# **Native Python**

### Before you begin

Python is a popular development language for datacenter automation. Before using the native features of Python together with several common packages, you need to prepare the environment and the required input files.

In addition to accessing the Astra Control REST API directly using Python, NetApp also provides a toolkit package which abstracts the API and removes some of the complexities. See NetApp Astra Control Python SDK for more information.

### Prepare the environment

The basic configuration requirements to run the Python scripts are described below.

#### Python 3

You need to have the latest version of Python 3 installed.

#### **Additional libraries**

The **Requests** and **urllib3** libraries must be installed. You can use pip or another Python management tool as appropriate for your environment.

#### **Network access**

The workstation where the scripts run must have network access and be able to reach Astra Control. When using Astra Control Service, you must be connected to the internet and be able to connect to the service at <a href="https://astra.netapp.io">https://astra.netapp.io</a>.

#### **Identity information**

You need a valid Astra account with the account identifier and API token. See Get an API token for more information.

### Create the JSON input files

The Python scripts rely on configuration information contained in JSON input files. Sample files are provided below.

You need to update the samples as appropriate for your environment.

#### **Identity information**

The following file contains the API token and Astra account. You need to pass this file to Python scripts using the -i (or --identity) CLI parameter.

```
{
    "api_token": "kH4CA_uVIa8q9UuPzhJaAHaGlaR7-no901DkkrVjIXk=",
    "account_id": "5131dfdf-03a4-5218-ad4b-fe84442b9786"
}
```

### List the apps

You can use the following script to list the applications for your Astra account.

See Before you begin for an example of the required JSON input file.

1 #!/usr/bin/env p	ython3

```
4 # Usage: python3 list man apps.py -i identity file.json
