Referência da XCP

Visão geral da referência do comando XCP

A referência de comando XCP fornece exemplos dos comandos disponíveis para XCP NFS e SMB. Cada comando tem parâmetros adicionais que você pode usar sozinho ou em combinação, conforme necessário. O XCP suporta rotação de ficheiros de registo e filtragem de registos com base no nível de gravidade.

Referência do comando NFS

ajuda

O comando NFS `help` exibe uma lista de comandos, parâmetros de comando e uma breve descrição de cada um. O `help` comando é útil para iniciantes que são novos na ferramenta XCP.

Sintaxe

```
xcp help
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp help
  USAGE:
xcp [[help] [command]| -version]
optional arguments:
help Show XCP help message and exit
-version Show XCP version number and exit
To see help text, you can run:
xcp help Display this content
xcp help info Step by step usage of all commands
xcp help <command> Individual command help
command:
activate Activate an XCP license on the current host
license Show XCP license information
show Request information from host about NFS exports
scan Read all the files from export path
copy Recursively copy everything from source to target
resume Resume copy operation from the point it was halted
sync Synchronize increment changes on source to target after copy
isync Sync changes on target without index
verify Verify that the target is the same as the source
delete Delete data on the NFS exported volume
chown Change the ownership on the NFS exported volume
chmod Change the permissions on the NFS exported volume
logdump Collect all logs related to the XCP job and dump those into
        a zipped folder named <ID>.zip under the current dir
estimate Estimate the time taken for the copy command to complete
indexdelete Remove indexes from catalog
```

informações de ajuda

Use o `info` parâmetro com o `help` comando para exibir documentação, exemplos e recomendações de ajuste.

Sintaxe

```
xcp help info
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp help info
COMMAND
info

USAGE
help info

DESCRIPTION
Step by step usage of the XCP command. Follow these steps after you
copy the binary and license

1. Download the XCP license and XCP binary to the Linux machine. Run
XCP activate: xcp activate

2. On a fresh system, the above command will fail when looking for a
license in
/opt/NetApp/xFiles/xcp.
Copy the XCP license to /opt/NetApp/xFiles/xcp and run the activate
command again: xcp activate

3. Check the validity of the license: xcp license

4. Configure the ini file located at /opt/NetApp/xFiles/xcp/xcp.ini
with catalog details: add catalog = catalog_nfs_server:/catalog_path

5. List all the exports and details from the NFS server: xcp show
server

6. Pick up one of the exports and run a scan of the export: xcp scan
server:/export1

7. Initiate baseline copy:
xcp copy -newid id1 server:/export1 server2:/e

8. If the copy is halted for some reason, you can use the "xcp resume"
command to resume the copy operation:
xcp resume -id id1
```

9. Start with incremental sync after the baseline is completed:

```
xcp sync -id id1
```

10. After copy or after every sync, you can verify to check data integrity:

```
xcp verify server:/export1 server2:/export2
```

SUPPORTED COMMANDS

help: Display information about commands and options

-exclude: Display examples of filters

-fmt: Display examples of filters

-match: Display examples of filters

help info: Display documentation, examples, and tuning recommendations

show: Request information from hosts about NFS and other RPC services

-v: Show more detailed information about servers

-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

scan: Read all the directories in a file tree or a saved index

-l, -q: File listing output formats

-stats, -csv, -html: Tree statistics report formats

-nonames: Do not look up user and group names for file listings or reports

-newid <name>: Catalog name for a new index

-id <name>: Catalog name of a previous copy or scan index

-match <filter>: Only process files and directories that match the filter

-fmt <string expression>: Formatted output

-du: Summarize space usage of each directory, including subdirectories

-md5: Checksum the files (also save the checksum files when indexing) (default: False)

-duk: Summarize space usage of directory, include subdirectories, with output in kilobytes

-acl4: Process NFSv4 access control lists (ACLs)

-acl4.threads <n>: Per-process thread pool size (default: 100)

-depth <n>: Limit the search depth

-dircount <n[k]>: Request size for reading directories (default: 64k)

-edupe: Include deduplication estimate in reports (see documentation for details)

-bs <n[k]>: Read/write block size for scans that read data with -md5 or -edupe (default: 64k)

-parallel <n>: Maximum concurrent batch processes (default: 7)

-noId: Disable the creation of a default index (default: False)

-exclude <filter>: Exclude the files and directories that match the

filter

- preserve-ctime: preserve ctime of the file/dir (default: False)
- nodes <name>: comma-separated list of worker nodes
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

copy: Recursively copy everything from source to target

- newid <name>: Catalog name for a new index
- md5: Checksum the files (also save the checksum files when indexing) (default: False)
- edup: Include deduplication estimate in reports (see documentation for details)
- nonames: Do not look up user and group names for file listings or reports
- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and directories
- bs <n[k]>: read/write blocksize (default: 64k)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- noId: Disable the creation of a default index (default: False)
- match <filter>: Only process files and directories that match the filter

-exclude <filter>: Exclude the files and directories that match the filter

- copybatch <filename [args]>: custom batch processing module
- chown: set destination uid and gid when copying as non-root user (default: False)

- preserve-ctime: preserve ctime of the file/dir (default: False)
- nodes <name>: comma-separated list of worker nodes
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

verify: Verify that the target is the same as the source

[no options]: Full verification of target structure, names, attributes, and data

- stats, -csv: Scan source and target trees in parallel and compare tree statistics
- nodata: Do not check data
- noattrs: Do not check attributes (default: False)

-noown: Do not check ownership (uid and gid) (default: False)
-nomods: Do not check file modification times
-mtimewindow <s>: Acceptable modification time difference for verification
-newid <name>: Catalog name for a new index
-v, -l: Output formats to list any differences found
-acl4: Process NFSv4 access control lists (ACLs)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-nonames: Do not look up user and group names for file listings or reports
-match <filter>: Only process files and directories that match the filter
-bs <n[k]>: read/write blocksize (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-noId: Disable the creation of a default index (default: False)
-exclude <filter>: Exclude the files and directories that match the filter
-preserve-atime: preserve atime of the file/dir (default: False)
-s3.insecure: use http instead of https
-s3.noverify: do not verify ssl certificates
-s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
-s3.profile <profile-name>: config/cred profile to be used
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

sync: Find all source changes and apply them to the target

-id <name>: Catalog name of a previous copy index
-snap <name or path>: Access a Snapshot copy of the source tree
-nonames: Do not look up user and group names for file listings or reports
-bs <n[k]>: read/write blocksize (default: 64k)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
-acl4.threads <n>: Per-process thread pool size (default: 100)
-exclude <filter>: Exclude the files and directories that match the filter
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

sync dry-run: Find source changes but don't apply them to the target

-id <name>: Catalog name of a previous copy index
-snap <name or path>: Access a Snapshot copy of the source tree
-stats: Deep scan the modified directories and report on everything new
-nonames: Do not look up user and group names for file listings or

reports

- v, -l, -q: File listing output formats
- dircount <n[k]>: Request size for reading directories (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- target: Check that the target files match the index
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

isync: Sync changes on target without index

- nodata: Do not check data
- noattrs: Do not check attributes
- nomods: Do not check file modification times
- mtimewindow <s>: Acceptable modification time difference for verification
- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and directories
- match <filter>: Only process files and directories that match the filter
- bs <n[k]>: read/write blocksize (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- exclude <filter>: Exclude the files and directories that match the filter
- newid <name>: Catalog name for a new index
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)
- preserve-ctime: preserve ctime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used

isync estimate: Find the estimated time to complete the next isync command

- nodata: Do not check data
- noattrs: Do not check attributes
- nomods: Do not check file modification times
- mtimewindow <s>: Acceptable modification time difference for verification
- acl4: Process NFSv4 access control lists (ACLs)
- acl4.threads <n>: Per-process thread pool size (default: 100)
- acl4.alwaysset: call "setacl" for all ACL-capable files and

directories

- match <filter>: Only process files and directories that match the filter
- bs <n[k]>: read/write blocksize (default: 64k)
- parallel <n>: Maximum concurrent batch processes (default: 7)
- dircount <n[k]>: Request size for reading directories (default: 64k)
- exclude <filter>: Exclude the files and directories that match the filter
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)
- preserve-atime: preserve atime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- id <name>: Catalog name of a previous copy index

resume: Restart an interrupted copy

- id <name>: Catalog name of a previous copy index
- bs <n[k]>: read/write
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

delete: Delete everything recursively

- match <filter>: Only process files and directories that match the filter
- force: Delete without confirmation
- removetopdir: remove directory including children
- exclude <filter>: Exclude the files and directories that match the filter
- parallel <n>: Maximum concurrent batch processes (default: 7)
- preserve-atime: preserve atime of the file/dir (default: False)
- s3.insecure: use http instead of https
- s3.noverify: do not verify ssl certificates
- s3.endpoint <S3 endpoint Url>: path such as https://10.10.10.101:1010
- s3.profile <profile-name>: config/cred profile to be used
- loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

activate: Activate a license on the current host
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

license: Show xcp license info

license update: Retrieve the latest license from the XCP server

chown: changing ownership of a file object
exclude <filter>: Exclude the files and directories that match the filter
-match <filter>: Only process files and directories that match the filter
-group <group>: linux gid to be set at source
-user <user>: linux uid to be set at source
-user-from <userFrom>: user to be changed
-group-from <groupFrom>: group to be changed
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

chmod: changing permissions of a file object
-exclude <filter>: Exclude the files and directories that match the filter
-match <filter>: Only process files and directories that match the filter
-reference <reference>: referenced file or directory point
-v: reports output for every object processed
-mode <mode>: mode to be set
-preserve-atime: preserve atime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO, DEBUG (default: INFO)

logdump: Collect all logs related to the XCP job and dump those into a zipped folder named <ID>.zip under current dir
-m <migration ID>: Filter logs by migration ID
-j <job ID>: Filter logs by job ID

estimate: Use a saved scan index to estimate copy time

```
-id <name>: Catalog name of a previous copy or scan index
-gbit <n>: Gigabits of bandwidth to estimate best-case time (default:
1)
-target <path>: Target to use for live test copy
-t <n[s|m|h]>: Duration of live test copy (default: 5m)
-bs <n[k]>: read/write blocksize (default: 64k)
-dircount <n[k]>: Request size for reading directories (default: 64k)
-parallel <n>: Maximum concurrent batch processes (default: 7)
preserve-ctime:
  preserve ctime of the file/dir (default: False)
-loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)

indexdelete: delete catalog indexes
  -match <filter>: Only process files and directories that match the
filter
  -loglevel <name>: Option to set log level; available levels are INFO,
DEBUG (default: INFO)
```

OUTPUT

In the `-l` output, the size, space used, and modification time are all shown in human-readable format. Time is relative to the current time, so it is time zone independent. For example, "14dlh" means that the file was modified 14 days and one hour ago. Note: "current time" is the time XCP started. The timestamp is saved in the index metadata (catalog:/xFiles/indexes/*.json) and is used for reports against the index.

The `-stats` option prints a human-readable report to the console. Other report format options are `-html` or `-csv`. The comma-separated values (CSV) format has exact values. CSV and HTML reports are automatically saved in the catalog, if there is one.

The histograms for modified, accessed, and changed only count regular files.

FILTERS

A filter expression should evaluate to True or False in Python. Filters are used in XCP for the `-match` and `-exclude` options. See below for some examples of the filters. Use "xcp help <command>" to check which options are supported for commands.

Variables and file attributes currently available to use in a filter: modified, accessed, changed: Floats representing age in hours depth, size, used, uid, gid, type, nlinks, mode, fileid: Integers name, base,

ext: Strings (if name is "demo.sql" then base is == "demo" and ext is == ".sql") owner, group: Strings size units: k, m, g, t, p = K, M, G, T, P = 1024, 1048576, 2**30, 2**40, 2**50 file types: f, d, b, c, l, s, q = F, D, B, C, L, S, Q = 1, 2, 3, 4, 5, 6, 7

Functions available to use in a filter:

rxm(pattern): Regular expression match for each file name
fnm(pattern): Unix-style wildcard match for each file name
load(path): List of lines from a local (external) file
rand(N): Match one out of every N files at random
path(pattern): Wildcard match for the full path
paths(<full_file_path>): Match or exclude all NFS export paths listed in the file
Note: unlike most shell wildcards, pattern "/a/*" will match path /a/b/c

The rxm() function only runs Python re.compile (pattern) once. Similarly, load() only reads its file once.

Filter examples:

Match files modified less than half an hour ago "type == f and modified < .5"

Find anything with "core" in the name ("in" is a Python operator):
"'core' in name"

Same match using regular expressions: "rxm('.*core.*')"

Same match using wildcards: "fnm('*core*')"

Match files that are not regular files, directories, or links: "type not in (f,d,l)"

Find jpg files over 500 megabytes (M is a variable): "fnm('*.jpg') and size > 500*M"

Find files with "/demo/smith" in the path (x is the file; str(x) is its full path): "'/demo/smith' in str(x)"

Exclude copying anything with "f" in its name: "fnm('*f*')"

Exclude multiple export paths specified in "/root/excludePaths.txt".
"paths('/root/excludePaths.txt')"

The file "excludePaths.txt" may contain multiple export paths where each path is listed on a new line.

The export paths may contain wildcards.

For example, `10.10.1.10:/source_vol/*.txt` in file `excludePaths.txt` will exclude all files having ".txt" extension

If there are incremental changes in previously included directories and you want to exclude anything that has "dir40" as a substring in its name, you can specify the new exclude filter with the `sync`. This overrides the exclude filter used previously with the `copy` command and applies the new exclude filter.

Note that if there are incremental changes on the source after the copy operation and there are files with "f" in their name, then these are copied on to the target when the `sync` operation is performed. If you want to avoid copying such files or directories, you can use the following command: `xcp sync -exclude "'f' in name" -id <id>`

PERFORMANCE

On Linux, please set the following in `/etc/sysctl.conf` and run `"sysctl -p"`:

```
net.core.rmem_default = 1342177
net.core.rmem_max = 16777216
net.core.wmem_default = 1342177
net.core.wmem_max = 16777216
net.ipv4.tcp_rmem = 4096 1342177 16777216
net.ipv4.tcp_wmem = 4096 1342177 16777216
net.core.netdev_max_backlog = 300000
net.ipv4.tcp_fin_timeout = 10
```

Make sure that your system has multiple CPUs and at least a few gigabytes (GBs) of free memory.

Searching, checksumming or copying hundreds of thousands or millions of files should be many times faster with XCP than with standard tools such `cp`, `find`, `du`, `rsync`, or OS drag-and-drop.

For the case of a single file, reading or copying with XCP is usually faster with a faster host CPU. When processing many files, reading or copying is faster with more cores or CPUs.

The main performance throttle option is `-parallel` for the maximum number of concurrent processes as the number of concurrent directories being read and files being processed. For small numbers of files and/or when there is a network quality of service (QoS) limiter, you might also be able to increase performance by opening multiple channels. The usage section above shows how to use multiple host target addresses. The same syntax also opens more channels to a single target.

For example: "host1,host1:/vol/src" makes each XCP process open two channels to host1. In some WAN environments, this can improve performance. Within a datacenter, if there are only 1 GbE network interface cards (NICs) on the host with XCP it usually helps to use the multipath syntax to leverage more than one NIC. To verify that you are running I/O over multiple paths, use OS tools to monitor network I/O. For example, on Linux, try "sar -n DEV 2 200".

ENVIRONMENT VARIABLES

XCP_CONFIG_DIR: Override the default location /opt/NetApp/xFiles/xcp. If set, the value should be an OS filesystem path, possibly a mounted NFS directory. When XCP_CONFIG_DIR is set, a new directory with name same as hostname is created inside the custom configuration directory path wherein new logs will be stored

XCP_LOG_DIR: Override the default, which stores the XCP log in the configuration directory. If set, the value should be an OS filesystem path, possibly a mounted NFS directory. When XCP_LOG_DIR is set, a new directory with name same as hostname is created inside the custom log directory path wherein new logs will be stored

XCP_CATALOG_PATH: Override the setting in xcp.ini. If set, the value should be in the XCP path format, server:export[:subdirectory].

SECURITY

All the files and directories in the catalog are world readable except for the index files, which have a ".index" suffix and are located in subdirectories under the top-level catalog "indexes" directory. Because each index file is essentially an archive of metadata of an entire file tree, the catalog should be stored on a NetApp volume with export permissions matching the the actual sources and targets. Note that file data is not stored in the index, only metadata.

SUPPORT

<https://www.netapp.com/us/contact-us/support.aspx>

mostrar

O comando `NFS show` consulta os serviços RPC e as exportações NFS de um ou mais servidores de storage. O comando também lista os serviços e exportações disponíveis e mostra a capacidade usada e livre de cada exportação, seguida pelos atributos da raiz

de cada exportação.

Sintaxe

```
xcp show <ip_address_or_host_name>
```

O `show` comando requer o nome do host ou o endereço IP do sistema exportado NFSv3.

Mostrar exemplo

```
[root@localhost linux]# ./xcp show <IP address or hostname of NFS
server>

getting pmap dump from <IP address or hostname of NFS server> port
111... getting export list from <IP address or hostname of NFS
server>...
sending 3 mounts and 12 nfs requests to <IP address or hostname of NFS
server>...

== RPC Services ==
'<IP address or hostname of NFS server>': UDP rpc services: MNT v1/2/3,

Xcp command : xcp show <IP address or hostname of NFS server>
0 error
Speed   : 3.62 KiB in (17.9 KiB/s), 6.28 KiB out (31.1 KiB/s) Total
Time   : 0s.
STATUS  : PASSED
```

mostrar -v

Use o `-v` parâmetro com o `show` comando para retornar detalhes sobre servidores NFS usando o endereço IP ou o nome do host.

Sintaxe

```
xcp show -v
```

licença

O comando NFS `license` exibe informações de licença XCP.

Antes de executar este comando, verifique se o arquivo de licença é baixado e copiado para `/opt/NetApp/xFiles/xcp/` o diretório no host cliente XCP Linux.

Sintaxe

```
xcp license
```

Mostrar exemplo

```
[root@localhost /]# ./xcp license

Licensed to "XXX, NetApp Inc, XXX@netapp.com" until Sun Mar 31 00:00:00
2029 License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

atualização da licença

Use o `update` parâmetro com o `license` comando para recuperar a licença mais recente do servidor XCP.

Sintaxe

```
xcp license update
```

Mostrar exemplo

```
[root@localhost /]# ./xcp license update

XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]
until Sun Mar 31 00:00:00 yyyy
```

ativar

O comando NFS `activate` ativa a licença XCP.

Antes de executar este comando, verifique se o arquivo de licença é baixado e copiado para `opt/NetApp/xFiles/xcp/` o diretório no host cliente XCP Linux.

Sintaxe

```
xcp activate
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp activate

XCP activated
```

digitalizar

O comando XCP NFS `scan` verifica recursivamente todo o NFSv3 caminhos exportados de origem e retorna estatísticas de estrutura de arquivos.

A NetApp recomenda que você coloque as montagens de exportação NFS de origem no modo somente leitura durante a operação de digitalização.

Sintaxe

```
xcp scan <source_nfs_export_path>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan <IP address of NFS server>:/

source_vol

Xcp command : xcp scan <IP address of NFS server>:/source_vol
```

A tabela a seguir lista os `scan` parâmetros e sua descrição.

Parâmetro	Descrição
<code>digitalização -l</code>	Lista os arquivos no formato de saída de listagem longa.
<code>digitalização -q</code>	Mostra o número de ficheiros lidos.
<code>estatísticas de exame</code>	Lista os arquivos no formato de relatório estatístico de árvore.
<code>digitalização -csv</code>	Lista os arquivos no formato de relatório CSV de estatísticas de árvore.
<code>digitalização -html</code>	Lista os arquivos no formato de relatório HTML estatístico de árvore.
<code>scan -não-nomes</code>	Exclui nomes de usuários e grupos de listas de arquivos e relatórios.
<code>scan -newid</code>	Especifica o nome do catálogo para um novo índice.
<code>scan -id</code>	Especifica o nome do catálogo de uma cópia ou índice de digitalização anterior.

Parâmetro	Descrição
<code>scan -match</code>	Apenas processa arquivos e diretórios que correspondem ao filtro.
<code>scan -fmt</code>	Apenas processa arquivos e diretórios que correspondem ao formato.
<code>digitalização -du</code>	Resume o uso de espaço de cada diretório, incluindo subdiretórios.
<code>scan -md5</code>	Gera somas de verificação nos arquivos e salva as somas de verificação ao indexar (padrão: False).
<code>scan -depth</code>	Limita a profundidade de pesquisa.
<code><<nfs_scan_dircount,digitalização -dircount [k]></code>	Especifica o tamanho da solicitação ao ler diretórios.
<code>digitalização -edupe</code>	Inclui a estimativa de deduplicação nos relatórios.
<code><<nfs_scan_bs,scan -bs [k]></code>	Especifica o tamanho do bloco de leitura/gravação para varreduras que leem dados usando <code>-md5</code> ou <code>-edupe</code> (padrão: 64K).
<code>digitalização -paralela</code>	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<code>Scan -noid</code>	Desativa a criação de um índice padrão (default: False).
<code>scan -subdir-namentos</code>	Recupera os nomes dos subdiretórios de nível superior em um diretório.
<code>digitalização -preservar-tempo</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>digitalização -s3.insecure</code>	Fornece a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>scan -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>digitalização -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.
<code>digitalização -s3.noverify</code>	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

digitalização -l

Use o `-l` parâmetro com o `scan` comando para listar arquivos no formato de saída de listagem longa.

Sintaxe

```
xcp scan -l <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
root@localhost linux]# ./xcp scan -l <IP address or hostname of
NFSserver>:/source_vol

rw-r--r-- --- root root 1KiB 4KiB 42s source_vol/USER.2/FILE_4
Xcp command : xcp scan -l <IP address or hostname of NFS
server>:/source_vol
13 scanned, 0 matched, 0 error
Speed : 3.73 KiB in (4.89 KiB/s), 756 out (989/s)
Total Time : 0s.
STATUS : PASSED
```

digitalização -q

Utilize o `-q` parâmetro com o `scan` comando para mostrar o número de ficheiros lidos.

Sintaxe

```
xcp scan -q <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -q <IP address or hostname of NFSserver>:/source_vol
```

```
Xcp command : xcp scan -q <IP address or hostname of NFS server>:/source_vol
13 scanned, 0 matched, 0 error
Speed : 3.73 KiB in (3.96 KiB/s), 756 out(801/s)
Total Time : 0s.
STATUS : PASSED
```

scan -stats, scan -csv e scan -html

Use os `-stats` parâmetros, `-csv` e `-html` com o `scan` comando para listar arquivos no formato de relatório estatístico de árvore.

- A `-stats` opção imprime um relatório legível por humanos no console. Outras opções de formato de relatório são `-html` ou `-csv`. O formato CSV (valores separados por vírgula) tem valores exatos. Os relatórios CSV e HTML são salvos automaticamente no catálogo, se existir um catálogo.
- Os relatórios XCP (`.csv`, `.html`) são salvos no local do catálogo especificado no `xcp.ini` arquivo. Os arquivos são armazenados na `<catalog path>/catalog/indexes/1/reports` pasta. Pode visualizar relatórios de amostra no ["Referência NetApp XCP 1.9.3"](#).

Sintaxe

```
xcp scan -stats <ip_address>:/source_vol
```

Mostrar exemplo

```
root@client1 linux]# ./xcp scan -stats <ip_address>:/fgl

scan -não-nomes

Use o `-nonames` parâmetro com o `scan` comando para excluir nomes de usuários e grupos de listas de arquivos ou relatórios.

Quando usado com o `scan` comando, o `-nonames` parâmetro só se aplica a listas de arquivos retornadas usando a `-l` opção.

Sintaxe

```
xcp scan -nonames <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -nonames <IP address or hostname of
NFS server>:/source_vol

STATUS : PASSED
```

scan -newid <name>

Use o `-newid <name>` parâmetro com o `scan` comando para especificar o nome do catálogo para um novo índice ao executar uma digitalização.

Sintaxe

```
xcp scan -newid <name> <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -newid ID001 <IP address or hostname

Total Time : 0s.
STATUS : PASSED
```

scan -id <catalog_name>

Use o `-id` parâmetro com o `scan` comando para especificar o nome do catálogo da cópia anterior ou índice de digitalização.

Sintaxe

```
xcp scan -id <catalog_name>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -id 3

xcp: Index: {source: 10.10.1.10:/vol/ex_s01/etc/keymgr, target: None}

scan -depth <n> (exame - profundidade)

Utilize o `-depth <n>` parâmetro com o `scan` comando para limitar a profundidade de pesquisa de um exame. O `-depth <n>` parâmetro especifica a profundidade nos subdiretórios que o XCP pode digitalizar arquivos. Por exemplo, se o número 2 for especificado, o XCP irá analisar apenas os dois primeiros níveis de subdiretório.

Sintaxe

```
xcp scan -depth <n> <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -depth 2 <IP address or hostname of
NFS server>:/source_vol

source_vol
source_vol/r1.txt
source_vol/USER.1
source_vol/USER.2
source_vol/USER.1/FILE_1
source_vol/USER.1/FILE_2
source_vol/USER.1/FILE_3

source_vol/USER.1/FILE_5
source_vol/USER.1/file1.txt
source_vol/USER.1/file2.txt
source_vol/USER.1/logfile.txt
source_vol/USER.1/log1.txt
source_vol/USER.2/FILE_1
source_vol/USER.2/FILE_5
source_vol/USER.2/FILE_2
source_vol/USER.2/FILE_3
source_vol/USER.2/FILE_4
Xcp command : xcp scan -depth 2 <IP address or hostname of
NFSserver>:/source_vol
18 scanned, 0 matched, 0 error
Speed : 4.59 KiB in (6.94 KiB/s), 756 out (1.12KiB/s)
Total Time : 0s.
STATUS : PASSED
```

scan -dircount <n[k]>

Use o `-dircount <n[k]>` parâmetro com o `scan` comando para especificar o tamanho da solicitação ao ler diretórios em uma varredura. O valor padrão é 64k.

Sintaxe

```
xcp scan -dircount <n[k]> <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp scan -dircount 64k <IP address or
hostname of NFS server>:/source_vol

source_vol
source_vol/USER.1/FILE_1
source_vol/USER.1/FILE_2
source_vol/USER.1/FILE_3
source_vol/USER.1/FILE_4
source_vol/USER.1/FILE_5
source_vol/USER.1/file1.txt
source_vol/USER.1/file2.txt
source_vol/USER.1/logfile.txt
source_vol/USER.1/log1.txt
source_vol/r1.txt
source_vol/USER.1
source_vol/USER.2
source_vol/USER.2/FILE_1
source_vol/USER.2/FILE_5
```

digitalização -edupe

Use o `-edupe` parâmetro com o `scan` comando para incluir a estimativa de deduplicação nos relatórios.

O Simple Storage Service (S3) não suporta arquivos esparsos. Portanto, especificar um bucket S3 como destino de destino `scan -edupe` retorna o valor "nenhum" para dados esparsos.

Sintaxe

```
xcp scan -edupe <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
root@localhost linux]# ./xcp scan -edupe <IP address or hostname of
NFSserver>:/source_vol

Xcp command : xcp scan -subdir-names <IP address or hostname of NFS
server>:/source_vol
7 scanned, 0 matched, 0 error
Speed : 1.30 KiB in (1.21 KiB/s), 444 out(414/s)
Total Time : 1s.
STATUS : PASSED
```

digitalização -preservar-tempo

Use o `-preserve-atime` parâmetro com o `scan` comando para restaurar todos os arquivos para a última data acessada na origem.

Quando um compartilhamento NFS é verificado, o tempo de acesso é modificado nos arquivos se o sistema de armazenamento estiver configurado para modificar o tempo de acesso na leitura. O XCP não altera diretamente o tempo de acesso. O XCP lê os ficheiros um a um e isto aciona uma atualização para o tempo de acesso. A `-preserve-atime` opção repõe o tempo de acesso ao valor original definido antes da operação de leitura do XCP.

Sintaxe

```
xcp scan -preserve-atime <ip_address_or_hostname>:/source_vol
```

Mostrar exemplo

```
[root@client 1 linux]# ./xcp scan -preserve-atime
101.10.10.10:/source_vol

cópia

O comando XCP NFS `copy` verifica e copia toda a estrutura do diretório de origem para uma exportação NFSv3 de destino.

O `copy` comando requer ter caminhos de origem e destino como variáveis. Os arquivos digitalizados e copiados, a taxa de transferência, a velocidade e os detalhes do tempo decorrido são exibidos no final da operação de cópia.

- O arquivo de log de tempo de execução está localizado `/opt/NetApp/xFiles/xcp/xcp.log` nesse caminho é configurável. Registro adicional está localizado no catálogo após cada comando ser executado.
- Se a origem for um sistema de 7 modos, você poderá usar uma cópia Snapshot como fonte. Por exemplo: `<ip_address>:/vol/ex_s01/.snapshot/<snapshot_name>`

Sintaxe

```
xcp copy <source_nfs_export_path> <destination_nfs_export_path>
```

Mostrar exemplo

```
root@localhost linux]# ./xcp copy <IP address of NFS
server>:/source_vol < IP address of
destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

```

A tabela a seguir lista os `copy` parâmetros e sua descrição.

Parâmetro	Descrição
<code>copiar - nomes não-iguais</code>	Exclui nomes de usuários e grupos de listas de arquivos e relatórios.
<code>copiar -corresponder</code>	Apenas processa arquivos e diretórios que correspondem ao filtro.
<code>copiar -md5</code>	Gera somas de verificação nos arquivos e salva as somas de verificação ao indexar (padrão: False).
<code><<copy_dircount,copiar -dircount [k]></code>	Especifica o tamanho da solicitação ao ler diretórios.
<code>copiar -edupe</code>	Inclui a estimativa de deduplicação nos relatórios.
<code><<copy_bs,copiar -bs [k]></code>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<code>copiar -paralelo</code>	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<code>copiar -preservar-tempo</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>cópia -s3.insecure</code>	Fornece a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code><<copy_s3_endpoint,copiar -s3.endpoint ></code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code><<copy_s3_profile,copiar -s3.profile ></code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.

Parâmetro	Descrição
cópia -s3.noverify	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

copiar - nomes não-iguais

Use o `-nonames` parâmetro com o `copy` comando para excluir nomes de usuários e grupos de listas de arquivos ou relatórios.

Sintaxe

```
xcp copy -nonames <source_ip_address_or_hostname>:/source_vol  
<destination_ip_address_or_hostname>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp copy -nonames <IP address or hostname of  
NFS server>:/source_vol <IP  
address of destination NFS server>:/dest_vol

```

copiar - combinar <filter>

Use o `-match <filter>` parâmetro com o `copy` comando para especificar que somente os arquivos e diretórios que correspondem a um filtro são processados.

Sintaxe

```
xcp copy -match <filter> <source_ip_address_or_hostname>:/source_vol  
<destination_ip_address_or_hostname>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp copy -match bin <IP address or hostname
of NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

```

copiar -md5 <string_expression>

Use o `-md5` parâmetro com o `copy` comando para gerar somas de verificação para as listas de arquivos e salvar as somas de verificação ao indexar. O valor padrão é definido como `false`.

Sintaxe

```
xcp copy -md5 <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp copy -md5 <IP address or hostname of NFS
server>:/source_vol <IP
address of destination NFS server>:/dest_vol

xcp: WARNING: No index name has been specified, creating one with name:

```

copiar -dircount <n[k]>

Use o `-dircount <n[k]>` parâmetro com o `copy` comando para especificar o tamanho da solicitação ao ler diretórios. O valor padrão é 64k.

Sintaxe

```
xcp copy -dircount <n[k]> <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp copy -dircount 32k <IP address or
hostname of NFS server>:/source_vol
<IP address of destination NFS server>:/dest_vol

```

copiar -edupe

Use o `-edupe` parâmetro com o `copy` comando para incluir a estimativa de deduplicação nos relatórios.

O Simple Storage Service (S3) não suporta arquivos esparsos. Portanto, especificar um bucket S3 como destino de destino `copy -edupe` retorna o valor "nenhum" para dados esparsos.

Sintaxe

```
xcp copy -edupe <source_ip_address_or_hostname>:/source_vol
<destination_ip_address_or_hostname>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp copy -edupe <IP address or hostname of
NFS server>:/source_vol <IP
address of destination NFS server>:/dest_vol

sincronizar

Visualize as descrições, parâmetros e exemplos do comando XCP `sync`, inclusive quando o `sync` comando é usado com a `dry run` opção.

sincronizar

O comando XCP NFS `sync` verifica se há alterações e modificações em um diretório NFS de origem usando um nome de tag de índice de catálogo ou o número de uma operação de cópia anterior. As alterações incrementais na origem são copiadas e aplicadas ao diretório de destino. Os números antigos do índice do catálogo são substituídos por novos após a operação de sincronização.

Durante a operação de sincronização, os arquivos e diretórios modificados são copiados para a exportação NFSv3 de destino novamente.

Sintaxe

```
xcp sync -id <catalog_name>
```

O `-id <catalog_name>` parâmetro é necessário com o `sync` comando.

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync -id autoname_copy_2020-03-04_01.10.22.338436

xcp: Index: {source: <IP address or hostname of NFS server>:/source_vol, target: <IP address of destination NFS server>:/dest_vol}
Xcp command : xcp sync -id autoname_copy_2020-03-04_01.10.22.338436
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (27.6 KiB/s), 22.7 KiB out (23.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

A tabela a seguir lista os `sync` parâmetros e sua descrição.

Parâmetro	Descrição
sincronizar -id	Especifica o nome do catálogo de um índice de cópia anterior. Este é um parâmetro necessário para o <code>sync</code> comando.
sync -nomes diferentes	Exclui nomes de usuários e grupos de listas de arquivos e relatórios.
<<sync_bs,sincronizar -bs [k]>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<<sync_dircount,sincronizar -dircount [k]>	Especifica o tamanho da solicitação ao ler diretórios.
sincronizar -paralelo	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
sincronizar -preservar-atime	Restaura todos os arquivos para a última data acessada na origem.

sync -nomes diferentes

Use o `-nonames` parâmetro com o `sync` comando para excluir nomes de usuários e grupos de listas de arquivos ou relatórios.

Sintaxe

```
xcp sync -id <catalog_name> -nonames
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -nonames
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 26.4 KiB in (22.2 KiB/s), 22.3 KiB out (18.8 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sincronizar -bs <n[k]>

Use o `-bs <n[k]>` parâmetro com o `sync` comando para especificar o tamanho do bloco de leitura/gravação. O tamanho padrão do bloco é 64k.

Sintaxe

```
xcp sync -id <catalog_name> -bs <n[k]>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync -id ID001 -bs 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -bs 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.4 KiB/s), 21.0 KiB out (16.9 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sincronizar -dircount <n[k]>

Use o `-dircount <n[k]>` parâmetro com o `sync` comando para especificar o tamanho da solicitação ao ler diretórios. O valor padrão é 64k.

Sintaxe

```
xcp sync -id <catalog_name> -dircount <n[k]>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -dircount 32k
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (27.8 KiB/s), 21.0 KiB out (23.0 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sincronizar -paralelo

Use o `-parallel` parâmetro com o `sync` comando para especificar o número máximo de processos em lote simultâneos. O valor padrão é 7.

Sintaxe

```
xcp sync -id <catalog_name> -parallel <n>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync -id ID001 -parallel 4
0 scanned, 0 copied, 0 modification, 0 new item, 0 delete item, 0 error
Speed : 25.3 KiB in (20.6 KiB/s), 21.0 KiB out (17.1 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

-preserve-atime

Use o `-preserve-atime` parâmetro com o `sync` comando para restaurar todos os arquivos para a última data acessada na origem.

A `-preserve-atime` opção repõe o tempo de acesso ao valor original definido antes da operação de leitura do XCP.

Sintaxe

```
xcp sync -preserve-atime -id <catalog_name>
```

Mostrar exemplo

```
[root@client-1 linux]# ./xcp sync -preserve-atime -id XCP_copy_2022-06-30_14.22.53.742272

xcp: Job ID: Job_XCP_copy_2022-06-30_14.22.53.742272_2022-06-30_14.27.28.660165_sync

```

sincronizar a seco

O `sync` comando com a `dry-run` opção procura por alterações ou modificações feitas no diretório NFS de origem usando o número de índice de catálogo anterior de uma operação de cópia. Este comando também deteta arquivos e diretórios que são novos, movidos, excluídos ou renomeados desde a operação de cópia anterior. O comando relata as alterações de origem, mas não as aplica ao destino.

Sintaxe

```
xcp sync dry-run -id <catalog_name>
```

O `-id <catalog_name>` parâmetro é necessário com a `sync dry-run` opção de comando.

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (46.5 KiB/s), 5.48 KiB out (16.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

A tabela a seguir lista os `sync dry-run` parâmetros e sua descrição.

Parâmetro	Descrição
sincronizar dry-run -id	Especifica o nome do catálogo de um índice de cópia anterior. Este é um parâmetro necessário para o <code>sync</code> comando.
sincronizar dry-run -stats	Executa uma varredura profunda dos diretórios modificados e relata tudo o que é novo.
sincronizar dry-run -l	Imprime detalhes sobre arquivos e diretórios alterados.
sincronizar dry-run -nonames	Exclui nomes de usuários e grupos de listas de arquivos e relatórios.
<code><<sync_dry_run_dircount,sincronizar dry-run -dircount [k]></code>	Especifica o tamanho da solicitação ao ler diretórios.
sincronizar dry-run -parallel	Especifica o número máximo de processos em lote simultâneos (padrão: 7).

sincronizar dry-run -id <catalog_name>

Use o `-id <catalog_name>` parâmetro com `sync dry-run` para especificar o nome do catálogo de um índice de cópia anterior.

O `-id <catalog_name>` parâmetro é necessário com a `sync dry-run` opção de comando.

Sintaxe

```
xcp sync dry-run -id <catalog_name>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001
0 matched, 0 error
Speed : 15.2 KiB in (21.7 KiB/s), 5.48 KiB out (7.81 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sincronizar dry-run -stats

Use o `-stats` parâmetro com `sync dry-run` para executar uma varredura profunda dos diretórios modificados e relatar tudo o que é novo.

Sintaxe

```
xcp sync dry-run -id <catalog_name> -stats
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -stats

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
4,895 reviewed, 43,163 checked at source, 12.8 MiB in (2.54 MiB/s),
5.49 MiB out (1.09 MiB/s),
5s
4,895 reviewed, 101,396 checked at source, 19.2 MiB in (1.29 MiB/s),
12.8 MiB out (1.47 MiB/s),

Xcp command : xcp sync dry-run -id ID001 -stats
0 matched, 0 error
Speed : 22.9 MiB in (1.74 MiB/s), 17.0 MiB out (1.29 MiB/s)
Total Time : 13s.
STATUS : PASSED
```

sincronizar dry-run -l

Use o `-l` parâmetro com `sync dry-run` para imprimir detalhes sobre arquivos e diretórios alterados.

Sintaxe

```
xcp sync dry-run -id <catalog_name> -l
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -l

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -l
0 matched, 0 error
Speed : 15.2 KiB in (13.6 KiB/s), 5.48 KiB out (4.88 KiB/s)
Total Time : 1s.
STATUS : PASSED
```

sincronizar dry-run -nonames

Use o `-nonames` parâmetro com `sync dry-run` para excluir nomes de usuários e grupos de listas de

arquivos ou relatórios.

Sintaxe

```
xcp sync dry-run -id <catalog_name> -nonames
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -nonames

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -nonames
0 matched, 0 error
Speed : 15.2 KiB in (15.8 KiB/s), 5.48 KiB out (5.70 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sincronizar dry-run -dircount <n[k]>

Use o `-dircount <n[k]>` parâmetro com `sync dry-run` para especificar o tamanho da solicitação ao ler diretórios. O valor padrão é 64k.

Sintaxe

```
xcp sync dry-run -id <catalog_name> -dircount <n[k]>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -dircount 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -dircount 32k
0 matched, 0 error
Speed : 15.2 KiB in (32.5 KiB/s), 5.48 KiB out (11.7 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

sincronizar dry-run -paralelo

Use o `-parallel` parâmetro com `sync dry-run` para especificar o número máximo de processos em lote simultâneos. O valor padrão é 7.

Sintaxe

```
xcp sync dry-run -id <catalog_name> -parallel <n>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp sync dry-run -id ID001 -parallel 4

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}
Xcp command : xcp sync dry-run -id ID001 -parallel 4
0 matched, 0 error
Speed : 15.2 KiB in (25.4 KiB/s), 5.48 KiB out (9.13 KiB/s)
Total Time : 0s.
STATUS : PASSED
```

retomar

O comando XCP NFS `resume` reinicia uma operação de cópia interrompida especificando o nome ou número do índice do catálogo. O nome do índice de catálogo ou o número da operação de cópia anterior está localizado `<catalog path>:/catalog/indexes` no diretório.

Sintaxe

```
xcp resume -id <catalog_name>
```

O `-id <catalog_name>` parâmetro é necessário com o `resume` comando.

Mostrar exemplo

```
[root@localhost linux]# ./xcp resume -id ID001

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}

A tabela a seguir lista os resume parâmetros e sua descrição.

Parâmetro	Descrição
retomar -id	Especifica o nome do catálogo de um índice de cópia anterior. Este é um parâmetro necessário para o comando RESUME.
<<resume_bs,retomar -bs [k]>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<<resume_dircount,retomar -dircount [k]>	Especifica o tamanho da solicitação ao ler diretórios.

Parâmetro	Descrição
<code>retomar -paralelo</code>	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<code>retomar -preservar-tempo</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>retomar -s3.insecure</code>	Fornecer a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>resume -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>retomar -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.
<code>retomar -s3.noverify</code>	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

retomar -bs <n[k]>

Use o `-bs <n[k]>` parâmetro com o `resume` comando para especificar o tamanho do bloco de leitura/gravação. O tamanho padrão do bloco é 64k.

Sintaxe

```
xcp resume -id <catalog_name> -bs <n[k]>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp resume -id ID001 -bs 32k

xcp: Index: {source: <IP address or hostname of NFS
server>:/source_vol, target: <IP address of
destination NFS server>:/dest_vol}

retomar s3.profile <profile_name>

Use o `-s3.profile <profile_name>` parâmetro com o `resume` comando para especificar um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.

Por padrão, o RESUME usa o perfil S3 e o ponto final S3 especificados durante a operação de cópia. No entanto, se você especificar um novo endpoint S3 e perfil S3 no currículo, ele substituirá o padrão usado com o `copy` comando.

Sintaxe

```
xcp resume -s3.profile <name> -s3.endpoint -id <catalog_name>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp resume -s3.profile sg -s3.endpoint

verifique

O `verify` comando usa a comparação completa de dados byte por byte entre diretórios de origem e destino após uma operação de cópia sem usar um número de índice de catálogo. O comando verifica os tempos de modificação e outros atributos de arquivo ou diretório, incluindo permissões. O comando também lê os arquivos em ambos os lados e compara os dados.

Sintaxe

```
xcp verify <source NFS export path> <destination NFS exportpath>
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp verify <IP address of NFS
server>:/source_vol <IP address of destination NFS server>:/dest_vol

A tabela a seguir lista os `verify` parâmetros e sua descrição.

Parâmetro	Descrição
<code>verifique -stats</code>	Verifica as árvores de origem e destino em paralelo e compara estatísticas de árvore.
<code>verifique -csv</code>	Verifica as árvores de origem e destino em paralelo e compara estatísticas de árvore.
<code>verifique -nodata</code>	Não verifica os dados.
<code>verifique -noattrs</code>	Não verifica atributos.
<code>verifique -nomods</code>	Não verifica os tempos de modificação do ficheiro.
<code>verificar -mtimewindow</code>	Especifica a diferença de tempo de modificação aceitável para verificação.
<code>verifique -v</code>	Recupera formatos de saída para listar quaisquer diferenças encontradas.
<code>verificar -l</code>	Recupera formatos de saída para listar quaisquer diferenças encontradas.
<code>verifique -nomes diferentes</code>	Exclui nomes de usuários e grupos de listas de arquivos ou relatórios.
<code>verificar -corresponder</code>	Apenas processa arquivos e diretórios que correspondem ao formato.
<code><<nfs_verify_bs,verificar -bs [k]></code>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<code>verificar -paralelo</code>	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<code><<nfs_verify_dircount,verificar -dircount [k]></code>	Especifica o tamanho da solicitação ao ler diretórios.
<code>Verifique -noid</code>	Desativa a criação de um índice padrão (default: False).
<code>verifique -preserve-atime</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>verifique o -s3.insecure</code>	Fornece a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>verificar -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>verificar -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.

Parâmetro	Descrição
verifique o -s3.noverify	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

verifique -stats e verifique -csv

Use os `-stats` parâmetros e `-csv` com o `verify` comando para verificar as árvores de origem e destino em paralelo e comparar estatísticas de árvore.

Sintaxe

```
cp verify -stats <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

Mostrar exemplo

```
[root@localhost linux]# ./xcp verify -stats
<source_ip_address>:/source_vol <destination_ip_address>:/dest_vol

verifique -preserve-atime

Use o `-preserve-atime` parâmetro com o `verify` comando para restaurar todos os arquivos para a última data acessada na origem. O `-preserve-atime` parâmetro repõe o tempo de acesso ao valor original definido antes da operação de leitura do XCP.

Sintaxe

```
xcp verify -preserve-atime <source_ip_address>:/source_vol  
<destination_ip_address>:/dest_vol
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp verify -preserve-atime  
<IP_address>:/source_vol <destination_IP_address>:/dest_vol

verifique o -s3.insecure

Use o `-s3.insecure` parâmetro com o `verify` comando para usar HTTP em vez de HTTPS para comunicação de bucket S3.

Sintaxe

```
xcp verify -s3.insecure hdfs:///user/test s3://<bucket_name>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp verify -s3.insecure hdfs://<HDFS source>
s3://<s3-bucket>

chmod

O comando XCP NFS `chmod` verifica e altera a permissão de arquivo de todos os arquivos para a estrutura de diretório dada. O comando 'chmod' requer modo ou referência, compartilhamento NFS ou o caminho POSIX como uma variável. O comando XCP `chmod` altera recursivamente as permissões para um determinado caminho. O comando output exibe o total de arquivos digitalizados e as permissões alteradas na saída.

Sintaxe

```
xcp chmod -mode <value> <source NFS export path>
```

Mostrar exemplo

```
[root@user-1 linux]# ./xcp chmod -mode <IP address>:/source_vol

Xcp command : xcp chmod -mode <IP address>://source_vol
Stats : 6 scanned, 4 changed mode
Speed : 1.96 KiB in (2.13 KiB/s), 812 out (882/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux] #
```

A tabela a seguir lista os `chmod` parâmetros e sua descrição.

Parâmetro	Descrição
<code>chmod -exclude</code>	Exclui os arquivos e diretórios que correspondem ao filtro.
<code>chmod -corresponder</code>	Apenas processa os arquivos e diretórios que correspondem ao filtro.
<code>chmod -referência</code>	Especifica o arquivo referenciado ou ponto de diretório.
<code>chmod -v</code>	Reporta a saída para cada objeto processado.

`chmod -exclude <filter>`

Use o `-exclude <filter>` parâmetro com o `chmod` comando para excluir os arquivos e diretórios que correspondem ao filtro.

Sintaxe

```
xcp chmod -exclude <filter> -mode <value> <source NFS export path>
```

Mostrar exemplo

```
[root@user-1 linux]# ./xcp chmod -exclude "fnm('3.img')" -mode 770
101.11.10.10:/s_v1/D3/

Excluded: 1 excluded, 0 did not match exclude criteria
Xcp command : xcp chmod -exclude fnm('3.img') -mode 770
101.11.10.10:/s_v1/D3/
Stats : 5 scanned, 1 excluded, 5 changed mode
Speed : 2.10 KiB in (7.55 KiB/s), 976 out (3.43 KiB/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]#
```

chmod -match <filter>

Use o `-match <filter>` parâmetro com o `chmod` comando para processar apenas os arquivos e diretórios que correspondem ao filtro.

Sintaxe

```
xcp chmod -match <filter> -mode <value> <source NFS export path>
```

Mostrar exemplo

```
[root@user-1 linux]# ./xcp chmod -match "fnm('2.img')" -mode 777
101.11.10.10:/s_v1/D2/

Filtered: 1 matched, 5 did not match
Xcp command : xcp chmod -match fnm('2.img') -mode
101.11.10.10:/s_v1/D2/
Stats : 6 scanned, 1 matched, 2 changed mode
Speed : 1.67 KiB in (1.99 KiB/s), 484 out (578/s)
Total Time : 0s.
STATUS : PASSED
[root@user-1 linux]
```

chmod -referência <reference>

Use o `-reference <reference>` parâmetro com o `chmod` comando para especificar o arquivo ou ponto de diretório referenciado.

Sintaxe

```
xcp chmod -reference <reference> <source NFS export path>
```

Mostrar exemplo

```
[root@user-1 linux]# ./xcp chmod -reference 101.11.10.10:/s_v1/D1/1.txt  
102.21.10.10:/s_v1/D2/
```

```
Xcp command : xcp chmod -reference 101.11.10.10:/s_v1/D1/1.txt  
102.21.10.10:/s_v1/D2/
```

```
Stats : 6 scanned, 6 changed mode
```

```

despejo de memória

O comando NFS `logdump` filtra os logs com base na ID de migração ou na ID da tarefa e descarrega esses logs em um `.zip` arquivo no diretório atual. O `.zip` ficheiro tem o mesmo nome que a migração ou ID da tarefa que é utilizada com o comando.

Sintaxe

```
xcp logdump -m <migration ID>  
xcp logdump -j <job ID>
```

Mostrar exemplo

```

A tabela a seguir lista os `delete` parâmetros e sua descrição.

Parâmetro	Descrição
<code>eliminar -corresponder</code>	Apenas processa os arquivos e diretórios que correspondem ao filtro.
<code>eliminar -force</code>	Elimina sem confirmação.
<code>delete -removetopodir</code>	Remove o diretório, incluindo diretórios filho.
<code>eliminar -excluir</code>	Exclui os arquivos e diretórios que correspondem ao filtro.
<code>eliminar -paralelo</code>	Especifica o máximo de processos em lote simultâneos (padrão: 7).
<code>delete -preserve-atime</code>	Preserva o tempo de acesso do arquivo ou diretório (padrão: False).
<code>eliminar -loglevel</code>	Define o nível de log; os níveis disponíveis são INFO, DEBUG (default: INFO).
<code>eliminar -s3.insecure</code>	Fornecer a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>eliminar -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>eliminar -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.
<code>eliminar -s3.noverify</code>	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

excluir -match <filter>

Use o `-match <filter>` parâmetro com o `delete` comando para processar apenas os arquivos e diretórios que correspondem ao filtro.

Sintaxe

```
xcp delete -match <filter> <NFS export path>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp delete -match "fnm('XCP_copy_2023-04-25_05.51.28.315997')" 10.101.10.101:/xcp_catalog

estimativa

O comando XCP NFS `estimate` é usado para estimar o tempo para concluir uma cópia de linha de base da origem para o destino. Ele calcula o tempo estimado para concluir uma cópia de linha de base usando todos os recursos do sistema disponíveis atuais, como CPU, RAM, rede e outros parâmetros. Você pode usar a `-target` opção para iniciar uma operação de cópia de amostra e obter o tempo de estimativa.

Sintaxe

```
xcp estimate -id <name>
```

Mostrar exemplo

```
[root@client-01 linux]# ./xcp estimate -t 100 -id estimate01 -target
10.101.10.10:/temp8

```

A tabela a seguir lista os estimate parâmetros e sua descrição.

Parâmetro	Descrição
estimativa -id	Especifica o nome do catálogo de uma cópia ou índice de digitalização anterior.
estimativa -gbit	Usa gigabits de largura de banda para estimar o melhor tempo (padrão: 1).
estimativa -alvo	Especifica o destino a ser usado para cópia de teste em tempo real.
<<nfs_estimate_t,estimativa -t /s/m/h>	Especifica a duração da cópia de teste ao vivo (padrão: 5m).
<<nfs_estimate_bs,estimativa -bs [k]>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<<nfs_estimate_dircount,estimativa -dircount [k]>	Especifica o tamanho da solicitação para diretórios de leitura (padrão: 64K).
estimar -preservar-tempo	Preserva o tempo de acesso do arquivo ou diretório (padrão: False).

Parâmetro	Descrição
<code>estimativa -loglevel</code>	Define o nível de log; os níveis disponíveis são INFO, DEBUG (default: Info)

estimativa -id <name>

Use o `-id <name>` parâmetro com o `estimate` comando para excluir os arquivos e diretórios que correspondem ao filtro.

Sintaxe

```
xcp estimate -id <name>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp estimate -id csdata01

```

A tabela a seguir lista os indexdelete parâmetros e sua descrição.

Parâmetro	Descrição
<code>indexdelete -corresponder</code>	Apenas processa os arquivos e diretórios que correspondem ao filtro.
<code>indexdelete -loglevel</code>	Define o nível de log; os níveis disponíveis são INFO, DEBUG (default: INFO).

indexdelete -match <filter>

Use o `-match <filter>` parâmetro com o `indexdelete` comando para processar apenas os arquivos e diretórios que correspondem ao filtro.

Sintaxe

```
xcp indexdelete -match <filter>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp indexdelete -match "fnm('S3_index12')"  
  
Job ID: Job_2023-11-16_02.44.39.862423_indexdelete

isync

Visualize as descrições, parâmetros e exemplos do comando XCP `isync`, inclusive quando o `isync` comando é usado com a `estimate` opção.

isync

O comando XCP NFS `isync` compara a origem e o destino e sincroniza as diferenças no destino sem usar o índice de catálogo.

Sintaxe

```
xcp isync <source_ip_address>:/src <destination_ip_address>:/dest
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp isync <source_ip_address>:/src
<destination_ip_address>:/dest

```

A tabela a seguir lista os `isync` parâmetros e sua descrição.

Parâmetro	Descrição
<code>isync -nodata</code>	Não verifica os dados.
<code>isync -noattr</code>	Não verifica atributos.
<code>isync -nômods</code>	Não verifica os tempos de modificação do ficheiro.
<code>isync -mtimewindow</code>	Especifica a diferença de tempo de modificação aceitável para verificação.

Parâmetro	Descrição
<code>isync -corresponder</code>	Apenas processa os arquivos e diretórios que correspondem ao filtro.
<code><<nfs_isync_bs,isync -bs [k]></code>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
<code>isync -parallel</code>	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<code><<nfs_isync_dircount,isync -dircount [k]></code>	Especifica o tamanho da solicitação ao ler diretórios (padrão 64k).
<code>isync -exclude</code>	Exclui os arquivos e diretórios que correspondem ao filtro.
<code>isync -newid</code>	Especifica o nome do catálogo para um novo catálogo de índice.
<code>isync -loglevel</code>	Define o nível de log; os níveis disponíveis são INFO, DEBUG (default: INFO).
<code>isync -preserve-atime</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>isync -s3.insecure</code>	Fornecer a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>isync -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>isync -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.
<code>isync -s3.noverify</code>	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

isync -nodata

Use o `-nodata` parâmetro com o `isync` comando para especificar não verificar dados.

Sintaxe

```
xcp isync -nodata <source_ip_address>:/source_vol
<destination_ip_address>:/dest_vol
```

Mostrar exemplo

```
root@client1 linux]# ./xcp isync -nodata
<source_ip_address>:/source_vol<destination_ip_address>:/dest_vol

A tabela a seguir lista os `isync estimate` parâmetros e sua descrição.

Parâmetro	Descrição
estimativa isync -nodata	Não verifica os dados.
estimativa isync -noattrs	Não verifica atributos.
isync estimation -nômods	Não verifica os tempos de modificação do ficheiro.
isync orest -mtimewindow	Especifica a diferença de tempo de modificação aceitável para verificação.
estimativa isync -corresponder	Apenas processa os arquivos e diretórios que correspondem ao filtro.
<<nfs_isync_estimate_bs,estimativa isync -bs [k]>	Especifica o tamanho do bloco de leitura/gravação (padrão: 64K).
estimativa isync -paralelo	Especifica o número máximo de processos em lote simultâneos (padrão: 7).
<<nfs_isync_estimate_dircount,estimativa isync -dircount [k]>	Especifica o tamanho da solicitação ao ler diretórios (padrão 64k).
estimativa isync -excluir	Exclui os arquivos e diretórios que correspondem ao filtro.

Parâmetro	Descrição
<code>isync orest -id</code>	Especifica o nome do catálogo para uma operação de cópia anterior.
<code>estimativa isync -loglevel</code>	Define o nível de log; os níveis disponíveis são INFO, DEBUG (default: INFO).
<code>estimativa de isync -preservar-atime</code>	Restaura todos os arquivos para a última data acessada na origem.
<code>estimativa isync -s3.insecure</code>	Fornecer a opção de usar HTTP em vez de HTTPS para comunicação de bucket S3.
<code>estimativa isync -s3.endpoint</code>	Substitui o URL padrão do endpoint do Amazon Web Services (AWS) com o URL especificado para a comunicação de bucket do S3.
<code>isync -s3.profile</code>	Especifica um perfil do arquivo de credenciais da AWS para comunicação de bucket do S3.
<code>estimativa isync -s3.noverify</code>	Substitui a verificação padrão da certificação SSL para comunicação de bucket S3.

estimativa isync -nodata

Use o `-nodata` parâmetro com `isync estimate` para especificar não verificar os dados.

Sintaxe

```
xcp isync estimate -nodata -id <name>
```

Mostrar exemplo

```
[root@client1 linux]# ./xcp isync estimate -nodata -id <name>

Referência do comando SMB

ajuda

O comando SMB `help` exibe uma lista de comandos, parâmetros de comando e uma breve descrição de cada um. Este comando é muito útil para iniciantes que são novos no XCP.

Sintaxe

```
xcp --help
```

Mostrar exemplo

```
C:\Users\Administrator\Desktop\xcp>xcp --help
usage: xcp [-h] [-version]

{scan,show,listen,configure,copy,sync,verify,license,activate,help}
...
optional arguments:
  -h, --help            show this help message and exit
  -version              show program's version number and exit

XCP commands:
  {scan,show,listen,configure,copy,sync,verify,license,activate,help}
  scan                 Read all the files in a file tree
  show                 Request information from host about SMB shares
  listen               Run xcp service
  configure             Configure xcp.ini file
  copy                 Recursively copy everything from source to target
  sync                 Sync target with source
  verify               Verify that the target is the same as the source
  license              Show xcp license info
  activate              Activate a license on the current host
  help                 Show help for commands
```

ajude o <command>

Use <command> com `help` para exibir exemplos e detalhes de opções para o <command> especificado.

Sintaxe

```
xcp help <command>
```

A saída de exemplo a seguir mostra os detalhes, uso, argumentos e argumentos opcionais para o `sync` comando.

Mostrar exemplo

```

C:\Users\Administrator\Desktop\xcp>xcp help sync
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-preserve-
atime]
[-noatime] [-noctime] [-nomtime] [-noattrs]
[-noownership] [-atimewindow <float>] [-ctimewindow <float>]
[-mtimewindow <float>] [-acl] [-fallback-user FALLBACK_USER]
[-fallback-group FALLBACK_GROUP] [-l]
source target
Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED
attributes.
XCP sync will ignore these file attributes.
positional arguments:
source
target
optional arguments:
-h, --help            show this help message and exit
-v                    increase debug verbosity
-parallel <n>        number of concurrent processes (default: <cpu-
count>)
-match <filter>     only process files and directories that match the
filter
                    see `xcp help -match` for details)
-preserve-atime      restore last accessed date on source
-noatime             do not check file access time
-noctime            do not check file creation time
-nomtime            do not check file modification time
-noattrs            do not check attributes
-noownership         do not check ownership
-atimewindow <float> acceptable access time difference in seconds
-ctimewindow <float> acceptable creation time difference in seconds
-mtimewindow <float> acceptable modification time difference in
seconds
-acl                 copy security information
-fallback-user FALLBACK_USER
                    a user on the target machine to receive the
permissions of local
(nondomain)source machine users (eg. domain\administrator)
-fallback-group     FALLBACK_GROUP
                    a group on the target machine to receive the
permissions of local
(non-domain) source machine groups (eg. domain\administrators)
-l                  increase output
-root               sync acl for root directory
C:\Users\Administrator\Desktop\xcp>

```

mostrar

O comando `SMB show` consulta os serviços RPC e as exportações NFS de um ou mais servidores de storage. O comando também lista os serviços disponíveis e as exportações com a capacidade usada e livre de cada exportação, seguido pelos atributos da raiz de cada exportação.

Sintaxe

O `show` comando requer o nome do host ou o endereço IP do sistema exportado NFSv3:

```
xcp show \\<IP address or hostname of SMB server>
```

Mostrar exemplo

```

xcp show \\<IP address or hostname of SMB server>
0 errors
Total Time : 0s
STATUS : PASSED
```

A tabela a seguir lista os show parâmetros e sua descrição.

Parâmetro	Descrição
mostrar -v	Imprime detalhes verbose sobre servidores SMB usando o endereço IP ou o nome do host.
mostrar -h, --help	Exibe informações detalhadas sobre como usar o comando.

licença

O comando SMB `license` exibe informações de licença XCP.

Sintaxe

```
xcp license
```

Mostrar exemplo

```
C:\Users\Administrator\Desktop\xcp>xcp license
xcp license
XCP <version>; (c) yyyy NetApp, Inc.; Licensed to XXX [NetApp Inc]
until Mon Dec 31 00:00:00 yyyy
License type: SANDBOX
License status: ACTIVE
Customer name: N/A
Project number: N/A
Offline Host: Yes
Send statistics: No
Host activation date: N/A
License management URL: https://xcp.netapp.com
```

ativar

O comando SMB `activate` ativa a licença XCP. Antes de executar este comando, verifique se o arquivo de licença é baixado e copiado no diretório C: NetApp no host ou na máquina cliente XCP. A licença pode ser ativada em qualquer número de hosts.

Sintaxe

```
xcp activate
```

Mostrar exemplo

```
C:\Users\Administrator\Desktop\xcp>xcp activate
XCP activated
```

digitalizar

O comando `SMB scan` verifica recursivamente todo o compartilhamento SMB e lista todos os arquivos até o final `scan` do comando.

Sintaxe

```
xcp scan \\<SMB share path>
```

Mostrar exemplo

```
C:\Users\Administrator\Desktop\xcp>xcp scan \\<IP address or hostname
of SMB server>\volxcp
c:\netapp\xcp\xcp scan \\<IP address of SMB destination
server>\source_share
volxcp\3333.txt
volxcp\SMB.txt
volxcp\SMB1.txt
volxcp\com.txt
volxcp\commands.txt
volxcp\console.txt
volxcp\linux.txt
volxcp\net use.txt
volxcp\newcom.txt
volxcp\notepad.txt
c:\netapp\xcp\xcp scan \\<IP address of SMB destination
server>\source_share
60,345 scanned, 0 matched, 0 errors
Total Time : 8s
STATUS : PASSED
C:\Users\Administrator\Desktop\xcp>Parameters
```

A tabela a seguir lista os `scan` parâmetros e sua descrição.

Parâmetro	Descrição
<code>scan -h, --help</code>	Apresenta informações detalhadas sobre como utilizar o comando Scan.

Parâmetro	Descrição
<code>digitalização -v</code>	Aumenta a verbosidade de depuração.
<code>digitalização -paralela</code>	Especifica o número de processos simultâneos (padrão: <cpu-count>).
<code>scan -match</code>	Apenas processa arquivos e diretórios que correspondem ao filtro.
<code>digitalização -excluir</code>	Exclui apenas arquivos e diretórios no filtro.
<code>digitalização -preservar-tempo</code>	Restaura a última data acessada na origem.
<code>scan -depth</code>	Limita a profundidade de pesquisa a n níveis.
<code>estatísticas de exame</code>	Lista os arquivos no formato de relatório estatístico de árvore.
<code>digitalização -html</code>	Lista os arquivos no formato de relatório HTML estatístico de árvore.
<code>digitalização -csv</code>	Lista os arquivos no formato de relatório CSV de estatísticas de árvore.
<code>digitalização -l</code>	Lista os arquivos no formato de saída de listagem longa.
<code>leitura - propriedade</code>	Recupera informações de propriedade de arquivos e diretórios no sistema de origem.
<code>digitalização -du</code>	Resume o uso de espaço de cada diretório, incluindo subdiretórios.
<code>scan -fmt</code>	Formata a listagem de arquivos de acordo com a expressão Python (`xcp help -fmt` consulte para obter detalhes).
<code>scan -ads</code>	Verifica recursivamente todo o compartilhamento SMB e lista todos os arquivos e quaisquer fluxos de dados alternativos associados.

scan -h, --help

Use os `-h` parâmetros e `--help` com o `scan` comando para exibir informações detalhadas sobre como usar o comando `scan`.

Sintaxe

```
xcp scan --help
```

Mostrar exemplo

```
C:\netapp\xcp>xcp scan --help

usage: xcp scan [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-depth
<n>] [-loglevel <name>] [-stats] [-l] [-ownership] [-du]
                [-fmt <expression>] [-html] [-csv] [-edupe] [-bs <n>]
                [-ads]
                source
positional arguments:
  source
optional arguments:
  -h, --help            show this help message and exit
  -v                    increase debug verbosity
  -parallel <n>         number of concurrent processes (default: <cpu-
count>)
  -match <filter>       only process files and directories that match
the filter (see `xcp help -match` for details)
  -exclude <filter>    Exclude files and directories that match the
filter (see `xcp help -exclude` for details)
  -preserve-atime       restore last accessed date on source
  -depth <n>           limit the search depth
  -loglevel <name>     option to set log level filter (default:INFO)
  -stats                print tree statistics report
  -l                    detailed file listing output
  -ownership            retrieve ownership information
  -du                   summarize space usage of each directory
including subdirectories
  -fmt <expression>    format file listing according to the python
expression (see `xcp help -fmt` for details)
  -html                 Save HTML statistics report
  -csv                  Save CSV statistics report
  -edupe                Include dedupe and sparse data estimate in
reports (see documentation for details)
  -bs <n>               read/write block size for scans which read data
with -edupe (default: 64k)
  -ads                  scan NTFS alternate data stream
```

digitalização -v

Use o `-v` parâmetro com o `scan` comando para fornecer informações detalhadas de Registro para solucionar problemas ou depurar quando um erro ou aviso é relatado.

Sintaxe

```
xcp scan -v \\<IP address or hostname of SMB server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -v \\<IP address or hostname of SMB
server>\source_share
xcp scan -v \\<IP address or hostname of SMB server>\source_share

scan -parallel <n>

Use o `-parallel <n>` parâmetro com o `scan` comando para definir um número maior ou menor de processos simultâneos XCP.

O valor máximo para `n` é 61.

Sintaxe

```
xcp scan -parallel <n> \\<IP address or hostname of SMB  
server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share

cifs_share
xcp scan -parallel 8 \\<IP address or hostname of SMB
server>\cifs_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

scan -match <filter>

Use o `-match <filter>` parâmetro com o `scan` comando para processar somente arquivos e diretórios que correspondam ao filtro.

Sintaxe

```
xcp scan -match <filter> \\<IP address or hostname of SMB
server>\source_share
```

No exemplo a seguir, `scan -match` verifica todos os arquivos que foram alterados entre um mês e um ano e imprime uma linha no console para cada arquivo encontrado. O formato ISO de seu último tempo de modificação, um tamanho legível por humanos do arquivo, seu tipo e seu caminho relativo são retornados para cada arquivo.

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -match "1*month < modified < 1*year" -fmt
"{'{:>15} {:>7}{}
{'}.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname of SMB server>\source_share
xcp scan -match "1*month < modified < 1*year" -fmt "{'{:>15} {:>7} {}
{'}.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname of SMB server>\source_share

xcp scan -match 1*month < modified < 1*year -fmt '{{:>15} {:>7} {}
{'}.format(iso(mtime), humanize_size(size), type, relpath) \\<IP
address or hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

No exemplo a seguir, `scan -match` lista os arquivos que não foram modificados por mais de 3 meses e têm um tamanho maior que 4MB.

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -match "modified > 3*month and size > 4194304"
-fmt "'{},{},{{},
{{}'.format(iso(mtime), humanize_size(size), relpath)" \\<IP address or
hostname of SMB
server>\source_share
xcp scan -match "modified > 3*month and size > 4194304" -fmt "'{},{}, {{},
{{}'.format(iso(mtime), humanize_size(size), relpath)" \\<IP address or
hostname of SMB server>\source_share

xcp scan -match modified > 3*month and size > 4194304 -fmt '{},{}, {{},
{{}'.format(iso(mtime), humanize_size(size), relpath) \\<IP address or
hostname of SMB server>\source_share
317 scanned, 0 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

O primeiro dos dois exemplos a seguir corresponde apenas aos diretórios e a formatação adiciona uma vírgula entre as variáveis "mtime", "caminho relativo" e "profundidade".

O segundo exemplo redireciona a mesma saída para "name.csv".

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
"','.join(map(str, [iso(mtime), relpath, depth]))" \\<IP address or
hostname of SMB server>\source_share
xcp scan -match "type is directory" -fmt "','.join(map(str,
[iso(mtime), relpath, depth]))" \\<IP address or hostname of SMB
server>\source_share

2013-03-07_15:41:40.376072,source_share\agnostic,1
2020-03-05_04:15:07.769268,source_share,0

xcp scan -match type is directory -fmt "','.join(map(str, [iso(mtime),
relpath, depth]))" \\<IP address or hostname of SMB server>\source_share
317 scanned, 2 matched, 0 errors
Total Time : 0s
STATUS : PASSED
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -match "type is directory" -fmt
"','.join(map(str, [iso(mtime), relpath, depth]))" "\\<IP address or
hostname of SMB server>\source_share > name.csv
xcp scan -match "type is directory" -fmt "','.join(map(str,
[iso(mtime), relpath, depth]))" "\\<IP address or hostname of SMB
server>\source_share > name.csv
```

O exemplo a seguir imprime o caminho completo e o valor bruto `mtime` de todos os arquivos que não são diretórios. O `mtime` valor é preenchido com 70 caracteres para facilitar um relatório de console legível.

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -match "type is not directory" -fmt
"'{}{:>70}'.format(abspath, mtime)" "\\<IP address or hostname of SMB
server>\source_share
xcp scan -match "type is not directory" -fmt "'{}
{:>70}'.format(abspath, mtime)" "\\<IP address or hostname of SMB
server>\source_share

digitalização -excluir <filter>

Use o `-exclude <filter>` comando com o `scan` para excluir diretórios e arquivos com base no padrão no filtro.

Sintaxe

```
xcp scan -exclude <filter> \\<IP address or hostname of SMB
server>\source_share
```

No exemplo a seguir, `scan -exclude` exclui qualquer arquivo que tenha mudado entre um mês e um ano e imprime uma linha no console para cada arquivo que não é excluído. Os detalhes impressos para cada arquivo são o formato ISO de seu último tempo de modificação, um tamanho legível por humanos do arquivo, seu tipo e seu caminho relativo.

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -exclude "1*month < modified < 1*year" -fmt
"{:>15} {:>7}{}
{}'.format(iso(mtime), humanize_size(size), type, relpath)" \\<IP
address or hostname ofSMB server>\localtest\arch\win32\agnostic

xcp scan -exclude type is directory -fmt ','.join(map(str, [iso(mtime),
relpath, depth])) \\<IP address or hostname of SMB
server>\localtest\arch\win32\agnostic\snapmirror
18 scanned, 1 excluded, 0 errors
Total Time : 0s
STATUS : PASSED
```

Este exemplo a seguir imprime o caminho completo do arquivo e o bruto `mtimevalue` de todos os arquivos que não são diretórios. O `mtimevalue` é acolchoado com 70 caracteres para facilitar um relatório de console legível.

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -exclude "type is not directory" -fmt "{}
{:>70}'.format(abspath, mtime)" \\<IP address or hostname of
SMBserver>\source_share

xcp scan -exclude type is not directory -fmt '{}'
{:>70}'.format(abspath, mtime) \\<IP address or hostname of SMB
server>\source_share
18 scanned, 17 excluded, 0errors
Total Time : 0s
STATUS : PASSED
```

digitalização -preservar-tempo

Use o `-preserve-atime` parâmetro com o `scan` comando para restaurar a última data acessada de todos os arquivos na origem e redefinir o `atime` para o valor original antes que o XCP leia o arquivo.

Ao digitalizar um compartilhamento SMB, o tempo de acesso é modificado nos arquivos (se o sistema de armazenamento estiver configurado para modificar `atime` na leitura) porque o XCP está lendo os arquivos um a um. O XCP nunca altera o `atime`, apenas lê o ficheiro, que aciona uma atualização no `atime`.

Sintaxe

```
xcp scan -preserve-atime \\<IP address or hostname of SMB
server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -preserve-atime \\<IP address or hostname of SMB
server>\source_share
xcp scan -preserve-atime \\<IP address or hostname of SMB
server>\source_share

scan -depth <n> (exame - profundidade)

Use o `-depth <n>` parâmetro com o `scan` comando para limitar a profundidade de pesquisa de diretórios dentro de um compartilhamento SMB.

A `-depth` opção específica como o Deep XCP pode digitalizar os arquivos para os subdiretórios.

Sintaxe

```
xcp scan -depth <2> \\<IP address or hostname of SMB server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -depth 2 \\<IP address or hostname of SMB
server>\source_share
xcp scan -depth 2 \\<IP address or hostname of SMB server>\source_share

```

estatísticas de exame

Use o `-stats` parâmetro com o `scan` comando para listar arquivos em um formato de relatório de estatísticas de árvore.

A opção `-stats` imprime um relatório legível por humanos no console. Outras opções de formato de relatório são `-html` ou `-csv`. O formato CSV (valores separados por vírgula) tem valores exatos. Os relatórios CSV e HTML são salvos automaticamente no catálogo, se existir um catálogo.

Sintaxe

```
xcp scan -stats \\<IP address or hostname of SMB server>\source_share
```

Mostrar exemplo

```
C:\netapp\xcp>xcp scan -stats \\<IP address or hostname of SMB
server>\cifs_share

digitalização -html

Use o `-html` parâmetro com o `scan` comando para listar arquivos em um relatório de estatísticas HTML.

Os relatórios XCP (.csv, .html) são salvos no mesmo local que o binário XCP. O nome do arquivo está no formato `<xcp_process_id>_<time_stamp>.html`. Quando o XCP não consegue mapear identificadores de segurança (SIDs) para nomes de proprietários, ele usa os últimos dígitos após o "-" final no SID para representar o proprietário. Por exemplo, quando o XCP não consegue mapear o SID S-1-5-21-1896871423-3211229150-3383017265-4854184 para seu proprietário, ele representa o proprietário usando 4854184.

Sintaxe

```
xcp scan -stats -html -preserve-atime -ownership \\<IP address or hostname
of SMB server>\source_share
```

Mostrar exemplo

```
Z:\scripts\xcp\windows>xcp scan -stats -html -preserve-atime -ownership
\\<IP address or hostname of SMB server>\source_share

STATUS : PASSED
```

digitalização -du

Use o `-du` parâmetro com o `scan` comando para resumir o uso de espaço de cada diretório, incluindo subdiretórios.

Sintaxe

```
xcp scan -du \\<IP address or hostname of SMB server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -du \\<IP address or hostname of SMB
server>\source_share xcp scan -du \\<IP address or hostname of SMB
server>\source_share

STATUS : PASSED
```

scan -fmt <expression>

Use o `-fmt <expression>` parâmetro com o `scan` comando para formatar uma listagem de arquivo de acordo com uma expressão definida.

Sintaxe

```
xcp scan -fmt "'", '.join(map(str, [relpath, name, size, depth]))'
\\<IPaddress or hostname of SMB server>\source_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp scan -fmt "'", '.join(map(str, [relpath, name, size,
depth]))" \\<IP address or hostname of SMB server>\source_share
xcp scan -fmt "'", '.join(map(str, [relpath, name, size, depth]))"

scan -ads

Use o `-ads` parâmetro flag com o `scan` comando para verificar recursivamente todo o compartilhamento SMB e listar todos os arquivos e quaisquer fluxos de dados alternativos associados.

Sintaxe

```
xcp scan -ads \\<source_ip_address>\source_share\src
```

Mostrar exemplo

```
C:\netapp\xcp>xcp scan -ads \\<source_ip_address>\source_share\src

xcp scan -ads \\<source_ip_address>\source_share\src
6 scanned, 0 matched, 0 errors, 15 ads scanned
Total Time : 2s
STATUS : PASSED
```

cópia

O `copy` comando verifica e copia toda a estrutura do diretório de origem para um compartilhamento SMB de destino. O `copy` comando requer caminhos de origem e destino como variáveis. Os arquivos digitalizados e copiados, a taxa de transferência/velocidade e os detalhes do tempo decorrido são impressos no console uma vez a cada cinco segundos.

- O ficheiro de registo de tempo de execução é armazenado em "C: NetApp".
- `copy` Este comando copia dados sem uma lista de controle de acesso (ACL).

Sintaxe

```
xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share

xcp copy \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

A tabela a seguir lista os `copy` parâmetros e sua descrição.

Parâmetro	Descrição
<code>copy -h, --help</code>	Exibe informações detalhadas sobre o <code>copy</code> comando.
<code>cópia -v</code>	Aumente a verbosidade da depuração.
<code>copiar -paralelo</code>	Especifica o número de processos simultâneos (padrão: <code><cpu-count></code>).
<code>copiar -corresponder</code>	Processa apenas ficheiros e diretórios que correspondem ao filtro (consulte <code>xcp help -match</code> para obter detalhes).
<code>copiar -excluir</code>	Exclui apenas arquivos e diretórios no filtro
<code>copiar -preservar-tempo</code>	Restaura a última data acessada na origem.
<code>copiar -acl</code>	Copia informações de segurança.
<code>copy -fallback-user</code>	Especifica o usuário do ative Directory ou o usuário local (não domínio) na máquina de destino que recebe as permissões de usuários de máquina de origem local (não domínio). Por exemplo, domínio/administrador.

Parâmetro	Descrição
<code>copy -fallback-group</code>	Especifica o grupo do ative Directory ou o grupo local (não domínio) na máquina de destino que recebe as permissões de grupos de máquinas de origem local (não domínio). Por exemplo, domínio/administradores.
<code>copiar -root</code>	Copia as ACLs de um diretório raiz.
<code>copy -aclverify (sim, não)</code>	Fornecer uma opção para ignorar ou incluir a verificação ACL durante a operação <code>copy -acl</code> .
<code>copiar -nopropriedade</code>	Não copia a propriedade.
<code>copiar -bs</code>	Tamanho de bloqueio de leitura/escrita (predefinição:1M)
<code>copiar -anúncios</code>	Copia fluxos de dados alternativos NTFS do compartilhamento SMB de origem para o compartilhamento SMB de destino.

copy -h, --help

Use os `-h` parâmetros e `--help` com o `copy` comando para exibir informações detalhadas sobre o `copy` comando

Sintaxe

```
xcp copy -help
```

Mostrar exemplo

```
C:\netapp\xcp>xcp copy -help

usage: xcp copy [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve- atime] [-acl] [-fallback-user FALLBACK_USER]
[-fallback-group FALLBACK_GROUP] [-loglevel <name>] [-root] [-
noownership] [- aclverify {yes,no}] [-bs <n>] [-ads]
        source target

positional arguments:
  source
  target

optional arguments:
-h, --help            show this help message and exit
-v                    increase debug verbosity
-parallel <n>        number of concurrent processes (default: <cpu-
count>)
-match <filter>      only process files and directories that match the
filter (see `xcp help -match` for details)
-exclude <filter>    Exclude files and directories that match the
filter (see `xcp help - exclude` for details)
-preserve-atime      restore last accessed date on source
-acl                  copy security information
-fallback-user FALLBACK_USER
                        the name of the user on the target machine to
receive the permissions of local (non-domain) source machine users (eg.
domain\administrator)
-fallback-group FALLBACK_GROUP
                        the name of the group on the target machine to
receive the permissions of local (non-domain) source machine groups
(eg. domain\administrators)
-loglevel <name>    option to set log level filter (default:INFO)
-root                copy acl for root directory
-noownership         do not copy ownership
-aclverify {yes,no} choose whether you need to skip acl verification
-bs <n>              read/write block size for copy (default: 1M)
-ads                 copy NTFS alternate data streams.
```

cópia -v

Use o `-v` parâmetro com o `copy` comando para fornecer informações detalhadas de depuração.

Sintaxe

```
xcp copy -v \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -v \\<IP address of SMB destination server>\src
\\<IP address of SMB destination server>\dest\d1

failed to set attributes for "d1": (5, 'CreateDirectory', 'Access is
denied.')
failed to copy "f1.txt": (5, 'CreateFile', 'Access is denied.')
failed to set attributes for "": (5, 'SetFileAttributesW', 'Access is
denied.') error setting timestamps on "": errno (code: 5) Access is
denied.
H:\p 4\xcp_latest\xcp_cifs\xcp\ main .py copy -v \\<IP address of SMB
destination server>\src \\<IP address of SMB destination
server>\dest\d1
3 scanned, 0 matched, 0 skipped, 1 copied, 0 (0/s), 3 errors
Total Time : 3s
STATUS : FAILED
```

copy -parallel <n>

Use o `-parallel <n>` parâmetro com o `copy` comando para definir um número maior ou menor de processos simultâneos XCP. O valor padrão para `-parallel` é igual à contagem de CPU.

O valor máximo para `n` é 61.

Sintaxe

```
xcp copy -parallel <n> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -parallel 7 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -parallel 7 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

copiar - combinar <filter>

Use o `-match <filter>` parâmetro com o `copy` comando para copiar apenas os dados que correspondem ao argumento passado.

Sintaxe

```
xcp copy -match <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -match "'gx' in name" \\<IP address or hostname
of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -match 'gx' in name \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 5 matched, 4 copied, 0 errors
Total Time : 1s
STATUS : PASSED
```

copiar - excluir <filter>

Use o `-exclude <filter>` parâmetro com o `copy` comando para copiar somente os dados excluídos.

Sintaxe

```
xcp copy -exclude <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

No exemplo a seguir, os arquivos e diretórios que têm a string "ressync" em seu nome foram excluídos para cópia.

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -exclude "'ressync' in name" \\<IP address or
hostname of SMB server>\source_share \\<IP address or hostname of SMB
server>\dest_share
```

```
xcp copy -exclude 'ressync' in name \\<IP address or hostname of SMB
server>\source_share \\<IP address or hostname of SMB
server>\dest_share
18 scanned, 2 excluded, 0 skipped, 15 copied, 122KiB (50.5KiB/s), 0
errors
Total Time : 2s
STATUS : PASSED
```

copiar -preservar-tempo

Use o `-preserve-ctime` parâmetro com o `copy` comando para redefinir o "atime" para o valor original antes de XCP ler o arquivo.

Sintaxe

```
xcp copy -preserve-ctime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
317 scanned, 0 matched, 316 copied, 0 errors
Total Time : 2s
STATUS : PASSED
```

copy -acl -fallback-user <fallback_user> -fallback-group <fallback_group>

Use o `-acl` parâmetro com o `copy` comando para ativar a transferência dos descritores de segurança (ACLs).

Use o `-acl` parâmetro com `-fallback-user` as opções e `-fallback-group` para especificar um usuário e um grupo na máquina de destino ou do ative Directory para receber as permissões de usuários ou grupos de máquinas de origem locais (que não sejam de domínio). Isso não se refere a usuários não correspondidos de um ative Directory.

Sintaxe

```
xcp copy -acl -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

copy -aclverify (sim, não)

Use o `-aclverify {yes, no}` parâmetro com o `copy` comando para fornecer uma opção para ignorar ou incluir a verificação ACL durante uma operação de cópia ACL.

Você deve usar o `-aclverify {yes, no}` parâmetro com o `copy -acl` comando. Por padrão, a operação de cópia ACL verifica as ACLs. Se definir a `-aclverify` opção como `no`, pode ignorar a verificação da ACL e `fallback-user` as opções e `fallback-group` não são necessárias. Se definir `-aclverify` como `yes`, é necessário o `fallback-user` e `fallback-group` as opções, conforme apresentado no exemplo seguinte.

Sintaxe

```
xcp copy -acl -aclverify yes -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\NetApp\xcp>xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 5s, 0
acls copied
12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 10s, 0
acls copied
12 scanned, 0 matched, 0 skipped, 0 copied, 0 (0/s), 0 errors, 15s, 0
acls copied xcp copy -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (634/s), 0 errors,
11 acls copied
Total Time : 16s
STATUS : PASSED

C:\NetApp\xcp>xcp copy -acl -aclverify no
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

xcp copy -acl -aclverify no \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
12 scanned, 0 matched, 0 skipped, 11 copied, 10KiB (5.61KiB/s), 0
errors, 11 acls copied
Total Time : 1s
STATUS : PASSED
```

copiar -root

Use o `-root` parâmetro com o `copy` comando para copiar as ACLs para o diretório raiz.

Sintaxe

```
xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\NetApp\XCP>xcp copy -acl -root -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp copy -acl -root -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
6 scanned, 0 matched, 0 skipped, 5 copied, 200 (108/s), 0 errors, 6
acls copied
Total Time : 1s
STATUS : PASSED
```

copiar -nopropriedade

Use o `-noownership` parâmetro com o `copy` comando para especificar para não copiar a propriedade da origem para o destino. Você deve usar `-noownership` com a `-acl` opção e ela requer `fallback-user` e `fallback-group` como parâmetros obrigatórios.

Sintaxe

```
xcp.exe copy -acl -noownership -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\Netapp\xcp>xcp.exe copy -acl -noownership -fallback-user
"DOMAIN\User" -fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

acls copied
568 scanned, 0 matched, 0 skipped, 135 copied, 4.26MiB (872KiB/s), 0
errors, 15s, 137 acls copied xcp.exe copy -acl -noownership -fallback
-user "DOMAIN\User" -fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
568 scanned, 0 matched, 0 skipped, 567 copied, 17.7MiB (1.01MiB/s), 0
errors, 567 acls copied
Total Time : 17s
STATUS : PASSED
```

copy -bs <n>

Use o `-bs <n>` parâmetro com o `copy` comando para fornecer um tamanho de bloco de leitura/gravação. O valor padrão é 1M.

Sintaxe

```
xcp.exe copy -bs <n> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\Netapp\xcp>xcp.exe copy -bs 32k \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share

xcp.exe copy -bs 32k \\<source_IP_address>\source_share
\\<destination_IP_address>\dest_share
568 scanned, 0 matched, 0 skipped, 567 copied, 17.7MiB (6.75MiB/s), 0
errors
Total Time : 2s
STATUS : PASSED
```

copiar -anúncios

Use o `-ads` parâmetro com o `copy` comando para copiar fluxos de dados alternativos NTFS do compartilhamento SMB de origem para o compartilhamento SMB de destino.

Sintaxe

```
xcp copy -ads \\<IP address or hostname of SMB server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp copy -ads \\<source_IP_address>\source_share\src

ads copied
Total Time : 3m9s
STATUS : PASSED
```

sincronizar

O `sync` comando procura alterações e modificações nos compartilhamentos de origem e destino em paralelo e aplica as ações apropriadas ao destino para garantir que o destino seja idêntico ao da fonte. O `sync` comando compara conteúdo de dados, carimbos de hora, atributos de arquivo, propriedade e informações de segurança.

Sintaxe

```
xcp sync \\<source SMB share> \\<IP address of SMB destination server>
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
xcp sync \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

A tabela a seguir lista os `sync` parâmetros e sua descrição.

Parâmetro	Descrição
<code>sync -h, --help</code>	Mostrar esta mensagem de ajuda e sair.
<code>sincronização -v</code>	Aumente a verbosidade da depuração.
<code>sincronizar -paralelo</code>	Número de processos simultâneos (padrão: <cpu-count>).
<code>sincronizar -corresponder</code>	Processe somente arquivos e diretórios que correspondam ao filtro (consulte <code>xcp help -match</code> para obter detalhes).
<code>sync -exclude</code>	Exclua somente arquivos e diretórios no filtro.
<code>sincronizar -preservar-atime</code>	Restaurar a última data acessada na origem.
<code>sincronizar -nostime</code>	Não verifique o tempo de acesso ao ficheiro.
<code>sincronizar -noctime</code>	Não verifique a hora de criação do ficheiro.
<code>sync -nomtime</code>	Não verifique o tempo de modificação do ficheiro. (Esta opção está obsoleta. A sincronização continuará a ser executada sem esta opção.)

Parâmetro	Descrição
<code>sincronizar -nostrs</code>	Não verifique os atributos.
<code>sincronizar -nospropriedade</code>	Não verifique a propriedade.
<code>sincronizar -atimewindow</code>	Diferença de tempo de acesso aceitável, em segundos.
<code>sincronizar -ctimewindow</code>	Diferença de tempo de criação aceitável, em segundos.
<code>sincronizar -mtimewindow</code>	Diferença de tempo de modificação aceitável, em segundos,
<code>sync -acl</code>	Copiar informações de segurança.
<code>sync -fallback-user</code>	Usuário do ativo Directory ou usuário local (não-domínio) na máquina de destino para receber as permissões de usuários de máquinas de origem locais (não-domínio) (exemplo: Domínio/administrador).
<code>sync -fallback-group</code>	Grupo do ativo Directory ou grupo local (não-domínio) na máquina de destino para receber as permissões de grupos de máquinas de origem locais (não-domínio) (exemplo: Domínio/administradores).
<code>sincronização -l</code>	Aumenta os detalhes de saída.
<code>sincronizar -root</code>	Sincronizar ACLs para o diretório raiz.
<code>sincronizar -onlyacl</code>	Copie apenas as informações de segurança.
<code>sync -aclverify (sim, não)</code>	Forneça uma opção para incluir ou ignorar a verificação da ACL durante a operação de sincronização da ACL.
<code>sincronizar -bs</code>	Tamanho de bloco de leitura/escrita (predefinição:1M).
<code>sincronizar -ads</code>	Use o <code>sync</code> comando com o <code>-ads</code> sinalizador para procurar alterações e modificações de fluxos de dados alternativos no compartilhamento SMB de origem e destino. Se houver alterações, ele aplica a alteração ao destino para garantir que o destino seja idêntico à origem.

sync -h, --help

Use os `-h` parâmetros e `--help` com o `sync` comando para exibir informações detalhadas sobre o `sync` comando

Sintaxe

```
xcp sync --help
```

Mostrar exemplo

```
C:\Netapp\xcp>xcp sync --help
usage: xcp sync [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>] [-preserve-atime] [-noatime] [-noctime] [-nomtime] [-noattrs]
[-atimewindow <float>]
[-ctimewindow <float>] [-mtimewindow <float>] [-acl] [-fallback-user
FALLBACK_USER] [-fallback-group FALLBACK_GROUP] [-loglevel <name>] [-l]
[-root]
[-noownership] [-onlyacl] [-aclverify {yes,no}] [-bs <n>] [-ads] source
target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

- source
- target

optional arguments:

- h, --help show this help message and exit
- v increase debug verbosity
- parallel <n> number of concurrent processes (default: <cpu-count>)
- match <filter> only process files and directories that match the filter (see `xcp help -match` for details)
- exclude <filter> Exclude files and directories that match the filter (see `xcp help -exclude` for details)
- preserve-atime restore last accessed date on source
- noatime do not check file access time
- noctime do not check file creation time
- nomtime do not check file modification time
- noattrs do not check attributes
- atimewindow <float> acceptable access time difference in seconds
- ctimewindow <float> acceptable creation time difference in seconds
- mtimewindow <float> acceptable modification time difference in seconds
- acl copy security information
- fallback-user FALLBACK_USER the name of the user on the target machine to receive the permissions of local (non-domain) source machine users (eg. domain\administrator)
- fallback-group FALLBACK_GROUP the name of the group on the target machine to receive the permissions of local (non-domain) source machine groups

(eg. domain\administrators)

```
-loglevel <name>      option to set log levelfilter
-l                    increase output detail
-root                 sync acl for root directory
-noownership          do not sync ownership
-onlyacl              sync only acls
-aclverify {yes,no}  choose whether you need to skip acl
verification
-bs <n>               read/write block size for sync (default: 1M)
-ads                  sync ntfs alternate data stream
```

sincronização -v

Use o `-v` parâmetro com o `sync` comando para fornecer informações detalhadas de depuração.

Sintaxe

```
xcp sync -v \\<IP address or hostname of SMB
server>\vol_SMB_source_XXXXXX\warning \\<IP address of SMB destination
server>\vol_SMB_target_XXXXXX
```

Mostrar exemplo

```

```

sync -parallel <n>

Use o `-parallel <n>` parâmetro com o `sync` comando para definir um número maior ou menor de processos simultâneos XCP. O `sync -parallel <n>` comando sincroniza com o número de processos simultâneos (padrão: `<cpu-count>`).

O valor máximo para n é 61.

Sintaxe

```
xcp sync -parallel <n>> \\<IP address or hostname of SMB
server>\volxcp\\<IP address of SMB destination server>\xcpl_test1
```

Mostrar exemplo

```
C:\xcp>xcp sync -parallel 5 \\<IP address or hostname of SMB
server>\volxcp\\<IP address of SMB destination server>\xcpl_test1

Sending statistics...
```

sincronizar -match <filter>

Use o `-match <filter>` parâmetro com o `sync` comando para verificar a árvore de origem e destino e comparar apenas os arquivos ou diretórios que correspondem ao argumento de filtro. Se houver alguma diferença, o comando aplica as ações necessárias no alvo para mantê-las sincronizadas.

Sintaxe

```
xcp sync -match <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -match "'gx' in name" \\<IP address or hostname
of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -match "'gx' in name" \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -match 'gx' in name \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 10 compared, 0 removed, 0 errors
Total Time : 2s
STATUS : PASSED
```

sync -exclude <filter>

Use o `-exclude <filter>` parâmetro com o `sync` comando para excluir somente arquivos e diretórios no filtro.

Sintaxe

```
xcp sync -exclude <filter> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\netapp\xcp>xcp sync -exclude "path('*Exceptions*')" \\<IP address or
hostname of SMB server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -exclude path('*Exceptions*') \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
451 scanned, 427 excluded, 0 copied, 24 compared, 0 skipped, 0 removed,
0 errors
Total Time : 2s
STATUS : PASSED
```

sincronizar -preservar-atime

Use o `-preserve-atime` parâmetro com o `sync` comando para redefinir "atime" para o valor original antes de XCP ler o arquivo.

Sintaxe

```
xcp sync -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -preserve-atime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 4s
STATUS : PASSED
```

sincronizar -noatime

Use o `-noatime` parâmetro com o `sync` comando para sincronizar todas as diferenças na origem para o destino, excluindo arquivos que só têm diferenças no tempo de acesso.

Sintaxe

```
xcp sync -noatime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -noatime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -noatime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp sync -noatime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sincronizar -noctime

Use o `-noctime` parâmetro com o `sync` comando para sincronizar todas as diferenças na origem para o

destino, excluindo arquivos que só têm diferenças no tempo de criação.

Sintaxe

```
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -noctime \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp sync -noctime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share  
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

sync -nomtime

Use o `-nomtime` parâmetro com o `sync` comando para sincronizar todas as diferenças na origem para o destino, excluindo arquivos que só têm diferenças no tempo de modificação. (Esta opção está obsoleta. O `sync` comando continuará a ser executado sem esta opção.)

Sintaxe

```
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -nomtime \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp sync -nomtime \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sincronizar -nostrs

Use o `-noattrs` parâmetro com o `sync` comando para sincronizar todas as diferenças na origem para o destino, excluindo arquivos que só têm diferenças nos atributos de arquivo. O XCP copia um ficheiro apenas quando tem conteúdo diferente (as ACLs são transferidas).

Sintaxe

```
xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -noattrs \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -noattrs \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -noattrs \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sincronizar -nospropriedade

Use o `-noownership` parâmetro com o `sync` comando para sincronizar todas as diferenças da fonte com o

destino, excluindo arquivos que só têm diferenças na propriedade.

Sintaxe

```
xcp sync -noownership \\<IP address or hostname of SMB
server>\vol_SMB_source_XXXXXX \\<IP address of SMB destination
server>\vol_SMB_target_XXXXXX
```

Mostrar exemplo

```
>xcp sync -acl -noownership -fallback-user "DOMAIN\User" -fallback
-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP address
of SMB destination server>\dest_share
```

Total Time : 10m29s
STATUS : PASSED
```

sync -atimewindow <float>

Use o `-atimewindow <float>` parâmetro com o `sync` comando para especificar a diferença aceitável, em segundos, para o tempo de um arquivo da origem para o destino. O XCP não informa os ficheiros como sendo diferentes se a diferença de tempo for inferior a `<value>`.

Sintaxe

```
xcp sync -atimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

No exemplo a seguir, o XCP aceita uma diferença de tempo de até 10 minutos entre os arquivos de origem e destino e não atualiza o tempo no destino.

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -atimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\source_share
xcp sync -atimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\source_share

xcp sync -atimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\source_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sincronizar -ctimewindow <float>

Use o `-ctimewindow <float>` parâmetro com o `sync` comando para especificar a diferença aceitável, em segundos, para o `ctime` de um arquivo da origem para o destino. O XCP não relata arquivos como sendo diferentes quando a diferença no `ctime` é menor que o `<value>`.

Sintaxe

```
xcp sync -ctimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

No exemplo a seguir, o XCP aceita uma diferença de tempo por até 10 minutos entre os arquivos de origem e destino e não atualiza o `ctime` no destino.

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -ctimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -ctimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -ctimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED
```

sincronizar -mtimewindow <float>

Use o `-mtimewindow <float>` parâmetro com o `sync` comando para especificar a diferença aceitável, em segundos, para o mtime de um arquivo da origem para o destino. O XCP não relata os arquivos como sendo diferentes quando a diferença no mtime é menor que o `<value>`.

Sintaxe

```
xcp sync -mtimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp sync -mtimewindow 600 \\<IP address or hostname of
SMB server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -mtimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp sync -mtimewindow 600 \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors Total Time :
3s
STATUS : PASSED
```

sync -acl -fallback-user <fallback_user> -fallback-group <fallback_group>

Use os `-acl -fallback-user` parâmetros e `-fallback-group` com o `sync` comando para comparar os dados e as informações de segurança da origem com o destino e aplicar as ações necessárias no destino. As `-fallback-user` opções e `-fallback-group` são um usuário ou grupo na máquina de destino ou no ative Directory que recebem as permissões dos usuários ou grupos de origem locais (que não sejam de domínio).

Não pode utilizar a `-acl` opção sem as `-fallback-user` opções e `-fallback-group`

Sintaxe

```
xcp sync -acl -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address or hostname of SMB
server>\performance_SMB_home_dirs \\<IP address of SMB destination
server>\performance_SMB_home_dirs
```

Mostrar exemplo

```
C:\xcp>xcp sync -acl -fallback-user "DOMAIN\User" -fallback-group
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share

Total Time : 1m51
STATUS : PASSED

```

sincronização -l

Use o `-l` parâmetro com o `sync` comando para fornecer informações detalhadas de Registro na saída padrão para todas as ações executadas pelo XCP no destino.

Sintaxe

```

xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share

```

Mostrar exemplo

```

c:\netapp\xcp>xcp sync -l \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp sync -l \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share

File "atime" changed, timestamps set for "agnostic"
File "atime" changed, timestamps set for "<root>"

address of SMB destination server>\dest_share
634 scanned, 0 copied, 634 compared, 0 removed, 0 errors
Total Time : 3s
STATUS : PASSED

```

sincronizar -root

Use o `-root` parâmetro com o `sync` comando para sincronizar as ACLs para o diretório raiz.

Sintaxe

```
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\NetApp\XCP>xcp sync -acl -root -fallback-user "DOMAIN\User"  
-fallback-group "DOMAIN\Group" \\<IP address or hostname of SMB  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp sync -acl -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share

acls copied  
Total Time : 2s  
STATUS : PASSED
```

sync -onlyacl-fallback-user <fallback_user> -fallback-group <fallback_group>

Use os `-onlyacl` parâmetros, `-fallback-user` e `-fallback-group` com o `sync` comando para comparar as informações de segurança entre a origem e o destino e aplicar as ações necessárias no destino. O `-fallback-user` e `-fallback-group` são um utilizador ou grupo na máquina de destino ou no ativo Directory que recebem as permissões dos utilizadores ou grupos de origem locais (que não sejam de domínio).

Não é possível utilizar o `-onlyacl` parâmetro sem as `-fallback-user` opções e `-fallback-group`

Sintaxe

```
xcp sync -onlyacl -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\Users\ctladmin\Desktop>xcp sync -onlyacl -fallback-user
"DOMAIN\User" -fallback-group "DOMAIN\Group"
\\<source_IP_address>\source_share \\<IP address of SMB destination
server>\dest_share
```

sync -aclverify (sim, não)

Use o `-aclverify{yes,no}` parâmetro com o `sync` comando para fornecer uma opção para incluir ou ignorar a verificação da ACL durante a operação de sincronização da ACL. Esta opção só pode ser utilizada com os `sync -acl` comandos e `sync -onlyacl`. A sincronização da ACL executa a verificação da ACL por padrão. Se definir a `-aclverify` opção como `no`, pode ignorar a verificação da ACL e `fallback-user` as opções e `fallback-group` não são necessárias. Se definir `-aclverify` como `yes`, é necessário o `fallback-user` e `fallback-group` as opções, conforme apresentado no exemplo seguinte.

Sintaxe

```
xcp sync -acl -aclverify yes -fallback-user <fallback_user> -fallback
-group <fallback_group> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\NetApp\xcp>xcp sync -acl -aclverify yes -fallback-user "DOMAIN\User"
-fallback-group "DOMAIN\Group" \\<source_IP_address>\source_share \\<IP
address of SMB destination server>\dest_share

sincronizar -bs <n>

Use o `-bs <n>` parâmetro com o `sync` comando para fornecer um tamanho de bloco de leitura/gravação. O tamanho padrão é 1M.

Sintaxe

```
xcp.exe sync -bs <n> \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\Netapp\xcp>xcp.exe sync -bs 64k \\<source_IP_address>\source_share
\\<IP address of SMB destination server>\dest_share
1,136 scanned, 0 copied, 1,135 compared, 0 skipped, 95 removed, 0

xcp.exe sync -bs 64k \\<source_IP_address>\source_share \\<IP address
of SMB destination server>\dest_share 1,136 scanned, 283 copied, 1,136
compared, 0 skipped, 283 removed, 0 errors
Total Time : 10s
STATUS : PASSED
```

sincronizar -ads

``-ads`` Use o parâmetro com o ``sync`` comando para verificar se há alterações e modificações em fluxos de dados alternativos no compartilhamento SMB de origem e destino. Se houver alterações, ele aplica a alteração ao destino para garantir que o destino seja idêntico à origem.

Sintaxe

```
xcp sync -ads \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\netapp\xcp>xcp sync -ads \\<source_IP_address>\source_share\src
\\<dest_IP_address>\dest_share

verifique

O `verify` comando lê e compara os compartilhamentos de origem e destino e fornece informações sobre o que é diferente. Você pode usar o `verify` comando em qualquer origem e destino, independentemente da ferramenta usada para executar a operação de cópia ou sincronização.

Sintaxe

```
xcp verify \\<IP address or hostname of SMB server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify \\<IP address of SMB source server>\source_share \\ <IP
address of SMB destination server>\dest_share

xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
xcp verify \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
Total Time : 3s
STATUS : PASSED
```

A tabela a seguir lista os `verify` parâmetros e sua descrição.

Parâmetro	Descrição
<code>verifique -h, --help</code>	Mostrar esta mensagem de ajuda e sair.
<code>verifique -v</code>	Aumente a verbosidade da depuração.
<code>verificar -paralelo</code>	Número de processos simultâneos (padrão: <cpu-count>).
<code>verificar -corresponder</code>	Processe somente arquivos e diretórios que correspondam ao filtro (consulte <code>xcp help -match</code> para obter detalhes).

Parâmetro	Descrição
<code>verificar -excluir</code>	Exclua somente arquivos e diretórios no filtro.
<code>verifique -preserve-atime</code>	Restaurar a última data acessada na origem.
<code>verifique -nodata</code>	Não verifique os dados.
<code>verifique -atime</code>	Verifique o tempo de acesso ao arquivo.
<code>verifique -noctime</code>	Não verifique a hora de criação do ficheiro.
<code>verifique -nomtime</code>	Não verifique o tempo de modificação do ficheiro.
<code>verifique -noattr</code>	Não verifique os atributos.
<code>verifique -nopropriedade</code>	Não verifique a propriedade.
<code>verifique -ads</code>	O <code>verify</code> comando com o <code>-ads</code> parâmetro verifica se há fluxos de dados alternativos na origem e no destino e exibe quaisquer diferenças.
<code>verifique -noacls</code>	Não verifique ACLs.
<code>verificar -atimewindow</code>	Diferença de tempo de acesso aceitável, em segundos.
<code>verificar -ctimewindow</code>	Diferença de tempo de criação aceitável, em segundos.
<code>verificar -mtimewindow</code>	Diferença de tempo de modificação aceitável, em segundos,
<code>verifique -stats</code>	Analise árvores de origem e destino em paralelo e compare estatísticas de árvore.
<code>verificar -l</code>	Aumenta os detalhes de saída.
<code>verifique -ll</code>	Aumenta o detalhe de saída (formato git diff).
<code>verificar -fallback-user</code>	Usuário do ativo Directory ou usuário local (não-domínio) na máquina de destino para receber as permissões de usuários de máquinas de origem locais (não-domínio) (exemplo: Domínio/administrador).
<code>verificar -fallback-group</code>	Grupo do ativo Directory ou grupo local (não-domínio) na máquina de destino para receber as permissões de grupos de máquinas de origem locais (não-domínio) (exemplo: Domínio/administradores).
<code>verifique -root</code>	Verifique ACLs para o diretório raiz.
<code>verifique -onlyacl</code>	Verifique apenas as informações de segurança.

verifique -h, --help

Use os `-h` parâmetros e `--help` com o `verify` comando para exibir informações detalhadas sobre o `verify` comando

Sintaxe

```
xcp verify -help
```

Mostrar exemplo

```
C:\Netapp\xcp>xcp verify -help
usage: xcp verify [-h] [-v] [-parallel <n>] [-match <filter>] [-exclude
<filter>][-preserve-ctime]
[-loglevel <name>] [-fallback-user FALLBACK_USER]
[-fallback-group FALLBACK_GROUP] [-noacls] [-nodata] [-stats] [-l] [-
root] [-noownership] [-onlyacl] [-noctime] [-nomtime] [-noattrs] [-
ctime]
[-atimewindow <float>] [-ctimewindow <float>] [-mtimewindow <float>] [-
ads] source target
```

Note: ONTAP does not let a SMB client modify COMPRESSED or ENCRYPTED attributes. XCP sync will ignore these file attributes.

positional arguments:

- source
- target

optional arguments:

- h, --help show this help message and exit
- v increase debug verbosity
- parallel <n> number of concurrent processes (default: <cpu-count>)
- match <filter> only process files and directories that match the filter (see `xcp help -match` for details)
- exclude <filter> Exclude files and directories that match the filter (see `xcp help -exclude` for details)
- preserve-ctime restore last accessed date on source
- help-diag Show all options including diag. The diag options should be used only on recommendation by NetApp support.
- loglevel <name> option to set log level filter (default:INFO)
- fallback-user FALLBACK_USER
a user on the target machine to translate the permissions of local (non-domain) source machine users (eg. domain\administrator)
- fallback-group FALLBACK_GROUP
a group on the target machine to translate the permissions of local (non- domain) source machine groups (eg. domain\administrators)
- nodata do not check data
- stats scan source and target trees in parallel and compare tree statistics
- l detailed file listing output
- root verify acl for root directory
- noacls do not check acls

```

-noownership          do not check ownership
-onlyacl             verify only acls
-noctime            do not check file creation time
-nomtime           do not check file modification time
-noattrs           do not check attributes
-atime            verify access time as well
-atimewindow <float> acceptable access time difference in seconds
-ctimewindow <float> acceptable creation time difference in seconds
-mtimewindow <float> acceptable modification time difference in
seconds
-ads              verify ntfs alternate data stream

```

verifique -v

Use o `-v` parâmetro com o `verify` comando para fornecer informações detalhadas de depuração.

Sintaxe

```
xcp verify -v \\<IP address of SMB source server>\source_share address of
SMB destination server>\dest_share
```

Mostrar exemplo

```

c:\netapp\xcp> xcp verify -v \\<IP address of SMB source
server>\source_share address of SMB destination server>\dest_share
xcp verify -v \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share

xcp verify -v \\< IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED

```

verifique -parallel <n>

Use o `-parallel <n>` parâmetro com o `verify` comando para definir um número maior ou menor de processos simultâneos XCP. O `verify -parallel <n>` comando verifica o número de processos simultâneos (padrão: `<cpu-count>`).

O valor máximo para n é 61.

Sintaxe

```
xcp verify -v -parallel <n> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
  
xcp verify -v -parallel 8 \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 4s  
STATUS : PASSED
```

verifique -match <filter>

Use o `-match <filter>` parâmetro com o `verify` comando para verificar a árvore de origem e destino e comparar apenas os arquivos ou diretórios que correspondem ao argumento de filtro. Se houver alguma diferença, o comando aplica as ações necessárias no alvo para mantê-las sincronizadas.

Sintaxe

```
xcp verify -v -match <filter> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -v -match "'Microsoft' in name" \\<IP address
of SMB source server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -v -match "'Microsoft' in name" \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -v -match 'Microsoft' in name \\<IP address of SMB source
server> \source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 0 compared, 0 same, 0 different, 0 missing, 0 errors
Total Time : 1s
STATUS : PASSED
```

verifique -excluir <filter>

Use o `-exclude <filter>` parâmetro com o `verify` comando para excluir somente arquivos e diretórios no filtro.

Sintaxe

```
xcp verify -exclude <filter> \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\netapp\xcp>xcp verify -exclude "path('*Exceptions*')" \\<IP address
of SMB sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share

210 scanned, 99 excluded, 6 compared, 5 same, 1 different, 0 missing, 0

445 scanned, 427 excluded, 17 compared, 17 same, 0 different, 0
missing, 0 errors
Total Time : 1m11s
STATUS : PASSED
```

verifique -preserve-atime

Use o `-preserve-atime` parâmetro com o `verify` comando para redefinir `atime` o valor original antes que o XCP leia o arquivo.

Sintaxe

```
xcp verify -preserve-atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -preserve-atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -preserve-atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

Total Time : 8s
STATUS : PASSED
```

verifique -nodata

Use o `-nodata` parâmetro com o `verify` comando para não comparar dados.

Sintaxe

```
xcp verify -nodata \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -nodata \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -nodata \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp verify -nodata \\<IP address of SMB source server> \source_share
\\<IP address of SMB destination server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s

```

verifique -atime

Use o `-atime` parâmetro com o `verify` comando para comparar carimbos de hora de acesso ao arquivo da origem para o destino.

Sintaxe

```
xcp verify -ll -atime \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\Netapp\xcp> xcp verify -ll -atime \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share

STATUS : FAILED
```

verifique -noctime

Use o `-noctime` parâmetro com o `verify` comando para não comparar carimbos de hora de criação de arquivos da origem para o destino.

Sintaxe

```
xcp verify -noctime \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -noctime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -noctime \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp verify -noctime \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share : PASSED

STATUS : PASSED
```

verifique -nomtime

Use o `-nomtime` parâmetro com o `verify` comando para não comparar carimbos de hora de modificação de arquivo da origem para o destino.

Sintaxe

```
xcp verify -nomtime \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -nomtime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -nomtime \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share

xcp verify -nomtime \\<IP address of SMB source server>\source_share
\\<IP address of SMB destination server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors

STATUS : PASSED
```

verifique -noattrs

Use o `-noattrs` parâmetro com o `verify` comando para não verificar atributos.

Sintaxe

```
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share

xcp verify -noattrs \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verifique -nopropriedade

Use o `-noownership` parâmetro com o `verify` comando para não verificar a propriedade.

Sintaxe

```
xcp verify -noownership \\<IP address of SMB source server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -noownership \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share : PASSED
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verifique -ads

Use o `-ads` parâmetro com o `verify` comando para verificar se há fluxos de dados alternativos na origem e no destino e exibir quaisquer diferenças.

Sintaxe

```
xcp verify -ads \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -ads \\<source_IP_address>\source_share\src
\\<dest_IP_address>\dest_share
```

server>\dest_share  
318 scanned, 317 compared, 317 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

verifique -noacls -noownership

Use o `-noownership` parâmetro com `verify -noacls` para não verificar ACLs ou propriedade da origem para o destino.

Sintaxe

```
xcp verify -noacls -noownership <source> <target>
```

verifique -atimewindow <float>

Use o `-atimewindow <float>` parâmetro com o `verify` comando para especificar a diferença aceitável, em segundos, para o `atime` de um arquivo da origem para o destino. O XCP não informa os ficheiros como sendo diferentes se a diferença `atime` for inferior a `<value>`. O `verify - atimewindow` comando só pode ser usado com a `-atime` bandeira.

Sintaxe

```
xcp verify -atimewindow <float> \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\Netapp\xcp> xcp verify -atimewindow 600 -atime \\<IP address of SMB
source server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -atimewindow 600 -atime \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

14 scanned, 13 compared, 13 same, 0 different, 0 missing, 0 errors
```

verifique -ctimewindow <float>

Use o `-ctimewindow <float>` parâmetro com o `verify` comando para especificar a diferença aceitável, em segundos, para o `ctime` de um arquivo da origem para o destino. O XCP não relata os ficheiros como sendo diferentes quando a diferença no `ctime` é inferior ao `<value>`.

Sintaxe

```
xcp verify -ctimewindow <float> \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -ctimewindow 600 \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -ctimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -ctimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verifique -mtimewindow <float>

Use o `-mtimewindow <float>` parâmetro com o `verify` comando para especificar a diferença aceitável, em segundos, para o `mtime` de um arquivo da origem para o destino. O XCP não relata os ficheiros como sendo diferentes quando a diferença no `mtime` é inferior ao `<value>`.

Sintaxe

```
xcp verify -mtimewindow <float> \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -mtimewindow 600 \\<IP address of SMB
sourceserver>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -mtimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share

xcp verify -mtimewindow 600 \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verifique -stats

Use o `-stats` parâmetro com o `verify` comando para digitalizar a origem e o destino e imprimir um relatório de estatísticas de árvore mostrando semelhanças ou diferenças entre os dois compartilhamentos.

Sintaxe

```
xcp verify -stats \\<IP address or hostname of SMB server>\source_share  
\\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -stats \\<IP address or hostname of SMB
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -stats \\<IP address or hostname of SMB server>\source_share
\\<IP address of SMB destination server>\dest_share
```

```

verificar -l

Use o `-l` parâmetro com o `verify` comando para listar as diferenças entre arquivos e diretórios na origem e no destino.

Sintaxe

```
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

No exemplo a seguir, durante a cópia, as informações de propriedade não foram transferidas e você pode ver as diferenças na saída do comando.

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -l \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination  
server>\dest_share  
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
  
xcp verify -l \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors  
Total Time : 3s  
STATUS : PASSED
```

verifique -ll

Use o `-ll` parâmetro com o `verify` comando para listar as diferenças detalhadas dos arquivos ou diretórios da origem e do destino. O formato é como git diff. O valor vermelho é o antigo da fonte, e o valor verde é o novo do alvo.

Sintaxe

```
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
c:\netapp\xcp>xcp verify -ll \\<IP address of SMB source
server>\source_share \\<IP address of SMB destination
server>\dest_share
xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share

xcp verify -ll \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
374 scanned, 373 compared, 373 same, 0 different, 0 missing, 0 errors
Total Time : 3s
STATUS : PASSED
```

verifique-fallback-user <fallback_user> -fallback-group <fallback_group>

Use os `-fallback-user` parâmetros e `-fallback-group` com o `verify` comando para listar as diferenças de ACL e propriedade entre arquivos e diretórios na origem e destino.

Se utilizar `fallback-user` e `fallback-group` com uma operação de cópia ou sincronização, o NetApp recomenda que também utilize os `fallback-user` parâmetros e `fallback-group` com a operação verificar.

Sintaxe

```
xcp verify -fallback-user <fallback_user> -fallback-group <fallback_group>
\\<IP address of SMB source server>\source_share \\<IP address of SMB
destination server>\dest_share
```

verifique -noownership-fallback-user <fallback_user> -fallback-group <fallback_group>

Use os `-noownership`, `-fallback-user` parâmetros e `-fallback-group` com o `verify` comando para listar as diferenças da ACL e ignorar a verificação da propriedade entre arquivos e diretórios na origem e no destino.

Sintaxe

```
xcp verify -noownership -fallback-user <fallback_user> -fallback-group
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP
address of SMB destination server>\dest_share
```

verifique -noacls-fallback-user <fallback_user> -fallback-group <fallback_group>

Use os `-noacls` parâmetros, `-fallback-user` e `-fallback-group` com o `verify` comando para ignorar a verificação das ACLs e verificar a propriedade entre arquivos e diretórios na origem e no destino.

Sintaxe

```
xcp verify -noacls -fallback-user <fallback_user> -fallback-group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

verifique -root

Use o `-root` parâmetro com o `verify` comando para verificar as ACLs do diretório raiz.

Sintaxe

```
xcp verify -root -fallback-user <fallback_user> -fallback- group  
<fallback_group> \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\NetApp\XCP>xcp verify -root -fallback-user "DOMAIN\User" -fallback  
-group "DOMAIN\Group" \\<IP address of SMB source server>\source_share  
\\<IP address of SMB destination server>\dest_share  
  
xcp verify -l -root -fallback-user "DOMAIN\User" -fallback-group  
"DOMAIN\Group" \\<IP address of SMB source server>\source_share \\<IP  
address of SMB destination server>\dest_share  
7 scanned, 6 compared, 6 same, 0 different, 0 missing, 0 errors  
Total Time : 1s  
STATUS : PASSED
```

verifique -onlyacl -fallback-user <fallback_user> -fallback- group <fallback_group>

Utilize os `-onlyacl` `-fallback-user` parâmetros e `-fallback-group` com o `verify` comando para comparar apenas as informações de segurança entre a origem e o destino.

Sintaxe

```
xcp verify -onlyacl -preserve-atime -fallback-user <fallback_user>  
-fallback- group <fallback_group> \\<IP address of SMB source  
server>\source_share \\<IP address of SMB destination server>\dest_share
```

Mostrar exemplo

```
C:\Users\ctladmin\Desktop>xcp verify -onlyacl -preserve-atime -fallback
-user "DOMAIN\User" -fallback- group "DOMAIN\Group" -ll
\\<source_IP_address>\source_share \\<IP address of SMB destination
server>\dest_share

configurar

O `configure` comando configura o sistema SMB e se conecta ao sistema onde o banco de dados PostgreSQL está sendo executado.

Sintaxe

```
xcp.exe configure
```

Mostrar exemplo

```
C:\NetApp\XCP>xcp.exe configure

Please choose the menu you want to start:
1. Configure xcp.ini file
0. Quit
```

ouça

O `listen` comando lê o binário XCP e inicia os serviços XCP.

Sintaxe

```
xcp.exe listen
```

Mostrar exemplo

```
c:\NetApp\XCP>xcp.exe listen
* Serving Flask app "xcp_rest_smb_app" (lazy loading)
* Environment: production
  WARNING: This is a development server. Do not use it in a production
deployment. Use a production WSGI server instead.
* Debug mode: off
```

Casos de uso da XCP

Casos de uso para XCP NFS e SMB

Saiba mais sobre os diferentes casos de uso de migração de dados do XCP para o NetApp XCP.

["Migração de dados do modo 7 para o ONTAP"](#)

["Migração de dados CIFS com ACLs de uma caixa de armazenamento de origem para o ONTAP"](#)

Registo XCP

Defina a opção logConfig

Saiba mais sobre a opção logConfig no `xcpLogConfig.json` arquivo de configuração JSON para XCP NFS e SMB.

O exemplo a seguir mostra o conjunto de arquivos de configuração JSON com a opção "logConfig":

Exemplo

```
{
  "level": "INFO",
  "maxBytes": "52428800",
  "name": "xcp.log"
}
```

- Com esta configuração, você pode filtrar as mensagens de acordo com a sua gravidade selecionando um valor de nível válido de CRITICAL, ERROR, WARNING, INFO e Debug.
- A `maxBytes` definição permite alterar o tamanho do ficheiro dos ficheiros de registo rotativos. A predefinição é 50MB. Definir o valor como rotação de 0 paradas e um único arquivo é criado para todos os logs.
- A `name` opção configura o nome do arquivo de log.
- Se algum par de valores de chave estiver ausente, o sistema usará o valor padrão. Se você cometer um erro especificando o nome de uma chave existente, ela será tratada como uma nova chave e a nova chave não afetará como os sistemas funcionam ou a funcionalidade do sistema.

Defina a opção eventlog

O XCP suporta mensagens de eventos, que você pode ativar usando a `eventlog` opção no `xcpLogConfig.json` arquivo de configuração JSON.

Para NFS, todas as mensagens de evento são gravadas no `xcp_event.log` arquivo localizado no local padrão `/opt/NetApp/xFiles/xcp/` ou em um local personalizado configurado usando a seguinte variável de ambiente:

XCP_CONFIG_DIR

Quando ambas as localizações estão definidas, `XCP_LOG_DIR` é utilizado.

Para SMB, todas as mensagens de eventos são gravadas no arquivo `xcp_event.log` localizado no local padrão `C:\NetApp\XCP\`.

Configuração JSON para mensagens de eventos para NFS e SMB

Nos exemplos a seguir, os arquivos de configuração JSON habilitam mensagens de eventos para NFS e SMB.

Exemplo de arquivo de configuração JSON com a opção eventlog ativada

```
{
  "eventlog": {
    "isEnabled": true,
    "level": "INFO"
  },
  "sanitize": false
}
```

Exemplo de arquivo de configuração JSON com eventlog e outras opções ativadas

```
{
  "logConfig": {
    "level": "INFO",
    "maxBytes": 52428800,
    "name": "xcp.log"
  },
  "eventlog": {
    "isEnabled": true,
    "level": "INFO"
  },
  "syslog": {
    "isEnabled": true,
    "level": "info",
    "serverIp": "10.101.101.10",
    "port": 514
  },
  "sanitize": false
}
```

A tabela a seguir mostra as subopções eventlog e sua descrição:

Sub-opção	Tipo de dados JSON	Valor padrão	Descrição
isEnabled	Booleano	Falso	Esta opção booleana é usada para ativar mensagens de eventos. Se definido como false, ele não gera nenhuma mensagem de evento e nenhum log de eventos será publicado no arquivo de log de eventos.
level	Cadeia de caracteres	INFORMAÇÕES	Nível do filtro de gravidade da mensagem de evento. As mensagens de eventos suportam cinco níveis de gravidade em ordem de diminuição da gravidade: CRÍTICA, ERRO, AVISO, INFORMAÇÕES e DEPURAÇÃO

Modelo para uma mensagem de log de eventos NFS

A tabela a seguir mostra um modelo e um exemplo para uma mensagem de log de eventos NFS:

Modelo	Exemplo
<pre><Time stamp> - <Severity level> {"Event ID": <ID>, "Event Category":<category of xcp event log>, "Event Type": <type of event log>, "ExecutionId": < unique ID for each xcp command execution >, "Event Source": <host name>, "Description": <XCP event log message>}</pre>	<pre>2020-07-14 07:07:07,286 - ERROR {"Event ID": 51, "Event Category": "Application failure", "Event Type": "No space left on destination error", " ExecutionId ": 408252316712, "Event Source": "NETAPP-01", "Description": "Target volume is left with no free space while executing : copy {}. Please increase the size of target volume 10.101.101.101:/cat_vol"}</pre>

Opções de mensagens do EventLog

As seguintes opções estão disponíveis para uma mensagem eventlog:

- `Event ID`: O identificador exclusivo para cada mensagem de log de eventos.
- `Event Category`: Explica a categoria do tipo de evento e da mensagem do log de eventos.
- `Event Type`: Esta é uma string curta que descreve a mensagem de evento. Vários tipos de eventos podem pertencer a uma categoria.
- `Description`: O campo de descrição contém a mensagem de log de eventos gerada pelo XCP.
- `ExecutionId`: Um identificador exclusivo para cada comando XCP executado.

Ative o cliente syslog

O XCP oferece suporte a um cliente syslog para enviar mensagens de log de eventos XCP para um recetor syslog remoto para NFS e SMB. Ele suporta o protocolo UDP usando a porta padrão 514.

Configure o cliente syslog para NFS e SMB

A ativação do cliente syslog requer a configuração `syslog` da opção no `xcpLogConfig.json` arquivo de configuração para NFS e SMB.

O exemplo de configuração a seguir para o cliente syslog para NFS e SMB:

```

{
  "syslog":{
    "isEnabled":true,
    "level":"INFO",
    "serverIp":"10.101.101.d",
    "port":514
  },
  "sanitize":false
}

```

Opções do syslog

A tabela a seguir mostra as sub opções do syslog e sua descrição:

Sub-opção	Tipo de dados JSON	Valor padrão	Descrição
isEnabled	Booleano	Falso	Esta opção booleana habilita o cliente syslog no XCP. Configurá-lo como false irá ignorar a configuração syslog.
level	Cadeia de caracteres	INFORMAÇÕES	Nível do filtro de gravidade da mensagem de evento. As mensagens de eventos suportam cinco níveis de gravidade em ordem de diminuição da gravidade: CRÍTICA, ERRO, AVISO, INFORMAÇÕES e DEPURACÃO
serverIp	Cadeia de caracteres	Nenhum	Esta opção lista os endereços IP ou nomes de host do servidor syslog remoto.
port	Integar	514	Esta opção é a porta do recetor syslog remoto. Você pode configurar os recetores syslog para aceitar datagramas syslog em uma porta diferente com esta opção.a porta UDP padrão é 514.

A `sanitize` opção não deve ser especificada na configuração "syslog". Essa opção tem um escopo global e é comum ao log, log de eventos e syslog na configuração JSON. Definir esse valor como "verdadeiro" ocultará informações confidenciais nas mensagens syslog postadas no servidor syslog.

Formato de mensagem syslog

Todas as mensagens syslog enviadas para o servidor syslog remoto via UDP são formatadas de acordo com o formato RFC 5424 para NFS e SMB.

A tabela a seguir mostra o nível de gravidade de acordo com o RFC 5424 suportado para mensagens syslog para XCP:

Valores de gravidade	Nível de gravidade
3	Erro: Condições de erro

Valores de gravidade	Nível de gravidade
4	Aviso: Condições de aviso
6	Informativo: Mensagens informativas
7	Debug: Mensagens no nível de depuração

No cabeçalho syslog para NFS e SMB, a versão tem um valor de 1 e o valor de instalação para todas as mensagens para XCP é definido como 1 (mensagens no nível do usuário):

<PRI> = syslog facility * 8 + severity value

Formato de mensagem syslog de aplicativos XCP com um cabeçalho syslog para NFS:

A tabela a seguir mostra um modelo e um exemplo do formato de mensagem syslog com um cabeçalho syslog para NFS:

Modelo	Exemplo
<pre><PRI><version> <Time stamp> <hostname> xcp_nfs - - - <XCP message></pre>	<pre><14>1 2020-07-08T06:30:34.341Z netapp xcp_nfs - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}</pre>

Mensagem do aplicativo XCP sem cabeçalho syslog para NFS

A tabela a seguir mostra um modelo e um exemplo do formato de mensagem syslog sem um cabeçalho syslog para NFS:

Modelo	Exemplo
<pre><message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message></pre>	<pre>INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "netapp", "Description": "XCP scan is completed by scanning 8 items"}</pre>

Formato de mensagem syslog de aplicativos XCP com cabeçalho syslog para SMB

A tabela a seguir mostra um modelo e um exemplo do formato de mensagem syslog com um cabeçalho syslog para SMB:

Modelo	Exemplo
<pre><PRI><version> <Time stamp> <hostname> xcp_smb - - - <XCP message</pre>	<pre><14>1 2020-07-10T10:37:18.452Z bansala01 xcp_smb - - - INFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP- 01", "Description": "XCP scan is completed by scanning 17 items"}</pre>

Mensagem do aplicativo XCP sem cabeçalho syslog para SMB

A tabela a seguir mostra um modelo e um exemplo do formato de mensagem syslog sem um cabeçalho syslog para SMB:

Modelo	Exemplo
<pre><message severity level i.e CRITICAL, ERROR, WARNING, INFO, DEBUG> <XCP event log message></pre>	<pre>NFO {"Event ID": 14, "Event Category": "XCP job status", "Event Type": "XCP scan completion", "Event Source": "NETAPP-01", "Description": "XCP scan is completed by scanning 17items"}</pre>

Registos de eventos XCP

Logs de eventos NFS XCP

Veja exemplos de logs de eventos para XCP NFS.

A tabela a seguir mostra logs de eventos para XCP NFS.
