Activate scanning on your data sources

Getting started with BlueXP classification for Cloud Volumes ONTAP and on-premises ONTAP

Complete a few steps to start scanning your Cloud Volumes ONTAP and on-premises ONTAP volumes using BlueXP classification.

Quick start

Get started quickly by following these steps, or scroll down to the remaining sections for full details.

1

Discover the data sources that you want to scan

Before you can scan volumes, you must add the systems as working environments in BlueXP:

- For Cloud Volumes ONTAP systems, these working environments should already be available in BlueXP
- For on-premises ONTAP systems, [BlueXP must discover the ONTAP clusters](#)

2

Deploy the BlueXP classification instance

[Deploy BlueXP classification](#) if there isn't already an instance deployed.

3

Enable BlueXP classification and select the volumes to scan

Select the **Configuration** tab and activate compliance scans for volumes in specific working environments.

4

Ensure access to volumes

Now that BlueXP classification is enabled, ensure that it can access all volumes.

- The BlueXP classification instance needs a network connection to each Cloud Volumes ONTAP subnet or on-prem ONTAP system.
- Security groups for Cloud Volumes ONTAP must allow inbound connections from the BlueXP classification instance.
- Make sure these ports are open to the BlueXP classification instance:
 - For NFS - ports 111 and 2049.
 - For CIFS - ports 139 and 445.
- NFS volume export policies must allow access from the BlueXP classification instance.
- BlueXP classification needs Active Directory credentials to scan CIFS volumes.

Click **Compliance > Configuration > Edit CIFS Credentials** and provide the credentials.

5

Manage the volumes you want to scan

Select or deselect the volumes that you want to scan and BlueXP classification will start or stop scanning them.

Discovering the data sources that you want to scan

If the data sources you want to scan are not already in your BlueXP environment, you can add them to the canvas at this time.

Your Cloud Volumes ONTAP systems should already be available in the Canvas in BlueXP. For on-premises ONTAP systems, you'll need to have [BlueXP discover these clusters](#).

Deploying the BlueXP classification instance

Deploy BlueXP classification if there isn't already an instance deployed.

If you are scanning Cloud Volumes ONTAP and on-premises ONTAP systems that are accessible over the internet, you can [deploy BlueXP classification in the cloud](#) or [in an on-premises location that has internet access](#).

If you are scanning on-premises ONTAP systems that have been installed in a dark site that has no internet access, you need to [deploy BlueXP classification in the same on-premises location that has no internet access](#). This also requires that the BlueXP Connector is deployed in that same on-premises location.

Upgrades to BlueXP classification software is automated as long as the instance has internet connectivity.

Enabling BlueXP classification in your working environments

You can enable BlueXP classification on Cloud Volumes ONTAP systems in any supported cloud provider, and on on-premises ONTAP clusters.

1. From the BlueXP left navigation menu, click **Governance > Classification** and then select the **Configuration** tab.

2. Select how you want to scan the volumes in each working environment. [Learn about mapping and classification scans](#):

- To map all volumes, click **Map all Volumes**.
- To map and classify all volumes, click **Map & Classify all Volumes**.
- To customize scanning for each volume, click **Or select scanning type for each volume**, and then choose the volumes you want to map and/or classify.

See [Enabling and disabling compliance scans on volumes](#) for details.

3. In the confirmation dialog box, click **Approve** to have BlueXP classification start scanning your volumes.

Result

BlueXP classification starts scanning the volumes you selected in the working environment. Results will be available in the Compliance dashboard as soon as BlueXP classification finishes the initial scans. The time that it takes depends on the amount of data—it could be a few minutes or hours.

- By default, if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, the system won't scan the files in your volumes because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, click **Or select scanning type for each volume**. The resulting page has a setting you can enable so that BlueXP classification will scan the volumes regardless of permissions.
- BlueXP classification scans only one file share under a volume. If you have multiple shares in your volumes, you'll need to scan those other shares separately as a shares group. [See more details about this BlueXP classification limitation](#).

Verifying that BlueXP classification has access to volumes

Make sure that BlueXP classification can access volumes by checking your networking, security groups, and export policies. You'll need to provide BlueXP classification with CIFS credentials so it can access CIFS volumes.

Steps

1. Make sure that there's a network connection between the BlueXP classification instance and each network that includes volumes for Cloud Volumes ONTAP or on-prem ONTAP clusters.
2. Ensure that the security group for Cloud Volumes ONTAP allows inbound traffic from the BlueXP classification instance.

You can either open the security group for traffic from the IP address of the BlueXP classification instance, or you can open the security group for all traffic from inside the virtual network.

3. Ensure the following ports are open to the BlueXP classification instance:
 - For NFS - ports 111 and 2049.
 - For CIFS - ports 139 and 445.
4. Ensure that NFS volume export policies include the IP address of the BlueXP classification instance so it can access the data on each volume.
5. If you use CIFS, provide BlueXP classification with Active Directory credentials so it can scan CIFS volumes.
 - a. From the BlueXP left navigation menu, click **Governance > Classification** and then select the

Configuration tab.

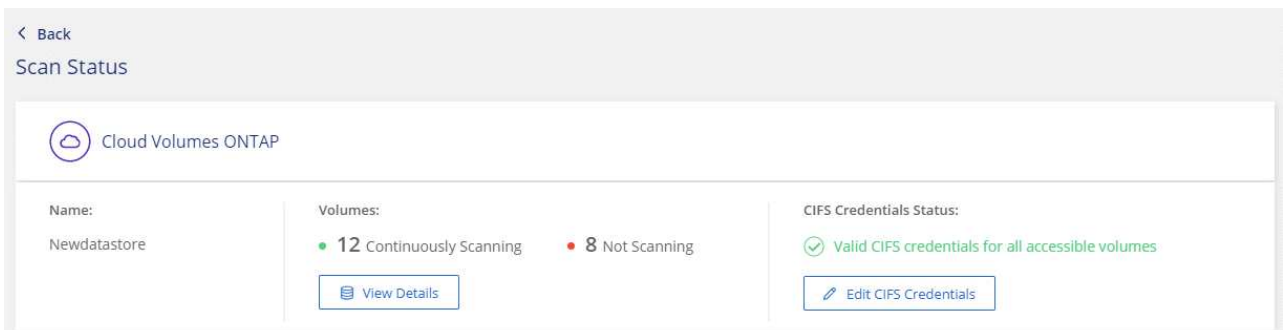

- b. For each working environment, click **Edit CIFS Credentials** and enter the user name and password that BlueXP classification needs to access CIFS volumes on the system.

The credentials can be read-only, but providing admin credentials ensures that BlueXP classification can read any data that requires elevated permissions. The credentials are stored on the BlueXP classification instance.

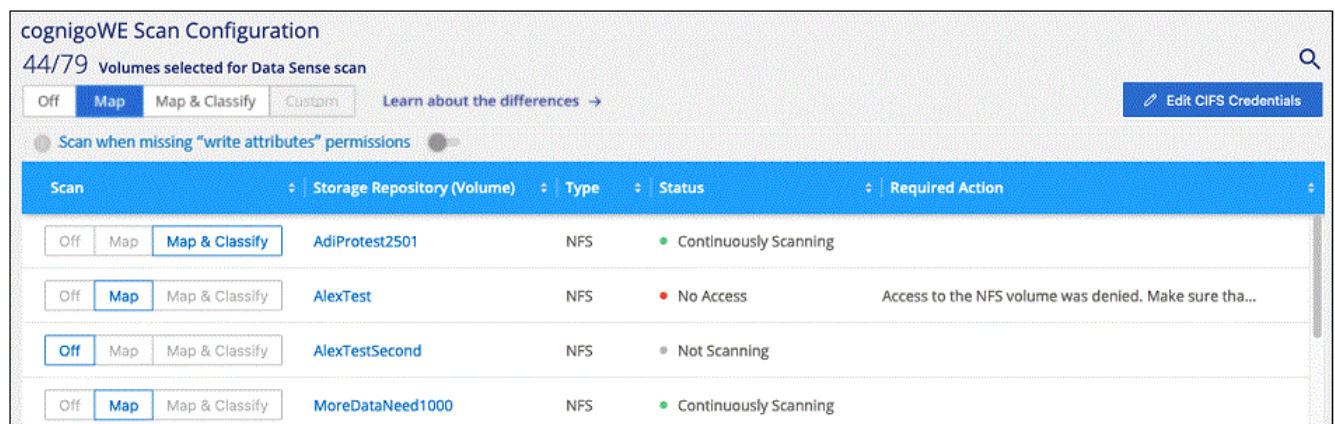

If you want to make sure your files "last accessed times" are unchanged by BlueXP classification scans, we recommend that the user has Write Attributes permissions in CIFS or write permissions in NFS. If possible, we recommend making the Active Directory configured user part of a parent group in the organization which has permissions to all files.

After you enter the credentials, you should see a message that all CIFS volumes were authenticated successfully.

6. On the *Configuration* page, click **View Details** to review the status for each CIFS and NFS volume and correct any errors.

For example, the following image shows four volumes; one of which BlueXP classification can't scan due to network connectivity issues between the BlueXP classification instance and the volume.

Enabling and disabling compliance scans on volumes

You can start or stop mapping-only scans, or mapping and classification scans, in a working environment at any time from the Configuration page. You can also change from mapping-only scans to mapping and classification scans, and vice-versa. We recommend that you scan all volumes.

The switch at the top of the page for **Scan when missing "write attributes" permissions** is disabled by default. This means that if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, that the system won't scan the files because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, turn the switch ON and all files are scanned regardless of the permissions. [Learn more.](#)

To:	Do this:
Enable mapping-only scans on a volume	In the volume area, click Map
Enable full scanning on a volume	In the volume area, click Map & Classify
Disable scanning on a volume	In the volume area, click Off
Enable mapping-only scans on all volumes	In the heading area, click Map
Enable full scanning on all volumes	In the heading area, click Map & Classify
Disable scanning on all volumes	In the heading area, click Off

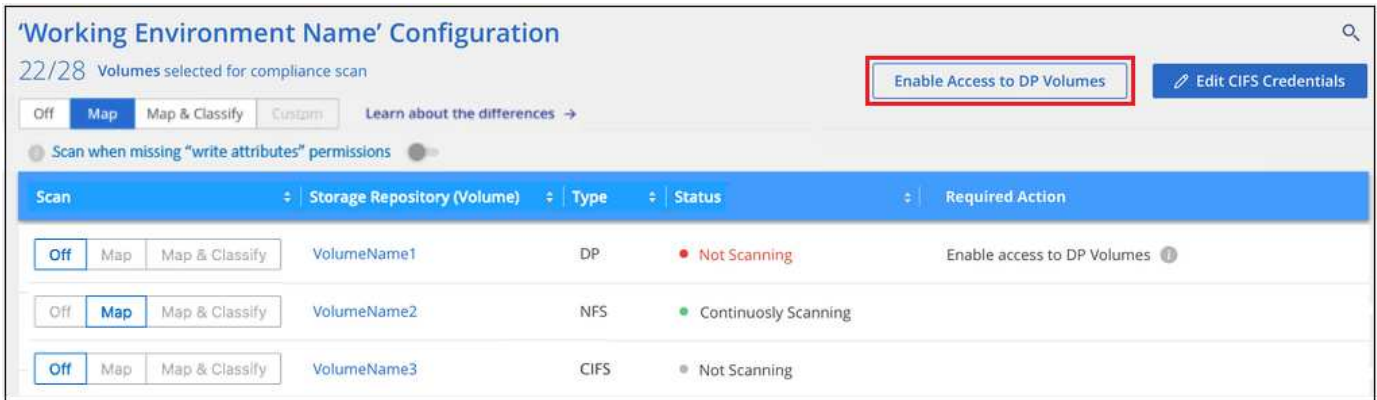

New volumes added to the working environment are automatically scanned only when you have set the **Map** or **Map & Classify** setting in the heading area. When set to **Custom** or **Off** in the heading area, you'll need to activate mapping and/or full scanning on each new volume you add in the working environment.

Scanning data protection volumes

By default, data protection (DP) volumes are not scanned because they are not exposed externally and BlueXP classification cannot access them. These are the destination volumes for SnapMirror operations from an on-premises ONTAP system or from a Cloud Volumes ONTAP system.

Initially, the volume list identifies these volumes as *Type DP* with the *Status Not Scanning* and the *Required Action Enable Access to DP volumes*.

Steps

If you want to scan these data protection volumes:

1. Click **Enable Access to DP volumes** at the top of the page.
2. Review the confirmation message and click **Enable Access to DP volumes** again.
 - Volumes that were initially created as NFS volumes in the source ONTAP system are enabled.
 - Volumes that were initially created as CIFS volumes in the source ONTAP system require that you enter CIFS credentials to scan those DP volumes. If you already entered Active Directory credentials so that BlueXP classification can scan CIFS volumes you can use those credentials, or you can specify a different set of Admin credentials.

3. Activate each DP volume that you want to scan [the same way you enabled other volumes](#).

Result

Once enabled, BlueXP classification creates an NFS share from each DP volume that was activated for scanning. The share export policies only allow access from the BlueXP classification instance.

Note: If you had no CIFS data protection volumes when you initially enabled access to DP volumes, and later add some, the button **Enable Access to CIFS DP** appears at the top of the Configuration page. Click this button and add CIFS credentials to enable access to these CIFS DP volumes.

Active Directory credentials are only registered in the storage VM of the first CIFS DP volume, so all DP volumes on that SVM will be scanned. Any volumes that reside on other SVMs will not have the Active Directory credentials registered, so those DP volumes won't be scanned.

Getting started with BlueXP classification for Azure NetApp Files

Complete a few steps to get started with BlueXP classification for Azure NetApp Files.

Quick start

Get started quickly by following these steps, or scroll down to the remaining sections for full details.

1

Discover the Azure NetApp Files systems you want to scan

Before you can scan Azure NetApp Files volumes, [BlueXP must be set up to discover the configuration](#).

2

Deploy the BlueXP classification instance

Deploy [BlueXP classification in BlueXP](#) if there isn't already an instance deployed.

3

Enable BlueXP classification and select the volumes to scan

Click **Compliance**, select the **Configuration** tab, and activate compliance scans for volumes in specific working environments.

4

Ensure access to volumes

Now that BlueXP classification is enabled, ensure that it can access all volumes.

- The BlueXP classification instance needs a network connection to each Azure NetApp Files subnet.
- Make sure these ports are open to the BlueXP classification instance:
 - For NFS – ports 111 and 2049.
 - For CIFS – ports 139 and 445.
- NFS volume export policies must allow access from the BlueXP classification instance.
- BlueXP classification needs Active Directory credentials to scan CIFS volumes.

Click **Compliance > Configuration > Edit CIFS Credentials** and provide the credentials.

5

Manage the volumes you want to scan

Select or deselect the volumes that you want to scan and BlueXP classification will start or stop scanning them.

Discovering the Azure NetApp Files system that you want to scan

If the Azure NetApp Files system you want to scan is not already in BlueXP as a working environment, you can add it to the canvas at this time.

[See how to discover the Azure NetApp Files system in BlueXP](#).

Deploying the BlueXP classification instance

Deploy [BlueXP classification](#) if there isn't already an instance deployed.

BlueXP classification must be deployed in the cloud when scanning Azure NetApp Files volumes, and it must be deployed in the same region as the volumes you wish to scan.

Note: Deploying BlueXP classification in an on-premises location is not currently supported when scanning Azure NetApp Files volumes.

Upgrades to BlueXP classification software is automated as long as the instance has internet connectivity.

Enabling BlueXP classification in your working environments

You can enable BlueXP classification on your Azure NetApp Files volumes.

1. From the BlueXP left navigation menu, click **Governance > Classification** and then select the **Configuration** tab.

2. Select how you want to scan the volumes in each working environment. [Learn about mapping and classification scans](#):
 - To map all volumes, click **Map all Volumes**.
 - To map and classify all volumes, click **Map & Classify all Volumes**.
 - To customize scanning for each volume, click **Or select scanning type for each volume**, and then choose the volumes you want to map and/or classify.

See [Enabling and disabling compliance scans on volumes](#) for details.

3. In the confirmation dialog box, click **Approve** to have BlueXP classification start scanning your volumes.

Result

BlueXP classification starts scanning the volumes you selected in the working environment. Results will be available in the Compliance dashboard as soon as BlueXP classification finishes the initial scans. The time that it takes depends on the amount of data—it could be a few minutes or hours.

- By default, if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, the system won't scan the files in your volumes because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, click **Or select scanning type for each volume**. The resulting page has a setting you can enable so that BlueXP classification will scan the volumes regardless of permissions.
- BlueXP classification scans only one file share under a volume. If you have multiple shares in your volumes, you'll need to scan those other shares separately as a shares group. [See more details about this BlueXP classification limitation.](#)

Verifying that BlueXP classification has access to volumes

Make sure that BlueXP classification can access volumes by checking your networking, security groups, and export policies. You'll need to provide BlueXP classification with CIFS credentials so it can access CIFS volumes.

Steps

1. Make sure that there's a network connection between the BlueXP classification instance and each network that includes volumes for Azure NetApp Files.

For Azure NetApp Files, BlueXP classification can only scan volumes that are in the same region as BlueXP.

2. Ensure the following ports are open to the BlueXP classification instance:
 - For NFS – ports 111 and 2049.
 - For CIFS – ports 139 and 445.
3. Ensure that NFS volume export policies include the IP address of the BlueXP classification instance so it can access the data on each volume.
4. If you use CIFS, provide BlueXP classification with Active Directory credentials so it can scan CIFS volumes.
 - a. From the BlueXP left navigation menu, click **Governance > Classification** and then select the **Configuration** tab.

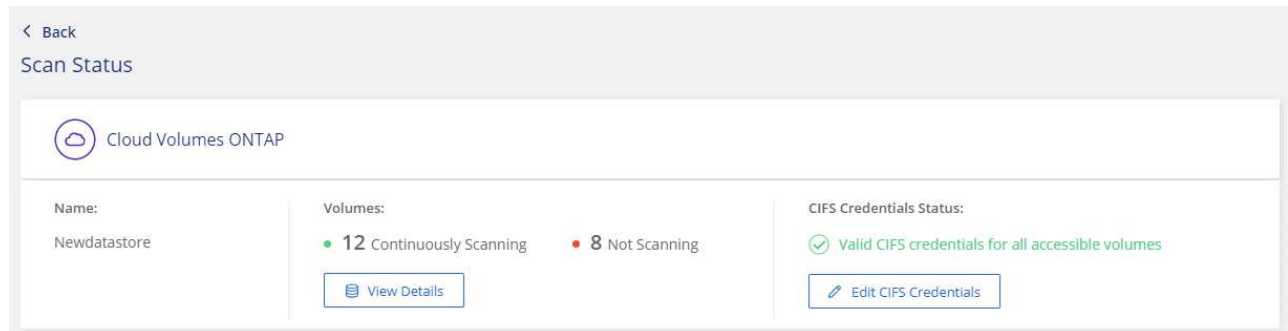

- b. For each working environment, click **Edit CIFS Credentials** and enter the user name and password that BlueXP classification needs to access CIFS volumes on the system.

The credentials can be read-only, but providing admin credentials ensures that BlueXP classification can read any data that requires elevated permissions. The credentials are stored on the BlueXP classification instance.

If you want to make sure your files "last accessed times" are unchanged by BlueXP classification

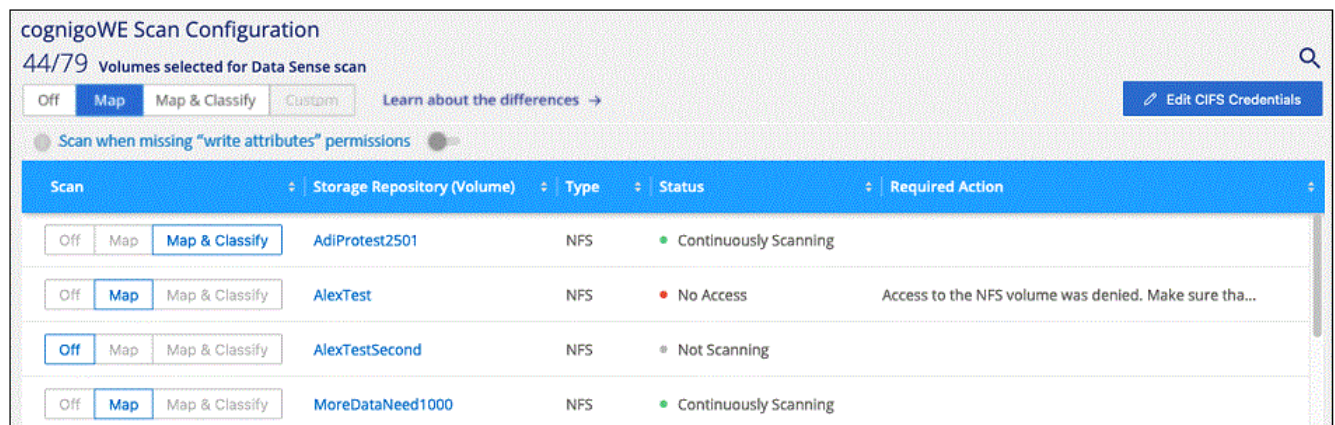

scans, we recommend that the user has Write Attributes permissions in CIFS or write permissions in NFS. If possible, we recommend making the Active Directory configured user part of a parent group in the organization which has permissions to all files.

After you enter the credentials, you should see a message that all CIFS volumes were authenticated successfully.

5. On the *Configuration* page, click **View Details** to review the status for each CIFS and NFS volume and correct any errors.

For example, the following image shows four volumes; one of which BlueXP classification can't scan due to network connectivity issues between the BlueXP classification instance and the volume.

Enabling and disabling compliance scans on volumes

You can start or stop mapping-only scans, or mapping and classification scans, in a working environment at any time from the Configuration page. You can also change from mapping-only scans to mapping and classification scans, and vice-versa. We recommend that you scan all volumes.

The switch at the top of the page for **Scan when missing "write attributes" permissions** is disabled by default. This means that if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, that the system won't scan the files because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, turn the switch ON and all files are scanned regardless of the permissions. [Learn more.](#)

New volumes added to the working environment are automatically scanned only when you have set the **Map** or **Map & Classify** setting in the heading area. When set to **Custom** or **Off** in the heading area, you'll need to activate mapping and/or full scanning on each new volume you add in the working environment.

Get started with BlueXP classification for Amazon FSx for ONTAP

Complete a few steps to get started scanning Amazon FSx for ONTAP volume with BlueXP classification.

Before you begin

- You need an active Connector in AWS to deploy and manage BlueXP classification.
- The security group you selected when creating the working environment must allow traffic from the BlueXP classification instance. You can find the associated security group using the ENI connected to the FSx for ONTAP file system and edit it using the AWS Management Console.

[AWS security groups for Linux instances](#)

[AWS security groups for Windows instances](#)

[AWS elastic network interfaces \(ENI\)](#)

Quick start

Get started quickly by following these steps or scroll down for full details.

1

Discover the FSx for ONTAP file systems you want to scan

Before you can scan FSx for ONTAP volumes, [you must have an FSx working environment with volumes configured](#).

2

Deploy the BlueXP classification instance

[Deploy BlueXP classification in BlueXP](#) if there isn't already an instance deployed.

3

Enable BlueXP classification and select the volumes to scan

Select the **Configuration** tab and activate compliance scans for volumes in specific working environments.

4

Ensure access to volumes

Now that BlueXP classification is enabled, ensure that it can access all volumes.

- The BlueXP classification instance needs a network connection to each FSx for ONTAP subnet.
- Make sure the following ports are open to the BlueXP classification instance:
 - For NFS – ports 111 and 2049.
 - For CIFS – ports 139 and 445.
- NFS volume export policies must allow access from the BlueXP classification instance.
- BlueXP classification needs Active Directory credentials to scan CIFS volumes.

Click **Compliance > Configuration > Edit CIFS Credentials** and provide the credentials.

5

Manage the volumes you want to scan

Select or deselect the volumes you want to scan and BlueXP classification will start or stop scanning them.

Discovering the FSx for ONTAP file system that you want to scan

If the FSx for ONTAP file system you want to scan is not already in BlueXP as a working environment, you can add it to the canvas at this time.

[See how to discover or create the FSx for ONTAP file system in BlueXP](#).

Deploying the BlueXP classification instance

[Deploy BlueXP classification](#) if there isn't already an instance deployed.

You should deploy BlueXP classification in the same AWS network as the Connector for AWS and the FSx volumes you wish to scan.

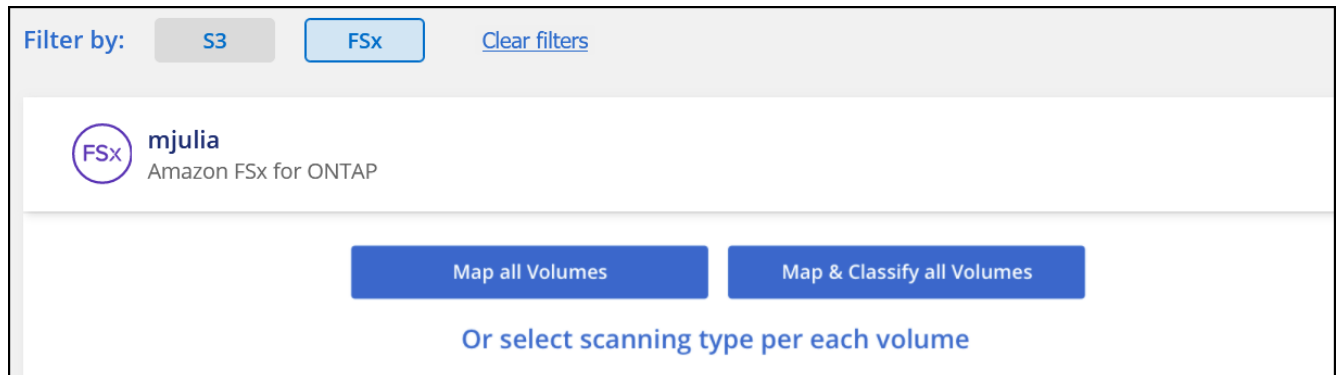

Note: Deploying BlueXP classification in an on-premises location is not currently supported when scanning FSx volumes.

Upgrades to BlueXP classification software is automated as long as the instance has internet connectivity.

Enabling BlueXP classification in your working environments

You can enable BlueXP classification for FSx for ONTAP volumes.

1. From the BlueXP left navigation menu, click **Governance > Classification** and then select the **Configuration** tab.

2. Select how you want to scan the volumes in each working environment. [Learn about mapping and classification scans](#):

- To map all volumes, click **Map all Volumes**.
- To map and classify all volumes, click **Map & Classify all Volumes**.
- To customize scanning for each volume, click **Or select scanning type for each volume**, and then choose the volumes you want to map and/or classify.

See [Enabling and disabling compliance scans on volumes](#) for details.

3. In the confirmation dialog box, click **Approve** to have BlueXP classification start scanning your volumes.

Result

BlueXP classification starts scanning the volumes you selected in the working environment. Results will be available in the Compliance dashboard as soon as BlueXP classification finishes the initial scans. The time that it takes depends on the amount of data—it could be a few minutes or hours.

- By default, if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, the system won't scan the files in your volumes because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, click **Or select scanning type for each volume**. The resulting page has a setting you can enable so that BlueXP classification will scan the volumes regardless of permissions.
- BlueXP classification scans only one file share under a volume. If you have multiple shares in your volumes, you'll need to scan those other shares separately as a shares group. [See more details about this BlueXP classification limitation](#).

Verifying that BlueXP classification has access to volumes

Make sure BlueXP classification can access volumes by checking your networking, security groups, and export policies.

You'll need to provide BlueXP classification with CIFS credentials so it can access CIFS volumes.

Steps

1. On the *Configuration* page, click **View Details** to review the status and correct any errors.

<input type="checkbox"/> Off <input type="checkbox"/> Map <input checked="" type="checkbox"/> Map & Classify	jrmclone	NFS	● No Access	Check network connectivity between the Data Sense ...

2. Make sure there's a network connection between the BlueXP classification instance and each network that includes volumes for FSx for ONTAP.

For FSx for ONTAP, BlueXP classification can scan volumes only in the same region as BlueXP.

3. Ensure the following ports are open to the BlueXP classification instance.
 - For NFS – ports 111 and 2049.
 - For CIFS – ports 139 and 445.
4. Ensure NFS volume export policies include the IP address of the BlueXP classification instance so it can access the data on each volume.
5. If you use CIFS, provide BlueXP classification with Active Directory credentials so it can scan CIFS volumes.
 - a. From the BlueXP left navigation menu, click **Governance > Classification** and then select the **Configuration** tab.
 - b. For each working environment, click **Edit CIFS Credentials** and enter the user name and password that BlueXP classification needs to access CIFS volumes on the system.

The credentials can be read-only, but providing admin credentials ensures that BlueXP classification can read any data that requires elevated permissions. The credentials are stored on the BlueXP classification instance.

If you want to make sure your files "last accessed times" are unchanged by BlueXP classification scans, we recommend that the user has Write Attributes permissions in CIFS or write permissions in NFS. If possible, we recommend making the Active Directory configured user part of a parent group in the organization which has permissions to all files.

After you enter the credentials, you should see a message that all CIFS volumes were authenticated successfully.

Enabling and disabling compliance scans on volumes

You can start or stop mapping-only scans, or mapping and classification scans, in a working environment at any time from the Configuration page. You can also change from mapping-only scans to mapping and

classification scans, and vice-versa. We recommend that you scan all volumes.

The switch at the top of the page for **Scan when missing "write attributes" permissions** is disabled by default. This means that if BlueXP classification doesn't have write attributes permissions in CIFS, or write permissions in NFS, that the system won't scan the files because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, turn the switch ON and all files are scanned regardless of the permissions. [Learn more.](#)

To:	Do this:
Enable mapping-only scans on a volume	In the volume area, click Map
Enable full scanning on a volume	In the volume area, click Map & Classify
Disable scanning on a volume	In the volume area, click Off
Enable mapping-only scans on all volumes	In the heading area, click Map
Enable full scanning on all volumes	In the heading area, click Map & Classify
Disable scanning on all volumes	In the heading area, click Off

New volumes added to the working environment are automatically scanned only when you have set the **Map** or **Map & Classify** setting in the heading area. When set to **Custom** or **Off** in the heading area, you'll need to activate mapping and/or full scanning on each new volume you add in the working environment.

Scanning data protection volumes

By default, data protection (DP) volumes are not scanned because they are not exposed externally and BlueXP classification cannot access them. These are the destination volumes for SnapMirror operations from an FSx for ONTAP file system.

Initially, the volume list identifies these volumes as *Type DP* with the *Status Not Scanning* and the *Required Action Enable Access to DP volumes*.

'Working Environment Name' Configuration 22/28 Volumes selected for compliance scan

Enable Access to DP Volumes [Edit CIFS Credentials](#)

Off **Map** Map & Classify Custom [Learn about the differences](#) →

Scan when missing "write attributes" permissions

Scan	Storage Repository (Volume)	Type	Status	Required Action
Off Map Map & Classify	VolumeName1	DP	Not Scanning	Enable access to DP Volumes ⓘ
Off Map Map & Classify	VolumeName2	NFS	Continuously Scanning	
Off Map Map & Classify	VolumeName3	CIFS	Not Scanning	

Steps

If you want to scan these data protection volumes:

1. Click **Enable Access to DP volumes** at the top of the page.
2. Review the confirmation message and click **Enable Access to DP volumes** again.
 - Volumes that were initially created as NFS volumes in the source FSx for ONTAP file system are enabled.
 - Volumes that were initially created as CIFS volumes in the source FSx for ONTAP file system require that you enter CIFS credentials to scan those DP volumes. If you already entered Active Directory credentials so that BlueXP classification can scan CIFS volumes you can use those credentials, or you can specify a different set of Admin credentials.

Provide Active Directory Credentials

Use existing CIFS Scanning Credentials (user1@domain2) Use Custom Credentials

Active Directory Domain DNS IP Address

DP Volumes, created from a SnapMirror relationship, do not allow external access by default. Continuing will create NFS shares from DP Volumes which have been activated for **Data Sense**. The shares' export policies will allow access only from the Cloud **Data Sense** instance. [Learn More](#)

Enable Access to DP Volumes

Provide Active Directory Credentials

Use existing CIFS Scanning Credentials (user1@domain2) Use Custom Credentials

Username Password

Active Directory Domain DNS IP Address

DP Volumes, created from a SnapMirror relationship, do not allow external access by default. Continuing will create NFS shares from DP Volumes which have been activated for **Data Sense**. The shares' export policies will allow access only from the Cloud **Data Sense** instance. [Learn More](#)

Enable Access to DP Volumes

3. Activate each DP volume that you want to scan [the same way you enabled other volumes](#).

Result

Once enabled, BlueXP classification creates an NFS share from each DP volume that was activated for scanning. The share export policies only allow access from the BlueXP classification instance.

Note: If you had no CIFS data protection volumes when you initially enabled access to DP volumes, and later add some, the button **Enable Access to CIFS DP** appears at the top of the Configuration page. Click this button and add CIFS credentials to enable access to these CIFS DP volumes.

Active Directory credentials are only registered in the storage VM of the first CIFS DP volume, so all DP volumes on that SVM will be scanned. Any volumes that reside on other SVMs will not have the Active Directory credentials registered, so those DP volumes won't be scanned.

Scan database schemas

Complete a few steps to start scanning your database schemas with BlueXP classification.

Quick start

Get started quickly by following these steps, or scroll down to the remaining sections for full details.

1

Review database prerequisites

Ensure that your database is supported and that you have the information necessary to connect to the database.

2

Deploy the BlueXP classification instance

Deploy [BlueXP classification](#) if there isn't already an instance deployed.

3

Add the database server

Add the database server that you want to access.

4

Select the schemas

Select the schemas that you want to scan.

Review prerequisites

Review the following prerequisites to make sure that you have a supported configuration before you enable BlueXP classification.

Supported databases

BlueXP classification can scan schemas from the following databases:

- Amazon Relational Database Service (Amazon RDS)
- MongoDB
- MySQL
- Oracle
- PostgreSQL
- SAP HANA
- SQL Server (MSSQL)

The statistics gathering feature **must be enabled** in the database.

Database requirements

Any database with connectivity to the BlueXP classification instance can be scanned, regardless of where it is hosted. You just need the following information to connect to the database:

- IP Address or host name
- Port
- Service name (only for accessing Oracle databases)
- Credentials that allow read access to the schemas

When choosing a user name and password, it's important to choose one that has full read permissions to all the schemas and tables you want to scan. We recommend that you create a dedicated user for the BlueXP classification system with all the required permissions.

Note: For MongoDB, a read-only Admin role is required.

Deploy the BlueXP classification instance

Deploy BlueXP classification if there isn't already an instance deployed.

If you are scanning database schemas that are accessible over the internet, you can [deploy BlueXP classification in the cloud](#) or [deploy BlueXP classification in an on-premises location that has internet access](#).

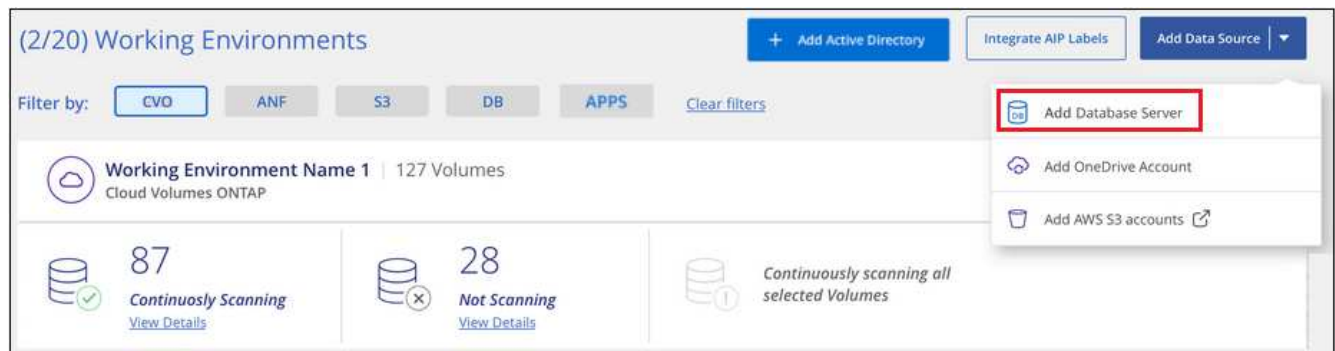

If you are scanning database schemas that have been installed in a dark site that has no internet access, you need to [deploy BlueXP classification in the same on-premises location that has no internet access](#). This also requires that the BlueXP Connector is deployed in that same on-premises location.

Upgrades to BlueXP classification software is automated as long as the instance has internet connectivity.

Add the database server

Add the database server where the schemas reside.

1. From the Working Environments Configuration page, click **Add Data Source > Add Database Server**.

2. Enter the required information to identify the database server.
 - a. Select the database type.
 - b. Enter the port and the host name or IP address to connect to the database.
 - c. For Oracle databases, enter the Service name.

- d. Enter the credentials so that BlueXP classification can access the server.
- e. Click **Add DB Server**.

Add DB Server

To activate Compliance on Databases, first add a Database Server. After this step, you'll be able to select which Database Schemas you would like to activate Compliance for.

Database

Database Type:

Host Name or IP Address:

Port:

Service Name:

Credentials

Username:

Password:

Add DB Server **Cancel**

The database is added to the list of working environments.

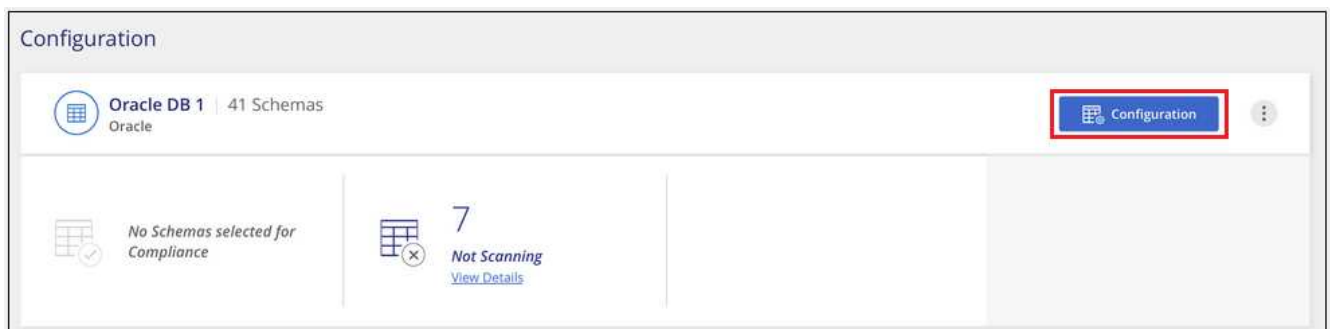

Enable and disable compliance scans on database schemas

You can stop or start full scanning of your schemas at any time.

There is no option to select mapping-only scans for database schemas.

1. From the *Configuration* page, click the **Configuration** button for the database you want to configure.

2. Select the schemas that you want to scan by moving the slider to the right.

'Working Environment Name' Configuration			
28/28 Schemas selected for compliance scan		<input type="text"/> Edit Credentials	
Scan	Schema Name	Status	Required Action
<input checked="" type="checkbox"/>	DB1 - SchemaName1	● Not Scanning	Add Credentials ⓘ
<input checked="" type="checkbox"/>	DB1 - SchemaName2	● Continuously Scanning	
<input checked="" type="checkbox"/>	DB1 - SchemaName3	● Continuously Scanning	
<input checked="" type="checkbox"/>	DB1 - SchemaName4	● Continuously Scanning	

Result

BlueXP classification starts scanning the database schemas that you enabled. If there are any errors, they'll appear in the Status column, alongside the required action to fix the error.

Note that BlueXP classification scans your databases once per day - databases are not continuously scanned like other data sources.

Scanning file shares

Complete a few steps to start scanning NFS or CIFS file shares from Google Cloud NetApp Volumes and from older NetApp 7-mode systems. These file shares can reside on-premises or in the cloud.

Scanning data from non-NetApp file shares is not supported in the BlueXP classification core version.

Quick start

Get started quickly by following these steps, or scroll down to the remaining sections for full details.

1

Review file share prerequisites

For CIFS (SMB) shares, ensure that you have credentials to access the shares.

2

Deploy the BlueXP classification instance

[Deploy BlueXP classification](#) if there isn't already an instance deployed.

3

Create a group to hold the file shares

The group is a container for the file shares that you want to scan, and it is used as the working environment name for those file shares.

4

Add the file shares to the group

Add the list of file shares that you want to scan and select the type of scanning. You can add up to 100 file shares at a time.

Reviewing file share requirements

Review the following prerequisites to make sure that you have a supported configuration before you enable BlueXP classification.

- The shares can be hosted anywhere, including in the cloud or on-premises. CIFS shares from older NetApp 7-Mode storage systems can be scanned as file shares.

Note that BlueXP classification can't extract permissions or the "last access time" from 7-Mode systems. Additionally, because of a known issue between some Linux versions and CIFS shares on 7-Mode systems, you must configure the share to use only SMB v1 with NTLM authentication enabled.

- There needs to be network connectivity between the BlueXP classification instance and the shares.
- Make sure these ports are open to the BlueXP classification instance:
 - For NFS – ports 111 and 2049.
 - For CIFS – ports 139 and 445.
- You can add a DFS (Distributed File System) share as a regular CIFS share. However, because BlueXP classification is not aware that the share is built upon multiple servers/volumes combined as a single CIFS share, you might receive permission or connectivity errors about the share when the message really only applies to one of the folders/shares that is located on a different server/volume.
- For CIFS (SMB) shares, ensure that you have Active Directory credentials that provide read access to the shares. Admin credentials are preferred in case BlueXP classification needs to scan any data that requires elevated permissions.

If you want to make sure your files "last accessed times" are unchanged by BlueXP classification scans, we recommend that the user has Write Attributes permissions in CIFS or write permissions in NFS. If possible, we recommend making the Active Directory configured user part of a parent group in the organization which has permissions to all files.

- You will need the list of shares you want to add in the format `<host_name>:/<share_path>`. You can enter the shares individually, or you can supply a line-separated list of the file shares you want to scan.

Deploying the BlueXP classification instance

Deploy BlueXP classification if there isn't already an instance deployed.

Upgrades to BlueXP classification software is automated as long as the instance has internet connectivity.

Creating the group for the file shares

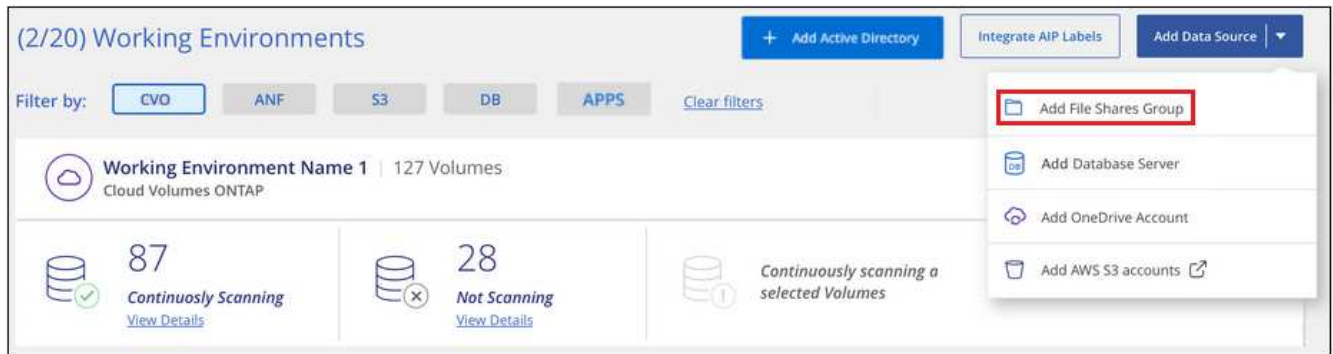

You must add a files shares "group" before you can add your file shares. The group is a container for the file shares that you want to scan, and the group name is used as the working environment name for those file shares.

You can mix NFS and CIFS shares in the same group, however, all CIFS file shares in a group need to be using the same Active Directory credentials. If you plan to add CIFS shares that use different credentials, you

must make a separate group for each unique set of credentials.

Steps

1. From the Working Environments Configuration page, click **Add Data Source > Add File Shares Group**.

2. In the Add Files Shares Group dialog, enter the name for the group of shares and click **Continue**.

The new File Shares Group is added to the list of working environments.

Adding file shares to a group

You add file shares to the File Shares Group so that the files in those shares will be scanned by BlueXP classification. You add the shares in the format `<host_name>:/<share_path>`.

You can add individual file shares, or you can supply a line-separated list of the file shares you want to scan. You can add up to 100 shares at a time.

When adding both NFS and CIFS shares in a single group, you'll need to run through the process twice - once adding NFS shares, and then again adding the CIFS shares.

Steps

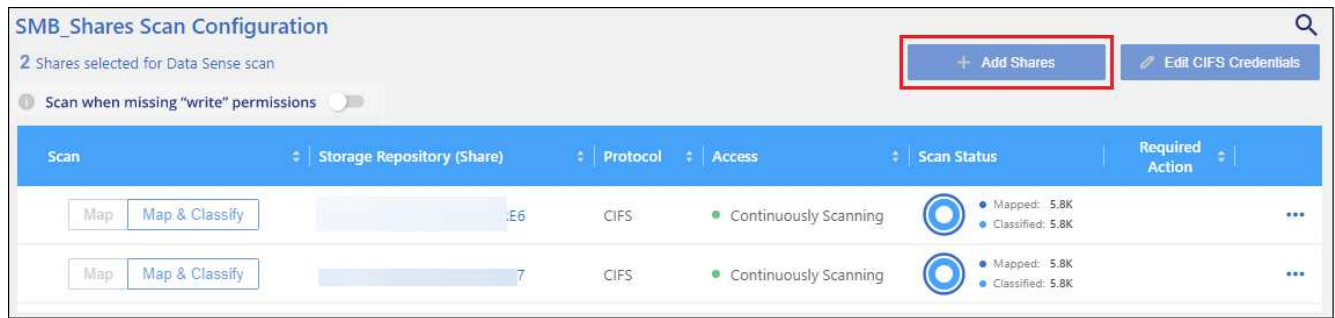

1. From the *Working Environments* page, click the **Configuration** button for the File Shares Group.

2. If this is the first time adding file shares for this File Shares Group, click **Add your first Shares**.

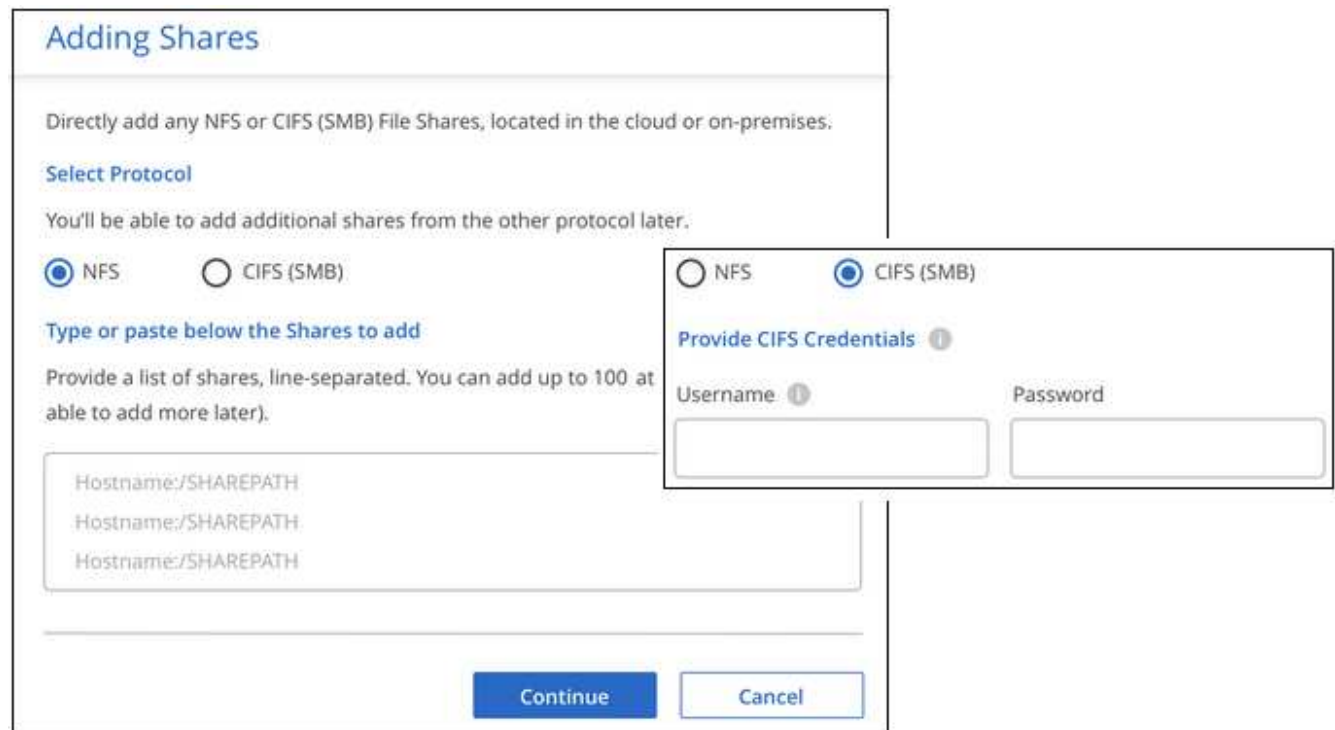

If you are adding file shares to an existing group, click **Add Shares**.

3. Select the protocol for the file shares you are adding, add the file shares that you want to scan - one file share per line - and click **Continue**.

When adding CIFS (SMB) shares, you need to enter the Active Directory credentials that provide read access to the shares. Admin credentials are preferred.

A confirmation dialog displays the number of shares that were added.

If the dialog lists any shares that could not be added, capture this information so that you can resolve the issue. In some cases you can re-add the share with a corrected host name or share name.

4. Enable mapping-only scans, or mapping and classification scans, on each file share.

To:	Do this:
Enable mapping-only scans on file shares	Click Map
Enable full scans on file shares	Click Map & Classify
Disable scanning on file shares	Click Off

The switch at the top of the page for **Scan when missing "write attributes" permissions** is disabled by default. This means that if BlueXP classification doesn't have write attributes permissions in CIFS, or write

permissions in NFS, that the system won't scan the files because BlueXP classification can't revert the "last access time" to the original timestamp. If you don't care if the last access time is reset, turn the switch ON and all files are scanned regardless of the permissions. [Learn more](#).

Result

BlueXP classification starts scanning the files in the file shares you added, and the results are displayed in the Dashboard and in other locations.

Removing a file share from compliance scans

If you no longer need to scan certain file shares, you can remove individual file shares from having their files scanned at any time. Just click **Remove Share** from the Configuration page.

The screenshot shows the 'Working Environment 2 Configuration' page. At the top, there are two buttons: '+ Add Shares' and 'Edit CIFS Credentials'. Below these, it says '2/22 Shares selected for compliance scan'. A table with columns 'Scan', 'Share name', 'Protocol', 'Status', and 'Required Action' is displayed. The 'Scan' column has buttons for 'Off', 'Map', and 'Map & Classify'. The 'Share name' column contains 'Sharepath1'. The 'Protocol' column contains 'NFS'. The 'Status' column contains 'Not Scanning' with a red dot. The 'Required Action' column contains 'Add new credentials' and a three-dot menu icon. A 'Remove Share' button is highlighted with a red box in the bottom right corner of the table.

Scan	Share name	Protocol	Status	Required Action
Off Map Map & Classify	Sharepath1	NFS	Not Scanning	Add new credentials ...
