. "nl-port", network+loop port, node port which connects to both loops and switches. "n-port", network port, node port used to connect a node to a Fibre Channel switch.
switch-name		string optional	This is the switch name, if any, connected to the FC port. Field is not present when port-type is "l-port"
switch-wwn		string optional	This is the world wide name of the switch, if any, connected to the FC port. Field is not present when port-type is "l-port"

APIs in Category: **feature**

feature-status-list-info
feature-usage-get-iter
feature-usage-summary-get-iter

This set of APIs allow management of 7-Mode and Cluster-Mode features for Data ONTAP 8.2 and later. The feature status are set internally based on the enablement, entitlement, and other configuration restrictions of the feature.

feature-status-list-info

[top]

Returns status information for managed features.

Output Name	Range	Type	Description
managed-feature-status-list		managed-feature-status-info[]	An array, one entry per each managed feature.

Errno	Description
EINTERNALERROR	

feature-usage-get-iter

[top]

Returns feature usage information for DATA ONTAP features. The feature usage information is reported on a per controller node basis.

Input Name	Range	Type	Description
desired-attributes		usage-state-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		usage-state-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the feature object. All feature objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		usage-state-info[] optional	The list of attributes of feature objects.
next-tag		string optional	Tag for the next call. Not present when there are no more feature objects to return.

num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

feature-usage-summary-get-iter

[top]

Returns feature usage summary information for DATA ONTAP features. The feature usage information is reported on a per controller node basis.

Input Name	Range	Type	Description
desired-attributes		usage-summary-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		usage-summary-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the feature object. All feature objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		usage-summary-info[] optional	The list of attributes of feature objects.
next-tag		string optional	Tag for the next call. Not present when there are no more feature objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

Element definition: **managed-feature-status-info**

[top]

Status information about a managed feature. When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of

objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
feature-name		managed-feature optional	Managed feature name. Attributes: key, non-creatable, non-modifiable
notes		string optional	Additional information about the managed feature status. Attributes: non-creatable, non-modifiable
status		managed-feature-status optional	Status of a managed feature. Attributes: non-creatable, non-modifiable

Element definition: **usage-state-info**

[top]

Information about feature usage. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
date-collected		datetime optional	The time data was collected. Attributes: non-creatable, non-modifiable
feature-message		string optional	Additional feature reported message. Attributes: non-creatable, non-modifiable
feature-name		managed-feature optional	Name of the feature. Attributes: key, non-creatable, non-modifiable Possible values: • "cifs" , • "nfs" , • "iscsi" , • "fcp" , • "dedupe" , • "flexclone" , • "compression" , • "snaprestore" , • "snaplock" , • "snaplock_enterprise" , • "snapvault_primary" , • "snapvault_secondary" , • "snapmirror" , • "syncmirror" , • "flexcache" , • "ndmp" , • "multistore" , • "cdmi" , • "snapdrive_windows" , • "snapmanager_exchange" , • "snapmanager_sql" , • "snapmanager_sharepoint" ,

			• "snapmanager_hyperv" , • "snapdrive_unix" , • "snapmanager_oracle" , • "snapmanager_sap" , • "v_storageattach" , • "mt_ek_mgmt" , • "s3"
node		node-name optional	Name of the controller node. Attributes: key, non-creatable, non-modifiable
owner		string optional	Name of the controller node. Attributes: non-creatable, non-modifiable
serial-number		node-serial-number optional	Serial number of the controller node. Attributes: key, non-creatable, non-modifiable
usage-status		feature-usage-state optional	The usage status information. Attributes: non-creatable, non-modifiable Possible values: • "not_used" - Not Used, • "configured" - Configured, • "in_use" - In Use, • "not_available" - Not Available
week-number		seqnum optional	The week of data collection. Week number one is the oldest week of collection. Attributes: key, non-creatable, non-modifiable

Element definition: **usage-summary-info**

[top]

Summary information about feature usage. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
			Name of the feature. Attributes: key, non-creatable, non-modifiable Possible values: • "cifs" , • "nfs" , • "iscsi" , • "fcp" , • "dedupe" , • "flexclone" , • "compression" , • "snaprestore" , • "snaplock" , • "snaplock_enterprise" , • "snapvault_primary" , • "snapvault_secondary" ,

feature-name		managed-feature optional	• "snapmirror" , • "syncmirror" , • "flexcache" , • "ndmp" , • "multistore" , • "cdmi" , • "snapdrive_windows" , • "snapmanager_exchange" , • "snapmanager_sql" , • "snapmanager_sharepoint" , • "snapmanager_hyperv" , • "snapdrive_unix" , • "snapmanager_oracle" , • "snapmanager_sap" , • "v_storageattach" , • "mt_ek_mgmt" , • "s3"
last-used-time		datetime optional	The time when the feature was last recorded to be in-use. Attributes: non-creatable, non-modifiable
owner		string optional	Name of the controller node. Attributes: non-creatable, non-modifiable
serial-number		node-serial-number optional	Serial number of the controller node. Attributes: key, non-creatable, non-modifiable
weeks-configured	**[0..2147483647]**	integer optional	Number of weeks the feature was recorded to be configured. Attributes: non-creatable, non-modifiable
weeks-in-use	**[0..2147483647]**	integer optional	Number of weeks the feature was recorded to be in-use. Attributes: non-creatable, non-modifiable
weeks-not-available	**[0..2147483647]**	integer optional	Number of weeks the feature was recorded to not have usage data available. Attributes: non-creatable, non-modifiable
weeks-not-used	**[0..2147483647]**	integer optional	Number of weeks the feature was recorded to be not used. Attributes: non-creatable, non-modifiable

Element definition: **datetime**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

- "v_storageattach" ,
- "mt_ek_mgmt" ,
- "s3"

[none]

Element definition: **managed-feature-status**

[top]

Represents the status of a managed feature. Possible values:

- "on" - feature is entitled and turned on,
- "available" - feature is entitled and available to be turned on. Its current on/off status is unknown,
- "on_not_configurable" - feature is no longer entitled but it was turned on before and remains to be on. Feature is not configurable at the moment,
- "off" - feature is entitled but turned off,
- "not_available" - feature is not entitled, licensing infrastructure is unavailable, or other configuration check prevents feature use. The field notes can provide additional information.

file-write-file

The path and filename values used in these APIs are "NFS" filenames by default. If a file is created with a name that is illegal in CIFS, CIFS access to the file will need to use the file's 8.3 name. Similarly, if two filenames created by these APIs differ only by case (e.g. "a" and "A"), CIFS access will see the 8.3 name for the second one created.

To access files or directories with Unicode file names, the UTF-8 equivalent of the Unicode path can be used. If a file contains Unicode-format data, the filer returns all the data in the file including the identifier in the first two bytes of the file which indicates the file contains Unicode data (0xFEFF).

A file may optionally contain multiple distinct streams of data. A stream is an on disk structure containing a sequence of bytes, analogous to a file. A stream associated with a file is identified by a name, and data may be read or written to a file or stream. A stream can be thought of as a hidden file associated with a base file, and is visible in the name space of the base file. Streams are typically used to store metadata associated with the base file

file-assign-qos

[top]

Manage the association of QoS policy group to a specified file. QoS Policy groups define measurable Service Level Objectives (SLOs) that apply to the storage object with which the policy group is associated. In Data ONTAP 8.2 hierarchical QoS is not supported i.e. QoS policy groups cannot be assigned to multiple objects in the file's storage hierarchy - such as the parent LUN, volume or Vserver.

Input Name	Range	Type	Description
			The caching policy that is associated with this file. This policy is used to make caching decisions for this file. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing

caching-policy		string optional	Vserver, the system uses the default cluster-wide policy. The possible options for this value are: • none - Does not cache any user data or metadata blocks. • auto - Read caches all metadata blocks and randomly read user data blocks, and write caches all randomly overwritten user data blocks. • meta - Read caches only metadata blocks. • random_read - Read caches all metadata and randomly read user data blocks. • random_read_write - Read caches all metadata, randomly read and randomly written user data blocks. • all_read - Read caches all metadata, randomly read and sequentially read user data blocks. • all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. • all - Read caches all data blocks read and written. It does not do any write caching. Default caching-policy is auto.
file		string	Complete file path of the file without a trailing slash.
qos-adaptive-policy-group-name		string optional	The QoS adaptive policy group name that is to be associated with this file in order to enforce service level objectives (SLO). NOTE: none is a reserved keyword for deleting the association of the file with a QoS adaptive policy group.
qos-policy-group-name		string optional	The QoS Policy Group name that is to be associated with this file in order to enforce Service Level Objectives (SLO). NOTE: none is a reserved keyword for deleting the association of the file with a QoS policy group.
volume		volume-name	Name of the Volume in which the file resides.
vserver		vserver-name	Name of the Vserver in which the volume that hosts the file resides.

file-compact-data

[top]

compact data

Input Name	Range	Type	Description
file		string	File Path
node		filer-id	Node

snapshot		snapshot-id	Snapshot Copy Name
volume		volume-name	Volume Name
vserver		vserver-name	Vserver Name

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-create-directory

[top]

Create a directory.

Input Name	Range	Type	Description
path		string	Path of the directory to be created. The value is expected to begin with /vol/.
perm		string	Permission of the directory to be created. It's similar to Unix style permission bits: 0755 gives read/write/execute permissions to owner and read/execute to group and other users. It consists of 4 octal digits derived by adding up bits 4, 2 and 1. Omitted digits are assumed to be zeros. First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file: read (4), write (2) and execute (1); the third selects permissions for other users in the same group; the fourth for other users not in the group. Note: Prior to Data ONTAP 7.3.1 this value was treated as a base-10 number.

file-fingerprint-abort

[top]

The file-fingerprint-abort API can be used to abort an ongoing fingerprint operation. This api only aborts the fingerprint operations that have been started and have not finished. You identify the session-id with this API, and it aborts the fingerprint operation that is associated with that particular session-id. You must specify session-id when using file-fingerprint-abort.

Input Name	Range	Type	Description
session-id	**[0..2^32-1]**	integer	session-id of the fingerprint operation that needs to be stopped.

Errno	Description
EONTAPI_EINVAL	
EONTAPI_ENOENT	
EONTAPI_EIO	
EONTAPI_EOFFLINE	
EINTERNALERROR	

file-fingerprint-dump

[top]

The file-fingerprint-dump API returns the fingerprint information for a file. The session-id must be specified when using the file-fingerprint-dump API.This is the session-id of the fingerprint operation that is returned when a fingerprint operation is started using the file-fingerprint-start API. If the fingerprint operation is complete, it will also show the complete fingerprint information for the file.

Input Name	Range	Type	Description
desired-attributes		fingerprint-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
session-id	**[0..2^32-1]**	integer	An unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

Output Name	Range	Type	Description
attributes		fingerprint-info	The attributes of the file.

Errno	Description

Errno	Description
EONTAPI_EINVAL	
EONTAPI_ENOENT	
EONTAPI_EIO	
EONTAPI_EOFFLINE	
EINTERNALERROR	

file-fingerprint-get-iter

[top]

The file-fingerprint-get-iter API returns information for one or several fingerprint operations. We need to specify either session-id or vserver-name and volume-name with the file-fingerprint-get-iter API. When queried with session-id, the file-fingerprint-get-iter API returns the progress of the fingerprint operation with the specified session-id. When queried with vserver-name and volume-name, the file-fingerprint-get-iter API returns the progress of all the fingerprint operations running on that particular volume.

Input Name	Range	Type	Description
desired-attributes		fingerprint-status-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fingerprint-status-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the file object. All file objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fingerprint-status-info[] optional	The list of attributes of file objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EONTAPI_EINVAL	
EONTAPI_ENOENT	
EONTAPI_EIO	
EONTAPI_EOFFLINE	
EINTERNALERROR	

file-fingerprint-start

[top]

The file-fingerprint-start API is used to start the fingerprint computation a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is an unique identifier for the fingerprint operation. To start the fingerprint computation on a file, the following parameters should be compulsarily specified:

- vserver : Name of the vserver which owns the volume.
- file : Complete file path of the file on which the fingerprint needs to be computed. This file path is of the form vol//

Input Name	Range	Type	Description
algorithm		string optional	The digest algorithm which will be used for the fingerprint computation. Fingerprint can be computed using one of the following digest algorithms : • md5 • sha-256 If no algorithm is specified during file fingerprint start, then by default, we compute fingerprint of the file using the sha-256 digest alogorithm.
file		string	Full path of the file on which fingerprint needs to be calculated. The value begins with /vol/.
scope		string optional	The file scope which will be used for the fingerprint computation. FIngerprint can be computed over one of the following : • data • metadata • both data and metadata If no scope is specified during file fingerprint start, then by default, we compute fingerprint of the file over both data and metadata.

Output Name	Range	Type	Description
result-session-id		integer optional	An unique identifier for the fingerprint operation. The result-session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

file-get-space-reservation-info

[top]

Queries the space reservation settings for the named file.

This API is not supported for Infinite Volumes.

Input Name	Range	Type	Description
path		string	File to be queried.
volume-id		string	The identifier of the volume in which the named file exists. There are two legal choices for a volume identifier, either a DSID or a UUID. DSIDs are formatted as 18-character strings composed of 16 hex characters, zero filled if required and prefixed with '0x'. Here is an example of an actual DSID: 0x0000000000000401 UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used. Here is an example of an actual UUID: 49e370d6-5b5a-11d9-9eb5-000100000529

Output Name	Range	Type	Description
is-fill-enabled		boolean	Whether or not the file is set with fill.
is-overwrite-enabled		boolean	Whether or not the file is set with overwrite.

file-hole-range-query-iter

[top]

Return ranges of holes in a file

Input Name	Range	Type	Description
length		integer	The number of bytes to scan. If this is zero scan until end of file. If the length is not an integral multiple of the block size it will be rounded up to the end of the block. Range : [0..2^63-1]
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 64
offset		integer	The starting offset of the file from where the scan for holes should begin. If the offset is not an integral multiple of the block size it will be rounded down to the start of the block. Range : [0..2^63-1]
path		string	The full path of the file for which hole information is to be queried. Format must be of the following: /vol/my_vol/my_file
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		hole-range-info[] optional	The list of attributes of file objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

[top]

file-inode-info

Get parent information for a given inode.

This API corresponds to the "inodepath" diagnostic-level CLI in ONTAP-Classic, and has the same defaults.

The input is:

- Required, a volume identifier. A volume may be specified by name, fsid, or (in some ONTAP products) UUID/DSID.
- Required, an inode number.
- Optional, a snapshot identifier to get information from a snapshot rather than the active volume. A snapshot may be specified by name or by id.
- Optional, various reporting flags (see below) to enable or disable optional output information.

The output is:

- All volume identifiers, the one used as input plus the values of the others.
- Optionally, all snapshot identifiers; the one used as input plus the value of the other.
- The number of parents for the inode.
- Optionally, one or more volume relative pathnames to the inode
- Optionally, one or more leaf names for the inode.
- Optionally, one or more of the actual parent info stored for the inode, in the form of the parent dir inode number and the parent directory cookie (fbn and offset into the fbn) used to find the dir entry that refers to the inode in the parent directory (ie. the info used to get the leaf name).

This API is only supported for flexible volumes and FlexGroup constituents.

Input Name	Range	Type	Description
encoded		boolean optional	Specifies if non ASCII characters present in the filename will be hex encoded or not. If set to true, then all non-ASCII characters present in the filename are transformed to \XX where XX is the hex equivalent of the character. For example, if the filename has a non-ASCII character whose hex equivalent is 0x5C then the character would be encoded as a three byte sequence of '\','5' and 'C' & returned as "\5C". By default, the value is false.
generation		integer optional	The generation number for this inode. Range: [1..2^32-1]
inode-number		integer	The inode number for which information is desired.
logical-snap-id		integer optional	All snapshots are associated with an internal index. "logical-snap-id" is the client-visible index that maps the the underlying internal index. Range: [1..255].
report-cifs-paths		boolean optional	Flag for indicating if the paths returned should be cifs-paths
report-leaf-name		boolean optional	If set to true, report the leaf name of the given inode. The leaf name is equivalent to the final component of a full pathname. For example, the leaf name of: /vol/vol0/foo/bar/baz is: baz By default, the inode's leaf name is not shown.
report-no-pathname		boolean optional	If set to true, do not report on the given inode's full pathname. By default, the inode's full pathname is reported.

report-other-parents		boolean optional	If set to true, report the requested information for all of the parents for the given inode. By default, only information about one of the given inode's parents is reported.
report-parent-data		boolean optional	If set to true, report various other pieces of information about the given inode. This information includes the inode of the parent directory containing the given inode, along with the directory cookie by which the given inode is known in that parent directory inode. By default, this other information is not reported for the given inode.
snap-id		integer optional	The snapshot number within the given volume in which the given inode is to be referenced. At most, one of snap-id or snap-name can be provided. If neither is provided, we reference the given inode within the active file system of the given volume. Valid snapshot ids have a range of 0 to (WAFL_SNAP_CNT - 1) (currently 255). A value of 0 will refer to the active file system of the given volume. This refers to the physical snapshot identifier.
snap-name		string optional	A snapshot name within the given volume in which the given inode is to be referenced. At most, one of snap-id or snap-name can be provided. If neither is provided, we reference the given inode within the active file system of the given volume.
volume-dsid		string optional	The DSID (Data Set IDentifier) of the volume containing the given inode. Exactly one of volume-fsid, volume-name, volume-uuid or volume-dsid must be specified. DSIDs are formatted as 18-character strings composed of 16 hex characters prefixed with '0x'. NOTE: This form of volume identification is only supported in some ONTAP products (ONTAP-NG).
volume-fsid		integer optional	The FSID (file system identifier) of the volume containing the given inode. Exactly one of volume-fsid, volume-name, volume-uuid, or volume-dsid must be specified. An FSID may have any uint32_t value.
volume-name		string optional	The name of the volume containing the given inode. Exactly one of volume-fsid, volume-name, volume-uuid, or volume-dsid must be specified.
volume-uuid		string optional	The UUID (Universally Unique IDentifier) of the volume containing the given inode. Exactly one of volume-fsid, volume-name, volume-uuid or volume-dsid must be specified. UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used. An example UUID is 532ad684-c8ec-11d9-945f-00065b8c8a1e. NOTE: This form of volume identification is only supported in some ONTAP products (ONTAP-NG).

Output Name	Range	Type	Description
inode-number		integer	The number identifying the inode.
inode-paths		inode-parent-info[]	List of requested paths and parent information for the given inode.
logical-snap-id		integer optional	Logical snapshot index. This index maps to the above internal index. Logical index allows users to choose the same snapshot index across all members of a striped volume. This index is also useful for logical volume replication. A logical snapshot index of 0 implies that the

			snapshot is is not client-visible i.e. this is a un-coordinated snapshot. Range: [0..255].
number-of-parents		integer	The number of parents for the inode. For a file, this is the number of links to the file.
snapshot-id		integer optional	The snapshot id, if requested info is from a snapshot. This is the physical snapshot identifier.
snapshot-name		string optional	The name of the snapshot, if requested info is from a snapshot.
volume-dsid		string optional	The volume DSID.
volume-fsid		integer	The volume FSID.
volume-name		string	The volume name.
volume-uuid		string	The volume UUID.

file-inode-info-get-iter

[top]

Get information about all the files associated with an inode in a volume.

Input Name	Range	Type	Description
desired-attributes		inode-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		inode-info	A query that specifies which objects to return. A query could be specified on any number of attributes in the file object. All file objects matching this query up to 'max-records' will be returned.

tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		inode-info[] optional	The list of attributes of file objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

file-list-directory-iter

[top]

list of files in a given directory.

Input Name	Range	Type	Description
desired-attributes		file-info[] optional	Specify which attributes to return. If not set return all of them.
max-records	**[1..2^32-1]**	integer optional	Maximum number of directory entries to retrieve.
path		string	Pathname of the directory to list. The value is expected to begin with /vol/.
query		file-info[] optional	A query that specifies which objects to return. The query can specify any attributes in the file object. All file objects matching this query up to 'max-records' will be returned.
tag		string optional	Should be empty for first call. For subsequent calls should be the value returned by next-tag below.

Output Name	Range	Type	Description
attributes-list		file-info[] optional	Array with information for each file in the named directory.
next-tag		string optional	Tag to be used in the next call to continue iteration. Will not be returned if there are no more entries.
num-records	**[0..2^32-1]**	integer	This tells you how many records are being returned from this particular call to file-list-directory-iter-next. When this value is 0, you have retrieved everything.

file-list-directory-iter-end

[top]

Terminate a directory iteration.

Input Name	Range	Type	Description
tag		string	Tag from a previous file-list-directory-iter-start.

Errno	Description
EONTAPI_ENOENT	

Vfiler-enabled
Yes

file-list-directory-iter-next

[top]

Obtain a list of files in a given directory.

Input Name	Range	Type	Description
maximum		integer	Maximum number of directory entries to retrieve.
tag		string	Tag from a previous file-list-directory-iter-start.

Output Name	Range	Type	Description
files		file-info[]	Array with information for each file in the named directory.
			This tells you how many records are being returned from this particular

records		integer	call to file-list-directory-iter-next. When this value is 0, you have retrieved everything.

Errno	Description
EONTAPI_ENOENT	
EVOLUMEQUIESCED	
EVOLUMEBUSY	

Vfiler-enabled
Yes

file-list-directory-iter-start

[top]

Start in iteration through the list of files in a given directory.

Input Name	Range	Type	Description
encoded		boolean optional	Specifies if non ASCII characters present in the filename will be hex encoded or not. If set to true, then all non-ASCII characters present in the filename are transformed to \XX where XX is the hex equivalent of the character. For example, if the filename has a non-ASCII character whose hex equivalent is 0x5C then the character would be encoded as a three byte sequence of '\','5' and 'C' & returned as "\5C". By default, the value is false.
path		string	Pathname of the directory to list. The value is expected to begin with /vol/.

Output Name	Range	Type	Description
records		integer	Number of items that have been saved for future retrieval with file-list-directory-iter-next.
tag		string	Tag to be used in subsequent iterations.

Errno	Description
EONTAPI_ENOENT	
EVOLUMEQUIESCED	
EVOLUMEBUSY	
EAPIERROR	
EONTAPI_EINVAL	

Vfiler-enabled

file-punch-hole-iter

[top]

Punch hole in the file. Hole punching involves reclaiming of blocks in a file by unallocating them and then direct or indirect blocks can be made to point to 0.

Input Name	Range	Type	Description
attributes-list		hole-range-info[]	This is the array containing the ranges that need to be hole punched.
path		string	Path of the file. Format must be of the following: /vol/my_vol/path-to-file
tag		string optional	Do not set on first iteration. Use value of next-tag on subsequent iterations.

Output Name	Range	Type	Description
next-tag		string optional	Returned if not all ranges have been punched

file-read-file

[top]

Read data from a named file. API will fail if length exceeds 1 MB. This API should only be used on normal files or streams associated with files. The results for other file types such as LUNs is undefined.

Input Name	Range	Type	Description
length	**[0..1048576]**	integer	Number of bytes to read from the file.
offset	**[0..2^63-1]**	integer	Offset into file to start reading from. If the value of offset is beyond the eof, the API will fail with EAPIERROR.
path		string	Name of the file to read. For example: "/vol/<volume>/<file>".
stream-name		string optional	A stream is an on disk structure which contains a sequence of bytes, analogous to a file. A stream is always associated with exactly one file. Characters that are valid for a file name are also valid for the stream-name. e.g., "meta", "resource1". Use this option if the data should be read from the named stream associated with file specified by <path> Default is empty stream name, in which case the data is read from file specified by <path> This field is available in Data ONTAP 8.2 or later.

Output Name	Range	Type	Description
data		string	Data read from the file. The format of the data is ASCII hex characters, two characters representing one byte from the file. (This format allows the representation of 0-valued bytes.)
length	**[0..1048576]**	integer	Number of bytes actually read from the file. If this value is 0, then you have attempted to read at or past the end of the file.

file-set-space-reservation-info

[top]

Sets the space reservation settings for the named file. is-overwrite-enabled and is-fill-enabled both must be the same value.

This API is not supported for Infinite Volumes.

Input Name	Range	Type	Description
is-fill-enabled		boolean optional	Whether or not to set the file with fill.
is-overwrite-enabled		boolean optional	Whether or not to set the file with overwrite.
path		string	File to be queried.
volume-id		string	The identifier of the volume in which the named file exists. There are two legal choices for a volume identifier, either a DSID or a UUID. DSIDs are formatted as 18-character strings composed of 16 hex characters, zero filled if required and prefixed with '0x'. Here is an example of an actual DSID: 0x0000000000000401 UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used. Here is an example of an actual UUID: 49e370d6-5b5a-11d9-9eb5-000100000529 Space reservations are not supported on any volume within a Vserver

			with Infinite Volume, whether on the Infinite Volume itself or any of its constituents.

file-truncate-file

[top]

Truncate a file. Any data past the truncation point will be lost, of course.

Input Name	Range	Type	Description
path		string	Path of the file to truncate. The value is expected to begin with /vol/.
size	**[0..2^63-1]**	integer optional	If provided, the file size in bytes is set to this value. The default value is 0.

file-usage-get

[top]

Reports unique bytes held in a file.

Input Name	Range	Type	Description
length		integer optional	Length of the range in bytes. If it is not specified, the range that is reported is from start-offset to end-of-file. Range : [0..2^63-1].
path		string	File name to generate report: E.g., /vol/vol1/file1
start-offset		integer optional	Start range of file in bytes. If this is not specified, it is assumed to be beginning of file (offset 0). Range : [0..2^63-1].

Output Name	Range	Type	Description
total-bytes		integer	Number of bytes held by this file. Range : [0..2^63-1].
unique-bytes		integer	Number of bytes 'uniquely' held by this file. Range : [0..2^63-1].

Errno	Description
EVSERVERNOTFOUND	
EINVALIDINPUTERROR	
EINTERNALERROR	
EONTAPI_ENOENT	
EONTAPI_EINVAL

file-usage-result-get

[top]

Used to poll and retrieve results for a previous file-usage-start call. EINPROGRESS indicates that the background job has not finished yet.

Input Name	Range	Type	Description
cookie		string	Cookie that was returned in an earlier file-usage-start call.

Output Name	Range	Type	Description
total-bytes		integer	Number of bytes held by this file. Range : [0..2^63-1].
unique-bytes		integer	Number of bytes 'uniquely' held by this file. Range : [0..2^63-1].

EINVALIDINPUTERROR	
EINTERNALERROR	
EONTAPI_EINVAL	
EONTAPI_ESTALE	
EONTAPI_EINPROGRESS	

file-usage-start

[top]

Starts a background job to compute unique bytes held in a file. The result can be obtained by passing the cookie to file-usage-result-get call.

Input Name	Range	Type	Description
length		integer optional	Length of the range in bytes. If it is not specified, the range that is reported is from start-offset to end-of-file. Range : [0..2^63-1].
path		string	File name to generate report: E.g., /vol/vol1/file1
start-offset		integer optional	Start range of file in bytes. If this is not specified, it is assumed to be beginning of file (offset 0). Range : [0..2^63-1].

Output Name	Range	Type	Description

cookie		string	Cookie to be used with subsequent file-usage-result-get call.

Errno	Description
EVSERVERNOTFOUND	
EINVALIDINPUTERROR	
EINTERNALERROR	
EONTAPI_ENOENT	
EONTAPI_EINVAL	
EONTAPI_EAGAIN	

file-write-file

[top]

Write data into a named file. If the file/stream does not previously exist, it will be created - the owner of the file will be root and it will be readable but not writable by non-root users. API will fail if data exceeds 1 MB. This API should only be used on normal files or streams associated with files. The results for other file types such as LUNs is undefined.

Input Name	Range	Type	Description
data		string	Data to be written. The format of the data is ASCII hex characters, two characters representing one byte. Whitespace characters, for convenience in formatting, can be present in the value and are ignored.
offset	**[-1..2^63-1]**	integer	Offset into file at which to start writing. If the offset is -1, the data is appended to the file. The valid maximum value for (offset + data length) is the maximum total file size which is Data ONTAP version and file system dependent. If the value of the (offset + data length) is beyond the maximum total file size, the API will fail with EAPIERROR.
overwrite		boolean optional	If false, and the file already exists, then the API will fail, with an errno of EEXIST. This allows the client to ensure that it was the exclusive creator of the file. The default value is true.
path		string	Pathname of the file to write. For example: "/vol/<volume>/<file>".
stream-name		string optional	A stream is an on disk structure which contains a sequence of bytes, analogous to a file. A stream is always associated with exactly one file. Characters that are valid for a file name are also valid for the stream-name. e.g., "meta", "resource1". Use this option if the data should be written to the named stream associated with file specified by <path> Default is empty stream name, in which case the data is written to file specified by <path> This field is available in Data ONTAP 8.2 or later.

Output Name	Range	Type	Description
length	**[0..1048576]**	integer	Number of bytes actually written.

Element definition: **file-info**

[top]

Information about a single file.

Name	Range	Type	Description
accessed-timestamp	**[0..2^32-1]**	integer	Last asscess time of the file. The value is in seconds since January 1, 1970.
acl-type		string	The type of access control list (acl) on the file. Possible values are: "no_acl", "nt_acl", "nfs_acl", and goddess forbid, "unknown".
bytes-used	**[0..2^63-1]**	integer optional	returns the number of bytes actually used on disk by this file
changed-timestamp	**[0..2^32-1]**	integer	Last changed time of the file. The value is in seconds since January 1, 1970.
creation-timestamp	**[0..2^32-1]**	integer	Creation time of the file. The value is in seconds since January 1, 1970.
dsid	**[0..2^64-1]**	integer optional	Data Set ID
file-size	**[0..2^63-1]**	integer	The size of the file in bytes.
file-type		string	Type of the file. Possible values: file, directory, blockdev, chardev, symlink, socket, fifo, stream, lun.
group-id	**[0..2^32-1]**	integer	The integer id of the group owner of the file.
hard-links-count	**[0..2^32-1]**	integer	The number of hard links to the file.
inode-gen-number	**[0..2^32-1]**	integer optional	Inode generation number
inode-number	**[0..2^32-1]**	integer	The file node number.
is-empty		boolean optional	This element tells whether directory is empty or not. Directory is considered empty if it only contains entries for "." and "..". This element is present if file is directory. In some special error cases like volume goes offline in between or directory is moved in the middle of getting this info, this field might not get set.
is-junction		boolean optional	Returns true if the directory is a junction.
is-snapshot		boolean optional	Returns true if the directory is a snapshot.
is-vm-		boolean	Returns true if the file is vm-aligned. A vm-aligned file is a file which is padded with zero-filled data at the beginning so that it's actual data starts at a different offset instead of zero. This is done in VM environments so that reads/writes to this file are aligned to WAFL's 4k

aligned		optional	block boundary. The amount by which the start offset is adjusted depends on the vm-align setting of the hosting volume. Use the volume-list-info or the volume-get-iter API to get this information.
modified-timestamp	**[0..2^32-1]**	integer	Last modification time of the file. The value is in seconds since January 1, 1970.
msid	**[0..2^64-1]**	integer optional	Mirror Set ID
name		string optional	Name of the file.
owner-id	**[0..2^32-1]**	integer	The integer id of the owner of the file.
perm		string	File permission bits. It's similar to Unix style permission bits: 0755 gives read/write/execute permissions to owner and read/execute to group and other users. It consists of 4 octal digits derived by adding up bits 4, 2 and 1. Omitted digits are assumed to be zeros. First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file: read (4), write (2) and execute (1); the third selects permissions for other users in the same group; the fourth for other users not in the group.

Element definition: **filer-id**

[top]

Filer UUID

[none]

Element definition: **fingerprint-info**

[top]

FingerPrint info When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggregate-uuid		string optional	An Universal Unique IDentifier (UUID) for the aggregate containing the volume. Attributes: non-creatable, non-modifiable
file-metadata		file-fingerprint-info optional	File fingerprint info
filer-id		uuid optional	ID (NVRAM ID) of owner. Attributes: non-creatable, non-modifiable
filer-name		string	Specifies the name of the filer. If the filer name has not been written to the disks, this will not be returned. Attributes: non-

		optional	creatable, non-modifiable
fingerprint-algorithm		fingerprintalgo optional	The digest algorithm which was used for the fingerprint computation. Fingerprint is computed using md5 or sha-256 digest algorithm. The digest algorithm to be used for the fingerprint computation can be specified when the fingerprint operation is started using the file-fingerprint-start API. If no algorithm was specified during file fingerprint start, then by default, we compute fingerprint of the file using the sha-256 digest alogorithm. Attributes: non-creatable, non-modifiable Possible values: • "md5" , • "sha256"
fingerprint-end-time	**[0..2^64-1]**	integer optional	End time of fingerprint computation in seconds since January 1, 1970. Time is taken out of system clock. Range : [0..2^64-1]. Attributes: non-creatable, non-modifiable
fingerprint-input-path		string optional	Full path of the file on which fingerprint is calculated. The value begins with /vol/. Attributes: non-creatable, non-modifiable
fingerprint-scope		fingerprintscope optional	The file scope which was used for the fingerprint computation. Fingerprint is computed over the file data or metadata or both data and metadata depending on the scope selected when starting the fingerprint operation. If no scope was specified during file fingerprint start, then by default, we compute fingerprint of the file over both data and metadata. Attributes: non-creatable, non-modifiable Possible values: • "data_and_metadata" , • "data_only" , • "metadata_only"
fingerprint-start-time	**[0..2^64-1]**	integer optional	Start time of fingerprint computation in seconds since January 1, 1970. This time is calculated using the system clock. Attributes: non-creatable, non-modifiable
fingerprint-version		string optional	Version of the fingerprint output format. Attributes: non-creatable, non-modifiable
formatted-fingerprint-end-time		string optional	End time of fingerprint computation in a human readable format :: in GMT timezone.Time is taken out of system clock. Attributes: non-creatable, non-modifiable
formatted-fingerprint-start-time		string optional	Start time of fingerprint computation in a human readable format: :: in GMT timezone. This time is calculated using the system clock. Attributes: non-creatable, non-modifiable
formatted-snaplock-system-compliance-clock		string optional	If System Compliance Clock is initialized then human readable time :: in GMT timezone. A value of 'not_initalized' indicates that System Compliance Clock has not been initialized. Attributes: non-creatable, non-modifiable
formatted-snaplock-volume-compliance-clock		string optional	Volume Compliance Clock time for SnapLock volumes in human readable format. :: in GMT timezone. This field is not included for Non-SnapLock volumes. Attributes: non-creatable, non-modifiable
			Expiry date of the SnapLock volume in a human-readable format :: in GMT timezone. A value of 'infinite' indicates that the volume has an infinite expiry date. A value of 'indefinite' indicates that the volume has an indefinite expiry date. A value of 'unspecified' indicates that the volume has an

formatted-volume-expiry-date		string optional	unspecified expiry date. A value of 'scan_in_progress' indicates that expiry date is not displayed since WORM scan on the volume is in progress. A value of 'no_expiry_date' indicates that expiry date is not displayed since the SnapLock volume has no WORM files and WORM Snapshot copies. This field is not included if the volume is offline or the volume is regular volume. Attributes: non-creatable, non-modifiable
is-volume-expiry-date-wraparound		boolean optional	True if the date represented in the field volume-expiry-date is a wraparound format. The wraparound format indicates that dates after 01/19/2038 are mapped from 01/01/1970 - 12/31/2002 to 01/19/2038 - 01/19/2071. The field is not included if volume-expiry-date is not included. Attributes: non-creatable, non-modifiable
session-id	**[0..2^32-1]**	integer optional	An unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed. Attributes: key, non-creatable, non-modifiable
snaplock-license		snaplocklicense optional	Status of SnapLock license. Attributes: non-creatable, non-modifiable Possible values: • "available" , • "not_available"
snaplock-system-compliance-clock	**[0..2^64-1]**	integer optional	If System Compliance Clock is initialized then time in seconds in the standard UNIX format (since 01/01/1970 00:00:00) in GMT timezone. Range:[0..2^64-1]. Attributes: non-creatable, non-modifiable
snaplock-volume-compliance-clock	**[0..2^64-1]**	integer optional	Volume Compliance Clock time in seconds for the SnapLock volumes.The time is in the standard UNIX format (since 01/01/1970 00:00:00) in GMT timezone. This field is not included for Non-SnapLock volumes. Range:[0..2^64-1]. Attributes: non-creatable, non-modifiable
volume-containing-aggregate		string optional	Specifies the name of the aggregate in which the given volume resides Attributes: non-creatable, non-modifiable
volume-dsid	**[0..2^64-1]**	integer optional	The DSID (Data Set IDentifier) of the volume containing the given file. Attributes: non-creatable, non-modifiable
volume-expiry-date	**[0..2^64-1]**	integer optional	Expiry date of the SnapLock volume in seconds in the standard UNIX format(since 01/01/1970 00:00:00).Range: [0..2^64-1]. This field is not included if • Volume is non-SnapLock volume, or • SnapLock volume has an infinite expiry date, or • SnapLock volume has an indefinite expiry date, or • SnapLock volume has an unspecified expiry date, or • SnapLock volume has no WORM files or WORM Snapshot copies, or • SnapLock volume has WORM scanner in progress The volume expiry date can be in wraparound format.The wraparound format indicates that dates after 01/19/2038 are mapped from 01/01/1970 - 12/31/2002 to 01/19/2038 - 01/19/2071. Attributes: non-creatable, non-modifiable
volume-msid	**[0..2^64-1]**	integer optional	Volume's Mirror Set ID. Attributes: non-creatable, non-modifiable

volume-name		volume-name optional	Specifies the name of the volume on which the file resides. Attributes: non-creatable, non-modifiable
volume-snaplock-type		snaplocktype optional	The type of the SnapLock volume. This value is only given for SnapLock volumes. The possible values are : • compliance • enterprise Attributes: non-creatable, non-modifiable Possible values: • "non_snaplock" - Non SnapLock, • "compliance" - SnapLock Compliance, • "enterprise" - SnapLock Enterprise
vserver-id		uuid optional	An Universal Unique IDentifier (UUID) for the vserver owning the volume Attributes: non-creatable, non-modifiable
vserver-name		vserver-name optional	Specifies the name of the vserver which owns the volume on which the file resides. Attributes: non-creatable, non-modifiable

Element definition: **fingerprint-status-info**

[top]

Fingerprint Status Information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
file		string optional	Full path of the file on which fingerprint is calculated. The value begins with /vol/. Attributes: non-creatable, non-modifiable
operation-status		wormopstatus optional	Specifies the operation status of the fingerprint operation. The operation-status of the fingerpirnt operation can be one of the following: • In-progress • Completed • Failed • Aborting • Unknown Attributes: non-creatable, non-modifiable Possible values: • "unknown" , • "in_progress" , • "failed" , • "aborting" , • "completed"
			Specifies the amount of progress that has been made on an ongoing fingerprint operation. If the operation-status of the

progress-percentage	**[0..2^32-1]**	integer optional	fingerprint operation is 'Completed' then the progress-percentage is always 100 and if the operation-status of the fingerprint operation is 'Failed' then the progress-percentage is always 0. Attributes: non-creatable, non-modifiable
session-id	**[0..2^32-1]**	integer optional	An unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed. Attributes: key, non-creatable, non-modifiable
volume		volume-name optional	Specifies the name of the volume on which the file resides. If using this parameter, the following parameters should also be specified: • vserver-name : Name of the vserver to which this volume belongs. Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Specifies the name of the vserver which owns the volume on which the file resides. If using this parameter, the following parameters should also be specified: • volume-name : Name of the volume on which the file resides Attributes: key, non-creatable, non-modifiable

Element definition: **hole-range-info**

[top]

The hole start need not be an integral multiple of the block size. It will be rounded up to the start of the next block. The hole-size does not need to be the size of a block. It will be rounded down to the beginning of the block. It is possible that after the adjustments there is nothing to punch. That is ok and will be treated as success. Note that presently in WAFL small files are entirely within the inode. It is possible to "hole punch" those however nothing happens. The data is left alone. Considering the use case fot this ZAPI and the amount of effort to code the "correct" solution this is deemed an acceptable condition. If the file is vm-aligned then the range chosen to hole-punch could be rounded down by a block to ensure that we don't punch block containing valid user data.

Name	Range	Type	Description
hole-size		integer	Size of the hole in terms of bytes. If punching a hole WAFL presently limits this value to 4MB. Range : [0..2^63-1]
hole-start		integer	Starting offset of the hole. Range : [0..2^63-1]

Element definition: **inode-info**

[top]

Inode Information.

When returned as part of the output, all elements of this typedef are reported, unless limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it

shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
dsid	**[0..2^64-1]**	integer optional	The DSID (Data Set IDentifier) of the volume containing the given inode. Exactly one of volume or dsid must be specified in query. Attributes: key, non-creatable, non-modifiable
file-name		string optional	Name of the file associated with inode. Attributes: non-creatable, non-modifiable
file-path		string optional	Full path name of the file associated with the inode number. Attributes: key, non-creatable, non-modifiable
inode-number	**[0..2^32-1]**	integer	The inode number for which information is desired. Attributes: key, non-creatable, non-modifiable
parent-dir-index	**[0..2^64-1]**	integer optional	The index of the directory entry of the file in its parent directory. Attributes: non-creatable, non-modifiable
parent-inode-number	**[0..2^64-1]**	integer optional	Inode number of the parent directory of the file. Attributes: non-creatable, non-modifiable
snapshot-id	**[0..255]**	integer optional	The snapshot number within the given volume in which the given inode is to be referenced. At most, one of snaphot-id or snapshot-name can be provided in query. If neither is provided, we reference the given inode within the active file system of the given volume. A value of 0 will refer to the active file system of the given volume. Attributes: non-creatable, modifiable
snapshot-name		string optional	The snapshot name within the given volume in which the given inode is to be referenced. At most, one of snapshot-id or snapshot-name can be provided in query. If neither is provided, we reference the given inode within the active file system of the given volume. Attributes: non-creatable, modifiable
volume		volume-name optional	The name of the volume containing the given inode. Exactly one of volume or dsid must be specified in query. Attributes: key, non-creatable, non-modifiable

Element definition: **inode-parent-info**

[top]

Inode's path and parent information.

Name	Range	Type	Description
inode-name		string optional	Name of inode in parent directory.
inode-parent-		integer optional	The opaque readdir cookie to determine the index of the inode in the parent directory tree. Note that this value is used as a testing hook, we do not

cookie			plan to support its semantics and those semantics might change over time.
inode-parent-inode-number		integer optional	Inode number of the parent directory.
inode-path		string optional	Full path to inode

Element definition: **snapshot-id**

[top]

Snapshot Id

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

[none]

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

Element definition: **file-fingerprint-info**

[top]

File fingerprint info

Name	Range	Type	Description
access-time	**[0..2^64-**	integer	Access Time Attributes: non-creatable, non-modifiable

	1]	optional	
changed-time	**[0..2^64-1]**	integer optional	Changed Time Attributes: non-creatable, non-modifiable
creation-time	**[0..2^64-1]**	integer optional	Creation Time Attributes: non-creatable, non-modifiable
data-fingerprint		string optional	The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if scope is 'metadata-only'. Attributes: non-creatable, non-modifiable
file		string optional	Full path of the file on which fingerprint is calculated. The value begins with /vol/. Attributes: non-creatable, non-modifiable
file-size	**[0..2^64-1]**	integer optional	The size of the file in bytes. Range : [0..2^64-1]. Attributes: non-creatable, non-modifiable
file-type		string optional	Type of the file. Possible values: • 'worm', • 'worm_appendable', • 'worm_active_log', • 'worm_log' and • 'regular' Attributes: non-creatable, non-modifiable
fileid	**[0..2^32-1]**	integer optional	A unique number within filesystem identifying the file for fingerprint. Range : [0..2^31-1] Attributes: non-creatable, non-modifiable
formatted-access-time		string optional	Last access time of the file formatted in a human-readable format :: in GMT timezone. The field is included for regular files and files on Non-SnapLock volumes. Attributes: non-creatable, non-modifiable
formatted-changed-time		string optional	Last changed time of the file formatted in a human-readable format. :: in GMT timezone. Attributes: non-creatable, non-modifiable
formatted-creation-time		string optional	Creation time of the file formatted in a human-readable format. :: in GMT timezone. Attributes: non-creatable, non-modifiable
formatted-modified-time		string optional	Last modification time of the file formatted in a human-readable format. :: in GMT timezone. Attributes: non-creatable, non-modifiable
formatted-retention-time		string optional	Expiry date of the file protected by SnapLock formatted in a human-readable format. This takes care of wraparound dates and prints the expiry date of the file in the format :: in GMT timezone. A value of 'infinite' indicates that this file has infinite retention time. A value of 'indefinite' indicates that this file has indefinite retention time. A value of 'unspecified' indicates that this file has unspecified retention time. This field is not included for regular files that are not protected by SnapLock and files on Non-SnapLock volumes. Attributes: non-creatable, non-modifiable
fsid	**[0..2^32-1]**	integer optional	Filesystem ID. Range : [0..2^31-1] Attributes: non-creatable, non-modifiable
group-id	**[0..2^32-1]**	integer optional	The integer id of the group owner of the file. Range : [0..2^31-1] Attributes: non-creatable, non-modifiable
is-changed-time-wraparound		boolean optional	This field is included for WORM files when changed-time is in wraparound format. This field is true if the date represented in changed-time is in wraparound format and false if changed-time is not is not in wraparound format. The wraparound format indicates that dates after 01/19/2038 are mapped from 01/01/1970 - 12/31/2002 to 01/19/2038 - 01/19/2071. This field is not included for regular files. Attributes: non-creatable, non-modifiable
			True if the date represented in retention-time is in wraparound format.The wraparound format indicates that dates after 01/19/2038

is-wraparound		boolean optional	are mapped from 01/01/1970 - 12/31/2002 to 01/19/2038 - 01/19/2071. This field is not included if retention-time is not included Attributes: non-creatable, non-modifiable
litigation-count	**[0..255]**	integer optional	The number of litigations on the file. Attributes: non-creatable, non-modifiable
metadata-fingerprint		string optional	The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, gid and file type. The fingerprint is base64 encoded. This field is not included if scope is 'data-only'. Attributes: non-creatable, non-modifiable
modified-time	**[0..2^64-1]**	integer optional	Modification Time Attributes: non-creatable, non-modifiable
owner-id	**[0..2^32-1]**	integer optional	The integer id of the owner of the file. Range : [0..2^31-1] Attributes: non-creatable, non-modifiable
owner-sid		string optional	The owner SID of the file. This field is included in the case when file has NTFS security style. Attributes: non-creatable, non-modifiable
retention-time	**[0..2^64-1]**	integer optional	Retention Time Attributes: non-creatable, non-modifiable

file-directory-security-set

This set of ZAPIs allows to view or set file security settings. To view security of a file/folder, pass the file/folder path name as argument to show command. To set security on a file/folder, policy needs to be created. Policy has set of tasks and each task has a file/folder path name and the security descriptor identifier which will be applied on the file/folder.

file-directory-effective-permissions-get

[top]

Gives information about the maximal access for the mentioned user on given path.

Input Name	Range	Type	Description
client-ip-address		ip-address optional	This optional parameter specifies the incoming CIFS or UNIX user client ip address.
expand-mask		boolean optional	Specifies whether to expand the bit mask of ACE.
path		string	Specifies UNIX style file or folder path for which the effective permission has to be found out.
share-name		cifs-share-name optional	This optional parameter specifies that the given path name lookup starts from cifs share map path.
unix-user-name		string optional	Specifies name of the UNIX user for which the effective permission has to be found out.
win-user-name		string optional	Specifies name of the Windows user for which the effective permission has to be found out.

Output Name	Range	Type	Description
permission		fsecurity-acl[]	Specifies the resultant NT style effective permission.
share-path		string optional	The CIFS share path.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-get

[top]

Returns security information of a file/folder

Input Name	Range	Type	Description
cifs-share-name		cifs-share-name optional	Specifies that the given path name lookup starts from cifs share map path. Mutually exclusive with volume-name field.
expand-mask		boolean optional	Specifies whether to expand the bit mask of DOS attributes, security descriptor's control flags and every ACE.
inode		integer optional	File Inode Number
lookup-names		boolean optional	Specifies whether the SID needs to be converted to user/group name.
path		string optional	Specifies the file or folder path whose security information needs to be read. If volume-name or cifs-share-name is not specified, path name lookup starts from the root path of the vserver
sddl		boolean optional	Specifies whether to show the acls in windows sddl format.
textual-mask		boolean optional	Specifies whether to show the mask in textual format.
volume-name		volume-name optional	Specifies that the given path name lookup starts from volume junction path. Mutually exclusive with cifs-share-name field.

Output Name	Range	Type	Description
acls		fsecurity-acl[] optional	NTFS or NFSV4 Security descriptor ACLs.
dos-attributes		integer optional	DOS Attributes
effective-style		security-style-enum	Effective security style of the file/folder. The 'unified' security style, which applies only to Infinite Volumes, cannot be applied to file/folder security.
expanded-dos-attr		string optional	Bitwise expanded DOS Attributes of the specified file/folder path. This field returns value if expand mask is true. Example follows, DOS Attributes: ...0 .... = Offline .... ..0. .... = Sparse .... 0... .... = Normal ....0. .... = Archive ....1 .... = Directory .... .0.. = System ....0. = Hidden ....0 = Read Only
inode		integer optional	File Inode Number
path		string optional	Specifies the file or folder path whose security information needs to be read. If volume-name or cifs-share-name is not specified, path name lookup starts from the root path of the vserver
security-style		security-style-enum	Security style of the file/folder. The 'unified' security style, which applies only to Infinite Volumes, cannot be applied to file/folder security.
text-dos-attr		string optional	DOS Attributes in Text
unix-group-id		integer optional	UNIX Group Id
unix-mode-bits		integer optional	Unix mode permission bits in octal value.
unix-user-id		integer optional	UNIX User Id

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-ntfs-create

[top]

Creates a new NTFS security descriptor

Input Name	Range	Type	Description
			Specifies the security descriptor control flags in hexa decimal. The following are the bit fields of control flags. 1... .... = Self Relative .0.. .... = RM Control Valid ..0. .... = SACL Protected

control-flags-raw	**[0..2^32-1]**	integer optional	...0 .... = DACL Protected .... 0... .... = SACL Inherited .... .0.. .... = DACL Inherited .... ..0. .... = SACL Inherit Required ....0 .... = DACL Inherit Required ....0. .... = SACL Defaulted ....0 .... = SACL Present .... 0... = DACL Defaulted .... .1.. = DACL Present ....0. = Group Defaulted ....0 = Owner Defaulted At present only the following flags are honored. Others are ignored. ..0. .... = SACL Protected ...0 .... = DACL Protected ....0. .... = SACL Defaulted .... 0... = DACL Defaulted ....0. = Group Defaulted ....0 = Owner Defaulted
group		name-or-sid optional	Specifies group's SID or domain account name of NTFS security descriptor.
ntfs-sd		file-security-ntfs-sd	Specifies NTFS security descriptor identifier.
owner		name-or-sid optional	Specifies owner's SID or domain account name of NTFS security descriptor.
return-record		boolean optional	If set to true, returns the file-directory-security-ntfs on successful creation. Default: false

Output Name	Range	Type	Description
result		file-directory-security-ntfs optional	The file-directory-security-ntfs created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

file-directory-security-ntfs-dacl-add

[top]

Add a discretionary access control entry to NTFS security descriptor.

Input Name	Range	Type	Description
access-type		access-type	Specifies DACL ACE's access type. Possible values: • "deny" , • "allow"
account		name-or-sid	Specifies DACL ACE's SID or domain account name of NTFS security descriptor.
			Specifies DACL ACE's Advanced access rights. Mutually exclusive with rights and rights-raw fields. Possible values: • "read_data" , • "write_data" ,

advanced-rights		advanced-access-rights[] optional	• "append_data" , • "read_ea" , • "write_ea" , • "execute_file" , • "delete_child" , • "read_attr" , • "write_attr" , • "delete" , • "read_perm" , • "write_perm" , • "write_owner" , • "full_control"
apply-to		inheritance-level[] optional	Specifies apply DACL entry. Possible values: • "this_folder" , • "sub_folders" , • "files"
ntfs-sd		file-security-ntfs-sd	Specifies NTFS security descriptor identifier.
rights		access-rights optional	Specifies DACL ACE's access rights. Mutually exclusive with advanced-rights and rights-raw fields. Possible values: • "no_access" , • "full_control" , • "modify" , • "read_and_execute" , • "read" , • "write"
rights-raw	**[0..2^32-1]**	integer optional	Specifies DACL ACE's access rights in raw. This field is similar to advanced-rights fields. 'advanced-rights' specifies the value in enum but rights-raw specifies the access rights in integer format. Mutually exclusive with rights and advanced-rights fields.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-ntfs-dacl-get-iter

[top]

Returns information about one or more discretionary access control entries

Input Name	Range	Type	Description
desired-attributes		file-directory-security-ntfs-dacl optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
		file-directory-	A query that specifies which objects to return. A query could be

query		security-ntfs-dacl optional	specified on any number of attributes in the file-directory-security-ntfs-dacl object. All file-directory-security-ntfs-dacl objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		file-directory-security-ntfs-dacl[] optional	The list of attributes of file-directory-security-ntfs-dacl objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file-directory-security-ntfs-dacl objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description

EINTERNALERROR	

file-directory-security-ntfs-sacl-add

[top]

Add a system/audit access control entry to NTFS security descriptor.

Input Name	Range	Type	Description
account		name-or-sid	Specifies SACL ACE's SID or domain account name of NTFS security descriptor.
advanced-		advanced-access-	Specifies SACL ACE's access rights. Mutually exclusive with rights-raw field. Possible values: • "read_data" , • "write_data" , • "append_data" , • "read_ea" , • "write_ea" , • "execute_file" ,

rights		rights[] optional	"delete_child" , • "read_attr" , • "write_attr" , • "delete" , • "read_perm" , • "write_perm" , • "write_owner" , • "full_control"
apply-to		inheritance-level[] optional	Specifies how this ACE has to be applied on this folder and it's subfolders and files. This field is ignored if the security is mapped with a path which is not a folder. Possible values: • "this_folder" , • "sub_folders" , • "files"
audit-access-type		audit-access-type	Specifies SACL ACE's access type. Possible values: • "failure" , • "success"
ntfs-sd		file-security-ntfs-sd	Specifies NTFS security descriptor identifier.
rights		access-rights optional	Specifies SACL ACE's access rights. Possible values: • "no_access" , • "full_control" , • "modify" , • "read_and_execute" , • "read" , • "write"
rights-raw	**[0..2^32-1]**	integer optional	Specifies SACL ACE's access rights in raw. This field is similar to advanced-rights fields. 'advanced-rights' specifies the value in enum but rights-raw specifies the access rights in integer format. Mutually exclusive with rights and advanced-rights fields.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-ntfs-sacl-get-iter

[top]

Returns information about one or more system/audit access control entries

Input Name	Range	Type	Description
desired-attributes		file-directory-security-ntfs-sacl optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20

query		file-directory-security-ntfs-sacl optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the file-directory-security-ntfs-sacl object. All file-directory-security-ntfs-sacl objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		file-directory-security-ntfs-sacl[] optional	The list of attributes of file-directory-security-ntfs-sacl objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file-directory-security-ntfs-sacl objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

file-directory-security-ntfs-sacl-modify

[top]

Modify an system/audit access control entry of a file security descriptor

Input Name	Range	Type	Description
account		name-or-sid	Specifies SACL ACE's SID or domain account name of NTFS security descriptor.
advanced-rights		advanced-access-rights[] optional	Specifies SACL ACE's access rights. Mutually exclusive with rights-raw field. Possible values: • "read_data" , • "write_data" , • "append_data" , • "read_ea" , • "write_ea" , • "execute_file" , • "delete_child" , • "read_attr" , • "write_attr" , • "delete" , • "read_perm" , • "write_perm" , • "write_owner" , • "full_control"
apply-to		inheritance-level[]	Specifies how this ACE has to be applied on this folder and it's subfolders and files. This field is ignored if the security is mapped with a path which is not a folder. Possible values: • "this_folder" ,

		optional	• "sub_folders" , • "files"
audit-access-type		audit-access-type	Specifies SACL ACE's access type. Possible values: • "failure" , • "success"
ntfs-sd		file-security-ntfs-sd	Specifies NTFS security descriptor identifier.
rights		access-rights optional	Specifies SACL ACE's access rights. Possible values: • "no_access" , • "full_control" , • "modify" , • "read_and_execute" , • "read" , • "write"
rights-raw	**[0..2^32-1]**	integer optional	Specifies SACL ACE's access rights in raw. This field is similar to advanced-rights fields. 'advanced-rights' specifies the value in enum but rights-raw specifies the access rights in integer format. Mutually exclusive with rights and advanced-rights fields.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-ntfs-sacl-remove

[top]

Remove an system/audit access control entry from NTFS security descriptor.

Input Name	Range	Type	Description
account		name-or-sid	Specifies SACL ACE's SID or domain account name of NTFS security descriptor.
audit-access-type		audit-access-type	Specifies SACL ACE's access type. Possible values: • "failure" , • "success"
ntfs-sd		file-security-ntfs-sd	Specifies NTFS security descriptor identifier.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-policy-create

[top]

Creates a new file/folder security policy configuration. To preserve the security configuration of a file(or, folder) or set of files(or, folders) security policy has been defined. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.

Input Name	Range	Type	Description
policy-name		file-security-policy-name	Specifies the name of the policy. To preserve the security configuration of a file(or, folder) or set of files(or, folders) security policy has been defined. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.
return-record		boolean optional	If set to true, returns the file-directory-security-policy on successful creation. Default: false

Output Name	Range	Type	Description
result		file-directory-security-policy optional	The file-directory-security-policy created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

file-directory-security-policy-delete

[top]

Deletes a file/folder security policy. To preserve the security configuration of a file(or, folder) or set of files(or, folders) security policy has been defined. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.

Input Name	Range	Type	Description
policy-name		file-security-policy-name	Specifies the name of the policy. To preserve the security configuration of a file(or, folder) or set of files(or, folders) security policy has been defined. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-policy-get-iter

[top]

Returns information about one or more security policies. To preserve the security configuration of a file(or, folder) or set of files(or, folders) security policy has been defined. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.

Input Name	Range	Type	Description
desired-attributes		file-directory-security-policy optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		file-directory-security-policy optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the file-directory-security-policy object. All file-directory-security-policy objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		file-directory-security-policy[] optional	The list of attributes of file-directory-security-policy objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file-directory-security-policy objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

file-directory-security-policy-task-add

[top]

Add a file security policy task. A task maps security descriptor with a file or folder.

Input Name	Range	Type	Description
access-control		access-control optional	Specifies the access control of task to be applied. Its value can be file-directory or slag respectively. The slag value is not supported on FlexGroups. Default value will be file-directory. Possible values: • "file_directory" , • "slag"
		ntfs-	Specifies NTFS propagation mode. Possible values:

ntfs-mode		propagation-mode optional	"propagate" , • "ignore" , • "replace"
ntfs-sd		file-security-ntfs-sd[] optional	Specifies NTFS security descriptor identifier.
path		string	Specifies the file or folder path of the task. In case of SLAG this path specify the volume or qtree mounted path.
policy-name		file-security-policy-name	Specifies the name of the policy to which the task needs to be added.
security-type		security-type optional	Specifies the type of security. Possible values: • "ntfs" , • "nfsv4"
task-index-number	**[1..10000]**	integer optional	Specifies the target index/position of this task in the policy. If a policy has already 5 tasks and this is the 6th task you are adding and you want to add this task as 2nd task, you can specifiy the index 2. By default the task gets added as last task. If the index number exceeds the number of positions, it will go at the end.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

file-directory-security-policy-task-get-iter

[top]

Returns information about one or more policy tasks. Policy is a container for tasks and a task associates a file/folder path name and the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. Policy can't have duplicate task entries and there is only one task per path.

Input Name	Range	Type	Description
desired-attributes		file-directory-security-policy-task optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		file-directory-security-policy-task optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the file-directory-security-policy-task object. All file-directory-security-policy-task objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		file-directory-security-policy-task[] optional	The list of attributes of file-directory-security-policy-task objects.
next-tag		string optional	Tag for the next call. Not present when there are no more file-directory-security-policy-task objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

file-directory-security-policy-task-modify

[top]

Modify a file security policy task

Input Name	Range	Type	Description
ntfs-mode		ntfs-propagation-mode optional	NTFS Propagation Mode Possible values: • "propagate" , • "ignore" , • "replace"
ntfs-sd		file-security-ntfs-sd[] optional	NTFS Security Descriptor Name
path		string	Path
policy-name		file-security-policy-name	Policy Name
security-type		security-type optional	Security Type Possible values: • "ntfs" , • "nfsv4"
task-index-number	**[1..10000]**	integer optional	Position

Errno	Description

Element definition: **file-directory-security-ntfs** [top]

NTFS security descriptor management When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
control-flags-raw	**[0..2^32-1]**	integer optional	Specifies the security descriptor control flags in hexa decimal. - "unified" - Unified

[none]

Element definition: **security-type** [top]

ntfs|nfsv4 Possible values:

- "ntfs" ,
- "nfsv4"

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

APIs in Category: **fileservice-audit**

fileservice-audit-config-create
fileservice-audit-config-get
fileservice-audit-config-get-iter
fileservice-audit-config-get-total-records
fileservice-audit-config-modify
fileservice-audit-disable
fileservice-audit-enable
fileservice-audit-remove
fileservice-audit-repair
fileservice-audit-rotate-log

This set of ZAPIs help manage the File Service Audit settings for auditing file access over CIFS and NFS, CIFS logon, logoff and management events.

fileservice-audit-config-create

[top]

Create audit configuration for a Vserver

Input Name	Range	Type	Description
destination		string	Audit log destination path. The path where consolidated audit logs are stored. If the path is not valid, the api returns error
events		audit-events[] optional	The Categories of events that will be audited. Default: file_ops,cifs_logon_logoff,audit-policy-change Possible values: • "file_ops" - File Operation Events, • "cifs_logon_logoff" - CIFS Logon and Logoff Events, • "cap_staging" - Central Access Policy Staging Events, • "file_share" - File Share Category Events, • "audit_policy_change" - Audit Policy Change Events, • "user_account" - Local User Account Management Events, • "authorization_policy_change" - Authorization Policy Change Events, • "security_group" - Local Security Group Management Events, • "async_delete" - Volume File Async Delete Events
format		audit-format optional	The format in which the logs would be generated by consolidation process. Default: evtx Possible values: • "xml" - Data ONTAP-Specific XML Log Format, • "evtx" - Microsoft Windows EVTX Log Format
retention-duration		elapsed-time-ext optional	Audit log files retention duration. A value of 0d0h0m0s indicates that all the files will be retained. This parameter is mutually exclusive with rotate-limit. Do not use this parameter along with rotate-limit parameter. Default: 0s

return-record		boolean optional	If set to true, returns the fileservice-audit-config on successful creation. Default: false
rotate-limit	**[0..2^32-1]**	integer optional	Audit log files rotation Limit. A value of 0 indicates that all the files will be retained. This parameter is mutually exclusive with retention-duration. Do not use this parameter along with retention-duration parameter. Default: 0
rotate-schedule-day		cron-day-of-month[] optional	Audit log rotation schedule: Day. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-dayofweek		cron-day-of-week[] optional	Audit log rotation schedule: Day of Week. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-hour		cron-hour[] optional	Audit log rotation schedule: Hour. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-minute		cron-minute[] optional	Audit Log rotation schedule: Minute. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-month		cron-month[] optional	Audit log rotation schedule: Month. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-size		audit-rotate-size-or-dash optional	Audit log file size limit. By default rotation is done based on size. This parameter is mutually exclusive with time related rotate parameters. If time based rotation is needed use the time based rotation parameters(rotate-schedule-month, rotate-schedule-dayofweek, rotate-schedule-day... etc). Default: 100MB

Output Name	Range	Type	Description
result		fileservice-audit-config optional	The fileservice-audit-config created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

fileservice-audit-config-get

[top]

Show Audit configuration details for a Vserver

Input Name	Range	Type	Description
desired-attributes		fileservice-audit-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

Output Name	Range	Type	Description
attributes		fileservice-audit-config	The attributes of the fileservice-audit-config.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

fileservice-audit-config-get-iter

[top]

Show Audit configuration details for all Vservers

Input Name	Range	Type	Description
desired-attributes		fileservice-audit-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fileservice-audit-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the fileservice-audit-config object. All fileservice-audit-config objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fileservice-audit-config[] optional	The list of attributes of fileservice-audit-config objects.
next-tag		string optional	Tag for the next call. Not present when there are no more fileservice-audit-config objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

fileservice-audit-config-get-total-records

[top]

Return the total number of records

Output Name	Range	Type	Description
count	[0..2^64-1]	integer	The total number of fileservice-audit-config objects.

fileservice-audit-config-modify

[top]

Modify audit configuration for a Vserver

Input Name	Range	Type	Description
audit-guarantee		boolean optional	Strict guarantee of auditing for a Vserver. If this is true, file access is denied if audit record can not be generated and if this is false, auditing is done on a best effort basis. Default: true
destination		string optional	Audit log destination path. The path where consolidated audit logs are stored. If the path is not valid, the api returns error
events		audit-events[] optional	The Categories of events that will be audited. Default: file_ops,cifs_logon_logoff,audit-policy-change Possible values: • "file_ops" - File Operation Events, • "cifs_logon_logoff" - CIFS Logon and Logoff Events, • "cap_staging" - Central Access Policy Staging Events, • "file_share" - File Share Category Events, • "audit_policy_change" - Audit Policy Change Events, • "user_account" - Local User Account Management Events, • "authorization_policy_change" - Authorization Policy Change Events, • "security_group" - Local Security Group Management Events, • "async_delete" - Volume File Async Delete Events
format		audit-format optional	The format in which the logs would be generated by consolidation process. Default: evtx Possible values: • "xml" - Data ONTAP-Specific XML Log Format, • "evtx" - Microsoft Windows EVTX Log Format
retention-duration		elapsed-time-ext optional	Audit log files retention duration. A value of 0d0h0m0s indicates that all the files will be retained. This parameter is mutually exclusive with rotate-limit. Do not use this parameter along with rotate-limit parameter. Default: 0s
rotate-limit	**[0..2^32-1]**	integer optional	Audit log files rotation Limit. A value of 0 indicates that all the files will be retained. This parameter is mutually exclusive with retention-duration. Do not use this parameter along with retention-duration parameter. Default: 0
rotate-schedule-day		cron-day-of-month[] optional	Audit log rotation schedule: Day. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-dayofweek		cron-day-of-week[] optional	Audit log rotation schedule: Day of Week. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-hour		cron-hour[] optional	Audit log rotation schedule: Hour. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-minute		cron-minute[] optional	Audit Log rotation schedule: Minute. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
rotate-schedule-month		cron-month[] optional	Audit log rotation schedule: Month. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter
		audit-rotate-	Audit log file size limit. By default rotation is done based on size. This parameter is mutually exclusive with time related rotate parameters.

rotate-size		size-or-dash optional	If time based rotation is needed use the time based rotation parameters(rotate-schedule-month, rotate-schedule-dayofweek, rotate-schedule-day... etc). Default: 100MB

Element definition: **fileservice-audit-config**

[top]

Vserver Audit configuration and management on name When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
audit-guarantee		boolean optional	Strict guarantee of auditing for a Vserver. If this is true, file access is denied if audit record can not be generated and if this is false, auditing is done on a best effort basis. Default: true Attributes: non-creatable, modifiable
destination		string optional	Audit log destination path. The path where consolidated audit logs are stored. If the path is not valid, the api returns error Attributes: required-for-create, modifiable
events		audit-events[] optional	The Categories of events that will be audited. Default: file_ops,cifs_logon_logoff,audit-policy-change Attributes: optional-for-create, modifiable Possible values: • "file_ops" - File Operation Events, • "cifs_logon_logoff" - CIFS Logon and Logoff Events, • "cap_staging" - Central Access Policy Staging Events, • "file_share" - File Share Category Events, • "audit_policy_change" - Audit Policy Change Events, • "user_account" - Local User Account Management Events, • "authorization_policy_change" - Authorization Policy Change Events, • "security_group" - Local Security Group Management Events, • "async_delete" - Volume File Async Delete Events
format		audit-format optional	The format in which the logs would be generated by consolidation process. Default: evtx Attributes: optional-for-create, modifiable Possible values: • "xml" - Data ONTAP-Specific XML Log Format, • "evtx" - Microsoft Windows EVTX Log Format

is-enabled		boolean optional	Auditing State. Default: false Attributes: non-creatable, non-modifiable
retention-duration		elapsed-time-ext optional	Audit log files retention duration. A value of 0d0h0m0s indicates that all the files will be retained. This parameter is mutually exclusive with rotate-limit. Do not use this parameter along with rotate-limit parameter. Default: 0s Attributes: optional-for-create, modifiable
rotate-limit	**[0..2^32-1]**	integer optional	Audit log files rotation Limit. A value of 0 indicates that all the files will be retained. This parameter is mutually exclusive with retention-duration. Do not use this parameter along with retention-duration parameter. Default: 0 Attributes: optional-for-create, modifiable
rotate-schedule-day		cron-day-of-month[] optional	Audit log rotation schedule: Day. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter Attributes: optional-for-create, modifiable
rotate-schedule-dayofweek		cron-day-of-week[] optional	Audit log rotation schedule: Day of Week. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter Attributes: optional-for-create, modifiable
rotate-schedule-hour		cron-hour[] optional	Audit log rotation schedule: Hour. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter Attributes: optional-for-create, modifiable
rotate-schedule-minute		cron-minute[] optional	Audit Log rotation schedule: Minute. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter Attributes: optional-for-create, modifiable
rotate-schedule-month		cron-month[] optional	Audit log rotation schedule: Month. By Default rotation is done based on size. This parameter is mutually exclusive with rotate-size. Do not use this parameter along with rotate-size parameter Attributes: optional-for-create, modifiable
rotate-size		audit-rotate-size-or-dash optional	Audit log file size limit. By default rotation is done based on size. This parameter is mutually exclusive with time related rotate parameters. If time based rotation is needed use the time based rotation parameters(rotate-schedule-month, rotate-schedule-dayofweek, rotate-schedule-day... etc). Default: 100MB Attributes: optional-for-create, modifiable
rotation-schedule-description		string optional	Rotation schedules derived from rotation time related parameters Attributes: non-creatable, non-modifiable
vserver		vserver-name optional	Vserver Attributes: key, non-creatable, non-modifiable

APIs in Category: **flash**

flash-get-thresholds
flash-thresholds-get-iter

The Flash Management Module (FMM) is the management interface to access information about flash devices in the system.

flash-get-thresholds

[top]

Get threshold profiles available in Flash Management Module.

Input Name	Range	Type	Description
node		string	The name of the system to which the flash thresholds apply.
profile		string optional	Name of the threshold profile. If not provided, all available profiles will be printed.

Output Name	Range	Type	Description
flash-threshold-profile		flash-threshold-profile[] optional	A collection of failure threshold entries.

flash-thresholds-get-iter

[top]

Iterate over a list of Flash Cache threshold profiles objects.

Input Name	Range	Type	Description
desired-attributes		flash-threshold-profile optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		flash-threshold-profile optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Flash Cache threshold profiles object. All Flash Cache threshold profiles objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		flash-threshold-profile[] optional	The list of attributes of Flash Cache threshold profiles objects.

next-tag		string optional	Tag for the next call. Not present when there are no more Flash Cache threshold profiles objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

Element definition: **flash-threshold-profile**

[top]

A definition for a threshold element

Name	Range	Type	Description
flash-threshold		flash-threshold[]	The list of threshold entries for this profile.
node		string	The name of the system to which the flash thresholds apply.
profile		string	The name of the profile in plain text.

Element definition: **flash-threshold**

[top]

A definition for a threshold element. Each threshold specifies what level of errors or failures the specified domain can sustain before the specified action is taken.

Name	Range	Type	Description
action		string	Action to be taken if this threshold is exceeded. Possible values: "log an EMS event", "log an EMS_event, and disable the 'domain'", "log an EMS event, and send an AutoSupport message", "log an EMS event, send an AutoSupport message, and disable the 'domain'"
domain		string	The type of domain. Possible values: "card", "bank", "chip" (in Data ONTAP 7.3.x to 8.1) or "lun" (from Data ONTAP 8.2 onwards).
threshold-units		string	The metric for threshold. Possible values: "count", or "percentage".
threshold-value	**[0..2^31-1]**	integer	Threshold value in 'threshold-units'.
time-slice		string	The time slice. Available if the 'threshold-unit' is "count". If not, output will say 'none'. Possible values: "none", "seconds", "minutes", or "hours".

APIs in Category: **flash-device**

flash-device-get-iter
flash-device-list-info

Flash Cache is the caching device. This interface is used to access information about Flash Cache devices in the system.

flash-device-get-iter

[top]

Iterate over a list of Flash Cache device info objects.

Input Name	Range	Type	Description
desired-attributes		flash-device-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		flash-device-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the Flash Cache device info object. All Flash Cache device info objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		flash-device-info[] optional	The list of attributes of Flash Cache device info objects.
next-tag		string optional	Tag for the next call. Not present when there are no more Flash Cache device info objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

flash-device-list-info

[top]

Get a collection of Flash Cache device info objects.

Input Name	Range	Type	Description
node		node-name	Node
slot-number		integer	Slot

		optional	
subslot-number		integer optional	Subslot

Output Name	Range	Type	Description
flash-device-info		flash-device-info[] optional	Information about Flash Cache devices

Errno	Description
EINTERNALERROR	

Element definition: **flash-device-info**

[top]

Information about Flash Cache devices When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
average-erase-cycle-count	**[0..2^64-1]**	integer optional	Avg Erase Cycle Count Attributes: non-creatable, non-modifiable

APIs in Category: **flexcache**

flexcache-connected-cache-get-iter
flexcache-create-async
flexcache-default-size-get
flexcache-destroy-async
flexcache-get-iter
flexcache-origin-cleanup-cache-relationship
flexcache-origin-config-get-iter
flexcache-origin-config-modify
flexcache-usage-get

This set of APIs allow configuring and managing FlexCache on Data ONTAP Cluster-Mode environment.

flexcache-connected-cache-get-iter

[top]

Retrieve connected cache information. This must be run at the origin cluster.

Input Name	Range	Type	Description
desired-attributes		flexcache-origin-connected-cache-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		flexcache-origin-connected-cache-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the flexcache-origin object. All flexcache-origin objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		flexcache-origin-connected-cache-info[] optional	The list of attributes of flexcache-origin objects.
next-tag		string optional	Tag for the next call. Not present when there are no more flexcache-origin objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EOBJECTNOTFOUND	
EVSERVERNOTFOUND	
EINTERNALERROR	

flexcache-create-async

[top]

Create a cache relationship. This must be run at the cache cluster.

Input Name	Range	Type	Description
aggr-list		aggr-name[] optional	The array of aggregates which are used for FlexGroup constituents. Each aggregate in the array will host at least one FlexGroup constituent.
aggr-list-multiplier		integer optional	Aggregate list repeat count
auto-provision-as		autoprovisionvolumetype optional	Automatically provision as volume of type
is-disconnected-mode-off-for-locks		boolean optional	Specifies if the origin will honor the cache side locks when doing the lock checks in the disconnected mode. The default value will be set to false to allow origin to skip such lock checks with the disconnected cache and go ahead with processing of the conflicting locks. If set to true the origin denies the lock operation (open or byte-range) if it conflicts with the authority granted to the disconnected cache.
is-global-file-locking-enabled		boolean optional	Global file locking mode
junction-path		junction-path optional	Junction path of the cache volume
origin-volume		volume-name	The name of the origin volume for the cache volume.
origin-vserver		xc-vs-name optional	The name of origin Vserver where the origin volume resides
size		size optional	Size of cache volume
space-guarantee		space-guarantee-enum optional	Flexcache volume space guarantee type
use-tiered-aggregate		boolean optional	Flexcache volume uses fabricpool aggregate
volume		volume-name	The name of the cache volume.

Output Name	Range	Type	Description
result-error-code	[0..2^32-1]	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	[0..2^64-1]	integer optional	The ID of the job that was spawned to create this flexcache.
			The operation status. Possible values: "succeeded"

result-status		string optional	if creation completed successfully, "in_progress" if creation is in progress, "failed" if creation failed.

flexcache-default-size-get

[top]

Get recommended FlexCache size

Input Name	Range	Type	Description
origin-size	**[0..2^64-1]**	integer	Origin Size

Output Name	Range	Type	Description
flexcache-size	**[0..2^64-1]**	integer optional	FlexCache Size

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

flexcache-destroy-async

[top]

Delete a cache relationship. This must be run at the cache cluster. A job will be spawned to operate on the flexcache and the job id will be returned. The progress of the job can be tracked using the job APIs.

Input Name	Range	Type	Description
volume		volume-name	The name of the cache volume.

Output Name	Range	Type	Description
result-error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
result-error-message		string optional	Error description, if the operation caused an error.
result-jobid	**[0..2^64-1]**	integer optional	Job Id, if this operation was performed via a job.
result-status		string	The operation status. Possible values: "succeeded", "in_progress", "failed".

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

flexcache-get-iter

[top]

Get a set of cache relationships. This must be run at the cache cluster.

Input Name	Range	Type	Description
desired-attributes		flexcache-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		flexcache-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the flexcache object. All flexcache objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		flexcache-info[] optional	The list of attributes of flexcache objects.
next-tag		string optional	Tag for the next call. Not present when there are no more flexcache objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

flexcache-origin-cleanup-cache-relationship

[top]

Cleanup cache relationship. This must be run at the origin cluster.

Errno	Description
EOBJECTNOTFOUND	
EVSERVERNOTFOUND	
EINTERNALERROR	
FEATURE/COMMAND_NOT_SUPPORTED	

flexcache-origin-config-get-iter

[top]

Get FlexCache origin configuration for all origin volume. This must be run at the origin cluster.

Input Name	Range	Type	Description
desired-attributes		flexcache-origin-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		flexcache-origin-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the flexcache-origin-config object. All flexcache-origin-config objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		flexcache-origin-config[] optional	The list of attributes of flexcache-origin-config objects.
next-tag		string optional	Tag for the next call. Not present when there are no more flexcache-origin-config objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

flexcache-origin-config-modify

[top]

Modify the FlexCache origin configuration. This must be run at the origin cluster.

Input Name	Range	Type	Description
is-bli-enabled		boolean optional	Is BLI Enabled.
is-global-file-locking-enabled		boolean optional	Is Global File Locking Enabled.
origin-volume		volume-name	Name of the origin volume.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

flexcache-usage-get

[top]

Get the capacity used by FlexCache

Output Name	Range	Type	Description
used-size	**[0..2^64-1]**	integer optional	Total FlexCache Size
used-size-pct	**[0..2^64-1]**	integer optional	Percentage of Licensed Capacity Used

Errno	Description

Element definition: **aggr-name**

[top]

Name of the aggregate

[none]

Element definition: **autoprovisionvolumetype**

[top]

FlexGroup Possible values:

- "flexgroup"

[none]

Element definition: **flexcache-info**

[top]

Information about the cache relationship When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
aggr-list		aggr-name[] optional	The array of aggregates which are used for FlexGroup constituents. Each aggregate in the array will host at least one FlexGroup constituent. Attributes: optional-for-create, non-modifiable
create-time		date optional	FlexCache Volume Create Time Attributes: non-creatable, non-modifiable
flexgroup-msid	**[0..2^64-1]**	integer optional	Cache volume's FlexGroup MSID Attributes: non-creatable, non-modifiable
junction-path		junction-path optional	Junction path of the cache volume Attributes: optional-for-create, non-modifiable
origin-cluster		cluster-name optional	The name of the origin cluster, where the origin Vserver and origin volume reside Attributes: non-creatable, non-modifiable
origin-volume		volume-name optional	The name of the origin volume for the cache volume. Attributes: required-for-create, non-modifiable
origin-volume-msid	**[0..2^64-1]**	integer optional	Origin volume's MSID Attributes: non-creatable, non-modifiable
origin-vserver		xc-vs-name optional	The name of origin Vserver where the origin volume resides Attributes: optional-for-create, non-modifiable
origin-vserver-uuid		uuid optional	Origin Vserver UUID Attributes: non-creatable, non-modifiable
size		size optional	Size of cache volume Attributes: optional-for-create, non-modifiable
space-guarantee		space-guarantee-enum optional	Flexcache volume space guarantee type Attributes: optional-for-create, non-modifiable Possible values: • "none" , • "volume"
volume		volume-name optional	The name of the cache volume. Attributes: key, required-for-create, non-modifiable
vserver		vserver-name optional	The name of the Vserver which owns the volume. Attributes: key, non-creatable, non-modifiable

Element definition: **flexcache-origin-config**

[top]

FlexCache Origin Configuration When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-bli-enabled		boolean optional	Is BLI Enabled. Attributes: non-creatable, modifiable
is-global-file-locking-enabled		boolean optional	Is Global File Locking Enabled. Attributes: non-creatable, modifiable
origin-volume		volume-name optional	Name of the origin volume. Attributes: key, non-creatable, non-modifiable
origin-vserver		vserver-name optional	Name of the origin Vserver. Attributes: key, non-creatable, non-modifiable

Element definition: **flexcache-origin-connected-cache-info**

[top]

Information of caches connected to the origin When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cache-cluster		cluster-name optional	Name of the cache cluster. Attributes: non-creatable, non-modifiable
cache-volume		volume-name optional	Name of the cache volume. Attributes: key, non-creatable, non-modifiable
cache-vserver		xc-vs-name optional	Name of the cache Vserver. Attributes: key, non-creatable, non-modifiable
origin-volume		volume-name optional	Name of the origin volume. Attributes: key, non-creatable, non-modifiable

origin-vserver		vserver-name optional	Name of the origin Vserver. Attributes: key, non-creatable, non-modifiable

Element definition: **junction-path**

[top]

The Junction Path.

The fully-qualified pathname in the owning Vserver's namespace at which a volume is mounted. Note that this pathname may itself contain junctions, one for each volume (other than the namespace root volume) that provides storage along the pathname's length. As with all fully-qualified pathnames , this string must begin with '/'. In addition, it must not end with '/'.

An example of a valid FlexVol or FlexGroup junction path is: '/user/my_volume'. An example of a valid Infinite Volume junction path is: '/repository'.

Only one volume can be mounted at any given junction path.

[none]

Element definition: **size**

[top]

Size in bytes Range : [0..2^63-1].

[none]

Element definition: **space-guarantee-enum**

[top]

none|volume Possible values:

- "none" ,
- "volume"

[none]

Element definition: **volume-name**

[top]

The name of the volume.

Volume names can contain letters, numbers, and the underscore character (_). The first character must be a letter or an underscore. When creating a Cluster-Mode volume, the user can specify at most 203 characters. If the prefix '/vol/' appears in the volume name, it is stripped out and the characters that follow the prefix constitute the actual volume name.

Volume names are scoped by their owning Vserver in a cluster, with each Vserver's volume namespace

being totally independent. Thus, any Vserver 'S' in a cluster cannot have two volumes with the same name 'V'. However, two different Vservers in the same cluster can each have a volume named 'V'.

For example, any given Vserver in a cluster can only have at most one volume named 'vol0'. However, two different Vservers S1 and S2 in the cluster may each have a volume named 'vol0'.

[none]

Element definition: **xc-vs-name** [top]

Cross Cluster Vserver Name

[none]

Element definition: **aggr-name** [top]

Name of the aggregate

[none]

Element definition: **cluster-name** [top]

Name of the Peer Cluster

[none]

Element definition: **date** [top]

Date (in seconds since Jan. 1, 1970 12:00:00) Range : [0..2^31-1].

[none]

Element definition: **uuid** [top]

The 128-bit universally-unique identifier (UUID).

UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

[none]

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

This set of APIs enables programmatic control of policy life cycle including: creation, enablement, configuration, monitoring, and deletion. Also, it includes commands for server monitoring and control, as well as notification filtering based on file extension. FPolicy APIs provided for Data ONTAP Clustered-Mode environment enables in creating/modifying/deleting/retrieving following FPolicy entities:

1. Event: This collectively specifies the protocols, fileops, for which notification is generated.

2. Scope: This specifies the scope on which FPolicy will be working on. A scope can be on a volume, share, or a export policy. Scope also contains the file extensions.

3. External-Engine: This specifies the attributes required for a notification to be sent to external FPolicy servers.

4. Policy: Once an event and external engine is created, it can be attached to a policy. A scope has to be defined for a policy before it is enabled to run.

fpolicy-extensions

[top]

Manipulates with list of extensions in exclude or include set. Exlude set defines extension patterns that won't trigger fpolicy processing.

Input Name	Range	Type	Description
command		string	Command to be applied on the specified set. Supported values: "add", "remove", "set", "reset".
extensions		extension-list-info[] optional	List of extensions. This element is required if the the command input value is "add", "set" or "remove".
policy-name		string	Name of the policy.
set-name		string	Defines to which set (exclude or include) a command (add, remove, etc) will be applied to. For instance, command = add, set-name = include will add specified list of extensions to the include set. Possible values: "exclude", "include".

Errno	Description
EINVALIDINPUTERROR

fpolicy-get-policy-options

[top]

Shows value of policy options.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.

Output Name	Range	Type	Description
is-ads-monitored		boolean optional	Indicator if the policy monitors the cifs operations on Alternate Data Streams.
is-cifs-disconnect-check-enabled		boolean	'true' if requests associated with disconnected CIFS sessions must not be screened, 'false' otherwise.
is-cifs-setattr-enabled		boolean	Indicator whether cifs-setattr support is enabled on this policy or not. If set to true, cifs setattr operations will be screened.
is-required		boolean	Indicator if the screening with this policy is required, i.e. will it fail if the server is not registered. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed.
reqcancel-timeout		integer	Timeout (in secs) for a screen request to be processed by an FPolicy server. Range : [0..4294967].
secondary-servers		secondary-server-info[]	List of server's IP addresses. Servers registered from these IP will be considered as secondary servers.
serverprogress-timeout		integer	Timeout (in secs) in which a throttled FPolicy server must complete at least one screen request. Range : [0..4294967].

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-get-required-info

[top]

Shows current options for the policy.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.

Output Name	Range	Type	Description
is-required		boolean	Indicator if the policy is required, i.e. will it fail if the server is not responding. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed.

fpolicy-list-info

[top]

Returns a list of existing policies.

Input Name	Range	Type	Description
policy-name		string optional	Name of the policy. If this parameter is set, policies will have information pertaining to the policy named. If there is no such a policy, policies will be empty.

Output Name	Range	Type	Description

policies		policy-info[]	List of policies.

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-operations-list-set

[top]

Manipulate a list of operations and network protocols for a policy. This determines which user requests cause the filer to notify fpolicy servers for this policy. The list provided will replace the list currently in place, if any. Note that this can be confusing to a server which has already connected to a policy and provided a list of operations. For example, it may have requested notifications when users open files, but start receiving notifications when users create symlinks. This API is provided in support of "native file blocking" in which there is no server connected to the filer for a policy. Note that it is possible to get the list of operations and protocols currently set for a policy with the fpolicy-list-info API.

Input Name	Range	Type	Description
force		boolean optional	If a server is connected to the filer and has already set the list of operations, should this API override the server's setting? If "force" is "true", the policy's set of operations will be dropped and replaced with the values provided by this API. Default value is false.
monitored-operations		monitored-operation-info[]	List of operations related values.
monitored-protocols		monitored-protocol-info[]	List of protocol related values.
offline-only		boolean optional	Sets the state of offline filtering. If offline filtering is set, then only user requests for files which are marked "offline" cause notifications. Default value is false.
policy-name		string	Name of the policy.

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-passthrough-read-connection-get-iter

[top]

Returns passthrough-read connection status information.

Input Name	Range	Type	Description

desired-attributes		fpolicy-passthrough-read-connection-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		fpolicy-passthrough-read-connection-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the fpolicy-passthrough-read-connection object. All fpolicy-passthrough-read-connection objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fpolicy-passthrough-read-connection-info[] optional	The list of attributes of fpolicy-passthrough-read-connection objects.
next-tag		string optional	Tag for the next call. Not present when there are no more fpolicy-passthrough-read-connection objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

fpolicy-policy-create

[top]

Create a policy.

Input Name	Range	Type	Description
allow-privileged-access		boolean optional	Indicator if privileged access should be given to FPolicy servers registered for the policy. Default Value is no.
engine-name		engine-name	Name of the Engine. Default Engine is 'native'.
events		event-name[]	Events for file access monitoring.
			Indicator if the screening with this policy is required, i.e. it will fail if no

is-mandatory		boolean optional	servers are able process the notification registered as a part of external engine. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed. Default value is true.
is-passthrough-read-enabled		boolean optional	Indicator if passthrough-read should be allowed to FPolicy servers registered for the policy. Default value is false.
policy-name		policy-name	Name of the policy.
privileged-user-name		string optional	User name for privileged access. No default value is set for this attribute.
return-record		boolean optional	If set to true, returns the fpolicy-policy on successful creation. Default: false

Output Name	Range	Type	Description
result		fpolicy-policy-info optional	The fpolicy-policy created (keys or the entire object if requested)

EPOLICYNOTFOUND	

fpolicy-policy-event-create

[top]

Create FPolicy Event.

Input Name	Range	Type	Description
event-name		event-name	Name of the Event.
file-operations		fpolicy-operation[] optional	Name of file operations. By default no operations are monitored. Possible values: • "close" - File close operation, • "create" - File create operation, • "create_dir" - File create directory operation, • "delete" - File delete operation, • "delete_dir" - Directory delete operation, • "getattr" - Get attribute operation, • "link" - Link operation, • "lookup" - Lookup operation, • "open" - File open operation, • "read" - File read operation, • "write" - File write operation, • "rename" - File rename operation, • "rename_dir" - Directory rename operation, • "setattr" - Set attribute operation, • "symlink" - Symbolic link operation
filter-string		fpolicy-filter[] optional	Name of filters. It is notification filtering parameters. By default no filters are selected. Possible values: • "monitor_ads" - Monitor alternate data stream, • "close_with_modification" - Filter close with modification, • "close_without_modification" - Filter close without modification, • "first_read" - Filter first read, • "first_write" - Filter first write, • "offline_bit" - Filter offline bit set, • "open_with_delete_intent" - Filter open with delete intent, • "open_with_write_intent" - Filter open with write intent, • "write_with_size_change" - Filter write with size change, • "close_with_read" - Filter close with read, • "setattr_with_owner_change" - Filter file owner change, • "setattr_with_group_change" - Filter file group change, • "setattr_with_sacl_change" - Filter file sacl change, • "setattr_with_dacl_change" - Filter file dacl change, • "setattr_with_modify_time_change" - Filter file modify time change, • "setattr_with_access_time_change" - Filter file access time change, • "setattr_with_creation_time_change" - Filter file creation time change, • "setattr_with_mode_change" - Filter file mode change, • "setattr_with_size_change" - Filter file size change, • "setattr_with_allocation_size_change" - Filter allocation size change, • "exclude_directory" - Filter to exclude directory operations
protocol		fpolicy-proto optional	Name of protocol for which event is created. By default no protocol is selected. Possible values: • "cifs" - CIFS protocol, • "nfsv3" - NFSv3 protocol, • "nfsv4" - NFSv4 protocol

return-record		boolean optional	If set to true, returns the fpolicy-policy-event on successful creation. Default: false
volume-operation		boolean optional	Indicator if the volume operation required for the event.Default Value is false.

Output Name	Range	Type	Description

[top]

Set FPolicy event options. FPolicy event is consist of protocol, file operation, volume operation and f ilters.

Input Name	Range	Type	Description
event-name		event-name	Name of the Event.
file-operations		fpolicy-operation[] optional	Name of file operations. By default no operations are monitored. Possible values: • "close" - File close operation, • "create" - File create operation, • "create_dir" - File create directory operation, • "delete" - File delete operation, • "delete_dir" - Directory delete operation, • "getattr" - Get attribute operation, • "link" - Link operation, • "lookup" - Lookup operation, • "open" - File open operation, • "read" - File read operation, • "write" - File write operation, • "rename" - File rename operation, • "rename_dir" - Directory rename operation, • "setattr" - Set attribute operation, • "symlink" - Symbolic link operation
			Name of filters. It is notification filtering parameters. By default no filters are selected. Possible values: • "monitor_ads" - Monitor alternate data stream, • "close_with_modification" - Filter close with modification, • "close_without_modification" - Filter close without

filter-string		fpolicy-filter[] optional	modification, • "first_read" - Filter first read, • "first_write" - Filter first write, • "offline_bit" - Filter offline bit set, • "open_with_delete_intent" - Filter open with delete intent, • "open_with_write_intent" - Filter open with write intent, • "write_with_size_change" - Filter write with size change, • "close_with_read" - Filter close with read, • "setattr_with_owner_change" - Filter file owner change, • "setattr_with_group_change" - Filter file group change, • "setattr_with_sacl_change" - Filter file sacl change, • "setattr_with_dacl_change" - Filter file dacl change, • "setattr_with_modify_time_change" - Filter file modify time change, • "setattr_with_access_time_change" - Filter file access time change, • "setattr_with_creation_time_change" - Filter file creation time change, • "setattr_with_mode_change" - Filter file mode change, • "setattr_with_size_change" - Filter file size change, • "setattr_with_allocation_size_change" - Filter allocation size change, • "exclude_directory" - Filter to exclude directory operations
protocol		fpolicy-proto optional	Name of protocol for which event is created. By default no protocol is selected. Possible values: • "cifs" - CIFS protocol, • "nfsv3" - NFSv3 protocol, • "nfsv4" - NFSv4 protocol
volume-operation		boolean optional	Indicator if the volume operation required for the event.Default Value is false.

EEVENTNOTFOUND	

fpolicy-policy-external-engine-create

[top]

Create an external engine.

Input Name	Range	Type	Description
certificate-ca		string optional	Certificate authority name. No default value is set for this field.
certificate-common-name		common-name optional	FQDN or custom common name of certificate. No default value is set for this field.
certificate-serial		string optional	Serial number of certificate. No default value is set for this field.
engine-name		engine-name	Name of the external engine.

extern-engine-type		external-engine-type optional	External engine type. If the engine is asynchronous, no reply is sent from FPolicy servers. Default value set for this field is synchronous. Possible values: • "synchronous" - Synchronous External Engine, • "asynchronous" - Asynchronous External Engine
is-resiliency-enabled		boolean optional	Indicates if the resiliency with this engine is required. If set to true, the notifications will be stored in a path as resiliency-directory-path for the duration specified in max-retention-duration if all the servers are disconnected. If it is false, the notifications will not be stored. Default value is false.
keep-alive-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to send keep-alive message to FPolicy server. Default value set for this field is 10 seconds.
max-connection-retries	**[0..2^32-1]**	integer optional	Number of times storage appliance will attempt to establish a broken connection to FPolicy server. Default value set for this field is 5.
max-server-requests	**[0..2^32-1]**	integer optional	Maximum number of outstanding screen requests that will be queued for an FPolicy Server. Default value set for this field is 50.
port-number	**[1..65535]**	integer	Port number of the FPolicy server application.
primary-servers		ip-address[]	Primary FPolicy servers.
recv-buffer-size	**[0..2^32-1]**	integer optional	Receive buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb).
request-abort-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds for a screen request to be aborted by storage appliance. Default value set for this field is 40 seconds.
request-cancel-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds for a screen request to be processed by an FPolicy server. Default value set for this field is 20 seconds.
resiliency-directory-path		string optional	Directory path under Vserver for storing file access notifications. File access notifications will be stored in a generated file during the outage time. The path is the full, user visible path relative to the Vserver root, and it might be crossing junction mount points. Example: '/path1' where '/' is the root of the Vserver and 'path1' is the directory where to store notifications.
resiliency-max-retention-duration		time-interval optional	Maximum retention duration for which the notifications will be stored. After this time window further notifications will not be stored. Default value set for this field is 180 seconds. Maximum retention duration can be 600 seconds.
return-record		boolean optional	If set to true, returns the fpolicy-policy-external-engine on successful creation. Default: false
secondary-servers		ip-address[] optional	Secondary FPolicy servers. No default value is set for this field.
send-buffer-size	**[0..2^32-1]**	integer optional	Send buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb).
server-progress-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds in which a throttled FPolicy server must complete at least one screen request. If no request is processed within the timeout, connection to FPolicy server is terminated. Default value set for this field is 60 seconds.
session-timeout		time-interval optional	Session Id purge timeout during FPolicy server reconnection. Default value set for this field is 10 seconds.
			SSL option for external communication. No default value is set for

ssl-option		fpolicy-ssl-opts	this field. Possible values: • "no_auth" - Communication over TCP, • "server_auth" - Authentication of FPolicy server only, • "mutual_auth" - Mutual authentication of storage system and FPolicy server
status-request-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to query status request from FPolicy server. Default value set for this field is 10 seconds.

Output Name	Range	Type	Description

fpolicy-policy-external-engine-get-iter

[top]

Returns information on external engines.

Input Name	Range	Type	Description
desired-		fpolicy-external-	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If

attributes		engine-info optional	present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		fpolicy-external-engine-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the fpolicy-policy-external-engine object. All fpolicy-policy-external-engine objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		fpolicy-external-engine-info[] optional	The list of attributes of fpolicy-policy-external-engine objects.
next-tag		string optional	Tag for the next call. Not present when there are no more fpolicy-policy-external-engine objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	
EVSERVERNOTFOUND	
EENGINENOTFOUND	

fpolicy-policy-external-engine-modify

[top]

Modify an external engine. External engine can be modified only when none of the enabled policies are using it.

Input Name	Range	Type	Description
certificate-ca		string optional	Certificate authority name. No default value is set for this field.
certificate-common-name		common-name optional	FQDN or custom common name of certificate. No default value is set for this field.
certificate-serial		string optional	Serial number of certificate. No default value is set for this field.
engine-name		engine-name	Name of the external engine.
extern-engine-type		external-engine-type optional	External engine type. If the engine is asynchronous, no reply is sent from FPolicy servers. Default value set for this field is synchronous. Possible values: • "synchronous" - Synchronous External Engine, • "asynchronous" - Asynchronous External Engine

is-resiliency-enabled		boolean optional	Indicates if the resiliency with this engine is required. If set to true, the notifications will be stored in a path as resiliency-directory-path for the duration specified in max-retention-duration if all the servers are disconnected. If it is false, the notifications will not be stored. Default value is false.
keep-alive-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to send keep-alive message to FPolicy server. Default value set for this field is 10 seconds.
max-connection-retries	**[0..2^32-1]**	integer optional	Number of times storage appliance will attempt to establish a broken connection to FPolicy server. Default value set for this field is 5.
max-server-requests	**[0..2^32-1]**	integer optional	Maximum number of outstanding screen requests that will be queued for an FPolicy Server. Default value set for this field is 50.
port-number	**[1..65535]**	integer optional	Port number of the FPolicy server application.
primary-servers		ip-address[] optional	Primary FPolicy servers.
recv-buffer-size	**[0..2^32-1]**	integer optional	Receive buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb).
request-abort-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds for a screen request to be aborted by storage appliance. Default value set for this field is 40 seconds.
request-cancel-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds for a screen request to be processed by an FPolicy server. Default value set for this field is 20 seconds.
resiliency-directory-path		string optional	Directory path under Vserver for storing file access notifications. File access notifications will be stored in a generated file during the outage time. The path is the full, user visible path relative to the Vserver root, and it might be crossing junction mount points. Example: '/path1' where '/' is the root of the Vserver and 'path1' is the directory where to store notifications.
resiliency-max-retention-duration		time-interval optional	Maximum retention duration for which the notifications will be stored. After this time window further notifications will not be stored. Default value set for this field is 180 seconds. Maximum retention duration can be 600 seconds.
secondary-servers		ip-address[] optional	Secondary FPolicy servers. No default value is set for this field.
send-buffer-size	**[0..2^32-1]**	integer optional	Send buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb).
server-progress-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds in which a throttled FPolicy server must complete at least one screen request. If no request is processed within the timeout, connection to FPolicy server is terminated. Default value set for this field is 60 seconds.
session-timeout		time-interval optional	Session Id purge timeout during FPolicy server reconnection. Default value set for this field is 10 seconds.
ssl-option		fpolicy-ssl-opts optional	SSL option for external communication. No default value is set for this field. Possible values: • "no_auth" - Communication over TCP, • "server_auth" - Authentication of FPolicy server only, • "mutual_auth" - Mutual authentication of storage system and FPolicy server

status-request-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to query status request from FPolicy server. Default value set for this field is 10 seconds.

EPOLICYNOTFOUND	

fpolicy-policy-modify

[top]

Modify a policy.

Input Name	Range	Type	Description
allow-privileged-access		boolean optional	Indicator if privileged access should be given to FPolicy servers registered for the policy. Default Value is no.
engine-name		engine-name optional	Name of the Engine. Default Engine is 'native'.
events		event-name[] optional	Events for file access monitoring.
is-mandatory		boolean optional	Indicator if the screening with this policy is required, i.e. it will fail if no servers are able process the notification registered as a part of external engine. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed. Default value is true.
is-passthrough-read-enabled		boolean optional	Indicator if passthrough-read should be allowed to FPolicy servers registered for the policy. Default value is false.
policy-name		policy-name	Name of the policy.
privileged-user-name		string optional	User name for privileged access. No default value is set for this attribute.

fpolicy-policy-scope-create

[top]

Set FPolicy scope options. FPolicy Scope is consist of share, volume, export policy, volume, file extention.

Input Name	Range	Type	Description
check-extensions-on-directories		boolean optional	Indicates whether directory names are also subjected to extensions check, similar to file names. By default, the value is true if policy is configured with Native engine, false otherwise.
export-policies-to-exclude		string[] optional	Export Policies to exclude for file access monitoring. By default no export policy is selected.
export-policies-to-include		string[] optional	Export policies to include for file access monitoring. By default no export policy is selected.

file-extensions-to-exclude		string[] optional	File extensions excluded for screening. By default no file extension is selected.
file-extensions-to-include		string[] optional	File extensions included for screening. By default no file extension is selected.
is-monitoring-of-objects-with-no-extension-enabled		boolean optional	Indicates whether monitoring of Objects with no extension is required. By default, the value is false.
policy-name		policy-name	Name of the policy.
return-record		boolean optional	If set to true, returns the fpolicy-policy-scope on successful creation. Default: false
shares-to-exclude		string[] optional	Shares to exclude for file access monitoring. By default no share is selected.
shares-to-include		string[] optional	Shares to include for file access monitoring. By default no share is selected.
volumes-to-exclude		string[] optional	Volumes that are inactive for the file policy. The list can include items which are regular expressions, such as 'vol*' or 'user?'. Note that if a policy has both an exclude list and an include list, the include list is ignored by the filer when processing user requests. By default no volume is selected.
volumes-to-include		string[] optional	Volumes that are active for the file policy. The list can include items which are regular expressions, such as 'vol*' or 'user?'. By default no volume is selected.

fpolicy-server-stop

[top]

Stops specific primary server serving the policy. Effectively, this will unregister the fpolicy server.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.
server-ip		ip-address	The ip address, in dotted-decimal format, of the server.

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-set-policy-options

[top]

Sets policy's options to on/off.

Input Name	Range	Type	Description
is-ads-monitored		boolean optional	Indicates if the policy monitors the cifs operations on Alternate Data Streams. Default is false.

is-cifs-disconnect-check-enabled		boolean optional	'true' if requests associated with disconnected CIFS sessions must not be screened, 'false' otherwise.
is-cifs-setattr-enabled		boolean optional	Indicator whether cifs-setattr support is enabled on this policy or not. If set to true, cifs setattr operations will be screened. Default is false.
is-required		boolean optional	Indicator if the screening with this policy is required, i.e. will it fail if the server is not registered. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed. Default is false.
policy-name		string	Name of the policy.
reqcancel-timeout		integer optional	Timeout (in secs) for a screen request to be processed by an FPolicy server. Range : [0..4294967].
secondary-servers		secondary-server-info[] optional	List of server's IP addresses. Servers registered from these IP will be considered as secondary servers.
serverprogress-timeout		integer optional	Timeout (in secs) in which a throttled FPolicy server must complete at least one screen request. Range : [0..4294967].

Errno	Description
EINVALIDINPUTERROR

Yes

fpolicy-set-required

[top]

Sets policy's "required" option to on/off.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.
required		boolean	Indicator if the policy is required. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed.

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-set-secondary-servers

[top]

Sets secondary servers information in a form of a list of ip addresses. These servers will be used if all

primary servers are not available, thus increasing system availabilty.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.
secondary-servers		secondary-server-info[]	List of servers' IP addresses.

Errno	Description
EINVALIDINPUTERROR	
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-status

[top]

Returns status of options fpolicy enable.

Output Name	Range	Type	Description
is-enabled		boolean	Shows if the fpolicy mechanism is enabled or not.

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-volume-list-info

[top]

Returns a volume-regular-expression list for an exclude or include set. The list describes limits to the set of volumes for which client requests trigger (include) or suppress (exclude) fpolicy processing for the provided policy.

Input Name	Range	Type	Description
policy-name		string	Name of the policy.

Output Name	Range	Type	Description
exclude-volumes		fpolicy-volumes-list-info[]	List of volumes that are inactive for the file policy. The list can include items which are regular expressions, such as "vol*" or "user?". Note that if a policy has both an exclude list and an include list, the include list is ignored by the filer when processing user requests.
include-volumes		fpolicy-volumes-list-info[]	List of volumes that are active for the file policy. The list can include items which are regular expressions, such as "vol*" or "user?".

Errno	Description
EINVALIDINPUTERROR	

Errno	Description
EINTERNALERROR	

Vfiler-enabled
Yes

fpolicy-volume-list-set

[top]

Manipulate a list of volumes in an exclude or include set. This limits the set of volumes for which client requests trigger (include) or suppress (exclude) fpolicy processing for the provided policy. The list provided will replace the list currently in place, if any. Note that if a policy has both an exclude list and an include list, the include list is ignored by the filer.

Input Name	Range	Type	Description
list-type		string	Defines to which set (exclude or include) a list will be applied. Possible values: "exclude", "include".
policy-name		string	Name of the policy.
volumes		fpolicy-volumes-list-info[]	List of volume specifications.

Event name

[none]

Element definition: **extension-list-info**

[top]

Structure containing extension information.

Name	Range	Type	Description
name-spec		string	Extension specification (including wild cards). Allowed are only DOS like, three character long extensions. The extensions are case insensitive. Supported wild card values: "???" to match any extension and "?" to match any character. Examples of allowed extension specifications: EXE ??? ?XT P??

Element definition: **external-engine-type**

[top]

External Engine Type Possible values:

- "synchronous" - Synchronous External Engine,
- "asynchronous" - Asynchronous External Engine

[none]

Element definition: **fpolicy-event-options-config**

[top]

Vserver FPolicy Event configuration and management on name When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
event-name		event-name optional	Name of the Event. Attributes: key, required-for-create, non-modifiable
			Name of file operations. By default no operations are monitored. Attributes: optional-for-create, modifiable Possible values: • "close" - File close operation, • "create" - File create operation, • "create_dir" - File create directory operation,

file-operations		fpolicy-operation[] optional	"delete" - File delete operation, • "delete_dir" - Directory delete operation, • "getattr" - Get attribute operation, • "link" - Link operation, • "lookup" - Lookup operation, • "open" - File open operation, • "read" - File read operation, • "write" - File write operation, • "rename" - File rename operation, • "rename_dir" - Directory rename operation, • "setattr" - Set attribute operation, • "symlink" - Symbolic link operation
filter-string		fpolicy-filter[] optional	Name of filters. It is notification filtering parameters. By default no filters are selected. Attributes: optional-for-create, modifiable Possible values: • "monitor_ads" - Monitor alternate data stream, • "close_with_modification" - Filter close with modification, • "close_without_modification" - Filter close without modification, • "first_read" - Filter first read, • "first_write" - Filter first write, • "offline_bit" - Filter offline bit set, • "open_with_delete_intent" - Filter open with delete intent, • "open_with_write_intent" - Filter open with write intent, • "write_with_size_change" - Filter write with size change, • "close_with_read" - Filter close with read, • "setattr_with_owner_change" - Filter file owner change, • "setattr_with_group_change" - Filter file group change, • "setattr_with_sacl_change" - Filter file sacl change, • "setattr_with_dacl_change" - Filter file dacl change, • "setattr_with_modify_time_change" - Filter file modify time change, • "setattr_with_access_time_change" - Filter file access time change, • "setattr_with_creation_time_change" - Filter file creation time change, • "setattr_with_mode_change" - Filter file mode change, • "setattr_with_size_change" - Filter file size change, • "setattr_with_allocation_size_change" - Filter allocation size change, • "exclude_directory" - Filter to exclude directory operations
protocol		fpolicy-proto optional	Name of protocol for which event is created. By default no protocol is selected. Attributes: optional-for-create, modifiable Possible values: • "cifs" - CIFS protocol, • "nfsv3" - NFSv3 protocol, • "nfsv4" - NFSv4 protocol
volume-operation		boolean optional	Indicator if the volume operation required for the event.Default Value is false. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-external-engine-info**

[top]

External engine configuration and management. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
certificate-ca		string optional	Certificate authority name. No default value is set for this field. Attributes: optional-for-create, modifiable
certificate-common-name		common-name optional	FQDN or custom common name of certificate. No default value is set for this field. Attributes: optional-for-create, modifiable
certificate-serial		string optional	Serial number of certificate. No default value is set for this field. Attributes: optional-for-create, modifiable
engine-name		engine-name optional	Name of the external engine. Attributes: key, required-for-create, non-modifiable
extern-engine-type		external-engine-type optional	External engine type. If the engine is asynchronous, no reply is sent from FPolicy servers. Default value set for this field is synchronous. Attributes: optional-for-create, modifiable Possible values: • "synchronous" - Synchronous External Engine, • "asynchronous" - Asynchronous External Engine
is-resiliency-enabled		boolean optional	Indicates if the resiliency with this engine is required. If set to true, the notifications will be stored in a path as resiliency-directory-path for the duration specified in max-retention-duration if all the servers are disconnected. If it is false, the notifications will not be stored. Default value is false. Attributes: optional-for-create, modifiable
keep-alive-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to send keep-alive message to FPolicy server. Default value set for this field is 10 seconds. Attributes: optional-for-create, modifiable
max-connection-retries	**[0..2^32-1]**	integer optional	Number of times storage appliance will attempt to establish a broken connection to FPolicy server. Default value set for this field is 5. Attributes: optional-for-create, modifiable
max-server-requests	**[0..2^32-1]**	integer optional	Maximum number of outstanding screen requests that will be queued for an FPolicy Server. Default value set for this field is 50. Attributes: optional-for-create, modifiable
port-number	**[1..65535]**	integer optional	Port number of the FPolicy server application. Attributes: required-for-create, modifiable
primary-servers		ip-address[] optional	Primary FPolicy servers. Attributes: required-for-create, modifiable
recv-buffer-size	**[0..2^32-1]**	integer optional	Receive buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb). Attributes: optional-for-create, modifiable
request-abort-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds for a screen request to be aborted by storage appliance. Default value set for this field is 40 seconds. Attributes: optional-for-create, modifiable
request-			Timeout in seconds for a screen request to be processed by an

cancel-timeout	**[0..2^32-1]**	integer optional	FPolicy server. Default value set for this field is 20 seconds. Attributes: optional-for-create, modifiable
resiliency-directory-path		string optional	Directory path under Vserver for storing file access notifications. File access notifications will be stored in a generated file during the outage time. The path is the full, user visible path relative to the Vserver root, and it might be crossing junction mount points. Example: '/path1' where '/' is the root of the Vserver and 'path1' is the directory where to store notifications. Attributes: optional-for-create, modifiable
resiliency-max-retention-duration		time-interval optional	Maximum retention duration for which the notifications will be stored. After this time window further notifications will not be stored. Default value set for this field is 180 seconds. Maximum retention duration can be 600 seconds. Attributes: optional-for-create, modifiable
secondary-servers		ip-address[] optional	Secondary FPolicy servers. No default value is set for this field. Attributes: optional-for-create, modifiable
send-buffer-size	**[0..2^32-1]**	integer optional	Send buffer size of connected socket for FPolicy Server. Default value set for this field is 256 kilobytes (256Kb). Attributes: optional-for-create, modifiable
server-progress-timeout	**[0..2^32-1]**	integer optional	Timeout in seconds in which a throttled FPolicy server must complete at least one screen request. If no request is processed within the timeout, connection to FPolicy server is terminated. Default value set for this field is 60 seconds. Attributes: optional-for-create, modifiable
session-timeout		time-interval optional	Session Id purge timeout during FPolicy server reconnection. Default value set for this field is 10 seconds. Attributes: optional-for-create, modifiable
ssl-option		fpolicy-ssl-opts optional	SSL option for external communication. No default value is set for this field. Attributes: required-for-create, modifiable Possible values: • "no_auth" - Communication over TCP, • "server_auth" - Authentication of FPolicy server only, • "mutual_auth" - Mutual authentication of storage system and FPolicy server
status-request-interval	**[0..2^32-1]**	integer optional	Interval time in seconds for storage appliance to query status request from FPolicy server. Default value set for this field is 10 seconds. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-filter**

[top]

Filter Possible values:

- "monitor_ads" - Monitor alternate data stream,
- "close_with_modification" - Filter close with modification,
- "close_without_modification" - Filter close without modification,
- "first_read" - Filter first read,
- "first_write" - Filter first write,
- "offline_bit" - Filter offline bit set,
- "open_with_delete_intent" - Filter open with delete intent,

"open_with_write_intent" - Filter open with write intent,
- "write_with_size_change" - Filter write with size change,
- "close_with_read" - Filter close with read,
- "setattr_with_owner_change" - Filter file owner change,
- "setattr_with_group_change" - Filter file group change,
- "setattr_with_sacl_change" - Filter file sacl change,
- "setattr_with_dacl_change" - Filter file dacl change,
- "setattr_with_modify_time_change" - Filter file modify time change,
- "setattr_with_access_time_change" - Filter file access time change,
- "setattr_with_creation_time_change" - Filter file creation time change,
- "setattr_with_mode_change" - Filter file mode change,
- "setattr_with_size_change" - Filter file size change,
- "setattr_with_allocation_size_change" - Filter allocation size change,
- "exclude_directory" - Filter to exclude directory operations

[none]

Element definition: **fpolicy-operation**

[top]

File Operation Possible values:

- "close" - File close operation,
- "create" - File create operation,
- "create_dir" - File create directory operation,
- "delete" - File delete operation,
- "delete_dir" - Directory delete operation,
- "getattr" - Get attribute operation,
- "link" - Link operation,
- "lookup" - Lookup operation,
- "open" - File open operation,
- "read" - File read operation,
- "write" - File write operation,
- "rename" - File rename operation,
- "rename_dir" - Directory rename operation,
- "setattr" - Set attribute operation,
- "symlink" - Symbolic link operation

[none]

Element definition: **fpolicy-passthrough-read-connection-info**

[top]

FPolicy passthrough-read connection status. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
connected-since		datetime optional	Date and time since passthrough-read channel is connected. This will be returned only if the server-status is connected. Attributes: non-creatable, non-modifiable
control-session-id		string optional	Session ID of the control channel established with FPolicy server. Attributes: key, non-creatable, non-modifiable
disconnect-reason		fpolicy-passthru-disconnect-reason optional	Reason for passthrough-read channel disconnection. Attributes: non-creatable, non-modifiable Possible values: • "none" - Not applicable, • "control_conn_closed" - Control connection to the FPOlicy server is closed, • "pipe_client_close" - Connection closed by pipe client (FPolicy server), • "pipe_server_close" - Connection closed by pipe server (ONTAP) due to idle session, interface down etc., • "no_control_packet" - No control packet seen on this connection, • "control_conn_vserver_ip_changed" - Control connection is established using different vserver ip, • "fpolicy_process_restart" - FPolicy process has restarted
disconnected-since		datetime optional	Date and time since passthrough-read channel is disconnected. This will be returned only if the server-status is disconnected. Attributes: non-creatable, non-modifiable
fpolicy-server		ip-address optional	IP Address of the FPolicy server. Attributes: key, non-creatable, non-modifiable
node		node-name optional	Cluster node to which this connection is applicable. Attributes: key, non-creatable, non-modifiable
policy-name		policy-name optional	Policy name of the policy for which passthrough-read connection is opened. Attributes: key, non-creatable, non-modifiable
server-status		fpolicy-passthru-conn-status optional	Status of the passthrough-read connection. Attributes: non-creatable, non-modifiable Possible values: • "connected" - Passthrough read channel connected, • "disconnected" - Passtthrough read channel disconnected
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-policy-info**

[top]

FPolicy policy information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description

allow-privileged-access		boolean optional	Indicator if privileged access should be given to FPolicy servers registered for the policy. Default Value is no. Attributes: optional-for-create, modifiable
engine-name		engine-name optional	Name of the Engine. Default Engine is 'native'. Attributes: required-for-create, modifiable
events		event-name[] optional	Events for file access monitoring. Attributes: required-for-create, modifiable
is-mandatory		boolean optional	Indicator if the screening with this policy is required, i.e. it will fail if no servers are able process the notification registered as a part of external engine. If set to true, the request will fail if there is no server to evaluate it. If it's false, the request will succeed. Default value is true. Attributes: optional-for-create, modifiable
is-passthrough-read-enabled		boolean optional	Indicator if passthrough-read should be allowed to FPolicy servers registered for the policy. Default value is false. Attributes: optional-for-create, modifiable
policy-name		policy-name optional	Name of the policy. Attributes: key, required-for-create, non-modifiable
privileged-user-name		string optional	User name for privileged access. No default value is set for this attribute. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-policy-status-info**

[top]

FPolicy Policy status information. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
policy-name		policy-name optional	Name of the policy. Attributes: key, non-creatable, non-modifiable
sequence-number	**[1..10]**	integer optional	Sequence number(or priority) of the policy. 1 being highest and 10 being smallest. Default value is 1. Attributes: non-creatable, non-modifiable
status		boolean optional	Status of the policy. When on, policy is active. Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-proto**

[top]

Protocol Possible values:

- "cifs" - CIFS protocol,
- "nfsv3" - NFSv3 protocol,
- "nfsv4" - NFSv4 protocol

[none]

Element definition: **fpolicy-scope-config**

[top]

Vserver FPolicy Scope configuration and management on name When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
check-extensions-on-directories		boolean optional	Indicates whether directory names are also subjected to extensions check, similar to file names. By default, the value is true if policy is configured with Native engine, false otherwise. Attributes: optional-for-create, modifiable
export-policies-to-exclude		string[] optional	Export Policies to exclude for file access monitoring. By default no export policy is selected. Attributes: optional-for-create, modifiable
export-policies-to-include		string[] optional	Export policies to include for file access monitoring. By default no export policy is selected. Attributes: optional-for-create, modifiable
file-extensions-to-exclude		string[] optional	File extensions excluded for screening. By default no file extension is selected. Attributes: optional-for-create, modifiable
file-extensions-to-include		string[] optional	File extensions included for screening. By default no file extension is selected. Attributes: optional-for-create, modifiable
is-monitoring-of-objects-with-no-extension-enabled		boolean optional	Indicates whether monitoring of Objects with no extension is required. By default, the value is false. Attributes: optional-for-create, modifiable
policy-name		policy-name optional	Name of the policy. Attributes: key, required-for-create, non-modifiable
shares-to-exclude		string[] optional	Shares to exclude for file access monitoring. By default no share is selected. Attributes: optional-for-create, modifiable
shares-to-include		string[] optional	Shares to include for file access monitoring. By default no share is selected. Attributes: optional-for-create, modifiable
			Volumes that are inactive for the file policy. The list can include items

volumes-to-exclude		string[] optional	which are regular expressions, such as 'vol*' or 'user?'. Note that if a policy has both an exclude list and an include list, the include list is ignored by the filer when processing user requests. By default no volume is selected. Attributes: optional-for-create, modifiable
volumes-to-include		string[] optional	Volumes that are active for the file policy. The list can include items which are regular expressions, such as 'vol*' or 'user?'. By default no volume is selected. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-server-status-info**

[top]

External engine configuration and management. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
connected-since		datetime optional	Date and time since FPolicy server is connected. Attributes: non-creatable, non-modifiable
disconnect-reason		string optional	Reason for FPolicy server disconnection. Attributes: non-creatable, non-modifiable
disconnected-since		datetime optional	Date and time since FPolicy server is disconnected. Attributes: non-creatable, non-modifiable
fpolicy-server		ip-address optional	FPolicy server. Attributes: key, non-creatable, non-modifiable
node		node-name optional	Cluster node name. Attributes: key, non-creatable, non-modifiable
policy-name		policy-name optional	Name of the policy. Attributes: key, non-creatable, non-modifiable
server-status		fpolicy-server-status optional	Status of the connection. Attributes: non-creatable, non-modifiable Possible values: • "connected" - Server Connected, • "disconnected" - Server Disconnected, • "connecting" - Connecting Server, • "disconnecting" - Disconnecting Server
server-type		fpolicy-server-type optional	FPolicy server type. FPolicy server can be registered as primary or secondary server. Attributes: non-creatable, non-modifiable Possible values: • "primary" - Primary Server, • "secondary" - Secondary Server

vserver		string optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **fpolicy-ssl-opts**

[top]

no-auth|server-auth|mutual-auth Possible values:

- "no_auth" - Communication over TCP,
- "server_auth" - Authentication of FPolicy server only,
- "mutual_auth" - Mutual authentication of storage system and FPolicy server

[none]

Element definition: **fpolicy-volumes-list-info**

[top]

Structure containing volumes information.

Name	Range	Type	Description
volume-spec		string	Volume specification (including wild cards). The volumes are case insensitive. If no volume-spec is provided, then the list will be reset to an empty list. Supported wild card values: "?" to match any character and "*" to match any number of characters. Example specifications: vol0 vol? users*

Element definition: **ip-address**

[top]

IPv4 and IPv6 address

[none]

Element definition: **monitored-operation-info**

[top]

Structure containing information pertaining to monitored operations.

Name	Range	Type	Description
operation		string	Supported values: "file-create", "file- delete", "file-open", "file-close", "file-rename", "directory-create", "directory-delete", "directory-rename", "getattr", "setattr", "lookup", "read", "write", "link", "symlink"

Element definition: **monitored-protocol-info**

[top]

Structure containing information pertaining to monitored operations' protocols.

Name	Range	Type	Description
protocol		string	Supported values: "nfs", "cifs".

Element definition: **policy-info**

[top]

Structure containing information pertaining to policy.

Name	Range	Type	Description
is-ads-monitored		boolean	True if the policy monitors the cifs operations on Alternate Data Streams.
is-enabled		boolean	True if the policy is enabled. No matter whether the policy is enabled or disabled, values returned in other elements for the policy are always valid.
is-i2p-enabled		boolean	True if inode to pathname translation for NFS requests is supported and enabled.If enabled fpolicy requests to fpolicy server will carry full file path for NFS requests. The fields which will carry full file path are AccessPath and RenamePath for FP_ScreenRequest RPC call and sr_accesspath for FP_ScreenRequest2 RPC call.
is-offline-files-only		boolean optional	True if the file policy monitors only offlines files. Default is false.
monitored-operations		monitored-operation-info[]	List of monitored operations.
monitored-protocols		monitored-protocol-info[]	List of monitored protocols.
name		string	Policy name.
number-of-requests-blocked-locally		integer	Number of locally blocked(denied) screen requests. This value is reset each time the filer is rebooted or the policy is disabled. Range : [0..2^32-1].
number-of-screen-failures		integer	Number of failed (denied) screen requests. This value is reset each time the filer is rebooted or the policy is disabled. Range : [0..2^32-1].
number-of-screened-files		integer	Number of screened files since policy has been enabled. This value is reset each time the filer is rebooted or the policy is disabled. Range : [0..2^32-1].

Element definition: **policy-name**

[top]

Policy name

[none]

Element definition: **secondary-server-info**

[top]

Structure containing information pertaining to secondary servers.

Name	Range	Type	Description
server-ip		ip-address	The ip address, in dotted-decimal format, of the server.

Element definition: **server-info**

[top]

Structure containing information pertaining to servers.

Name	Range	Type	Description
idl-version		integer	Version of the Interface Definition Language(IDL) used by the Fpolicy server. Range : [0..2^32-1].
is-asynchronous		boolean optional	Shows if the server is registered as asynchronous, i.e. doesn't send reply to the filer.
is-size-and-owner-required		boolean optional	True if the server is registered to receive file size and file owner information with every Fpolicy request.
is-snapid-required		boolean optional	True if the server is registered to receive file snapshot ID with every Fpolicy request.
is-version2		boolean optional	True if the server is registered with version2 support enabled. version2 refers to the version of the FP_ScreenRequest(). When version2 is true the FPolicy server is enabled to receive FP_ScreenRequest2() RPC.
number-of-screen-failures		integer	Number of failed (denied) screens since server registrations. Range : [0..2^32-1].
number-of-screened-files		integer	Number of screened files since server registration. Range : [0..2^32-1].
offline-filter-bit		string optional	Shows the setting of offline filter. Supported values: "none", "on-set".
server-id		integer	The unique server ID assigned to the Fpolicy server at the time of Fpolicy server registration. Range : [0..2^32-1].
server-ip		ip-address	The ip address, in dotted-decimal format, of the server.
smb-req-pipe-name		string	The name of the FPolicy request pipe name on which FPolicy server is recieving the screen requests from the storage system. This name is sent by the FPolicy server at the time of the FPolicy server registration.

Element definition: **time-interval**

[top]

Time interval in seconds Range : [0..2^32-1].

[none]

Element definition: **common-name**

[top]

Represents the domain name in FQDN form that specifies its exact location in the tree hierarchy of the Domain Name System (DNS).

[none]

Element definition: **datetime**

[top]

The number of seconds since January 1, 1970. Range : [0..2^31-1].

[none]

Element definition: **engine-name**

[top]

Engine name

[none]

Element definition: **event-name**

[top]

Event name

[none]

Element definition: **external-engine-type**

[top]

External Engine Type Possible values:

- "synchronous" - Synchronous External Engine,
- "asynchronous" - Asynchronous External Engine

[none]

Element definition: **fpolicy-passthru-conn-status**

[top]

Status of fpolicy passthrough-read connection Possible values:

- "connected" - Passthrough read channel connected,
- "disconnected" - Passtthrough read channel disconnected

[none]

Element definition: **fpolicy-passthru-disconnect-reason**

[top]

Reason for fpolicy passthrough-read disconnection Possible values:

- "none" - Not applicable,
- "control_conn_closed" - Control connection to the FPOlicy server is closed,
- "pipe_client_close" - Connection closed by pipe client (FPolicy server),
- "pipe_server_close" - Connection closed by pipe server (ONTAP) due to idle session, interface down etc.,
- "no_control_packet" - No control packet seen on this connection,
- "control_conn_vserver_ip_changed" - Control connection is established using different vserver ip,
- "fpolicy_process_restart" - FPolicy process has restarted

[none]

Element definition: **fpolicy-server-status**

[top]

Status Possible values:

- "connected" - Server Connected,
- "disconnected" - Server Disconnected,
- "connecting" - Connecting Server,
- "disconnecting" - Disconnecting Server

[none]

Element definition: **fpolicy-server-type**

[top]

Server Type Possible values:

- "primary" - Primary Server,
- "secondary" - Secondary Server

[none]

Element definition: **ip-address**

[top]

IPv4 and IPv6 address

[none]

Element definition: **monitored-operation-info**

[top]

Structure containing information pertaining to monitored operations.

Group Policy Object (GPO) configuration APIs. Group Policy is a central component of Microsoft's change and configuration strategy for Win2K. With Group Policy, you can define users' environments and system configurations from one location. It is implemented by associating a Group Policy Object (GPO) with an Active Directory container. A GPO is a collection of attribute settings that govern a user or a computer's configuration. These APIs enable user to obtain the values associated with the following GPO entities:

1. Vserver GPO gpresult Information: The resultant GPO information. This api displays RSoP(Resultant Set of Policy) that is defined on Active Directory for a CIFS-enabled VServer.

2. Vserver Applied GPO Information: The applied GPO Information. This api displays the set of GPO policy that has been applied on a CIFS-enabled Vserver.

gpo-applied-info-get-iter

[top]

Get the list of entries of the applied GPO rules, organized on a per-Vserver basis.

Input Name	Range	Type	Description
desired-attributes		gpo-applied-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		gpo-applied-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the gpo object. All gpo objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		gpo-applied-info[] optional	The list of attributes of gpo objects.
next-tag		string optional	Tag for the next call. Not present when there are no more gpo objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description

EINTERNALERROR	

gpo-get-iter

[top]

Retrieve the Vserver's group policy configuration.

Input Name	Range	Type	Description
desired-attributes		gpo-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		gpo-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the gpo object. All gpo objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		gpo-config[] optional	The list of attributes of gpo objects.
next-tag		string optional	Tag for the next call. Not present when there are no more gpo objects to return.

Errno	Description
E_CIFS_OPERATION_NOT_SUPPORTED_IN_WORKGROUP_MODE	
E_CIFS_OPERATION_NOT_SUPPORTED_IN_REALM_MODE	

Element definition: gpo-applied-info

[top]

GPO information that is currently applied on a CIFS-enabled Vserver. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
adv-audit-cap-staging		gpo-evt-audit optional	This policy setting allows you to audit access requests where the permission granted or denied by a proposed policy differs from the current central access policy on an object. If you configure this policy setting, an audit event is generated each time a user accesses an object and the permission granted by the current central access policy on the object differs from that granted by the proposed policy. The resulting audit event will be generated as follows: 1) Success audits, when configured, records access attempts when the current central access policy grants access but the proposed policy denies access. 2) Failure audits when configured records access attempts when: a) The current central access policy does not grant access but the proposed policy grants access. b) A principal requests the maximum access rights they are allowed and the access rights granted by the current central access policy are different than the access rights granted by the proposed policy. Volume: Potentially high on a file server when the proposed policy differs significantly from the current central access policy. Default: No Auditing Attributes: non-

			creatable, non-modifiable Possible values: • "none" - None, • "success" - Success, • "failure" - Failure, • "both" - Success and Failure
cap-list		string[] optional	List of Central Access Policies. Attributes: non-creatable, non-modifiable
dspath		string optional	LDAP DN path. Attributes: non-creatable, non-modifiable
extension		string[] optional	List of the GPO extensions. Attributes: non-creatable, non-modifiable Possible values: • "registry" - Registry, • "diskquota" - Disk Quota, • "scripts" - Scripts, • "security" - Security, • "efsrecovery" - EFS Recovery, • "ipsecurity" - IP Security, • "unsupported" - Unsupported, • "cap" - CAP CSE, • "audit" - Audit
filesyspath		string optional	File System Path of a GPO policy file. Attributes: non-creatable, non-modifiable
gpo-index	**[0..2^32-1]**	integer optional	The index of the GPO in the GPO list of a Vserver. Attributes: key, non-creatable, non-modifiable
gpo-name		string optional	GPO name in text format. Attributes: non-creatable, non-modifiable
gpo-status		string optional	GPO status for each listed GPO: enabled or disabled. Attributes: non-creatable, non-modifiable
gpo-uuid		string optional	GPO name in UUID format. Attributes: non-creatable, non-modifiable
link		string optional	Type of the GPO. Attributes: non-creatable, non-modifiable Possible values: • "local" - Local, • "site" - Site, • "domain" - Domain, • "organizationalunit" - Organizational Unit, • "rsop" - Resultant set of policy
registry-hash-publication-mode		hash-publication-mode optional	Hash Publication Mode for BranchCache. Attributes: non-creatable, non-modifiable Possible values: • "per_share" - Allow hash publication only for shared folders on which BranchCache is enabled., • "disabled" - Disallow hash publication on all shared folders., • "all_shares" - Allow hash publication for all shared folder.
registry-hash-version		hash-version optional	Hash Version Support for BranchCache. Attributes: non-creatable, non-modifiable Possible values: • "version1" - Version 1 (V1)., • "version2" - Version 2 (V2)., • "all_versions" - Version 1 and 2 (V1 and V2).

registry-refresh-interval	**[0..2^32-1]**	integer optional	Registry refreshint time interval. Attributes: non-creatable, non-modifiable
registry-refresh-random-offset	**[0..2^32-1]**	integer optional	Registry refreshing time random offset. Attributes: non-creatable, non-modifiable
security-audit-log-ret-method		log-retention-method optional	Security log retention method. Attributes: non-creatable, non-modifiable Possible values: • "overwrite_as_needed" - Overwrite as needed, • "overwrite_by_days" - Overwrite by days, • "do_not_overwrite" - Do not overwrite
security-audit-logon-events		gpo-evt-audit optional	Log-on events to be audited. Attributes: non-creatable, non-modifiable Possible values: • "none" - None, • "success" - Success, • "failure" - Failure, • "both" - Success and Failure
security-audit-max-log-size	**[0..2^32-1]**	integer optional	Maximum size of security log. Attributes: non-creatable, non-modifiable
security-audit-object-access		gpo-evt-audit optional	Object access to be audited. Attributes: non-creatable, non-modifiable Possible values: • "none" - None, • "success" - Success, • "failure" - Failure, • "both" - Success and Failure
security-file-security		gpo-file-security-path[] optional	List of files or directories for which file security is applied. Attributes: non-creatable, non-modifiable
security-kerberos-clock-skew	**[0..2^32-1]**	integer optional	Kerberos maximum clock skew; Maximum tolerance for computer clock synchronization. Attributes: non-creatable, non-modifiable
security-kerberos-renewal-age	**[0..2^32-1]**	integer optional	Kerberos maximum lifetime for user ticket renewal. Attributes: non-creatable, non-modifiable
security-kerberos-ticket-age	**[0..2^32-1]**	integer optional	Kerberos maximum lifetime for user ticket. Attributes: non-creatable, non-modifiable
security-privilege-rights-change-notify		gpo-user-group[] optional	List of users and/or groups which can traverse directory trees even though the users and/or groups may not have permissions on the traversed directory. Attributes: non-creatable, non-modifiable
security-privilege-rights-security		gpo-user-group[] optional	List of users and/or groups that can specify object access auditing options for individual resources, such as files, Active Directory objects. Attributes: non-creatable, non-modifiable
security-privilege-		gpo-user-group[]	List of users and/or groups that have the right to take ownership of any securable object in the system. Attributes: non-creatable,

rights-take-ownership		optional	non-modifiable
security-registry-signing-required		boolean optional	SMB Signing Required Attributes: non-creatable, non-modifiable
security-restrict-anon-combined-restriction-for-anonymous-user		anonymous-restriction-level optional	Combined restriction for Anonymous User. This setting is derived from security-restrict-anon-noenum-for-sam, security-restrict-anon-noenum-for-samshare and security-restrict-anon-no-access. If no-access is set then this setting is set to no-access. If no-enumeration is set and no-access is not set then this setting is set to no-enumeration. If both no-enumeration and no-access are not set then this setting is set to no-restriction. Attributes: non-creatable, non-modifiable Possible values: • "no_restriction" - No Access Restriction for Anonymous User., • "no_enumeration" - Only Enumeration Is Restricted., • "no_access" - Access Restricted for Anonymous User.
security-restrict-anon-no-access		boolean optional	Restrict anonymous access to named pipes and shares. This setting is mapped to no-access value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restrict-anon-noenum-sam		boolean optional	Do not allow anonymous enumeration of SAM accounts. This setting is mapped to no-enumeration value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restrict-anon-noenum-sam-share		boolean optional	Do not allow anonymous enumeration of SAM accounts and shares. This setting is mapped to no-enumeration value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restricted-groups		gpo-user-group[] optional	List of Restricted groups. Attributes: non-creatable, non-modifiable
version	**[0..2^32-1]**	integer optional	The individual GPO's update version. Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver display name. Attributes: key, non-creatable, non-modifiable

Element definition: **gpo-config**

[top]

Group Policy configuration for Vservers. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. cap-list		string[] optional	List of Central Access Policies. Attributes: non-creatable, non-modifiable
dspath		string optional	LDAP DN path. Attributes: non-creatable, non-modifiable
			List of the GPO extensions. Attributes: non-creatable, non-modifiable Possible values: • "registry" - Registry,

extension		string[] optional	"diskquota" - Disk Quota, • "scripts" - Scripts, • "security" - Security, • "efsrecovery" - EFS Recovery, • "ipsecurity" - IP Security, • "unsupported" - Unsupported, • "cap" - CAP CSE, • "audit" - Audit
filesyspath		string optional	File System Path of a GPO policy file. Attributes: non-creatable, non-modifiable
gpo-index	**[0..2^32-1]**	integer optional	The index of the GPO in the GPO list of a Vserver. Attributes: key, non-creatable, non-modifiable
gpo-name		string optional	GPO name in text format. Attributes: non-creatable, non-modifiable
gpo-status		string optional	GPO status for each listed GPO: enabled or disabled. Attributes: non-creatable, non-modifiable
gpo-uuid		string optional	GPO name in UUID format. Attributes: non-creatable, non-modifiable
link		string optional	Type of the GPO. Attributes: non-creatable, non-modifiable Possible values: • "local" - Local, • "site" - Site, • "domain" - Domain, • "organizationalunit" - Organizational Unit, • "rsop" - Resultant set of policy
registry-hash-publication-mode		hash-publication-mode optional	Hash Publication Mode for BranchCache. Attributes: non-creatable, non-modifiable Possible values: • "per_share" - Allow hash publication only for shared folders on which BranchCache is enabled., • "disabled" - Disallow hash publication on all shared folders., • "all_shares" - Allow hash publication for all shared folder.
registry-hash-version		hash-version optional	Hash Version Support for BranchCache. Attributes: non-creatable, non-modifiable Possible values: • "version1" - Version 1 (V1)., • "version2" - Version 2 (V2)., • "all_versions" - Version 1 and 2 (V1 and V2).
registry-refresh-interval	**[0..2^32-1]**	integer optional	Registry refreshint time interval. Attributes: non-creatable, non-modifiable
registry-refresh-random-offset	**[0..2^32-1]**	integer optional	Registry refreshing time random offset. Attributes: non-creatable, non-modifiable
security-audit-log-ret-method		log-retention-method optional	Security log retention method. Attributes: non-creatable, non-modifiable Possible values: • "overwrite_as_needed" - Overwrite as needed, • "overwrite_by_days" - Overwrite by days, • "do_not_overwrite" - Do not overwrite
			Log-on events to be audited. Attributes: non-creatable, non-

security-audit-logon-events		gpo-evt-audit optional	modifiable Possible values: • "none" - None, • "success" - Success, • "failure" - Failure, • "both" - Success and Failure
security-audit-max-log-size	**[0..2^32-1]**	integer optional	Maximum size of security log in kbytes. Attributes: non-creatable, non-modifiable
security-audit-object-access		gpo-evt-audit optional	Object access to be audited. Attributes: non-creatable, non-modifiable Possible values: • "none" - None, • "success" - Success, • "failure" - Failure, • "both" - Success and Failure
security-file-security		gpo-file-security-path[] optional	List of files or directories for which file security is to be applied. Attributes: non-creatable, non-modifiable
security-kerberos-clock-skew	**[0..2^32-1]**	integer optional	Kerberos maximum clock skew; Maximum tolerance for computer clock synchronization. Attributes: non-creatable, non-modifiable
security-kerberos-renewal-age	**[0..2^32-1]**	integer optional	Kerberos maximum lifetime for user ticket renewal. Attributes: non-creatable, non-modifiable
security-kerberos-ticket-age	**[0..2^32-1]**	integer optional	Kerberos maximum lifetime for user ticket. Attributes: non-creatable, non-modifiable
security-privilege-rights-change-notify		gpo-user-group[] optional	List of users and/or groups which can traverse directory trees even though the users and/or groups may not have permissions on the traversed directory. Attributes: non-creatable, non-modifiable
security-privilege-rights-security		gpo-user-group[] optional	List of users and/or groups that can specify object access auditing options for individual resources, such as files, Active Directory objects. Attributes: non-creatable, non-modifiable
security-privilege-rights-take-ownership		gpo-user-group[] optional	List of users and/or groups that have the right to take ownership of any securable object in the system. Attributes: non-creatable, non-modifiable
security-registry-signing-required		boolean optional	SMB Signing Required Attributes: non-creatable, non-modifiable
security-restrict-anon-combined-restriction-for-anonymous-		anonymous-restriction-level optional	Combined restriction for Anonymous User. This setting is derived from security-restrict-anon-noenum-for-sam, security-restrict-anon-noenum-for-samshare and security-restrict-anon-no-access. If no-access is set then this setting is set to no-access. If no-enumeration is set and no-access is not set then this setting is set to no-enumeration. If both no-enumeration and no-access are not set then this setting is set to no-restriction. Attributes: non-creatable, non-modifiable Possible values: • "no_restriction" - No Access Restriction for Anonymous

user			User., • "no_enumeration" - Only Enumeration Is Restricted., • "no_access" - Access Restricted for Anonymous User.
security-restrict-anon-no-access		boolean optional	Restrict anonymous access to named pipes and shares. This setting is mapped to no-access value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restrict-anon-noenum-sam		boolean optional	Do not allow anonymous enumeration of SAM accounts. This setting is mapped to no-enumeration value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restrict-anon-noenum-sam-share		boolean optional	Do not allow anonymous enumeration of SAM accounts and shares. This setting is mapped to no-enumeration value of restrict-anonymous CIFS option in Data ONTAP. Attributes: non-creatable, non-modifiable
security-restricted-groups		gpo-user-group[] optional	List of Restricted groups. Attributes: non-creatable, non-modifiable
version	**[0..2^32-1]**	integer optional	The individual GPO's update version. Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver display name. Attributes: key, non-creatable, non-modifiable

Element definition: **gpo-restricted-group-applied-info**

Element definition: **gpo-user-group** [top]

A group name or a user name.

[none]

Element definition: **hash-publication-mode** [top]

Hash Publication Mode Possible values:

- "per_share" - Allow hash publication only for shared folders on which BranchCache is enabled.,
- "disabled" - Disallow hash publication on all shared folders.,
- "all_shares" - Allow hash publication for all shared folder.

[none]

Element definition: **hash-version** [top]

Hash Version Possible values:

- "version1" - Version 1 (V1).,
- "version2" - Version 2 (V2).,
- "all_versions" - Version 1 and 2 (V1 and V2).

[none]

Element definition: **log-retention-method** [top]

Audit log retention method Possible values:

- "overwrite_as_needed" - Overwrite as needed,
- "overwrite_by_days" - Overwrite by days,
- "do_not_overwrite" - Do not overwrite

[none]

Element definition: **vserver-name** [top]

The name of the Vserver.

[none]

APIs in Category: **group-mapping**

group-mapping-create
group-mapping-delete
group-mapping-get-iter
group-mapping-insert
group-mapping-modify
group-mapping-swap

group-mapping-create

[top]

This API is no longer supported as of ONTAP 9.5.0.

Create a new group mapping for a Vserver.

Input Name	Range	Type	Description
direction		name-mapping-direction	Direction in which the group mapping is applied. Possible values: • "krb_unix" - Kerberos principal name to UNIX user name mapping, • "win_unix" - Windows user name to UNIX user name mapping, • "unix_win" - UNIX user name to Windows user name mapping
pattern		string	Pattern to use to match the group while searching for a group that can be used as a replacement. The pattern is a UNIX-style regular expression. Regular expressions are case-insensitive when mapping from Windows to UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and UNIX to Windows.
position	**[1..1024]**	integer	Position of an existing group mapping in the list of group mappings for this Vserver.
replacement		string	The group that is to be used as a replacement if the pattern associated with this entry matches. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX 'sed' program.
return-record		boolean optional	If set to true, returns the group-mapping on successful creation. Default: false

Output Name	Range	Type	Description
result		group-mapping-info optional	The group-mapping created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	

group-mapping-delete

[top]

This API is no longer supported as of ONTAP 9.5.0.

Delete an existing group mapping entry.

Input Name	Range	Type	Description
direction		name-mapping-direction	Direction in which the group mapping is applied. Possible values: • "krb_unix" - Kerberos principal name to UNIX user name mapping, • "win_unix" - Windows user name to UNIX user name mapping, • "unix_win" - UNIX user name to Windows user name mapping
position	**[1..1024]**	integer	Position of an existing group mapping in the list of group mappings for this Vserver.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

group-mapping-get-iter

[top]

This API is no longer supported as of ONTAP 9.5.0.

Retrieve the list of group mappings in the cluster.

Input Name	Range	Type	Description
desired-attributes		group-mapping-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		group-mapping-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the group-mapping object. All group-mapping objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		group-mapping-info[] optional	The list of attributes of group-mapping objects.

next-tag		string optional	Tag for the next call. Not present when there are no more group-mapping objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

group-mapping-insert

[top]

This API is no longer supported as of ONTAP 9.5.0.

Insert a group mapping into the table at a specified position.

Input Name	Range	Type	Description
direction		name-mapping-direction	Direction in which the group mapping is applied. Possible values: • "krb_unix" - Kerberos principal name to UNIX user name mapping, • "win_unix" - Windows user name to UNIX user name mapping, • "unix_win" - UNIX user name to Windows user name mapping
pattern		string	Pattern to use to match the group while searching for a group that can be used as a replacement. The pattern is a UNIX-style regular expression. Regular expressions are case-insensitive when mapping from Windows to UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and UNIX to Windows.
position	**[1..1024]**	integer	Position within the set of group mappings that this new mapping will take. If a mapping already exists at this position, it will be moved to the next position in the list.
replacement		string	The group that is to be used as a replacement if the pattern associated with this entry matches. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX 'sed' program.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

group-mapping-modify

[top]

This API is no longer supported as of ONTAP 9.5.0.

Modify an existing group mapping entry.

Input Name	Range	Type	Description
			Direction in which the group mapping is applied. Possible values: • "krb_unix" - Kerberos principal name to UNIX user name

direction		name-mapping-direction	mapping, • "win_unix" - Windows user name to UNIX user name mapping, • "unix_win" - UNIX user name to Windows user name mapping
pattern		string optional	Pattern to use to match the group while searching for a group that can be used as a replacement. The pattern is a UNIX-style regular expression. Regular expressions are case-insensitive when mapping from Windows to UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and UNIX to Windows.
position	**[1..1024]**	integer	Position of an existing group mapping in the list of group mappings for this Vserver.
replacement		string optional	The group that is to be used as a replacement if the pattern associated with this entry matches. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX 'sed' program.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

group-mapping-swap

[top]

This API is no longer supported as of ONTAP 9.5.0.

Swap the position of one group mapping with another. The position is the place in the sequence of group mappings in which the mappings are applied.

Input Name	Range	Type	Description
direction		string	Direction in which the group mapping is applied.
position	**[1..1024]**	integer	Position of an existing group mapping in the list of group mappings for this Vserver.
with-position	**[0..2^32-1]**	integer	Position of an existing group mapping entry in the list of group mappings for this Vserver. This entry will be swapped with the entry at 'position'.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

Element definition: **group-mapping-info**

[top]

This type is no longer supported as of ONTAP 9.5.0.

group mapping configuration for Vservers. The possible sources of group mapping information and the order in which they are searched is determined by the Vserver's 'name-mapping-switch' option. If the 'name-mapping-switch' is set to 'file', the rules in this table are used to determine the mapping. Windows user groups, UNIX user groups and Kerberos principal groups can be three disjoint sets of groups. A mechanism is needed to map groups from one set to another when presenting ACLs across

multiprotocol clients. Each group mapping entry represents one such map in a given direction. group mappings are done using standard UNIX style regular expressions for pattern replacement. For example if a configuration is required to convert any Windows user in the Windows domain name 'EXAMPLE' into a UNIX user with the same name in NIS, the direction entry should be set to 'win-unix', the pattern string should be set to '418 :+)' and the replacement string should be set to '\1'. The double backslash (\\) in the pattern matches a single backslash in the source name. The parentheses denote a subexpression but do not match any characters themselves. The 'period' matches any single character. The 'plus' matches one or more characters of the previous expression. The pattern 'EXAMPLE\\(.+)' matches 'EXAMPLE\' followed by one or more of any character. In the replacement, '\1' refers to the string that the first subexpression matched. Assuming the Windows user 'EXAMPLE\user1', the replacement evaluates to 'user1'. If a mapping is required from Windows to UNIX and none of the name mapping entries match, the domain name is stripped from the the username and it is directly mapped to the UNIX user of the same name. Similarly if a mapping is required from a UNIX user to a Windows user and none of the name mapping entries match, the domain name is prefixed to the username and it is directly mapped to a Windows user of the When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
direction		name-mapping-direction optional	Direction in which the group mapping is applied. Attributes: key, required-for-create, non-modifiable Possible values: • "krb_unix" - Kerberos principal name to UNIX user name mapping, • "win_unix" - Windows user name to UNIX user name mapping, • "unix_win" - UNIX user name to Windows user name mapping
pattern		string optional	Pattern to use to match the group while searching for a group that can be used as a replacement. The pattern is a UNIX-style regular expression. Regular expressions are case-insensitive when mapping from Windows to UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and UNIX to Windows. Attributes: required-for-create, modifiable
position	**[1..1024]**	integer optional	Position of an existing group mapping in the list of group mappings for this Vserver. Attributes: key, required-for-create, non-modifiable
replacement		string optional	The group that is to be used as a replacement if the pattern associated with this entry matches. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX 'sed' program. Attributes: required-for-create, modifiable
vserver		string optional	Specifies the Vserver for the group mapping. Attributes: key, non-creatable, non-modifiable

Element definition: **name-mapping-direction**

[top]

Direction of the name mapping. Possible values:

- "krb_unix" - Kerberos principal name to UNIX user name mapping,

- "win_unix" - Windows user name to UNIX user name mapping,
- "unix_win" - UNIX user name to Windows user name mapping

ha-interconnect-nic-reset

[top]

Reset high-availability interconnect device of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

[top]

ha-interconnect-nvram-configuration-get-iter

Iterate over list of nodes in the cluster to get their basic nvram configuration information

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-nvram-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ha-interconnect-nvram-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ha-interconnect-nvram-info object. All ha-interconnect-nvram-info objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-nvram-info[] optional	The list of attributes of ha-interconnect-nvram-info objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-nvram-info objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	
EHAIC_NO_NVRAM	

ha-interconnect-ood-clear-error-statistics

[top]

Clear high-availability interconnect device out-of-order delivery error statistics of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-clear-performance-statistics

[top]

Clear high-availability interconnect device out-of-order delivery performance statistics of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-disable-statistics

[top]

Disable high-availability interconnect device out-of-order delivery statistics collection for the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-enable-statistics

[top]

Enable high-availability interconnect device out-of-order delivery statistics collection for the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-optimization-off

[top]

Disable coalescing work requests on high-availability interconnect device of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-optimization-on

[top]

Enable coalescing work requests on high-availability interconnect device of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-ood-send-diagnostic-buffer

[top]

Send diagnostic buffer to the HA partner of the selected node

Input Name	Range	Type	Description
node-name		filer-id	Node

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	
EHAIC_SEND_DIAG_FAIL	

ha-interconnect-ood-status-get-iter

[top]

Iterate over list of nodes in the cluster to get their high-availability interconnect device out-of-order delivery information

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-ood-status optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
		ha-	A query that specifies which objects to return. A query could be

query		interconnect-ood-status optional	specified on any number of attributes in the ha-interconnect-ood-status object. All ha-interconnect-ood-status objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-ood-status[] optional	The list of attributes of ha-interconnect-ood-status objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-ood-status objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	
EHAIC_COMMAND_UNSUPPORTED	

ha-interconnect-performance-statistics-get-iter

[top]

Iterate over list of nodes in the cluster to get their high-availability interconnect performance statistics

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-performance-statistics optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ha-interconnect-performance-statistics optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ha-interconnect-performance-statistics object. All ha-interconnect-performance-statistics objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-performance-statistics[] optional	The list of attributes of ha-interconnect-performance-statistics objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-performance-statistics objects to return.
num-records	**[0..2^32-**	integer	The number of records returned in this call.

	1]		

Errno	Description
EINTERNALERROR	

ha-interconnect-port-details-get-iter

[top]

Iterate over list of nodes in the cluster to get their high-availability interconnect device port information

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-port-details optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		ha-interconnect-port-details optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ha-interconnect-port-details object. All ha-interconnect-port-details objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-port-details[] optional	The list of attributes of ha-interconnect-port-details objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-port-details objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ha-interconnect-scatter-gather-list-statistics-get-iter

[top]

Iterate over list of nodes in the cluster to get their high-availability interconnect device scatter-gather list entry statistics

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-scatter-gather-list-	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is

		statistics optional	available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ha-interconnect-scatter-gather-list-statistics optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ha-interconnect-scatter-gather-list-statistics object. All ha-interconnect-scatter-gather-list-statistics objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-scatter-gather-list-statistics[] optional	The list of attributes of ha-interconnect-scatter-gather-list-statistics objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-scatter-gather-list-statistics objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ha-interconnect-timeout-values-get-iter

[top]

Iterate over list of nodes in the cluster to get their high-availability interconnect software timeout values

Input Name	Range	Type	Description
desired-attributes		ha-interconnect-timeout optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ha-interconnect-timeout optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ha-interconnect-timeout object. All ha-interconnect-timeout objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ha-interconnect-timeout[]	The list of attributes of ha-interconnect-timeout objects.

		optional	
next-tag		string optional	Tag for the next call. Not present when there are no more ha-interconnect-timeout objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR

[none]

Element definition: **ha-interconnect-config-details**

[top]

High-availability interconnect configuration information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
connection-request-initiator		ha-ic-initiator optional	The initiator of the connection request. Attributes: non-creatable, non-modifiable Possible values: • "local" - HA Interconnect connections are initiated by the local node, • "partner" - HA Interconnect connections are initiated by the partner
interconnect-port-details		interconnect-port-info[] optional	Interconnect device ports information
interface-type		ha-ic-interface-type optional	High-availability interconnect links connection interface. Attributes: non-creatable, non-modifiable Possible values: • "backplane" - HA Interconnect is using backplane (internal) links, • "external" - HA Interconnect is using external links
local-node-sysid	**[0..2^32-1]**	integer optional	Local system identifier. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this configuration information belongs. Attributes: key, non-creatable, non-modifiable
partner-node-sysid	**[0..2^32-1]**	integer optional	HA partner system identifier. Attributes: non-creatable, non-modifiable
transport-type		string optional	High-availability interconnect type. Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-flint-flash-info**

[top]

High-availability interconnect binary firmware image information residing in flash card attached to adapter When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
board-id		string optional	Interconnect device board identifier. Attributes: non-creatable, non-modifiable
chip-revision		string optional	Chip Revision Attributes: non-creatable, non-modifiable
device-id	**[0..2^32-1]**	integer optional	Device ID Attributes: non-creatable, non-modifiable
fw-version		string optional	Firmware Version Attributes: non-creatable, non-modifiable

hw-access-key		string optional	Hardware Access Key Attributes: non-creatable, non-modifiable
image-type		ha-ic-flint-image-type optional	Image Type Attributes: non-creatable, non-modifiable Possible values: • "connectx" - ConnectX device family, • "fs2" - Flexible storage solutions device family, • "failsafe" - Failsafe enabled device family, • "short" - Non-Failsafe device family
invariant-sector-version	**[0..2^32-1]**	integer optional	Invariant Sector Version Attributes: non-creatable, non-modifiable
node-guid		string optional	Node global unique identifier. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this device firmware image information belongs. Attributes: key, non-creatable, non-modifiable
parameter-set-id		string optional	Parameter set identifier. Attributes: non-creatable, non-modifiable
port1-guid		string optional	Port 1 global unique identifier. Attributes: non-creatable, non-modifiable
port1-mac		string optional	Port 1 MAC address. Attributes: non-creatable, non-modifiable
port2-guid		string optional	Port 2 GUID Attributes: non-creatable, non-modifiable
port2-mac		string optional	Port 2 MAC address. Attributes: non-creatable, non-modifiable
product-version		string optional	Product Version Attributes: non-creatable, non-modifiable
sys-image-guid		string optional	System image global unique identifier. Attributes: non-creatable, non-modifiable
vendor-specific-data		string optional	Vendor specific data. Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-flint-image-info**

[top]

High-availability interconnect binary firmware image information residing in system When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
board-id		string optional	Interconnect device board identifier. Attributes: non-creatable, non-modifiable
chip-revision		string optional	Chip Revision Attributes: non-creatable, non-modifiable
	[0..2^32-	integer	

device-id	**1]**	optional	Device ID Attributes: non-creatable, non-modifiable
fw-version		string optional	Firmware Version Attributes: non-creatable, non-modifiable
hw-access-key		string optional	Hardware Access Key Attributes: non-creatable, non-modifiable
image-type		ha-ic-flint-image-type optional	Image Type Attributes: non-creatable, non-modifiable Possible values: • "connectx" - ConnectX device family, • "fs2" - Flexible storage solutions device family, • "failsafe" - Failsafe enabled device family, • "short" - Non-Failsafe device family
invariant-sector-version	**[0..2^32-1]**	integer optional	Invariant Sector Version Attributes: non-creatable, non-modifiable
node-guid		string optional	Node global unique identifier. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this device firmware image information belongs. Attributes: key, non-creatable, non-modifiable
parameter-set-id		string optional	Parameter set identifier. Attributes: non-creatable, non-modifiable
port1-guid		string optional	Port 1 global unique identifier. Attributes: non-creatable, non-modifiable
port1-mac		string optional	Port 1 MAC address. Attributes: non-creatable, non-modifiable
port2-guid		string optional	Port 2 GUID Attributes: non-creatable, non-modifiable
port2-mac		string optional	Port 2 MAC address. Attributes: non-creatable, non-modifiable
product-version		string optional	Product Version Attributes: non-creatable, non-modifiable

vendor-specific-data		string optional	Vendor specific data. Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-flush-details**

[top]

High-availability interconnect flush information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
			High-availability interconnect device NVRAM channel name.

channel-name		ha-ic-nv-channel optional	Attributes: key, non-creatable, non-modifiable Possible values: • "wafl" - HA Interconnect WAFL NV Channel, • "raid" - HA Interconnect RAID NV Channel, • "misc" - HA Interconnect MISC NV Channel
node-name		node-name optional	The node to which this flush information belongs. Attributes: key, non-creatable, non-modifiable
recv-flush-request-id	**[0..2^64-1]**	integer optional	Flush receive request identifier. Attributes: non-creatable, non-modifiable
recv-notify-complete-id	**[0..2^64-1]**	integer optional	Flush receive request completion identifier. Attributes: non-creatable, non-modifiable
sent-flush-request-id	**[0..2^64-1]**	integer optional	Flush sent request identifier. Attributes: non-creatable, non-modifiable
sent-notify-complete-id	**[0..2^64-1]**	integer optional	Flush sent request completion identifier. Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-nvram-info**

[top]

Basic nvram configuration information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
local-size		size optional	Amount of NVRAM used by Local Node Attributes: non-creatable, non-modifiable
node-name		node-name optional	Node Attributes: key, non-creatable, non-modifiable
partition		string optional	NVRAM Partition Attributes: non-creatable, non-modifiable
total-size		size optional	Total NVRAM Size Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-ood-status**

[top]

High-availability interconnect device out-of-order delivery information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-coalescing-enabled		boolean optional	Is Coalescing Enabled Attributes: non-creatable, non-modifiable
is-ood-enabled		boolean optional	Is OOD Enabled Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this out-of-order delivery capability information belongs. Attributes: key, non-creatable, non-modifiable

Element definition: **ha-interconnect-performance-statistics**

[top]

Display high-availability interconnect performance statistics When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
average-bytes-per-transfer	**[0..2^64-1]**	integer optional	Average amount of bytes sent per transfer. Attributes: non-creatable, non-modifiable
average-megabytes-per-second		string optional	Average megabytes (MB) transferred per second. Attributes: non-creatable, non-modifiable
average-receive-queue-wait-time	**[0..2^64-1]**	integer optional	Average amount of time (in usecs) the interconnect device waited to post an empty buffer into the receive queue. Attributes: non-creatable, non-modifiable
average-remote-nv-msgs-time	**[0..2^64-1]**	integer optional	Average time (in usecs) between two remote NV messages. Attributes: non-creatable, non-modifiable
average-remote-nv-transfer-size	**[0..2^64-1]**	integer optional	Average transfer size of a remote NV message. Attributes: non-creatable, non-modifiable
average-remote-nv-transfer-time	**[0..2^64-1]**	integer optional	Average transfer time taken (in usecs) by remote NV messages. Attributes: non-creatable, non-modifiable
avg-misc-queue-length	**[0..2^64-1]**	integer optional	Average MISC interconnect channel queue depth. Attributes: non-creatable, non-modifiable
avg-nvlog-sync-time	**[0..2^64-1]**	integer optional	Average time taken (in msecs) to sync NVLOG between HA partner nodes. Attributes: non-creatable, non-modifiable
avg-raid-queue-length	**[0..2^64-1]**	integer optional	Average RAID interconnect channel queue depth. Attributes: non-creatable, non-modifiable
avg-wafl-queue-length	**[0..2^64-1]**	integer optional	Average WAFL interconnect channel queue depth. Attributes: non-creatable, non-modifiable

elapsed-time	**[0..2^32-1]**	integer optional	Elapsed time (in seconds) between statistics collection start time and end time. Attributes: non-creatable, non-modifiable
ic-16k-writes	**[0..2^64-1]**	integer optional	Total number of 16K or more size writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-4k-writes	**[0..2^64-1]**	integer optional	Total number of 4K size writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-8k-writes	**[0..2^64-1]**	integer optional	Total number of 8K size writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-data-aligned	**[0..2^64-1]**	integer optional	Total number of aligned data writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-data-misaligned	**[0..2^64-1]**	integer optional	Total number of misaligned data writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-discontiguous-writes	**[0..2^64-1]**	integer optional	Total number of times the interconnect device performs discontiguous writes spanned across memory pages. Attributes: non-creatable, non-modifiable
ic-isdone	**[0..2^64-1]**	integer optional	Total number of times the interconnect client checked for the completion of a given tranfer ID. Attributes: non-creatable, non-modifiable
ic-isdone-fail	**[0..2^64-1]**	integer optional	Total number of times the check for the completion of a given trasfer ID is not yet successful. Attributes: non-creatable, non-modifiable
ic-isdone-pass	**[0..2^64-1]**	integer optional	Total number of times the check for the completion of a given transfer ID is successful. Attributes: non-creatable, non-modifiable
ic-metadata-aligned	**[0..2^64-1]**	integer optional	Total number of aligned metadata writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-metadata-misaligned	**[0..2^64-1]**	integer optional	Total number of misaligned metadata writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-small-writes	**[0..2^64-1]**	integer optional	Total number of less than 4K size writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-waitdone-time	**[0..2^64-1]**	integer optional	Average time (in usecs) the interconnect device spent waiting for the IDs to be transferred successfully. Attributes: non-creatable, non-modifiable
ic-waits	**[0..2^64-1]**	integer optional	Total number of times the interconnect device waits until the transfer of a given ID is successful. Attributes: non-creatable, non-modifiable
ic-xorder-reads	**[0..2^64-1]**	integer optional	Total number of out-of-order reads performed by the interconnect device. Attributes: non-creatable, non-modifiable
ic-xorder-writes	**[0..2^64-1]**	integer optional	Total number of out-of-order writes performed by the interconnect device. Attributes: non-creatable, non-modifiable
max-nvlog-sync-time	**[0..2^64-1]**	integer optional	Maximum time taken (in msecs) to sync NVLOG between HA partner nodes. Attributes: non-creatable, non-modifiable
max-sgl-length	**[0..2^32-1]**	integer optional	Maximum length of scatter-gather list supported by the interconnect device. Attributes: non-creatable, non-modifiable
misc-data-io	**[0..2^64-1]**	integer optional	Total number of MISC data IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
misc-flush-io	**[0..2^64-1]**	integer optional	Total number of MISC flush IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
misc-metadata-io	**[0..2^64-1]**	integer optional	Total number of MISC metadata IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this performance statistics belongs. Attributes: key, non-creatable, non-modifiable
nonpreempt-	**[0..2^64-**	integer	Total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout. Attributes: non-

timeout	**1]**	optional	creatable, non-modifiable
notify-timeout	**[0..2^64-1]**	integer optional	Total number of times data transfer on the HA interconnect timed out. Attributes: non-creatable, non-modifiable
nv-conn-failover-time	**[0..2^64-1]**	integer optional	NV connection failover time (in msecs). Attributes: non-creatable, non-modifiable
preempt-timeout	**[0..2^64-1]**	integer optional	Total number of times polling on the given transfer ID is preempted. Attributes: non-creatable, non-modifiable
queue-max-timeout	**[0..2^64-1]**	integer optional	Total number of times the interconnect device timed out waiting to post requests on the send queue. Attributes: non-creatable, non-modifiable
queue-max-wait-count	**[0..2^64-1]**	integer optional	Total number of times the interconnect device waited to post requests on the send queue. Attributes: non-creatable, non-modifiable
queue-max-wait-time	**[0..2^64-1]**	integer optional	Average amount of time (in usecs) the interconnect device waited to post requests on the send queue. Attributes: non-creatable, non-modifiable
raid-data-io	**[0..2^64-1]**	integer optional	Total number of RAID data IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
raid-flush-io	**[0..2^64-1]**	integer optional	Total number of RAID flush IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
raid-metadata-io	**[0..2^64-1]**	integer optional	Total number of RAID metadata IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
rdma-read	**[0..2^64-1]**	integer optional	Total number of RDMA reads performed by the interconnect device. Attributes: non-creatable, non-modifiable
rdma-read-waitdone-time	**[0..2^64-1]**	integer optional	Average time (in usecs) the interconnect device spent polling for transfer IDs on the RDMA-read channel. Attributes: non-creatable, non-modifiable
remote-nv-transfers	**[0..2^64-1]**	integer optional	Total number of remote NV transfers attempted. Attributes: non-creatable, non-modifiable
total-receive-queue-waits	**[0..2^64-1]**	integer optional	Total number of times the interconnect device waited to post an empty buffer into the receive queue. Attributes: non-creatable, non-modifiable
total-transfers	**[0..2^64-1]**	integer optional	Total number of transfers made through the interconnect device. Attributes: non-creatable, non-modifiable
wafl-data-io	**[0..2^64-1]**	integer optional	Total number of WAFL data IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
wafl-flush-io	**[0..2^64-1]**	integer optional	Total number of WAFL flush IOs made through the interconnect device. Attributes: non-creatable, non-modifiable
wafl-metadata-io	**[0..2^64-1]**	integer optional	Total number of WAFL metadata IOs made through the interconnect device. Attributes: non-creatable, non-modifiable

Element definition: **ha-interconnect-port-details**

[top]

High-availability interconnect device port information When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of

objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
device-port-details		device-port-info[] optional	Interconnect device port link state information
link-monitor		boolean optional	Link monitor detection capability. On means link monitor detection is enabled on this device. Attributes: non-creatable, non-modifiable
node-name		node-name optional	The node to which this high-availability interconnect device port information belongs. Attributes: key, non-creatable, non-modifiable

Element definition: **ha-interconnect-scatter-gather-list-statistics**

[top]

High-availability interconnect device scatter-gather list entry statistics When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
node-name		node-name optional	The node to which this scatter-gather list entry statistics belongs. Attributes: key, non-creatable, non-modifiable
sgl-details		sgl-info[] optional	Interconnect device scatter-gather list statistics

Element definition: **ha-interconnect-status-info**

[top]

High-availability interconnect connection status When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
command-revision	**[0..2^32-1]**	integer optional	High-availability interconnect device command revision. Attributes: non-creatable, non-modifiable

debug-firmware		boolean optional	High-availability interconnect device firmware debug capability status. Attributes: non-creatable, non-modifiable
device-type		string optional	Device Type Attributes: non-creatable, non-modifiable
driver-name		string optional	High-availability interconnect device driver name. Attributes: non-creatable, non-modifiable
firmware		string optional	High-availability interconnect device firmware version. Attributes: non-creatable, non-modifiable
hardware-revision	**[0..2^32-1]**	integer optional	High-availability interconnect device hardware revision. Attributes: non-creatable, non-modifiable
ic-connection		ha-ic-state optional	The status of failover monitor channel over the interconnect. up means channel is active. Attributes: non-creatable, non-modifiable Possible values: • "up" - Indicate up status of a HA Interconnect entity, • "down" - Indicate down status of a HA Interconnect entity, • "error" - Indicate error status of a HA Interconnect entity
is-link0-active		boolean optional	Link 0 active status. True means there are active channels over this interconnect link. Attributes: non-creatable, non-modifiable
is-link1-active		boolean optional	Link 1 active status. True means there are active channels over this interconnect link. Attributes: non-creatable, non-modifiable
link-status		ha-ic-state optional	High-availability interconnect link status. up means the link is online. Attributes: non-creatable, non-modifiable Possible values: • "up" - Indicate up status of a HA Interconnect entity, • "down" - Indicate down status of a HA Interconnect entity, • "error" - Indicate error status of a HA Interconnect entity
link0-status		ha-ic-state optional	High-availability interconnect link 0 status. up means the link is online. Attributes: non-creatable, non-modifiable Possible values: • "up" - Indicate up status of a HA Interconnect entity, • "down" - Indicate down status of a HA Interconnect entity, • "error" - Indicate error status of a HA Interconnect entity
link1-status		ha-ic-state optional	High-availability interconnect link 1 status. up means the link is online. Attributes: non-creatable, non-modifiable Possible values: • "up" - Indicate up status of a HA Interconnect entity, • "down" - Indicate down status of a HA Interconnect entity, • "error" - Indicate error status of a HA Interconnect entity
node-name		node-name optional	The node to which this connection status belongs. Attributes: key, non-creatable, non-modifiable
nvlog-rdma		ha-ic-state optional	The status of NVRAM channels over the interconnect. up means channels are active. Attributes: non-creatable, non-modifiable Possible values: • "up" - Indicate up status of a HA Interconnect entity, • "down" - Indicate down status of a HA Interconnect entity, • "error" - Indicate error status of a HA Interconnect entity
port-number-1	**[0..2^32-1]**	integer optional	High-availability interconnect device port 1. Attributes: non-creatable, non-modifiable
port-number-2	**[0..2^32-1]**	integer optional	High-availability interconnect device port 2. Attributes: non-creatable, non-modifiable

port1-base-lid		string optional	High-availability interconnect device port 1 local identifier. Attributes: non-creatable, non-modifiable
port1-data-rate		string optional	High-availability interconnect device port 1 supported data rate. Attributes: non-creatable, non-modifiable
port1-gid		string optional	High-availability interconnect device port 1 global identifier. Attributes: non-creatable, non-modifiable
port1-link-info		string optional	High-availability interconnect device port 1 link information. Attributes: non-creatable, non-modifiable
port1-mtu	**[0..2^32-1]**	integer optional	High-availability interconnect device port 1 maximum transmission unit size. Attributes: non-creatable, non-modifiable
port1-port-name		string optional	High availability interconnect device port 1 port name. Attributes: non-creatable, non-modifiable
port1-qsfp-part-number		string optional	High-availability interconnect device port 1 QSFP (Quad Small Form-factor Pluggable) part number. Attributes: non-creatable, non-modifiable
port1-qsfp-serial-number		string optional	High-availability interconnect device port 1 QSFP (Quad Small Form-factor Pluggable) serial number. Attributes: non-creatable, non-modifiable
port1-qsfp-type		string optional	High-availability interconnect device port 1 QSFP (Quad Small Form-factor Pluggable) cable type. Attributes: non-creatable, non-modifiable
port1-qsfp-vendor		string optional	High-availability interconnect device port 1 QSFP (Quad Small Form-factor Pluggable) vendor name. Attributes: non-creatable, non-modifiable
port1-remote-lid		string optional	High-availability interconnect device port 2 remote local identifier. Attributes: non-creatable, non-modifiable
port2-base-lid		string optional	High-availability interconnect device port 2 local identifier. Attributes: non-creatable, non-modifiable
port2-data-rate		string optional	High-availability interconnect device port 2 supported data rate. Attributes: non-creatable, non-modifiable
port2-gid		string optional	High-availability interconnect device port 2 global identifier. Attributes: non-creatable, non-modifiable
port2-link-info		string optional	High-availability interconnect device port 2 link information. Attributes: non-creatable, non-modifiable
port2-mtu	**[0..2^32-1]**	integer optional	High-availability interconnect device port 2 maximum transmission unit size. Attributes: non-creatable, non-modifiable
port2-port-name		string optional	High availability interconnect device port 2 port name. Attributes: non-creatable, non-modifiable
port2-qsfp-part-number		string optional	High-availability interconnect device port 2 QSFP (Quad Small Form-factor Pluggable) part number. Attributes: non-creatable, non-modifiable
port2-qsfp-serial-number		string optional	High-availability interconnect device port 2 QSFP (Quad Small Form-factor Pluggable) serial number. Attributes: non-creatable, non-modifiable
port2-qsfp-type		string optional	High-availability interconnect device port 2 QSFP (Quad Small Form-factor Pluggable) cable type. Attributes: non-creatable, non-modifiable
port2-qsfp-vendor		string optional	High-availability interconnect device port 2 QSFP (Quad Small Form-factor Pluggable) vendor name. Attributes: non-creatable, non-modifiable
serial-number		string optional	High-availability interconnect device serial number. Attributes: non-creatable, non-modifiable
slot	**[0..2^32-1]**	integer optional	High-availability interconnect device PCI slot number. Attributes: non-creatable, non-modifiable
		string	High-availability interconnect device version number. Attributes:

version		optional	non-creatable, non-modifiable

Element definition: **ha-interconnect-timeout**

[top]

High-availability interconnect software timeout values When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ic-mvia-timeout	**[1000..34000]**	integer optional	Interconnect Read/write Timeout For Virtual Platforms(msecs) Attributes: non-creatable, modifiable
ic-timeout	**[1000..4000]**	integer optional	Interconnect Read/write Timeout (msecs) Attributes: non-creatable, modifiable
node-name		node-name optional	The node to which these timeout values belongs. Attributes: key, non-creatable, non-modifiable
ofw-mvia-timeout	**[1000..34000]**	integer optional	Firmware Read Timeout For Virtual Platforms(msecs) Attributes: non-creatable, modifiable
ofw-timeout	**[1000..4000]**	integer optional	Firmware Read Timeout (msecs) Attributes: non-creatable, modifiable

igroup-set-attribute
igroup-unbind-portset

igroup-add

[top]

Adds initiator to an existing initiator group.

Input Name	Range	Type	Description
force		boolean optional	Forcibly add the initiator, disabling mapping and type conflict checks with the high-availability partner. If not specified all conflict checks are performed. In Data ONTAP Cluster-Mode, this field is accepted for backwards compatibility and is ignored.
initiator		string	WWPN, WWPN Alias, or iSCSI name of Initiator to add.
initiator-group-name		string	Name of initiator group.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	
EVDISK_ERROR_NOT_VALID_FC_WWN	
EVDISK_ERROR_NOT_VALID_ISCSI_NAME

EVDISK_ERROR_PARTNER_HAS_DIFFERENT_OS_TYPE	
EVDISK_ERROR_VIRTUAL_LUN_MAPPING_CONFLICT	
E_SAN_NOT_READY	

Vfiler-enabled
Yes

igroup-bind-portset

[top]

Bind an existing igroup to a given portset.

Input Name	Range	Type	Description
initiator-group-name		string	Name of initiator group to bind the portset to.
portset-name		string	Name of portset.

Errno	Description
EVDISK_ERROR_PORTSET_NO_SUCH_SET	
EVDISK_ERROR_NO_SUCH_INITGROUP	
EVDISK_ERROR_INITGROUP_ALREADY_BOUND	
EVDISK_ERROR_PORTSET_THROTTLE_EXCEEDED	
EVDISK_ERROR_INITGROUP_BIND_WRONG_TYPE	
EVDISK_ERROR_INITGROUP_EMPTY_PSET_BIND	
E_SAN_NOT_READY	

igroup-create

[top]

Creates a new initiator group. In Data ONTAP 7.3 and upto ONTAP 8.0, the ALUA (Asymmetric Logical Unit Access) attribute will be enabled by default if initiator-group-type is "fcp" and os-type is "aix", "hpux", or "linux. In Data ONTAP 7-mode 8.1 and later, the ALUA attribute is enabled by default for all os-type if initiator-group-type is "fcp". In Data ONTAP Cluster-Mode 8.1 and later, the ALUA attribute is enabled by default on all initiator groups.

Input Name	Range	Type	Description
bind-portset		string optional	Name of a current portset to bind to the newly created igroup.
initiator-group-name		string	Name of initiator group.
initiator-group-type		string	Type of the initiator group. Possible values: "fcp", "iscsi", "mixed". "mixed" is available in Data ONTAP Cluster-Mode 8.1 or later only.
os-type		initiator-group-os-type optional	OS type of the initiators within the group. The default value if not specified is "default". The os type applies to all initiators within the group and governs the finer details of SCSI protocol interaction with these initiators. It is strongly recommended for the caller of this API to specify an OS type that is not "default". Some host OSes require this type field be set correctly in order to function properly.

Errno	Description
EINVALIDINPUTERROR	
EVDISK_ERROR_INITGROUP_INVALID_ATTR_OS_TYPE_VALUE	
EVDISK_ERROR_INITGROUP_EXISTS	
EVDISK_ERROR_INITGROUP_MISSING_ARGS	
EVDISK_ERROR_INITGROUP_INVALID_ATTR_TYPE

EVDISK_ERROR_INITGROUP_BIND_WRONG_TYPE	
E_SAN_NOT_READY	

Vfiler-enabled
Yes

igroup-destroy

[top]

Destroys an existing initiator group. By default a group cannot be destroyed if there are existing lun maps defined for that group. This behaviour can be overridden with the use of force option set to "true" which will destroy the initiator group and any associated lun maps.

Input Name	Range	Type	Description
force		boolean optional	Forcibly destroy the initiator group, even if there are existing lun maps. Best practice is to attempt to unmap all the luns associated with a group before destroying it.
initiator-group-name		string	Name of initiator group.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	
EVDISK_ERROR_INITGROUP_MAPS_EXIST	
E_SAN_NOT_READY	

Vfiler-enabled
Yes

igroup-get-iter

[top]

Iterate over a list of igroup objects.

Input Name	Range	Type	Description
desired-attributes		initiator-group-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		initiator-group-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the igroup object. All igroup objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		initiator-group-info[] optional	The list of attributes of igroup objects.
next-tag		string optional	Tag for the next call. Not present when there are no more igroup objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

igroup-list-info

[top]

Get information for initiator group(s).

Input Name	Range	Type	Description
initiator-group-name		string optional	Name of initiator group. If specified, only information for that group is returned. If not specified, information for all of the initiator groups is returned.

Output Name	Range	Type	Description
initiator-groups		initiator-group-info[]	List of initiator groups.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	

Vfiler-enabled
Yes

igroup-lookup-lun

[top]

Find the path to the lun mapped at a given lun-id for a given initiator group.

Input Name	Range	Type	Description
initiator-group-name		string	Name of initiator group to search.
lun-id	**[0..4095]**	integer	Lun-id (Logical Unit Number) to search for.

Output Name	Range	Type	Description
path		string	Path to the lun.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	

Errno	Description
EVDISK_ERROR_NO_SUCH_LUNMAP	

Vfiler-enabled
Yes

igroup-os-type-list

[top]

Displays the supported values and descriptions for initiator-group-os-type.

Output Name	Range	Type	Description
ostypes		system-api-enum-value-info[]	Enumeration type name/value pair

Errno	Description
EINTERNALERROR	

igroup-remove

[top]

Removes node(s) from an initiator group. The operation is prohibited if there are existing lun maps defined for that group. The force option set to "true" can be used to forcibly remove the node regardless of mappings.

Input Name	Range	Type	Description
force		boolean optional	Forcibly remove the initiator even if there are existing LUNs mapped to this initiator group.
initiator		string	WWPN, WWPN Alias, or iSCSI name of Initiator to remove.
initiator-group-name		string	Name of initiator group.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	
EVDISK_ERROR_INITGROUP_MAPS_EXIST	
EVDISK_ERROR_NOT_VALID_FC_WWN	
EVDISK_ERROR_NOT_VALID_ISCSI_NAME	
EVDISK_ERROR_NODE_NOT_IN_INITGROUP	
E_SAN_NOT_READY	

Vfiler-enabled
Yes

igroup-rename

[top]

Rename an existing initiator group. The rename operation is non-disruptive.

Input Name	Range	Type	Description
initiator-group-name		string	Name of initiator group to be renamed.
initiator-group-new-name		string	New name to be given to initiator group.

Errno	Description
EVDISK_ERROR_NO_SUCH_INITGROUP	
EVDISK_ERROR_INITGROUP_EXISTS	
EVDISK_ERROR_CANT_CREATE_INITGROUP_FILE	
EVDISK_ERROR_CANT_WRITE_INITGROUP_FILE	
EVDISK_ERROR_CANT_RENAME_INITGROUP_FILE	
EINVALIDINPUTERROR	
E_SAN_NOT_READY	

Vfiler-enabled
Yes

igroup-set-attribute

[top]

Sets an attribute for an initiator group.

Input Name	Range	Type	Description
attribute		string	Name of the attribute to change. Possible values: "alua", "os-type", "throttle_borrow", "throttle_reserve", "report_scsi_name". "alua" is available in Data ONTAP 7.2 or later. "report_scsi_name" is available in Data ONTAP 8.1.0 or later. "alua", "throttle_reserve","throttle_borrow" and "report_scsi_name" are not available in Data ONTAP Cluster-Mode.
initiator-group-name		string	Name of initiator group.
value		string	Value for the attribute. The valid values for "os-type" are the supported os-types listed in the igroup-create API. In Data ONTAP 7-Mode, setting the "os-type" attribute will perform checks with the high-availability partner if this filer is running in the 'single_image' fcp cfmode and this igroup is an FCP igroup. It is also strongly recommended the "default" os-type not be used. Using "default" may cause problems with LUN access. API to always require the proper OS type information The valid values for "throttle_reserve" are 0-99 The valid values for "throttle_borrow" are true or false The valid values for "alua" are true or false The valid values for "report_scsi_name" are true or false

Element definition: **initiator-group-info**

[top]

Information about an initiator group.

Name	Range	Type	Description
initiator-group-alua-enabled		boolean	Boolean value to indicate if this initiator group has ALUA (Asymmetric Logical Unit Access) features enabled for luns mapped to this initiator group.
initiator-group-delete-on-unmap		boolean optional	Boolean value to indicate if this initiator group will be automatically deleted when unmapped from a LUN if it is no longer part of any other LUN maps. This field is available in Data ONTAP 9.2 and later.
initiator-group-name		string	Name of this initiator group.
initiator-group-os-type		initiator-group-os-type	OS type of the initiator group
initiator-group-portset-name		string optional	Name of the portset that is bound to the initiator group, if any.
initiator-			

group-report-scsi-name-enabled		boolean optional	Boolean value to indicate whether to report or hide SCSI Name String (8h) Descriptor to initiator's INQUIRY VPD 0x83 page command. This field is available in Data ONTAP 8.1.0 and later.
initiator-group-throttle-borrow		boolean	Boolean value to indicate that the igroups throttle reserve may be exceeded if the igroup attempts to use more than it has reserved.
initiator-group-throttle-reserve		integer	Percentage of filer SCSI command blocks reserved for this initiator group's exclusive usage.
initiator-group-type		string	Type of the initiators in this group. Possible values: "iscsi", "fcp", "mixed".
initiator-group-use-partner		boolean optional	Boolean value to indicate if this initiator group is configured for its luns to require the use of host multi-pathing software for correct high-availability failover operation. In Data ONTAP 7-Mode, this value is optional and is only returned for FCP initiator groups on an storage system in an HA pair. In Data ONTAP Cluster-Mode, this field will always be 'true'.
initiator-group-uuid		string optional	This value is Universally-unique identifier (UUID) of this initiator group. The UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s. The first grouping has 8 hexadecimal characters, the second through fourth groupings have four hexadecimal characters each, and the fifth and final grouping has 12 hexadecimal characters. Note that a leading '0x' is not used. This field is available in Data ONTAP 7-mode 7.3.6, 8.0.2, 8.1.0 and later for the igroup-list-info API. This field is available in Data ONTAP Cluster-Mode 8.1.0 and later for the igroup-get-iter and lun-map-list-info APIs. Here is an example of an actual UUID: 35d6ca90-c759-11df-8b6d-00a098132c6c
initiator-group-vsa-enabled		boolean	Boolean value to indicate if this initiator group has Volume Set Addressing (VSA) enabled or disabled.
initiators		initiator-info[] optional	List of initiators belonging to this group.
lun-id	**[0..4095]**	integer optional	LUN identifier to which the LUN is mapped at the host. This value is optional and is only returned for the lun-map-list-info api.
vserver		string optional	Name of the vserver hosting this initiator group

Element definition: **initiator-group-os-type**

[top]

The operating system of the initiator group. This value modifies the finer details of SCSI protocol

interaction for initiators in the group. Possible values:

- "aix" The initiators belong to an AIX host,
- "default" The initiators belong to an unknown host type,
- "hpux" The initiators belong to an HP-UX host,
- "hyper_v" The initiators belong to a Hyper-V parent host,
- "linux" The initiators belong to a Linux host,
- "netware" The initiators belong to a NetWare host,
- "openvms" The initiators belong to an OpenVMS host,
- "solaris" The initiators belong to a Solaris host,
- "vmware" The initiators belong to a VMware ESX host,
- "windows" The initiators belong to a Windows host,
- "xen" The initiators belong to a Xen hypervisor host.

[none]

Element definition: **system-api-enum-value-info**

[top]

Enumeration type name/value pair When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
description		string optional	Description of the enumeration value Attributes: non-creatable, non-modifiable
value		string optional	Name of the enumeration value Attributes: key, non-creatable, non-modifiable

Element definition: **initiator-info**

[top]

Information about one initiator.

Name	Range	Type	Description
initiator-name		string	Name of the initiator.

iscsi-adapter-config-down

[top]

Configures the specified adapter down. This API is obsolete beginning with ONTAP 7.1 and will always return the error EOPNOTSUPPORTED. There is no equivalent API to replace it.

Input Name	Range	Type	Description
iscsi-adapter		string	iscsi adapter.

Errno	Description
EOPNOTSUPPORTED	

License
iscsi

iscsi-adapter-config-up

[top]

Configures the specified adapter up. This API is obsolete beginning with ONTAP 7.1 and will always return the error EOPNOTSUPPORTED. There is no equivalent API to replace it.

Input Name	Range	Type	Description
iscsi-adapter		string	iscsi adapter.

Errno	Description
EOPNOTSUPPORTED	

License
iscsi

iscsi-adapter-initiators-list-info

[top]

Get the list of initiators currently connected to any of the portal groups associated with specified adapter. Information returned for each initiator includes the target portal group number to which the initiator is connected, as well as the iSCSI initiator nodename and ISID. If no adapter is specified, information is returned for all initiators connected through any adapter in the system. NOTE: Beginning with ONTAP 7.1 this API is only intended for use by legacy applications that are already coded to this API. New applications should use iscsi-portal-list-info to get the list of iSCSI portals. associated with this filer. Complete removal of this ZAPI may occur in any release after 7.1.

Input Name	Range	Type	Description
iscsi-adapter		string optional	Adapter to get initiator list for. If no adapter is specified, information is returned for all initiators connected through any iscsi adapter in the system.

Output Name	Range	Type	Description
iscsi-adapters		iscsi-adapter-initiators-info[]	A list of iscsi adapters containing list of initiators.

iscsi-initiator-add-auth

[top]

Add initiator to the authentication list.

Input Name	Range	Type	Description
auth-type		string	Authentication type. Possible values: "CHAP", "none", "deny".
initiator		string	Name of initiator. The initiator name must conform to RFC 3720, for example: "iqn.1987-06.com.initvendor1:appsrv.sn.2346".
initiator-address-ranges		ip-range-or-mask[] optional	May be a single IPv4 or IPv6 address or a range containing a start address and an end address. The start and end addresses themselves are included in the range. If not present, the initiator is allowed to log in from any IP address. An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'. An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.
outbound-passphrase		string optional	Outbound CHAP user password. Outbound authentication is optional. If Outbound authentication is not specified, then the initiator can only do inbound authentication.
outbound-user-name		string optional	Outbound CHAP user name. Outbound authentication is optional. If Outbound authentication is not specified, then the initiator can only do inbound authentication.
passphrase		string optional	Inbound CHAP user password, required for auth-type equal to CHAP.
radius		boolean optional	"true" if RADIUS is the only forced CHAP authentication policy, Default is "false".
user-name		string optional	Inbound CHAP user name, required for auth-type equal to CHAP.

iscsi-tpgroup-alua-set

[top]

Change the ALUA parameters on a tpgroup Asymmetric Logical Unit Access (ALUA) management Data ONTAP supports SCSI ALUA functionality for managing multi-pathed SCSI devices. ALUA provides a standardized mechanism for path discovery and prioritization. Devices are identified by target port IDs, which are then grouped into target port groups. Each group has a state which, when configured,

enables the host multipathing software to select the appropriate path priorities when accessing a LUN. For iSCSI, ALUA settings are controlled at the target portal group level using the "iscsi-tpgroup-alua-set" ZAPI. A target portal group can be configured to be either "optimized" or "non-optimized"; a host typically uses all the optimized paths before using any non-optimized paths it may find. All target portal groups are optimized by default. There is also an optional "preferred" setting that may be used on a target portal group. Check your host's multi-pathing software documentation to see if it supports ALUA and the preferred setting. ALUA is enabled on Initiator Groups using the "igroup-set-attribute" ZAPI. All LUNs mapped to an ALUA enabled Initiator Group will support the ALUA functionality.

Input Name	Range	Type	Description
tpgroup-alua-preferred		boolean	If "true", target portal group will be marked as preferred for ALUA enabled Initiator Groups
tpgroup-alua-state		string	Possible values: "optimized", "non-optimized"

Element definition: **iscsi-adapter-initiators-info**

[top]

A list of initiators currently connected to the adapter.

Name	Range	Type	Description
iscsi-connected-initiators		iscsi-connected-initiator-info[]	Information about the connected initiators
name		string	The name this adapter is given.

Element definition: **iscsi-config-adapter-info**

[top]

Configuration information about a single iscsi adapter.

Name	Range	Type	Description
name		string	The name this adapter is given.
portal-addresses		iscsi-portal-address-info[]	A list of portal group address + port that this adapter is listening on.
state		string	State of the adapter, either "online", "offline", "local", "partner" or "error". "online" and "offline" are used when the adapter is used for the current host. "local" is used if the adapter is operating on behalf of the local host, and "partner" is used if the adapter is operating on behalf of the partner host. "error" is used if an internal error occurred while retrieving the adapter information.
status		string optional	A short status message explaining the state. i.e. if the adapter is offline, the reason for it, or if its "error" what the error is. This will not be returned if the state of the adapter is "online".

Element definition: **iscsi-connection-list-entry-info**

[top]

Information about an iSCSI connection. In Data ONTAP 7-Mode, connections are uniquely identified by the combination of 'session-id' and 'connection-id'. In Data ONTAP Cluster-Mode, sessions are uniquely identified within a Vserver by the combination of 'tpgroup-name', 'session-id' and 'connection-id'.

Name	Range	Type	Description
connection-id	**[0..65535]**	integer	Connection id
			Current state of this connection. Possible values: • "New_Connection",

connection-state		string	• "Waiting_Tpgtag_Assignment", • "Login_Waiting_Req", • "Login_Req_Rcvd", • "Login_Waiting_Auth", • "Login_OK_New_Session_Requested", • "Login_New_Session_Waiting_Reinstatement", • "Login_OK_New_Conn_Requested", • "Login_New_Conn_Waiting_Reinstatement", • "Login_Send_Final_Resp", • "Full_Feature_Phase", • "Shutdown_Start", • "Shutdown_Waiting_Sockio_Shutdown", • "Shutdown_Sockio_Shutdown_Done", • "Shutdown_Waiting_ImmDeliv_FFPCmds_Done", • "Shutdown_ImmDeliv_FFPCmds_Done", • "Shutdown_Recovery_Waiting_FFPCmds_Ready", • "Shutdown_Recovery_Waiting_Logout_Rcvd", • "Shutdown_Recovery_Logout_Rcvd", • "Shutdown_Recovery_Waiting_FFPCmds_Reassigned", • "Shutdown_Terminate_Abort_Seq_FFPCmds", • "Shutdown_Terminate_Waiting_Seq_FFPCmds_Done", • "Shutdown_Terminate_Seq_FFPCmds_Done".
has-session		boolean	True if this connection is associated to a session, false otherwise.
interface-name		string	Name of the network interface hosting this connection. In Data ONTAP 7-Mode, this is the name of a physical ethernet interface, for example: "e0c". In Data ONTAP Cluster-Mode, this is the name of an iSCSI data LIF in the Vserver.
local-ip-address		string	Storage System iSCSI Target IP address.
local-ip-port	**[0..65535]**	integer	Storage System iSCSI Target TCP port.
remote-ip-address		string	Remote initiator IP address.
remote-ip-port	**[0..65535]**	integer	Remote initiator TCP port.
session-id	**[0..65535]**	integer	Session id for the associated session, or 0 if this connection is not yet associated to a session.
tpgroup-name		string	The name of the target portal group associated with this session.
tpgroup-tag	**[0..65535]**	integer	The tag of the target portal group associated with this session.
vserver		string	Name of the vserver containing this connection.

Element definition: **iscsi-initiator-list-entry-info**

[top]

Information about a single initiator.

Name	Range	Type	Description
initiator-aliasname		string optional	User-friendly name assigned to initiator. This field is only present if the initiator provided an alias during login.
initiator-		initiator-group-list-	List of initiator groups containing this iSCSI initiator.

group-list		info[] optional	
initiator-nodename		string	Name of initiator. The initiator name must conform to RFC 3720, for example: "iqn.1987-06.com.initvendor1:appsrv.sn.2346".
isid		string	ISID for this session selected by initiator represented as 6 hexadecimal octets separated by colons, for example: "40:01:37:00:00:00".
target-session-id	**[0..65535]**	integer	iSCSI session identifier assigned by the target.
tpgroup-name		string	The name of the target portal group associated with this session.
tpgroup-tag	**[0..65535]**	integer	Tag of target portal group associated with this session.
vserver		string	Name of the vserver this initiator is connected to.

Element definition: **iscsi-interface-accesslist-entry-info**

[top]

Information about a single accesslist entry When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
initiator		string optional	Initiator that can access the iSCSI LIFs Attributes: key, non-creatable, non-modifiable
interface-name		string optional	iSCSI LIF Name Attributes: key, non-creatable, non-modifiable
vserver		string optional	Vserver hosting the iSCSI LIF Attributes: key, non-creatable, non-modifiable

Element definition: **iscsi-interface-list-entry-info**

[top]

Information about a single interface

Name	Range	Type	Description
current-node		string	Name of the node currently hosting the LIF.
current-port		string	Name of the physical ethernet interface currently hosting the LIF.
interface-name		string	Name of interface. In Data ONTAP 7-Mode, this is the name of a physical ethernet interface, for example: "e0c". In Data ONTAP Cluster-Mode, this is the name of an iSCSI data LIF in the Vserver.
ip-address		string	iSCSI target portal IP address.
ip-port	**[0..65535]**	integer	iSCSI target portal TCP port.

is-interface-enabled		boolean	"true" if interface enabled for iSCSI, "false" otherwise.
relative-port-id	**[1..65535]**	integer	The SCSI Relative Target Port Identifier of the LIF.
sendtargets-fqdn		string optional	Specifies the Fully Qualified Domain Name (FQDN) of the LIF to be returned in iSCSI SendTargets discovery. If unset, the IP address of the LIF is used instead.
tpgroup-name		string	Name of target portal group interface is associated with.
tpgroup-tag	**[0..65535]**	integer	Id of target portal group interface is associated with.
vserver		string optional	The name of the vserver containing this iSCSI data LIF.

Element definition: **iscsi-iptpgroup-list-entry-info**

[top]

Information about a single portal group

Name	Range	Type	Description
ipaddress-list-entries		ipaddress-list-entry-info[]	List of IP Addresses associated with this iptpgroup
tpgroup-name		string	Portal group name
tpgroup-tag		integer	Portal group tag

Element definition: **iscsi-isns-info**

[top]

iSCSI iSNS Service Configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-isns-enabled		boolean optional	true if the iSNS Service is running, false otherwise. Attributes: optional-for-create, non-modifiable
isns-entity-id		string optional	Entity id existing on the iSNS server Attributes: non-creatable, non-modifiable
isns-ip-addr		ip-address optional	iSNS server IP address. Attributes: required-for-create, modifiable
last-successful-update		integer optional	Last successful iSNS update time in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable
last-update-attempt		integer optional	Last iSNS update attempt time in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable

last-update-result		string optional	Result of the last iSNS update. Attributes: non-creatable, non-modifiable
vserver		string optional	Vserver hosting the iSNS service. Attributes: key, non-creatable, non-modifiable

Element definition: **iscsi-portal-list-entry-info**

[top]

information about a single portal

Name	Range	Type	Description
interface-name		string	Name of network interface exporting this portal
ip-address		string	portal IP address
ip-port	**[0..65535]**	integer	portal listening port
tpgroup-tag	**[0..65535]**	integer	tag of portal group this portal is associated with

Element definition: **iscsi-security-entry-info**

[top]

Information about a single authentication entry.

Name	Range	Type	Description
auth-chap-policy		string optional	CHAP authentication path. Possible values: "local", "radius".
auth-type		string	Authentication type. Possible values: "CHAP", "none", "deny".
initiator		string	Name of initiator. The initiator name must conform to RFC 3720, for example: "iqn.1987-06.com.initvendor1:appsrv.sn.2346", or "default" if this is a default auth entry.
initiator-address-ranges		ip-range-or-mask[] optional	May be a single IPv4 or IPv6 address or a range containing a start address and an end address. The start and end addresses themselves are included in the range. If not present, the initiator is allowed to log in from any IP address. An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'. An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.
outbound-user-name		string optional	Outbound CHAP user name, returned only if auth-type is CHAP, and outbound authentication is set for initiator.
user-name		string optional	Inbound CHAP user name, returned only if auth-type is CHAP.
vserver		string	Vserver containing this authentication information.

Element definition: **iscsi-service-info**

[top]

iSCSI Target Service Configuration. When returned as part of the output, all elements of this typedef

are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
alias-name		string optional	The iSCSI target alias of the Vserver. Attributes: optional-for-create, modifiable
is-available		boolean optional	true if the iSCSI Service is running, false otherwise. Attributes: non-creatable, non-modifiable
login-timeout	**[5..120]**	integer optional	Login phase duration in seconds. Specifies maximum time the login phase remains active until the iSCSI target terminates the connection. Attributes: optional-for-create, modifiable
max-cmds-per-session	**[4..256]**	integer optional	Maximum commands per session. Specifies the maximum number of commands per session that the iSCSI target can accept. Attributes: optional-for-create, modifiable
max-conn-per-session	**[1..32]**	integer optional	Maximum connections per session. Specifies the maximum number of connections per session that the iSCSI target can accept. Attributes: optional-for-create, modifiable
max-error-recovery-level	**[0..2]**	integer optional	(DEPRECATED)-Maximum error recovery level. The possible values are: • 0 - session failure recovery. • 1 - digest failure recovery. • 2 - connection failure recovery. Attributes: optional-for-create, modifiable
node-name		string optional	The iSCSI target name of the Vserver. Attributes: optional-for-create, modifiable
retain-timeout	**[1..120]**	integer optional	Default time-to-retain value in seconds. Specifies the wait time before active task reassignment is possible after an unexpected connection termination. Attributes: optional-for-create, modifiable
tcp-window-size	**[8760..262800]**	integer optional	TCP receive window size in bytes. Attributes: optional-for-create, modifiable
vserver		string optional	Vserver hosting the iSCSI service. Attributes: key, non-creatable, non-modifiable

Element definition: **iscsi-session-list-entry-info**

[top]

Information about a single iSCSI session. In Data ONTAP 7-Mode, sessions are uniquely identified by the 'target-session-id'. In Data ONTAP Cluster-Mode, sessions are uniquely identified within a Vserver by the combination of 'tpgroup-name' and 'target-session-id'.

Name	Range	Type	Description
cmd-window-size	**[0..2^31-1]**	integer	The maximum number of I/O operations per session. This field has been superseded by max-ios-per-session starting with Data ONTAP 8.3 and is retained for compatibility.

data-pdu-in-order		boolean	The DataPDUInOrder of the session as defined in RFC 3720.
data-sequence-in-order		boolean	The DataSequenceInOrder of the session as defined in RFC 3720.
default-time-to-retain	**[0..3600]**	integer	The DefaultTime2Retain of the session as defined in RFC 3720, in seconds.
default-time-to-wait	**[0..3600]**	integer	The DefaultTime2Wait of the session as defined in RFC 3720, in seconds.
error-recovery-level	**[0..2]**	integer	iSCSI ErrorRecoveryLevel as defined in RFC 3720.
first-burst-length	**[512..2^24-1]**	integer	The FirstBurstLength of the session as defined in RFC 3720, in bytes.
immediate-data-enabled		boolean	True if this session has immediate data enabled, false otherwise.
initial-r2t-enabled		boolean	True if this session has R2T enabled, false otherwise.
initiator-aliasname		string optional	The user-friendly name assigned to initiator. This field is only present if the initiator provided an alias during login.
initiator-nodename		string	Name of initiator. The initiator name must conform to RFC 3720, for example: "iqn.1987-06.com.initvendor1:appsrv.sn.2346".
iscsi-session-connection-list-entries		iscsi-session-connection-list-entry-info[] optional	List of TCP/IP connections associated with this session.
iscsi-sesssion-cmd-list-entries		iscsi-sesssion-cmd-list-entry-info[] optional	List of active commands associated with this session
isid		string	ISID for this session selected by initiator represented as 6 hexadecimal octets separated by colons, for example: "40:01:37:00:00:00".
max-burst-length	**[512..2^24-1]**	integer	The MaxBurstLength of the session as defined in RFC 3720, in bytes.
max-connections	**[0..65535]**	integer	Maximum number of connections for this session.
max-ios-per-session	**[0..2^31-1]**	integer	The maximum number of I/O operations per session. This field is available in Data ONTAP 8.3 and later.
max-outstanding-r2t	**[1..65535]**	integer	The MaxOutstandingR2T of the session as defined in RFC 3720.
session-type		string	Possible values: "normal" or "discovery".
target-session-id	**[0..65535]**	integer	The iSCSI session identifier assigned by the storage system.
tpgroup-name		string	The name of the target portal group associated with this session.
tpgroup-tag	**[0..65535]**	integer	The tag of the target portal group associated with this session.
vserver		string	The name of the vserver containing this session.

Information about a single portal group

Name	Range	Type	Description
interface-list-entries		interface-list-entry-info[] optional	List of interfaces associated with this tpgroup.
is-user-defined		boolean	True if the target portal group is user defined, false if the target portal group is system defined.
tpgroup-alua-preferred		boolean optional	True if target portal group is the preferred group for ALUA enabled initiator groups, false otherwise.
tpgroup-alua-state		string optional	Possible values: "optimized", "non-optimized".
tpgroup-name		string	Portal group name.
tpgroup-tag		integer	Portal group tag.
vserver		string optional	Vserver containing this target portal group.

Element definition: **lif-name**

[top]

Logical Interface Id

[none]

Element definition: **initiator-group-list-info**

[top]

The initiator group this initiator belongs to.

Name	Range	Type	Description
initiator-group-name		string	Name of initiator group.

Counts for Command Descriptor Blocks processed

Name	Range	Type	Description
data-in-blocks		integer	Count of data in blocks.
data-out-blocks		integer	Count of data out blocks.

error-status		integer	Count of errors.
success-status		integer	Count of successes.
total		integer	Total Command Descriptor Blocks processed.

Element definition: **iscsi-connected-initiator-info**

[top]

Information about an initiator connected to an iSCSI adapter.

Name	Range	Type	Description
initiator-name		string	Name of initiator.
isid		string	ISID in form of "xx:xx:xx:xx:xx:xx".
portal-group-id		integer	Target portal group number to which the initiator is connected.

Element definition: **iscsi-error-stats-info**

[top]

Counts for iSCSI errors.

Name	Range	Type	Description
data-digest		integer	Count of digest errors.
failed-logins		integer	Count of failed logins.
failed-logouts		integer	Count of failed logouts.
failed-task-mgt		integer	Count of failed management tasks.
failed-text-cmd		integer	Count of failed text commands.
hdr-digest		integer	Count of digest errors.
invalid-header		integer	Count of PDU discards due to invalid PDU header.
outside-cmd-sn-window		integer	Count of PDU discards due to PDU being outside of command sequence number window.
protocol		integer	Count of protocol errors.
total		integer	Total errors.

Element definition: **iscsi-portal-address-info**

[top]

Configuration information about an inet-address and port pair for a portal group.

Name	Range	Type	Description
id		integer	ID of this portal group.
inet-address		ip-address	inet-address.
port		integer	The port that is being listened on for that address.

Element definition: **iscsi-received-stats-info**

[top]

Counts for PDUs received.

Name	Range	Type	Description
data-out		integer	Count of data out requests.
login-req		integer	Count of login requests.
logout-req		integer	Count of logout requests.
nop-out		integer	Count of NOP Out.
scsi-cmd		integer	Count of SCSI commands.
scsi-task-mgt-cmd		integer	Count of SCSI task management commands.
snack		integer	Count of SNACK requests.
text-req		integer	Count of text requests.
total		integer	Total PDUs received.
unknown		integer	Count of unknown PDUs.

Cluster management requires that certain operations run reliably, asynchronously and on particular schedules. These 'jobs' offer these benefits to the work they manage:

- Guaranteed execution, even in the face of node failure or reboot.
- Cluster-wide or node-specific scheduling. This permits jobs to execute where it makes the most sense.
- Flexible scheduling as a one time event, on regular intervals or coordinated to specific calendar dates.

On their exterior, jobs are a fundamentally simple concept. A job is a task that executes at a specific time. Around this idea, there are extended attributes that control if the job will be automatically re-scheduled upon completion, survive major system failures, run under which priority and so on. But in a healthy cluster with little activity, all jobs appear very similarly. The job APIs are generally comprised of those that enumerate and act upon jobs in the system and those that allow schedule customization. It should be noted that there are no APIs that allow one to explicitly create jobs. This is intentional as jobs are used to manage internal system workload. Jobs are responsible for activities like moving a volume, scanning for viruses or automatically taking snapshots as opposed to being a generic administrative process scheduler.

Every job is described specifically by its type, id, affinity, visibility and schedule. Both the job type and id are represented by unique universal identifiers (UUIDs). All jobs of a given type will perform the same task, usually with different runtime data. For instance a volume move operation is one type of job, but can be used for many different volumes. Job id is a specific instance of a job type. In the example above three different volume move jobs would have the same type but three different job ids. Jobs are also sometimes identified by a monotonically increasing numeric value, although this is often just a shorthand notation for the UUID. Affinity describes whether a job may be scheduled for execution on any node in the cluster (cluster) or must be tied to a specific compute instance (node). Visibility dictates whether a job's state is stored in the cluster-wide replicated database (public) or only on the node on which it is scheduled for execution (private). Finally a job schedun abstract concept like when the system starts up or based upon a calendar date or interval between executions of the same job.

Jobs always execute as small state machines with a definitive current state as well as a specific list of states the job may enter at any point in time. A job can be in one of the following states:

- Initial - job has been created but not queued yet
- Queued - job is in the queue; it could be ready to run immediately or it may be scheduled to run at a later time
- Running - the job has been picked by an instance of the Job Manager and is running
- Waiting - the job is waiting for another job to complete
- Pausing - the job is in the process of pausing after being

requested to pause
- Paused - the job is indefinitely paused
- Quitting - the job has been requested to terminate and it is shutting down
- Success - the job has successfully completed and the results are available
- Failure - the job has failed
- Reschedule - the job is being re-scheduled
- Error - internal error occurred
- Quit - the job has been requested to terminate
- Dead - the job exceeded the drop dead time and is being removed from the queue
- Unknown - the state of the job is unknown
- Restart - the job is restartable
- Dormant - the job is inactive while waiting on some external event

Internally, the job execution engine organizes jobs of similar states into common queues. Queues are processed according to the rules of the state. For example, jobs in the wait queue are only periodically checked to determine if their waiting condition is met, whereas jobs in the running queue are actively processed as CPU capacity permits.

These APIs allow for job enumeration, schedule creation and low-level management. The most common enumeration APIs are job-get, job-private-get and job-history-get, while the more specific APIs like job-by-node-get act on a subset of the job-get result set once it has been suitable filtered and/or sorted.

Schedules may either occur at well-defined calendar dates or on a given interval between job executions. Use of the low-level APIs should be attempted with care as they can cause the jobs to behave abnormally or fail.

job-by-node-get

[top]

Get a single job entry. This is just a performance optimization for job-get that only searches for the job among the ones currently owned by the given node.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
job-id	**[0..2^64-1]**	integer	The job id.
job-node		node-name	The name of the node where the job is run.

Output Name	Range	Type	Description
attributes		job-info	The attributes of the job-by-node entry.

Errno	Description

EOBJECTNOTFOUND	
EINTERNALERROR	

job-by-node-get-iter

[top]

Get multiple job records organized by node. This is just a performance optimization for job-get-iter that only searches for the job among the ones currently owned by the given node.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		job-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the job-by-node entry object. All job-by-node entry objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		job-info[] optional	The list of attributes of job-by-node entry objects.
next-tag		string optional	Tag for the next call. Not present when there are no more job-by-node entry objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

job-completed-get

[top]

Get a single completed job entry. This is just a performance optimization for job-get.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
job-id	**[0..2^64-1]**	integer	Job ID

Output Name	Range	Type	Description

attributes		job-info	The attributes of the job completed.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

job-completed-get-iter

[top]

Get multiple completed job records. This is just a performance optimization for job-get-iter.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		job-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the job completed object. All job completed objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		job-info[] optional	The list of attributes of job completed objects.
next-tag		string optional	Tag for the next call. Not present when there are no more job completed objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

job-get

[top]

Get a single job entry.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
job-id	**[0..2^64-1]**	integer	The job id.

Output Name	Range	Type	Description
attributes		job-info	The attributes of the job.

num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

job-history-get

[top]

Get a single job history event.

Input Name	Range	Type	Description
desired-attributes		job-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.

job-node		node-name	The name of the node where the job ran, or the node that changed the job's state.
log-id	**[0..2^64-1]**	integer	The internal identifier of this job history event.

Output Name	Range	Type	Description
attributes		job-history-info	The attributes of the job history event.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

job-history-get-iter

[top]

Get multiple job history records.

Input Name	Range	Type	Description
desired-attributes		job-history-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 100
query		job-history-info optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the job history event object. All job history event objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		job-history-info[] optional	The list of attributes of job history event objects.
next-tag		string optional	Tag for the next call. Not present when there are no more job history event objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

job-pause

[top]

Pause a job. A job must be of a type that has job-type-is-pausible set to true before it may be paused. Once notified of a pause request, a job should stop performing work until it is subsequently resumed.

Input Name	Range	Type	Description
job-id	**[0..2^64-1]**	integer	The job id.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

job-pause-iter

[top]

Pause a collection of jobs.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple job objects match a given query. If set to true, the API will continue with the next matching job even when the operation fails for the job. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed operations before the server gives up and returns. If set, the API will continue with the next matching job even when the operation on a previous matching job fails, and do so until the total number of objects failed to be operated on reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed operations. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of job objects to be operated in this call. Default: 20
query		job-info	If operating on a specific job, this input element must specify all keys. If operating on job objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of job objects (just keys) that were not operated on due to some error. If set to false, the list of job objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of job objects (just keys) that were successfully operated on. If set to false, the list of job objects operated on will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		job-pause-iter-info[] optional	Information about job objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching job objects to be operated on.
	[0..2^32-	integer	The number of job objects that matched the query, but were not

num-failed	**1]**	optional	operated on due some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of job objects that matched the query and were successfully processed.
success-list		job-pause-iter-info[] optional	The job objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

Errno	Description
EINTERNALERROR	

job-private-completed-get

[top]

Get a single completed, private job entry. This is just a performance optimization for job-private-get.

Input Name	Range	Type	Description
desired-attributes		job-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
job-id	**[0..2^64-1]**	integer	Job ID
job-node		node-name	Node

return-failure-list		boolean optional	If set to true, the API will return the list of job objects (just keys) that were not operated on due to some error. If set to false, the list of job objects not operated on will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of job objects (just keys) that were successfully operated on. If set to false, the list of job objects operated on will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
failure-list		job-resume-iter-info[] optional	Information about job objects that were not operated on due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching job objects to be operated on.
num-failed	[0..2^32-1]	integer optional	The number of job objects that matched the query, but were not operated on due some error.
num-succeeded	[0..2^32-1]	integer optional	The number of job objects that matched the query and were successfully processed.
success-list		job-resume-iter-	The job objects that were successfully processed. This element will be returned only if input element 'return-success-list' is true.

		info[] optional	

Errno	Description
EINTERNALERROR	

job-schedule-cron-create

[top]

Create a new cron job schedule entry.

Input Name	Range	Type	Description
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified.
job-schedule-cron-day		cron-day-of-month[] optional	The day(s) of the month when the job should be run.
job-schedule-cron-day-of-week		cron-day-of-week[] optional	The day(s) in the week when the job should be run.
job-schedule-cron-hour		cron-hour[] optional	The hour(s) of the day when the job should be run.
job-schedule-cron-minute		cron-minute[]	The minute(s) of each hour when the job should be run.
job-schedule-cron-month		cron-month[] optional	The month(s) when the job should be run.
job-schedule-name		string	The name of the job schedule.
return-record		boolean optional	If set to true, returns the job-schedule-cron on successful creation. Default: false

Output Name	Range	Type	Description
result		job-schedule-cron-info optional	The job-schedule-cron created (keys or the entire object if requested)

Errno	Description
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

job-schedule-cron-destroy

[top]

Delete a single cron job schedule entry. The entry must not be in use.

Input Name	Range	Type	Description
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified.
job-schedule-name		string	The name of the job schedule.

Errno	Description
E_SCHEDULE_IN_USE	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

job-schedule-cron-destroy-iter

[top]

Delete multiple cron job schedule entries. The entries must not be in use.

Input Name	Range	Type	Description
continue-on-failure		boolean optional	This input element is useful when multiple job-schedule-cron objects match a given query. If set to true, the API will continue deleting the next matching job-schedule-cron even when the deletion of a previous job-schedule-cron fails. If set to false, the API will return on the first failure. Default: false
max-failure-count	**[1..2^32-1]**	integer optional	When allowing failures ('continue-on-failure' is set to true), then this input element may be provided to limit the number of failed deletions before the server gives up and returns. If set, the API will continue deleting the next matching job-schedule-cron even when the deletion of a previous matching job-schedule-cron fails, and do so until the total number of objects failed to be deleted reaches the maximum specified. If set to the maximum or not provided, then there will be no limit on the number of failed deletions. Only applicable if 'continue-on-failure' is set to true. Default: 2^32-1
max-records	**[1..2^32-1]**	integer optional	The maximum number of job-schedule-cron objects to delete in this call. Default: 100
query		job-schedule-cron-info	If deleting a specific job-schedule-cron, this input element must specify all keys. If deleting multiple job-schedule-cron objects based on query, this input element must specify a query.
return-failure-list		boolean optional	If set to true, the API will return the list of job-schedule-cron objects (just keys) that were not deleted due to some error. If set to false, the list of job-schedule-cron objects not deleted will not be returned. Default: true
return-success-list		boolean optional	If set to true, the API will return the list of job-schedule-cron objects (just keys) that were successfully deleted. If set to false, the list of job-schedule-cron objects deleted will not be returned. Default: true
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the next-tag obtained from the previous call.

Output Name	Range	Type	Description
		job-	

failure-list		schedule-cron-destroy-iter-info[] optional	Information about job-schedule-cron objects that were not deleted due to some error. This element will be returned only if input element 'return-failure-list' is true.
next-tag		string optional	Tag for the next call. Not present when there are no more matching job-schedule-cron objects to be deleted.
num-failed	**[0..2^32-1]**	integer optional	Number of job-schedule-cron objects that matched the query, but were not deleted due to some error.
num-succeeded	**[0..2^32-1]**	integer optional	The number of job-schedule-cron objects that matched the query and were successfully deleted.
success-list		job-schedule-cron-destroy-iter-info[] optional	The job-schedule-cron objects that were successfully deleted. This element will be returned only if input element 'return-success-list' is true

Errno	Description
EINTERNALERROR	

job-schedule-cron-get

[top]

Get a single cron job schedule entry.

Input Name	Range	Type	Description
desired-attributes		job-schedule-cron-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified.
job-schedule-name		string	The name of the job schedule.

Output Name	Range	Type	Description
attributes		job-schedule-cron-info	The attributes of the job-schedule-cron.

Errno	Description
EINTERNALERROR	

job-stop

[top]

Stop a job. A job must be of a type that has job-type-is-quittable set to true before it may be stopped. job-stop attempts to stop a job that's currently running. If the job allows itself to stop it completes its current run. If the job has a recurring schedule it will transition to the Queued state; otherwise it will transition into either the Success or Failure state.

Input Name	Range	Type	Description
job-id	**[0..2^64-1]**	integer	The job id.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

job-stop-iter

Job Manager cron scheduling minute. -1 represents all minutes and only supported for cron schedule create and modify. Range : [-1..59].

[none]

Element definition: **cron-month**

[top]

Job Manager cron scheduling month. -1 represents all months and only supported for cron schedule create and modify. Range : [-1..11].

[none]

Element definition: **job-history-info**

[top]

Job history log event When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
job-completion		string optional	Human-readable job completion message. Attributes: non-creatable, non-modifiable
job-description		string optional	Job description. Attributes: non-creatable, non-modifiable
job-end-time	**[0..2^31-1]**	integer optional	When the job last completed. The time value is in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable
job-event-time	**[0..2^31-1]**	integer optional	The time when this event was logged. The time value is in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable
job-event-type		job-event-type optional	The type of this history event. Attributes: non-creatable, non-modifiable Possible values: • "idle" - The job has become idle, • "running" - The job has started running, • "succeeded" - The job has completed successfully, • "failed" - The job has completed with a failure, • "paused" - The job has been paused, • "stopped" - The job has been stopped, • "deleted" - The job has been deleted, • "error" - Job Manager experienced an error while processing the job
job-id	**[0..2^64-1]**	integer optional	The identifier associated with this job by the Job Manager. This identifier is unique within a cluster. The 'job-history-get-iter' API can return multiple records for a given job identifier because it logs the state transitions that the job has been through. Records in the 'job-history-get-iter' API are returned in reverse chronological order. Attributes: non-creatable, non-modifiable
job-	**[0..2^64-**	integer	The error code, if any, that the Job Manager associated with this

manager-error-code	**1]**	optional	event. If set, 'job-error-text' will contain human-readable information about the error. Attributes: non-creatable, non-modifiable
job-manager-error-text		string optional	The human-readable text for the error code, if any, that the Job Manager associated with this event. Attributes: non-creatable, non-modifiable
job-name		string optional	Name of the job. Attributes: non-creatable, non-modifiable
job-node		node-name optional	The name of the node where the job ran, or the node that changed the job's state. Attributes: key, non-creatable, non-modifiable
job-progress		string optional	Human-readable job progress message. Attributes: non-creatable, non-modifiable
job-start-time	**[0..2^31-1]**	integer optional	When the job last started. The time value is in seconds since January 1, 1970. Attributes: non-creatable, non-modifiable
job-status-code	**[0..2^64-1]**	integer optional	Status code. Value other than 0 indicates an error in the job execution, in which case 'job-completion' will contain human-readable information about the error. Attributes: non-creatable, non-modifiable
job-username		string optional	The name of the user that created the job. Attributes: non-creatable, non-modifiable
job-uuid		uuid optional	Job's universally unique identifier (UUID). Attributes: non-creatable, non-modifiable
job-vserver		job-history-vserver-name optional	Vserver from which the job was created. Attributes: key, non-creatable, non-modifiable
log-id	**[0..2^64-1]**	integer optional	The internal identifier of this job history event. Attributes: key, non-creatable, non-modifiable

Element definition: **job-info**

[top]

Contains information about a specific job When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-restarted		boolean optional	Restarted? Attributes: non-creatable, non-modifiable
job-category		string optional	Job Category Attributes: non-creatable, non-modifiable
job-completion		string optional	Completion String Attributes: non-creatable, non-modifiable
job-description		string optional	Description Attributes: non-creatable, non-modifiable
job-dropdead-time	**[0..2^31-1]**	integer optional	Drop-dead Time Attributes: non-creatable, non-modifiable

job-end-time	**[0..2^31-1]**	integer optional	End Time Attributes: non-creatable, non-modifiable
job-id	**[0..2^64-1]**	integer optional	Job ID Attributes: key, non-creatable, non-modifiable
job-name		string optional	Name Attributes: non-creatable, non-modifiable
job-node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
job-priority		job-priority optional	Priority Attributes: non-creatable, non-modifiable Possible values: • "low" , • "medium" , • "high" , • "exclusive"
job-progress		string optional	Execution Progress Attributes: non-creatable, non-modifiable
job-queue-time	**[0..2^31-1]**	integer optional	Queue Time Attributes: non-creatable, non-modifiable
job-schedule		string optional	Schedule Attributes: non-creatable, non-modifiable
job-start-time	**[0..2^31-1]**	integer optional	Start Time Attributes: non-creatable, non-modifiable
job-state		job-state optional	State Attributes: non-creatable, non-modifiable Possible values: • "initial" - Initializing, • "queued" - Queued, • "running" - Running, • "waiting" - Waiting For Another Job, • "pausing" - Entering Paused State, • "paused" - Paused, • "quitting" - Entering Quit State, • "success" - Succeeded, • "failure" - Failed, • "reschedule" - Forcing Reschedule, • "error" - Internal Error, • "quit" - Quit, • "dead" - Died, • "unknown" - Unknown, • "restart" - Forcing Restart, • "dormant" - Waiting For External Event
job-status-code	**[0..2^64-1]**	integer optional	Status Code Attributes: non-creatable, non-modifiable
job-type		string optional	Job Type Attributes: non-creatable, non-modifiable
job-username		string optional	User Name Attributes: non-creatable, non-modifiable
job-uuid		uuid optional	UUID Attributes: non-creatable, non-modifiable
job-vserver		vserver-name optional	Owning Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **job-pause-iter-info**

[top]

Information about the operation that was attempted/performed against job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-key		job-info	The keys for the job object to which the operation applies.

Element definition: **job-private-pause-iter-info**

[top]

Information about the operation that was attempted/performed against private job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-private-key		job-info	The keys for the private job object to which the operation applies.

Element definition: **job-private-resume-iter-info**

[top]

Information about the operation that was attempted/performed against private job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-private-key		job-info	The keys for the private job object to which the operation applies.

Element definition: **job-private-soft-pause-iter-info**

[top]

Information about the operation that was attempted/performed against private job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.

error-message		string optional	Error description, if the operation caused an error.
job-private-key		job-info	The keys for the private job object to which the operation applies.

Element definition: **job-private-stop-iter-info** [top]

Information about the operation that was attempted/performed against private job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-private-key		job-info	The keys for the private job object to which the operation applies.

Element definition: **job-queue-config-info** [top]

Contains configuration detail information about the job queue. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
job-queue-config-jobs-per-type-threshold	**[0..100]**	integer optional	Threshold for accepted jobs per type. Attributes: non-creatable, modifiable
job-queue-config-queue-size-limit	**[0..2^32-1]**	integer optional	Job queue size limit. Attributes: non-creatable, modifiable
job-queue-config-warning-threshold	**[0..100]**	integer optional	Warning threshold for total number of jobs. Attributes: non-creatable, modifiable

Element definition: **job-resume-iter-info** [top]

Information about the operation that was attempted/performed against job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
		string	

error-message		optional	Error description, if the operation caused an error.
job-key		job-info	The keys for the job object to which the operation applies.

Element definition: **job-schedule-cron-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against job-schedule-cron object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-schedule-cron-key		job-schedule-cron-info	The keys for the job-schedule-cron object to which the deletion applies.

Element definition: **job-schedule-cron-info**

[top]

Contains detail information about cron job schedules. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified. Attributes: key, optional-for-create, non-modifiable
job-schedule-cron-day		cron-day-of-month[] optional	The day(s) of the month when the job should be run. Attributes: optional-for-create, modifiable
job-schedule-cron-day-of-week		cron-day-of-week[] optional	The day(s) in the week when the job should be run. Attributes: optional-for-create, modifiable
job-schedule-cron-hour		cron-hour[] optional	The hour(s) of the day when the job should be run. Attributes: optional-for-create, modifiable
job-schedule-cron-minute		cron-minute[] optional	The minute(s) of each hour when the job should be run. Attributes: required-for-create, modifiable
job-schedule-		cron-month[]	The month(s) when the job should be run. Attributes: optional-for-create, modifiable

cron-month		optional	
job-schedule-description		string optional	The description of the job schedule. Attributes: non-creatable, non-modifiable
job-schedule-name		string optional	The name of the job schedule. Attributes: key, required-for-create, non-modifiable

Element definition: **job-schedule-info**

[top]

Contains overview information about a single job schedule. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified. Attributes: key, optional-for-create, non-modifiable
job-schedule-description		string optional	The description of the job schedule. Attributes: non-creatable, non-modifiable
job-schedule-name		string optional	The name of the job schedule. Attributes: key, required-for-create, non-modifiable
job-schedule-type		schedule-type optional	The type of job schedule. Attributes: non-creatable, non-modifiable Possible values: • "cron" , • "interval" , • "builtin" , • "unknown"

Element definition: **job-schedule-interval-destroy-iter-info**

[top]

Information about the deletion operation that was attempted/performed against job-schedule-interval object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the deletion operation caused an error.
error-message		string optional	Error description, if the operation caused an error.

job-schedule-interval-key		job-schedule-interval-info	The keys for the job-schedule-interval object to which the deletion applies.

Element definition: **job-schedule-interval-info**

[top]

Contains detail information about interval job schedules. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
job-schedule-cluster		cluster-name optional	The cluster owner of the job schedule. Defaults to the local cluster. In a Metrocluster configuration, the partner cluster can be specified. Attributes: key, optional-for-create, non-modifiable
job-schedule-description		string optional	The description of the job schedule. Attributes: non-creatable, non-modifiable
job-schedule-interval-days	**[0..2^32-1]**	integer optional	The number of days between jobs. Attributes: optional-for-create, modifiable
job-schedule-interval-hours	**[0..2^32-1]**	integer optional	The number of hours between jobs. Attributes: optional-for-create, modifiable
job-schedule-interval-minutes	**[0..2^32-1]**	integer optional	The number of minutes between jobs. Attributes: optional-for-create, modifiable
job-schedule-interval-seconds	**[0..2^32-1]**	integer optional	The number of seconds between jobs. Attributes: optional-for-create, modifiable
job-schedule-name		string optional	The name of the job schedule. Attributes: key, required-for-create, non-modifiable

Element definition: **job-soft-pause-iter-info**

[top]

Information about the operation that was attempted/performed against job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.

error-message		string optional	Error description, if the operation caused an error.
job-key		job-info	The keys for the job object to which the operation applies.

Element definition: **job-stop-iter-info**

[top]

Information about the operation that was attempted/performed against job object.

Name	Range	Type	Description
error-code	**[0..2^32-1]**	integer optional	Error code, if the operation caused an error.
error-message		string optional	Error description, if the operation caused an error.
job-key		job-info	The keys for the job object to which the operation applies.

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **cluster-name**

[top]

Name of the Peer Cluster

[none]

Element definition: **cron-day-of-month**

[top]

Job Manager cron scheduling day of month. -1 represents all days of a month from 1 to 31, and only supported for cron schedule create and modify. Range : [-1..31].

[none]

Element definition: **cron-day-of-week**

[top]

Job Manager cron scheduling day of week. Zero represents Sunday. -1 represents all days of a week and only supported for cron schedule create and modify. Range : [-1..6].

[none]

Element definition: **cron-hour**

[top]

Job Manager cron scheduling hour. -1 represents all hours and only supported for cron schedule create and modify. Range : [-1..23].

[none]

Element definition: **cron-minute**

[top]

Job Manager cron scheduling minute. -1 represents all minutes and only supported for cron schedule create and modify. Range : [-1..59].

[none]

Element definition: **cron-month**

[top]

Job Manager cron scheduling month. -1 represents all months and only supported for cron schedule create and modify. Range : [-1..11].

[none]

Element definition: **job-event-type**

[top]

Jobs will trigger history events at certain stages of their life cycle. These events are of the types described herein. Possible values:

- "idle" - The job has become idle,
- "running" - The job has started running,
- "succeeded" - The job has completed successfully,
- "failed" - The job has completed with a failure,
- "paused" - The job has been paused,
- "stopped" - The job has been stopped,
- "deleted" - The job has been deleted,
- "error" - Job Manager experienced an error while processing the job

[none]

Element definition: **job-history-vserver-name**

[top]

The name of the Vserver.

[none]

Element definition: **job-info**

[top]

Contains information about a specific job When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
is-restarted		boolean optional	Restarted? Attributes: non-creatable, non-modifiable
job-category		string optional	Job Category Attributes: non-creatable, non-modifiable
job-completion		string optional	Completion String Attributes: non-creatable, non-modifiable
job-description		string optional	Description Attributes: non-creatable, non-modifiable
job-dropdead-time	**[0..2^31-1]**	integer optional	Drop-dead Time Attributes: non-creatable, non-modifiable
job-end-time	**[0..2^31-1]**	integer optional	End Time Attributes: non-creatable, non-modifiable
job-id	**[0..2^64-1]**	integer optional	Job ID Attributes: key, non-creatable, non-modifiable
job-name		string optional	Name Attributes: non-creatable, non-modifiable
job-node		node-name optional	Node Attributes: key, non-creatable, non-modifiable
job-priority		job-priority optional	Priority Attributes: non-creatable, non-modifiable Possible values: • "low" , • "medium" , • "high" , • "exclusive"
job-progress		string optional	Execution Progress Attributes: non-creatable, non-modifiable
job-queue-time	**[0..2^31-1]**	integer optional	Queue Time Attributes: non-creatable, non-modifiable
job-schedule		string optional	Schedule Attributes: non-creatable, non-modifiable
job-start-time	**[0..2^31-1]**	integer optional	Start Time Attributes: non-creatable, non-modifiable
			State Attributes: non-creatable, non-modifiable Possible values:

job-state		job-state optional	• "initial" - Initializing, • "queued" - Queued, • "running" - Running, • "waiting" - Waiting For Another Job, • "pausing" - Entering Paused State, • "paused" - Paused, • "quitting" - Entering Quit State, • "success" - Succeeded, • "failure" - Failed, • "reschedule" - Forcing Reschedule, • "error" - Internal Error, • "quit" - Quit, • "dead" - Died, • "unknown" - Unknown, • "restart" - Forcing Restart, • "dormant" - Waiting For External Event
job-status-code	**[0..2^64-1]**	integer optional	Status Code Attributes: non-creatable, non-modifiable
job-type		string optional	Job Type Attributes: non-creatable, non-modifiable
job-username		string optional	User Name Attributes: non-creatable, non-modifiable
job-uuid		uuid optional	UUID Attributes: non-creatable, non-modifiable
job-vserver		vserver-name optional	Owning Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **job-priority**

[top]

Execution priority of a job. There are thread pools for each priority level. Higher priority jobs may run in the pools of lower priorities. So High-priority jobs may run in the High, Medium or Low thread pools, Medium-priority jobs may run in the Medium or Low thread pools and Low-priority jobs may only run in the Low thread pool. The exception to this is Exclusive jobs: Exclusive-priority jobs will only run in the Exclusive thread pool and only Exclusive-priority jobs will be run in the Exclusive thread pool. Possible values:

- "low" ,
- "medium" ,
- "high" ,
- "exclusive"

[none]

Element definition: **job-state**

[top]

Jobs execute as self-contained state machines. They follow a series of careful steps from creation to destruction. These steps are dictated by the states that they find themselves in as well as the allowable list of states they may transition into. The state can be an indicator of whether a job is executing and if not, why that is the case. Possible values:

- "initial" - Initializing,
- "queued" - Queued,
- "running" - Running,
- "waiting" - Waiting For Another Job,
- "pausing" - Entering Paused State,
- "paused" - Paused,
- "quitting" - Entering Quit State,
- "success" - Succeeded,
- "failure" - Failed,
- "reschedule" - Forcing Reschedule,
- "error" - Internal Error,
- "quit" - Quit,
- "dead" - Died,
- "unknown" - Unknown,
- "restart" - Forcing Restart,
- "dormant" - Waiting For External Event

[none]

Element definition: **node-name**

[top]

The node's name

[none]

Element definition: **schedule-type**

[top]

Jobs may be scheduled according to one of three major styles: 'cron' is for jobs that should be run at a specific time or well-defined calendar date; 'interval' is for jobs that should be run on a regular period; 'builtin' is for jobs that should be run according to internal rules. Of these 'cron' and 'interval' may be customized. Possible values:

- "cron" ,
- "interval" ,
- "builtin" ,
- "unknown"

[none]

Element definition: **uuid**

[top]

The 128-bit universally-unique identifier (UUID).

UUIDs are formatted as 36-character strings. These strings are composed of 32 hexadecimal characters broken up into five groupings separated by '-'s.The first grouping has 8 hex characters, the second through fourth groupings have four hex characters each, and the fifth and final grouping has 12 hex characters. Note that a leading '0x' is not used.

[none]

Element definition: **vserver-name**

[top]

The name of the Vserver.

[none]

APIs in Category: **kerberos**

kerberos-config-get
kerberos-config-get-iter
kerberos-config-modify
kerberos-realm-create
kerberos-realm-delete
kerberos-realm-get-iter
kerberos-realm-modify

This set of ZAPIs allows Kerberos realm configuration and management.

kerberos-config-get

[top]

Get Kerberos configuration information for a LIF.

Input Name	Range	Type	Description
desired-attributes		kerberos-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
interface-name		string	Logical interface.

Output Name	Range	Type	Description
attributes		kerberos-config-info	The attributes of the kerberos-config.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

kerberos-config-get-iter

[top]

Get Kerberos configuration information for a group of LIFs.

Input Name	Range	Type	Description
desired-attributes		kerberos-config-info optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 50
query		kerberos-config-	A query that specifies which objects to return. A query could be specified on any number of attributes in the kerberos-config

		info optional	object. All kerberos-config objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		kerberos-config-info[] optional	The list of attributes of kerberos-config objects.
next-tag		string optional	Tag for the next call. Not present when there are no more kerberos-config objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

kerberos-config-modify

[top]

Modify Kerberos configuration information for a LIF

Input Name	Range	Type	Description
admin-password		string optional	Administrator password.
admin-user-name		string optional	Administrator username.
force		boolean optional	Force option to disable Kerberos security on a LIF (default:false). If set to true, any errors encountered when deleting the corresponding account on the KDC are ignored in which case the account should be deleted manually.
interface-name		string	Logical interface.
is-kerberos-enabled		boolean optional	If 'true', then kerberos security is enabled.
keytab-uri		string optional	Keytab to load the uri from.
machine-account		string optional	Machine Account Name.
organizational-unit		string optional	Organizational Unit.
service-principal-name		string optional	Kerberos service principal name.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_CANT_SHARE_AD_KERBEROS_ACCOUNT	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

kerberos-realm-create

[top]

Create a new Kerberos realm configuration.

In Data ONTAP 8.2.x and prior versions, Kerberos realms were owned by Cserver and were accessible only from Admin Vserver LIFs using the input 'config-name'. The 'vserver' input was not required.

Starting from Data ONTAP 8.3.0, Kerberos realms are owned by data Vservers and are accessible from both Admin and data Vserver LIFs. The 'config-name' input can no longer be used as a key. The 'realm' input must be used instead. The 'vserver' input is required.

Input Name	Range	Type	Description
ad-server-ip		ip-address optional	IP Address of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft'.
ad-server-name		string optional	Host name of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft'
admin-server-ip		ip-address optional	IP address of the host where the Kerberos administration daemon is running. This is usually the master KDC. If this parameter is omitted, the IP address specified in kdc-ip is used. If specified, this should be the same as the kdc-ip if the kdc-vendor is 'microsoft'.
admin-server-port		integer optional	The TCP port on the Kerberos administration server where the Kerberos administration service is running. The default for this parmater is 749.
clock-skew		integer optional	The clock skew in minutes is the tolerance for accepting tickets with time stamps that do not exactly match the host's system clock. The default for this parameter is 5 minutes.
comment		string optional	Comment
config-name		string optional	Kerberos configuration name.
kdc-ip		ip-address	IP address of the Key Distribution Centre (KDC) server for this Kerberos realm.
kdc-port		integer optional	TCP port on the KDC to be used for Kerberos communication. The default for this parameter is 88.
kdc-vendor		kdc-vendor	The vendor of the Key Distribution Centre (KDC) server. If the configuration uses a Microsoft Active Directory (AD) domain for authentication, this field should be 'microsoft'.
password-server-ip		ip-address optional	IP address of the host where the Kerberos password-changing server is running. Typically, this is the same as the host indicated in the adminserver-ip. If this parameter is omitted, the IP address in kdc-ip is used.
password-server-port		integer optional	The TCP port on the Kerberos password-changing server where the Kerberos password-changing service is running. The default for this parameter is 464.
realm		string	Kerberos realm name.

Errno	Description
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

kerberos-realm-delete

[top]

Delete the Kerberos realm configuration.

In Data ONTAP 8.2.x and prior versions, Kerberos realms were owned by Cserver and were accessible only from Admin Vserver LIFs using the input 'config-name'. The 'vserver' input was not required.

Starting from Data ONTAP 8.3.0, Kerberos realms are owned by data Vservers and are accessible from both Admin and data Vserver LIFs. The 'config-name' input can no longer be used as a key. The 'realm' input must be used instead. The 'vserver' input is required.

Input Name	Range	Type	Description
config-name		string optional	Kerberos configuration name.
realm		string optional	Kerberos realm name.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

kerberos-realm-get-iter

[top]

Retrieve the list of Kerberos realm configurations.

Input Name	Range	Type	Description
desired-attributes		kerberos-realm optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		kerberos-realm optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the kerberos-realm object. All kerberos-realm objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		kerberos-realm[] optional	The list of attributes of kerberos-realm objects.
next-tag		string optional	Tag for the next call. Not present when there are no more kerberos-realm objects to return.
num-records	**[0..2^32-**	integer	The number of records returned in this call.

	1]		

Errno	Description
EINTERNALERROR	

kerberos-realm-modify

[top]

Modify the Kerberos realm configuration.

In Data ONTAP 8.2.x and prior versions, Kerberos realms were owned by Cserver and were accessible only from Admin Vserver LIFs using the input 'config-name'. The 'vserver' input was not required.

Starting from Data ONTAP 8.3.0, Kerberos realms are owned by data Vservers and are accessible from both Admin and data Vserver LIFs. The 'config-name' input can no longer be used as a key. The 'realm' input must be used instead. The 'vserver' input is required.

Input Name	Range	Type	Description
ad-server-ip		ip-address optional	IP Address of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft'.
ad-server-name		string optional	Host name of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft'
admin-server-ip		ip-address optional	IP address of the host where the Kerberos administration daemon is running. This is usually the master KDC. If this parameter is omitted, the IP address specified in kdc-ip is used. If specified, this should be the same as the kdc-ip if the kdc-vendor is 'microsoft'.
admin-server-port		integer optional	The TCP port on the Kerberos administration server where the Kerberos administration service is running. The default for this parmater is 749.
clock-skew		integer optional	The clock skew in minutes is the tolerance for accepting tickets with time stamps that do not exactly match the host's system clock. The default for this parameter is 5 minutes.
comment		string optional	Comment
config-name		string optional	Kerberos configuration name.
kdc-ip		ip-address optional	IP address of the Key Distribution Centre (KDC) server for this Kerberos realm.
kdc-port		integer optional	TCP port on the KDC to be used for Kerberos communication. The default for this parameter is 88.
kdc-vendor		kdc-vendor optional	The vendor of the Key Distribution Centre (KDC) server. If the configuration uses a Microsoft Active Directory (AD) domain for authentication, this field should be 'microsoft'.
password-server-ip		ip-address optional	IP address of the host where the Kerberos password-changing server is running. Typically, this is the same as the host indicated in the adminserver-ip. If this parameter is omitted, the IP address in kdc-ip is used.
password-server-port		integer optional	The TCP port on the Kerberos password-changing server where the Kerberos password-changing service is running. The default for this parameter is 464.
realm		string optional	Kerberos realm name.

EVSERVER_OPERATION_NOT_PERMITTED	

Element definition: **ip-address**

[top]

IPv4 and IPv6 address

[none]

Element definition: **kdc-vendor**

[top]

Kerberos Key Distribution Center (KDC) Vendor Possible values:

- "microsoft" ,
- "other"

[none]

Element definition: **kerberos-config-info**

[top]

Kerberos configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
admin-password		string optional	Administrator password for the Key Distribution Center. This is a required input. Attributes: non-creatable, modifiable
admin-user-name		string optional	Administrator username for the Key Distribution Center. This is a required input. Attributes: non-creatable, modifiable
force		boolean optional	Force option to disable Kerberos security on a LIF (default:false). If set to true, any errors encountered when deleting the corresponding account on the KDC are ignored in which case the account should be deleted manually. Attributes: non-creatable, modifiable
interface-name		string optional	Logical interface. Attributes: key, non-creatable, non-modifiable

ip-address		string optional	Logical interface IP address. Attributes: non-creatable, non-modifiable
is-kerberos-enabled		boolean optional	This is a required input. If 'true', Kerberos security is enabled by creating an account in the Key Distribution Center using the Service Principal Name. If another logical interface uses the same Service Principal Name, the account is shared. If 'false', Kerberos security is disabled and the associated account is deleted when it is not used by any logical interface. Attributes: non-creatable, modifiable
keytab-uri		string optional	Load Keytab from URI. This field should not be specified when disabling Kerberos. Attributes: non-creatable, modifiable
machine-account		string optional	Machine Account Name. Attributes: non-creatable, modifiable
organizational-unit		string optional	Organization Unit. This option is available for a Microsoft AD KDC only. Attributes: non-creatable, modifiable
permitted-enc-types		string[] optional	Permitted encryption types in the Vserver. Attributes: non-creatable, non-modifiable
service-principal-name		string optional	Kerberos service principal name. This is a required input for enabling Kerberos. This input should not be specified when disabling Kerberos. Attributes: non-creatable, modifiable
vserver		string optional	Vserver name. Attributes: key, non-creatable, non-modifiable

Element definition: **kerberos-realm**

[top]

Kerberos realm configuration specifies the locations of Key Distribution Center (KDC) servers and administration daemons for the Kerberos realms of interest. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ad-server-ip		ip-address optional	IP Address of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft'. Attributes: optional-for-create, modifiable
ad-server-name		string optional	Host name of the Active Directory Domain Controller (DC). This is a mandatory parameter if the kdc-vendor is 'microsoft' Attributes: optional-for-create, modifiable
admin-server-ip		ip-address optional	IP address of the host where the Kerberos administration daemon is running. This is usually the master KDC. If this parameter is omitted, the IP address specified in kdc-ip is used. If specified, this should be the same as the kdc-ip if the kdc-vendor is 'microsoft'. ldap-check-get-iter

[top]

Display the status of an LDAP configuration

Input Name	Range	Type	Description
desired-attributes		ldap-status optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ldap-status optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ldap-client-check object. All ldap-client-check objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ldap-status[] optional	The list of attributes of ldap-client-check objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ldap-client-check objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

ldap-client-create

[top]

Create a new Lightweight Directory Access Protocol (LDAP) client configuration for the cluster.

Input Name	Range	Type	Description
ad-domain		string optional	The Active Directory Domain Name for this LDAP configuration. The option is ONLY applicable for configurations using Active Directory LDAP servers.
base-dn		ldap-dn optional	Indicates the starting point for searches within the LDAP directory tree. If omitted, searches will start at the root of the directory tree.
base-scope		ldap-search-scope optional	This indicates the scope for LDAP search. If omitted, this parameter defaults to 'subtree'. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
bind-as-cifs-server		boolean optional	If set, the cluster will use the CIFS server's credentials to bind to the LDAP server. If omitted, this parameter defaults to 'true' if the configuration uses Active Directory LDAP and defaults to 'false' otherwise.
bind-dn		ldap-dn optional	The Bind Distinguished Name (DN) is the LDAP identity used during the authentication process by the clients. This is required if the LDAP server does not support anonymous binds. This field is not used if 'bind-as-cfs-server' is set to 'true'. Example : cn=username,cn=Users,dc=example,dc=com
bind-password		string optional	The password to be used with the bind-dn.
group-dn		ldap-dn optional	The Group Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for group lookups. If not specified, group lookups will start at the base-dn.
group-membership-filter		string optional	This indicates the custom filter to be used while looking up group membership from an LDAP server.
group-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing group lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates

is-netgroup-byhost-enabled		boolean optional	This indicates whether netgroup.byhost map should be queried for lookups.
ldap-client-config		string	The name of the LDAP client configuration.
ldap-servers		string[] optional	List of LDAP Servers to use for this configuration. The option is NOT applicable for configurations using ad-domain parameter.
ldaps-enabled		boolean optional	Indicates whether LDAPS is enabled or not.
min-bind-level		ldap-auth-method optional	The minimum authentication level that can be used to authenticate with the LDAP server. If omitted, this parameter defaults to 'sasl' if the configuration uses Active Directory LDAP. For configurations that use LDAP servers from other vendors, this parameter defaults to 'simple' if a 'bind-dn' is specified and 'anonymous' otherwise. Possible values: • "anonymous" - Anonymous bind, • "simple" - Simple bind, • "sasl" - Simple Authentication and Security Layer (SASL) bind
netgroup-byhost-dn		ldap-dn optional	The Netgroup Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for netgroup byhost lookups. If not specified, netgroup byhost lookups will start at the base-dn.
netgroup-byhost-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing netgroup byhost lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
netgroup-dn		ldap-dn optional	The Netgroup Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for netgroup lookups. If not specified, netgroup lookups will start at the base-dn.
netgroup-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing netgroup lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
obs-password		hex-string optional	Encrypted Password
preferred-ad-servers		ip-address[] optional	Preferred Active Directory (AD) Domain controllers to use for this configuration. This option is ONLY applicable for configurations using Active Directory LDAP servers
query-timeout	**[0..10]**	integer optional	Maximum time in seconds to wait for a query response from the LDAP server. The default for this parameter is 3 seconds.
referral-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for LDAP referral chasing for this Vserver.
return-		boolean	If set to true, returns the ldap-client on successful creation.

record		optional	Default: false
schema		string	LDAP schema to use for this configuration. The list of possible schemas can be obtained using the ldap-client-schema-get-iter API.
servers		ip-address[] optional	(DEPRECATED)-List of LDAP Server IP addresses to use for this configuration. The option is NOT applicable for configurations using Active Directory LDAP servers.
session-security		ldap-security optional	This indicates the level of security for LDAP communications. By default this option is none. Possible values: • "none" - No Signing or Sealing., • "sign" - Sign LDAP traffic., • "seal" - Seal and Sign LDAP traffic
tcp-port	**[1..65535]**	integer optional	The TCP port on the LDAP server to use for this configuration. If omitted, this parameter defaults to 389.
try-channel-binding		boolean optional	This indicates whether channel binding will be tried in case of TLS/LDAPS.
use-start-tls		boolean optional	This indicates if start_tls will be used over LDAP connections.
user-dn		ldap-dn optional	The User Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for user lookups. If this parameter is omitted, user lookups will start at the base-dn.
user-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing user lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates

Output Name	Range	Type	Description
result		ldap-client optional	The ldap-client created (keys or the entire object if requested)

Errno	Description
EDUPLICATEENTRY	
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

ldap-client-delete

[top]

Delete an existing Lightweight Directory Access Protocol (LDAP) client configuration from the cluster.

Input Name	Range	Type	Description
ldap-client-config		string	The name of the LDAP client configuration.

Errno	Description
EOBJECTNOTFOUND	

EINTERNALERROR	

ldap-client-get-iter

[top]

Retrieve the list of Lightweight Directory Access Protocol (LDAP) client configurations for the cluster.

Input Name	Range	Type	Description
desired-attributes		ldap-client optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	[1..2^32-1]	integer optional	The maximum number of records to return in this call. Default: 20
query		ldap-client optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ldap-client object. All ldap-client objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ldap-client[] optional	The list of attributes of ldap-client objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ldap-client objects to return.

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

ldap-client-modify

[top]

Modify an existing Lightweight Directory Access Protocol (LDAP) client configuration.

Input Name	Range	Type	Description
ad-domain		string optional	The Active Directory Domain Name for this LDAP configuration. The option is ONLY applicable for configurations using Active Directory LDAP servers.
base-dn		ldap-dn optional	Indicates the starting point for searches within the LDAP directory tree. If omitted, searches will start at the root of the directory tree.
base-scope		ldap-search-	This indicates the scope for LDAP search. If omitted, this parameter defaults to 'subtree'. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the

		scope optional	base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
bind-as-cifs-server		boolean optional	If set, the cluster will use the CIFS server's credentials to bind to the LDAP server. If omitted, this parameter defaults to 'true' if the configuration uses Active Directory LDAP and defaults to 'false' otherwise.
bind-dn		ldap-dn optional	The Bind Distinguished Name (DN) is the LDAP identity used during the authentication process by the clients. This is required if the LDAP server does not support anonymous binds. This field is not used if 'bind-as-cfs-server' is set to 'true'. Example : cn=username,cn=Users,dc=example,dc=com
bind-password		string optional	The password to be used with the bind-dn.
group-dn		ldap-dn optional	The Group Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for group lookups. If not specified, group lookups will start at the base-dn.
group-membership-filter		string optional	This indicates the custom filter to be used while looking up group membership from an LDAP server.
group-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing group lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
is-netgroup-byhost-enabled		boolean optional	This indicates whether netgroup.byhost map should be queried for lookups.
ldap-client-config		string	The name of the LDAP client configuration.
ldap-servers		string[] optional	List of LDAP Servers to use for this configuration. The option is NOT applicable for configurations using ad-domain parameter.
ldaps-enabled		boolean optional	Indicates whether LDAPS is enabled or not.
min-bind-level		ldap-auth-method optional	The minimum authentication level that can be used to authenticate with the LDAP server. If omitted, this parameter defaults to 'sasl' if the configuration uses Active Directory LDAP. For configurations that use LDAP servers from other vendors, this parameter defaults to 'simple' if a 'bind-dn' is specified and 'anonymous' otherwise. Possible values: • "anonymous" - Anonymous bind, • "simple" - Simple bind, • "sasl" - Simple Authentication and Security Layer (SASL) bind
netgroup-byhost-dn		ldap-dn optional	The Netgroup Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for netgroup byhost lookups. If not specified, netgroup byhost lookups will start at the base-dn.
			This indicates the scope for LDAP search when doing netgroup byhost lookups. Possible values:

netgroup-byhost-scope		ldap-search-scope optional	• "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
netgroup-dn		ldap-dn optional	The Netgroup Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for netgroup lookups. If not specified, netgroup lookups will start at the base-dn.
netgroup-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing netgroup lookups. Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
obs-password		hex-string optional	Encrypted Password
preferred-ad-servers		ip-address[] optional	Preferred Active Directory (AD) Domain controllers to use for this configuration. This option is ONLY applicable for configurations using Active Directory LDAP servers
query-timeout	**[0..10]**	integer optional	Maximum time in seconds to wait for a query response from the LDAP server. The default for this parameter is 3 seconds.
referral-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for LDAP referral chasing for this Vserver.
schema		string optional	LDAP schema to use for this configuration. The list of possible schemas can be obtained using the ldap-client-schema-get-iter API.
servers		ip-address[] optional	(DEPRECATED)-List of LDAP Server IP addresses to use for this configuration. The option is NOT applicable for configurations using Active Directory LDAP servers.
session-security		ldap-security optional	This indicates the level of security for LDAP communications. By default this option is none. Possible values: • "none" - No Signing or Sealing., • "sign" - Sign LDAP traffic., • "seal" - Seal and Sign LDAP traffic
skip-config-validation		boolean optional	If true, validation of the the corresponding Lightweight Directory Access Protocol (LDAP) client configuration will be skipped.
tcp-port	**[1..65535]**	integer optional	The TCP port on the LDAP server to use for this configuration. If omitted, this parameter defaults to 389.
try-channel-binding		boolean optional	This indicates whether channel binding will be tried in case of TLS/LDAPS.
use-start-tls		boolean optional	This indicates if start_tls will be used over LDAP connections.
user-dn		ldap-dn optional	The User Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for user lookups. If this parameter is omitted, user lookups will start at the base-dn.
		ldap-search-	This indicates the scope for LDAP search when doing user lookups. Possible values: • "base" - Searches only the base directory entry,

user-scope		scope optional	"onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates

Errno	Description
E_CIFS_COMMAND_OPTION_NOT_SUPPORTED_IN_WORKGROUP_MODE	

ldap-client-schema-copy

[top]

Copy an existing LDAP schema. If the LDAP server that the storage system needs to query does not support any of the default read-only schemas, this API can be used to create an editable copy of an existing read-only schema. After copying the schema, the copy can be modified using the ldap-client-schema-modify API.

Input Name	Range	Type	Description
new-schema-name		string	New Schema Template Name
schema		string	A name for the schema.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ldap-client-schema-delete

[top]

Delete an existing Lightweight Directory Access Protocol (LDAP) schema configuration. Only the schemas that are defined using the ldap-client-schema-copy API can be deleted using this API.

Input Name	Range	Type	Description
schema		string	A name for the schema.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ldap-client-schema-get-iter

[top]

Retrieve the list of Lightweight Directory Access Protocol (LDAP) client schema configurations that are defined for the cluster.

Input Name	Range	Type	Description
desired-attributes		ldap-client-schema	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is

		optional	available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ldap-client-schema optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ldap-client-schema object. All ldap-client-schema objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ldap-client-schema[] optional	The list of attributes of ldap-client-schema objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ldap-client-schema objects to return.
num-records	**[0..2^32-1]**	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ldap-client-schema-modify

[top]

Modify an existing Lightweight Directory Access Protocol (LDAP) schema configuration. If the LDAP server that the storage system needs to query does not support any of the default read-only schemas, the ldap-client-schema-copy API can be used to create a editable copy of an existing read-only schema. After copying the schema, the copy can be modified using this API to support the target schema.

Input Name	Range	Type	Description
cn-group-attribute		string optional	Name that represents the RFC 2256 cn attribute used by RFC 2307 when working with groups.
cn-netgroup-attribute		string optional	Name that represents the RFC 2256 cn attribute used by RFC 2307 when working with netgroups.
comment		string optional	A comment that can be associated with the schema.
enable-rfc2307bis		boolean optional	This indicates if the RFC 2307bis is enabled for client schema.
gecos-attribute		string optional	Name that represents the RFC 2307 gecos attribute.
gid-number-attribute		string optional	Name that represents the RFC 2307 gidNumber attribute.
group-of-unique-names-object-class		string optional	Name that represents the RFC 2307bis groupOfUniqueNames object class.
home-directory-attribute		string optional	Name that represents the RFC 2307 homeDirectory attribute.
login-shell-attribute		string optional	Name that represents the RFC 2307 loginShell attribute.
member-nis-netgroup-		string	Name that represents the RFC 2307 memberNisNetgroup

attribute		optional	attribute.
member-uid-attribute		string optional	Name that represents the RFC 2307 memberUid attribute.
nis-mapentry-attribute		string optional	Name that represents the RFC 2307 nisMapEntry Attribute.
nis-mapname-attribute		string optional	Name that represents the RFC 2307 nisMapName Attribute.
nis-netgroup-object-class		string optional	Name that represents the RFC 2307 nisNetgroup object class.
nis-netgroup-triple-attribute		string optional	Name that represents the RFC 2307 nisNetgroupTriple attribute.
nis-object-class		string optional	Name that represents the RFC 2307 nisObject Object Class.
posix-account-object-class		string optional	Name that represents the RFC 2307 posixAccount object class.
posix-group-object-class		string optional	Name that represents the RFC 2307 posixGroup object class.
schema		string	A name for the schema.
uid-attribute		string optional	Name that represents the RFC 1274 userid attribute used by RFC 2307 as uid.
uid-number-attribute		string optional	Name that represents the RFC 2307 uidNumber attribute.
unique-member-attribute		string optional	Name that represents the RFC 2307bis uniqueMember attribute.
user-password-attribute		string optional	Name that represents the RFC 2256 userPassword attribute used by RFC 2307.
windows-account-attribute		string optional	Attribute name to be used to get the windows account information for a unix user account.
windows-to-unix-attribute		string optional	Attribute name to be used to get the unix account information for a windows user account.
windows-to-unix-no-domain-prefix		boolean optional	This indicates if the name for windows to unix name mapping should have no domain prefix.
windows-to-unix-object-class		string optional	Name that represents the windowsToUnix object class.

Errno	Description
EOBJECTNOTFOUND	
EINTERNALERROR	

ldap-config-create

[top]

Create a new association between a Lightweight Directory Access Protocol (LDAP) client configuration and a Vserver. A Vserver can have only one client configuration associated with it.

Input Name	Range	Type	Description
client-config		string	The name of an existing Lightweight Directory Access Protocol (LDAP) client configuration. The LDAP client configuration can be created using the ldap-client-create API. The ldap-client-get-iter API can be used to retrieve the list of available LDAP client configurations for the cluster.
client-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for this Vserver.

return-record		boolean optional	If set to true, returns the ldap-config on successful creation. Default: false
skip-config-validation		boolean optional	If true, validation of the the corresponding Lightweight Directory Access Protocol (LDAP) client configuration will be skipped.

Output Name	Range	Type	Description

ldap-config-get-iter

[top]

Retrieve the list of Lightweight Directory Access Protocol (LDAP) configurations in the cluster.

Input Name	Range	Type	Description
desired-attributes		ldap-config optional	Specify the attributes that should be returned. If not present, all attributes for which information is available will be returned. If present, only the desired attributes for which information is available will be returned.
max-records	**[1..2^32-1]**	integer optional	The maximum number of records to return in this call. Default: 20
query		ldap-config optional	A query that specifies which objects to return. A query could be specified on any number of attributes in the ldap-config object. All ldap-config objects matching this query up to 'max-records' will be returned.
tag		string optional	Specify the tag from the last call. It is usually not specified for the first call. For subsequent calls, copy values from the 'next-tag' obtained from the previous call.

Output Name	Range	Type	Description
attributes-list		ldap-config[] optional	The list of attributes of ldap-config objects.
next-tag		string optional	Tag for the next call. Not present when there are no more ldap-config objects to return.
num-records	[0..2^32-1]	integer	The number of records returned in this call.

Errno	Description
EINTERNALERROR	

ldap-config-modify

[top]

Modify the Lightweight Directory Access Protocol (LDAP) configuration for a Vserver.

Input Name	Range	Type	Description
client-config		string optional	The name of an existing Lightweight Directory Access Protocol (LDAP) client configuration. The LDAP client configuration can be created using the ldap-client-create API. The ldap-client-get-iter API can be used to retrieve the list of available LDAP client configurations for the cluster.
client-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for this Vserver.
skip-config-validation		boolean optional	If true, validation of the the corresponding Lightweight Directory Access Protocol (LDAP) client configuration will be skipped.

Errno	Description
E_LDAP_VSERVER_CONFIG_INVALID	
E_LDAP_CLIENT_DISABLED_NOT_SUPPORTED	
EVSERVER_LOCKED_FOR_BASELINE	
EVSERVER_OPERATION_NOT_PERMITTED	

Element definition: **hex-string**

[top]

The displays the hexadecimal value in string. Integer value 161 will be displayed as a1

[none]

Element definition: **ip-address**

IPv4 and IPv6 address

[none]

Element definition: **ldap-auth-method**

[top]

anonymous|simple|sasl Possible values:

- "anonymous" - Anonymous bind,
- "simple" - Simple bind,
- "sasl" - Simple Authentication and Security Layer (SASL) bind

[none]

Element definition: **ldap-client**

[top]

LDAP Client Information. Each entry specifies an LDAP client configuration that can be associated with a Vserver using the ldap-config-create API. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
ad-domain		string optional	The Active Directory Domain Name for this LDAP configuration. The option is ONLY applicable for configurations using Active Directory LDAP servers. Attributes: optional-for-create, modifiable
base-dn		ldap-dn optional	Indicates the starting point for searches within the LDAP directory tree. If omitted, searches will start at the root of the directory tree. Attributes: optional-for-create, modifiable
base-scope		ldap-search-scope optional	This indicates the scope for LDAP search. If omitted, this parameter defaults to 'subtree'. Attributes: optional-for-create, modifiable Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
bind-as-cifs-server		boolean optional	If set, the cluster will use the CIFS server's credentials to bind to the LDAP server. If omitted, this parameter defaults to 'true' if the configuration uses Active Directory LDAP and defaults to 'false' otherwise. Attributes: optional-for-create, modifiable
bind-dn		ldap-dn optional	The Bind Distinguished Name (DN) is the LDAP identity used during the authentication process by the clients. This is required if the LDAP server does not support anonymous binds. This field is not used if 'bind-as-cfs-server' is set to 'true'. Example : cn=username,cn=Users,dc=example,dc=com Attributes: optional-for-create, modifiable
bind-		string	The password to be used with the bind-dn. Attributes: optional-

password		optional	for-create, modifiable
group-dn		ldap-dn optional	The Group Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for group lookups. If not specified, group lookups will start at the base-dn. Attributes: optional-for-create, modifiable
group-membership-filter		string optional	This indicates the custom filter to be used while looking up group membership from an LDAP server. Attributes: optional-for-create, modifiable
group-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing group lookups. Attributes: optional-for-create, modifiable Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
is-netgroup-byhost-enabled		boolean optional	This indicates whether netgroup.byhost map should be queried for lookups. Attributes: optional-for-create, modifiable
is-owner		boolean optional	This indicates if the vserver owns the client configuration. Attributes: non-creatable, non-modifiable
ldap-client-config		string optional	The name of the LDAP client configuration. Attributes: key, required-for-create, non-modifiable
ldap-servers		string[] optional	List of LDAP Servers to use for this configuration. The option is NOT applicable for configurations using ad-domain parameter. Attributes: optional-for-create, modifiable
ldaps-enabled		boolean optional	Indicates whether LDAPS is enabled or not. Attributes: optional-for-create, modifiable
min-bind-level		ldap-auth-method optional	The minimum authentication level that can be used to authenticate with the LDAP server. If omitted, this parameter defaults to 'sasl' if the configuration uses Active Directory LDAP. For configurations that use LDAP servers from other vendors, this parameter defaults to 'simple' if a 'bind-dn' is specified and 'anonymous' otherwise. Attributes: optional-for-create, modifiable Possible values: • "anonymous" - Anonymous bind, • "simple" - Simple bind, • "sasl" - Simple Authentication and Security Layer (SASL) bind
netgroup-byhost-dn		ldap-dn optional	The Netgroup Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for netgroup byhost lookups. If not specified, netgroup byhost lookups will start at the base-dn. Attributes: optional-for-create, modifiable
netgroup-byhost-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing netgroup byhost lookups. Attributes: optional-for-create, modifiable Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
			The Netgroup Distinguished Name (DN), if specified, is used as

netgroup-dn		ldap-dn optional	the starting point in the LDAP directory tree for netgroup lookups. If not specified, netgroup lookups will start at the base-dn. Attributes: optional-for-create, modifiable
netgroup-scope		ldap-search-scope optional	This indicates the scope for LDAP search when doing netgroup lookups. Attributes: optional-for-create, modifiable Possible values: • "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
obs-password		hex-string optional	Encrypted Password Attributes: optional-for-create, modifiable
preferred-ad-servers		ip-address[] optional	Preferred Active Directory (AD) Domain controllers to use for this configuration. This option is ONLY applicable for configurations using Active Directory LDAP servers Attributes: optional-for-create, modifiable
query-timeout	**[0..10]**	integer optional	Maximum time in seconds to wait for a query response from the LDAP server. The default for this parameter is 3 seconds. Attributes: optional-for-create, modifiable
referral-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for LDAP referral chasing for this Vserver. Attributes: optional-for-create, modifiable
schema		string optional	LDAP schema to use for this configuration. The list of possible schemas can be obtained using the ldap-client-schema-get-iter API. Attributes: required-for-create, modifiable
servers		ip-address[] optional	(DEPRECATED)-List of LDAP Server IP addresses to use for this configuration. The option is NOT applicable for configurations using Active Directory LDAP servers. Attributes: optional-for-create, modifiable
session-security		ldap-security optional	This indicates the level of security for LDAP communications. By default this option is none. Attributes: optional-for-create, modifiable Possible values: • "none" - No Signing or Sealing., • "sign" - Sign LDAP traffic., • "seal" - Seal and Sign LDAP traffic
skip-config-validation		boolean optional	If true, validation of the the corresponding Lightweight Directory Access Protocol (LDAP) client configuration will be skipped. Attributes: non-creatable, modifiable
tcp-port	**[1..65535]**	integer optional	The TCP port on the LDAP server to use for this configuration. If omitted, this parameter defaults to 389. Attributes: optional-for-create, modifiable
try-channel-binding		boolean optional	This indicates whether channel binding will be tried in case of TLS/LDAPS. Attributes: optional-for-create, modifiable
use-start-tls		boolean optional	This indicates if start_tls will be used over LDAP connections. Attributes: optional-for-create, modifiable
user-dn		ldap-dn optional	The User Distinguished Name (DN), if specified, is used as the starting point in the LDAP directory tree for user lookups. If this parameter is omitted, user lookups will start at the base-dn. Attributes: optional-for-create, modifiable
			This indicates the scope for LDAP search when doing user lookups. Attributes: optional-for-create, modifiable Possible values:

user-scope		ldap-search-scope optional	• "base" - Searches only the base directory entry, • "onelevel" - Searches the immediate subordinates of the base directory entry, • "subtree" - Searches the base directory entry and all its subordinates
vserver		vserver-name-data-admin optional	Name of the Vserver. Attributes: key, non-creatable, non-modifiable

Element definition: **ldap-client-schema**

[top]

An LDAP Client Schema Definition. A schema definition is a way of defining what attribute names are to be used in LDAP queries to get information that the storage system needs for its operation. This will depend on the schema that the LDAP server supports. For example, to query for user account information, the LDAP query should ask for the 'posixAccount' class if the LDAP server is compatible with RFC-2307 and it should ask for 'User' class if the LDAP server is an Active Directory LDAP Server. The default LDAP configuration has two schemas defined namely 'RFC-2307' and 'AD-SFU'. The 'RFC-2307' schema is the default schema that should be used to query servers that support RFC-2307. The 'AD-SFU' schema is the default schema that should be used to query Active Directory LDAP servers. These schemas are read-only and cannot be modified. The default schemas will work with most common LDAP configurations. If it is required to support other schema configurations, 808 :existing schemas can be copied using the 'ldap-client-schema-copy' API and modified using the 'ldap-client-schema-modify' API to work for the new configuration. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
cn-group-attribute		string optional	Name that represents the RFC 2256 cn attribute used by RFC 2307 when working with groups. Attributes: optional-for-create, modifiable
cn-netgroup-attribute		string optional	Name that represents the RFC 2256 cn attribute used by RFC 2307 when working with netgroups. Attributes: optional-for-create, modifiable
comment		string optional	A comment that can be associated with the schema. Attributes: optional-for-create, modifiable
enable-rfc2307bis		boolean optional	This indicates if the RFC 2307bis is enabled for client schema. Attributes: optional-for-create, modifiable
gecos-attribute		string optional	Name that represents the RFC 2307 gecos attribute. Attributes: optional-for-create, modifiable
gid-number-attribute		string optional	Name that represents the RFC 2307 gidNumber attribute. Attributes: optional-for-create, modifiable
group-of-unique-names-object-class		string optional	Name that represents the RFC 2307bis groupOfUniqueNames object class. Attributes: optional-for-create, modifiable

home-directory-attribute		string optional	Name that represents the RFC 2307 homeDirectory attribute. Attributes: optional-for-create, modifiable
is-owner		boolean optional	This indicates if the vserver owns the client schema. Attributes: non-creatable, non-modifiable
login-shell-attribute		string optional	Name that represents the RFC 2307 loginShell attribute. Attributes: optional-for-create, modifiable
member-nis-netgroup-attribute		string optional	Name that represents the RFC 2307 memberNisNetgroup attribute. Attributes: optional-for-create, modifiable
member-uid-attribute		string optional	Name that represents the RFC 2307 memberUid attribute. Attributes: optional-for-create, modifiable
nis-mapentry-attribute		string optional	Name that represents the RFC 2307 nisMapEntry Attribute. Attributes: optional-for-create, modifiable
nis-mapname-attribute		string optional	Name that represents the RFC 2307 nisMapName Attribute. Attributes: optional-for-create, modifiable
nis-netgroup-object-class		string optional	Name that represents the RFC 2307 nisNetgroup object class. Attributes: optional-for-create, modifiable
nis-netgroup-triple-attribute		string optional	Name that represents the RFC 2307 nisNetgroupTriple attribute. Attributes: optional-for-create, modifiable
nis-object-class		string optional	Name that represents the RFC 2307 nisObject Object Class. Attributes: optional-for-create, modifiable
posix-account-object-class		string optional	Name that represents the RFC 2307 posixAccount object class. Attributes: optional-for-create, modifiable
posix-group-object-class		string optional	Name that represents the RFC 2307 posixGroup object class. Attributes: optional-for-create, modifiable
schema		string optional	A name for the schema. Attributes: key, required-for-create, non-modifiable
uid-attribute		string optional	Name that represents the RFC 1274 userid attribute used by RFC 2307 as uid. Attributes: optional-for-create, modifiable
uid-number-attribute		string optional	Name that represents the RFC 2307 uidNumber attribute. Attributes: optional-for-create, modifiable
unique-member-attribute		string optional	Name that represents the RFC 2307bis uniqueMember attribute. Attributes: optional-for-create, modifiable
user-password-attribute		string optional	Name that represents the RFC 2256 userPassword attribute used by RFC 2307. Attributes: optional-for-create, modifiable
vserver		vserver-name-data-admin optional	Vserver Attributes: key, non-creatable, non-modifiable
windows-account-attribute		string optional	Attribute name to be used to get the windows account information for a unix user account. Attributes: optional-for-create, modifiable
windows-to-unix-attribute		string optional	Attribute name to be used to get the unix account information for a windows user account. Attributes: optional-for-create, modifiable
windows-to-unix-no-domain-prefix		boolean optional	This indicates if the name for windows to unix name mapping should have no domain prefix. Attributes: optional-for-create, modifiable
windows-to-unix-object-class		string optional	Name that represents the windowsToUnix object class. Attributes: optional-for-create, modifiable

[top]

Element definition: **ldap-config**

Lightweight Directory Access Protocol (LDAP) configuration. Specifies the LDAP client configuration that is associated with this Vserver and whether the configuration is enabled. When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
client-config		string optional	The name of an existing Lightweight Directory Access Protocol (LDAP) client configuration. The LDAP client configuration can be created using the ldap-client-create API. The ldap-client-get-iter API can be used to retrieve the list of available LDAP client configurations for the cluster. Attributes: required-for-create, modifiable
client-enabled		boolean optional	If true, the corresponding Lightweight Directory Access Protocol (LDAP) configuration is enabled for this Vserver. Attributes: optional-for-create, modifiable
skip-config-validation		boolean optional	If true, validation of the the corresponding Lightweight Directory Access Protocol (LDAP) client configuration will be skipped. Attributes: optional-for-create, modifiable
vserver		vserver-name-data-admin optional	Vserver Attributes: key, non-creatable, non-modifiable

Element definition: **ldap-search-scope**

[top]

base|onelevel|subtree Possible values:

- "base" - Searches only the base directory entry,
- "onelevel" - Searches the immediate subordinates of the base directory entry,
- "subtree" - Searches the base directory entry and all its subordinates

[none]

Element definition: **ldap-security**

[top]

The list of possible values for LDAP Security. Possible values:

- "none" - No Signing or Sealing.
- "sign" - Sign LDAP traffic.
- "seal" - Seal and Sign LDAP traffic.

[none]

Element definition: **ldap-status**

[top]

LDAP Configuration Check When returned as part of the output, all elements of this typedef are reported, unless otherwise stated in the elementâ€™s description or limited by a set of desired attributes specified by the caller.

When used as input to specify desired attributes to return, omitting a given element indicates that it shall not be returned in the output. In contrast, by providing an element (even with no value) the caller ensures that a value for that element will be returned, given that the value can be retrieved.

When used as input to specify queries, any element can be omitted in which case the resulting set of objects is not constrained by any specific value of that attribute.

Name	Range	Type	Description
client-config		string optional	Specifies the LDAP Client configuration for the Vserver Attributes: non-creatable, non-modifiable
ldap-dn-status-details		string[] optional	Specifies additional information about the status of a LDAP DN config. Attributes: non-creatable, non-modifiable
ldap-status		boolean optional	Specifies the status of a LDAP service. Attributes: non-creatable, non-modifiable
ldap-status-details		string optional	Specifies additional information about the status of a LDAP config. Attributes: non-creatable, non-modifiable
vserver		string optional	Specifies the Vserver for the LDAP configuration. Attributes: key, non-creatable, non-modifiable
