Manage storage with Element API

You can manage Element storage clusters using the Element software API.

The Element API is based on the JSON-RPC protocol over HTTPS. JSON-RPC is a simple text- based RPC protocol based on the lightweight JSON data-interchange format. Client libraries are available for all major programming languages.

About the Element software API

The Element API is based on the JSON-RPC protocol over HTTPS. JSON-RPC is a simple text-based RPC protocol based on the lightweight JSON data-interchange format. Client libraries are available for all major programming languages.

You can make API requests via HTTPS POST requests to the API endpoint. The body of the POST request is a JSON-RPC request object. The API does not currently support batch requests (multiple request objects in a single POST). When submitting API requests, you must use "application/json-rpc" as the content-type of the request, and ensure that the body is not form-encoded.

The Element web UI makes use of the API methods described in this document. You can monitor API operations in the UI by enabling the API Log; this enables you to see the methods that are being issued to the system. You can enable both requests and responses to see how the system replies to the methods that are issued.

Unless stated otherwise, all date strings in the API responses are in UTC+0 format.

When the storage cluster is heavily loaded or you submit many consecutive API requests with no intervening delay, a method might fail and return the error "xDBVersionMismatch". If this happens, retry the method call.

Request object members

Each Element software API request has the following basic parts:

| Name | Description | Туре | Default value | Required |
|--------|-----------------------------------|--------|---------------|----------|
| method | Name of the method to be invoked. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------|--|-------------------|---------------|----------|
| parameters | Object containing the parameters to the method being invoked. Named parameters are required. Positional parameters (passed as an array) are not allowed. | JSON object | {} | No |
| id | Identifier used to match the request to response, returned in the result. | string or integer | 0 | No |

Response object members

Each Element software API response body has the following basic parts:

| Name | Description | Туре |
|------------------|--|-------------------|
| result | The object returned by the method. The system returns an object with named members corresponding to the documented return value for the method. This member is not present if an error has occurred. | JSON object |
| error | The object returned when an error occurs. This member is present only if an error has occurred. | Object |
| id | An identifier used to match the request to response, as provided in the request. | string or integer |
| unusedParameters | A warning message that at least one incorrect parameter has been passed to the API method and has not been used. | Object |

Request endpoints

There are three types of request endpoints used in the API (storage cluster, storage cluster creation, and per-node). You should always use the latest endpoint supported by your version of Element software.

The three request endpoints in the API are designated in the following ways:

Cluster API methods

The HTTPS endpoint for storage-cluster-wide API requests is https://<mvip>/json-rpc/<api-version>, where:

- <mvip> is the management virtual IP address for the storage cluster.
- <api-version> is the version of the API you are using.

Cluster creation and bootstrap API methods

The HTTPS endpoint for creating a storage cluster and accessing bootstrap API requests is https://<nodelp>/json-rpc/<api-version>, where:

- <nodeIP> is the IP address of the node you are adding to the cluster.
- <api-version> is the version of the API you are using.

Per-node API methods

The HTTPS endpoint for individual storage node API requests is https://<nodeIP>:442/json-rpc/<api-version>, where:

- <nodeIP> is the management IP address of the storage node; 442 is the port the HTTPS server is running on
- <api-version> is the version of the API you are using.

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

API authentication

You can authenticate with the system when using the API by including an HTTP Basic authentication header with all API requests. If you omit authentication information, the system rejects the unauthenticated request with an HTTP 401 response. The system supports HTTP Basic authentication over TLS.

Use the cluster admin account for API authentication.

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

Asynchronous methods

Some API methods are asynchronous, which means that the operation they perform might not be complete when the method returns. Asynchronous methods return a handle that you can query to see the status of the operation; status information for some

operations might include a percentage of completion.

When you query an asynchronous operation, its result can be one of the following types:

- DriveAdd: The system is adding a drive to the cluster.
- BulkVolume: The system is performing a copy operation between volumes, such as a backup or restore.
- Clone: The system is cloning a volume.
- DriveRemoval: The system is copying data from a drive in preparation to remove it from the cluster.
- RtfiPendingNode: The system is installing compatible software on a node before adding it to the cluster.

Note the following points when using asynchronous methods or obtaining the status of a running asynchronous operation:

- Asynchronous methods are indicated in the individual method documentation.
- Asynchronous methods return an "asyncHandle", which is a handle that is known by the issuing API method. You can use the handle to poll for the status or result of the asynchronous operation.
- You can obtain the result of individual asynchronous methods with the GetAsyncResult method. When you
 use GetAsyncResult to query a completed operation, the system returns the result and automatically
 purges the result from the system. When you use GetAsyncResult to query an incomplete operation, the
 system returns the result but does not purge it.
- You can obtain the status and results of all running or completed asynchronous methods using the ListAsyncResults method. In this case, the system does not purge results for completed operations.

Attributes

Many of the API requests and responses use objects as well as simple types. Objects are a collection of key-value pairs, where the value is a simple type or possibly another object. Attributes are custom name-value pairs that can be set by the user in JSON objects. Some methods enable you to add attributes when creating or modifying objects.

There is a 1000-byte limit on encoded attribute objects.

Object member

| Name | Description | Туре |
|------------|---|-------------|
| attributes | List of name-value pairs in JSON object format. | JSON object |

Request example

The following request example uses the AddClusterAdmin method:

```
"method": "AddClusterAdmin",
"params": {
    "username": "joeadmin",
    "password": "68!5Aru268)$",
    "access": [
        "volume",
        "reporting"
    ],
    "attributes": {
        "name1": "value1",
        "name2": "value2",
        "name3": "value3"
    }
}
```

Common objects

The Element software API uses JSON objects to represent organized data concepts. Many of these API methods make use of these objects for data input and output. This section documents these commonly used objects; objects that are only used within a single method are documented with that method instead of in this section.

account

The account object contains information about an account. This object includes only "configured" information about the account, not any runtime or usage information.

Object members

This object contains the following members:

| Name | Description | Туре |
|--------------------|--|---------------|
| accountID | The unique account ID for the account. | integer |
| attributes | List of name-value pairs in JSON object format. | JSON object |
| enableChap | Specifies whether CHAP account credentials can be used by an initiator to access volumes. | boolean |
| initiatorSecret | The initiator CHAP secret. | string |
| status | The current status of the account. Possible values: active: An active account. locked: A locked account. removed: An account that has been deleted and purged. | string |
| storageContainerID | The unique ID of the virtual volume storage container associated with this account. | UUID |
| targetSecret | The target CHAP secret. | string |
| username | The username for the account. | string |
| volumes | A list of volume IDs for volumes owned by this account. | integer array |

- AddAccount
- GetAccountByID
- GetAccountByName

authSessionInfo

The authSessionInfo object contains information about an auth session.

Object members

| Name | Description | Туре |
|---------------------|---|---------------|
| accessGroupList | List of access groups for the user. | string array |
| authMethod | The type of authorization the cluster admin user has. Possible values: LDAP - authenticated via LDAP. Cluster - authenticated via a username and password stored in the cluster database. IdP - authenticated via a third-party Identity Provider. | string |
| clusterAdminIDs | List of cluster AdminID(s) associated with this session. For sessions related to LDAP or a third-party Identity Provider (IdP), this will be an aggregate list of matching Cluster AdminIDs associated with this session. | integer array |
| finalTimeout | Time at which the session becomes invalid. This is set when the session is created and cannot be changed. | string |
| idpConfigVersion | IdP configuration version when the session was created. | integer |
| lastAccessTimeout | Time at which the session becomes invalid due to inactivity. It is set to a new value when the session is accessed for use, up to the time where the session becomes invalid due to final Timeout being reached. | string |
| sessionCreationTime | Time at which the session is created. | string |

| Name | Description | Туре |
|-----------|---|--------|
| sessionID | UUID for this session. | UUID |
| username | Username associated with this session. For sessions related to LDAP, this will be the user's LDAP DN. For sessions related to a third-party IdP, this will be an arbitrary name-value pair that will be used for auditing operations within the session. It will not necessarily match a cluster admin name on the cluster. For example, a SAML Subject NameID,but this will be dictated by the configuration of the IdP and the resultant content of the SAML assertion. | string |

bulkVolumeJob

The bulkVolumeJob object contains information about bulk volume read or write operations, such as cloning or snapshot creation.

Object members

| Name | Description | Туре |
|--------------|---|----------------------|
| attributes | JSON attribute of the bulk volume job. | JSON object |
| bulkVolumeID | The internal bulk volume job ID. | integer |
| createTime | Timestamp created for the bulk volume job in UTC+0 format. | ISO 8601 date string |
| elapsedTime | The number of seconds since the job began. | string |
| format | The format of the bulk volume operation. Possible values: • native • uncompressed | string |
| key | The unique key created by the bulk volume session. | string |

| Name | Description | Туре |
|-----------------|---|---------|
| percentComplete | The completed percentage reported by the operation. | integer |
| remainingTime | The estimated time remaining in seconds. | integer |
| srcVolumeID | The source volume ID. | integer |
| status | The status of the operation. Possible values: • preparing • running • complete • failed | string |
| script | The name of the script if one is provided. | string |
| snapshotID | The ID of the snapshot if a snapshot is in the source of the bulk volume job. | integer |
| type | The type of bulk operation. Possible values: • read • write | string |

binding (virtual volumes)

The binding object contains information about the binding for a virtual volume. You can retrieve a list of this information for all virtual volumes using the ListVirtualVolumeBindings API method.

Object members

| Name | Description | Туре |
|--------------------|---|------|
| protocolEndpointID | The unique ID of the protocol endpoint. | UUID |

| Name | Description | Туре |
|--------------------------|--|---------|
| protocolEndpointInBandID | The scsiNAADeviceID of the protocol endpoint. | string |
| protocolEndpointType | The type of protocol endpoint. SCSI is the only value returned for the protocol endpoint type. | string |
| virtualVolumeBindingID | The unique ID of the virtual volume binding object. | integer |
| virtualVolumeHostID | The unique ID of the virtual volume host. | UUID |
| virtualVolumeID | The unique ID of the virtual volume. | UUID |
| virtualVolumeSecondaryID | The secondary ID of the virtual volume. | string |

- ListVirtualVolumeBindings
- protocolEndpoint

certificateDetails

The certificateDetails object contains the decoded information about a security certificate.

Object members

| Name | Description | Туре |
|-----------------|---|-----------------|
| issuer | The name of the issuer. | string |
| modulus | The modulus of the public key. | string |
| notAfter | The expiry date of the certificate. | ISO 8601 string |
| notBefore | The start date of the certificate. | ISO 8601 string |
| serial | The certificate serial number. | string |
| sha1Fingerprint | The digest of the DER-encoded version of the certificate. | string |

| Name | Description | Туре |
|---------|-------------------|--------|
| subject | The subject name. | string |

cluster

The cluster object contains information that the node uses to communicate with the cluster. You can retrieve this information with the GetClusterConfig API method.

Object members

| Name | Description | Туре |
|------------------------|--|--------------|
| cipi | Network interface used for cluster communication. | string |
| cluster | Unique cluster name. | string |
| encryptionCapable | Indicates whether the node supports drive encryption. | boolean |
| ensemble | The nodes that are participating in the cluster. | string array |
| fipsDriveConfiguration | Indicates whether the node supports FIPS 140-2 certified drives. | boolean |
| mipi | The network interface used for node management. | string |
| name | The cluster name. | string |
| nodelD | The node ID of the node in the cluster. | string |
| pendingNodeID | The ID of the pending node in the cluster. | integer |
| role | Identifies the role of the node. | integer |
| sipi | The network interface used for storage traffic. | string |

| Name | Description | Туре |
|---------|--|--------|
| state | The current state of the node. Possible values: • Available: The node has not been configured with a cluster name. • Pending: The node is pending for a specific named cluster and can be added. • Active: The node is an active | string |
| | member of a cluster and cannot be added to another cluster. PendingActive: The node is currently being returned to the factory software image, and is not yet an active member of a cluster. When complete, it will transition to the Active state. | |
| version | The version of software running on the node. | string |

Member modifiability and node states

This table indicates whether or not the object parameters can be modified at each possible node state.

| Parameter name | Available state | Pending state | Active state |
|-------------------|-----------------|---------------|--------------|
| cipi | No | No | No |
| cluster | Yes | Yes | No |
| encryptionCapable | No | No | No |
| ensemble | No | No | No |
| mipi | Yes | Yes | No |
| name | Yes | Yes | Yes |
| nodeID | No | No | No |
| pendingNodeID | No | No | No |
| role | No | No | No |

| sipi | No | No | No |
|---------|----|----|----|
| state | No | No | No |
| version | No | No | No |

GetClusterConfig

clusterAdmin

The clusterAdmin object contains information about the current cluster administrator user. You can retrieve admin user information with the GetCurrentClusterAdmin API method.

Object members

This object contains the following members:

| Name | Description | Туре |
|----------------|--|--------------|
| access | The methods this cluster admin can use. | string array |
| authMethod | The type of authorization the cluster admin user has. Possible values: • LDAP • Cluster • Local | string |
| attributes | List of name-value pairs in JSON object format. | JSON object |
| clusterAdminID | The cluster administrator ID for this cluster admin user. | integer |
| username | User name for this cluster admin. | string |

Find more information

GetCurrentClusterAdmin

clusterCapacity

The clusterCapacity object contains high-level capacity measurements for the cluster.

You can get cluster capacity information with the GetClusterCapacity API method. Space measurements in the object members are calculated in bytes.

Object members

| Name | Description | Туре |
|---------------------------|--|---------|
| activeBlockSpace | The amount of space on the block drives. This includes additional information such as metadata entries and space which can be cleaned up. | integer |
| activeSessions | The number of active iSCSI sessions communicating with the cluster. | integer |
| averageIOPS | The average IOPS for the cluster since midnight Coordinated Universal Time (UTC). | integer |
| clusterRecentIOSize | The average size of IOPS to all volumes in the cluster. | integer |
| currentIOPS | The average IOPS for all volumes in the cluster over the last 5 seconds. | integer |
| maxIOPS | The estimated maximum IOPS capability of the current cluster. | integer |
| maxOverProvisionableSpace | The maximum amount of provisionable space. This is a computed value. You cannot create new volumes if the current provisioned space plus the new volume size would exceed this number. The value is calculated as follows: maxOverProvisionableSpace maxProvisionedSpace * maxMetadataOverProvisionFa ctor | integer |
| maxProvisionedSpace | The total amount of provisionable space if all volumes are 100% filled (no thin provisioned metadata). | integer |

| Name | Description | Туре |
|-----------------------|---|-----------------|
| maxUsedMetadataSpace | The number of bytes on volume drives used to store metadata. | integer |
| maxUsedSpace | The total amount of space on all active block drives. | integer |
| nonZeroBlock | The total number of 4KiB blocks that contain data after the last garbage collection operation has completed. | integer |
| peakActiveSessions | The peak number of iSCSI connections since midnight UTC. | integer |
| peakIOPS | The highest value for currentIOPS since midnight UTC. | integer |
| provisionedSpace | The total amount of space provisioned in all volumes on the cluster. | integer |
| timestamp | The date and time, in UTC+0 format, that this cluster capacity sample was taken. | ISO 8601 string |
| totalOps | The total number of I/O operations performed throughout the lifetime of the cluster. | integer |
| uniqueBlocks | The total number of blocks stored on the block drives. The value includes replicated blocks. | integer |
| uniqueBlocksUsedSpace | The total amount of data the uniqueBlocks take up on the block drives. See the GetclusterCapacity method for information about how this number relates to the uniqueBlocks value. | integer |
| usedMetadataSpace | The total number of bytes on volume drives used to store metadata. | integer |

| Name | Description | Туре |
|------------------------------|--|---------|
| usedMetadataSpaceInSnapshots | The number of bytes on volume drives used for storing unique data in snapshots. This number provides an estimate of how much metadata space would be regained by deleting all snapshots on the system. | integer |
| usedSpace | The total amount of space used by all block drives in the system. | integer |
| zeroBlocks | The total number of empty 4KiB blocks without data after the last round of garbage collection operation has completed. | integer |

GetClusterCapacity

clusterConfig

The clusterConfig object returns information the node uses to communicate with the cluster.

Object members

| Name | Description | Туре |
|------------------------|--|--------------|
| cipi | Network interface used for cluster communication. | string |
| cluster | Unique name of the cluster. | string |
| encryptionCapable | Specifies whether the node supports encryption. | boolean |
| ensemble | Nodes that are participating in the cluster. | string array |
| fipsDriveConfiguration | Specifies whether the node supports FIPS 140-2 certified drives. | boolean |

| Name | Description | Туре |
|---------------|--|---------|
| hasLocalAdmin | Specifies whether the cluster has a local administrator. | boolean |
| mipi | Network interface used for node management. | string |
| name | Unique identifier for the cluster. | string |
| nodeID | Unique identifier for the node. | integer |
| pendingNodeID | Unique identifier for the pending node. | integer |
| role | Identifies the role of the node. | string |
| sipi | Network interface used for storage. | string |
| state | Indicates the state of the node. | string |
| version | Indicates the version of the node. | string |

clusterInfo

The clusterInfo object contains information that the node uses to communicate with the cluster. You can get this information with the GetClusterInfo API method.

Object members

| Name | Description | Туре |
|--------------------------|--|--------------|
| attributes | List of name-value pairs in JSON object format. | JSON object |
| defaultProtectionScheme | The protection scheme used by default for new volumes, unless a protection scheme is provided with the CreateVolume method call. This protection scheme must always be in the set of enabled protection schemes. | string |
| enabledProtectionSchemes | A list of all protection schemes that have been enabled on this storage cluster. | string array |

| Name | Description | Туре |
|-------------------------------|---|--------------|
| encryptionAtRestState | The state of the Encryption at Rest feature. Possible values: Enabling: Encryption at rest is being enabled. Enabled: Encryption at rest is enabled. Disabling: Encryption at rest is being disabled. Disabled: Encryption at rest is disabled. | string |
| ensemble | The nodes that are participating in the cluster. | string array |
| mvip | The floating (virtual) IP address for the cluster on the management network. | string |
| mvipInterface | The physical interface associated with the MVIP address. | string |
| mvipNodelD | The node that holds the master MVIP address. | integer |
| mvipVlanTag | The VLAN identifier for the MVIP address. | string |
| name | The unique cluster name. | string |
| repCount | The number of replicas of each piece of data to store in the cluster. The valid value is "2". | integer |
| softwareEncryptionAtRestState | Software-based encryption-at-rest state. | string |
| supportedProtectionSchemes | A list of all protection schemes that are supported on this storage cluster. | string array |
| svip | The floating (virtual) IP address for the cluster on the storage (iSCSI) network. | string |

| Name | Description | Туре |
|---------------|---|---------|
| svipInterface | The physical interface associated with the master SVIP address. | string |
| svipNodeID | The node holding the master SVIP address. | integer |
| svipVlanTag | The VLAN identifier for the master SVIP address. | string |
| uniqueID | The unique ID for the cluster. | string |
| uuid | The unique identifier for the cluster. | UUID |

- GetClusterInfo
- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

clusterPair

The clusterPair object contains information about clusters paired with the local cluster. You can retrieve a list of clusterPair objects for the local cluster with the ListClusterPairs method.

Object members

| Name | Description | Туре |
|-----------------|---|---------|
| clusterName | The name of the other cluster in the pair. | string |
| clusterPairID | A unique ID given to each cluster in the pair. | integer |
| clusterPairUUID | The universally unique identifier for the cluster pair. | string |
| UUID | Unique identifier for the remote cluster in the cluster pair. | integer |
| latency | The latency, in milliseconds, between clusters. | integer |

| Name | Description | Туре |
|---------|--|--------|
| mvip | The IP address of the management connection for paired clusters. | string |
| status | The status of the connection between the paired clusters. Possible values: • Unconfigured • Connected • Misconfigured • Disconnected | string |
| version | The Element version of the other cluster in the pair. | string |

ListClusterPairs

clusterStats

The clusterStats object contains statistical data for a cluster. Many of the volume-related statistics contained in the object are averaged for all volumes in the cluster. You can use the GetClusterStats method to retrieve this information for a cluster.

Object members

| Name | Description | Calculation | Туре |
|------------------|--|---------------|---------|
| actualIOPS | Current actual IOPS for the entire cluster in the last 500 milliseconds. | Point in time | integer |
| averageIOPSize | Average size in bytes of recent I/O to the cluster in the last 500 milliseconds. | Point in time | integer |
| clientQueueDepth | The number of outstanding read and write operations to the cluster. | N/A | integer |

| Name | Description | Calculation | Туре |
|----------------------|---|--------------------------|---------|
| clusterUtilization | The percentage of the cluster's max IOPS currently being utilized. This is computed as clusterUtilization = normalizedIOPS / maxIOPS (from GetClusterCapacity). | N/A | float |
| latencyUSec | The average time, in microseconds, to complete operations to a cluster in the last 500 milliseconds. | Point in time | integer |
| normalizedIOPS | Average number of IOPS for the entire cluster in the last 500 milliseconds. | Point in time | integer |
| readBytes | The total cumulative bytes read from the cluster since the creation of the cluster. | Monotonically increasing | integer |
| readBytesLastSample | The total number of bytes read from the cluster during the last sample period. | Point in time | integer |
| readLatencyUSec | The average time, in microseconds, to complete read operations to the cluster in the last 500 milliseconds. | Point in time | integer |
| readLatencyUSecTotal | The total time spent performing read operations since the creation of the cluster. | Monotonically increasing | integer |
| readOps | The total cumulative read operations to the cluster since the creation of the cluster. | Monotonically increasing | integer |
| readOpsLastSample | The total number of read operations during the last sample period. | Point in time | integer |

| Name | Description | Calculation | Туре |
|-----------------------|---|--------------------------|----------------------|
| samplePeriodMSec | The length of the sample period, in milliseconds. | N/A | integer |
| servicesCount | The number of services running on the cluster. If equal to the servicesTotal, this indicates that valid statistics were collected from all nodes. | Point in time | integer |
| servicesTotal | The total number of expected services running on the cluster. | N/A | integer |
| timestamp | The current time in UTC+0 format. | N/A | ISO 8601 date string |
| unalignedReads | The total cumulative unaligned read operations to a cluster since the creation of the cluster. | Monotonically increasing | integer |
| unalignedWrites | The total cumulative unaligned write operations to a cluster since the creation of the cluster. | Monotonically increasing | integer |
| writeBytes | The total cumulative bytes written to the cluster since the creation of the cluster. | Monotonically increasing | integer |
| writeBytesLastSample | The total number of bytes written to the cluster during the last sample period. | Monotonically increasing | integer |
| writeLatencyUSec | The average time, in microseconds, to complete write operations to a cluster in the last 500 milliseconds. | Point in time | integer |
| writeLatencyUSecTotal | The total time spent performing write operations since the creation of the cluster. | Monotonically increasing | integer |

| Name | Description | Calculation | Туре |
|--------------------|---|--------------------------|---------|
| writeOps | The total cumulative write operations to the cluster since the creation of the cluster. | Monotonically increasing | integer |
| writeOpsLastSample | The total number of write operations during the last sample period. | Point in time | integer |

GetClusterStats

clusterStructure

The clusterStructure object holds cluster configuration backup information created by the GetClusterStructure method. You can use the SetClusterStructure method to restore this information to a storage cluster you are rebuilding.

Object members

This object contains the combined return information from the following methods:

- GetClusterInfo
- ListAccounts
- ListInitiators
- ListVolumes (with includeVirtualVolumes=false)
- ListVolumeAccessGroups
- ListStorageContainers
- ListQoSPolicies
- GetSnmpInfo
- GetNtpInfo
- ListVirtualNetworks
- ListClusterAdmins
- ListSchedules
- ListSnapMirrorEndpoints
- GetFeatureStatus
- GetLdapConfiguration
- GetRemoteLoggingHosts
- GetDefaultQoS
- GetVolumeAccessGroupLunAssignments

- GetClusterStructure
- SetClusterStructure

drive

The drive object contains information about individual drives in the cluster's active nodes. This object contains details on drives that have been added as volume metadata or block drives, as well as drives that have not yet been added and are available. You can retrieve this information with the ListDrives API method.

Object members

| Name | Description | Туре |
|--------------------------|--|-------------|
| attributes | List of name-value pairs in JSON object format. This object is always null and is not modifiable. | JSON object |
| capacity | The total capacity of the drive, in bytes. | integer |
| chassisSlot | For HCI platforms, this value is the node letter and slot number in the server chassis where this drive is located. For storage platforms, the slot number is a string representation of the "slot" integer. | string |
| driveFailureDetail | If a drive's status is "Failed", this field provides more detail on why the drive was marked failed. | string |
| driveID | The ID of this drive. | integer |
| driveSecurityFaultReason | If enabling or disabling drive security failed, the reason why it failed. If the value is "none", there was no failure. | string |
| keyID | The keyID used by the key provider to acquire the authentication key for unlocking this drive. | UUID |

| Name | Description | Туре |
|-----------------|--|---------|
| keyProviderID | Identifies the provider of the authentication key for unlocking this drive. | integer |
| nodeID | The ID of the node containing this drive. | integer |
| segmentFileSize | The segment file size of the drive, in bytes. | integer |
| serial | The drive serial number. | string |
| slot | The slot number in the server chassis where this drive is located, or -1 if a SATADimm device is used for the internal metadata drive. | integer |
| status | The status of the drive. Possible values: available: An available drive. active: An active drive. erasing: A drive is in the process of being secure erased. Any data on that drive is permanently removed. failed: A drive that has failed. Any data that was previously on the drive has been migrated to other drives in the cluster. removing: A drive is in the process of being removed. Any data previously on the drive is being migrated to other drives in the cluster. | string |
| type | The type of drive. Possible values: volume: Stores volume metadata. block: Stores block data. unknown: Drive type not yet active and is yet to be determined. | string |

| Name | Description | Туре |
|----------------|---|---------|
| usableCapacity | The usable capacity of the drive, in bytes. | integer |

ListDrives

driveStats

The driveStats object contains high-level activity measurements for a single drive. You can retrieve measurement information with the API method <code>GetDriveStats</code>.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| activeSessions | Number of iSCSI sessions currently using this drive (only present for metadata drives). | integer |
| driveID | Unique ID of the drive in the cluster. | integer |
| failedDieCount | Number of failed drive hardware elements. | integer |
| iosInProgress | The number of I/Os to this drive that are in progress. | integer |
| lifeRemainingPercent | Drive media wear out indicator. | integer |
| lifetimeReadBytes | Total bytes read from this drive for the lifetime of the drive. | integer |
| lifetimeWriteBytes | Total bytes written to this drive for the lifetime of the drive. | integer |
| powerOnHours | Number of hours this drive has been powered on. | integer |
| reads | The number of read() calls per second to this drive. | integer |

| Name | Description | Туре |
|------------------------|---|----------------------|
| readBytes | Total bytes read from the drive due to client operations. | integer |
| readsCombined | The number of read() calls to adjacent sectors that could be combined into a larger read. | integer |
| readMsec | The number of milliseconds spent reading. | integer |
| readOps | Total read operations on the drive due to client operations. | integer |
| reallocatedSectors | Number of bad sectors replaced in this drive. | integer |
| reserveCapacityPercent | The available reserve capacity of the drive. | integer |
| timestamp | The current time in UTC+0 format. | ISO 8601 date string |
| totalCapacity | Total capacity of the drive, in bytes. | integer |
| uncorrectableErrors | The Reported Uncorrectable Errors value from the Self-Monitoring, Analysis and Reporting Technology (SMART) monitoring system in the drive. | integer |
| usedCapacity | Used capacity of the drive, in bytes. | integer |
| usedMemory | Amount of memory currently used by the node hosting this drive. | integer |
| writes | The number of write() calls per second to this drive. | integer |
| writeBytes | Total bytes written to the drive due to client activity. | integer |
| writesCombined | The number of write() calls to adjacent sectors that could be combined into a larger write. | integer |
| writeMsec | The number of milliseconds spent writing. | integer |

| Name | Description | Туре |
|----------|---|---------|
| writeOps | Total write operations to the drive due to client activity. | integer |

GetDriveStats

error

The error object contains an error code and message if an error occurs during a method call. All system-generated errors have an error code of 500.

Object members

This object contains the following members:

| Name | Description | Туре |
|---------|--|---------|
| code | The numeric code used to identify the error. All system-generated errors return a code of 500. | integer |
| name | The unique identifier for the specific error that occurred. Each method returns a documented set of errors, although you should be prepared to handle unrecognized errors as well. | string |
| message | A description of the error, possibly with additional details. | string |

event

The event object contains details of events that occur during an API method call or while the system is performing an operation.

Object members

| Name | Description | Туре |
|---------|--|-------------|
| details | Extra information about the event. | JSON object |
| driveID | The driveID of the drive reporting the failure. 0 if not applicable. | integer |

| Name | Description | Туре |
|---------------|--|----------------------|
| driveIDs | A list of the driveIDs of the drives reporting the failure. An empty list if not applicable. | integer array |
| eventID | Unique ID associated with each event. | integer |
| eventInfoType | The type of fault. | string |
| message | A string description of the event that occurred. | string |
| nodelD | The nodeID of the node reporting the failure. 0 if not applicable. | integer |
| serviceID | The serviceID of the service reporting the failure. 0 if not applicable. | integer |
| severity | Severity the event is reporting. | integer |
| timeOfPublish | The time at which the cluster's event log received the event, in UTC+0 format. | ISO 8601 date string |
| timeOfReport | The time at which the event occurred on the cluster, in UTC+0 format. | ISO 8601 date string |

Note: There might be a slight difference between timeOfReport and timeOfPublish if the event occurred and was not able to be immediately published.

Event types

The following list describes the possible event types that the eventInfoType member can contain:

- apiEvent: Events initiated through the API or web UI that modify settings.
- binAssignmentsEvent: Events related to the assignment of data to internal containers.
- binSyncEvent: Events related to a reassignment of data among block services.
- bsCheckEvent: Events related to block service checks.
- bsKillEvent: Events related to block service terminations.
- bulkOpEvent: Events that operate on an entire volume, such as a volume backup, restore, snapshot, or clone.
- · cloneEvent: Events related to volume cloning.
- clusterMasterEvent: Cluster configuration change events such as adding or removing nodes.

- · dataEvent: Events related to reading and writing data.
- dbEvent: Events related to the ensemble node database.
- driveEvent: Events related to drive operations.
- encryptionAtRestEvent: Events related to stored data encryption.
- ensembleEvent: Events related to ensemble size increase or decrease.
- fibreChannelEvent: Events related to Fibre Channel node configuration or connections.
- gcEvent: Events related to garbage collection. These processes run every 60 minutes to reclaim storage on block drives.
- ieEvent: Events related to internal system errors.
- installEvent: Eevnts related to automatic software installation on pending storage nodes.
- iSCSIEvent: Events related to iSCSI connection or configuration issues.
- limitEvent: Events related to the number of volumes or virtual volumes in an account or in the cluster nearing the maximum allowed.
- networkEvent: Events related to virtual networking.
- platformHardwareEvent: Events related to issues detected on hardware devices.
- · remoteClusterEvent: Events related to remote cluster pairing.
- schedulerEvent: Events related to scheduled snapshots.
- serviceEvent: Events related to system service status.
- statEvent: Events related to system statistics.
- · sliceEvent: Events related to metadata storage.
- snmpTrapEvent: Events related to SNMP traps.
- tsEvent: System transport service events.
- unexpectedException: Events related to unexpected errors.
- vasaProviderEvent: Events related to a VMware VASA provider.

ListEvents

fault

The fault object contains information about faults that are detected in the cluster. The ListClusterFaults method returns cluster fault information.

Object members

| Name | Description | Туре |
|----------------|---|---------|
| clusterFaultID | The unique ID associated with each cluster fault. | integer |

| Name | Description | Туре |
|---------------------|---|-----------------|
| code | The fault code for the specific fault that was detected. For further details, see Cluster Fault Codes. | string |
| data | Additional fault-specific information. | JSON object |
| date | The current time in UTC+0 format. | ISO 8601 string |
| details | The description of the fault with additional details. | string |
| driveID | The first drive ID in the driveIDs list. If the driveIDs list is empty (which means that no faults were returned that deal with drives), this value is 0. | integer |
| driveIDs | A list of driveID values for the drives that this fault refers to. Included for faults dealing with drives. If none, this is an empty array. | integer array |
| nodeHardwareFaultID | The identifier assigned to a hardware fault on the cluster. | integer |
| nodeID | The node ID for the node that this fault refers to. Included for node and drive faults, otherwise set to 0. | integer |
| resolved | The resolved status of the fault. Possible values: • true: The fault is no longer detected. • false: The fault is still present. | boolean |
| resolvedDate | The date and time the fault was resolved. | ISO 8601 string |
| serviceID | The service associated with the fault. This value is "0" (zero) if the fault is not associated with a service. | integer |

| Name | Description | Туре |
|----------|--|--------|
| severity | The severity of the fault. Possible values: warning: A minor issue. The cluster is functioning and upgrades are allowed at this severity level. error: A failure that generally should not affect service (except possible performance degradation or loss of HA). Some features might be disabled. critical: A serious failure that is affecting service. The system is unable to serve API requests or client I/O and is at risk of data loss. bestPractice: Faults triggered by sub-optimal system configuration. | string |
| type | The type of fault. Possible values: node: A fault affecting an entire node. drive: A fault affecting an individual drive. cluster: A fault affecting the entire cluster. service: A fault affecting a service on the cluster. volume: A fault affecting an individual volume. | string |

- ListClusterFaults
- Cluster fault codes

fibreChannelPort

The fibreChannelPort object contains information about individual ports on a node, or for an entire node in the cluster. You can retrieve this information using the ListNodeFibreChannelPortInfo method.

Object members

| Name | Description | Туре |
|-----------|--|---------|
| firmware | The version of the firmware installed on the Fibre Channel port. | integer |
| hbaPort | The ID of the individual host bus adapter (HBA) port. | integer |
| model | Model of the HBA on the port. | string |
| nPortID | The unique port node ID. | string |
| pciSlot | The slot containing the PCI card in the Fibre Channel node chassis. | integer |
| serial | The serial number on the Fibre Channel port. | string |
| speed | The speed of the HBA on the port. | string |
| state | Possible values: • Unknown • NotPresent • Online • Offline • Blocked • Bypassed • Diagnostics • Linkdown • Error • Loopback • Deleted | string |
| switchWwn | The World Wide Name of the Fibre Channel switch port. | string |
| wwnn | World Wide Node Name of the HBA node. | string |

| Name | Description | Туре |
|------|--|--------|
| · | World Wide Port Name assigned to the physical port of the HBA. | string |

ListNodeFibreChannelPortInfo

fipsErrorNodeReport

The fipsErrorNodeReport object contains error information for each node that does not respond with information about FIPS 140-2 support when you query it with the GetFipsReport method.

Object members

This object contains the following members:

| Name | Description | Туре |
|--------|---|-------------|
| nodelD | The ID of the node that did not respond. | integer |
| error | A JSON object containing error information. | JSON object |

fipsNodeReport

The fipsNodeReport object contains information about FIPS 140-2 support for a single node in the storage cluster. You can retrieve this information using the <code>GetFipsReport</code> method.

Object members

| Name | Description | Туре |
|--------|---|---------|
| nodeID | The ID of the node reporting the information. | integer |

| Name | Description | Туре |
|--------------|--|----------------------|
| fipsDrives | Whether or not FIPS 140-2 drive encryption is enabled for this node. Possible values: • None: This node is not capable | FipsDrivesStatusType |
| | of FIPS drive encryption. | |
| | Partial: Node is capable of FIPS drive encryption but not all drives present are FIPS- capable drives. | |
| | Ready: Node is capable of FIPS drive encryption and either all drives present are FIPS-capable drives, or there are no drives present. | |
| httpsEnabled | Whether or not FIPS 140-2 HTTPS encryption is enabled for this node. Possible values: | boolean |
| | true: enabled | |
| | false: disabled | |

fipsReport

The fipsReport object contains information about FIPS 140-2 support for all nodes in the storage cluster. You can retrieve this information using the GetFipsReport method.

Object members

This object contains the following members:

| Name | Description | Туре |
|------------|--|---------------------|
| nodes | A report on FIPS 140-2 support status for each node in the storage cluster. | fipsNodeReport |
| errorNodes | Error information for each node that did not respond with FIPS 140-2 support status. | fipsErrorNodeReport |

groupSnapshot

The groupSnapshot object contains information about a snapshot for a group of volumes. You can use the ListGroupSnapshots API method to retrieve group snapshot information.

Object members

| Name | Description | Туре |
|-------------------------|--|--------------------------------------|
| attributes | List of name-value pairs in JSON object format. | JSON object |
| createTime | The UTC+0 formatted day and time on which the group snapshot was created. | ISO 8601 date string |
| enableRemoteReplication | Identifies if the snapshot is enabled for remote replication. | boolean |
| groupSnapshotID | The unique ID of the group snapshot. | integer |
| groupSnapshotUUID | The UUID of the group snapshot. | string |
| members | An array of objects containing information about each member of the group snapshot. | snapshot array |
| name | The name of the group snapshot, or, if none was given, the UTC formatted day and time on which the snapshot was created. | string or ISO 8601 date string |
| remoteStatuses | An array containing the universal identifier and replication status of each remote snapshot on the target cluster as seen from the source cluster. | remoteClusterSnapshotStatus array |

| Name | Description | Туре |
|--------|--|--------|
| status | Current status of the snapshot. Possible values: | string |
| | Unknown: There was an error obtaining the status of the snapshot. | |
| | Preparing: This snapshot is being prepared for use and is not yet writable. | |
| | RemoteSyncing: This snapshot is being replicated from a remote cluster. | |
| | Done: This snapshot has finished preparation or replication and is now usable. | |
| | Active: This snapshot is the active branch. | |
| | Cloning: This snapshot is involved in a CopyVolume operation. | |

ListGroupSnapshots

hardwareInfo

The hardwareInfo object contains detailed information about the hardware and status of each node in the cluster. You can retrieve this information with the <code>GetHardwareInfo</code> API method.

Object members

| Name | Description | Туре |
|---------------|---|-------------------|
| boardSerial | The DMI board serial number. | string |
| bus | Motherboard media bus information. | JSON object |
| chassisSerial | The serial number of the chassis. | string |
| driveHardware | A list of information for each drive in the node. | JSON object array |

| Name | Description | Туре |
|----------------------|---|---------------|
| fibreChannelPorts | A list of Fibre Channel ports on the node. | integer array |
| hardwareConfig | Motherboard peripheral configuration information. | JSON object |
| kernelCrashDumpState | The crash dump configuration of the operating system kernel. | string |
| memory | Firmware and system memory hardware information. | JSON object |
| network | Descriptions of the hardware of each of the node's network interfaces. | JSON object |
| networkInterfaces | The status of the node's network interfaces. | JSON object |
| nodeSlot | For HCI platforms, the letter corresponding to the chassis slot this node is in ("A", "B", "C", or "D"). For storage platforms, this value is null. | string |
| nvram | NVRAM statistics for the node. | JSON object |
| origin | The vendor of the motherboard. | string |
| platform | A description of the chassis platform. | JSON object |
| serial | The serial number of the product. | string |
| storage | Storage controller information. | JSON object |
| systemMemory | Operating system memory usage and performance information. | JSON object |
| system | The type of node chassis. | JSON object |
| uuid | The unique ID of the node. | UUID |

GetHardwareInfo

host (virtual volumes)

The host object contains information about a virtual volume host. You can use the ListVirtualVolumeHosts method to get this information for all virtual volume hosts.

Object members

This object contains the following members:

| Name | Description | Туре |
|----------------------------|--|---------------|
| bindings | A list of objects describing the bindings for the virtual volume host. | integer array |
| clusterID | The unique ID of the cluster this host is associated with. | UUID |
| hostAddress | The IP address or DNS name of the virtual volume host. | string |
| initiatorNames | A list of initiator IQNs for the virtual volume host. | string array |
| virtualVolumeHostID | The unique ID of this virtual volume host. | UUID |
| visibleProtocolEndpointIDs | A list of IDs of protocol endpoints visible on this host. | UUID array |

Find more information

ListVirtualVolumeHosts

idpConfigInfo

The idpConfigInfo object contains configuration and integration details regarding a third-party Identity Provider (IdP).

Object members

| Name | Description | Туре |
|----------------------------|--|---------|
| enabled | Specifies whether this third party IdPconfiguration is enabled. | boolean |
| idpConfigurationID | UUID for the third-party IdP configuration. | UUID |
| idpMetadata | Metadata for configuration and integration details for SAML 2.0 single sign-on. | string |
| idpName | Name for retrieving IdP provider for SAML 2.0 single sign-on. | string |
| serviceProviderCertificate | A PEM format Base64 encoded PKCS#10 X.509 certificate to be used for communication with this IdP. | string |
| spMetadataUrl | URL for retrieving Service Provider (SP) Metadata from the Cluster to provide to the IdP for establish a trust relationship. | string |

initiator

The initiator object contains information about an iSCSI or Fibre Channel initiator. An initiator object can contain IQN or WWPN identifiers. You can use the ListInitiators method to get a list of all initiators known on the system. You use initiator objects to configure SCSI initiator access to a set of volumes through volume access groups. An initiator can only be a member of one volume access group at a time. You can restrict initiator access to one or more VLANs by specifying one or more virtualNetworkIDs using the CreateInitiators and ModifyInitiators methods. If you don't specify any virtual networks, the initiator can access all networks.

Object members

| Name | Description | Туре |
|------------|---|-------------|
| alias | The friendly name assigned to the initiator, if any. | string |
| attributes | A set of JSON attributes assigned to this initiator. Empty if no attributes are assigned. | JSON object |

| Name | Description | Туре |
|--------------------|---|---------------|
| chapUsername | The unique CHAP username for this initiator. | string |
| initiatorID | The numeric identifier for the initiator. | integer |
| initiatorName | The initiator name, in IQN or WWPN format. | string |
| initiatorSecret | The CHAP secret used to authenticate the initiator. | string |
| requireChap | True if CHAP is required for this initiator. | boolean |
| targetSecret | The CHAP secret used to authenticate the target (when using mutual CHAP authentication). | string |
| virtualNetworkIDs | The list of virtual network identifiers associated with this initiator. If one or more are defined, this initiator will only be able to login to the specified virtual networks. If no virtual networks are defined this initiator can login to all networks. | integer |
| volumeAccessGroups | A list of volume access group IDs that this initiator belongs to. | integer array |

ListInitiators

keyProviderKmip

The keyProviderKmip object describes a Key Management Interoperability Protocol (KMIP) key provider. A key provider is both a mechanism and a location for retrieving authentication keys for use with cluster features such as Encryption at Rest.

Object members

| Name | Description | Туре |
|---------------------|--|---------------|
| keyProviderID | The ID of the KMIP key provider. This is a unique value assigned by the cluster during key provider creation which cannot be changed. | integer |
| keyProviderIsActive | True if the KMIP key provider is active. A provider is considered active if there are outstanding keys which were created but not yet deleted and therefore assumed to still be in use. | boolean |
| keyProviderName | The name of the KMIP key provider. | string |
| keyServerIDs | A key server ID that is associated with this provider. The server must be added before this provider can become active. The server cannot be removed while this provider is active. Only one server ID is supported for each provider. | integer array |
| kmipCapabilities | The capabilities of this KMIP key provider including details about the underlying library, FIPS compliance, SSL provider, etc. | string |

keyServerKmip

The keyServerKmip object describes a Key Management Interoperability Protocol (KMIP) key server, which is a location for retrieving authentication keys for use with cluster features such as Encryption at Rest.

Object members

| Name | Description | Туре |
|---------------|---|---------|
| keyProviderID | If this KMIP key server is assigned to a provider, this member contains the ID of the KMIP key provider it is assigned to. Otherwise this member is null. | integer |

| Name | Description | Туре |
|------------------------------|--|--------------|
| keyServerID | The ID of the KMIP key server. This is a unique value assigned by the cluster during key server creation. This value cannot be changed. | integer |
| kmipAssignedProviderIsActive | If this KMIP key server is assigned to a provider (keyProviderID is not null), this member indicates whether that provider is active (providing keys which are currently in use). Otherwise, this member is null. | boolean |
| kmipCaCertificate | The public key certificate of the external key server's root CA. This is used to verify the certificate presented by the external key server in the TLS communication. For key server clusters where individual servers use different CAs, this member contains a concatenated string of the root certificates of all the CAs. | string |
| kmipClientCertificate | A PEM format Base64 encoded PKCS#10 X.509 certificate used by the Element storage KMIP client. | string |
| kmipKeyServerHostnames | The hostnames or IP addresses associated with this KMIP key server. | string array |
| kmipKeyServerName | The name of the KMIP key server. This name is only used for display purposes and does not need to be unique. | string |
| kmipKeyServerPort | The port number associated with this KMIP key server (typically 5696). | integer |

IdapConfiguration

The IdapConfiguration object contains information about the LDAP configuration on the storage system. You can retrieve LDAP information with the <code>GetLdapConfiguration</code> API method.

Object members

| Name | Description | Туре |
|-------------------------|---|---------|
| authType | Identifies which user authentication method to use. Possible values: • DirectBind • SearchAndBind | string |
| enabled | Identifies whether or not the system is configured for LDAP. Possible values: • true • false | boolean |
| groupSearchBaseDN | The base DN of the tree to start the group search (the system will perform a subtree search from here). | string |
| groupSearchCustomFilter | The custom search filter used. | string |
| groupSearchType | Controls the default group search filter used. Possible values: • NoGroups: No group support. • ActiveDirectory: Nested membership of all of a user's AD groups. • MemberDN: MemberDN style groups (single-level). | string |
| searchBindDN | A fully qualified DN to log in with to perform an LDAP search for the user (needs read access to the LDAP directory). | string |
| serverURIs | A comma-separated list of LDAP server URIs (for example, ldap://1.2.3.4 and ldaps://1.2.3.4:123.) | string |
| userDNTemplate | A string that is used to form a fully qualified user DN. | string |

| Name | Description | Туре |
|------------------|--|--------|
| userSearchBaseDN | The base DN of the tree used to start the search (will do a subtree search from here). | string |
| userSearchFilter | The LDAP filter used. | string |

GetLdapConfiguration

loggingServer

The loggingServer object contains information about any logging hosts configured for the storage cluster. You can use <code>GetRemoteLoggingHosts</code> to determine what the current logging hosts are and then use <code>SetRemoteLoggingHosts</code> to set the desired list of current and new logging hosts.

Object members

This object contains the following members:

| Name | Description | Туре |
|------|--|---------|
| host | IP address of the log server. | string |
| port | Port number used to communicate with the log server. | integer |

network (bonded interfaces)

The network (bonded interfaces) object contains configuration information for bonded network interfaces on a storage node. You can use the <code>GetConfig</code> and <code>GetNetworkConfig</code> methods to obtain this information for a storage node.

Object members

| Name | Description | Туре |
|-----------|---|--------|
| address | The IPv4 address assigned to this interface on the node. | string |
| addressV6 | The IPv6 management address assigned to the Bond1G interface on the node. | string |

| bond-downdelay | Time to wait, in milliseconds, before disabling a slave after a link failure has been detected. | string |
|-----------------------|--|--------|
| bond-fail_over_mac | The configuration of the MAC address of the network interface. | string |
| bond-miimon | The frequency, in milliseconds, at which the MII link state is inspected for link failures. | string |
| bond-mode | The bonding mode. Possible values: • ActivePassive (Default) • ALB • LACP (Recommended) | string |
| bond-primary_reselect | Specifies when the primary bond slave is chosen as the active slave. Possible values: • Always • Better • Failure | string |
| bond-slaves | The list of slave interfaces for the bond. | string |
| bond-lacp_rate | When Bond Mode is LACP, the rate may change to one of the following: • LACP Fast (Default) • LACP Slow | string |
| bond-updelay | The time, in milliseconds, to wait before enabling a slave after a link is detected. | string |
| dns-nameservers | A list of addresses used for domain name services, separated by comma or space. | string |
| dns-search | A space or comma separated list of DNS search domains. | string |

| family | Address family that the interface is configured to use. Currently "inet" for IPv4 is supported. | string |
|---------------------|--|--------|
| gateway | The IPv4 router network address used to send traffic from the local network. | string |
| gatewayV6 | The IPv6 router network address used to send traffic from the local Bond1G network. | string |
| ipV6PrefixLength | The subnet prefix length for static routes of type "net" for IPv6 traffic on the Bond1G network. | string |
| macAddress | The actual MAC address assigned to the interface and observed by the network. | string |
| macAddressPermanent | The immutable MAC address assigned by the manufacturer to the interface. | string |
| method | The method used to configure the interface. Possible values: Loopback: Used to define the IPv4 loopback interface. manual: Used to define interfaces that are not configured automatically. dhcp: Can be used to obtain an IP address via DHCP. static: Used to define Ethernet interfaces with statically allocated IPv4 addresses. | string |
| mtu | The largest packet size (in bytes) that the interface can transmit. Must be greater than or equal to 1500; up to 9000 is supported. | string |
| netmask | The bitmask that specifies the subnet for the interface. | string |

| network | Indicates where the IP address range begins based on the netmask. | string |
|---------------------|---|--------------|
| routes | Comma separated array of route strings to apply to the routing table. | string array |
| status | The state of the interface. Possible values: • Down: The interface is inactive. • Up: The interface is ready, but has no link. • UpAndRunning: The interface is ready and a link is established. | string |
| symmetricRouteRules | The symmetric routing rules configured on the node. | string array |
| upAndRunning | Indicates if the interface is ready and has a link. | boolean |
| virtualNetworkTag | The virtual network identifier of the interface (VLAN tag). | string |

Member modifiability and node states

This table indicates whether or not the object parameters can be modified at each possible node state.

| Member name | Available state | Pending state | Active state |
|-----------------------|--------------------------|---------------|--------------|
| address | Yes | Yes | No |
| addressV6 | Yes | Yes | No |
| bond-downdelay | Configured by the system | N/A | N/A |
| bond-fail_over_mac | Configured by the system | N/A | N/A |
| bond-milmon | Configured by the system | N/A | N/A |
| bond-mode | Yes | Yes | Yes |
| bond-primary_reselect | Configured by the system | N/A | N/A |

| bond-slaves | Configured by the system | N/A | N/A |
|---------------------|--------------------------|-----|-----|
| bond-lacp_rate | Yes | Yes | Yes |
| bond-updelay | Configured by the system | N/A | N/A |
| dns-nameservers | Yes | Yes | Yes |
| dns-search | Yes | Yes | Yes |
| family | No | No | No |
| gateway | Yes | Yes | Yes |
| gatewayV6 | Yes | Yes | Yes |
| ipV6PrefixLength | Yes | Yes | Yes |
| macAddress | Configured by the system | N/A | N/A |
| macAddressPermanent | Configured by the system | N/A | N/A |
| method | No | No | No |
| mtu | Yes | Yes | Yes |
| netmask | Yes | Yes | Yes |
| network | No | No | No |
| routes | Yes | Yes | Yes |
| status | Yes | Yes | Yes |
| symmetricRouteRules | Configured by the system | N/A | N/A |
| upAndRunning | Configured by the system | N/A | N/A |
| virtualNetworkTag | Yes | Yes | Yes |

- GetConfig
- GetNetworkConfig

network (all interfaces)

The network (all interfaces) object collects information about network interface configuration for a storage node. You can use the <code>GetConfig</code> and <code>GetNetworkConfig</code> methods to obtain this information for a storage node.

Object members

This object contains the following members:

| Name | Description | Туре |
|---------|---|-------------------------------|
| Bond10G | Configuration information for the Bond10G bonded interface. | network (bonded interfaces) |
| Bond1G | Configuration information for the Bond1G bonded interface. | network (bonded interfaces) |
| eth0-5 | One object for each Ethernet interface in the storage node, describing configuration information for the interface. These objects are numbered 0 through 5 to match the interface name. | network (Ethernet interfaces) |
| lo | Configuration information for the loopback interface. | network (local interfaces) |

Find more information

- GetConfig
- GetNetworkConfig

network (Ethernet interfaces)

The network (Ethernet interfaces) object contains configuration information for individual Ethernet interfaces. You can use the GetConfig and GetNetworkConfig methods to obtain this information for a storage node.

Object members

| Name | Description | Туре |
|-------------|--|--------|
| bond-master | Specifies which bonded interface this physical interface has joined as a bond slave. | string |

| family | Address family that the interface is configured to use. Currently "inet" for IPv4 is supported. | string |
|---------------------|--|---------|
| macAddress | The actual MAC address assigned to the interface and observed by the network. | string |
| macAddressPermanent | The immutable MAC address assigned by the manufacturer to the interface. | string |
| method | The method used to configure the interface. Possible values: • loopback: Used to define the IPv4 loopback interface. • manual: Used to define interfaces that are not configured automatically. • dhcp: Can be used to obtain an IP address via DHCP. • static: Used to define Ethernet interfaces with statically allocated IPv4 addresses. | string |
| status | The state of the interface. Possible values: Down: The interface is inactive. Up: The interface is ready, but has no link. UpAndRunning: The interface is ready and a link is established. | string |
| upAndRunning | Indicates if the interface is ready and has a link. | boolean |

Member modifiability and node states

This table indicates whether or not the object parameters can be modified at each possible node state.

| Parameter name | Available state | Pending state | Active state |
|----------------|-----------------|---------------|--------------|
| bond-master | No | No | No |

| family | No | No | No |
|---------------------|----------------------|-----|-----|
| macAddress | Configured by system | N/A | N/A |
| macAddressPermanent | Configured by system | N/A | N/A |
| method | No | No | No |
| status | Yes | Yes | Yes |
| upAndRunning | Configured by system | N/A | N/A |

- GetConfig
- GetNetworkConfig

network (local interfaces)

The network (local interfaces) object contains configuration information for local network interfaces, such as the loopback interface, on a storage node. You can use the GetConfig and GetNetworkConfig methods to obtain this information for a storage node.

Object members

| Name | Description | Туре |
|---------------------|---|--------|
| family | Address family that the interface is configured to use. Currently "inet" for IPv4 is supported. | string |
| macAddress | The actual MAC address assigned to the interface and observed by the network. | string |
| macAddressPermanent | The immutable MAC address assigned by the manufacturer to the interface. | string |

| method | The method used to configure the interface. Possible values: loopback: Used to define the IPv4 loopback interface. manual: Used to define interfaces that are not configured automatically. dhcp: Can be used to obtain an IP address via DHCP. static: Used to define Ethernet interfaces with statically allocated IPv4 addresses. | string |
|--------------|--|---------|
| status | The state of the interface. Possible values: Down: The interface is inactive. Up: The interface is ready, but has no link. UpAndRunning: The interface is ready and a link is established. | string |
| upAndRunning | Indicates if the interface is ready and has a link. | boolean |

Member modifiability and node states

This table indicates whether or not the object parameters can be modified at each possible node state.

| Parameter name | Available state | Pending state | Active state |
|---------------------|----------------------|---------------|--------------|
| family | No | No | No |
| macAddress | Configured by system | N/A | N/A |
| macAddressPermanent | Configured by system | N/A | N/A |
| method | No | No | No |
| status | Yes | Yes | Yes |
| upAndRunning | Configured by system | N/A | N/A |

- GetConfig
- GetNetworkConfig

network (SNMP)

The SNMP network object contains information about SNMP v3 configuration for the cluster nodes.

Object members

This object contains the following members:

| Name | Description | Туре |
|-----------|--|---------|
| access | The type of access allowed for SNMP information requests. Possible values: • ro: Read-only access. • rw: Read-write access. • rosys: Read-only access to a restricted set of system information. | string |
| cidr | A CIDR network mask. This network mask must be an integer greater than or equal to 0, and less than or equal to 32. It must also not be equal to 31. | integer |
| community | The SNMP community string. | string |
| network | This member, along with the cidr member, controls which network the access and community string apply to. The special value of "default" is used to specify an entry that applies to all networks. The CIDR mask is ignored when this member is either a host name or "default". | string |

Find more information

GetSnmpInfo

networkInterface

The networkInterface object contains configuration information for individual network interfaces on a storage node.

Object members

This object contains the following members:

| Name | Description | Туре |
|-------------------|--|---------|
| address | The IPv4 management address of the interface. | string |
| addressV6 | The IPv6 management address of the interface. | string |
| broadcast | The broadcast address of the interface. | string |
| macAddress | The MAC address of the interface. | string |
| mtu | The Maximum Transfer Unit, in bytes, of the interface. | integer |
| name | The name of the interface. | string |
| namespace | Whether or not this interface is assigned a virtual network namespace. | boolean |
| netmask | The subnet mask of the interface. | string |
| status | The operational status of the interface. | string |
| type | The type of interface (bond master, bond slave, etc). | string |
| virtualNetworkTag | The VLAN ID assigned to the interface on the virtual network. | integer |

networkInterfaceStats

The networkInterfaceStats object contains network statistics, the total number of transmitted and received packets, and error information for individual network interfaces on a storage node. You can use the <code>ListNetworkInterfaceStats</code> API method to list this information for the network interfaces on a storage node.

Object members

This object contains the following members:

| Name | Description | Туре |
|-----------------|--|---------|
| collisions | The number of collisions detected. | integer |
| name | Name of the network interface. | string |
| rxBytes | The total number of bytes received. | integer |
| rxCrcErrors | The number of received packets that had a CRC error. | integer |
| rxDropped | The number of received packets that were dropped. | integer |
| rxErrors | The number of bad or malformed packets received. | integer |
| rxFifoErrors | The number of FIFO overrun errors in the received data. | integer |
| rxFrameErrors | The number of received packets with frame alignment errors. | integer |
| rxLengthErrors | The number of received packets with a length error. | integer |
| rxMissedErrors | The number of packets missed by the receiver. | integer |
| rxOverErrors | The number of receiver ring buffer overflow errors for this interface. | integer |
| rxPackets | The total number of packets received. | integer |
| txBytes | The total number of bytes transmitted. | integer |
| txCarrierErrors | The number of carrier errors for the transmit side. | integer |
| txErrors | The number of packet transmission errors. | integer |
| txFifoErrors | The number of FIFO overrun errors on the transmit side. | integer |
| txPackets | The total number of packets transmitted. | integer |

node

The node object contains information about each node in the cluster. You can retrieve this information using the ListActiveNodes and ListAllNodes methods.

Object members

| Name | Description | Туре |
|-----------------------------|--|-------------|
| associatedFServiceID | The Fibre Channel service ID for the node. "0" if the node is not a Fibre Channel node. | integer |
| associatedMasterServiceID | Master service ID for the node. | integer |
| attributes | List of name-value pairs in JSON object format. | JSON object |
| chassisName | Uniquely identifies a chassis; identical for all nodes in a single chassis. | string |
| cip | The cluster IP address assigned to the node. | string |
| cipi | Network interface used for cluster communication. | string |
| customProtectionDomainName | Uniquely identifies a custom protection domain. This name is identical for all storage nodes within all chassis in a given custom protection domain. | string |
| fibreChannelTargetPortGroup | The target group associated with this node. "null" if the node is not a Fibre Channel node. | integer |
| maintenanceMode | Indicates which mode a node is in for maintenance. | n/a |
| mip | The IP address used for node management. | string |
| mipi | The network interface used for node management. | string |
| name | Host name for the node. | string |
| nodelD | NodeID for this node. | integer |

| Name | Description | Туре |
|-----------------|---|----------------------|
| nodeSlot | For HCI platforms, the letter corresponding to the chassis slot this node is in ("A", "B", "C", or "D"). For storage platforms, this value is null. | string |
| platformInfo | Hardware information for the node. Members: chassisType: The hardware platform of the node. cpuModel: The CPU model of the hardware platform. nodeMemoryGB: The amount of memory installed in the physical platform in GB. nodeType: The node model name. platformConfigVersion: The version of software configured for this node hardware. | JSON object |
| role | The node's role in the cluster. Possible values: • Management • Storage • Compute • Witness | |
| sip | The storage IP address assigned to the node. | string |
| sipi | The network interface used for storage traffic. | string |
| softwareVersion | Returns the current version of Element software running on the node. | string |
| uuid | The universally unique identifier associated with this node. | string |
| virtualNetworks | Object containing virtual network IP addresses and IDs. | virtualNetwork array |

- ListActiveNodes
- ListAllNodes

nodeProtectionDomains

The nodeProtectionDomains object contains information on the identify of a node and the protection domains associated with that node.

Object members

This object contains the following members:

| Name | Description | Туре |
|-------------------|---|------------------|
| nodeID | Unique identifier for the node. | integer |
| protectionDomains | List of protection domains of which the node is a member. | protectionDomain |

nodeStats

The nodeStats object contains high-level activity measurements for a node. You can use the GetNodeStats and ListNodeStats API methods to get some or all of the nodeStats objects.

Object members

| Name | Description | Туре |
|-----------|--|---------|
| count | The number of total samples in the nodeStats object. | integer |
| cpu | CPU usage, in %. | integer |
| cpuTotal | Monotonically increasing value of cpu utilization. | integer |
| cBytesIn | Bytes in on the cluster interface. | integer |
| cBytesOut | Bytes out on the cluster interface. | integer |
| sBytesIn | Bytes in on the storage interface. | integer |
| sBytesOut | Bytes out on the storage interface. | integer |

| Name | Description | Туре |
|---------------------------|---|----------------------|
| mBytesIn | Bytes in on the management interface. | integer |
| mBytesOut | Bytes out on the management interface. | integer |
| networkUtilizationCluster | Network interface utilization (in %) for the cluster network interface. | integer |
| networkUtilizationStorage | Network interface utilization (in %) for the storage network interface. | integer |
| readLatencyUSecTotal | Monotonically increasing value of total time spent performing read operations to the node. | integer |
| readOps | Monotonically increasing value of total read operations to a node. | integer |
| ssLoadHistogram | Histogram data illustrating slice service load over time. | JSON object |
| timestamp | The current time in UTC+0 format. | ISO 8601 date string |
| usedMemory | Total memory usage in bytes. | integer |
| writeLatencyUSecTotal | Monotonically increasing value of total time spent performing write operations to the node. | integer |
| writeOps | Monotonically increasing value of total write operations to a node. | integer |

ontapVersionInfo

The ontapVersionInfo object contains information about the API version of the ONTAP cluster in a SnapMirror relationship. The Element web UI uses the GetOntapVersionInfo API method to get this information.

Object members

This object contains the following members:

| Name | Description | Туре |
|----------------------|---|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| clientAPIMajorVesion | The ONTAP API major version in use by the Element API client. | string |
| clientAPIMinorVesion | The ONTAP API minor version in use by the Element API client. | string |
| ontapAPIMajorVersion | The current API major version supported by the ONTAP system. | string |
| ontapAPIMinorVesion | The current API minor version supported by the ONTAP system. | string |
| ontapVersion | The current software version running on the ONTAP cluster. | string |

pendingActiveNode

The pendingActiveNode object contains information about a node that is currently in the pendingActive state, between the pending and active states. These are nodes that are currently being returned to the factory software image. Use the ListPendingActiveNodes API method to return a list of this information for all pendingActive nodes.

Object members

| Name | Description | Туре |
|----------------|--|---------|
| activeNodeKey | A unique key that allows the node to join the cluster automatically after a successful installation of software. | string |
| assignedNodeID | The assigned node ID for the node. | string |
| asyncHandle | The asynchronous method handle that you can use to query the status of the operation. | integer |

| Name | Description | Туре |
|---------------------|--|-------------|
| cip | The cluster IP address assigned to the node. | string |
| mip | The management IP address assigned to the node. | string |
| nodeSlot | For HCI platforms, the letter corresponding to the chassis slot this node is in ("A", "B", "C", or "D"). For storage platforms, this value is null. | string |
| pendingActiveNodeID | The pending node ID of the node. | integer |
| platformInfo | Hardware information for the node. Members: chassisType: The hardware platform of the node. cpuModel: The CPU model of the hardware platform. nodeMemoryGB: The amount of memory installed in the physical platform in GB. nodeType: The node model name. platformConfigVersion: The version of software configured for this node hardware. | JSON object |
| role | The node's role in the cluster. Possible values: • Management • Storage • Compute • Witness | |
| sip | The storage (iSCSI) IP address assigned to the node. | string |
| softwareVersion | The current version of Element software running on the node. | string |

ListPendingActiveNodes

pendingNode

The pendingNode object contains information about a node that can be added to a cluster. Use the ListPendingNodes API method to return a list of this information for all pending nodes. You can add any of the listed nodes to a cluster using the AddNodes API method.

Object members

| Name | Description | Туре |
|---------------------|---|---------|
| cipi | The cluster IP address assigned to the node. | string |
| activeNodeKey | A unique key that allows the node to join the cluster automatically after a successful installation of software. | string |
| assignedNodeID | The assigned node ID for the node. | string |
| asyncHandle | The asynchronous method handle that you can use to query the status of the operation. | integer |
| chassisName | Uniquely identifies a chassis; identical for all nodes in a single chassis. | string |
| cip | The cluster IP address assigned to the node. | string |
| mip | The management IP address assigned to the node. | string |
| nodeSlot | For HCI platforms, the letter corresponding to the chassis slot this node is in ("A", "B", "C", or "D"). For storage platforms, this value is null. | string |
| pendingActiveNodeID | The pending node ID of the node. | integer |

| Name | Description | Туре |
|-----------------|--|-------------|
| platformInfo | Hardware information for the node. Members: chassisType: The hardware platform of the node. cpuModel: The CPU model of the hardware platform. nodeMemoryGB: The amount of memory installed in the physical platform in GB. nodeType: The node model name. platformConfigVersion: The version of software configured for this node hardware. | JSON object |
| role | The node's role in the cluster. Possible values: • Management • Storage • Compute • Witness | |
| sip | The storage (iSCSI) IP address assigned to the node. | string |
| softwareVersion | The current version of Element software running on the node. | string |

- AddNodes
- ListPendingNodes

protectionDomain

The protectionDomain object contains the name and type details for a protection domain.

Object members

| Name | Description | Туре |
|----------------------|--|--------|
| protectionDomainName | The name of the protection domain. | string |
| protectionDomainType | The type of the protection domain. Possible values: chassis: All storage nodes in a single chassis. custom: All storage nodes in a single customer-defined protection domain. | string |

protectionDomainLevel

The protectionDomainLevel object contains information about the storage cluster's current tolerance and resiliency levels. Tolerance levels indicate the cluster's ability to continue reading and writing data in the event of a failure, and resiliency levels indicate the cluster's ability to automatically heal itself from one or more failures within its associated type of protection domain.

Object members

| Name | Description | Туре |
|----------------------|--|----------------------------|
| protectionDomainType | The type of the protection domain which has the associated tolerance and resiliency. Possible values: • node: Any individual node. • chassis: Any individual node or all storage nodes in a single chassis. • custom: All storage nodes in a single customer-defined protection domain. | string |
| resiliency | The current resiliency of this cluster from the perspective of this protection domain type. | protectionDomainResiliency |
| tolerance | The current tolerance of this cluster from the perspective of this protection domain type. | protectionDomainTolerance |

protectionDomainResiliency

The protectionDomainResiliency object contains the resiliency status of this storage cluster. Resiliency indicates the storage cluster's ability to automatically heal itself from one or more failures all within a single protection domain of its associated protection domain type. A storage cluster is considered healed when it can continue reading and writing data through the failure of any single storage node (a state known as node tolerance).

Object members

This object contains the following members:

| Name | Description | Туре |
|---|---|----------------------------------|
| protectionSchemeResiliencies | A list of objects (one for each protection scheme) containing failure resiliency information for the associated type of protection domain. | protectionSchemeResiliency array |
| singleFailureThresholdBytesForBlo ckData | The maximum number of bytes that can be stored on the storage cluster before losing the ability to automatically heal to a state of node tolerance. | integer |
| sustainableFailuresForEnsemble | The predicted number of simultaneous failures that can occur without losing the ability to automatically heal to a state of node tolerance for the ensemble quorum. | integer |

protectionDomainTolerance

The protectionDomainTolerance object contains information about the ability of the storage cluster to continue reading and writing data in the event of one or more failures all within a single protection domain of its associated protection domain type.

Object members

| Name | Description | Туре |
|--------------------------------|---|---------------------------------|
| protectionSchemeTolerances | A list of objects (one for each protection scheme) containing failure tolerance information for the associated type of protection domain. | protectionSchemeTolerance array |
| sustainableFailuresForEnsemble | The number of simultaneous failures within the associated type of protection domain that can occur without losing the ensemble quorum. | integer |

protectionSchemeResiliency

The protectionSchemeResiliency object contains information about whether a storage cluster, for a specific protection scheme, can automatically heal itself from one or more failures within its associated protectionDomainType. A storage cluster is considered healed when it can continue reading and writing data through the failure of any single storage node (a state known as node tolerance).

Object members

This object contains the following members:

| Name | Description | Туре |
|---------------------------------|---|---------|
| protectionScheme | The current protection scheme of this storage cluster. The only possible value is doubleHelix. | string |
| sustainableFailuresForBlockData | The predicted number of simultaneous failures which can occur without losing the ability to automatically heal to a state of node tolerance for data. | integer |
| sustainableFailuresForMetadata | The predicted number of simultaneous failures which can occur without losing the ability to automatically heal to a state of node tolerance for metadata. | integer |

protectionSchemeTolerance

The protectionSchemeTolerance object contains information about whether a storage cluster, for a specific protection scheme, can continue to read and write data after failures.

Object members

This object contains the following members:

| Name | Description | Туре |
|---------------------------------|--|---------|
| protectionScheme | The current protection scheme of this storage cluster. The only possible value is doubleHelix. | string |
| sustainableFailuresForBlockData | The current number of simultaneous failures which can occur without losing block data availability for the associated protection scheme. | integer |
| sustainableFailuresForMetadata | The current number of simultaneous failures which can occur without losing metadata availability for the associated protection scheme. | integer |

protocolEndpoint

The protocolEndpoint object contains the attributes of a protocol endpoint. You can retrieve this information for all protocol endpoints in the cluster using the ListProtocolEndpoints API method.

Object members

| Name | Description | Туре |
|--------------------|--|---------|
| primaryProviderID | The ID of the primary protocol endpoint provider object for the protocol endpoint. | integer |
| protocolEndpointID | The unique ID of the protocol endpoint. | UUID |

| Name | Description | Туре |
|-----------------------|---|---------|
| protocolEndpointState | The status of the protocol endpoint. Possible values: Active: The protocol endpoint is in use. Start: The protocol endpoint is starting. Failover: The protocol endpoint has failed over. Reserved: The protocol endpoint is reserved. | string |
| providerType | The type of the protocol endpoint's provider. Possible values: • Primary • Secondary | string |
| scsiNAADeviceID | The globally unique SCSI device identifier for the protocol endpoint in NAA IEEE Registered Extended Format. | string |
| secondaryProviderID | The ID of the secondary protocol endpoint provider object for the protocol endpoint. | integer |

ListProtocolEndpoints

QoS

The QoS object contains information about Quality of Service (QoS) settings for volumes. Volumes created without specified QoS values are created using the default values. You can find default values using the GetDefaultQoS method.

Object members

| Name | Description | Туре |
|-----------|--|-------------|
| burstIOPS | Maximum "peak" 4KB IOPS allowed for short periods of time. Allows for bursts of I/O activity over the normal maxIOPS value. | integer |
| burstTime | The length of time burstIOPS is allowed. The value returned is represented in seconds. This value is calculated by the system based on IOPS set for QoS. | integer |
| curve | The curve is a set of key-value pairs. The keys are I/O sizes in bytes. The values represent the cost of performing one IOP at a specific I/O size. The curve is calculated relative to a 4096 byte operation set at 100 IOPS. | JSON object |
| maxIOPS | The desired maximum 4KB IOPS allowed over an extended period of time. | integer |
| minIOPS | The desired minimum 4KB IOPS to guarantee. The allowed IOPS will only drop below this level if all volumes have been capped at their minIOPS value and there is still insufficient performance capacity. | integer |

GetDefaultQoS

QoSPolicy

The QoSPolicy object contains information about a QoS policy on a storage cluster running Element software.

Object members

| Name | Description | Туре |
|-------------|--|---------|
| qosPolicyID | A unique integer identifier for the QoSPolicy automatically assigned by the storage cluster. | integer |

| Name | Description | Туре |
|-----------|---|---------------|
| name | The name of the QoS policy. For example: gold, platinum, or silver. | string |
| qos | The QoS settings that this policy represents. | QoS |
| volumeIDs | A list of volumes associated with this policy. | integer array |

GetQoSPolicy

remoteClusterSnapshotStatus

The remoteClusterSnapshotStatus object contains the UUID and status of a snapshot stored on a remote storage cluster. You can get this information with the ListSnapshots or ListGroupSnapshots API methods.

Object members

| Name | Description | Туре |
|----------------|--|--------|
| remoteStatus | The replication status of the remote snapshot on the target cluster as seen from the source cluster. Possible values: • Present: The snapshot exists on a remote cluster. • NotPresent: The snapshot does | string |
| | not exist on a remote cluster. | |
| | Syncing: This is a target cluster and it is currently replicating the snapshot. | |
| | Deleted: This is a target cluster. The snapshot has been deleted, and it still exists on the source. | |
| volumePairUUID | The universal identifier of the volume pair. | UUID |

schedule

The schedule object contains information about a schedule created to autonomously make a snapshot of a volume. You can retrieve schedule information for all schedules with the ListSchedules API method.

Object members

| Name | Description | Туре |
|------------------|--|----------------------|
| attributes | Indicates the frequency of the schedule occurrence. Possible values: • Day of Week • Day of Month • Time Interval | JSON object |
| hasError | Indicates whether or not the schedule has errors. Possible values: • true • false | boolean |
| hours | Shows the hours that will elapse before the next snapshot is created. Possible values are 0 through 24. | integer |
| lastRunStatus | Indicates the status of the last scheduled snapshot. Possible values: • Success • Failed | string |
| lastRunTimeStart | Indicates the last time the schedule started. | ISO 8601 date string |
| minutes | Shows the minutes that will elapse before the next snapshot is created. Possible values are 0 through 59. | integer |
| monthdays | Indicates the days of the month that a snapshot will be made. | array |

| Name | Description | Туре |
|-----------------|--|---------|
| paused | Indicates whether or not the schedule is paused. Possible values: • true • false | boolean |
| recurring | Indicates whether or not the schedule is recurring. Possible values: • true • false | boolean |
| runNextInterval | Indicates whether or not the schedule will run the next time the scheduler is active. When true, the schedule will run the next time the scheduler is active and then this value is set back to false. Possible values: • true • false | boolean |
| scheduleID | The unique ID of the schedule. | integer |

| Name | Description | Туре |
|--------------|---|-------------|
| scheduleInfo | Includes the unique name given to the schedule, the retention period for the snapshot that was created, and the volume ID of the volume from which the snapshot was created. Valid values: | JSON object |
| | enableRemoteReplication: Indicates if the snapshot should be included in remote replication. (boolean) | |
| | ensureSerialCreation: Specifies whether a new snapshot creation should be allowed if a previous snapshot replication is in progress. (boolean) | |
| | name: The snapshot name to be used. (string) | |
| | retention: The amount of time the snapshot is retained. Depending on the time, it displays in one of the following formats: | |
| | fifo: The snapshot is retained on a First-In-First- Out (FIFO) basis. If empty, the snapshot is retained forever. (string) | |
| | 。"HH:mm:ss" | |
| | volumeID: The ID of the volume to be included in the snapshot. (integer) | |
| | volumes: A list of volume IDs to be included in the group snapshot. (integer array) | |
| scheduleName | The unique name assigned to the schedule. | string |
| scheduleType | Only schedule types of snapshot are supported at this time. | string |

| Name | Description | Туре |
|-----------------|---|----------------------|
| snapMirrorLabel | The snapMirrorLabel to be applied to the created Snapshot or Group Snapshot, contained in the scheduleInfo. If not set, this value is null. | string |
| startingDate | Indicates the date the first time the schedule began or will begin; formatted in UTC time. | ISO 8601 date string |
| toBeDeleted | Indicates if the schedule is marked for deletion. Possible values: • true • false | boolean |
| weekdays | Indicates the days of the week that a snapshot will be made. | array |

ListSchedules

session (Fibre Channel)

The session object contains information about each Fibre Channel session that is visible to the cluster and what target ports it is visible on. You can retrieve this information with the ListFibreChannelSessions API method.

Object members

| Name | Description | Туре |
|---------------|---|---------|
| initiatorWWPN | The World Wide Port Name (WWPN) of the initiator that is logged into the target port. | string |
| nodeID | The node that owns the Fibre Channel session. | integer |

| Name | Description | Туре |
|---------------------|--|-------------|
| initiator | Information about this Fibre Channel session's server initiator. Members: | JSON object |
| | alias: The friendly name assigned to the initiator. | |
| | attributes: The attributes of this initiator. | |
| | initiatorID: The ID of this initiator. | |
| | initiatorName: The name of this initiator. | |
| | volumeAccessGroups: A list of volume access groups associated with this initiator. | |
| serviceID | The service ID of the target port involved in this session. | integer |
| targetWWPN | The WWPN of the target port involved in this session. | string |
| volumeAccessGroupID | The ID of the volume access group to which the initiatorWWPN belongs. If not in a volume access group, this value is null. | integer |

ListFibreChannelSessions

session (iSCSI)

The session (iSCSI) object contains detailed information about each volume's iSCSI session. You can retrieve iSCSI session information with the ListISCSISessions API method.

Object members

| Name | Description | Туре |
|-----------|---|---------|
| accountID | The account ID of the account used for CHAP authentication, if any. | integer |

| Name | Description | Туре |
|---------------------|---|----------------------|
| accountName | The name of the account used for CHAP authentication, if any. | string |
| createTime | The time of the creation of the iSCSI session, in UTC+0 format. | ISO 8601 date string |
| driveID | The driveID associated with the transport service hosting the session. | integer |
| drivelDs | A list of the driveIDs of the drives reporting the failure. An empty list if not applicable. | integer array |
| initiator | Information about this iSCSI session's server initiator. Members: alias: The friendly name assigned to the initiator. attributes: The attributes of this initiator. initiatorID: The ID of this initiator. initiatorName: The name of this initiator. volumeAccessGroups: A list of volume access groups associated with this initiator. | JSON object |
| initiatorIP | The IP address and port number of the iSCSI server initiator. | string |
| initiatorName | The iSCSI Qualified Name (IQN) of the iSCSI server initiator. | string |
| initiatorPortName | The initiatorName combined with the initiatorSessionID; identifies the initiator port. | string |
| initiatorSessionID | A 48-bit ID provided by the initiator that identifies the iSCSI session as belonging to that initiator. | integer |
| msSinceLastIscsiPDU | The time, in milliseconds, since the last iSCSI PDU was received for this session. | integer |

| Name | Description | Туре |
|------------------------|---|---------|
| msSinceLastScsiCommand | The time, in milliseconds, since the last SCSI command was received for this session. | integer |
| nodelD | The nodeID associated with the transport service hosting the session. | integer |
| serviceID | The serviceID of the transport service hosting the session. | integer |
| sessionID | The iSCSI session ID. | integer |
| targetIP | The IP address and port number of the iSCSI storage target. | string |
| targetName | The IQN of the iSCSI target. | string |
| targetPortName | The targetName combined with the target portal group tag; identifies the target port. | string |
| virtualNetworkID | The virtual network ID associated with the session. | integer |
| volumeID | The volumeID of the volume associated with the session, if any. | integer |
| volumeInstance | Identifies the volume object associated with the iSCSI session, if any. | integer |

ListISCSISessions

snapMirrorAggregate

The snapMirrorAggregate object contains information about the available ONTAP aggregates, which are collections of disks made available to volumes as storage. You can get this information using the ListSnapMirrorAggregates API method.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| aggregateName | The name of the aggregate. | string |
| nodeName | The name of the ONTAP node that owns this aggregate. | string |
| sizeAvailable | The number of available bytes remaining in the aggregate. | integer |
| sizeTotal | The total size (in bytes) of the aggregate. | integer |
| percentUsedCapacity | The percentage of disk space currently in use. | integer |
| volumeCount | The number of volumes in the aggregate. | integer |

snapMirrorClusterIdentity

The snapMirrorClusterIdentity object contains identification information about the remote ONTAP cluster in a SnapMirror relationship.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| clusterName | The name of the destination ONTAP cluster. | string |
| clusterUUID | The 128-bit universally-unique identifier of the destination ONTAP cluster. | string |
| clusterSerialNumber | The serial number of the destination ONTAP cluster. | string |

snapMirrorEndpoint

The snapMirrorEndpoint object contains information about the remote SnapMirror storage systems communicating with the Element storage cluster. You can retrieve this information with the ListSnapMirrorEndpoints API method.

Object members

This object contains the following members:

| Name | Description | Туре |
|----------------------|--|--------------|
| snapMirrorEndpointID | The unique identifier for the object in the local cluster. | integer |
| managementIP | The cluster management IP address of the endpoint. | string |
| clusterName | The ONTAP cluster name. This value is automatically populated with the value of "clusterName" from the snapMirrorClusterIdentity object. | string |
| username | The management user name for the ONTAP system. | string |
| ipAddresses | List of the inter-cluster storage IP addresses for all nodes in the cluster. You can get these IP addresses with the ListSnapMirrorNetworkInterfaces method. | string array |
| isConnected | The connectivity status of the control link to the ONTAP cluster. | boolean |

snapMirrorJobScheduleCronInfo

The snapMirrorJobScheduleCronInfo object contains information about a cron job schedule on the ONTAP system.

Object members

| Name | Description | Туре |
|------------------------|--|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| jobScheduleName | The name of the job schedule. | string |
| jobScheduleDescription | An automatically-generated human-readable summary of the schedule. | string |

snap MirrorLunInfo

The snapMirrorLunInfo object contains information about the ONTAP LUN object.

Object members

| Name | Description | Туре |
|----------------------|--|----------------------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| creationTimestamp | The creation time of the LUN. | ISO 8601 date string |
| IunName | The name of the LUN. | string |
| path | The path of the LUN. | string |
| size | The size of the LUN in bytes. | integer |
| sizeUsed | The number of bytes used by the LUN. | integer |
| state | The current access state of the LUN. Possible values: • online • offline • foreign_lun_error • nvfail • space_error | string |
| volume | The name of the volume that contains the LUN. | string |

| Name | Description | Туре |
|---------|------------------------------------|--------|
| vserver | The Vserver that contains the LUN. | string |

$snap {\bf Mirror Network Interface}$

The snapMirrorNetworkInterface object contains information about the intercluster Logical Interfaces (LIFs).

Object members

| Name | Description | Туре |
|----------------------|--|---------|
| administrativeStatus | Whether the logical interface (LIF) is administratively enabled or disabled. Possible values: • up • down | string |
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| interfaceName | The LIF name. | string |
| networkAddress | The IP address of the LIF. | string |
| networkMask | The network mask of the LIF. | string |
| interfaceRole | The role of the LIF. Possible values: • undef • cluster • data • node_mgmt • intercluster • cluster_mgmt | string |

| Name | Description | Туре |
|-------------------|---|--------|
| operationalStatus | The operational state of the LIF (whether or not it has formed a successful connection). This status can differ from the administrative status if there is a network problem that prevents the interface from functioning. Possible values: • up • down | string |
| vserverName | The name of the Vserver. | string |

snapMirrorNode

The snapMirrorNode object contains information about the nodes of the destination ONTAP cluster in a SnapMirror relationship.

Object members

| Name | Description | Туре |
|----------------------|--|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| name | The name of the ONTAP node. | string |
| model | The model of the ONTAP node. | string |
| serialNumber | The serial number of the ONTAP node. | string |
| productVersion | The ONTAP product version. | string |
| isNodeHealthy | The health of a node in the ONTAP cluster. Possible values: • true • false | string |

| Name | Description | Туре |
|----------------|---|--------|
| isNodeEligible | Whether or not the node is eligible to participate in an ONTAP cluster. Possible values: • true • false | string |

snapMirrorPolicy

The snapMirrorPolicy object contains information about a SnapMirror policy that is stored on an ONTAP system.

Object members

| Name | Description | Туре |
|----------------------|--|----------------------------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| policyName | The unique name assigned to the policy. | string |
| policyType | The type of policy. Possible values: • async_mirror • mirror_vault | string |
| comment | A human-readable description associated with the SnapMirror policy. | string |
| transferPriority | The priority at which a SnapMirror transfer runs. Possible values: normal: The default priority. These transfers are scheduled before most low priority transfers. low: These transfers have the lowest priority and are scheduled after most normal priority transfers. | string |
| policyRules | A list of objects describing the policy rules. | snapMirrorPolicyRule array |

| Name | Description | Туре |
|----------------|--|---------|
| totalKeepCount | The total retention count for all rules in the policy. | integer |
| totalRules | The total number of rules in the policy. | integer |
| vserverName | The name of the Vserver for the SnapMirror policy. | string |

snapMirrorPolicyRule

The snapMirrorPolicyRule object contains information about the rules in a SnapMirror policy.

Object members

This object contains the following members:

| Name | Description | Туре |
|-----------------|--|---------|
| snapMirrorLabel | The snapshot copy label, used for snapshot copy selection in extended data protection relationships. | string |
| keepCount | Specifies the maximum number of snapshot copies that are retained on the SnapMirror destination volume for a rule. | integer |

snap Mirror Relation ship

The snapMirrorRelationship object contains information about a SnapMirror relationship between a Element volume and an ONTAP volume.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |

| Name | Description | Туре |
|--------------------------|---|----------------------|
| snapMirrorRelationshipID | The unique identifier for each snapMirrorRelationship object in an array as would be returned in ListSnapMirrorRelationships. This UUID is created and returned from the ONTAP system. | string |
| sourceVolume | An object describing the source volume. | snapMirrorVolumeInfo |
| destinationVolume | An object describing the destination volume. | snapMirrorVolumeInfo |
| currentMaxTransferRate | The current maximum transfer rate between the source and destination volumes, in kilobytes per second. | integer |
| isHealthy | Whether the relationship is healthy or not. Possible values: true: The relationship is healthy. false: The relationship is not healthy. This can be caused by a manual or scheduled update failing or being aborted, or by the last scheduled update being delayed. | boolean |
| lagtime | The amount of time in seconds by which the data on the destination volume lags behind the data on the source volume. | integer |
| lastTransferDuration | The amount of time in seconds it took for the last transfer to complete. | integer |
| lastTransferError | A message describing the cause of the last transfer failure. | string |
| lastTransferSize | The total number of bytes transferred during the last transfer. | integer |
| lastTransferEndTimestamp | The timestamp of the end of the last transfer. | ISO 8601 date string |

| Name | Description | Туре |
|------------------|--|---------|
| lastTransferType | The type of the previous transfer in the relationship. | string |
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer |
| mirrorState | The mirror state of the SnapMirror relationship. Possible values: uninitialized: The destination volume has not been initialized. snapmirrored: The destination volume has been initialized and is ready to receive SnapMirror updates. broken-off: The destination volume is read-write and snapshots are present. | string |
| newestSnapshot | The name of the newest Snapshot copy on the destination volume. | string |
| policyName | Specifies the name of the ONTAP SnapMirror policy for the relationship. A list of available policies can be retrieved with ListSnapMirrorPolicies. Example values are "MirrorLatest" and "MirrorAndVault". | string |
| policyType | The type of the ONTAP SnapMirror policy for the relationship. See ListSnapMirrorPolicies. Examples are: "async_mirror" or "mirror_vault". | string |

| Name | Description | Туре |
|----------------------|---|---------|
| relationshipProgress | The total number of bytes that have been processed so far for the current activity of the relationship as returned in the relationship-status. This is set only when the "relationshipStatus" member indicates that an activity is in progress. | integer |
| relationshipStatus | The status of the SnapMirror relationship. Possible values: • idle • transferring • checking • quiescing • quiesced • queued • preparing • finalizing • aborting • breaking | string |
| relationshipType | The type of the SnapMirror relationship. On storage clusters running Element software, this value is always "extended_data_protection". | string |
| scheduleName | The name of the pre-existing cron schedule on the ONTAP system that is used to update the SnapMirror relationship. A list of available schedules can be retrieved with ListSnapMirrorSchedules. | string |
| unhealthyReason | The reason the relationship is not healthy. | string |

snapMirrorVolume

The snapMirrorVolume object contains information about an ONTAP volume.

Object members

This object contains the following members:

| Name | Description | Туре |
|----------------------|--|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| name | The name of the volume. | string |
| type | The type of volume. Possible values: • rw: Read-write volume • ls: Load-sharing volume • dp: Data protection volume | string |
| vserver | The name of the Vserver that owns this volume. | string |
| aggrName | The containing aggregate name. | string |
| state | The state of volume. Possible values: • online • restricted • offline • mixed | string |
| size | The total filesystem size (in bytes) of the volume. | string |
| availSize | The size (in bytes) of the available space in the volume. | string |

snapMirrorVolumeInfo

The snapMirrorVolumeInfo object contains information about a volume location in a SnapMirror relationship, such as its name and type.

Object members

| Name | Description | Туре |
|----------|--|---------|
| type | The type of volume. Possible values: • solidfire: The volume resides on a storage cluster running Element software. • ontap: The volume resides on a | string |
| volumeID | remote ONTAP cluster. The ID of the volume. Only valid if "type" is solidfire. | integer |
| vserver | The name of the Vserver that owns this volume. Only valid if "type" is ontap. | string |
| name | The name of the volume. | string |

snapMirrorVserver

The snapMirrorVserver object contains information about the Storage Virtual Machines (or Vservers) at the destination ONTAP cluster.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| snapMirrorEndpointID | The ID of the destination ONTAP system. | integer |
| vserverName | The name of the Vserver. | string |
| vserverType | The type of Vserver. Possible values: • data • admin • system • node | string |

| Name | Description | Туре |
|----------------------|--|-------------|
| vserverSubtype | The subtype of the Vserver. Possible values: default dp_destination data sync_source sync_destination | string |
| rootVolume | The root volume of the Vserver. | string |
| rootVolumeAggregate | The aggregate on which the root volume will be created. | string |
| vserverAggregateInfo | An array of snapMirrorVserverAggregateInfo objects. | JSON object |
| adminState | The detailed administrative state of the Vserver. Possible values: • running • stopped • starting • stopping • initializing • deleting | string |
| operationalState | The basic operational state of the Vserver. Possible values: • running • stopped | string |

$snap {\bf Mirror Vserver Aggregate Info}$

The snapMirrorVserverAggregateInfo object contains information about the available data Storage Virtual Machines (also called Vservers) at the destination ONTAP cluster.

Object members

| Name | Description | Туре |
|---------------|--|---------|
| aggrName | The name of the aggregate assigned to a Vserver. | string |
| aggrAvailSize | The assigned aggregate's available size. | integer |

snapshot

The snapshot object contains information about a snapshot made for a volume. You can use the ListSnapshots API method to retrieve a list of snapshot information for a volume or for all volumes. The object includes information about the active snapshot as well as each snapshot created for a volume.

Object members

| Name | Description | Туре |
|-------------------------|--|----------------------|
| attributes | List of name-value pairs in JSON object format. | JSON object |
| checksum | A small string representation of the data in the stored snapshot. This checksum can be used later to compare other snapshots to detect errors in the data. | string |
| createTime | The UTC+0 formatted time the snapshot was created. | ISO 8601 date string |
| enableRemoteReplication | Identifies if snapshot is enabled for remote replication. | boolean |
| expirationReason | Indicates how the snapshot expiration is set. Possible values: Api: The expiration time is set by using the API. None: No expiration time is set. Test: The expiration time is set for testing. fifo: Expiration occurs on a first-in-first-out basis. | string |

| Name | Description | Туре |
|----------------------|---|-----------------------------------|
| expirationTime | The time at which this snapshot will expire and be purged from the cluster. | ISO 8601 date string |
| groupID | The group ID if the snapshot is a member of a group snapshot. | integer |
| groupsnapshotUUID | Contains information about each snapshot in the group. Each of these members will have a UUID parameter for the snapshot's UUID. | string |
| instanceCreateTime | The time that the snapshot was created on the local cluster. | ISO 8601 date string |
| instanceSnapshotUUID | The universally unique ID of the snapshot on the local cluster. This ID does not get replicated to other clusters. | string |
| name | The unique name assigned to the snapshot. If no name is specified, the name is the UTC+0 formatted timestamp of when the snapshot was created. | string |
| remoteStatuses | An array containing the universal identifier and replication status of each remote snapshot on the target cluster as seen from the source cluster. | remoteClusterSnapshotStatus array |
| snapMirrorLabel | The label used by SnapMirror software to specify snapshot retention policy on SnapMirror endpoints. If not set, this value is null. | string |
| snapshotID | The unique ID of an existing snapshot. | string |
| snapshotUUID | The universally unique ID of an existing snapshot. When the snapshot is replicated across clusters, this ID is replicated along with it and is used to identify the snapshot across clusters. | string |

| Name | Description | Туре |
|-----------------|--|---------|
| status | Current status of the snapshot. Possible values: Unknown: There was an error obtaining the status of the snapshot. Preparing: This snapshot is being prepared for use and is not yet writable. RemoteSyncing: This snapshot is being replicated from a remote cluster. Done: This snapshot has finished preparation or replication and is now usable. Active: This snapshot is the active branch. Cloning: This snapshot is involved in a CopyVolume operation. | string |
| totalSize | The total size in bytes of the snapshot. | integer |
| virtualVolumeID | The ID of the virtual volume associated with this snapshot. | UUID |
| volumeID | The ID of the volume the snapshot was created from. | integer |
| volumeName | The name of the volume at the time the snapshot was created. | string |

ListSnapshots

snmpTrapRecipient

The snmpTrapRecipient object contains information about a host that is configured to receive SNMP traps generated by the storage cluster. You can use the GetSnmpTrapInfo API method to get a list of hosts configured to receive SNMP traps.

Object members

| Name | Description | Туре |
|-----------|--|---------|
| host | The IP address or host name of the target host. | string |
| port | The UDP port number on the host where the trap should be sent. Valid range is 1 through 65535. 0 (zero) is not a valid port number. The default port is 162. | integer |
| community | SNMP community string. | string |

storageContainer

The storageContainer object contains the attributes of a virtual volume storage container. You can retrieve this information for each storage container in the cluster using the ListStorageContainers API method.

Object members

| Name | Description | Туре |
|----------------------|---|---------|
| accountID | The ID of the storage system account associated with the storage container. | integer |
| initiatorSecret | The CHAP authentication secret for the initiator associated with the storage container. | string |
| name | The name of the storage container. | string |
| protocolEndpointType | The storage container's protocol endpoint type. SCSI is the only valid value. | string |
| status | The status of the storage container.Possible values:Active: The storage container is in use.Locked: The storage container is locked. | string |

| Name | Description | Туре |
|--------------------|--|------------|
| storageContainerID | The unique ID of the storage container. | UUID |
| targetSecret | The CHAP authentication secret for the target associated with the storage container. | string |
| virtualVolumes | A list of IDs of the virtual volumes associated with the storage container. | UUID array |

ListStorageContainers

syncJob

The syncJob object contains information about clone, remote replication, or slice synchronization jobs that are running on a cluster.

You can retrieve synchronization information with the ListSyncJobs API method.

Object members

| Name | Description | Туре |
|-----------------|---|---------|
| blocksPerSecond | The number of data blocks being transferred per second from the source cluster to the target cluster. Present only if the type member is set to remote. | integer |
| branchType | Returned for remote replication sync jobs only. Possible values: • snapshot • volume | string |
| bytesPerSecond | The number of bytes the clone is processing per second. Present only if the type member is set to clone or slice. | float |

| Name | Description | Туре |
|-----------------|---|--|
| cloneID | The identifier of the clone operation that is in progress. Present only if the type member is set to clone. | integer |
| currentBytes | The number of bytes the clone has processed in the source volume. Present only if the type member is set to clone or slice. | integer |
| dstServiceID | The service identifier hosting the primary replica for the volume. Present only if the type member is set to remote. | integer |
| dstVolumeID | The destination volume ID. Present only if the type member is set to clone or remote. | integer |
| elapsedTime | The time elapsed, in seconds, since the sync job started. | float or integer depending on the type of sync operation |
| groupCloneID | The ID of the group clone operation that is in progress. | integer |
| nodeID | Specifies the node the clone is occurring on. Present only if the type member is set to clone. | integer |
| percentComplete | The percentage of sync job completion. | float or integer depending on the type of sync operation |
| remainingTime | The estimated time, in seconds, to complete the operation. | float |
| sliceID | The ID of the slice drive being synced. | integer |

| Name | Description | Туре |
|--------------|--|---------|
| stage | Present only if the type member is set to remote or clone. Possible values: • metadata: Replication is in the process of determining what data needs to be transferred to the remote cluster. Status is not reported for this stage of the replication process. • data: Replication is in the process of transferring the bulk of the data to the remote cluster. • whole: Indicates backward compatibility of the slice for slice sync jobs. | string |
| snapshotID | The ID of the snapshot the clone was created from. Present only if the type member is set to clone. | integer |
| srcServiceID | The source service ID. | integer |
| srcVolumeID | The source volume ID. | integer |
| totalBytes | The total number of bytes of the clone. Present only if the type member is set to clone or slice. | integer |
| type | The type of sync operation. Possible values: | string |

ListSyncJobs

task (virtual volumes)

The task object contains information about a currently running or finished virtual volume task in the system. You can use the ListVirtualVolumeTasks method to retrieve this

information for all virtual volume tasks.

Object members

| Name | Description | Туре |
|----------------------|---|-------------|
| cancelled | Indicates whether or not the task was cancelled. Possible values: • true • false | boolean |
| cloneVirtualVolumeID | The unique virtual volume ID of the virtual volume being cloned (for clone tasks). | UUID |
| parentMetadata | An object containing metadata of the parent for tasks which clone or create snapshots of a virtual volume. | JSON object |
| parentTotalSize | The total space available (in bytes) on the parent for clone or snapshot tasks. | integer |
| parentUsedSize | The used space of the parent (in bytes) for clone or snapshot tasks. | integer |

| Name | Description | Туре |
|---------------------|--|--------|
| operation | The type of operation the task is performing. Possible values: | string |
| | unknown: The task operation is unknown. | |
| | prepare: The task is preparing a virtual volume. | |
| | snapshot: The task is creating a snapshot of a virtual volume. | |
| | rollback: The task is rolling back a virtual volume to a snapshot. | |
| | clone: The task is creating a clone of the virtual volume. | |
| | fastClone: The task is creating a fast clone of a virtual volume. | |
| | copyDiffs: The task is copying differing blocks to a virtual volume. | |
| status | The current status of the virtual volume task. Possible values: | string |
| | Error: The task has failed and returned an error. | |
| | Queued: The task is waiting to be run. | |
| | Running: The task is currently running. | |
| | Success: The task has completed successfully. | |
| virtualVolumeHostID | The unique ID of the host that started the task. | UUID |
| virtualVolumeID | The new, unique virtual volume ID (for tasks that create a new virtual volume). | UUID |
| virtualVolumeTaskID | The unique ID of the task. | UUID |

ListVirtualVolumeTasks

usmUser

You can use the SNMP usmUser object with the SetSnmpInfo API method to configure SNMP on the storage cluster.

Object members

This object contains the following members:

| Name | Description | Туре |
|------------|--|--------|
| access | The type of SNMP access for this user. Possible values: • rouser: Read-only access. • rwuser: Read-write access. All Element software MIB objects are read-only. | string |
| name | The name of the user. | string |
| password | The password of the user. | string |
| passphrase | The passphrase of the user. | string |
| secLevel | The type of credentials required for this user. Possible values: noauth: No password or passphrase is required. auth: A password is required for user access. priv: A password and passphrase are required for user access. | string |

Find more information

SetSnmpInfo

virtualNetwork

The virtualNetwork object contains information about a specific virtual network. You can use the ListVirtualNetworks API method to retrieve a list of this information for all virtual networks in the system.

Object members

| Name | Description | Туре |
|-------------------|--|-------------------|
| addressBlocks | The range of address blocks currently assigned to the virtual network. Members: • available: Binary string in "1"s and "0"s. "1" denotes that the IP address is available, and "0" denotes that the IP is not available. The string is read from right to left with the digit to the far right being the first IP address in the list of address blocks. • size: The size of this block of addresses. • start: The first IP address in the block. | JSON object array |
| attributes | List of name-value pairs in JSON object format. | JSON object |
| name | The name assigned to the virtual network. | string |
| netmask | The IP address of the netmask for the virtual network. | string |
| svip | The storage IP address for the virtual network. | string |
| gateway | The gateway used for the virtual network. | string |
| virtualNetworkID | The unique identifier for a virtual network. | integer |
| virtualNetworkTag | The VLAN tag identifier. | integer |

ListVirtualNetworks

virtualVolume

The virtualVolume object contains configuration information about a virtual volume as well as information about snapshots of the virtual volume. It does not include runtime or usage information. You can use the ListVirtualVolumes method to retrieve this information

for a cluster.

Object members

| Name | Description | Туре |
|-----------------------|---|-------------|
| bindings | A list of binding IDs for this virtual volume. | UUID array |
| children | A list of virtual volume UUIDs that are children of this virtual volume. | UUID array |
| descendants | When you pass recursive: true to the ListVirtualVolumes method, contains a list of virtual volume UUIDs that are descendants of this virtual volume. | UUID array |
| metadata | Key-value pairs of the virtual volume's metadata, such as virtual volume type, guest OS type, and so on. | JSON object |
| parentVirtualVolumeID | The virtual volume ID of the parent virtual volume. If the ID is all zeros, this is an independent virtual volume with no link to a parent. | UUID |
| snapshotID | The ID of the underlying volume snapshot. This value is "0" if the virtual volume does not represent a snapshot. | integer |
| snapshotInfo | The snapshot object for the associated snapshot (null if nonixestent). | snapshot |
| status | Current status of the virtual volume. Possible values: • cloning: The virtual volume is being processed in response to a clone or snapshot operation. • waiting: The virtual volume is waiting for a snapshot operation to complete. • ready: The virtual volume is ready for general purpose use. | string |

| Name | Description | Туре |
|-------------------|---|------------------|
| storageContainer | An object describing the storage container that owns this virtual volume. | storageContainer |
| virtualVolumeID | The unique ID of the virtual volume. | UUID |
| virtualVolumeType | The type of the virtual volume. | string |
| volumeID | The ID of the underlying volume. | integer |
| volumeInfo | When you pass details: true to the ListVirtualVolumes method, this member is an object describing the volume. | volume |

- ListVirtualVolumes
- snapshot
- storageContainer
- volume

volume

The volume object contains configuration information about unpaired or paired volumes. It does not include runtime or usage information, and does not contain information about virtual volumes.

Object members

| Name | Description | Туре |
|-----------------------------|--|-----------------|
| access | The type of access allowed for the volume. Possible values: • readOnly: Only read operations are allowed. • readWrite: Reads and writes are allowed. • locked: No reads or writes are allowed. • replicationTarget: Designated as a target volume in a replicated volume pair. | string |
| accountID | The accountID of the account containing the volume. | integer |
| attributes | List of name-value pairs in JSON object format. | JSON object |
| blockSize | The size of blocks on the volume. | integer |
| createTime | The UTC+0 formatted time the volume was created. | ISO 8601 string |
| currentProtectionScheme | The protection scheme that is being used for this volume. If a volume is converting from one protection scheme to another, this member reflects the protection scheme to which the volume is converting. | string |
| deleteTime | The UTC+0 formatted time the volume was deleted. | ISO 8601 string |
| enable512e | If set to true, the volume provides 512 byte sector emulation. | boolean |
| enableSnapMirrorReplication | Whether or not the volume can be used for replication with SnapMirror endpoints. | boolean |
| fifoSize | Specifies the maximum number of snapshots of the volume to be maintained simultaneously if using the First-In-First-Out (FIFO) snapshot retention mode. | integer |

| Name | Description | Туре |
|--------------------------|--|-----------------|
| iqn | The iSCSI Qualified Name of the volume. | string |
| lastAccessTime | The last time any access (including I/O) to the volume occurred (formatted as UTC+0). If the last access time is not known, this value is null. | ISO 8601 string |
| IastAccessTimeIO | The last time any I/O to the volume occurred (formatted as UTC+0). If the last access time is not known, this value is null. | ISO 8601 string |
| minFifoSize | Specifies the minimum number of First-In-First-Out (FIFO) snapshot slots reserved simultaneously by the volume if using the First-In-First-Out (FIFO) snapshot retention mode. | integer |
| name | The name of the volume as provided at creation time. | string |
| previousProtectionScheme | If a volume is converting from one protection scheme to another, this member reflects the protection scheme from which the volume is converting. This member does not change until a conversion is started. If a volume has never been converted, this member is null. | string |
| purgeTime | The UTC+0 formatted time the volume was purged from the system. | ISO 8601 string |
| qos | The quality of service settings for this volume. | QoS |
| qosPolicyID | The QoS policy ID associated with the volume. The value is null if the volume is not associated with a policy. | integer |
| scsiEUIDeviceID | Globally unique SCSI device identifier for the volume in EUI-64 based 16-byte format. | string |

| Name | Description | Туре |
|----------------------------|--|------------------|
| scsiNAADeviceID | Globally unique SCSI device identifier for the volume in NAA IEEE Registered Extended format. | string |
| sliceCount | The number of slices on the volume. This value is always "1". | integer |
| status | The current status of the volume. Possible values: init: A volume that is being initialized and is not ready for connections. active: An active volume ready for connections. deleted: A volume that has been marked for deletion, but not yet purged. | string |
| totalSize | The total bytes of provisioned capacity. | integer |
| virtualVolumeID | The unique virtual volume ID associated with the volume, if any. | UUID |
| volumeAccessGroups | List of IDs pf volume access groups to which a volume belongs. This value is an empty list if a volume does not belong to any volume access groups. | integer array |
| volumeConsistencyGroupUUID | The universally unique ID of the volume consistency group of which the volume is a member. | UUID |
| volumeID | The unique volumeID for the volume. | integer |
| volumePairs | Information about a paired volume. Visible only if a volume is paired. This value is an empty list if the volume is not paired. | volumePair array |
| volumeUUID | The universally unique ID of the volume. | UUID |

- QoS

volumeAccessGroup

The volumeAccessGroup object contains information about a specific volume access group. You can retrieve a list of this information for all access groups with the API method ListVolumeAccessGroups.

Object members

This object contains the following members:

| Name | Description | Туре |
|---------------------|---|---------------|
| attributes | List of name-value pairs in JSON object format. | JSON object |
| deletedVolumes | Array of volumes that have been deleted from the volume access group that have not yet been purged from the system. | integer array |
| initiatorIDs | A list of IDs of initiators that are mapped to the volume access group. | integer array |
| initiators | Array of unique IQN/WWPN initiators that are mapped to the volume access group. | string array |
| name | Name of the volume access group. | string |
| volumeAccessGroupID | Unique VolumeAccessGroupID identifier for the volume access group. | integer |
| volumes | A list of VolumeIDs belonging to the volume access group. | integer array |

Find more information

ListVolumeAccessGroups

volumePair

The volumePair object contains information about a volume that is paired with another volume on a different cluster. If the volume is not paired, this object is empty. You can use the ListActivePairedVolumes and ListActiveVolumes API methods to return information about paired volumes.

Object members

| Name | Description | Туре |
|-------------------|--|-------------|
| clusterPairID | The cluster on which the volume is paired. | integer |
| remoteReplication | Details on volume replication. Members: • mode: (string) One of "Async", "Sync", or "SnapshotsOnly". • pauseLimit: (integer) Internal use only. • remoteServiceID: (integer) The remote slice service ID. • resumeDetails: (string) Reserved for future use. • snapshotReplication (JSON object) • state: (string) The state of the ongoing snapshot replication, if one is in progress. • stateDetails: (string) Reserved for future use. • state: (string) The state of the volume replication. • stateDetails: (string) Reserved for future use. | JSON object |
| remoteSliceID | The cluster-defined slice ID on the remote cluster. | integer |
| remoteVolumeID | The ID of the volume on the remote cluster that the local volume is paired with. | integer |

| Name | Description | Туре |
|------------------|---|--------|
| remoteVolumeName | The name of the remote volume. | string |
| volumePairUUID | A universally unique, cluster- defined identifier for this pairing in a canonical format. | string |

- ListActivePairedVolumes
- ListActiveVolumes

volumeStats

The volumeStats object contains statistical data for an individual volume.

Object members

You can use the following methods to get volumeStats objects for some or all volumes:

- GetVolumeStats
- ListVolumeStatsByAccount
- ListVolumeStatsByVolume
- ListVolumeStatsByVolumeAccessGroup

| Name | Description | Calculation | Туре |
|------------|---|---------------|---------|
| accountID | The ID of the account of the volume owner. | N/A | integer |
| actualIOPS | The current actual IOPS to the volume in the last 500 milliseconds. | Point in time | integer |

| Name | Description | Calculation | Туре |
|----------------------|--|---------------|----------------------------------|
| asyncDelay | The length of time since the volume was last synced with the remote cluster. If the volume is not paired, this is null. Note: A target volume in an active replication state always has an asyncDelay of 0 (zero). Target volumes are system-aware during replication and assume asyncDelay is accurate at all times. | N/A | ISO 8601 duration string or null |
| averageIOPSize | The average size in bytes of recent I/O to the volume in the last 500 milliseconds. | Point in time | integer |
| burstIOPSCredit | The total number of IOP credits available to the user. When volumes are not using up to the configured maxIOPS, credits are accrued. | N/A | integer |
| clientQueueDepth | The number of outstanding read and write operations to the volume. | N/A | integer |
| desiredMetadataHosts | The metadata (slice) services being migrated to if the volume metadata is being migrated between metadata services. A "null" value means the volume is not migrating. | N/A | JSON object |
| latencyUSec | The average time, in microseconds, to complete operations to the volume in the last 500 milliseconds. A "0" (zero) value means there is no I/O to the volume. | Point in time | integer |

| Name | Description | Calculation | Туре |
|----------------------|--|--------------------------|-------------|
| metadataHosts | The metadata (slice) services on which the volume metadata resides. Possible values: • primary: The primary metadata services hosting the volume. • liveSecondaries: Secondary metadata services that are currently in a "live" state. • deadSecondaries: Secondary metadata services that are in a dead state. | N/A | JSON object |
| normalizedIOPS | Average number of IOPS for the entire cluster in the last 500 milliseconds. | Point in time | integer |
| nonZeroBlocks | The total number of 4KiB blocks that contain data after the last garbage collection operation has completed. | N/A | integer |
| readBytes | The total cumulative bytes read from the volume since the creation of the volume. | Monotonically increasing | integer |
| readBytesLastSample | The total number of bytes read from the volume during the last sample period. | Point in time | integer |
| readLatencyUSec | The average time, in microseconds, to complete read operations to the volume in the last 500 milliseconds. | Point in time | integer |
| readLatencyUSecTotal | The total time spent performing read operations from the volume. | Monotonically increasing | integer |

| Name | Description | Calculation | Туре |
|--------------------|--|--------------------------|----------------------|
| readOps | The total read operations to the volume since the creation of the volume. | Monotonically increasing | integer |
| readOpsLastSample | The total number of read operations during the last sample period. | Point in time | integer |
| samplePeriodMSec | The length of the sample period, in milliseconds. | N/A | integer |
| throttle | A floating value between 0 and 1 that represents how much the system is throttling clients below their maxIOPS because of re-replication of data, transient errors, and snapshots taken. | N/A | float |
| timestamp | The current time in UTC+0 format. | N/A | ISO 8601 date string |
| unalignedReads | The total cumulative unaligned read operations to a volume since the creation of the volume. | Monotonically increasing | integer |
| unalignedWrites | The total cumulative unaligned write operations to a volume since the creation of the volume. | Monotonically increasing | integer |
| volumeAccessGroups | The list of IDs of volume access group(s) to which a volume belongs. | N/A | integer array |
| volumeID | The ID of the volume. | N/A | integer |
| volumeSize | Total provisioned capacity in bytes. | N/A | integer |

| Name | Description | Calculation | Туре |
|----------------------|---|--------------------------|---------|
| volumeUtilization | A floating point value that describes how fully the client is using the volume's input / output capabilities in comparison with the maxIOPS QoS setting for that volume. Possible values: • 0: The client is not using the volume. | N/A | float |
| | 0.01 to 0.99: The client is not fully utilizing the volume's IOPS capabilities. | | |
| | 1.00: The client is fully utilizing the volume up to the IOPS limit set by the maxIOPS setting. | | |
| | • > 1.00: The client is utilizing more than the limit set by maxIOPS. This is possible when the burstIOPS QoS setting is set higher than maxIOPS. For example, if maxIOPS is set to 1000 and burstIOPS is set to 2000, the volumeUtilization value would be 2.00 if the client fully utilizes the volume. | | |
| writeBytes | The total cumulative bytes written to the volume since the creation of the volume. | Monotonically increasing | integer |
| writeBytesLastSample | The total number of bytes written to the volume during the last sample period. | Monotonically increasing | integer |

| Name | Description | Calculation | Туре |
|-----------------------|--|--------------------------|---------|
| writeLatencyUSec | The average time, in microseconds, to complete write operations to a volume in the last 500 milliseconds. | Point in time | integer |
| writeLatencyUSecTotal | The total time spent performing write operations to the volume. | Monotonically increasing | integer |
| writeOps | The total cumulative write operations to the volume since the creation of the volume. | Monotonically increasing | integer |
| writeOpsLastSample | The total number of write operations during the last sample period. | Point in time | integer |
| zeroBlocks | The total number of empty 4KiB blocks without data after the last round of garbage collection operation has completed. | Point in time | integer |

Common methods

Common methods are methods used to retrieve information about the storage cluster, the API itself, or ongoing API operations.

- GetAPI
- GetAsyncResult
- GetCompleteStats
- GetLimits
- GetOrigin
- GetRawStats
- ListAsyncResults

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

GetAPI

You can use the GetAPI method to get a list of all the API methods and supported API endpoints that can be used in the system.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|---------------------|--|--------------|
| <version></version> | A list of all supported API methods for this software version, where <version> is the current software version this system is running.</version> | string array |
| currentVersion | The current version of the storage cluster software. | string |
| supportedVersions | A list of all API endpoints supported by the system. | string array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetAPI",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

GetAsyncResult

You can use <code>GetAsyncResult</code> to retrieve the result of asynchronous method calls. Some method calls require some time to run, and might not be finished when the system sends the initial response. To obtain the status or result of the method call, use <code>GetAsyncResult</code> to poll the asyncHandle value returned by the method.

GetAsyncResult returns the overall status of the operation (in progress, completed, or error) in a standard fashion, but the actual data returned for the operation depends on the original method call and the return data is documented with each method.

If the keepResult parameter is missing or false, the asyncHandle becomes inactive when the result is returned, and later attempts to query that asyncHandle return an error. You can keep the asyncHandle active for future queries by setting the keepResult parameter to true.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|---|---------|---------------|----------|
| asyncHandle | A value that was returned from the original asynchronous method call. | integer | None | Yes |
| keepResult | If true, GetAsyncResult does not remove the asynchronous result upon returning it, enabling future queries to that asyncHandle. | boolean | false | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|---|--------|
| status | Status of the asynchronous method call. Possible values: • running: The method is still running. • complete: The method is complete and the result or error is available. | string |
| result | If the asynchronous method successfully completed, this is the result of the asynchronous operation. If the asynchronous operation failed, this member is not present. | string |
| error | If the status is complete and the asynchronous method failed, this member includes the error details. If the asynchronous operation succeeded, this member is not present. | string |
| resultType | The type of operation the asynchronous method call is or was performing. | string |

| Name | Description | Туре |
|----------------|---|----------------------|
| details | If the status is running, this member includes information relevant to the method's current operation. If the asynchronous method is not running, this member is not present. | JSON Object |
| createTime | The time that the asynchronous method was called, in UTC+0 format. | ISO 8601 date string |
| lastUpdateTime | The time that the asynchronous method's status was last updated, in UTC+0 format. | ISO 8601 date string |

Note: The return value of GetAsyncResult is essentially a nested version of the standard JSON response with an additional status field.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetAsyncResult",
   "params": {
        "asyncHandle" : 389
},
   "id" : 1
}
```

Response example: method error

This method returns a response similar to the following example:

```
"error": {
    "code": 500,
    "message": "DBClient operation requested on a non-existent path at
[/asyncresults/1]",
    "name": "xDBNoSuchPath"
    },
    "id": 1
}
```

If "response" were the JSON response object from the GetAsyncResult call, then "response.error" would

correspond to an error with the GetAsyncResult method itself (such as querying a non-existent asyncHandle).

Response example: asynchronous task error

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "createTime": "2016-01-01T02:05:53Z",
    "error": {
        "bvID": 1,
        "message": "Bulk volume job failed",
        "name": "xBulkVolumeScriptFailure",
        "volumeID": 34
    },
    "lastUpdateTime": "2016-01-21T02:06:56Z",
    "resultType": "BulkVolume",
    "status": "complete"
}
```

The "response.result.error" would correspond to an error result from the original method call.

Response example: asynchronous task success

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "createTime": "2016-01-01T22:29:18Z",
    "lastUpdateTime": "2016-01-01T22:45:51Z",
    "result": {
        "cloneID": 25,
        "message": "Clone complete.",
        "volumeID": 47
    },
    "resultType": "Clone",
    "status": "complete"
}
```

The "response.result.result" is the return value for the original method call if the call completed successfully.

New since version

9.6

GetCompleteStats

NetApp engineering uses the <code>GetCompleteStats</code> API method to test new features. The data returned from <code>GetCompleteStats</code> is not documented, changes frequently, and is not guaranteed to be accurate. You should not use <code>GetCompleteStats</code> for collecting performance data or any other management integration with a storage cluster running Element software.

Use the following supported API methods to retrieve statistical information:

- GetVolumeStats
- GetClusterStats
- GetNodeStats
- GetDriveStats

New since version

9.6

GetLimits

You can use the <code>GetLimits</code> method to get the limit values set by the API. These values might change between releases of Element, but do not change without an update to the system. Knowing the limit values set by the API can be useful when writing API scripts for user-facing tools.

The <code>GetLimits</code> method returns the limits for the current software version regardless of the API endpoint version used to pass the method.

Parameters

This method has no input parameters.

Return values

This method returns a JSON object with name-value pairs containing the API limits.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetLimits",
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "accountCountMax": 5000,
        "accountNameLengthMax": 64,

        "volumesPerVolumeAccessGroupCountMax": 2000,
        "witnessNodesPerClusterCountMax": 4
   }
}
```

9.6

GetOrigin

You can use the GetOrigin method to get the origination certificate for where the node was built.

Parameters

This method returns "null" if there is no origination certification.

This method has no input parameters.

This method returns vendor origination certification information.

Request example

Requests for this method are similar to the following example:

```
{
  "method": "GetOrigin",
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"integrator": "SolidFire",
  "<signature>": {
    "pubkey": [public key info],
    "version": 1,
    "data": [signature info]
},
    "contract-id": "none",
    "location": "Boulder, CO",
    "organization": "Engineering",
    "type": "element-x"
}
]
```

New since version

9.6

GetRawStats

NetApp engineering uses the <code>GetRawStats</code> API method to test new features. The data returned from <code>GetRawStats</code> is not documented, changes frequently, and is not guaranteed to be accurate. You should not use <code>GetRawStats</code> for collecting performance data or any other management integration with a storage cluster running Element software.

Use the following supported API methods to retrieve statistical information:

- GetVolumeStats
- GetClusterStats
- GetNodeStats
- GetDriveStats

9.6

ListAsyncResults

You can use ListAsyncResults to list the results of all currently running and completed asynchronous methods on the system. Querying asynchronous results with ListAsyncResults does not cause completed asyncHandles to expire; you can use GetAsyncResult to query any of the asyncHandles returned by ListAsyncResults.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------------|---|--------------|---------------|----------|
| asyncResultTypes | An optional list of types of results. You can use this list to restrict the results to only these types of operations. Possible values: | string array | None | No |
| | DriveAdd: Operations involving the system adding a drive to the cluster. | | | |
| | BulkVolume: Copy operations between volumes, such as backups or restores. | | | |
| | Clone: Volume cloning operations. | | | |
| | DriveRemoval: Operations involving the system copying data from a drive in preparation to remove it from the cluster. | | | |
| | RtfiPendingNod e: Operations involving the system installing compatible software on a node before adding it to the cluster. | | | |

This method has the following return value:

| Name | Description | Туре |
|------|-------------|------|
|------|-------------|------|

| asyncHandles | An array of serialized asynchronous method results. | JSON object array |
|--------------|---|-------------------|
| | | |

Request example

Requests for this method are similar to the following example:

```
"method": "ListAsyncResults",
   "params": {
   },
   "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
     "asyncHandles": [
         "asyncResultID": 47,
         "completed": true,
         "createTime": "2016-01-01T22:29:19Z",
         "data": {
           "cloneID": 26,
           "message": "Clone complete.",
           "volumeID": 48
         "lastUpdateTime": "2016-01-01T22:45:43Z",
         "resultType": "Clone",
         "success": true
     },
      ...]
  }
```

New since version

9.6

GetAsyncResult

Account API methods

Account methods enable you to add, remove, view, and modify account and security information.

- AddAccount
- GetAccountByID
- GetAccountByName
- GetAccountEfficiency
- ListAccounts
- ModifyAccount
- RemoveAccount

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddAccount

You can use AddAccount to add a new account to the system. You can also use this method to create new volumes under the new account as the account is created. The Challenge-Handshake Authentication Protocol (CHAP) settings you specify for the account apply to all volumes owned by the account.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|---|-------------|---------------|----------|
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| enableChap | Specifies whether CHAP account credentials can be used by an initiator to access volumes. | boolean | true | No |

| Name | Description | Туре | Default value | Required |
|-----------------|--|--------|---------------|----------|
| initiatorSecret | The CHAP secret to use for the initiator. This secret must be 12 to 16 characters in length and should be impenetrable. The initiator CHAP secret must be unique and cannot be the same as the target CHAP secret. If not specified, a random secret is created. | string | None | No |
| targetSecret | The CHAP secret to use for the target (mutual CHAP authentication). This secret must be 12 to 16 characters in length and should be impenetrable. The target CHAP secret must be unique and cannot be the same as the initiator CHAP secret. If not specified, a random secret is created. | string | None | No |
| username | The unique username for this account. (Must be 1 to 64 characters in length). | string | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|-----------|---|---------|
| account | An object containing information about the newly created account. | account |
| accountID | The ID of the newly created account object. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "AddAccount",
    "params": {
        "username" : "bobsmith",
        "initiatorSecret" : "168[#5A757ru268)",
        "targetSecret" : "tlt<,8TUYa7bC",
        "attributes" : {
            "billingcode" : 2345
        }
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
 "id": 1,
 "result": {
   "account": {
     "accountID": 90,
     "attributes": {
       "billingcode": 2345
     },
     "initiatorSecret": "168[#5A757ru268)",
     "status": "active",
     "storageContainerID": "00000000-0000-0000-0000-0000000000",
     "targetSecret": "tlt<,8TUYa7bC",
     "username": "bobsmith",
     "volumes": [],
     "enableChap": true
   },
    "accountID": 90
  }
}
```

New since version

9.6

GetAccountByID

You can use GetAccountByID to get details about a specific account, given its accountID.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------|---|---------|---------------|----------|
| accountID | The account ID of the account for which to get information. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|------------------|---------|
| account | Account details. | account |

Request example

Requests for this method are similar to the following example:

```
"method": "GetAccountByID",
   "params": {
       "accountID" : 3
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"account": {
    "attributes": {},
    "username": "account3",
    "targetSecret": "targetsecret",
    "volumes": [],
    "enableChap": true,
    "status": "active",
    "accountID": 3,
    "storageContainerID": "abcdef01-1234-5678-90ab-cdef01234567",
    "initiatorSecret": "initiatorsecret"
}
```

9.6

GetAccountByName

You can use GetAccountByName to get details about a specific account, given its username.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------|----------------------------|--------|---------------|----------|
| username | User name for the account. | string | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|------------------|---------|
| account | Account details. | account |

Request example

Requests for this method are similar to the following example:

```
"method": "GetAccountByName",
   "params": {
      "username" : "jimmyd"
    },
     "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"account": {
    "attributes": {},
    "username": "jimmyd",
    "targetSecret": "targetsecret",
    "volumes": [],
    "enableChap": true,
    "status": "active",
    "accountID": 1,
    "storageContainerID": "abcdef01-1234-5678-90ab-cdef01234567",
    "initiatorSecret": "initiatorsecret"
}
```

New since version

9.6

GetAccountEfficiency

You can use GetAccountEfficiency to get efficiency statistics about a volume account. This method returns efficiency information only for the account you give as a parameter.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------|--|---------|---------------|----------|
| accountID | Specifies the volume account for which efficiency statistics are returned. | integer | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|------------------|--|----------------------|
| compression | The amount of space saved by data compression for all volumes in the account. Stated as a ratio where a value of "1" means data has been stored with no compression. | float |
| deduplication | The amount of space saved by not duplicating data for all volumes in the account. Stated as a ratio. | float |
| missingVolumes | The volumes that could not be queried for efficiency data. Missing volumes can be caused by the Garbage Collection (GC) cycle being less than an hour old, temporary loss of network connectivity, or restarted services since the GC cycle. | integer array |
| thinProvisioning | The ratio of space used to the amount of space allocated for storing data. Stated as a ratio. | float |
| timestamp | The last time efficiency data was collected after Garbage Collection (GC), in UTC+0 format. | ISO 8601 date string |

Request example

Requests for this method are similar to the following example:

```
"method": "GetAccountEfficiency",
    "params": {
        "accountID": 3
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "compression": 2.020468042933262,
    "deduplication": 2.042488619119879,
    "missingVolumes": [],
    "thinProvisioning": 1.010087163391013,
    "timestamp": "2014-03-10T14:06:02Z"
}
```

New since version

9.6

ListAccounts

You can use ListAccounts to get the entire list of storage tenant accounts, with optional paging support. Element accounts enable access to volumes.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------------------------|---|---------|---------------|----------|
| includeStorageCont ainers | Virtual volume storage containers are included in the response by default. To exclude storage containers, set to false. | boolean | true | No |

| Name | Description | Туре | Default value | Required |
|----------------|--|---------|---------------|----------|
| startAccountID | Starting accountID to return. If no account exists with this accountID, the next account by accountID order is used as the start of the list. To page through the list, pass the accountID of the last account in the previous response + 1. | integer | None | No |
| limit | Maximum number of account objects to return. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|----------|-----------------------|---------------|
| accounts | The list of accounts. | account array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListAccounts",
    "params": {
        "startAccountID" : 0,
        "limit" : 1000
     },
     "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "result" : {
    "accounts": [
        "attributes": {},
        "username": "jamesw",
        "targetSecret": "168#5A757ru268)",
        "volumes": [],
        "enableChap": false,
        "status": "active",
        "accountID": 16,
        "storageContainerID": "abcdef01-1234-5678-90ab-cdef01234567",
        "initiatorSecret": "168#5A757ru268)"
    },
        "attributes": {},
        "username": "jimmyd",
        "targetSecret": "targetsecret",
        "volumes": [],
        "enableChap": true,
        "status": "active",
        "accountID": 5,
        "storageContainerID": "abcdef01-1234-5678-90ab-cdef01234567",
        "initiatorSecret": "initiatorsecret"
  ]
}
}
```

9.6

ModifyAccount

You can use the ModifyAccount method to modify an existing account.

When you lock an account, any existing connections from that account are immediately terminated. When you change an account's CHAP settings, any existing connections remain active, and the new CHAP settings are used on subsequent connections or reconnections. To clear an account's attributes, specify {} for the attributes parameter.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------|---|-------------|---------------|----------|
| accountID | AccountID for the account to modify. | integer | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| enableChap | Specifies whether CHAP account credentials can be used by an initiator to access volumes. | boolean | None | No |
| initiatorSecret | The CHAP secret to use for the initiator. This secret must be 12-16 characters in length and should be impenetrable. The initiator CHAP secret must be unique and cannot be the same as the target CHAP secret. | string | None | No |
| status | Status for the account. Possible values: • active: Account is active and connections are allowed. • locked: Account is locked and connections are refused. | string | None | No |

| Name | Description | Туре | Default value | Required |
|--------------|---|--------|---------------|----------|
| targetSecret | The CHAP secret to use for the target (mutual CHAP authentication). This secret must be 12-16 characters in length and should be impenetrable. The target CHAP secret must be unique and cannot be the same as the initiator CHAP secret. | string | None | No |
| username | Used to change the username associated with the account. (Must be 1 to 64 characters in length). | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------|--|---------|
| account | An object containing information about the modified account. | account |

Request example

Requests for this method are similar to the following example. In this example, the attributes are cleared by specifying {} for them:

```
"method": "ModifyAccount",
"params": {
    "accountID" : 25,
    "status" : "locked",
    "attributes" : {}
},
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"account": {
    "storageContainerID": "abcdef01-1234-5678-90ab-cdef01234567",
    "username": "user1",
    "accountID": 1,
    "volumes": [
    ],
    "enableChap": true,
    "initiatorSecret": "txz123456q890",
    "attributes": {
    },
    "status": active",
    "targetSecret": "rxe123b567890"
}
```

New since version

9.6

RemoveAccount

You can use the RemoveAccount method to remove an existing account. You must delete and purge all volumes associated with the account using DeleteVolume before you can remove the account. If volumes on the account are still pending deletion, you cannot use RemoveAccount to remove the account.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-----------|----------------------------------|---------|---------------|----------|
| accountID | The ID of the account to remove. | integer | None | Yes |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example.

```
"method": "RemoveAccount",
"params": {
    "accountID" : 25
},
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : { }
}
```

DeleteVolume

Administrator API methods

You can use administrator API methods to create, modify, view, and remove storage cluster administrators and assign levels of access and privileges for those with access to a storage cluster.

- AddClusterAdmin
- GetCurrentClusterAdmin
- GetLoginBanner
- ListClusterAdmins
- ModifyClusterAdmin
- RemoveClusterAdmin
- SetLoginBanner

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddClusterAdmin

You can use the AddClusterAdmin method to add a new cluster admin account. A cluster admin can manage the cluster via the API and management tools. Cluster admins are completely separate and unrelated to standard tenant accounts.

Each cluster admin can be restricted to a subset of the API. You should use multiple cluster admin accounts for different users and applications. As a best practice, give each cluster admin the minimal permissions necessary; this reduces the potential impact of credential compromise.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|--------------|---------------|----------|
| access | Controls which methods the cluster admin can use. | string array | None | Yes |
| acceptEula | Accept the End User License Agreement. Set to true to add a cluster administrator account to the system. If omitted or set to false, the method call fails. | boolean | None | Yes |
| attributes | List of name/value pairs in JSON object format. | JSON object | None | No |
| password | Password used to authenticate this cluster admin. | string | None | Yes |
| username | Unique username for this cluster admin. Must be between 1 and 1024 characters in length. | string | None | Yes |

Return value

This method has the following return value:

| Name Description Type |
|-----------------------|
|-----------------------|

| ClusterAdminID for the newly created cluster admin. | integer |
|---|---------|
| | |

Request example

Requests for this method are similar to the following example:

```
"method": "AddClusterAdmin",
"params": {
    "username": "joeadmin",
    "password": "68!5Aru268)$",
    "attributes": {},
    "acceptEula": true,
    "access": ["volumes", "reporting", "read"]
},
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id":1,
    "result" : {
        "clusterAdminID": 2
    }
}
```

Access control

GetCurrentClusterAdmin

You can use the GetCurrentClusterAdmin method to return information for the current primary Cluster Admin. The primary Cluster Admin was created when the cluster was created.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------|--------------------------------------|--------------|
| clusterAdmin | Information about the cluster admin. | clusterAdmin |

Request example

Requests for this method are similar to the following example:

```
{
"method": "GetCurrentClusterAdmin",
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

New since version

10.0

GetLoginBanner

You can use the GetLoginBanner method to get the currently active Terms of Use banner that users see when they log in to the Element web interface.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|--|---------|
| banner | The current text of the Terms of Use banner. This value can contain text even when the banner is disabled. | string |
| enabled | The status of the Terms of Use banner. Possible values: true: The Terms of Use banner is displayed upon web interface login. false: The Terms of Use banner is not displayed upon web interface login. | boolean |

Request example

Requests for this method are similar to the following example:

```
"id": 3411,
  "method": "GetLoginBanner",
  "params": {}
}
```

Response example

This method returns a response similar to the following example:

```
"id": 3411,
"result": {
    "loginBanner": {
        "banner": "Welcome to NetApp!",
        "enabled": false
    }
}
```

10.0

ListClusterAdmins

You can use the ListClusterAdmins method to return the list of all cluster administrators for the cluster.

There can be several cluster administrator accounts with different levels of permissions. There can be only one primary cluster administrator in the system. The primary Cluster Admin is the administrator that was created when the cluster was created. LDAP administrators can also be created when setting up an LDAP system on the cluster.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------|--|---------|---------------|----------|
| showHidden | Shows hidden cluster administrator users, such as SNMP admin. | boolean | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------|---|--------------------|
| clusterAdmins | Information about all cluster and LDAP administrators that exist for a cluster. | clusterAdmin array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListClusterAdmins",
   "params": {},
    "showHidden": true
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id":1,
"result":{
  "clusterAdmins":[
       "access":[
           "administrator"
       ],
       "attributes":null,
       "authMethod": "Cluster",
       "clusterAdminID":1,
       "username": "admin"
   },
       "access":[
           "read",
           "administrator"
       "attributes":{
       "authMethod": "Ldap",
       "clusterAdminID":7,
       "username": "john.smith"
   },
       "access":[
           "read",
           "administrator"
       "attributes":{},
       "authMethod": "Ldap",
       "clusterAdminID":6,
       "username": "cn=admin1
jones, ou=ptusers, c=prodtest, dc=solidfire, dc=net"
     ]
  }
}
```

9.6

ModifyClusterAdmin

You can use the ModifyClusterAdmin method to change the settings for a cluster admin, LDAP cluster admin, or third-party Identity Provider (IdP) cluster admin. You cannot change access for the administrator cluster admin account.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------|---|--------------|---------------|----------|
| access | Controls which methods this cluster admin can use. | string array | None | No |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| clusterAdminID | ClusterAdminID for the cluster admin, LDAP cluster admin, or IdP cluster admin to modify. | integer | None | Yes |
| password | Password used to authenticate this cluster admin. This parameter does not apply to an LDAP or IdP cluster admin. | string | None | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "ModifyClusterAdmin",
"params": {
    "clusterAdminID" : 2,
    "password" : "7925Brc429a"
},
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1
  "result" : { }
}
```

New since version

9.6

Find more information

Access control

RemoveClusterAdmin

You can use the RemoveClusterAdmin method to remove a cluster admin, an LDAP cluster admin, or a third-party Identity Provider (IdP) cluster admin. You cannot remove the "admin" Cluster Admin account.

Parameter

When an IdP cluster admin is removed that has authenticated sessions associated with a third-party Identity Provider IdP, those sessions will either logout or possibly experience a loss of access rights within their current session. The access rights loss will depend on whether the removed IdP cluster admin matched one of multiple IdP cluster admins from a given user's SAML attributes. The remaining set of matching IdP cluster admins results in a reduced set of aggregate access rights. Other cluster admin user types are logged out when their cluster admins are removed.

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------------|---|---------|---------------|----------|
| clusterAdminID | ClusterAdminID for the Cluster Admin to remove. | integer | None | Yes |

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "RemoveClusterAdmin",
   "params": {
       "clusterAdminID" : 2
   },
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1
  "result" : { }
}
```

New since version

9.6

SetLoginBanner

You can use the SetLoginBanner method to configure the Terms of Use banner that users see when they log in to the Element web interface.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|---------|---------------|----------|
| banner | The desired text of the Terms of Use banner. The maximum length allowed is 4,096 characters. | string | None | No |
| enabled | The status of the Terms of Use banner. Possible values: • true: The Terms of Use banner is displayed upon web interface login. • false: The Terms of Use banner is not displayed upon web interface login. | boolean | None | No |

This method has the following return values:

| Name | Description | Туре |
|---------|--|---------|
| banner | The current text of the Terms of Use banner. This value can contain text even when the banner is disabled. | string |
| enabled | The status of the Terms of Use banner. Possible values: • true: The Terms of Use banner is displayed upon web interface login. • false: The Terms of Use banner is not displayed upon web interface login. | boolean |

Request example

Requests for this method are similar to the following example:

```
"id": 3920,
  "method": "SetLoginBanner",
  "params": {
     "banner": "Welcome to NetApp!",
     "enabled": true
}
```

Response example

This method returns a response similar to the following example:

```
"id": 3920,
"result": {
    "loginBanner": {
        "banner": "Welcome to NetApp!",
        "enabled": true
     }
}
```

New since version

10.0

Cluster API methods

Element software cluster API methods enable you to manage the configuration and topology of the storage cluster and the nodes that belong to a storage cluster.

Some cluster API methods operate on nodes that are part of a cluster, or have been configured to join a cluster. You can add nodes to a new cluster or to an existing cluster. Nodes that are ready to be added to a cluster are in a "pending" state, which means they have been configured but not yet added to the cluster.

- AddNodes
- ClearClusterFaults
- CreateClusterInterfacePreference
- DeleteClusterInterfacePreference
- EnableFeature

- GetClusterCapacity
- GetClusterFullThreshold
- GetClusterHardwareInfo
- GetClusterInfo
- GetClusterInterfacePreference
- GetClusterMasterNodeID
- GetClusterStats
- GetClusterVersionInfo
- GetFeatureStatus
- GetLoginSessionInfo
- GetNodeHardwareInfo
- GetNodeStats
- ListActiveNodes
- ListAllNodes
- ListClusterFaults
- ListClusterInterfacePreferences
- ListEvents
- ListNodeStats
- ListISCSISessions
- ListServices
- ListPendingNodes
- ListPendingActiveNodes
- ModifyClusterFullThreshold
- ModifyClusterInterfacePreference
- RemoveNodes
- SetLoginSessionInfo
- Shutdown

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddNodes

You can use the AddNodes method to add one or more new nodes to a cluster.

When a node that is not configured starts up for the first time, you are prompted to configure the node. Once you configure the node, it is registered as a "pending node" with the cluster. Storage clusters running Element software automatically image a node to the version on the cluster. When you add a pending node, the method response includes an asyncHandle value that you can use with the GetAsyncResult method to guery the

status of the automatic imaging process.

The process of adding a Fibre Channel node is the same as adding Element iSCSI storage nodes to a cluster. Fibre Channel nodes are registered in the system with a NodeID. When they become accessible, they are put in a "pending node" status. The ListAllNodes method will return the pendingNodeID for iSCSI nodes as well as any Fibre Channel nodes that are available to add to the cluster.

When you add a node to a cluster that you have configured for virtual networking, the system requires a sufficient number of virtual storage IP addresses to allocate a virtual IP to the new node. If there are no virtual IP addresses available for the new node, the AddNode operation fails. Use the ModifyVirtualNetwork method to add more storage IP addresses to your virtual network.

Once you add a node, any drives on the node are made available and you can add them using the AddDrives method to increase the storage capacity of the cluster.

It may take several seconds after adding a new node for it to start up and register its drives as available.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------|---|---------------|---------------|----------|
| autoInstall | If true, a return to factory image (RTFI) will be performed on the node upon adding. The default behavior is to perform RTFI. If the cEnableAutoInst all cluster constant is false, it takes priority over this parameter. If an upgrade is in progress, the RTFI process will not happen regardless of the value for this parameter. | boolean | None | No |
| pendingNodes | Pending NodelDs for the nodes to be added. You can list all pending nodes using the ListPendingNodes method. | integer array | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|-------------|--|-------------------|
| autoInstall | Whether or not the added nodes are being returned to the factory image. | boolean |
| nodes | An array of objects mapping the previous "pendingNodeID" to the "nodeID". When you add a pending node that is running an incompatible software version, this array includes an asyncHandle value that you can use with the GetAsyncResult method to query the status of the automatic imaging process. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
"method": "AddNodes",
   "params": {
      "autoInstall" : true,
      "pendingNodes" : [1]
    },
    "id":1
}
```

Response example

This method returns a response similar to the following example:

```
{
 id: null,
 result: {
    autoInstall: true,
    nodes: [
      {
        activeNodeKey: "giAm2ep1hA",
        assignedNodeID: 6,
        asyncHandle: 3,
        cip: "10.10.5.106",
        mip: "192.168.133.106",
        pendingNodeID: 2,
        platformInfo: {
          chassisType: "R620",
          cpuModel: "Intel(R) Xeon(R) CPU E5-2640 0 @ 2.50GHz",
          nodeMemoryGB: 72,
          nodeType: "SF3010"
        },
        sip: "10.10.5.106",
        softwareVersion: "9.0.0.1077"
    ]
  }
}
```

ClearClusterFaults

You can use the ClearClusterFaults method to clear information about both current and previously detected faults. Both resolved and unresolved faults can be cleared.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------|---|--------|---------------|----------|
| faultTypes | Determines the types of faults to clear. Possible values: • current: Faults that are detected currently and have not been resolved. • resolved: Faults that were previously detected and resolved. • all: Both current and resolved faults. The fault status can be determined by the "resolved" field of the fault object. | string | resolved | No |

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ClearClusterFaults",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
    "result" : {}
}
```

9.6

CreateClusterInterfacePreference

The CreateClusterInterfacePreference method enables systems integrated with storage clusters running Element software to create and store arbitrary information on the storage cluster. This method is for internal use.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|--|--------|---------------|----------|
| name | The name of the cluster interface preference. | string | None | Yes |
| value | The value of the cluster interface preference. | string | None | Yes |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {}
}
```

New since version

11.0

DeleteClusterInterfacePreference

The DeleteClusterInterfacePreference method enables systems integrated with storage clusters running Element software to delete an existing cluster interface preference. This method is for internal use.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------|---|--------|---------------|----------|
| name | The name of the cluster interface preference to delete. | string | None | Yes |

Return values

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteClusterInterfacePreference",
    "params": {
         "name": "prefname"
         },
         "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {}
}
```

New since version

11.0

EnableFeature

You can use the EnableFeature method to enable cluster features such as VVols that are disabled by default.

Parameter

This method has the following input parameter.

For systems running Element software 11.x, enabling virtual volumes before or after setting protection domain monitoring causes the cluster protection domains feature to function only at node level.

| Name | Description | Туре | Default value | Required |
|---------|---|--------|---------------|----------|
| feature | Enable a cluster feature. Possible values: • fips: Enable FIPS 140-2 certified encryption for HTTPS communications. • FipsDrives: Enable FIPS 140-2 drive support for the storage cluster. • SnapMirror: Enable the SnapMirror replication cluster feature. • vvols: Enable the Element software VVols cluster feature. | string | None None | Yes |

Return value

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "EnableFeature",
    "params": {
        "feature" : "vvols"
    },
    "id": 1
}
```

Response example

```
{
  "id": 1,
  "result": {}
}
```

9.6

GetClusterCapacity

You can use the <code>GetClusterCapacity</code> to return high-level capacity measurements for an entire storage cluster. This method returns fields that you can use to calculate the efficiency rates shown in the Element web UI. You can use the efficiency calculations in scripts to return the efficiency rates for thin provisioning, deduplication, compression, and overall efficiency.

Efficiency calculations

Use the following equations to calculate thin provisioning, deduplication, and compression. These equations apply to Element 8.2 and later.

- thinProvisioningFactor = (nonZeroBlocks + zeroBlocks) / nonZeroBlocks
- deDuplicationFactor = (nonZeroBlocks + snapshotNonZeroBlocks) / uniqueBlocks
- compressionFactor = (uniqueBlocks * 4096) / (uniqueBlocksUsedSpace * 0.93)

Overall efficiency rate calculation

Use the following equation to calculate overall cluster efficiency using the results of the thin provisioning, deduplication, and compression efficiency calculations.

efficiencyFactor = thinProvisioningFactor * deDuplicationFactor * compressionFactor

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------------|--|-----------------|
| clusterCapacity | Capacity measurements for the storage cluster. | clusterCapacity |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetClusterCapacity",
   "params": {},
   "id" : 1
}
```

Response example

```
"id": 1,
 "result": {
    "clusterCapacity": {
      "activeBlockSpace": 236015557096,
     "activeSessions": 20,
     "averageIOPS": 0,
      "clusterRecentIOSize": 0,
      "currentIOPS": 0,
      "maxIOPS": 150000,
      "maxOverProvisionableSpace": 259189767127040,
     "maxProvisionedSpace": 51837953425408,
      "maxUsedMetadataSpace": 404984011161,
      "maxUsedSpace": 12002762096640,
      "nonZeroBlocks": 310080350,
      "peakActiveSessions": 20,
      "peakIOPS": 0,

      "usedMetadataSpaceInSnapshots": 8745762816,
      "usedSpace": 244572686901,
      "zeroBlocks": 352971938
 }
}
```

9.6

GetClusterFullThreshold

You can use the GetClusterFullThreshold method to view the stages set for cluster fullness levels. This method returns all fullness metrics for the cluster.

When a cluster reaches the Error stage of block cluster fullness, the maximum IOPS on all volumes are reduced linearly to the volume minimum IOPS as the cluster approaches the Critical stage. This helps prevent the cluster from reaching the Critical stage of block cluster fullness.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|--------------------------------|--|---------|
| blockFullness | The current computed level of block fullness of the cluster. • stage1Happy: No alerts or error | string |
| | conditions. Corresponds to the Healthy state in the web UI. | |
| | stage2Aware: No alerts or error conditions. Corresponds to the Healthy state in the web UI. | |
| | stage3Low: Your system cannot provide redundant data protection from two non- simultaneous node failures. Corresponds to the Warning state in the web UI. You can configure this level in the web UI (by default, the system triggers this alert at a capacity of 3% below the Error state). | |
| | stage4Critical: The system is not capable of providing redundant data protection from a single node failure. No new volumes or clones can be created. Corresponds to the Error state in the Element UI. | |
| | stage5CompletelyConsumed: Completely consumed. The cluster is read-only and iSCSI connections are maintained, but all writes are suspended. Corresponds to the Critical state in the Element UI. | |
| fullness | Reflects the highest level of fullness between "blockFullness" and "metadataFullness". | string |
| maxMetadataOverProvisionFactor | A value representative of the number of times metadata space can be over provisioned relative to the amount of space available. For example, if there was enough metadata space to store 100 TiB of volumes and this number was set to 5, then 500 TiB worth of volumes could be created. | integer |

| Name | Description | Туре |
|------------------------------|--|---------|
| metadataFullness | The current computed level of metadata fullness of the cluster. • stage1Happy: No alerts or error conditions. Corresponds to the Healthy state in the web UI. • stage2Aware: No alerts or error conditions. Corresponds to the Healthy state in the web UI. • stage3Low: Your system cannot provide redundant data protection from two nonsimultaneous node failures. Corresponds to the Warning state in the web UI. You can configure this level in the web UI (by default, the system triggers this alert at a capacity of 3% below the Error state). • stage4Critical: The system is not capable of providing redundant data protection from a single node failure. No new volumes or clones can be created. Corresponds to the Error state in the Element UI. • stage5CompletelyConsumed: Completely consumed. The cluster is read-only and iSCSI connections are maintained, but all writes are suspended. Corresponds to the Critical state in the Element UI. | string |
| sliceReserveUsedThresholdPct | Error condition. A system alert is triggered if the reserved slice utilization is greater than this value. | integer |
| stage2AwareThreshold | Awareness condition. The value that is set for the stage 2 cluster threshold level. | integer |
| stage2BlockThresholdBytes | The number of bytes being used by the cluster at which a stage 2 condition will exist. | integer |

| Name | Description | Туре |
|--------------------------------|--|---------|
| stage2MetadataThresholdBytes | The number of metadata bytes being used by the cluster at which a stage 2 fullness condition will exist. | |
| stage3BlockThresholdBytes | The number of storage bytes being used by the cluster at which a stage 3 fullness condition will exist. | integer |
| stage3BlockThresholdPercent | The percent value set for stage 3. At this percent full, a warning is posted in the Alerts log. | integer |
| stage3LowThreshold | Error condition. The threshold at which a system alert is created due to low capacity on a cluster. | integer |
| stage3MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 3 fullness condition will exist. | integer |
| stage3MetadataThresholdPercent | The percent value set for stage3 of metadata fullness. At this percent full, a warning will be posted in the Alerts log. | integer |
| stage4BlockThresholdBytes | The number of storage bytes being used by the cluster at which a stage 4 fullness condition will exist. | integer |
| stage4CriticalThreshold | Error condition. The threshold at which a system alert is created to warn about critically low capacity on a cluster. | integer |
| stage4MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 4 fullness condition will exist. | integer |
| stage5BlockThresholdBytes | The number of storage bytes used by the cluster at which a stage 5 fullness condition will exist. | integer |
| stage5MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 5 fullness condition will exist. | integer |

| Name | Description | Туре |
|------------------------------|---|---------|
| sumTotalClusterBytes | The physical capacity of the cluster, measured in bytes. | integer |
| sumTotalMetadataClusterBytes | The total amount of space that can be used to store metadata. | integer |
| sumUsedClusterBytes | The number of storage bytes used on the cluster. | integer |
| sumUsedMetadataClusterBytes | The amount of space used on volume drives to store metadata. | integer |

Request example

Requests for this method are similar to the following example:

```
"method" : "GetClusterFullThreshold",
    "params" : {},
    "id" : 1
}
```

Response example

```
{
  "id":1,
  "result":{
    "blockFullness": "stage1Happy",
    "fullness": "stage3Low",
    "maxMetadataOverProvisionFactor":5,

ModifyClusterFullThreshold

GetClusterHardwareInfo

You can use the GetClusterHardwareInfo method to retrieve the hardware status and information for all Fibre Channel nodes, iSCSI nodes and drives in the cluster. This generally includes manufacturers, vendors, versions, and other associated hardware identification information.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------|--|--------|---------------|----------|
| type | Include only one of the following types of hardware information in the response. Possible values: | string | all | No |
| | drives: Lists only drive information in the response. | | | |
| | nodes: Lists only node information in the response. | | | |
| | all: Includes both drive and node information in the response. | | | |
| | If this parameter is omitted, a type of all is assumed. | | | |

Return value

This method has the following return value:

| Name | Description | Туре |
|------|---|--------------|
| | Hardware information for all nodes and drives in the cluster. Each object in this output is labeled with the nodeID of the given node. | hardwareInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterHardwareInfo",
    "params": {
        "type": "all"
    },
    "id": 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

GetClusterInterfacePreference

The GetClusterInterfacePreference method enables systems integrated with storage clusters running Element software to get information about an existing cluster

interface preference. This method is for internal use.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------|---|--------|---------------|----------|
| name | The name of the cluster interface preference. | string | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------|---|-------------|
| preference | The name and value of the requested cluster interface preference. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterInterfacePreference",
    "params": {
         "name": "prefname"
         },
         "id": 1
}
```

Response example

11.0

GetClusterMasterNodelD

You can use the GetClusterMasterNodeID method to retrieve the ID of the node that performs cluster-wide administration tasks and holds the storage virtual IP address (SVIP) and management virtual IP address (MVIP).

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|------------------------|---------|
| nodelD | ID of the master node. | integer |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "GetClusterMasterNodeID",
  "params": {},
  "id" : 1
}
```

Response example

```
{
  "id" : 1
  "result": {
     "nodeID": 1
    }
}
```

9.6

GetClusterStats

You can use the GetClusterStats method to retrieve high-level activity measurements for the cluster. Values returned are cumulative from the creation of the cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------|-------------------------------|--------------|
| clusterStats | Cluster activity information. | clusterStats |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterStats",
   "params": {},
   "id" : 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "clusterStats": {
      "actualIOPS": 9376,
      "averageIOPSize": 4198,
      "clientQueueDepth": 8,
      "clusterUtilization": 0.09998933225870132,

  }
}
```

9.6

GetClusterVersionInfo

You can use the <code>GetClusterVersionInfo</code> method to retrieve information about the Element software version running on each node in the cluster. This method also returns information about nodes that are currently in the process of upgrading software.

Cluster version info object members

This method has the following object members:

| Name | Description | Туре |
|----------------------|--|---------|
| nodeID | ID of the node. | integer |
| nodeInternalRevision | Internal software version of the node. | string |
| nodeVersion | Software version of the node. | string |

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|-----------------------|---|-------------------|
| clusterAPIVersion | The current API version on the cluster. | string |
| clusterVersion | Version of Element software currently running on the cluster. | string |
| clusterVersionInfo | List of nodes in the cluster with version information for each node. | JSON object array |
| pendingClusterVersion | If present, this is the version that the cluster software is currently being upgraded or reverted to. | string |

| Name | Description | Туре |
|---------------------|---|-------------|
| softwareVersionInfo | The state of an upgrade. Object members: | JSON object |
| | • currentVersion: | |
| | The current software version on a node. | |
| | nodeID: ID of the node being upgraded from currentVersion to pendingVersion. This field is 0 (zero) if there is no upgrade in progress. | |
| | packageName: Name of the software package being installed. | |
| | pendingVersion: The version of the software being installed. | |
| | startTime: The date and time the installation was started, in UTC+0 format. | |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterVersionInfo",
    "params": {},
    "id" : 1
}
```

Response example

```
"id": 1,
 "result": {
   "clusterAPIVersion": "6.0",
   "clusterVersion": "6.1382",
   "clusterVersionInfo": [
      "nodeID": 1,
      "nodeInternalRevision": "BuildType=Release Element=carbon
Release=carbon ReleaseShort=carbon Version=6.1382 sfdev=6.28
Repository=dev Revision=061511b1e7fb BuildDate=2014-05-28T18:26:45MDT",
      "nodeVersion": "6.1382"

      "pendingVersion": "6.1382",
      "startTime": ""
  }
}
```

9.6

GetFeatureStatus

You can use the GetFeatureStatus method to retrieve the status of a cluster feature.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|---|--------|---------------|----------|
| feature | The status of a cluster feature. If no value is provided, the system returns a status of all features. Possible values: • Vvols: Retrieve status for the VVols cluster feature. • SnapMirror: Retrieve status for the SnapMirror replication cluster feature. | string | None | No |
| | Fips: Retrieve status for the FIPS 140-2 encryption for HTTPS communication feature. fipsDrives: Retrieve status for the FIPS 140-2 drive encryption feature. | | | |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|--|-------------------|
| features | An array of feature objects indicating the feature name and its status. Object members: • feature: (string) The name of the feature. • enabled: (boolean) Whether the feature is enabled or not. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
"method": "GetFeatureStatus",
    "params": {
    },
    "id": 1
}
```

Response example

```
{
    "id": 1,
    "result": {
        "features": [
            {
                 "enabled": true,
                 "feature": "Vvols"
            },
             {
                 "enabled": true,
                 "feature": "SnapMirror"
            },
                 "enabled": true,
                 "feature": "Fips"
            },
             {
                 "enabled": true,
                 "feature": "FipsDrives"
        ]
    }
}
```

9.6

GetLoginSessionInfo

You can use the <code>GetLoginSessionInfo</code> method to return the period of time a login authentication session is valid for both login shells and the TUI.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|--|-------------|
| loginSessionInfo | An object containing the authentication expiration period. Possible objects returned: • timeout: | JSON object |
| | The time, in minutes, when this session will timeout and expire. Formatted in H:mm:ss. For example: 1:30:00, 20:00, 5:00. All leading zeros and colons are removed regardless of the format the timeout was entered. | |

Request example

Requests for this method are similar to the following example:

```
"method": "GetLoginSessionInfo",
    "params": {},
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
"id": 1,
   "result" : {
     "loginSessionInfo" : {
        "timeout" : "30:00"
     }
   }
}
```

GetNodeHardwareInfo

You can use the GetNodeHardwareInfo method to return all the hardware information and status for the node specified. This generally includes manufacturers, vendors,

versions, and other associated hardware identification information.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------|--|---------|---------------|----------|
| nodeID | The ID of the node for which hardware information is being requested. Information about a Fibre Channel node is returned if a Fibre Channel node is specified. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|---|--------------|
| nodeHardwareInfo | Hardware information for the specified nodeID. Each object in this output is labeled with the nodeID of the given node. | hardwareInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "GetNodeHardwareInfo",
    "params": {
        "nodeID": 1
     },
     "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

ListActiveNodes

You can use the ListActiveNodes method to return the list of currently active nodes that are in the cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|--------------------------------------|------------|
| nodes | List of active nodes in the cluster. | node array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListActiveNodes",
   "params": {},
   "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

ListActiveNodes

ListAllNodes

You can use the ListAllNodes method to list active and pending nodes in the cluster.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|--------------------|--|-------------------------|
| nodes | List of objects describing active nodes in the cluster. | node |
| pendingActiveNodes | List of objects describing pending active nodes for the cluster. | pendingActiveNode array |
| pendingNodes | List of objects describing pending nodes for the cluster. | pendingNode array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListAllNodes",
   "params": {},
   "id" : 1
}
```

Response example

```
{
    "id": 1,
    "result": {
        "nodes": [
            {
                "associatedFServiceID": 0,
                "associatedMasterServiceID": 1,
                "attributes": {},
                "chassisName": "CT5TV12",
                "cip": "10.1.1.1",
                "cipi": "Bond10G",
                "fibreChannelTargetPortGroup": null,
                "mip": "10.1.1.1",
                "mipi": "Bond1G",
                "name": "NLABP0704",
                "nodeID": 1,

    }
}
```

9.6

ListClusterFaults

You can use the ListClusterFaults method to list information about any faults detected on the cluster. With this method, you can list both current faults as well as faults that have been resolved. The system caches faults every 30 seconds.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|--|---------|---------------|----------|
| bestPractices | Include faults triggered by sub- optimal system configuration. Possible values: • true • false | boolean | None | No |
| faultTypes | Determines the types of faults returned. Possible values: • current: List active, unresolved faults. • resolved: List faults that were previously detected and resolved. • all: List both current and resolved faults. You can see the fault status in the "resolved" member of the fault object. | string | all | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--|-------|
| faults | An object describing the requested cluster faults. | fault |

Request example

Requests for this method are similar to the following example:

```
"method": "ListClusterFaults",
    "params": {
        "faultTypes": "current",
        "bestPractices": true
     },
     "id": 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "faults": [
        "clusterFaultID": 1,
        "code": "notUsingLACPBondMode",

}
```

9.6

ListClusterInterfacePreferences

The ListClusterInterfacePreference method enables systems integrated with storage clusters running Element software to list the existing cluster interface preferences stored on the system. This method is for internal use.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|--|-------------------|
| preferences | A list of cluster interface objects currently stored on the storage cluster, each containing the name and value of the preference. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListClusterInterfacePreferences",
    "params": {
    },
    "id": 1
}
```

Response example

11.0

ListEvents

You can use the ListEvents method to list events detected on the cluster, sorted from oldest to newest.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------|---|---------|---------------|----------|
| driveID | Specifies that only events with this drive ID will be returned. | integer | 0 | No |
| endEventID | Identifies the end of a range of event IDs to return. | integer | (unlimited) | No |
| endPublishTime | Specifies that only events published earlier than this time will be returned. | string | 0 | No |
| endReportTime | Specifies that only events reported earlier than this time will be returned. | string | 0 | No |

| Name | Description | Туре | Default value | Required |
|------------------|---|---------|---------------|----------|
| eventType | Specifies the type of events to return. See event for possible event types. | string | 0 | No |
| maxEvents | Specifies the maximum number of events to return. | integer | (unlimited) | No |
| nodeID | Specifies that only events with this node ID will be returned. | integer | | |
| serviceID | Specifies that only events with this service ID will be returned. | | | |
| startEventID | Identifies the beginning of a range of events to return. | integer | 0 | No |
| startPublishTime | Specifies that only events published after this time will be returned. | string | 0 | No |
| startReportTime | Specifies that only events reported after this time will be returned. | string | 0 | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|-----------------|-------------|
| events | List of events. | event array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListEvents",
   "params": {
   },
   "id" : 1
}
```

Response example

```
"id":1,

9.6

ListNodeStats

You can use the ListNodeStats method to view the high-level activity measurements for all storage nodes in a storage cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|------------------------------------|-----------|
| nodeStats | Storage node activity information. | nodeStats |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListNodeStats",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
     "nodeStats": {
       "nodes": [
         "cBytesIn": 46480366124,

ListISCSISessions

You can use the ListISCSISessions method to list iSCSI connection information for volumes in the cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|---------------------------------------|---------|
| sessions | Information about each iSCSI session. | session |

Request example

Requests for this method are similar to the following example:

```
"method": "ListISCSISessions",
   "params": {},
   "id" : 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "sessions": [
        "accountID": 1,
        "accountName": "account1",

  }
}
```

9.6

ListServices

You can use the ListServices method to list services information for nodes, drives, current software, and other services that are running on the cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|--|-------------|
| services | Services that are running on drives and nodes. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListServices",
   "params": {},
   "id" : 1
}
```

Response example

```
"id": 1,
"result": {
    "services": [
            "drive": {
                "assignedService": 22,

```

9.6

ListPendingNodes

You can use the ListPendingNodes method to list the pending storage nodes in the system. Pending nodes are storage nodes that are running and configured to join the storage cluster but have not yet been added using the AddNodes API method.

IPv4 and IPv6 management addresses

Note that ListPendingNodes does not list pending nodes that have different address types for the management IP address (MIP) and management virtual IP address (MVIP). For example, if a pending node has an IPv6 MVIP and an IPv4 MIP, ListPendingNodes will not include the node as part of the result.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------|---------------------------------------|-------------------|
| pendingNodes | List of pending nodes in the cluster. | pendingNode array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListPendingNodes",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 3,
 "result": {
    "pendingNodes": [
      {
        "assignedNodeID": 0,
        "cip": "10.26.65.101",
        "cipi": "Bond10G",
        "compatible": true,
        "mip": "172.26.65.101",
        "mipi": "Bond1G",
        "name": "VWC-EN101",
        "pendingNodeID": 1,
        "platformInfo": {
          "chassisType": "R620",
          "cpuModel": "Intel(R) Xeon(R) CPU E5-2640 0 @ 2.50GHz",
          "nodeMemoryGB": 72,
          "nodeType": "SF3010"
        },
        "sip": "10.26.65.101",
        "sipi": "Bond10G",
        "softwareVersion": "9.0.0.1554",
        "uuid": "4C4C4544-0048-4410-8056-C7C04F395931"
   ]
}
```

AddNodes

ListPendingActiveNodes

You can use the ListPendingActiveNodes method to list nodes in the cluster that are in the PendingActive state, between pending and active states. Nodes in this state are being returned to the factory image.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------------|--|-------------------------|
| pendingActiveNodes | List of objects detailing information about all PendingActive nodes in the system. | pendingActiveNode array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListPendingActiveNodes",
   "params": {},
   "id" : 1
}
```

Response example

```
{
 id: null,
 result: {
    pendingActiveNodes: [
      activeNodeKey: "5rPHP31TAO",
      assignedNodeID: 5,
      asyncHandle: 2,
      cip: "10.10.5.106",
      mip: "192.168.133.106",
      pendingNodeID: 1,
      platformInfo: {
        chassisType: "R620",
        cpuModel: "Intel(R) Xeon(R) CPU E5-2640 0 @ 2.50GHz",
        nodeMemoryGB: 72,
        nodeType: "SF3010"
      },
     sip: "10.10.5.106",
     softwareVersion: "9.0.0.1077"
}
```

9.6

ModifyClusterFullThreshold

You can use the ModifyClusterFullThreshold method to change the level at which the system generates an event when the storage cluster approaches a certain capacity utilization. You can use the threshold setting to indicate the acceptable amount of utilized block storage before the system generates a warning.

For example, if you want to be alerted when the system reaches 3% below the "Error" level block storage utilization, enter a value of "3" for the stage3BlockThresholdPercent parameter. If this level is reached, the system sends an alert to the Event Log in the Cluster Management Console.

Parameters

This method has the following input parameters:

You must select at least one parameter.

| Name | Description | Туре | Default value | Required |
|------------------------------------|---|---------|---------------|----------|
| maxMetadataOverPr ovisionFactor | A value representative of the number of times metadata space can be over provisioned relative to the amount of space available. For example, if there was enough metadata space to store 100 TiB of volumes and this number was set to 5, then 500 TiB worth of volumes could be created. | integer | 5 | No |
| stage2AwareThresh old | The number of nodes of capacity remaining in the cluster before the system triggers a capacity notification. | integer | None | No |
| stage3BlockThresho IdPercent | The percentage of block storage utilization below the "Error" threshold that causes the system to trigger a cluster "Warning" alert. | integer | None | No |
| stage3MetadataThre sholdPercent | The percentage of metadata storage utilization below the "Error" threshold that causes the system to trigger a cluster "Warning" alert. | integer | None | No |

Return values

This method has the following return values:

| Name | Description | Туре | |
|------|-------------|------|--|
|------|-------------|------|--|

| blockFullness | The current computed level of block fullness of the cluster. | string |
|--------------------------------|--|---------|
| | stage1Happy: No alerts or error conditions. Corresponds to the Healthy state in the web UI. | |
| | stage2Aware: No alerts or error conditions. Corresponds to the Healthy state in the web UI. | |
| | stage3Low: Your system cannot provide redundant data protection from two non- simultaneous node failures. Corresponds to the Warning state in the web UI. You can configure this level in the web UI (by default, the system triggers this alert at a capacity of 3% below the Error state). | |
| | stage4Critical: The system is not capable of providing redundant data protection from a single node failure. No new volumes or clones can be created. Corresponds to the Error state in the Element UI. | |
| | stage5CompletelyConsumed: Completely consumed. The cluster is read-only and iSCSI connections are maintained, but all writes are suspended. Corresponds to the Critical state in the Element UI. | |
| fullness | Reflects the highest level of fullness between "blockFullness" and "metadataFullness". | string |
| maxMetadataOverProvisionFactor | A value representative of the number of times metadata space can be over provisioned relative to the amount of space available. For example, if there was enough metadata space to store 100 TiB of volumes and this number was set to 5, then 500 TiB worth of volumes could be created. | integer |

| metadataFullness | The current computed level of metadata fullness of the cluster. | string |
|------------------------------|--|---------|
| | stage1Happy: No alerts or error conditions. Corresponds to the Healthy state in the web UI. | |
| | stage2Aware: No alerts or error conditions. Corresponds to the Healthy state in the web UI. | |
| | stage3Low: Your system cannot provide redundant data protection from two non- simultaneous node failures. Corresponds to the Warning state in the web UI. You can configure this level in the web UI (by default, the system triggers this alert at a capacity of 3% below the Error state). | |
| | stage4Critical: The system is not capable of providing redundant data protection from a single node failure. No new volumes or clones can be created. Corresponds to the Error state in the Element UI. | |
| | stage5CompletelyConsumed: Completely consumed. The cluster is read-only and iSCSI connections are maintained, but all writes are suspended. Corresponds to the Critical state in the Element UI. | |
| sliceReserveUsedThresholdPct | Error condition. A system alert is triggered if the reserved slice utilization is greater than the sliceReserveUsedThresholdPct value returned. | integer |
| stage2AwareThreshold | Awareness condition. The value that is set for "Stage 2" cluster threshold level. | integer |
| stage2BlockThresholdBytes | The number of bytes being used by the cluster at which a stage 2 fullness condition will exist. | integer |

| stage2MetadataThresholdBytes | The number of metadata bytes being used by the cluster at which a stage 2 fullness condition will exist. | |
|------------------------------|---|---------|
| stage3BlockThresholdBytes | The number of storage bytes being used by the cluster at which a stage 3 fullness condition will exist. | integer |
| stage3BlockThresholdPercent | The percent value set for stage 3. At this percent full, a warning is posted in the Alerts log. | integer |
| stage3LowThreshold | Error condition. The threshold at which a system alert is created due to low capacity on a cluster. | integer |
| stage3MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 3 fullness condition will exist. | |
| stage4BlockThresholdBytes | The number of storage bytes being used by the cluster at which a stage 4 fullness condition will exist. | integer |
| stage4CriticalThreshold | Error condition. The threshold at which a system alert is created to warn about critically low capacity on a cluster. | integer |
| stage4MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 4 fullness condition will exist. | |
| stage5BlockThresholdBytes | The number of storage bytes used by the cluster at which a stage 5 fullness condition will exist. | integer |
| stage5MetadataThresholdBytes | The number of metadata bytes used by the cluster at which a stage 5 fullness condition will exist. | |
| sumTotalClusterBytes | The physical capacity of the cluster, measured in bytes. | integer |
| sumTotalMetadataClusterBytes | The total amount of space that can be used to store metadata. | integer |

| sumUsedClusterBytes | The number of storage bytes used on the cluster. | integer |
|-----------------------------|--|---------|
| sumUsedMetadataClusterBytes | The amount of space used on volume drives to store metadata. | integer |

9.6

ModifyClusterInterfacePreference

The ModifyClusterInterfacePreference method enables systems integrated with storage clusters running Element software to change an existing cluster interface preference. This method is for internal use.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|---|--------|---------------|----------|
| name | The name of the cluster interface preference to modify. | string | None | Yes |
| value | The new value of the cluster interface preference. | string | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "ModifyClusterInterfacePreference",
    "params": {
    "name": "testname",
    "value": "newvalue"
},
    "id": 1
}
```

Response example

```
{
    "id": 1,
    "result": {}
}
```

11.0

RemoveNodes

You can use RemoveNodes to remove one or more nodes that should no longer participate in the cluster.

Before removing a node, you must remove all drives the node contains using the RemoveDrives method. You cannot remove a node until the RemoveDrives process has completed and all data has been migrated away from the node. After you remove a node, it registers itself as a pending node. You can add the node again or shut it down (shutting the node down removes it from the pending node list).

Cluster master node removal

If you use RemoveNodes to remove the cluster master node, the method might time out before returning a response. If the method call fails to remove the node, make the method call again. Note that if you are removing the cluster master node along with other nodes, you should use a separate call to remove the cluster master node by itself.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------------------|---|---------------|---------------|----------|
| ignoreEnsembleTole ranceChange | Ignore changes to the ensemble's node failure tolerance when removing nodes. If the storage cluster uses data protection schemes that tolerate multiple node failures and removing the nodes would decrease the node failure tolerance of the ensemble, the node removal normally fails with an error. You can set this parameter to true to disable the ensemble tolerance check so that the node removal succeeds. | boolean | false | No |
| nodes | List of NodelDs for the nodes to be removed. | integer array | None | Yes |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
{
    "method": "RemoveNodes",
    "params": {
        "nodes" : [3,4,5]
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1
  "result" : {},
}
```

9.6

SetLoginSessionInfo

You can use the <code>SetLoginSessionInfo</code> method to set the period of time that a login authentication for a session is valid. After the login period elapses without activity on the system, the authentication expires. New login credentials are required for continued access to the cluster after the login period has elapsed.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|---|--------|---------------|----------|
| timeout | Cluster authentication expiration period. Formatted in HH:mm:ss. For example: 01:30:00, 00:90:00, and 00:00:5400 can all be used to equal a 90 minute timeout period. The minimum timeout value is 1 minute. When a value is not provided, or is set to zero, the login session has no timeout value. | string | 30 minutes | No |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "SetLoginSessionInfo",
   "params": {
      "timeout" : "01:30:00"
    },
     "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

9.6

Shutdown

You can use the Shutdown method to restart or shutdown the nodes in a cluster. You can shut down a single node, multiple nodes, or all of the nodes in the cluster using this method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|--|---------------|---------------|----------|
| nodes | List of NodelDs for the nodes to be restarted or shut down. | integer array | None | Yes |

| Name | Description | Туре | Default value | Required |
|--------|--|--------|---------------|----------|
| option | Action to take for the cluster. Possible values: * restart: Restarts the cluster. * halt: Performs a full power-off. | string | restart | No |

Return value

This method has no return value. == Request example Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

9.6

Cluster creation API Methods

You can use these API methods to create a storage cluster. All of these methods need to be used against the API endpoint on a single node.

- CheckProposedCluster
- CreateCluster
- GetBootstrapConfig

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

CheckProposedCluster

You can use the <code>CheckProposedCluster</code> method to test a set of storage nodes before creating a storage cluster with them to identify possible errors or faults that would occur from the attempt, such as unbalanced mixed node capabilities or node types that are not supported for two-node storage clusters.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|---|--------------|---------------|----------|
| nodes | A list of storage IP addresses of the initial set of storage nodes making up the storage cluster. | string array | None | Yes |
| force | Set to true to run on all storage nodes in the storage cluster. | boolean | None | No |

Return values

This method has the following return values:

| Name Description Type | |
|-----------------------|--|
|-----------------------|--|

| proposedClusterValid | Indicates whether or not the proposed storage nodes would make up a valid storage cluster. Possible values: • true • false | boolean |
|-----------------------|---|--------------|
| proposedClusterErrors | Errors that would occur if a storage cluster was created using the proposed storage nodes. | string array |

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
"id": 1,
   "result": {
        "proposedClusterValid": true,
        "proposedClusterErrors": [ ]
}
```

11.0

CreateCluster

You can use the <code>CreateCluster</code> method to initialize the node in a cluster that has ownership of the "mvip" and "svip" addresses. Each new cluster is initialized using the management IP (MIP) of the first node in the cluster. This method also automatically adds all the nodes being configured into the cluster. You only need to use this method once each time a new cluster is initialized.

After you log in to the master node for the cluster and run the GetBootStrapConfig method to get the IP addresses for the rest of the nodes that you want to include in the cluster, you can run the CreateCluster method against the master node for the cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------------------------------|--|-------------|---------------|----------|
| acceptEula | Indicate your acceptance of the End User License Agreement when creating this cluster. To accept the EULA, set this parameter to true. | boolean | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| enableSoftwareEncr yptionAtRest | Enable this parameter to use software-based encryption at rest. Defaults to false on all clusters. After software encryption at rest is enabled, it cannot be disabled on the cluster. | boolean | true | No |
| mvip | Floating (virtual) IP address for the cluster on the management network. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|--------------|---|--------------|---------------|---|
| nodes | CIP/SIP addresses of the initial set of nodes making up the cluster. This node's IP must be in the list. | string array | None | Yes |
| orderNumber | Alphanumeric sales order number. Required on software-based platforms. | string | None | No (hardware-based platforms) Yes (software-based platforms) |
| password | Initial password for the cluster admin account. | string | None | Yes |
| serialNumber | Nine-digit alphanumeric Serial Number. May be required on software-based platforms. | string | None | No (hardware-based platforms) Yes (software-based platforms) |
| svip | Floating (virtual) IP address for the cluster on the storage (iSCSI) network. | string | None | Yes |
| username | User name for the cluster admin. | string | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
  "method": "CreateCluster",
  "params": {
    "acceptEula": true,
    "mvip": "10.0.3.1",
    "svip": "10.0.4.1",
    "username": "Admin1",
    "password": "9R7ka4rEPa2uREtE",
    "attributes": {
      "clusteraccountnumber": "axdf323456"
    },
    "nodes": [
      "10.0.2.1",
      "10.0.2.2",
      "10.0.2.3",
      "10.0.2.4"
   ]
  },
  "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
"id" : 1,
"result" : {}
}
```

- GetBootstrapConfig
- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

GetBootstrapConfig

You can use the <code>GetBootstrapConfig</code> method to get cluster and node information from the bootstrap configuration file. Use this API method on an individual node before it has been joined with a cluster. The information this method returns is used in the cluster

configuration interface when you create a cluster.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре | |
|-------------|--|-------------------|--|
| clusterName | Name of the cluster. | string | |
| mvip | Cluster MVIP address. Empty if the node is not part of a cluster. | string | |
| nodeName | Name of the node. | string | |
| nodes | List of information about each node that is actively waiting to join the cluster. Possible values: • chassisType: (string) Hardware platform of the node. • cip: (string) Cluster IP address of the node. • compatible: (boolean) Indicates if the node is compatible with the node the API call was executed against. • hostname: (string) Host name of the node. • mip: (string) The IPv4 management IP address of the node. • mipV6: (string) The IPv6 management IP address of the node. • nodeType: (string)Model name of the node. • version: (string)Version of software currently installed on the node. | JSON object array | |
| svip | Cluster SVIP address. Null if the node is not part of a cluster. | string | |

| Name | Description | Туре |
|---------|---|--------|
| version | Version of Element software currently installed on the node that was called by this API method. | string |

Request example

CreateCluster

Drive API methods

You can use drive API methods to add and manage drives that are available to a storage cluster. When you add a storage node to the storage cluster or install new drives in an existing storage node, the drives are available to be added to the storage cluster.

- AddDrives
- GetDriveHardwareInfo
- GetDriveStats
- ListDrives
- ListDriveStats
- RemoveDrives
- SecureEraseDrives

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddDrives

You can use the AddDrives method to add one or more available drives to the cluster, enabling the drives to host a portion of the data for the cluster.

When you add a storage node to the cluster or install new drives in an existing node, the new drives are marked as available and must be added via AddDrives before they can be utilized. Use the ListDrives method to display drives that are available to be added. When you add a drive, the system automatically determines the type of drive it should be.

The method is asynchronous and returns as soon as the processes for rebalancing the drives in the cluster are started. However, it might take more time for the data in the cluster to be rebalanced using the newly added drives; the rebalancing continues even after the AddDrives method call is complete. You can use the GetAsyncResult method to query the method's returned asyncHandle. After the AddDrives method returns, you can use the ListSyncJobs method to see the progress of the rebalancing of data with the new drives.

When you add multiple drives, it is more efficient to add them in a single AddDrives method call rather than multiple individual methods with a single drive each. This reduces the amount of data balancing that must occur to stabilize the storage load on the cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------|---|-------------------|---------------|------------------------|
| drives | Information about each drive to be added to the cluster. Possible values: | JSON object array | None | Yes (type is optional) |
| | driveID: The ID of the drive to add (integer). | | | |
| | • type: The type of drive to add (string). Valid values are "slice", "block", or "volume". If omitted, the system assigns the correct type. | | | |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|---|---------|
| asyncHandle | Handle value used to obtain the operation result. | integer |

Request example

Requests for this method are similar to the following example:

```
{
 "id": 1,
 "method": "AddDrives",
  "params": {
    "drives": [
        "driveID": 1,
        "type": "slice"
      },
        "driveID": 2,
        "type": "block"
      },
        "driveID": 3,
        "type": "block"
    ]
  }
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result" : {
     "asyncHandle": 1
  }
}
```

GetDriveHardwareInfo

You can use the GetDriveHardwareInfo method to get all the hardware information

for the given drive. This generally includes manufacturers, vendors, versions, and other associated hardware identification information.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|----------------------------------|---------|---------------|----------|
| driveID | ID of the drive for the request. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--|--------------|
| result | Returned hardware information for the specified driveID. | hardwareInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "GetDriveHardwareInfo",
    "params": {
       "driveID": 5
},
    "id" : 100
}
```

Response example

```
{
   "id" : 100,
   "result" : {
     "driveHardwareInfo" : {
       "description" : "ATA Drive",
       "dev" : "8:80",
       "devpath" :
"/devices/pci0000:40/0000:40:01.0/0000:41:00.0/host6/port-6:0/expander-

ListDrives

GetDriveStats

You can use the <code>GetDriveStats</code> method to get high-level activity measurements for a single drive. Values are cumulative from the addition of the drive to the cluster. Some values are specific to block drives. Statistical data is returned for either block or metadata drive types when you run this method.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|----------------------------------|---------|---------------|----------|
| driveID | ID of the drive for the request. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------|---|------------|
| driveStats | Drive activity information for the specified driveID. | driveStats |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "GetDriveStats",
    "params": {
        "driveID": 3
    },
    "id" : 1
}
```

Response example (block drive)

This method returns a response similar to the following example for a block drive:

```
{
 "id": 1,
  "result": {
    "driveStats": {
      "driveID": 10,
      "failedDieCount": 0,
      "lifeRemainingPercent": 99,
      "lifetimeReadBytes": 26471661830144,
      "lifetimeWriteBytes": 13863852441600,

ListDrives

ListDrives

You can use the ListDrives method to list the drives that exist in the active nodes of the cluster. This method returns drives that have been added as volume metadata or block drives as well as drives that have not been added and are available.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--------------------------------|-------------|
| drives | List of drives in the cluster. | drive array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListDrives",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id" : 1,
   "result" : {
     "drives" : [
         "attributes" : {},
         "capacity" : 299917139968,
         "driveID" : 35,
         "nodeID" : 5,
         "serial" : "scsi-SATA INTEL SSDSA2CW6CVPR141502R3600FGN-part2",
         "slot" : 0,
         "status" : "active",
         "type" : "volume"
       },
         "attributes" : {},
         "capacity" : 600127266816,
         "driveID" : 36,
         "nodeID" : 5,
         "serial" : "scsi-SATA INTEL SSDSA2CW6CVPR1415037R600FGN",
         "slot" : 6,
         "status" : "active",
         "type" : "block"
     }
  ]
}
```

9.6

ListDriveStats

You can use the ListDriveStats method to list high-level activity measurements for multiple drives in the cluster. By default, this method returns statistics for all drives in the cluster, and these measurements are cumulative from the addition of the drive to the cluster. Some values this method returns are specific to block drives, and some are specific to metadata drives.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------|--|---------------|---------------|----------|
| drives | List of drive IDs (driveID) for which to return drive statistics. If you omit this parameter, measurements for all drives are returned. | integer array | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|--|-------------------|
| driveStats | List of drive activity information for each drive. | driveStats array |
| errors | This list contains the driveID and associated error message. It is always present, and empty if there are no errors. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
"id": 1,
   "method": "ListDriveStats",
   "params": {
      "drives":[22,23]
    }
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "driveStats": [
        "driveID": 22,
        "failedDieCount": 0,
        "lifeRemainingPercent": 84,
        "lifetimeReadBytes": 30171004403712,
        "lifetimeWriteBytes": 103464755527680,
        "powerOnHours": 17736,
        "readBytes": 14656542,
         "readOps": 3624,
        "reallocatedSectors": 0,
        "reserveCapacityPercent": 100,
        "timestamp": "2016-03-01T00:19:24.782735Z",
        "totalCapacity": 300069052416,
        "usedCapacity": 1783735635,
        "usedMemory": 879165440,
        "writeBytes": 2462169894,
        "writeOps": 608802
      }
    ],
    "errors": [
        "driveID": 23,
        "exception": {
          "message": "xStatCheckpointDoesNotExist",
          "name": "xStatCheckpointDoesNotExist"
    1
  }
}
```

GetDriveStats

RemoveDrives

You can use the RemoveDrives method to proactively remove drives that are part of the

cluster. You might use this method when reducing cluster capacity or preparing to replace drives nearing the end of their service life. RemoveDrives creates a third copy of the block data on the other nodes in the cluster and waits for syncing to complete before moving the drives to the "Available" list. Drives in the "Available" list are completely removed from the system and have no running services or active data.

RemoveDrives is an asynchronous method. Depending on the total capacity of the drives being removed, it might take several minutes to migrate all of the data.

When removing multiple drives, use a single RemoveDrives method call rather than multiple individual methods with a single drive each. This reduces the amount of data balancing that must occur to evenly stabilize the storage load on the cluster.

You can also remove drives with a "failed" status using RemoveDrives. When you remove a drive with a "failed" status, the drive is not returned to an "available" or "active" status. The drive is unavailable for use in the cluster.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------|--|---------------|---------------|----------|
| drives | List of driveIDs to remove from the cluster. | integer array | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|---|---------|
| asyncHandle | Handle value used to obtain the operation result. | integer |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "RemoveDrives",
    "params": {
        "drives" : [3, 4, 5]
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result" : {
      "asyncHandle": 1
   }
}
```

SecureEraseDrives

You can use the SecureEraseDrives method to remove any residual data from drives that have a status of "available". You might use this method when replacing a drive nearing the end of its service life that contained sensitive data. This method uses a Security Erase Unit command to write a predetermined pattern to the drive and resets the encryption key on the drive. This asynchronous method might take several minutes to complete.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------|------------------------------------|---------------|---------------|----------|
| drives | List of drive IDs to secure erase. | integer array | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|---|---------|
| asyncHandle | Handle value used to obtain the operation result. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "SecureEraseDrives",
    "params": {
        "drives" : [3, 4, 5]
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id" : 1
   "result" : {
      "asyncHandle" : 1
   }
}
```

GetVolumeAccessGroupLunAssignments

You can use the GetVolumeAccessGroupLunAssignments method to retrieve details on LUN mappings of a specified volume access group.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------------------|---|---------|---------------|----------|
| volumeAccessGroup ID | A unique volume access group ID used to return information. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------------------------|--|-------------|
| volumeAccessGroupLunAssignme nts | A list of all physical Fibre Channel ports, or a port for a single node. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "GetVolumeAccessGroupLunAssignments",
    "params": {
        "volumeAccessGroupID": 5
     },
     "id" : 1
    }
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {
    "volumeAccessGroupLunAssignments" : {
       "volumeAccessGroupID" : 5,
       "lunAssignments" : [
          {"volumeID" : 5, "lun" : 0},
          {"volumeID" : 6, "lun" : 1},
          {"volumeID" : 7, "lun" : 2},
          {"volumeID" : 8, "lun" : 3}
       ],
       "deletedLunAssignments" : [
           {"volumeID" : 44, "lun" : 44}
       1
    }
  }
}
```

9.6

ListFibreChannelPortInfo

You can use the ListFibreChannelPortInfo method to list information about the Fibre Channel ports.

This API method is intended for use on individual nodes; a userid and password are required for access to individual Fibre Channel nodes. However, this method can be used on the cluster if the force parameter is set to true. When used on the cluster, all Fibre Channel interfaces are listed.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|---|---------|---------------|----------|
| force | Set to true to run on all nodes in the cluster. | boolean | None | No |

Return value

This method has the following return value:

| Name Description Type | |
|-----------------------|--|
|-----------------------|--|

| A list of all physical Fibre Channel ports, or a port for a single node. | fibreChannelPort array |
|--|------------------------|
| | |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListFibreChannelPortInfo",
    "params": {},
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
 "id": 1,

]
}
```

```
}
}
}
```

9.6

ListFibreChannelSessions

You can use the ListFibreChannelSessions method to list information about the Fibre Channel sessions on a cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|---------------|
| | A list of objects describing active Fibre Channel sessions on the cluster. | session array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListFibreChannelSessions",
    "params": {},
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {
     "sessions" : [
       "initiatorWWPN" : "21:00:00:0e:1e:14:af:40",
       "nodeID" : 5,
       "serviceID" : 21,
       "targetWWPN": "5f:47:ac:c0:00:00:00:10",
       "volumeAccessGroupID": 7
    },
       "initiatorWWPN" : "21:00:00:0e:1e:14:af:40",
       "nodeID" : 1,
       "serviceID" : 22,
       "targetWWPN": "5f:47:ac:c0:00:00:00:11",
       "volumeAccessGroupID": 7
    }
    ]
}
```

9.6

ListNodeFibreChannelPortInfo

You can use the ListNodeFibreChannelPortInfo method to list information about the Fibre Channel ports on a node.

This API method is intended for use on individual nodes; a userid and password are required for access to individual Fibre Channel nodes. When used on the cluster, all Fibre Channel interfaces are listed.

Parameter

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|------------------------|
| | A list of all physical Fibre Channel ports, or a port for a single node. | fibreChannelPort array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListNodeFibreChannelPortInfo",
   "params": {
        "nodeID": 5,
        "force": true
   },
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
 "id": 1,
 "result": {
    "fibreChannelPorts": [
        "firmware": "7.04.00 (d0d5)",
        "hbaPort": 1,
        "model": "QLE2672",
        "nPortID": "0xc7002c",
        "pciSlot": 3,
        "serial": "BFE1335E03500",
        "speed": "8 Gbit",

${\bf Modify Volume Access Group Lun Assignments}$

You can use the ModifyVolumeAccessGroupLunAssignments method to define custom LUN assignments for specific volumes.

This method changes only LUN values set on the lunAssignments parameter in the volume access group. All other LUN assignments remain unchanged.

LUN assignment values must be unique for volumes in a volume access group. You cannot define duplicate LUN values within a volume access group. However, you can use the same LUN values again in different volume access groups.

Valid LUN values are 0 through 16383. The system generates an exception if you pass a LUN value outside of this range. None of the specified LUN assignments are modified if there is an exception.

CAUTION:

If you change a LUN assignment for a volume with active I/O, the I/O can be disrupted. You should change the server configuration before changing volume LUN assignments.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------|---|---------------|---------------|----------|
| volumeAccessGroup ID | Unique volume access group ID for which the LUN assignments will be modified. | integer | None | Yes |
| lunAssignments | The volume IDs with new assigned LUN values. | integer array | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------------------------|---|------|
| volumeAccessGroupLunAssignme nts | An object containing details of the modified volume access group LUN assignments. | , |

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "volumeAccessGroupLunAssignments": {
      "deletedLunAssignments": [],
      "lunAssignments": [

Initiator API methods

Initiator methods enable you to add, remove, view, and modify iSCSI initiator objects, which handle communication between the storage system and external storage clients.

- CreateInitiators
- DeleteInitiators
- ListInitiators
- ModifyInitiators

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

CreateInitiators

You can use <code>CreateInitiators</code> to create multiple new initiator IQNs or World Wide Port Names (WWPNs) and optionally assign them aliases and attributes. When you use <code>CreateInitiators</code> to create new initiators, you can also add them to volume access groups.

If the operation fails to create one of the initiators provided in the parameter, the method returns an error and does not create any initiators (no partial completion is possible).

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------|---|-------------------|---------------|----------|
| initiators | A list of objects containing characteristics of each new initiator. Objects: • alias: (Optional) The friendly name to assign to this initiator. (string) • attributes: (Optional) A set of JSON attributes to assign to this initiator. (JSON object) • chapUsername: (Optional) The unique CHAP username for this initiator. Defaults to the initiator name (IQN) if not specified during creation and requireChap is true. (string) • initiatorSec ret: (Optional) The CHAP secret used to authenticate the initiator. Defaults to a randomly generated secret if not specified during creation and requireChap is true. (string) • name: (Required) The name of the initiator (IQN or WVPN) to create. (string) • name: (requireChap: (Optional) True if CHAP is required during | JSON object array | None | Yes |

Return value

This method has the followthis rieitiatoralue:

(boolean)

| List of objects describing the newly created initiators. | Name | Description | Туре |
|--|------|-------------|-----------------|
| | | | initiator array |

аитпеписате тте

target (when **Error** using mutual

This method can return the following error: authentication).

Find more information

ListInitiators

DeleteInitiators

You can use DeleteInitiators to delete one or more initiators from the system (and from any associated volumes or volume access groups).

If DeleteInitiators fails to delete one of the initiators provided in the parameter, the system returns an error and does not delete any initiators (no partial completion is possible).

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------|--|---------------|---------------|----------|
| initiators | An array of IDs of initiators to delete. | integer array | None | Yes |

Return values

This method has no return values.

Error

This method can return the following error:

| Name | Description |
|------------------------|---|
| xInitiatorDoesNotExist | Returned if the initiator name you choose does not exist. |

Request example

Requests for this method are similar to the following example:

```
"id": 5101,
"method": "DeleteInitiators",
"params": {
    "initiators": [
        145,
        147
      ]
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 5101,
  "result": {}
}
```

New since version

9.6

ListInitiators

You can use the ListInitiators method to get the list of initiator IQNs or World Wide Port Names (WWPNs).

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------------|--|---------------|---------------|----------|
| initiators | A list of initiator IDs to retrieve. You can supply this parameter or the startInitiatorID parameter, but not both. | integer array | None | No |
| startInitiatorID | The initiator ID at which to begin the listing. You can supply this parameter or the initiators parameter, but not both. | integer | 0 | No |
| limit | The maximum number of initiator objects to return. | integer | (unlimited) | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------|------------------------------------|-----------------|
| initiators | List of the initiator information. | initiator array |

Exceptions

This method can have the following exception:

| Name | Description |
|-------------------|--|
| xInvalidParameter | Thrown if you include both the startInitiatorID and the initiators parameters in the same method call. |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListInitiators",
  "params": {},
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

New since version

9.6

ModifyInitiators

You can use the ModifyInitiators method to change the attributes of one or more existing initiators.

You cannot change the name of an existing initiator. If you need to change the name of an initiator, delete it first with the DeleteInitiators method and create a new one with the CreateInitiators method.

If ModifyInitiators fails to change one of the initiators provided in the parameter, the method returns an error and does not modify any initiators (no partial completion is possible).

Parameter

This method has the following input parameter:

| Name | Description | Type | Default value | Required |
|---------|-------------|---------|---------------|-----------|
| Italiio | Dosonption | 1 3 9 0 | Doladit value | rtoquirou |

| initiators | A list of objects containing characteristics of each initiator to modify. Possible objects: • alias: | JSON object array | None | Yes |

LDAP API methods

You can use the Lightweight Directory Access Protocol (LDAP) to authenticate access to Element storage. The LDAP API methods described in this section enable you to configure LDAP access to the storage cluster.

- AddLdapClusterAdmin
- EnableLdapAuthentication
- DisableLdapAuthentication
- GetLdapConfiguration
- TestLdapAuthentication

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddLdapClusterAdmin

You can use the AddLdapClusterAdmin to add a new LDAP cluster administrator user. An LDAP cluster administrator can manage the cluster using the API and management tools. LDAP cluster admin accounts are completely separate and unrelated to standard tenant accounts.

Parameters

You can also use this method to add an LDAP group that has been defined in Active Directory®. The access level that is given to the group is passed to the individual users in the LDAP group.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|--------------|---------------|----------|
| access | Controls which methods this cluster admin can use. | string array | None | Yes |
| acceptEula | Accept the End User License Agreement. Set to true to add a cluster administrator account to the system. If omitted or set to false, the method call fails. | boolean | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| username | The distinguished user name for the new LDAP cluster admin. | string | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

Access control

EnableLdapAuthentication

You can use the EnableLdapAuthentication method to configure an LDAP directory connection for LDAP authentication to a cluster. Users that are members of the LDAP directory can then log in to the storage system using their LDAP credentials.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------------|---|--------------|-----------------|----------|
| authType | Identifies which user authentication method to use. Possible values: • DirectBind • SearchAndBin d | string | SearchAndBind | No |
| groupSearchBaseD N | The base DN of the tree to start the group subtree search. | string | None | No |
| groupSearchType | Controls the default group search filter used. Possible values: • NoGroups: No group support. • ActiveDirectory: Nested membership of all of a user's active directory groups. • MemberDN: MemberDN style groups (single level). | string | ActiveDirectory | No |
| serverURIs | A comma-separated list of LDAP or LDAPS server URIs. You can add a custom port to the end of an LDAP or LDAPS URI by using a colon followed by the port number. For example, the URI "Idap://1.2.3.4" uses the default port and the URI "Idaps://1.2.3.4:123" uses the custom port 123. | string array | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------------------|--|--------|---------------|----------|
| userSearchBaseDN | The base DN of the tree to start the subtree search. This parameter is required when using an authType of SearchAndBind. | string | None | No |
| searchBindDN | A fully qualified DN to log in with to perform an LDAP search for the user. The DN requires read access to the LDAP directory. This parameter is required when using an authType of SearchAndBind. | string | None | Yes |
| searchBindPasswor d | The password for the searchBindDN account used for searching. This parameter is required when using an authType of SearchAndBind. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------------|---|--------|---------------|----------|
| userSearchFilter | The LDAP search filter to use when querying the LDAP server. The string should have the placeholder text "%USERNAME%" which is replaced with the username of the authenticating user. For example, (&(objectClass=pers on)(sAMAccountNa me=%USERNAME%)) will use the sAMAccountName field in Active Directory to match the username entered at cluster login. This parameter is required when using an authType of SearchAndBind. | string | None | Yes |
| userDNTemplate | A string template used to define a pattern for constructing a full user distinguished name (DN). The string should have the placeholder text "%USERNAME%" which is replaced with the username of the authenticating user. This parameter is required when using an authType of DirectBind. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------------------------|--|--------|---------------|----------|
| groupSearchCustom Filter | For use with the CustomFilter search type, an LDAP filter to use to return the DNs of a user's groups. The string can have placeholder text of %USERNAME% and %USERDN% to be replaced with their username and full userDN as needed. | string | None | Yes |

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "EnableLdapAuthentication",
  "params": {
     "authType": "SearchAndBind",
     "groupSearchBaseDN": "dc=prodtest, dc=solidfire, dc=net",
     "groupSearchType": "ActiveDirectory",
     "searchBindDN": "SFReadOnly@prodtest.solidfire.net",
     "searchBindPassword": "zsw@#edcASD12",
     "sslCert": "",
     "userSearchBaseDN": "dc=prodtest,dc=solidfire,dc=net",
     "userSearchFilter":
"(&(objectClass=person)(sAMAccountName=%USERNAME%))",
     "serverURIs":[
           "ldaps://111.22.333.444",
           "ldap://555.66.777.888"
       },
  "id": 1
}
```

Response example

```
{
"id": 1,
"result": {
    }
}
```

9.6

DisableLdapAuthentication

You can use the <code>DisableLdapAuthentication</code> method to disable LDAP authentication and remove all LDAP configuration settings. This method does not remove any configured cluster admin accounts for users or groups. After LDAP authentication has been disabled, cluster admins that are configured to use LDAP authentication can no longer access the cluster.

Parameters

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
  "method": "DisableLdapAuthentication",
  "params": {},

"id": 1
}
```

Response example

```
{
"id": 1,
"result": {}
}
```

9.6

GetLdapConfiguration

You can use the GetLdapConfiguration method to get the currently active LDAP configuration on the cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value.

| Name | Description | Туре |
|-------------------|---|-------------------|
| IdapConfiguration | List of the current LDAP configuration settings. This API call does not return the plain text of the search account password. Note: If LDAP authentication is currently disabled, all the returned settings are empty with the exception of "authType", and "groupSearchType" which are set to "SearchAndBind" and "ActiveDirectory" respectively. | IdapConfiguration |

Request example

Requests for this method are similar to the following example:

```
"method": "GetLdapConfiguration",
   "params": {},
   "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "ldapConfiguration": {
        "authType": "SearchAndBind",
        "enabled": true,
        "groupSearchBaseDN": "dc=prodtest,dc=solidfire,dc=net",
        "groupSearchCustomFilter": "",
        "groupSearchType": "ActiveDirectory",
        "searchBindDN": "SFReadOnly@prodtest.solidfire.net",
        "serverURIs": [
           "ldaps://111.22.333.444",
           "ldap://555.66.777.888"
           ],
        "userDNTemplate": "",
        "userSearchBaseDN": "dc=prodtest,dc=solidfire,dc=net",
        "userSearchFilter":
"(&(objectClass=person)(sAMAccountName=%USERNAME%))"
}
```

9.6

TestLdapAuthentication

You can use the TestLdapAuthentication method to validate the currently enabled LDAP authentication settings. If the configuration is correct, the API call returns the group membership of the tested user.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------|---|--------|---------------|----------|
| username | The username to be tested. | string | None | Yes |
| password | The password for the username to be tested. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|---|-------------------|---------------|----------|
| IdapConfiguration | An IdapConfiguration object to be tested. If you provide this parameter, the system tests the provided configuration even if LDAP authentication is currently disabled. | IdapConfiguration | None | No |

This method has the following return values:

| Name | Description | Туре |
|--------|---|--------|
| groups | List of LDAP groups that include the tested user as a member. | array |
| userDN | The tested user's full LDAP distinguished name. | string |

Request example

Requests for this method are similar to the following example:

Response example

```
"id": 1,
"result": {
    "groups": [
        "CN=StorageMgmt,OU=PTUsers,DC=prodtest,DC=solidfire,DC=net"
        ],
        "userDN": "CN=Admin1
Jones,OU=PTUsers,DC=prodtest,DC=solidfire,DC=net"
    }
}
```

9.6

Multi-factor authentication API methods

You can use multi-factor authentication (MFA) to manage user sessions using a third-party Identity Provider (IdP) via the Security Assertion Markup Language (SAML).

- AddIdpClusterAdmin
- CreateIdpConfiguration
- DeleteAuthSession
- DeleteAuthSessionsByClusterAdmin
- DeleteAuthSessionsByUsername
- DeleteIdpConfiguration
- DisableIdpAuthentication
- EnableIdpAuthentication
- · GetIdpAuthenticationState
- ListActiveAuthSessions
- ListIdpConfigurations
- UpdateIdpConfiguration

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddldpClusterAdmin

You can use the AddIpdClusterAdmin method to add a cluster administrator user authenticated by a third-party Identity Provider (IdP). IdP cluster admin accounts are configured based on SAML attribute-value information provided within the IdP's SAML

assertion associated with the user. If a user successfully authenticates with the IdP and has SAML attribute statements within the SAML assertion matching multiple IdP cluster admin accounts, the user will have the combined access level of those matching IdP cluster admin accounts.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|--------------|---------------|----------|
| access | Controls which methods this IdP cluster admin can use. | string array | None | Yes |
| acceptEula | Accept the End User License Agreement. Set to true to add a cluster administrator account to the system. If omitted or set to false, the method call fails. | boolean | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| username | A SAML attribute-value mapping to an IdP cluster admin (for example, email=test@exampl e.com). This can be defined using a specific SAML subject using NameID or as an entry in the SAML attribute statement, such as eduPersonAffili ation. | string | None | Yes |

Return values

This method has the following return value:

| Name | Description | Туре |
|------|-------------|------|
|------|-------------|------|

| clusterAdminID | Unique identifier for the newly created cluster admin. | integer |
|----------------|--|---------|
| | | |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "AddIdpClusterAdmin",
    "params": {
        "username": "email=test@example.com",
        "acceptEula": true,
        "access": ["administrator"]
    }
}
```

Response example

This method returns a response similar to the following example:

```
{
    "result": {
        "clusterAdminID": 13
    }
}
```

New since version

12.0

CreateIdpConfiguration

You can use the <code>CreateIpdConfiguration</code> method to create a potential trust relationship for authentication using a third-party Identity Provider (IdP) for the cluster. A SAML Service Provider certificate is required for IdP communication. This certificate is generated as required, and returned by this API call.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|------------------------|--------|---------------|----------|
| idpMetadata | IdP metadata to store. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|---------|--|--------|---------------|----------|
| idpName | Name used to identify an IdP provider for SAML 2.0 single sign-on. | string | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|---------------|--|---------------|
| idpConfigInfo | Information about the third-party Identity Provider (IdP) configuration. | idpConfigInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateIdpConfiguration",
"params": {
    "idpMetadata": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>
        <EntityDescriptor
        xmlns=\"urn:oasis:names:tc:SAML:2.0:metadata\"

    }
}
```

12.0

DeleteAuthSession

You can use the <code>DeleteAuthSession</code> method to delete an individual user authentication session. If the calling user is not in the ClusterAdmins / Administrator AccessGroup, only the authentication session belonging to the calling user can be deleted.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-----------|---|------|---------------|----------|
| sessionID | Unique identifier for the auth session to be deleted. | UUID | None | Yes |

Return values

This method has the following return value:

| Name | Description | Туре |
|---------|--|-----------------|
| session | Session information for the delete auth session. | authSessionInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteAuthSession",
    "params": {
          "sessionID": "a862a8bb-2c5b-4774-a592-2148e2304713"
     },
     "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "session": {
            "accessGroupList": [
                "administrator"
            ],
            "authMethod": "Cluster",
            "clusterAdminIDs": [
                1
            "finalTimeout": "2020-04-09T17:51:30Z",
            "idpConfigVersion": 0,
            "lastAccessTimeout": "2020-04-06T18:21:33Z",
            "sessionCreationTime": "2020-04-06T17:51:30Z",
            "sessionID": "a862a8bb-2c5b-4774-a592-2148e2304713",
            "username": "admin"
        }
   }
}
```

DeleteAuthSessionsByClusterAdmin

You can use the DeleteAuthSessionsByClusterAdmin method to delete all authentication sessions associated with the specified ClusterAdminID. If the specified ClusterAdminID maps to a group of users, all authentication sessions for all members of that group will be deleted. To view a list of sessions for possible deletion, use the ListAuthSessionsByClusterAdmin method with the ClusterAdminID parameter.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------------|--|---------|---------------|----------|
| clusterAdminID | Unique identifier for the cluster admin. | integer | None | Yes |

Return values

This method has the following return value:

| Name | Description | Туре |
|----------|--|-----------------|
| sessions | Session information for the deleted authentication sessions. | authSessionInfo |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "DeleteAuthSessionsByClusterAdmin",
  "params": {
     "clusterAdminID": 1
  }
}
```

Response example

```
"sessions": [
        "accessGroupList": [
          "administrator"
        ],
        "authMethod": "Cluster",
        "clusterAdminIDs": [
          1
        ],
        "finalTimeout": "2020-03-14T19:21:24Z",
        "idpConfigVersion": 0,
        "lastAccessTimeout": "2020-03-11T19:51:24Z",
        "sessionCreationTime": "2020-03-11T19:21:24Z",
        "sessionID": "b12bfc64-f233-44df-8b9f-6fb6c011abf7",
        "username": "admin"
    ]
}
```

12.0

DeleteAuthSessionsByUsername

You can use the DeleteAuthSessionsByUsername method to delete all authentication sessions for a given user(s). A caller not in AccessGroup ClusterAdmins/Administrator can only delete their own sessions. A caller with ClusterAdmins/Administrator privileges can delete sessions belonging to any user. To see the list of sessions that could be deleted, use ListAuthSessionsByUsername with the same parameters. To view a list of sessions for possible deletion, use the ListAuthSessionsByUsername method with the same parameter.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------|---|-----------------|---------------|----------|
| Name authMethod | Authentication method of the user sessions to be deleted. Only a caller in the ClusterAdmins/Administrator AccessGroup can provide this parameter. Possible values are: • authMethod=ClusterAdmin username. • authMethod=Ld ap specifies the user's LDAP DN. • authMethod=ld p specifies either the user's IdP UUID or NameID. If the IdP is not | Type authMethod | None | Required |
| | configured to return either option, this specifies a random UUID issued when the session was created. | | | |
| username | Unique identifier for the user. | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|----------|--|-----------------|
| sessions | Session information for the deleted authentication sessions. | authSessionInfo |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "DeleteAuthSessionsByUsername",
  "params": {
     "authMethod": "Cluster",
     "username": "admin"
  }
}
```

Response example

This method returns a response similar to the following example:

```
"sessions": [
        "accessGroupList": [
          "administrator"
        ],
        "authMethod": "Cluster",
        "clusterAdminIDs": [
         1
        ],
        "finalTimeout": "2020-03-14T19:21:24Z",
        "idpConfigVersion": 0,
        "lastAccessTimeout": "2020-03-11T19:51:24Z",
        "sessionCreationTime": "2020-03-11T19:21:24Z",
        "sessionID": "b12bfc64-f233-44df-8b9f-6fb6c011abf7",
        "username": "admin"
      }
    1
}
```

New since version

12.0

DeleteIdpConfiguration

You can use the DeleteIdpConfiguration method to delete an existing configuration of a third-party IdP for the cluster. Deleting the last IdP configuration removes the SAML Service Provider certificate from the cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------|---|--------|---------------|----------|
| idpConfigurationID | UUID for the third- party IdP configuration. | UUID | None | No |
| idpName | Name used to identify and retrieve an IdP provider for SAML 2.0 single sign-on. | string | None | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteIdpConfiguration",
"params": {
    "idpConfigurationID": "f983c602-12f9-4c67-b214-bf505185cfed",
    "idpName": "https://provider.name.url.com"
}
```

Response example

This method returns a response similar to the following example:

```
{
    "result":{}
}
```

New since version

12.0

DisableIdpAuthentication

You can use the DisableIdpAuthentication method to disable support for

authentication using third-party IdPs for the cluster. Once disabled, users authenticated by third party IdPs are no longer able to access the cluster and any active authenticated sessions are invalidated/disconnected. LDAP and cluster admins are able to access the cluster via supported UIs.

Parameters

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "DisableIdpAuthentication",
   "params": {}
}
```

Response example

This method returns a response similar to the following example:

```
{
"result": {}
}
```

New since version

12.0

EnableIdpAuthentication

You can use the EnableIdpAuthentication method to enable support for authentication using third-party IdPs for the cluster. Once IdP authentication is enabled, LDAP and cluster admins are no longer able to access the cluster via supported UIs and any active authenticated sessions are invalidated/disconnected. Only users authenticated by third party IdPs are able to access the cluster via supported UIs.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------|--|------|---------------|----------|
| idpConfigurationID | UUID for the third-party IdP configuration. If only one IdP configuration exists, then the default is to enable that configuration. If you have only a single IdpConfiguration, you need not provide the idpConfigurationID parameter. | UUID | None | No |

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "EnableIdpAuthentication",
   "params": {
      "idpConfigurationID": "f983c602-12f9-4c67-b214-bf505185cfed",
   }
}
```

Response example

This method returns a response similar to the following example:

```
{
"result": {}
}
```

New since version

12.0

GetIdpAuthenticationState

You can use the GetIdpAuthenticationState method to return information regarding the state of authentication using third-party IdPs.

Parameters

This method has no input parameters.

Return values

This method has the following return value:

| Name | Description | Туре |
|---------|--|---------|
| enabled | Indicates whether third-party IdP authentication is enabled. | boolean |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetIdpAuthenticationState"
}
```

Response example

This method returns a response similar to the following example:

```
{
   "result": {"enabled": true}
}
```

New since version

12.0

ListActiveAuthSessions

You can use the ListActiveAuthSessions method to list all of the active authenticated sessions. Only users with Administrative access rights can call this method.

Parameters

This method has no input parameters.

Return values

This method has the following return value:

| Name | Description | Туре |
|----------|--|-----------------|
| sessions | Session information for the authentication sessions. | authSessionInfo |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListActiveAuthSessions"
}
```

Response example

This method returns a response similar to the following example:

New since version

12.0

ListIdpConfigurations

You can use the ListIdpConfigurations method to list configurations for third-party IdPs. Optionally, you can provide either the enabledOnly flag to retrieve the currently

enabled IdP configuration or an IdP metadata UUID or IdP name to query information for a specific IdP configuration.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------|---|---------|---------------|----------|
| enabledOnly | Filters the result to return the currently enabled IdP configuration. | boolean | None | No |
| idpConfigurationID | UUID for the third- party IdP configuration. | UUID | None | No |
| idpName | Retrieves IdP configuration information for a specific IdP name. | string | None | No |

Return values

This method has the following return value:

| Name | Description | Туре |
|----------------|--|---------------------|
| idpConfigInfos | Information on the third-party IdP configuration(s). | idpConfigInfo array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListIdpConfigurations",
   "params": {}
}
```

Response example

```
{
    "result": {
        "idpConfigInfo": {
        "enabled": true,
        "idpConfigurationID": "f983c602-12f9-4c67-b214-bf505185cfed",
        "idpMetadata": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\r\n
        <EntityDescriptor
xmlns=\"urn:oasis:names:tc:SAML:2.0:metadata\"\r\n
        xmlns:ds=\"http://www.w3.org/2000/09/xmldsig#\"\r\n
        xmlns:shibmd=\"urn:mace:shibboleth:metadata:1.0\"\r\n
        xmlns:xml=\"http://www.w3.org/XML/1998/namespace\"\r\n
        ...</Organization>\r\n
        </EntityDescriptor>",
        "idpName": "https://privider.name.url.com",
        "serviceProviderCertificate": "----BEGIN CERTIFICATE----\n
        MI...BHi\n
        ----END CERTIFICATE----\n",
        "spMetadataUrl": "https://10.193.100.100/auth/ui/saml2"
    }
}
```

12.0

UpdateIdpConfiguration

You can use the UpdateIdpConfiguration method to update an existing configuration with a third-party IdP for the cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------|--|---------|---------------|----------|
| generateNewCertific ate | When specified as true, a new SAML key and certificate is generated and replaces the existing pair. Note: Replacing the existing certificate will disrupt the established trust between the cluster and the IdP until the cluster's Service Provider metadata is reloaded at the IdP. If not provided or set to false, the SAML certificate and key remains unchanged. | boolean | None | No |
| idpConfigurationID | UUID for the third- party IdP configuration. | UUID | None | No |
| idpMetadata | IdP metadata for configuration and integration details for SAML 2.0 single sign-on. | string | None | No |
| idpName | Name used to identify and retrieve an IdP provider for SAML 2.0 single sign-on. | string | None | No |
| newIdpName | If specified, this name replaces the old IdP name. | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------------|---|---------------|
| idpConfigInfo | Information around the third-party IdP configuration. | idpConfigInfo |

Request example

Requests for this method are similar to the following example:

```
{
"method": "UpdateIdpConfiguration",
"params": {
        "idpConfigurationID": "f983c602-12f9-4c67-b214-bf505185cfed",
        "generateNewCertificate": true
    }
}
```

Response example

This method returns a response similar to the following example:

```
{
    "result": {
        "idpConfigInfo": {
        "enabled": true,
        "idpConfigurationID": "f983c602-12f9-4c67-b214-bf505185cfed",
        "idpMetadata": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\r\n
        <EntityDescriptor
xmlns=\"urn:oasis:names:tc:SAML:2.0:metadata\"\r\n
        xmlns:ds=\"http://www.w3.org/2000/09/xmldsig#\"\r\n
        xmlns:shibmd=\"urn:mace:shibboleth:metadata:1.0\"\r\n
        xmlns:xml=\"http://www.w3.org/XML/1998/namespace\"\r\n
        ...</Organization>\r\n
        </EntityDescriptor>",
        "idpName": "https://privider.name.url.com",
        "serviceProviderCertificate": "----BEGIN CERTIFICATE----\n
        MI...BHi\n
        ----END CERTIFICATE----\n",
        "spMetadataUrl": "https://10.193.100.100/auth/ui/saml2"
    }
}
```

    ]
}
```

12.0

ListAuthSessionsByUsername

You can use the ListAuthSessionsByUsername method to list all auth sessions for the specified user. A caller not in AccessGroup ClusterAdmins / Administrator privileges may only list their own sessions. A caller with ClusterAdmins / Administrator privileges may list sessions belonging to any user.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|---|------------|---------------|----------|
| authMethod | Authentication method of the user sessions to be listed. Only a caller in the ClusterAdmins/Admi nistrator AccessGroup can provide this parameter. Possible values are: | authMethod | None | Yes |
| | authMethod=Cl uster specifies the ClusterAdmin username. | | | |
| | authMethod=Ld ap specifies the user's LDAP DN. | | | |
| | • authMethod=Id p specifies either the user's IdP UUID or NameID. If the IdP is not configured to return either option, this specifies a random UUID issued when the session was created. | | | |
| username | Unique identifier for the user. | string | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|----------|--|-----------------|
| sessions | List of session information for the auth sessions. | authSessionInfo |

Request example

Requests for this method are similar to the following example:

```
"method": "ListAuthSessionsByUsername",
   "authMethod": "Cluster",
   "username": "admin"
}
```

Response example

This method returns a response similar to the following example:

Node API methods

You can use node API methods to configure individual nodes. These methods operate on single nodes that need to be configured, are configured but not yet participating in a cluster, or are actively participating in a cluster. Node API methods enable you to view and modify settings for individual nodes and the cluster network used to communicate with the node. You must run these methods against individual nodes; you cannot run per-

node API methods against the address of the cluster.

CheckPingOnVlan

You can use the <code>CheckPingOnVlan</code> method to test network connectivity on a temporary VLAN when performing pre-deployment network validation. <code>CheckPingOnVlan</code> creates a temporary VLAN interface, sends ICMP packets to all nodes in the storage cluster using the VLAN interface, and then removes the interface.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|---|---------|--------------------------|----------|
| attempts | Specifies the number of times the system should repeat the test ping. | integer | 5 | No |
| hosts | Specifies a comma- separated list of addresses or hostnames of devices to ping. | string | The nodes in the cluster | No |

| Name | Description | Туре | Default value | Required |
|---------------------------|---|---------|---------------|----------|
| interface | The existing (base) interface from which the pings should be sent. Possible values: • Bond10G: Send pings from the Bond10G interface. • Bond1G: Send pings from the Bond1G interface. | string | None | Yes |
| packetSize | Specifies the number of bytes to send in the ICMP packet that is sent to each IP. The number of bytes must be less than the maximum MTU specified in the network configuration. | integer | None | No |
| pingTimeoutMsec | Specifies the number of milliseconds to wait for each individual ping response. | integer | 500 ms | No |
| prohibitFragmentatio n | Enables the DF (Do not Fragment) flag for the ICMP packets. | boolean | false | No |
| sourceAddressV4 | The source IPv4 address to use in the ICMP ping packets. | string | None | Yes |
| sourceAddressV6 | The source IPv6 address to use in the ICMP ping packets. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|--|---------|---------------|----------|
| totalTimeoutSec | Specifies the time in seconds the ping should wait for a system response before issuing the next ping attempt or ending the process. | integer | 5 | No |
| virtualNetworkTag | The VLAN ID to use when sending the ping packets. | integer | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|------|---|-------------|
| | List of each IP the node was able to communicate with and ping response statistics. | JSON object |

Request example

Requests for this method are similar to the following example:

Response example

  }
}
```

11.1

CheckProposedNodeAdditions

You can use the CheckProposedNodeAdditions method to test a set of storage

nodes to see if you can add them to a storage cluster without errors or best practice violations.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|--|--------------|---------------|----------|
| nodes | A list of storage IP addresses of storage nodes that are ready to be added to a storage cluster. | string array | None | Yes |

Return values

This method has the following return values:

| proposedClusterValid Indicates whether proposed storage make up a valid st Possible values: • true • false | nodes would |
|--|-------------|

| 101 / 5 | | \ |
|-----------------------|--|-------------|
| proposedClusterErrors | Errors that would occur if a storage cluster was created using the proposed storage nodes. Possible error codes: | string arra |
| | nodesNoCapacity: Nodes did not have any useable capacity. | |
| | nodesTooLarge: Nodes constitute too large a portion of cluster capacity for the active protection scheme. | |
| | nodesConnectFailed: Could not connect to nodes to query hardware configuration. | |
| | nodesQueryFailed: Could not query nodes for hardware configuration. | |
| | nodesClusterMember: IP addresses for nodes are already in use in the cluster. | |
| | nonFipsNodeCapable: Unable to add a non-FIPS capable node to the storage cluster while the FIPS 140-2 drive encryption feature is enabled. | |
| | • nonFipsDrivesCapable: Unable to add a node with non- FIPS-capable drives to the | |

cluster while the FIPS 140-2 drive encryption feature is

enabled.

Request example

Requests for this method are similar to the following example:

```
"method": "CheckProposedNodeAdditions",
    "params": {
    "nodes": [
        "192.168.1.11",
        "192.168.1.12",
        "192.168.1.13",
        "192.168.1.14"
    ]
},
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
    "result": {
        "proposedClusterValid": true,
        "proposedClusterErrors": [ ]
}
```

New since version

11.0

CreateClusterSupportBundle

You can use the <code>CreateClusterSupportBundle</code> on the management node to gather support bundles from all nodes in a cluster. The individual node support bundles are compressed as tar.gz files. The cluster support bundle is a tar file containing the node support bundles. You can only run this method on a management node; it does not work when run on a storage node.

Parameters

You must call this method against the management node. For example:

```
https://<management node IP>:442/json-rpc/10.0
```

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------|---|--------------|---------------|----------|
| allowIncomplete | Allows the script to continue to run if bundles cannot be gathered from one or more of the nodes. | boolean | None | No |
| bundleName | Unique name for each support bundle created. If no name is provided, then "supportbundle" and the node name are used as the file name | string | None | No |
| mvip | The MVIP of the cluster. Bundles are gathered from all nodes in the cluster. This parameter is required if the nodes parameter is not specified. | string | None | Yes |
| nodes | The IP addresses of the nodes from which to gather bundles. Use either nodes or mvip, but not both, to specify the nodes from which to gather bundles. This parameter is required if mvip is not specified. | string array | None | Yes |
| password | The cluster admin password. Note: This password is visible as text when entered. | string | None | Yes |
| username | The cluster admin user name. | string | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
"id":1,
  "result":{
   "details":{
      "bundleName": "clusterbundle",
      "extraArgs":"",
      "files":[
          "/tmp/supportbundles/clusterbundle.cl-4SD5.tar"
      "output":"timeout -s KILL 1790s
/usr/local/bin/sfclustersupportbundle --quiet --name=\"clusterbundle\"
--target-directory=\"/tmp/solidfire-dtemp.MM7f0m\" --user=\"admin\"
--pass=\"admin\" --mvip=132.119.120.100"
       },
       "duration": "00:00:24.938127",
       "result": "Passed"
    }
}
```

9.6

CreateSupportBundle

You can use CreateSupportBundle to create a support bundle file under the node's directory. After creation, the bundle is stored on the node as a tar file (gz compression option is available via the extraArgs parameter.)

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|---|---------|---------------|----------|
| bundleName | Unique name for the support bundle. If no name is provided, then "supportbundle" and the node name are used as the file name. | string | None | No |
| extraArgs | Use 'compress gz' to create the support bundle as a tar.gz file. | string | None | No |
| timeoutSec | The number of seconds the support bundle script runs. | integer | 1500 | No |

Return values

This method has the following return values:

| Name Description | | Name | Description | Type |
|------------------|--|------|-------------|------|
|------------------|--|------|-------------|------|

| details | The details of the support bundle. Possible values: • bundleName: The name specified in the CreateSupportBundleAPI method. If no name was specified, "supportbundle" is used. • extraArgs: The arguments passed with this method. • files: A list of the support bundle files that the system created. • output: The command line output from the script that created the support bundle. • timeoutSec: The number of seconds the support bundle script runs before stopping. • url: URL to the support bundle created. | JSON object |
|----------|---|-------------|
| duration | The time used to create the support bundle in the format: HH:MM:SS.ssssss. | string |
| result | The success or failure of the support bundle operation. | string |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateSupportBundle",
"params": {
    "extraArgs": "--compress gz"
    },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
"id": 1,
"result": {
  "details": {
    "bundleName": "supportbundle",
    "extraArgs": "--compress gz",
    "files": [
         "supportbundle.nodehostname.tar.gz"
     ],
     "output": "timeout -s KILL 1500s /sf/scripts/sfsupportbundle --quiet
--compress gz /tmp/solidfire-dtemp.1L6bdX/supportbundle<br><br>>Moved
'/tmp/solidfire-dtemp.1L6bdX/supportbundle.nodehostname.tar.gz' to
/tmp/supportbundles",
      "timeoutSec": 1500,
      "url": [
"https://nodeIP:442/config/supportbundles/supportbundle.nodehostname.tar.q
z ''
     ]
    },
    "duration": "00:00:43.101627",
    "result": "Passed"
 }
}
```

9.6

DeleteAllSupportBundles

You can use the DeleteAllSupportBundles method to delete all support bundles generated with the CreateSupportBundle API method.

Parameters

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteAllSupportBundles",
    "params": {}
},
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
}
```

9.6

DisableMaintenanceMode

You can use the <code>DisableMaintenanceMode</code> method to take a storage node out of maintenance mode. You should only disable maintenance mode after you have completed maintenance and the node is online.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|---|---------------|---------------|----------|
| nodes | List of storage node IDs to take out of maintenance mode. | integer array | None | Yes |

Return values

This method has the following return values:

| Name Description Type | |
|-----------------------|--|
|-----------------------|--|

| asyncHandle | You can use the GetAsyncResult method to retrieve this asyncHandle and determine when the maintenance mode transition is complete. | integer |
|-------------|--|--------------------------|
| currentMode | The current maintenance mode state of the node. Possible values: Disabled: No maintenance has been requested. FailedToRecover: The node failed to recover from maintenance mode. Unexpected: The node was found to be offline, but was in the Disabled mode. RecoveringFromMaintenance: The node is in the process of recovering from maintenance mode. PreparingForMaintenance: Actions are being taken to prepare a node to have maintenance performed. ReadyForMaintenance: The | MaintenanceMode (string) |
| | node is ready for maintenance to be performed. | |

requestedMode

The requested maintenance mode state of the node. Possible values:

- MaintenanceMode (string)
- Disabled: No maintenance has been requested.
- FailedToRecover: The node failed to recover from maintenance mode.
- Unexpected: The node was found to be offline, but was in the Disabled mode.
- RecoveringFromMaintenance: The node is in the process of recovering from maintenance mode.
- PreparingForMaintenance: Actions are being taken to prepare a node to have maintenance performed.
- ReadyForMaintenance: The node is ready for maintenance to be performed.

Request example

Requests for this method are similar to the following example:

```
{
  "method": "DisableMaintenanceMode",
  "params": {
     "nodes": [6]
  },
  "id": 1
}
```

Response example

This method returns a response similar to the following example:

12.2

NetApp HCI storage maintenance mode concepts

DisableSsh

You can use the DisableSsh method to disable the SSH service for a single storage node. This method does not affect the cluster-wide SSH service timeout duration.

Parameter

This method has no input parameter.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|---------|
| enabled | The status of the SSH service for this node. | boolean |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "DisableSsh",
   "params": {
      },
   "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {"enabled": false}
}
```

EnableMaintenanceMode

You can use the EnableMaintenanceMode method to prepare a storage node for maintenance. Maintenance scenarios include any task that requires the node to be powered off or restarted.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------------|--|---------------|---------------|----------|
| forceWithUnresolve dFaults | Force maintenance mode to be enabled for this node even with blocking cluster faults present. | boolean | False | No |
| nodes | The list of node IDs to put in maintenance mode. Only one node at a time is supported. | integer array | None | Yes |
| perMinutePrimaryS wapLimit | The number of primary slices to swap per minute. If not specified, all primary slices will be swapped at once. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|---------|--|--------|---------------|----------|
| timeout | Specifies how long maintenance mode should remain enabled before it is automatically disabled. Formatted as a time string (for example, HH:mm:ss). If not specified, maintenance mode will remain enabled until explicitly disabled. | string | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|--|--------------------------|
| asyncHandle | You can use the GetAsyncResult method to retrieve this asyncHandle and determine when the maintenance mode transition is complete. | integer |
| currentMode | The current maintenance mode state of the node. Possible values: Disabled: No maintenance has been requested. FailedToRecover: The node failed to recover from maintenance mode. RecoveringFromMaintenance: The node is in the process of recovering from maintenance mode. PreparingForMaintenance: Actions are being taken to prepare a node to have maintenance performed. ReadyForMaintenance: The node is ready for maintenance to be performed. | MaintenanceMode (string) |

requestedMode The requested maintenance mode MaintenanceMode (string) state of the node. Possible values: • Disabled: No maintenance has been requested. • FailedToRecover: The node failed to recover from maintenance mode. • RecoveringFromMaintenance: The node is in the process of recovering from maintenance mode. • PreparingForMaintenance: Actions are being taken to prepare a node to have maintenance performed. • ReadyForMaintenance: The node is ready for maintenance

to be performed.

Request example

Requests for this method are similar to the following example:

```
"method": "EnableMaintenanceMode",
"params": {
    "forceWithUnresolvedFaults": False,
    "nodes": [6],
    "perMinutePrimarySwapLimit" : 40,
    "timeout" : "01:00:05"
    },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

12.2

NetApp HCI storage maintenance mode concepts

EnableSsh

You can use the EnableSsh method to enable the Secure Shell (SSH) service for a single node. This method does not affect the cluster-wide SSH timeout duration, and does not exempt the node from having SSH disabled by the global SSH timeout.

Parameter

This method has no input parameter.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|---------|
| enabled | The status of the SSH service for this node. | boolean |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "EnableSsh",
   "params": {
      },
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {"enabled": true}
}
```

GetClusterConfig

You can use the GetClusterConfig API method to return information about the cluster configuration the node uses to communicate with its cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|---------|
| | Cluster configuration information the node uses to communicate with the cluster. | cluster |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterConfig",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "cluster": {
      "cipi": "Bond10G",
      "cluster": "ClusterName",
      "ensemble": [
        "1:10.30.65.139",
        "2:10.30.65.140",
        "3:10.30.65.141"
      ],
      "fipsDriveConfiguration": true,
      "mipi": "Bond1G",
      "name": "xxx-en142",
      "nodeID": 4,
      "pendingNodeID": 0,
      "role": "Storage",
      "sipi": "Bond10G",
      "state": "Active",
      "version": "9.1.0"
  }
}
```

New since version

9.6

GetClusterState

You can use the GetClusterState API method to indicate if a node is part of a cluster or not.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|--|--------|
| cluster | Name of the cluster. | string |
| state | Available: Node has not been configured with a cluster name. | string |
| | Pending: Node is pending for a specific named cluster and can be added. | |
| | Active: Node is an active member of a cluster and may not be added to another cluster. | |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterState",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
"result" :
    "cluster" : "Cluster101"
    "state" : "Active"
}
```

New since version

9.6

GetConfig

You can use the GetConfig API method to get all configuration information for a node. This API method includes the same information available in both the GetClusterConfig and GetNetworkConfig API methods.

Parameters

This method has no input parameters.

Return values

This method has the following return value:

| Name | Description | Туре |
|--------|--|-------------|
| config | The configuration details of the cluster. This object contains: | JSON object |
| | cluster: Cluster information that identifies how the storage node communicates with the storage cluster it is associated with. | |
| | network (all interfaces): Network connection types and current settings for each network interface of the node. | |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetConfig",
   "params": {},
   "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

GetDriveConfig

You can use the GetDriveConfig method to get drive information for expected slice

and block drive counts as well as the number of slices and block drives that are currently connected to the node.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|---|-------|
| driveConfig | Information on the drives that are connected to the node. | drive |

Request example

Requests for this method are similar to the following example:

```
"method": "GetDriveConfig",
   "params": {},
   "id" : 1
}
```

Response example

Responses for this method are similar to the following example. Due to length, the response contains information for one drive of one storage node only.

```
{
    "id": 1,
    "result": {
            "driveConfig": {
                     "drives": [
                         {
                             "canonicalName": "sda",
                             "connected": true,
                             "dev": 2052,

                     "numTotalExpected": 11
            }
    }
}
```

GetHardwareConfig

You can use the <code>GetHardwareConfig</code> method to get the hardware configuration information for a node. This configuration data is intended for internal use. To get a more useful live system hardware component inventory, use the <code>GetHardwareInfo</code> method instead.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------|--|-------------|
| hardwareConfig | List of hardware information and current settings. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "GetHardwareConfig",
   "params": {},
   "id" : 1
}
```

9.6

GetHardwareInfo

You can use the GetHardwareInfo method to get live hardware information and status for a single node. Hardware information generally includes manufacturers, vendors, versions, drives, and other associated identification information.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| force | Set this "force" parameter to true to run on all nodes in the cluster. | boolean | false | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------|------------------------------------|--------------|
| hardwareInfo | Hardware information for the node. | hardwareInfo |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "GetHardwareInfo",
    "params": {
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```

9.6

GetIpmiConfig

You can use the <code>GetIpmiConfig</code> method to retrieve hardware sensor information from sensors that are in your node.

Parameter

This method has the following input parameter:

| Name | Description | Туре |
|-------------|--|--------|
| chassisType | Used to display information for each node chassis type. Possible values: | string |
| | all: returns sensor information for each chassis type. | |
| | {chassis type}: returns sensor information for a specified chassis type. | |

Return values

This method has the following return values:

| Name | Description | Туре |
|----------------|---|--------|
| sensorName | Name of the sensor that has been found. | string |
| uniqueSensorID | Unique identifier for the sensor. | string |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "GetIpmiConfig",
  "params": {

Getlpmilnfo

You can use the GetIpmiInfo method to display a detailed reporting of sensors

(objects) for node fans, intake and exhaust temperatures, and power supplies that are monitored by the system.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|-------------------|
| sensors | Detailed information from each sensor within a node. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "GetIpmiInfo",
  "params": {},
  "id" : 1
}
```

Response example

Due to the length of the returned response for this API method, portions of the response have been intentionally eliminated from this document. What is included are the portions of the hardware information that the system monitors in order to ensure the node is running at optimum performance.

GetNetworkConfig

You can use the GetNetworkConfig method to display the network configuration information for a node.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|---|--------------------------|
| network | Network connection types and current settings for each network interface of the node. | network (all interfaces) |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetNetworkConfig",
   "params": {},
   "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

Find more information

GetNetworkConfig

GetNetworkInterface

You can use the GetNetworkInterface method to get information about a network interface on a node.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------|---|---------|---------------|----------|
| interface | The name of the interface to get information about for each node. Possible values: • Bond1G • Bond10G | string | None | No |
| force | Set this parameter to true to run on all nodes in the cluster. | boolean | false | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|---|-------------------|
| nodes | An array of objects describing the interface for each storage node in the storage cluster. Each object within the array contains the following items: | JSON object array |
| | nodeID: (integer) The ID of the storage node in the storage cluster the interface information applies to. | |
| | result: (networkInterface) Interface configuration information for this storage node. | |

Requests for this method are similar to the following example:

```
"method": "GetNetworkInterface",
"params": {
    "interface": "Bond1G",
    "force": true
    },
"id": 1
}
```

Response example

```
"name": "Bond1G",
            "namespace": false,
            "netmask": "255.255.240.0",
            "status": "UpAndRunning",
            "type": "BondMaster",
            "virtualNetworkTag": 0
        }
    }
},
    "nodeID": 2,
    "result": {

                         "type": "BondMaster",
                         "virtualNetworkTag": 0
                     }
            }
        ]
}
```

9.6

${\bf GetNodeActiveTlsCiphers}$

You can use the GetNodeActiveTlsCiphers method on a single node to get a list of the TLS ciphers that are currently accepted on this node. You can use this method on management and storage nodes.

Parameter

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|---------------------|--|--------|
| mandatoryCiphers | List of mandatory TLS cipher suites for the node. These are ciphers which are always active on the node. | string |
| supplementalCiphers | List of supplemental TLS cipher suites for the node. | string |

Requests for this method are similar to the following example:

```
{
  "method": "GetNodeActiveTlsCiphers",
  "params": {},
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
      "id" : 1,
      "result" : {
        "mandatoryCiphers": [
            "DHE-RSA-AES256-SHA256",
            "DHE-RSA-AES256-GCM-SHA384",
            "ECDHE-RSA-AES256-SHA384",
            "ECDHE-RSA-AES256-GCM-SHA384"
        ],
        "supplementalCiphers": [
            "DHE-RSA-AES128-SHA256",
            "DHE-RSA-AES128-GCM-SHA256",
            "ECDHE-RSA-AES128-SHA256",
            "ECDHE-RSA-AES128-GCM-SHA256"
        ]
    }
}
```

${\bf GetNodeFipsDrivesReport}$

You can use the GetNodeFipsDrivesReport method to check the FIPS 140-2 drive encryption capability status of a single node in the storage cluster. You must run this method against an individual storage node.

Parameter

This method has no input parameter.

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|--|--------|
| fipsDrives | A JSON object containing the status of FIPS 140-2 feature support for this node. Possible values: | string |
| | None: Node is not FIPS capable. | |
| | Partial: Node is FIPS capable but not all drives in the node are FIPS drives. | |
| | Ready: Node is FIPS capable and all drives in the node are FIPS drives (or no drives are present). | |

Requests for this method are similar to the following example:

```
{
   "method": "GetNodeFipsDrivesReport",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "fipsDrives": "None"
    }
}
```

New since version

11.5

GetNodeSSLCertificate

You can use the GetNodeSSLCertificate method to retrieve the SSL certificate that is currently active on the management node.

Parameters

You must call this method against the management node. For example:

```
https://<management node IP>:442/json-rpc/10.0
```

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|---|-------------|
| certificate | The full PEM-encoded text of the certificate. | string |
| details | The decoded information of the certificate. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method" : "GetNodeSSLCertificate",
    "params" : {},
    "id" : 1
}
```

Response example

```

${\bf GetNode Supported TIs Ciphers}$

You can use the GetNodeSupportedTlsCiphers method on a single node to get a list of the TLS ciphers that are currently supported on this node. You can use this method on management and storage nodes.

Parameter

}

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|------------------------------|---|--------|
| mandatoryCiphers | List of mandatory TLS cipher suites for the node. These are ciphers which are always active on the node. | string |
| defaultSupplementalCiphers | List of default supplemental TLS cipher suites for the node. The supplemental ciphers are restored to this list when you run the ResetNodeSupplementalTlsCipher s API method. | string |
| supportedSupplementalCiphers | List of available supplemental TLS cipher suites which you can configure with the SetNodeSupplementalTlsCiphers API method. | string |

Request example

Requests for this method are similar to the following example:

```
"method": "GetNodeSupportedTlsCiphers",
   "params": {},
   "id" : 1
}
```

Response example

```
{
  "id" : 1,
  "result" : {
    "defaultSupplementalCiphers": [
        "DHE-RSA-AES128-SHA256",
        "DHE-RSA-AES128-GCM-SHA256",
        "ECDHE-RSA-AES128-SHA256",
        "ECDHE-RSA-AES128-GCM-SHA256"
    ],
    "mandatoryCiphers": [
        "DHE-RSA-AES256-SHA256",
        "DHE-RSA-AES256-GCM-SHA384",
        "ECDHE-RSA-AES256-SHA384",
        "ECDHE-RSA-AES256-GCM-SHA384"
    ],
    "supportedSupplementalCiphers": [
        "DHE-RSA-AES128-SHA256",
        "DHE-RSA-AES128-GCM-SHA256",
        "ECDHE-RSA-AES128-SHA256",
        "ECDHE-RSA-AES128-GCM-SHA256",
        "DHE-RSA-AES256-SHA",
        "ECDHE-RSA-AES256-SHA",
        "DHE-RSA-CAMELLIA256-SHA",
        "DHE-RSA-AES128-SHA",
        "ECDHE-RSA-AES128-SHA",
        "DHE-RSA-CAMELLIA128-SHA"
    ]
}
```

GetPatchInfo

You can use the GetPatchInfo method to get information about Element software patches installed on a storage node.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| force | Force the method to run on all nodes in the storage cluster. You only need this when you issue the API to a cluster IP address instead of a single node. Possible values: true false | boolean | false | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|------|---|-------------|
| · · | Object containing information about the patches installed on this node. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "GetPatchInfo",
    "params": {
        "force": false,
        },
        "id": 1
}
```

Response example

```
{
    "id": 1,
    "result": {
        "patches": {
          "SUST936": {
          "date": "Wed 09 Dec 2020 10:41:59 PM UTC",
          "description": "BMC fixes",
          "newFiles": [
              "None"
          ],
          "patchedFiles": [
               "Patched file 1.bin",
              "Patched file 2.dat",
              "Patched file 3.tgz"
          ]
          }
        }
    }
}
```

12.3

GetPendingOperation

You can use the <code>GetPendingOperation</code> method to detect an operation on a node that is currently in progress. This method can also be used to report back when an operation has completed.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|-----------|---|---------|
| pending | Possible values:true: The operation is still in progress.false:The operation is no longer in progress. | boolean |
| operation | Name of operation that is in progress or has completed. | string |

Requests for this method are similar to the following example:

```
"method": "GetPendingOperation",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
  "result" : {
     "pendingOperation" : {
         "pending" : "true",
         "operation" : "TestDrivesInternal",
     }
}
```

New since version

9.6

GetSshInfo

You can use the GetSshInfo method to query the status of the SSH service on a single node.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--|---------|
| result | The status of the SSH service for this node. | boolean |

Request example

Requests for this method are similar to the following example:

```
{
    "method" : "GetSshInfo",
    "params" : {},
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "enabled": false
    }
}
```

ListDriveHardware

You can use the ListDriveHardware method to list all the drives connected to a node. When used on individual nodes, this method returns drive hardware information. When used on the cluster master node MVIP, this method returns information for all drives on all nodes.

Parameters

The "securitySupported": true line of the method response does not imply that the drives are capable of encryption; only that the security status can be queried. If you have a node type with a model number ending in "-NE", commands to enable security features on these drives will fail.

This method has the following parameter:

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| force | Set to true to run this method on all nodes. | boolean | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------|---|-------------------|
| driveHardware | Returned drive hardware information for the node. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
{
"method": "ListDriveHardware",
"params": {},
"id" : 1
}
```

Response example

```
{
 "id": 1,
  "result": {
    "driveHardware": [
        "canonicalName": "sda",
        "connected": true,
        "dev": 2048,
        "devPath": "/dev/slot0",
        "driveEncryptionCapability": "fips",
        "driveType": "Slice",
        "lifeRemainingPercent": 98,
        "lifetimeReadBytes": 0,
        "lifetimeWriteBytes": 14012129542144,
        "name": "scsi-SATA SAMSUNG MZ7GE24S1M9NWAG501251",
        "path": "/dev/sda",

EnableEncryptionAtRest

ListNetworkInterfaces

You can use the ListNetworkInterfaces method to list information about each network interface on a node. This API method is intended for use on individual nodes; user ID and password authentication is required for access to individual nodes. However, you can use this method on the cluster if the parameter force is given the value true in the method call. When the parameter is used on the cluster, all interfaces are listed.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|---|---------|---------------|----------|
| force | true: Information about all network interfaces in the cluster is returned. false: No information is returned. | boolean | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------|--|------------------------|
| interfaces | A list of configuration information for each network interface of the storage node (or entire storage cluster, if force = true). | networkInterface array |

Request example

Requests for this method are similar to the following example:

```
{
"method": "ListNetworkInterfaces",
"params": {},
"id" : 1
}
```

Response example

```
{
    "id": 1,
   "result": {
        "nodes": [
            {
                "nodeID": 1,
                "result": {
                    "interfaces": [
                             "address": "10.117.80.32",
                             "addressV6": "::",
                             "broadcast": "10.117.95.255",

                     ]
                }
            }
        ]
    }
}
```

9.6

ListNetworkInterfaceStats

You can use the ListNetworkInterfaceStats method to list statistics such as the number of dropped packets and various types of errors for each network interface on a node. This API method is intended for use on individual nodes; user ID and password authentication is required for access to individual nodes. However, you can use this method on the cluster if the parameter force is given the value true in the method call. When the parameter is used on the cluster, network statistics for all interfaces are listed.

Parameter

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------------------|--|-----------------------------|
| networkInterfaceStats | A list of network statistics information, such as the number of dropped packets and various types of network errors, for each network interface of a storage node. | networkInterfaceStats array |

Request example

Requests for this method are similar to the following example:

```
{
"method": "ListNetworkInterfaceStats",
"params": {},
"id" : 1
}
```

Response example

```
{
    "networkInterfaceStats": [
            "rxErrors": 1,
            "rxPackets": 1,
            "txErrors": 1,
            "rxDropped": 1,
            "txCarrierErrors": 1,
            "rxOverErrors": 1,
            "rxMissedErrors": 1,
            "txPackets": 1,
            "name": "if_name",
            "rxLengthErrors": 1,
            "collisions": 1,
            "rxFifoErrors": 1,
            "txBytes": 1,
            "rxBytes": 1,
            "rxFrameErrors": 1,
            "rxCrcErrors": 1,
            "txFifoErrors": 1
    ]
}
```

12.3

ListTests

You can use the ListTests method to list the tests that are available to run on a node.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|--|--------------|
| tests | List of tests that can be performed on the node. | string array |

Requests for this method are similar to the following example:

```
{
   "method": "ListTests",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
 "result": {
   "tests": [
             "TestConnectEnsemble",
             "TestConnectMvip",
             "TestConnectSvip",
             "TestDrives",
             "TestHardwareConfig",
             "TestLocateCluster",
             "TestPing",
             "TestLocalConnectivity",
             "TestRemoteConnectivity",
             "TestNetworkConfig"
           ]
      }
}
```

New since version

9.6

ListUtilities

You can use the ListUtilities method to list the operations that are available to run on a node.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|---|--------------|
| utilities | List of utilities currently available to run on the node. | string array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListUtilities",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "utilities": [
        "ResetDrives",
        "ResetNode",
        "RestartNetworking",
        "RestartServices",
        "CreateSupportBundle",
        "DeleteAllSupportBundles",
        "CreateClusterSupportBundle"
    ]
}
```

New since version

9.6

RemoveNodeSSLCertificate

You can use the RemoveNodeSSLCertificate method to remove the user SSL certificate and private key for the management node. After the certificate and private key

are removed, the management node is configured to use the default certificate and private key.

Parameters

You must call this method against the management node. For example:

```
https://<management node IP>:442/json-rpc/10.0
```

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method" : "RemoveNodeSSLCertificate",
    "params" : {},
    "id" : 3
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id" : 3,
    "result" : {}
}
```

ResetDrives

You can use the ResetDrives method to proactively initialize drives and remove all data currently residing on a drive. The drive can then be reused in an existing node or used in an upgraded node.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------|---|---------|---------------|----------|
| drives | List of device names (not driveIDs) to reset. | string | None | Yes |
| force | Set to true to reset the drive. | boolean | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|---|-------------------|
| details | Details of drives that are being reset. | JSON object array |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "ResetDrives",
    "params": {
        "drives" : "slot3",
        "force" : true
},
    "id" : 1
}
```

Response example

```
{
 "id": 1,
 "result": {
  "details": {
   "drives": [
     "drive": "slot3",
     "returnCode": 0,
     "stderr": " * Unlocking /dev/slot9 .[ ok ] \ * Setting master
password /dev/slot9 .[ ok ]\ * Secure erasing /dev/slot9 (hdparm)
[tries=0/1] .....[ ok ]",
     "stdout": ""
   }
  ]
 },
 "duration": "00:00:28.501269",
 "result": "Passed"
  }
}
```

9.6

ResetNode

You can use the ResetNode method to reset a node to the factory settings. All data, packages (software upgrades, etc), configurations, and log files are deleted from the node when you call this method. However, network settings for the node are preserved during this operation. Nodes that are participating in a cluster cannot be reset to the factory settings.

Parameters

The ResetNode API can only be used on nodes that are in an "Available" state. It cannot be used on nodes that are "Active" in a cluster, or in a "Pending" state.

CAUTION:

This method clears any customer data that is on the node.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|-------------|---------------|----------|
| build | Used to specify the URL to a remote Element software image to which the node will be reset. | URL | None | No |
| force | Set to true to reset the node. | boolean | None | Yes |
| options | Used to enter specifications for running the reset operations. Details are be provided by NetApp Support, if required. | JSON object | None | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

Response example

```
"id": null,
"result": {
    "rtfiInfo": {
        "build": "file:///sf/rtfi/image/filesystem.squashfs",
        "generation": "9",

9.6

ResetNodeSupplementalTlsCiphers

You can use the ResetNodeSupplementalTlsCiphers method to restore the list of supplemental TLS ciphers to the default. You can use this command on management nodes.

Parameter

You must call this method against the management node. For example:

```
https://<management node IP>:442/json-rpc/10.0
```

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "ResetNodeSupplementalTlsCiphers",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

RestartNetworking

You can use the RestartNetworking method to restart the networking services on a node.

CAUTION:

This method restarts all networking services on a node, causing temporary loss of networking connectivity.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|---|---------|---------------|----------|
| force | Set to true to restart networking services on a node. | boolean | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{ "id" : 1,
   "result" : {}
}
```

New since version

9.6

RestartServices

You can use the RestartServices method to restart the services on a node.

Parameters

CAUTION:

This method causes temporary node services interruption.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|---------|---------------|----------|
| force | Set to true to restart services on a node. | boolean | None | Yes |
| service | Service name to be restarted. | string | None | No |
| action | Action to perform on the service (start, stop, restart). | string | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|----------|---|-------------|
| details | The output of the service restart procedure, including errors (if any). | JSON object |
| duration | The time, in seconds, it took to restart services to the node. | string |
| result | Results of the restart. | string |

Request example

Requests for this method are similar to the following example:

Response example

```
"id": 1,
   "result": {
     "details": "solidfire stop/waiting\nsolidfire start/running, process
7284\n",
     "duration": "00:00:02.541594",
     "result": "Passed"
}
```

9.6

SetClusterConfig

You can use the SetClusterConfig method to set the configuration that a node uses to communicate with the cluster it is associated with. To display the current cluster interface settings for a node, run the GetClusterConfig API method.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|---|---------|---------------|----------|
| cluster | Configuration attributes that should be changed during this method call. Only the fields you want changed need to be added to this method as members in this parameter. | cluster | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|---------|
| cluster | Configuration information the node uses to communicate with the cluster. | cluster |

Requests for this method are similar to the following example:

```
"method": "SetClusterConfig",
    "params": {
        "cluster": {
            "name": "myhost",
            "mipi": "Bond10G"
        },
        "id" : 1
      }
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id" : 1,
   "result" : {
      "cluster" : {
         "cipi" : "Bond10G",
         "cluster" : "QoS",
         "ensemble" : [
            "1:10.10.5.42",
            "2:10.10.5.43",
            "3:10.10.5.44",
            "4:10.10.5.46",
            "5:10.10.5.47"
          "hostname" : "myhost",
          "mipi" : "Bond10G",
          "nodeID" : 1,
          "sipi" : "Bond10G",
          "state" : "Active"
   }
}
```

New since version

9.6

SetConfig

You can use the <code>SetConfig</code> method to set the network and cluster information for the node. This method includes the same settings in a single API method that are available using both <code>SetClusterConfig</code> and <code>SetNetworkConfig</code> methods. Only the fields you want changed need to be included with this method.

Parameter

CAUTION:

Changing the bond-mode on a node can cause a temporary loss of network connectivity.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|--------------------------|---------------|----------|
| cluster | Cluster information that identifies how the storage node communicates with the storage cluster it is associated with. | cluster | None | No |
| network | Network connection types and current settings for each network interface of the node. | network (all interfaces) | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--|-------------|
| config | The new and current configuration for the node. This object contains: | JSON object |
| | cluster: Cluster information that identifies how the storage node communicates with the storage cluster it is associated with. | |
| | network (all interfaces): Network connection types and current settings for each network interface of the node. | |

Requests for this method are similar to the following example:

Response example

The response from this method is the same as the return for the GetConfig method. All fields for the object display and updated values are seen when SetConfig is used.

New since version

9.6

- SetNetworkConfig
- GetConfig

SetNetworkConfig

You can use the SetNetworkConfig method to set the network configuration for a node. To display the current network settings for a node, run the GetNetworkConfig API method.

Parameter

CAUTION:

Changing the bond-mode on a node can cause a temporary loss of network connectivity.

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|--|--------------------------|---------------|----------|
| network | An object containing node network settings to modify. You only need to add the fields you want changed to this method as attributes in this parameter. | network (all interfaces) | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|---|--------------------------|
| network | The new and current network configuration for the node. | network (all interfaces) |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "SetNetworkConfig",
        "params": {
            "network": {
                 "Bond10G": {
                     "bond-mode": "ALB"
                 },
                 "Bond1G": {
                     "netmask": "255.255.224.0"
                 },
                 "eth0": {
                     "method": "bond"
                 },
                 "lo": {
                     "method": "loopback"
            }
        }
}
```

Response example

The response from this method is the same as the response from the GetNetworkConfig method. The method

displays all members for each object and includes the new values for any changed members.

New since version

9.6

- GetNetworkConfig
- GetNetworkConfig

SetNodeSSLCertificate

You can use the SetNodeSSLCertificate method to set a user SSL certificate and private key for the management node.

After using the API, you must reboot the management node.

Parameters

You must call this method against the management node. For example:

https://<management node IP>:442/json-rpc/10.0

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|--------|---------------|----------|
| certificate | The PEM-encoded text version of the certificate. Note: When setting a node or cluster certificate, the certificate must include the extendedKeyUsage extension for serverAuth. This extension allows the certificate to be used without error on common operating systems and browsers. If the extension is not present, the API will reject the certificate as invalid. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------|--|--------|---------------|----------|
| privateKey | The PEM-encoded text version of the private key. | string | None | Yes |

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
},
"id" : 2
```

Response example

}

This method returns a response similar to the following example:

```
{
    "id" : 2,
    "result" : {}
}
```

SetNodeSupplementalTIsCiphers

You can use the SetNodeSupplementalTlsCiphers method to specify the list of supplemental TLS ciphers. You can use this command on management nodes.

Parameter

You must call this method against the management node. For example:

```
https://<management node IP>:442/json-rpc/10.0
```

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------------------|---|--------|---------------|----------|
| supplementalCipher s | The supplemental cipher suite names using the OpenSSL naming scheme. Use of cipher suite names is case-insensitive. | string | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|---------------------|--|--------|
| mandatoryCiphers | List of mandatory TLS cipher suites for the node. These are ciphers which are always active on the node. | string |
| supplementalCiphers | List of supplemental TLS cipher suites for the node. | string |

Request example

Requests for this method are similar to the following example:

```
"method": "SetNodeSupplementalTlsCiphers",
"params": {
    "supplementalCiphers": [
        "DHE-RSA-AES128-SHA256",
        "DHE-RSA-AES128-GCM-SHA256",
        "ECDHE-RSA-AES128-SHA256",
        "ECDHE-RSA-AES128-GCM-SHA256"
    ]
},
"id": 1
}
```

Response example

```
{
  "id" : 1,
  "result" : {
        "mandatoryCiphers": [
            "DHE-RSA-AES256-SHA256",
            "DHE-RSA-AES256-GCM-SHA384",
            "ECDHE-RSA-AES256-SHA384",
            "ECDHE-RSA-AES256-GCM-SHA384"
        ],
        "supplementalCiphers": [
            "DHE-RSA-AES128-SHA256",
            "DHE-RSA-AES128-GCM-SHA256",
            "ECDHE-RSA-AES128-SHA256",
            "ECDHE-RSA-AES128-GCM-SHA256"
        ]
    }
}
```

Shutdown

You can use the Shutdown method to restart or shutdown the nodes in a cluster. You can shut down a single node, multiple nodes, or all of the nodes in the cluster using this method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------|--|---------------|---------------|----------|
| nodes | List of NodelDs for the nodes to be restarted or shut down. | integer array | None | Yes |
| option | Action to take for the cluster. Possible values: * restart: Restarts the cluster. * halt: Performs a full power-off. | string | restart | No |

Return value

This method has no return value. == Request example Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

New since version

9.6

TestConnectEnsemble

You can use the TestConnectEnsemble method to verify connectivity with a specified database ensemble. By default it uses the ensemble for the cluster the node is associated with. Alternatively you can provide a different ensemble to test connectivity.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|--------|---------------|----------|
| ensemble | A comma-separated list of ensemble node cluster IP addresses for connectivity testing. | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------|--|-------------|
| details | Objects returned: nodes: (object) A list of each ensemble node in the test and the results of the tests. duration: (string) The time required to run the test. result: (string) The results of the entire test. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "TestConnectEnsemble",
   "params": {},
   "id": 1
}
```

Response example

```
{
   "id": 1,
   "result": {
      "details": {
         "nodes": {
            "1:10.10.20.70": "Passed",
            "2:10.10.20.71": "Passed",
            "3:10.10.20.72": "Passed",
            "4:10.10.20.73": "Passed",
            "5:10.10.20.74": "Passed"
        }
      },
        "duration": "00:00:00:756072",
        "result": "Passed"
  }
}
```

9.6

TestConnectMvip

You can use the TestConnectMvip method to test the management connection to the storage cluster. The test pings the MVIP and executes a simple API method to verify connectivity.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------|---|--------|---------------|----------|
| mvip | You can pass this value to test the management connection of a different MVIP. You do not need to use this value when testing the connection to the target cluster. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|---|-------------|
| details | Information about the test operation (JSON object): | JSON object |
| | connected: Indicates if the test could connect to the MVIP (boolean) | |
| | mvip: The MVIP tested against (string) | |
| | pingBytes: Details of the ping tests with 56 bytes and 1500 bytes (object) | |
| | ° 56: Results of the 56 Byte ping test (JSON object): | |
| | individualRespons eTimes: List of response times from each ensemble node (string array) | |
| | individualStatus: List of ping status from each ensemble node (boolean array) | |
| | responseTime: Average ping response time (string) | |
| | successful: Indicates if the ping test was successful (boolean) | |
| | ° 1500: Results of the 1500 byte ping test (JSON object): | |
| | individualRespons eTimes: List of response times from each ensemble node (string array) | |
| | individualStatus: List of ping status from each ensemble node (boolean array) | |
| | <pre>responseTime: Average ping response time (string)</pre> | |
| | successful: Whether the ping test was successful (boolean) | |
| | duration: Length of time required to run the test | |

Request example

Requests for this method are similar to the following expende of the test

```
as a whole (string)

{
    "method": "TestConnectMvip",
    "params": {
        "mvip": "172.27.62.50"
        },
        "id":1
}
```

Response example

```
"id": 1,
"result": {
  "details": {
    "connected": true,
    "mvip": "172.27.62.50",
    "pingBytes": {
      "1500": {
        "individualResponseTimes": [
          "00:00:00.000250",
          "00:00:00.000206",
          "00:00:00.000200",
          "00:00:00.000199",
          "00:00:00.000199"
       ],
        "individualStatus": [
           true,
           true,
           true,
           true,
           true
       ],
       "responseTime": "00:00:00.000211",
       "successful": true
     },
     "56": {
        "individualResponseTimes": [
          "00:00:00.000217",
          "00:00:00.000122",
          "00:00:00.000117",
```

```
"00:00:00.000119",
            "00:00:00.000121"
         ],
         "individualStatus": [
            true,
            true,
            true,
            true,
            true
         ],
         "responseTime": "00:00:00.000139",
         "successful": true
      }
    "duration": "00:00:00.271244",
    "result": "Passed"
}
```

9.6

TestConnectSvip

You can use the TestConnectSvip method to test the storage connection to the storage cluster. The test pings the SVIP using ICMP packets, and when successful, connects as an iSCSI initiator.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------|---|--------|---------------|----------|
| svip | You can pass this value to test the management connection of a different SVIP. You do not need to use this value when testing the connection to the target cluster. | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------|---|--------|
| details | Information about the test operation (JSON object): | string |
| | connected: Indicates if the test could connect to the SVIP (boolean) | |
| | • svip: The SVIP tested against (string) | |
| | pingBytes: Details of the ping tests with 56 bytes and 9000 bytes (object) | |
| | ° 56: Results of the 56 byte ping test (JSON object): | |
| | individualRespons eTimes: List of response times from each ensemble node (string array) | |
| | individualStatus: List of ping status from each ensemble node (boolean array) | |
| | <pre>responseTime: Average ping response time (string)</pre> | |
| | successful: Indicates if the ping test was successful (boolean) | |
| | 9000: Results of the 9000 Byte ping test (JSON object): | |
| | <pre>individualRespons eTimes: List of response times from each ensemble node (string array)</pre> | |
| | individualStatus: List of ping status from each ensemble node (boolean array) | |
| | <pre>responseTime: Average ping response time (string)</pre> | |
| | successful: Indicates if the ping test was successful (boolean) | |
| | duration: Length of time | |
| 398 | required to run the test (string) | |

Request example

Requests for this method are similar to the following expende of the test

```
as a whole (string)

{
    "method": "TestConnectSvip",
    "params": {
        "svip": "172.27.62.50"
        },
        "id": 1
}
```

Response example

```
"id": 1,
"result": {
  "details": {
    "connected": true,
    "pingBytes": {
         "56": {
             "individualResponseTimes": [
                 "00:00:00.000152",
                 "00:00:00.000132",
                 "00:00:00.000119",
                 "00:00:00.000114",
                 "00:00:00.000112"
            ],
            "individualStatus": [
                true,
                true,
                true,
                true,
                true
            ],
            "responseTime": "00:00:00.000126",
            "successful": true
         },
        "9000": {
              "individualResponseTimes": [
                   "00:00:00.000295",
                   "00:00:00.000257",
                   "00:00:00.000172",
                   "00:00:00.000172",
```

```
"00:00:00.000267"
              ],
               "individualStatus": [
                   true,
                   true,
                   true,
                   true,
                   true
             ],
             "responseTime": "00:00:00.000233",
             "successful": true
           }
        },
        "svip": "172.27.62.50"
      },
      "duration": "00:00:00.421907",
      "result": "Passed"
}
```

9.6

TestDrives

You can use the TestDrives method to run a hardware validation on all drives on the node. This method detects hardware failures on the drives and reports any in the results of the validation tests.

Parameters

You can only use the TestDrives method on nodes that are not "Active" in a cluster.

This test takes approximately 10 minutes.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|---------|---------------|----------|
| force | Set to true to test the drives on the node. | boolean | None | Yes |
| minutes | Specifies the number of minutes for the test to run. | integer | 10 | No |

This method has the following return value:

| Name | Description | Туре |
|------|--|-------------|
| | Information about the test operation success or failure. | JSON object |

Request example

Requests for this method are similar to the following example:

Response example

This method returns a table containing test results for each drive in the node.

New since version

9.6

TestHardwareConfig

You can use the TestHardwareConfig method to perform hardware tests on a node. Test options include verifying hardware configurations, firmware versions, and that all drives are present.

Parameters

These test are not intended to detect hardware failures.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| clean | Starts the hardware configuration test with a clean cache. Possible values: • true: Deletes the cached test results file and reruns the tests. • false: Retrieves a cached test results. | boolean | false | No |
| force | The force parameter must be included in this method to successfully reset the node. | boolean | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|---------|---------------------------------|-------------|
| details | Hardware configuration details. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "TestHardwareConfig",
   "params": {
      "force": true
    },
   "id": 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

New since version

9.6

Find more information

TestHardwareConfig

TestLocateCluster

You can use the <code>TestLocateCluster</code> method to validate that the node can locate the cluster specified in the cluster configuration. The output validates that the cluster has been created and lists the nodes in the cluster ensemble.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|-------------|
| details | Information about the test operation success or failure. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "TestLocateCluster",
    "params": {},
    "id" : 1
}
```

Response example

```
{
   "id": 1,
   "result": {
      "details": {
         "complete": true,
         "ensemble": {
            "nodes": [
                 "IP": "10.10.5.94",
                 "nodeID": 1
               },
                 "IP": "10.10.5.107",
                 "nodeID": 2
               } ,
                 "IP": "10.10.5.108",
                 "nodeID": 3
            ]
         "version": "5.749"
      } ,
      "duration": "0.0384478sec",
      "result": "Passed"
  }
}
```

9.6

TestLocalConnectivity

You can use the TestLocalConnectivity method to ping the Cluster IP (CIP) of each node in an active cluster.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|-------------|
| | Individual ping response times for each node in the local, active cluster. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "TestLocalConnectivity",
    "params": {},
    "id": 1
}
```

Response example

Requests for this method are similar to the following example:

```
"id": null,
"result": {
   "details": {
              "10.26.86.17": {
                 individualResponseTimes: [
                       "00:00:00.006868",
                       "00:00:00.005933",
                       "00:00:00.006655",
                       "00:00:00.006584",
                       "00:00:00.006334"
                  ],
                 individualStatus: [
                        true,
                        true,

                     "00:00:00.005675",
                     "00:00:00.009904",
                     "00:00:00.006225"
                 ],
                          "individualStatus": [
                      true,
                      true,
                      true,
                      true,
                      true
```

9.6

TestNetworkConfig

You can use the TestNetworkConfig method to test that the configured network settings match the network settings being used on the system.

Parameters

When you configure a node with the SetNetworkConfig method, in the UI or TUI, the configuration is validated and stored. The TestNetworkConfig API test uses the stored configuration for post-validation logic. For example, in the event of a power outage or network failure, you can use this API method to ensure a node is running with the most currently stored network configuration. This validates that there are no errors in the configuration and that the current configuration is in use.

This test is designed to only show failures in the response output. If there are no errors, this test does not return any output. See the following response examples.

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|---|-------------|
| | Contains any errors found when validating the currently stored network settings with the running network configuration. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "TestNetworkConfig",
   "params": {},
   "id" : 1
}
```

Response example 1

If no errors are detected, then no responses are returned.

```
"id" : 1,
    "result": {
    "details": {
        "network": {...}
    },
        "duration": "00:00:00.144514",
        "result": "Passed"
    }
}
```

Response example 2

Example of an MTU Mismatch.

Response example 3

Example of a missing static route.

SetNetworkConfig

TestPing

You can use the <code>TestPing</code> method to test network connectivity to all nodes in the cluster on both 1G and 10G interfaces using ICMP packets. The test uses the appropriate MTU sizes for each packet based on the MTU settings in the network configuration. <code>TestPing</code> does not create a temporary VLAN interface.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|---|---------|---------------|----------|
| attempts | Specifies the number of times the system should repeat the test ping. | integer | 5 | No |

| Name | Description | Туре | Default value | Required |
|---------------------------|---|---------|------------------|----------|
| hosts | Specifies a comma- separated list of addresses or hostnames of devices to ping. If no hosts are specified, the method pings the hosts in the storage cluster. | string | None | No |
| interface | The existing (base) interface from which the pings should be sent. Possible values: • Bond10G: Send pings from the Bond10G interface. • Bond1G: Send pings from the Bond1G interface. | string | None | No |
| packetSize | Specifies the number of bytes to send in the ICMP packet that is sent to each IP. The number of bytes must be less than the maximum MTU specified in the network configuration. | integer | None | No |
| pingTimeoutMsec | Specifies the number of milliseconds to wait for each individual ping response. | integer | 500 milliseconds | No |
| prohibitFragmentatio n | Enables the DF (Do not Fragment) flag for the ICMP packets. | boolean | false | No |

| Name | Description | Туре | Default value | Required |
|-------------------|--|---------|---------------|----------|
| sourceAddressV4 | The source IPv4 address to use in the ICMP ping packets. | string | None | No |
| sourceAddressV6 | The source IPv6 address to use in the ICMP ping packets. | string | None | No |
| totalTimeoutSec | Specifies the time in seconds the ping should wait for a system response before issuing the next ping attempt or ending the process. | integer | 5 | No |
| virtualNetworkTag | The VLAN ID to use when sending the ping packets. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------|---|-------------|
| details | List of each IP the node was able to communicate with and ping response statistics. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "TestPing",
    "params": {
        "interface": "Bond1G",
        "hosts": "192.168.0.1"
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
 "id": 1,
  "result": {
    "details": {
      "192.168.0.1": {
        "individualResponseCodes": [
          "Success",

TestRemoteConnectivity

You can use <code>TestRemoteConnectivity</code> method to ping each node of the remote cluster and check the remote ensemble database connection. Clusters must be paired in order to return useful results with this method. If the remote database connection fails, the response from the system lists the exceptions.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|---|-------------|
| details | Individual ping response times for each node. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "TestRemoteConnectivity",
    "params": {
        "force": "true"
     },
     "id": 1
}
```

Response example

```
"00:00:00.006584",
    "00:00:00.006334"
  ],
  "individualStatus": [
    "true",
    "true",
    "true",
    "true",
    "true"
  ],
  "responseTime": "00:00:00.006475",
  "successful": true
},
"10.26.86.18": {
  "individualResponseTimes": [

Replication API methods

Replication API methods enable you to connect two clusters for continuous data protection (CDP). When you connect two clusters, active volumes within a cluster can be continuously replicated to a second cluster to provide data recovery. By pairing volumes for replication, you can protect your data from events that might render it inaccessible.

Cluster pairing order of operations

You must establish a connection between a pair of storage clusters running Element software before remote replication can be used.

Use the following set of API methods to establish a cluster connection:

StartClusterPairing:

This API method creates and returns a pairing key that is used to establish a cluster pair. The key is encoded and contains information that is used to establish communications between clusters. A single cluster can be paired with up to four other clusters. However, a new key must be generated for each cluster pairing. The StartClusterPairing method generates a new key each time the method is called. Use each unique key with the CompleteClusterPairing method to pair each additional cluster.

For security reasons, the pairing key should not be sent to other users via email. The key contains a user name and password.

CompleteClusterPairing:

This method uses the pairing key created with the StartClusterPairing API method to create a cluster pair. Issue the CompleteClusterPairing API method with the clusterPairingKey parameter to the destination. The origination cluster is the cluster that created the key.

Find more information

- StartClusterPairing
- CompleteClusterPairing

Volume pairing order of operations

You must create a cluster pair between two corresponding clusters before volumes can be paired.

Use the following set of API methods to establish a cluster connection:

StartVolumePairing:

This API method creates and returns a volume pairing key that is used to create a volume pair. The key contains information that is used to establish communications between volumes.

CompleteVolumePairing:

This method uses the pairing key created with the StartVolumePairing API method to create a volume pair. Issue the CompleteVolumePairing API method with the volumeID and volumePairingKey parameters to the destination volume.

Only one of the paired volumes can be identified as a replication target volume. Use the ModifyVolumePair API method to establish the direction of the volume's data replication by identifying which volume is the target. Data is replicated from the source volume to the target volume.

Find more information

- StartVolumePairing
- CompleteVolumePairing
- ModifyVolumePair

Supported modes of replication for paired clusters

The following modes of replication are supported on the paired clusters:

- Asynchronous replication of data: The data sent to the replication target volume is sent asynchronously. The system does not wait for an acknowledgment to be sent before writing data.
- Synchronous replication of data: The data sent to the replication target volume is sent synchronously. When the I/O operations sent from the host are acknowledged by the system, the system acknowledgment is sent back to the host and the data is sent to the replication target volume.
- Snapshots-only replication of data: Only volume snapshots are replicated to the target cluster.

CompleteClusterPairing

The CompleteClusterPairing method is the second step in the cluster pairing process. Use this method with the encoded key received from the StartClusterPairing method to complete the cluster pairing process.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------------|--|--------|---------------|----------|
| clusterPairingKey | A string of characters that is returned from the StartClusterPairing API method. | string | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|---------------|---|---------|
| clusterPairID | Unique identifier for the cluster pair. | integer |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "CompleteClusterPairing",
    "params": {
        "clusterPairingKey" :

StartVolumePairing

ListClusterPairs

You can use the ListClusterPairs method to list all clusters that are paired with the current cluster. This method returns information about active and pending cluster pairings, such as statistics about the current pairing as well as the connectivity and latency (in milliseconds) of the cluster pairing.

Parameter

This method has no input parameter:

This method has the following return value:

| Name | Description | Туре |
|--------------|--|-------------------|
| clusterPairs | Information about each paired cluster. | clusterPair array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListClusterPairs",
   "params": {
     },
   "id" : 1
}
```

Response example

```
{
"id": 1,

9.6

ListActivePairedVolumes

You can use the ListActivePairedVolumes method to list all of the active volumes paired with a volume. This method returns information about volumes with active and pending pairings.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--|------------------|
| volumes | Volume information for the paired volumes. | volumePair array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListActivePairedVolumes",
    "params": {
      },
      "id" : 1
}
```

Response example

```
{

                   }
               ]
       1
   }
}
```

9.6

ModifyVolumePair

You can use the ModifyVolumePair method to pause or restart replication between a pair of volumes. This method is set on the source volume (the volume with read/write access).

Parameters

| Name | Description | Туре | Default value | Required |
|--------------|--|---------|---------------|----------|
| volumeID | Identification number of the volume to be modified. | integer | None | Yes |
| pausedManual | Remote replication can be paused or restarted on the source (read/write) volume. Possible values: • true: Pause volume replication. • false: Restart volume replication. If no value is specified, no change in replication is performed. | boolean | None | No |

| mode | Volume replication mode. Possible values: • Async: Writes are acknowledged when they complete locally. The cluster does not wait for writes to be replicated to the target cluster. • Sync: The source acknowledges the write when the data is stored locally and on the remote cluster. | string | None | No |
|------|--|--------|------|----|
| | SnapshotsOnly: Only snapshots created on the source cluster are replicated. Active writes from the source volume are not replicated. | | | |

This method has no return value.

Request example

```
"method": "ModifyVolumePair",
"params": {
    "pausedManual": false,
    "volumeID": 5,
    "mode": "sync"
    },
    "id": 1
}
```

This method returns a response similar to the following example:

```
{
   "id" : 1,
   "result" : {}
}
```

New since version

9.6

RemoveClusterPair

You can use the RemoveClusterPair method to close the open connections between two paired clusters.

Parameter

Before you remove a cluster pair, you must first remove all volume pairing to the clusters with the RemoveVolumePair API method.

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------|--|---------|---------------|----------|
| clusterPairID | Unique identifier used to pair two clusters. | integer | None | Yes |

Return value

This method has no return value.

Request example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result": {}
}
```

New since version

9.6

RemoveVolumePair

You can use the RemoveVolumePair method to remove the remote pairing between two volumes. Use this method on both the source and target volumes that are paired together. When you remove the volume pairing information, data is no longer replicated to or from the volume.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|---------|---------------|----------|
| volumeID | ID of the volume on which to stop the replication process. | integer | None | Yes |

Return value

This method has no return value.

Request example

```
{
   "method": "RemoveVolumePair",
   "params": {
      "volumeID": 5
   "id" : 1
   }
}
```

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result": {
   }
}
```

New since version

9.6

StartClusterPairing

You can use the <code>StartClusterPairing</code> method to create an encoded key from a cluster that is used to pair with another cluster. The key created from this API method is used in the <code>CompleteClusterPairing</code> method to establish a cluster pairing. You can pair a cluster with a maximum of four other clusters.

Parameter

This method has no input parameter.

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------------|---|---------|
| clusterPairingKey | A string of characters that is used by the CompleteClusterPairing API method. | string |
| clusterPairID | Unique identifier for the cluster pair. | integer |

Request example

```
"method": "StartClusterPairing",
   "params": {
      },
      "id" : 1
}
```

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "clusterPairID": 1,
        "clusterPairingKey":

CompleteClusterPairing

StartVolumePairing

You can use the StartVolumePairing method to create an encoded key from a volume that is used to pair with another volume. The key that this method creates is used in the CompleteVolumePairing method to establish a volume pairing.

Parameters

| Name | Description | Туре | Default value | Required |
|----------|---|---------|---------------|----------|
| mode | The mode of the volume on which to start the pairing process. The mode can only be set if the volume is the source volume. Possible values: * Async: Writes are acknowledged when they complete locally. The cluster does not wait for writes to be replicated to the target cluster. (Default if no mode parameter specified.) * Sync: Source acknowledges write when the data is stored locally and on the remote cluster. * SnapshotsOnl y: Only snapshots created on the source cluster are replicated. Active writes from the source volume are not replicated. | string | None | No |
| volumeID | The ID of the volume on which to start the pairing process. | integer | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|------|--|--------|
| , | A string of characters that is used by the CompleteVolumePairing API method. | string |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "StartVolumePairing",
    "params": {
         "mode": "Async",
         "volumeID" : 14
         },
         "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
    "result" : {
        "volumePairingKey" :
"7b226d766970223a223139322e3136382e3133392e313232222c22766f6c756d654944223

CompleteVolumePairing

Security API methods

You can integrate Element software with external security-related services, such as an external key management server. These security-related methods enable you to

configure Element security features such as external key management for Encryption at Rest.

- AddKeyServerToProviderKmip
- CreateKeyProviderKmip
- CreateKeyServerKmip
- CreatePublicPrivateKeyPair
- DeleteKeyProviderKmip
- DeleteKeyServerKmip
- DisableEncryptionAtRest
- EnableEncryptionAtRest

AddKeyServerToProviderKmip

You can use the AddKeyServerToProviderKmip method to assign a Key Management Interoperability Protocol (KMIP) key server to the specified key provider. During assignment, the server is contacted to verify functionality. If the specified key server is already assigned to the specified key provider, no action is taken and no error is returned. You can remove the assignment using the

RemoveKeyServerFromProviderKmip method.

Parameters

| Name | Description | Туре | Default value | Required |
|---------------|---|---------|---------------|----------|
| keyProviderID | The ID of the key provider to assign the key server to. | integer | None | Yes |
| keyServerID | The ID of the key server to assign. | integer | None | Yes |

This method has no return value. The assignment is considered successful as long as there is no error returned.

Request example

Requests for this method are similar to the following example:

```
"method": "AddKeyServerToProviderKmip",
   "params": {
        "keyProviderID": 1,
        "keyServerID": 15
        },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result":
        {}
    }
}
```

New since version

11.7

CreateKeyProviderKmip

You can use the CreateKeyProviderKmip method to create a Key Management Interoperability Protocol (KMIP) key provider with the specified name. A key provider

defines a mechanism and location to retrieve authentication keys. When you create a new KMIP key provider, it does not have any KMIP key servers assigned to it. To create a KMIP key server, use the <code>CreateKeyServerKmip</code> method. To assign it to a provider, see <code>AddKeyServerToProviderKmip</code>.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------|---|--------|---------------|----------|
| keyProviderName | The name to associate with the created KMIP key provider. This name is only used for display purposes and does not need to be unique. | string | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|-----------------|--|-----------------|
| kmipKeyProvider | An object containing details about the newly created key provider. | KeyProviderKmip |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateKeyProviderKmip",
   "params": {
      "keyProviderName": "ProviderName",
      },
"id": 1
}
```

Response example

11.7

CreateKeyServerKmip

You can use the <code>CreateKeyServerKmip</code> method to create a Key Management Interoperability Protocol (KMIP) key server with the specified attributes. During creation, the server is not contacted; it does not need to exist before you use this method. For clustered key server configurations, you must provide the hostnames or IP addresses of all server nodes in the kmipKeyServerHostnames parameter. You can use the <code>TestKeyServerKmip</code> method to test a key server.

Parameters

| Name | Description | Туре | Default value | Required |
|----------------------------|--|--------------|---------------|----------|
| kmipCaCertificate | The public key certificate of the external key server's root CA. This will be used to verify the certificate presented by external key server in the TLS communication. For key server clusters where individual servers use different CAs, provide a concatenated string containing the root certificates of all the CAs. | string | None | Yes |
| kmipClientCertificate | A PEM format Base64 encoded PKCS#10 X.509 certificate used by the Solidfire KMIP client. | string | None | Yes |
| kmipKeyServerHost names | Array of the hostnames or IP addresses associated with this KMIP key server. Multiple hostnames or IP addresses must only be provided if the key servers are in a clustered configuration. | string array | None | Yes |
| kmipKeyServerNam e | The name of the KMIP key server. This name is only used for display purposes and does not need to be unique. | string | None | Yes |
| kmipKeyServerPort | The port number associated with this KMIP key server (typically 5696). | integer | None | No |

This method has the following return values:

| Name | Description | Туре |
|---------------|--|---------------|
| kmipKeyServer | An object containing details about the newly created key server. | KeyServerKmip |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateKeyServerKmip",
    "params": {
        "kmipCaCertificate": "MIICPDCCAaUCEDyRMcsf9tAbDpq40ES/E...",
        "kmipClientCertificate": "dKkkirWmnWXbj9T/UWZYB2oK0z5...",
        "kmipKeyServerHostnames" : ["server1.hostname.com",
        "server2.hostname.com"],
        "kmipKeyServerName" : "keyserverName",
        "kmipKeyServerPort" : 5696
    },
    "id": 1
}
```

Response example

```
{
   "id": 1,
   "result":
        "kmipKeyServer": {
            "kmipCaCertificate": "MIICPDCCAaUCEDyRMcsf9tAbDpq40ES/E...",
            "kmipKeyServerHostnames":[
                "server1.hostname.com", "server2.hostname.com"
            ],
            "keyProviderID":1,
            "kmipKeyServerName": "keyserverName",
            "keyServerID":1
            "kmipKeyServerPort":1,
            "kmipClientCertificate": "dKkkirWmnWXbj9T/UWZYB2oK0z5...",
            "kmipAssignedProviderIsActive":true
        }
    }
}
```

11.7

CreatePublicPrivateKeyPair

You can use the <code>CreatePublicPrivateKeyPair</code> method to create public and private SSL keys. You can use these keys to generate certificate signing requests. There can only be one key pair in use for each storage cluster. Before using this method to replacing existing keys, ensure the keys are no longer in use by any providers.

Parameters

| Name | Description | Туре | Default value | Required |
|------------|---|--------|---------------|----------|
| commonName | The X.509 distinguished name Common Name field (CN). | string | None | No |
| country | The X.509 distinguished name Country field ©. | string | None | No |

| Name | Description | Туре | Default value | Required |
|--------------------|---|--------|---------------|----------|
| emailAddress | The X.509 distinguished name Email Address field (MAIL). | string | None | No |
| locality | The X.509 distinguished name Locality Name field (L). | string | None | No |
| organization | The X.509 distinguished name Organization Name field (O). | string | None | No |
| organizationalUnit | The X.509 distinguished name Organizational Unit Name field (OU). | string | None | No |
| state | The X.509 distinguished name State or Province Name field (ST or SP or S). | string | None | No |

This method has no return values. If there is no error, key creation is considered successful.

Request example

```
"method": "CreatePublicPrivateKeyPair",
    "params": {
        "commonName": "Name",
        "country": "US",
        "emailAddress": "email@domain.com"
      },
      "id": 1
}
```

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result":
   {}
}
```

New since version

11.7

DeleteKeyProviderKmip

You can use the DeleteKeyProviderKmip method to delete the specified inactive Key Management Interoperability Protocol (KMIP) key provider.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|---------------------------------------|---------|---------------|----------|
| keyProviderID | The ID of the key provider to delete. | integer | None | Yes |

Return values

This method has no return values. The delete operation is considered successful as long is there is no error.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteKeyProviderKmip",
    "params": {
        "keyProviderID": "1"
        },
        "id": 1
}
```

Response example

```
{
   "id": 1,
   "result":
   {}
}
```

11.7

DeleteKeyServerKmip

You can use the <code>DeleteKeyServerKmip</code> method to delete an existing Key Management Interoperability Protocol (KMIP) key server. You can delete a key server unless it is the last one assigned to its provider, and that provider is providing keys which are currently in use.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| keyServerID | The ID of the KMIP key server to delete. | integer | None | Yes |

Return values

This method has the no return values. The delete operation is considered successful if there are no errors.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteKeyServerKmip",
   "params": {
        "keyServerID": 15
    },
   "id": 1
}
```

Response example

```
{
   "id": 1,
   "result":
   {}
}
```

11.7

DisableEncryptionAtRest

You can use the <code>DisableEncryptionAtRest</code> method to remove the encryption that was previously applied to the cluster using the <code>EnableEncryptionAtRest</code> method. This disable method is asynchronous and returns a response before encryption is disabled. You can use the <code>GetClusterInfo</code> method to poll the system to see when the process has completed.

To see the current status of encryption at rest and/or software encryption at rest on the cluster, use the get cluster info method. You can use the GetSoftwareEncryptionAtRestInfo method to get information the cluster uses to encrypt data at rest.

You cannot use this method to disable software encryption at rest. To disable software encryption at rest, you need to create a new cluster with software encryption at rest disabled.

Parameters

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "DisableEncryptionAtRest",
    "params": {},
    "id": 1
}
```

Response example

```
"id" : 1,
"result" : {}
}
```

9.6

Find more information

- GetClusterInfo
- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

EnableEncryptionAtRest

You can use the <code>EnableEncryptionAtRest</code> method to enable the Advanced Encryption Standard (AES) 256-bit encryption at rest on the cluster so that the cluster can manage the encryption key used for the drives on each node. This feature is not enabled by default.

To see the current status of encryption at rest and/or software encryption at rest on the cluster, use the get cluster info method. You can use the GetSoftwareEncryptionAtRestInfo method to get information the cluster uses to encrypt data at rest.

This method does not enable software encryption at rest. This can only be done using the create cluster method with enableSoftwareEncryptionAtRest set to true.

When you enable encryption at rest, the cluster automatically manages encryption keys internally for the drives on each node in the cluster.

If a keyProviderID is specified, the password is generated and retrieved according to the type of key provider. This is usually done using a Key Management Interoperability Protocol (KMIP) key server in the case of a KMIP key provider. After this operation, the specified provider is considered active and cannot be deleted until Encryption at Rest is disabled using the DisableEncryptionAtRest method.

If you have a node type with a model number ending in "-NE", the <code>EnableEncryptionAtRest</code> method call will fail with a response of "Encryption not allowed. Cluster detected non-encryptable node".

You should only enable or disable encryption when the cluster is running and in a healthy state. You can enable or disable encryption at your discretion and as often as you need.

This process is asynchronous and returns a response before encryption is enabled. You can use the GetClusterInfo method to poll the system to see when the process has completed.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|---------------------------------------|---------|---------------|----------|
| keyProviderID | The ID of a KMIP key provider to use. | integer | None | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "EnableEncryptionAtRest",
   "params": {},
   "id": 1
}
```

Response examples

This method returns a response similar to the following example from the EnableEncryptionAtRest method. There is no result to report.

```
{
    "id": 1,
    "result": {}
}
```

While Encryption At Rest is being enabled on a cluster, GetClusterInfo returns a result describing the state of Encryption at Rest ("encryptionAtRestState") as "enabling". After Encryption at Rest is fully enabled, the returned state changes to "enabled".

```
{
   "id": 1,
      "result": {
         "clusterInfo": {
            "attributes": { },
                "encryptionAtRestState": "enabling",
            "ensemble": [
                "10.10.5.94",
               "10.10.5.107",
               "10.10.5.108"
            ],
            "mvip": "192.168.138.209",
            "mvipNodeID": 1,
            "name": "Marshall",
            "repCount": 2,
            "svip": "10.10.7.209",
            "svipNodeID": 1,
            "uniqueID": "91dt"
      }
}
```

${\bf GetClientCertificateSignRequest}$

You can use the <code>GetClientCertificateSignRequest</code> method to generate a certificate signing request that can be signed by a certificate authority to generate a client certificate for the cluster. Signed certificates are needed to establish a trust relationship for interacting with external services.

Parameters

This method has no input parameters.

This method has the following return values:

| Name | Description | Туре |
|------|--|--------|
| J I | A PEM format Base64 encoded PKCS#10 X.509 client certificate sign request. | string |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClientCertificateSignRequest",
    "params": {
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

New since version

11.7

GetKeyProviderKmip

You can use the GetKeyProviderKmip method to retrieve information about the specified Key Management Interoperability Protocol (KMIP) key provider.

Parameters

| Name | Description | Туре | Default value | Required |
|---------------|---|---------|---------------|----------|
| keyProviderID | The ID of the KMIP key provider object to return. | integer | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|------|--|-----------------|
| | An object containing details about the requested key provider. | KeyProviderKmip |

Request example

Requests for this method are similar to the following example:

```
"method": "GetKeyProviderKmip",
   "params": {
       "keyProviderID": 15
      },
"id": 1
}
```

Response example

11.7

GetKeyServerKmip

You can use the GetKeyServerKmip method to return information about the specified Key Management Interoperability Protocol (KMIP) key server.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| keyServerID | The ID of the KMIP key server to return information about. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------------|--|---------------|
| kmipKeyServer | An object containing details about the requested key server. | KeyServerKmip |

Request example

```
"method": "GetKeyServerKmip",
   "params": {
        "keyServerID": 15
    },
   "id": 1
}
```

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result":
        "kmipKeyServer": {
            "kmipCaCertificate": "MIICPDCCAaUCEDyRMcsf9tAbDpq40ES/E...",
            "kmipKeyServerHostnames":[
                "server1.hostname.com", "server2.hostname.com"
            "keyProviderID":1,
            "kmipKeyServerName": "keyserverName",
            "keyServerID":15
            "kmipKeyServerPort":1,
            "kmipClientCertificate": "dKkkirWmnWXbj9T/UWZYB2oK0z5...",
            "kmipAssignedProviderIsActive":true
        }
    }
}
```

New since version

11.7

GetSoftwareEncryptionAtRestInfo

You can use the GetSoftwareEncryptionAtRestInfo method to get software encryption-at-rest information the cluster uses to encrypt data at rest.

Parameters

This method has no input parameters.

This method has the following return values:

| Parameter | Description | Туре | Optional |
|---------------------------------|---|-------------------|----------|
| masterKeyInfo | Information about the current software encryption-at-rest master key. | EncryptionKeyInfo | True |
| rekeyMasterKeyAsyncRes ultID | The async result ID of the current or most recent rekey operation (if any), if it has not been deleted yet. GetAsyncResult output will include a newKey field that contains information about the new master key and a keyToDecommission field that contains information about the old key. | integer | True |
| state | The current software encryption-at-rest state. Possible values are disabled or enabled. | string | False |
| version | A version number that is incremented each time software encryption at rest is enabled. | integer | False |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "getsoftwareencryptionatrestinfo"
}
```

Response example

12.3

ListKeyProvidersKmip

You can use the ListKeyProvidersKmip method to retrieve a list of all existing Key Management Interoperability Protocol (KMIP) key providers. You can filter the list by specifying additional parameters.

Parameters

| Name | Description | Туре | Default value | Required |
|---------------------|--|---------|---------------|----------|
| keyProviderIsActive | Filters returned KMIP key server objects based on whether they are active. Possible values: | boolean | None | No |
| | true: Returns only KMIP key providers which are active (providing keys which are currently in use). | | | |
| | false: Returns only KMIP key providers which are inactive (not providing any keys and able to be deleted). | | | |
| | If omitted, returned KMIP key providers are not filtered based on whether they are active. | | | |

| Name | Description | Туре | Default value | Required |
|--------------------------------------|--|---------|---------------|----------|
| kmipKeyProviderHa sServerAssigned | Filters returned KMIP key providers based on whether they have a KMIP key server assigned. Possible values: • true: Returns only KMIP key providers which | boolean | None | No |
| | have a KMIP key server assigned. | | | |
| | false: Returns only KMIP key providers which do not have a KMIP key server assigned. | | | |
| | If omitted, returned KMIP key providers are not filtered based on whether they have a KMIP key server assigned. | | | |

This method has the following return values:

| Name | Description | Туре |
|------------------|--|-----------------------|
| kmipKeyProviders | A list of KMIP key providers that have been created. | KeyProviderKmip array |

Request example

```
{
  "method": "ListKeyProvidersKmip",
  "params": {},
  "id": 1
}
```

This method returns a response similar to the following example:

New since version

11.7

ListKeyServersKmip

You can use the ListKeyServersKmip method to list all Key Management Interoperability Protocol (KMIP) key servers that have been created. You can filter the results by specifying additional parameters.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------------------------|--|---------|---------------|----------|
| keyProviderID | When specified, the method only returns KMIP key servers that are assigned to the specified KMIP key provider. If omitted, returned KMIP key servers will not be filtered based on whether they are assigned to the specified KMIP Key Provider. | integer | None | No |
| kmipAssignedProvid erlsActive | Filters returned KMIP key server objects based on whether they are active. Possible values: • true: Returns only KMIP key servers which are active (providing keys which are currently in use). • false: Returns only KMIP key servers which are inactive (not providing any keys and able to be deleted). If omitted, returned KMIP key servers are not filtered based on whether they are active. | boolean | None | No |

| Name | Description | Туре | Default value | Required |
|-----------------------------|---|---------|---------------|----------|
| kmipHasProviderAs signed | Filters returned KMIP key servers based on whether they have a KMIP key provider assigned. Possible values: | boolean | None | No |
| | true: Returns only KMIP key servers which have a KMIP key provider assigned. | | | |
| | false: Returns only KMIP key servers which do not have a KMIP key provider assigned. | | | |
| | If omitted, returned KMIP key servers are not filtered based on whether they have a KMIP key provider assigned. | | | |

This method has the following return values:

| Name | Description | Туре |
|----------------|--|---------------------|
| kmipKeyServers | The complete list of KMIP key servers which have been created. | KeyServerKmip array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListKeyServersKmip",
   "params": {},
"id": 1
}
```

Response example

This method returns a response similar to the following example:

New since version

11.7

ModifyKeyServerKmip

You can use the ModifyKeyServerKmip method to modify an existing Key Management Interoperability Protocol (KMIP) key server to the specified attributes. Although the only required parameter is the keyServerID, a request containing only the keyServerID will take no action and return no error. Any other parameters you specify will replace the existing values for the key server with the specified keyServerID. The key server is contacted during the operation to ensure that it is functional. You can provide multiple hostnames or IP addresses with the kmipKeyServerHostnames parameter, but only if the key servers are in a clustered configuration.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| keyServerID | The ID of the KMIP Key Server to modify. | integer | None | Yes |

| kmipCaCertificate | The public key certificate of the external key server's root CA. This will be used to verify the certificate presented by external key server in the TLS communication. For key server clusters where individual servers use different CAs, provide a concatenated string containing the root certificates of all the CAs. | string | None | No |
|----------------------------|--|--------------|------|----|
| kmipClientCertificate | A PEM format Base64 encoded PKCS#10 X.509 certificate used by the Solidfire KMIP client. | string | None | No |
| kmipKeyServerHost names | Array of the hostnames or IP addresses associated with this KMIP key server. Multiple hostnames or IP addresses must only be provided if the key servers are in a clustered configuration. | string array | None | No |
| kmipKeyServerNam e | The name of the KMIP key server. This name is only used for display purposes and does not need to be unique. | string | None | No |
| kmipKeyServerPort | The port number associated with this KMIP key server (typically 5696). | integer | None | No |

This method has the following return values:

| Name | Description | Туре |
|---------------|---|---------------|
| kmipKeyServer | An object containing details about the newly modified key server. | KeyServerKmip |

Request example

Requests for this method are similar to the following example:

```
"method": "ModifyKeyServerKmip",
"params": {
    "keyServerID": 15
    "kmipCaCertificate": "CPDCCAaUCEDyRMcsf9tAbDpq40ES/E...",
    "kmipClientCertificate": "kirWmnWXbj9T/UWZYB2oK0z5...",
    "kmipKeyServerHostnames" : ["server1.hostname.com",
"server2.hostname.com"],
    "kmipKeyServerName" : "keyserverName",
    "kmipKeyServerPort" : 5696
    },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result":
        "kmipKeyServer": {
            "kmipCaCertificate": "CPDCCAaUCEDyRMcsf9tAbDpq40ES/E...",
            "kmipKeyServerHostnames":[
                "server1.hostname.com", "server2.hostname.com"
            ],
            "keyProviderID":1,
            "kmipKeyServerName": "keyserverName",
            "keyServerID":1
            "kmipKeyServerPort":1,
            "kmipClientCertificate": "kirWmnWXbj9T/UWZYB2oK0z5...",
            "kmipAssignedProviderIsActive":true
        }
    }
}
```

New since version

11.7

RekeySoftwareEncryptionAtRestMasterKey

You can use the RekeySoftwareEncryptionAtRestMasterKey method to rekey the software encryption-at-rest master key used to encrypt DEKs (Data Encryption Keys). During cluster creation, software encryption at rest is configured to use Internal Key Management (IKM). This rekey method can be used after cluster creation to use either IKM or External Key Management (EKM).

Parameters

This method has the following input parameters. If the keyManagementType parameter is not specified, the rekey operation is performed using the existing key management configuration. If the keyManagementType is specified and the key provider is external, the keyProviderID parameter must also be used.

| Parameter | Description | Туре | Optional |
|-------------------|--|---------|----------|
| keyManagementType | The type of key management used to manage the master key. Possible values are: Internal: Rekey using internal key management. External: Rekey using external key management. If this parameter is not specified, the rekey operation is performed using the existing key management configuration. | string | True |
| keyProviderID | The ID of the key provider to use. This is a unique value returned as part of one of the CreateKeyProvider methods. The ID is only required when keyManagementType is External and is otherwise invalid. | integer | True |

This method has the following return values:

| Parameter | Description | Туре | Optional |
|-------------|---|---------|----------|
| asyncHandle | Determine the status of the rekey operation using this asyncHandle value with GetAsyncResult. GetAsyncResult output will include a newKey field that contains information about the new master key and a keyToDecommission field that contains information about the old key. | integer | False |

Request example

Requests for this method are similar to the following example:

```
"method": "rekeysoftwareencryptionatrestmasterkey",
"params": {
    "keyManagementType": "external",
    "keyProviderID": "<ID number>"
}
```

Response example

This method returns a response similar to the following example:

```
{
    "asyncHandle": 1
}
```

New since version

12.3

RemoveKeyServerFromProviderKmip

You can use the RemoveKeyServerFromProviderKmip method to unassign the specified Key Management Interoperability Protocol (KMIP) key server from the provider it was assigned to. You can unassign a key server from its provider unless it is the last one and its provider is active (providing keys which are currently in use). If the specified key server is not assigned to a provider, no action is taken and no error is returned.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| keyServerID | The ID of the KMIP key server to unassign. | integer | None | Yes |

Return values

This method has no return values. The removal is considered successful as long as no error is returned.

Request example

Requests for this method are similar to the following example:

```
"method": "RemoveKeyServerFromProviderKmip",
   "params": {
      "keyServerID": 1
    },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result":
      {}
   }
}
```

New since version

11.7

TestKeyProviderKmip

You can use the TestKeyProviderKmip method to test whether the specified Key Management Interoperability Protocol (KMIP) key provider is reachable and functioning normally.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|-------------------------------------|---------|---------------|----------|
| keyProviderID | The ID of the key provider to test. | integer | None | Yes |

Return values

This method has no return values. The test is considered successful as long as no error is returned.

Request example

Requests for this method are similar to the following example:

```
"method": "TestKeyProviderKmip",
    "params": {
        "keyProviderID": 15
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result":
        {}
    }
}
```

New since version

11.7

TestKeyServerKmip

You can use the TestKeyServerKmip method to test whether the specified Key Management Interoperability Protocol (KMIP) key server is reachable and functioning normally.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| keyServerID | The ID of the KMIP key server to test. | integer | None | Yes |

Return values

This method has no return values. The test is considered successful if there are no errors returned.

Request example

Requests for this method are similar to the following example:

```
"method": "TestKeyServerKmip",
   "params": {
      "keyServerID": 15
   },
   "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result":
      {}
   }
}
```

New since version

11.7

SnapMirror API methods

SnapMirror API methods are used by the Element web UI for managing snapshots mirrored with remote ONTAP systems. These methods are meant for use by the Element web UI only. If you need API access to SnapMirror functionality, use the ONTAP APIs. Request and return examples are not provided for SnapMirror API methods.

AbortSnapMirrorRelationship

The Element software web UI uses the AbortSnapMirrorRelationship method to stop SnapMirror transfers that have started but are not yet complete.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|--|--------------------------|---------------|----------|
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeIn fo | None | Yes |
| clearCheckpoint | Determines whether or not to clear the restart checkpoint. Possible values: • true • false | boolean | false | No |

This method has the following return values:

| Name | Description | Туре |
|------|---|------------------------|
| · | An object containing information about the aborted SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

BreakSnapMirrorRelationship

The Element web UI uses the <code>BreakSnapMirrorRelationship</code> method to break a <code>SnapMirror</code> relationship. When a <code>SnapMirror</code> relationship is broken, the destination volume is made read-write and independent, and can then diverge from the source. You can reestablish the relationship with the <code>ResyncSnapMirrorRelationship</code> API method. This method requires the <code>ONTAP</code> cluster to be available.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|--|--------------------------|---------------|----------|
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeIn fo | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|------------------------|--|------------------------|
| snapMirrorRelationship | An object containing information about the broken SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

Find more information

BreakSnapMirrorVolume

BreakSnapMirrorVolume

The Element web UI uses the <code>BreakSnapMirrorVolume</code> method to break the SnapMirror relationship between an ONTAP source container and Element target volume. Breaking an Element SnapMirror volume is useful if an ONTAP system becomes unavailable while replicating data to an Element volume. This feature enables a storage administrator to take control of an Element SnapMirror volume, break its relationship with the remote ONTAP system, and revert the volume to a previous snapshot.

Parameter

| Name | Description | Туре | Default value | Required |
|----------|--|---------|---------------|----------|
| volumeID | The volume on which to perform the break operation. The volume access mode must be snapMirrorTarget. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------|--|---------|---------------|----------|
| snapshotID | Roll back the volume to the snapshot identified by this ID. The default behavior is to roll back to the most recent snapshot. | integer | None | No |
| preserve | Preserve any snapshots newer than the snapshot identified by snapshotID. Possible values: • true: Preserve snapshots newer than snapshotID. • false: Do not preserve snapshots newer than snapshots newer than snapshotID. If false, any snapshots newer than snapshotID are deleted. | boolean | false | No |
| access | Resulting volume access mode. Possible values: • readWrite • readOnly • locked | string | readWrite | No |

This method has no return values.

New since version

10.0

Find more information

Break Snap Mirror Relationship

CreateSnapMirrorEndpoint

The Element web UI uses the CreateSnapMirrorEndpoint method to create a relationship with a remote SnapMirror endpoint.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------|--|--------|---------------|----------|
| managementIP | The management IP address of the remote SnapMirror endpoint. | string | None | Yes |
| username | The management user name for the ONTAP system. | string | None | Yes |
| password | The management password for the ONTAP system. | string | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|--------------------|--|--------------------|
| snapMirrorEndpoint | The newly created SnapMirror endpoint. | snapMirrorEndpoint |

New since version

10.0

${\bf Create Snap Mirror Endpoint Unmanaged}$

The Element software storage system uses the

CreateSnapMirrorEndpointUnmanaged method to enable remote, unmanaged SnapMirror endpoints to communicate with a Element storage cluster. Unmanaged endpoints cannot be administered using the Element SnapMirror APIs. They must be managed with ONTAP management software or APIs.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------|--|--------------|---------------|----------|
| clusterName | The name of the endpoint. | string | None | Yes |
| ipAddresses | The list of IP addresses for a cluster of ONTAP storage systems that should communicate with this Element storage cluster. | string array | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|--------------------|--|--------------------|
| snapMirrorEndpoint | The newly created SnapMirror endpoint. | snapMirrorEndpoint |

New since version

10.3

CreateSnapMirrorRelationship

The Element web UI uses the CreateSnapMirrorRelationship method to create a SnapMirror extended data protection relationship between a source and destination endpoint.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|---|-----------------------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| sourceVolume | The source volume in the relationship. | snapMirrorVolumeIn fo | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|---|--------------------------|---------------|----------|
| destinationVolume | The destination volume in the relationship. | snapMirrorVolumeIn fo | None | Yes |
| relationshipType | The type of relationship. On storage systems running Element software, this value is always "extended_data_prot ection". | string | None | No |
| policyName | Specifies the name of the ONTAP SnapMirror policy for the relationship. If not specified, the default policy name is MirrorLatest. | string | None | No |
| scheduleName | The name of the pre-existing cron schedule on the ONTAP system that is used to update the SnapMirror relationship. If no schedule is designated, snapMirror updates are not scheduled and must be updated manually. | string | None | No |
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer | None | No |

This method has the following return values:

| Name | Description | Туре |
|------------------------|--|------------------------|
| snapMirrorRelationship | Information about the newly created SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

CreateSnapMirrorVolume

The Element web UI uses the ${\tt CreateSnapMirrorVolume}$ method to create a volume on the remote ONTAP system.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| vserver | The name of the Vserver. | string | None | Yes |
| name | The destination ONTAP volume name. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------|--|---------|---------------|----------|
| type | The volume type. Possible values: • rw: Read-write volume • ls: Load-sharing volume • dp: Data protection volume If no type is provided, the default type is dp. | string | None | No |
| aggregate | The containing ONTAP aggregate in which to create the volume. You can use ListSnapMirrorAggre gates to get information about available ONTAP aggregates. | string | None | Yes |
| size | The size of the volume in bytes. | integer | None | Yes |

This method has the following return values:

| Name | Description | Туре |
|------------------|--|------------------|
| snapMirrorVolume | Information about a SnapMirror volume. | snapMirrorVolume |

New since version

10.1

DeleteSnapMirrorEndpoints

The Element web UI uses <code>DeleteSnapMirrorEndpoints</code> to delete one or more <code>SnapMirror</code> endpoints from the system.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------------|---------------|----------|
| snapMirrorEndpointI Ds | An array of IDs of SnapMirror endpoints to delete. | integer array | None | Yes |

Return values

This method has no return values.

New since version

10.0

DeleteSnapMirrorRelationships

The Element web UI uses the DeleteSnapMirrorRelationships method to remove one or more SnapMirror relationships between a source and destination endpoint.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|-----------------------------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| destinationVolumes | The destination volume or volumes in the SnapMirror relationship. | snapMirrorVolumeIn fo array | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|--------|---|-------------|
| result | If the delete action succeeded, this object contains a success message. If the action failed, it contains an error message. | JSON object |

New since version

10.1

GetOntapVersionInfo

The Element web UI uses GetOntapVersionInfo to get information about API version support from the ONTAP cluster in a SnapMirror relationship.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------|---------------|----------|
| snapMirrorEndpointI D | If provided, the system lists the version information from the endpoint with the specified snapMirrorEndpointI D. If not provided, the system lists the version information of all known SnapMirror endpoints. | integer | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|---|------------------------|
| ontapVersionInfo | The software version information of the ONTAP endpoint. | ontapVersionInfo array |

New since version

10.1

GetSnapMirrorClusterIdentity

The Element software web UI uses GetSnapMirrorClusterIdentity to get identity information about the ONTAP cluster.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------|---------------|----------|
| snapMirrorEndpointI D | If provided, the system lists the cluster identity of the endpoint with the specified snapMirrorEndpointI D. If not provided, the system lists the cluster identity of all known SnapMirror endpoints. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|---------------------------|---|---------------------------------|
| snapMirrorClusterIdentity | A list of cluster identities of SnapMirror endpoints. | snapMirrorClusterIdentity array |

New since version

10.1

InitializeSnapMirrorRelationship

The Element software web UI uses the InitializeSnapMirrorRelationship method to initialize the destination volume in a SnapMirror relationship by performing an initial baseline transfer between clusters.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------------------|---------------|----------|
| snapMirrorEndpointl D | The ID of the remote ONTAP system. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeIn fo | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------------|--|---------|---------------|----------|
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|------------------------|--|------------------------|
| snapMirrorRelationship | Information about the initialized SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

ListSnapMirrorAggregates

The Element software web UI uses the ListSnapMirrorAggregates method to list all SnapMirror aggregates that are available on the remote ONTAP system. An aggregate describes a set of physical storage resources.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | Return only the aggregates associated with the specified endpoint ID. If no endpoint ID is provided, the system lists aggregates from all known SnapMirror endpoints. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|----------------------|---|---------------------------|
| snapMirrorAggregates | A list of the aggregates available on the ONTAP storage system. | snapMirrorAggregate array |

New since version

10.1

ListSnapMirrorEndpoints

The Element software web UI uses the ListSnapMirrorEndpoints method to list all SnapMirror endpoints that the Element storage cluster is communicating with.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------------|---------------|----------|
| snapMirrorEndpointI Ds | Return only the objects associated with these IDs. If no IDs are provided or the array is empty, the method returns all SnapMirror endpoint IDs. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------------|--|--------------------------|
| snapMirrorEndpoints | A list of existing SnapMirror endpoints. | snapMirrorEndpoint array |

New since version

10.0

ListSnapMirrorLuns

The Element software web UI uses the ListSnapMirrorLuns method to list the LUN information for the SnapMirror relationship from the remote ONTAP cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------------------|---------------|----------|
| snapMirrorEndpointI D | List only the LUN information associated with the specified endpoint ID. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeIn fo | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|--------------------|---|-------------------------|
| snapMirrorLunInfos | A list of objects containing information about SnapMirror LUNs. | snapMirrorLunInfo array |

New since version

10.1

ListSnapMirrorNetworkInterfaces

The Element software web UI uses the ListSnapMirrorNetworkInterfaces method to list all available SnapMirror interfaces on a remote ONTAP system.

Parameter

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | Return only the network interfaces associated with the specified endpoint ID. If no endpoint ID is provided, the system lists interfaces from all known SnapMirror endpoints. | integer | None | No |
| interfaceRole | List only the network interface serving the specified role. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------------------------|---|----------------------------------|
| snapMirrorNetworkInterfaces | A list of the SnapMirror network interfaces available on the remote ONTAP storage system. | snapMirrornetworkInterface array |

New since version

10.1

ListSnapMirrorNodes

The Element software web UI uses the ListSnapMirrorNodes method to get a list of nodes in a remote ONTAP cluster.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------|---------------|----------|
| snapMirrorEndpointI D | If provided, the system lists the nodes of the endpoint with the specified snapMirrorEndpointI D. If not provided, the system lists the nodes of all known SnapMirror endpoints. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|-----------------|---|----------------------|
| snapMirrorNodes | A list of the nodes on the ONTAP cluster. | snapMirrorNode array |

New since version

10.1

ListSnapMirrorPolicies

The Element software web UI uses the <code>ListSnapMirrorPolicies</code> method to list all <code>SnapMirror</code> policies on a remote <code>ONTAP</code> system.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | List only the policies associated with the specified endpoint ID. If no endpoint ID is provided, the system lists policies from all known SnapMirror endpoints. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|--------------------|--|------------------------|
| snapMirrorPolicies | A list of the SnapMirror policies on the ONTAP storage system. | snapMirrorPolicy array |

New since version

10.1

ListSnapMirrorSchedules

The Element software web UI uses the ListSnapMirrorSchedules method to get a list of schedules that are available on a remote ONTAP cluster.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | If provided, the system lists the schedules of the endpoint with the specified SnapMirror endpoint ID. If not provided, the system lists the schedules of all known SnapMirror endpoints. | integer | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------------|---|--|
| snapMirrorSchedules | A list of the SnapMirror schedules on the remote ONTAP cluster. | snapMirrorJobScheduleCronInfo array |

New since version

10.1

ListSnapMirrorRelationships

The Element software web UI uses the ListSnapMirrorRelationships method to list one or all SnapMirror relationships on an Element storage cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|--------------------------|---------------|----------|
| snapMirrorEndpointI D | List only the relationships associated with the specified endpoint ID. If no endpoint ID is provided, the system lists relationships from all known SnapMirror endpoints. | integer | None | No |
| destinationVolume | List relationships associated with the specified destination volume. | snapMirrorVolumeIn fo | None | No |
| sourceVolume | List relationships associated with the specified source volume. | snapMirrorVolumeIn fo | None | No |
| vserver | List relationships on the specified Vserver. | string | None | No |
| relationshipID | List relationships associated with the specified relationship ID. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------------|--|------------------------------|
| snapMirrorRelationships | A list of objects containing information about SnapMirror relationships. | snapMirrorRelationship array |

New since version

10.1

ListSnapMirrorVolumes

The Element software web UI uses the ListSnapMirrorVolumes method to list all SnapMirror volumes available on a remote ONTAP system.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | List only the volumes associated with the specified endpoint ID. If no endpoint ID is provided, the system lists volumes from all known SnapMirror endpoints. | integer | None | No |
| vserver | List volumes hosted on the specified Vserver. The Vserver must be of type "data". | string | None | No |
| name | List only ONTAP volumes with the specified name. | string | None | No |
| type | List only ONTAP volumes of the specified type. Possible values: • rw: Read-write volumes • ls: Load-sharing volumes • dp: Data protection volumes | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|-------------------|---|------------------------|
| snapMirrorVolumes | A list of the SnapMirror volumes available on the ONTAP storage system. | snapMirrorVolume array |

New since version

10.1

ListSnapMirrorVservers

The Element software web UI uses the ListSnapMirrorVservers method to list all SnapMirror Vservers available on a remote ONTAP system.

Parameter

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| snapMirrorEndpointI D | List only the Vservers associated with the specified endpoint ID. If no endpoint ID is provided, the system lists Vservers from all known SnapMirror endpoints. | integer | None | No |
| vserverType | List only Vservers of the specified type. Possible values: admin data node system | string | None | No |
| vserverName | List only Vservers with the specified name. | string | None | No |

This method has the following return value:

| Name | Description | Туре |
|--------------------|--|-------------------------|
| snapMirrorVservers | A list of the SnapMirror Vservers available on the ONTAP storage system. | snapMirrorVserver array |

New since version

10.1

ModifySnapMirrorEndpoint

The Element software web UI uses the ModifySnapMirrorEndpoint method to change the name and management attributes for a SnapMirror endpoint.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| SnapMirrorEndpointl D | The SnapMirror endpoint to modify. | integer | None | Yes |
| managementIP | The new management IP Address for the ONTAP system. | string | None | No |
| username | The new management user name for the ONTAP system. | string | None | No |
| password | The new management password for the ONTAP system. | string | None | No |

Return value

This method has the following return value:

| Name Description Type | |
|-----------------------|--|
|-----------------------|--|

| snapMirrorEndpoint | Information about the modified SnapMirror endpoint. | snapMirrorEndpoint |
|--------------------|---|--------------------|
| | | |

New since version

10.0

ModifySnapMirrorEndpoint (unmanaged)

Element software uses this version of the ModifySnapMirrorEndpoint method to modify the storage cluster name or IP address attributes for an unmanaged SnapMirror endpoint. Unmanaged endpoints cannot be administered using the Element SnapMirror APIs. They must be managed with ONTAP management software or APIs.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------|---------------|----------|
| SnapMirrorEndpointI D | The SnapMirror endpoint to modify. | integer | None | Yes |
| clusterName | The new name of the endpoint. | string | None | No |
| ipAddresses | The new list of IP addresses for a cluster of ONTAP storage systems that should communicate with this Element storage cluster. | string array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------------|---|--------------------|
| snapMirrorEndpoint | Information about the modified SnapMirror endpoint. | snapMirrorEndpoint |

New since version

10.3

ModifySnapMirrorRelationship

You can use ModifySnapMirrorRelationship to change the intervals at which a scheduled snapshot occurs. You can also delete or pause a schedule by using this method.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------------------|---------------|----------|
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | Yes |
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer | None | No |
| policyName | Specifies the name of the ONTAP SnapMirror policy for the relationship. | string | None | No |
| scheduleName | The name of the pre-existing cron schedule on the ONTAP system that is used to update the SnapMirror relationship. | string | None | No |
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |

This method has the following return value:

| Name | Description | Туре |
|------------------------|---|------------------------|
| snapMirrorRelationship | An object containing the modified SnapMirror relationship attributes. | snapMirrorRelationship |

New since version

10.1

UpdateSnapMirrorRelationship

The Element software web UI uses the <code>UpdateSnapMirrorRelationship</code> method to make the destination volume in a <code>SnapMirror</code> relationship an up-to-date mirror of the source volume.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------------------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | Yes |
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer | None | No |

This method has the following return value:

| Name | Description | Туре |
|------------------------|---|------------------------|
| snapMirrorRelationship | An object containing information about the updated SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

QuiesceSnapMirrorRelationship

The Element software web UI uses the <code>QuiesceSnapMirrorRelationship</code> method to disable future data transfers for a SnapMirror relationship. If a transfer is in progress, the relationship status becomes "quiescing" until the transfer is complete. If the current transfer is aborted, it will not restart. You can reenable data transfers for the relationship using the <code>ResumeSnapMirrorRelationship</code> API method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|--------------------------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------------|--|------------------------|
| snapMirrorRelationship | An object containing information about the quiesced SnapMirror relationship. | snapMirrorRelationship |

10.1

ResumeSnapMirrorRelationship

The Element software web UI uses the ResumeSnapMirrorRelationship method to enable future transfers for a quiesced SnapMirror relationship.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|--------------------------|---------------|----------|
| snapMirrorEndpointI D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------------|---|------------------------|
| snapMirrorRelationship | An object containing information about the resumed SnapMirror relationship. | snapMirrorRelationship |

New since version

10.1

ResyncSnapMirrorRelationship

The Element software web UI uses the ResyncSnapMirrorRelationship method to establish or reestablish a mirror relationship between a source and destination endpoint. When you resync a relationship, the system removes snapshots on the destination volume that are newer than the common snapshot copy, and then mounts the destination volume as a data protection volume with the common snapshot copy as the exported snapshot copy.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|--|--------------------------|---------------|----------|
| snapMirrorEndpointl D | The endpoint ID of the remote ONTAP storage system communicating with the Element storage cluster. | integer | None | Yes |
| destinationVolume | The destination volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | Yes |
| maxTransferRate | Specifies the maximum data transfer rate between the volumes in kilobytes per second. The default value, 0, is unlimited and permits the SnapMirror relationship to fully utilize the available network bandwidth. | integer | None | No |
| sourceVolume | The source volume in the SnapMirror relationship. | snapMirrorVolumeinf o | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------------|--|------------------------|
| snapMirrorRelationship | An object containing information about the resynced SnapMirror relationship. | snapMirrorRelationship |

DisableBmcColdReset

You can use the DisableBmcColdReset method to disable the background task that periodically resets the Baseboard Management Controller (BMC) for all nodes in the cluster.

Parameter

This method has no input parameter.

Return values

This method has the following return value:

| Name | Description | Туре |
|--------------------------|--|---------|
| cBmcResetDurationMinutes | Returns the time between reset intervals. The interval should always be 0 after the command completes. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "DisableBmcColdReset",
   "params": {},
   "id" : 1
}
```

Response example

```
"id": 1,
"result": {
    "cBmcResetDurationMinutes": 0
}
```

12.0

DisableClusterSsh

You can use the <code>DisableClusterSsh</code> method to disable the SSH service for the entire storage cluster. When you add nodes to the storage cluster, the new nodes will inherit this cluster-wide setting.

Parameter

This method has no input parameter.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|---|-------------|
| result | A JSON object containing the status of the SSH service for the storage cluster, the time remaining until SSH is disabled, and the SSH service status for each node. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "DisableClusterSsh",
  "params": {
      },
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result" : {
    "enabled": true,
    "timeRemaining": "00:43:21",
    "nodes": [
        "nodeID": 1,
        "enabled": true
    },
       "nodeID": 2,
        "enabled": true
    },
    {
        "nodeID": 3,
        "enabled": false
    },
        "nodeID": 4,
        "enabled": false
    } ]
            }
    }
```

New since version

10.3

DisableSnmp

You can use the DisableSnmp method to disable SNMP on the cluster nodes.

Parameter

This method has no input parameter.

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "DisableSnmp",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "result" : {},
   "id" : 1
}
```

New since version

9.6

EnableBmcColdReset

You can use the EnableBmcColdReset method to enable a background task that periodically resets the Baseboard Management Controller (BMC) for all nodes in the cluster.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|--|---------|---------------|----------|
| timeout | The time between BMC reset operations, in minutes. | integer | 20160 minutes | No |

Return values

| Name | Description | Туре |
|--------------------------|--|---------|
| cBmcResetDurationMinutes | Returns the time between reset intervals. The interval should always be 0 after the command completes. | integer |

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
"id": 1,
   "result": {
        "cBmcResetDurationMinutes": 36000
}
```

New since version

12.0

EnableClusterSsh

You can use the <code>EnableClusterSsh</code> method to enable the SSH service on all nodes in the storage cluster.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|--------|---------------|----------|
| duration | The amount of time that the SSH service will remain enabled. | string | None | Yes |

Return values

| Name | Description | Туре |
|--------|---|-------------|
| result | A JSON object containing the status of the SSH service for the storage cluster, the time remaining until SSH is disabled, and the SSH service status for each node. | JSON object |

Requests for this method are similar to the following example:

```
{
   "method": "EnableClusterSsh",
   "params": {
      "duration" : "02:00:00.00"
   },
   "id" : 1
}
```

Response example

```
{
    "id": 1,
    "result" : {
    "enabled": true,
    "timeRemaining": "00:43:21",
    "nodes": [
        "nodeID": 1,
        "enabled": true
    },
        "nodeID": 2,
        "enabled": true
    },
        "nodeID": 3,
        "enabled": false
    },
        "nodeID": 4,
        "enabled": false
    } ]
           }
    }
```

10.3

EnableSnmp

You can use the EnableSnmp method to enable SNMP on cluster nodes. When you enable SNMP, the action applies to all nodes in the cluster, and the values that are passed replace all values set in any previous call to EnableSnmp.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------|---|---------|---------------|----------|
| snmpV3Enabled | If set to true, then SNMP v3 is enabled on each node in the cluster. If set to false, then SNMP v2 is enabled. | boolean | false | No |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
"method": "EnableSnmp",
   "params": {
        "snmpV3Enabled" : "true"
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

New since version

9.6

GetBinAssignmentProperties

You can use the GetBinAssignmentProperties method to retrieve the bin assignment properties in the database.

Parameter

This method has the no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------------|---|-------------------------------|
| properties | Details the properties for all current bin assignments in the database. | binAssignmentProperties array |

Request example

Requests for this method are similar to the following example:

```
"method": "GetBinAssignmentProperties",
    "params": {
    },
    "id": 1
}
```

Response example

```
{
    "id": 1,
   "result": {
        "properties": {
            "algorithmRuntimeMS": 1105,
            "areReplicasValid": true,
            "binCount": 65536,
            "isBalanced": true,
            "isStable": true,
            "isWellCoupled": false,
            "layout": [
                {
                    "protectionDomainName": "1",
                    "services": [
                             "budget": 7281,
                             "serviceID": 16
                         },
                             "budget": 7281,
                             "serviceID": 19
                         },
```

```
"budget": 7281,
                "serviceID": 24
            }
        ]
    },
        "protectionDomainName": "2",
        "services": [
                "budget": 7281,

        "protectionDomainName": "3",
        "services": [
                "budget": 7281,
                "serviceID": 18
            },
                "budget": 7281,
                "serviceID": 21
            },
                "budget": 7281,
                "serviceID": 23
        ]
    }
],
"numSwaps": 0,
"numUpdatingBins": 0,
"protectionDomainType": "node",
"reason": "Final",
"replicationCount": 2,
```

12.0

GetClusterSshInfo

You can use the <code>GetClusterSshInfo</code> method to query the status of the SSH service for the entire storage cluster.

Parameter

This method has no input parameter.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|---|-------------|
| result | A JSON object containing the status of the SSH service for the storage cluster, the time remaining until SSH is disabled, and the SSH service status for each node. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"method": "GetClusterSshInfo",
   "params": {},
   "id" : 1
}
```

Response example

```
{
    "id": 1,
    "result" : {
    "enabled": "true",
    "timeRemaining": "00:43:21",
    "nodes": [
        "nodeID": 1,
        "enabled": true
    },
        "nodeID": 2,
        "enabled": true
    },
        "nodeID": 3,
        "enabled": false
    },
        "nodeID": 4,
        "enabled": false
    } ]
           }
    }
```

10.3

GetClusterStructure

You can use the <code>GetClusterStructure</code> method to back up the current storage cluster configuration information. If the storage cluster configuration is changed while this method is running, the contents of the configuration backup will be unpredictable. You can save this data to a text file and restore it on other clusters, or the same cluster in the case of a disaster.

Parameter

This method has no input parameter.

Return values

| Name | Description | Туре |
|--------|---|------------------|
| result | A JSON object containing the current storage cluster configuration information. | clusterStructure |

Requests for this method are similar to the following example:

```
{
  "method": "GetClusterStructure",
  "params": {},
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
    "result" : <clusterStructure object containing configuration
information>
}
```

New since version

10.3

GetFipsReport

You can use the GetFipsReport method to check the FIPS 140-2 encryption feature support status of all nodes in the storage cluster.

Parameter

This method has no input parameter.

Return values

| Name | Description | Туре |
|--------|--|------------|
| result | A JSON object containing the status of FIPS 140-2 feature support for every node, and error information for each node that did not respond to the query. | fipsReport |

Requests for this method are similar to the following example:

```
"method": "GetFipsReport",
   "params": {},
   "id" : 1
}
```

Response example

```
{
    "id": 1,
    "result": {
    "nodes": [
        {
           "nodeID": 1,
           "fipsDrives": "None",
           "httpsEnabled": true
        },
           "nodeID": 3,
           "fipsDrives": "None",
           "httpsEnabled": true
    ],
    "errorNodes": [
           "nodeID": 2,
           "error": {
                "message": "The RPC timed out.",
                "name": "xRpcTimeout"
        }
    ]
}
```

10.3

GetLldpConfig

You can use the GetLldpConfig method to get the Link Layer Discovery Protocol (LLDP) configuration for each node of a storage cluster.

Parameters

This method has no input parameters.

Return values

| Name | Description | Туре |
|------|---|-------------|
| | Information about the storage cluster LLDP configuration. | JSON object |

Requests for this method are similar to the following example:

```
{
   "method": "GetLldpConfig",
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

GetLldpInfo

You can use the GetLldpInfo method to get the Link Layer Discovery Protocol (LLDP) configuration for each node of a storage cluster, or an individual storage node.

Parameters

This method has no input parameters.

Return values

| Name | Description | Туре |
|----------|--|-------------|
| lldplnfo | Information about the chassis, interface, and neighbor LLDP settings for each node of a storage cluster. | JSON object |

Requests for this method are similar to the following example:

```
{
   "method": "GetLldpInfo",
   "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

New since version

11.0

Find more information

GetLldpInfo

GetNodeFipsDrivesReport

You can use the GetNodeFipsDrivesReport method to check the FIPS 140-2 drive encryption capability status of a single node in the storage cluster. You must run this method against an individual storage node.

Parameter

This method has no input parameter.

Return values

| Name | Description | Туре |
|------------|--|--------|
| fipsDrives | A JSON object containing the status of FIPS 140-2 feature support for this node. Possible values: | string |
| | None: Node is not FIPS capable. | |
| | Partial: Node is FIPS capable but not all drives in the node are FIPS drives. | |
| | Ready: Node is FIPS capable and all drives in the node are FIPS drives (or no drives are present). | |

Requests for this method are similar to the following example:

```
{
   "method": "GetNodeFipsDrivesReport",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "fipsDrives": "None"
    }
}
```

New since version

11.5

GetNtpInfo

You can use the GetNtpInfo method to get the current network time protocol (NTP) configuration information.

Parameter

This method has no input parameter.

Return values

This method has the following return values:

| Name | Description | Туре |
|-----------------|--|--------------|
| servers | List of NTP servers. | string array |
| broadcastclient | Indicates whether or not the nodes in the cluster are listening for broadcast NTP messages. Possible values: • true • false | boolean |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetNtpInfo",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
   "result" : {
      "broadcastclient" : false,
      "servers" : [ "us.pool.ntp.org" ]
    }
}
```

New since version

9.6

GetNvramInfo

You can use the GetNvramInfo method to get information from each node about the NVRAM card.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| force | The force parameter must be included on this method to successfully run on all nodes in the cluster. | boolean | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|---|-------------|
| nvramInfo | Arrays of events and errors detected on the NVRAM card. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "GetNvramInfo",
    "params": {
        "force": true
        },
    "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

New since version

9.6

GetNvramInfo

GetProtectionDomainLayout

You can use the GetProtectionDomainLayout method to return all protection domain information for a cluster, including which chassis and which custom protection domain each node is in.

Parameter

This method has the no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------------|---|---|
| protectionDomainLayout | List of nodes, each with its associated protection domains. | JSON list of nodeProtectionDomains objects. |

Request example

Requests for this method are similar to the following example:

```
"method": "GetProtectionDomainLayout",
   "params": {},
   "id" : 1
}
```

Response example

```
},
      "protectionDomainName": "Rack-1",
      "protectionDomainType": "custom"
  1
},
  "nodeID": 2,
  "protectionDomains": [

      "protectionDomainType": "custom"
    }
```

```
]
}
}
```

12.0

GetRemoteLoggingHosts

You can use the GetRemoteLoggingHosts method to get the current list of log servers.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|---------------------|
| | List of IP address and port information about hosts configured to receive forwarded logging information. | loggingServer array |

Request example

Requests for this method are similar to the following example:

```
"id": 3386609,
"method": "GetRemoteLoggingHosts",
"params": {}
}
```

Response example

9.6

Find more information

SetRemoteLoggingHosts

GetSnmpACL

You can use the <code>GetSnmpACL</code> method to get the current SNMP access permissions on the cluster nodes.

Parameters

This method has no input parameters.

Return values

| Name | Description | Туре |
|----------|--|---------------|
| networks | List of networks and what type of access they have to the SNMP servers running on the cluster nodes. This value is present if SNMP v3 is disabled. | network array |

| Name | Description | Туре |
|----------|---|---------------|
| usmUsers | List of users and the type of access they have to the SNMP servers running on the cluster nodes. This value is present if SNMP v3 is enabled. | usmUser array |

Requests for this method are similar to the following example:

```
{
"method": "GetSnmpACL",
"params": {},
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

New since version

9.6

GetSnmpInfo

You can use the GetSnmpInfo method to get the current simple network management protocol (SNMP) configuration information.

Parameters

GetSnmpInfo is deprecated for versions later than Element version 8.0. The GetSnmpState and SetSnmpACL methods replace the GetSnmpInfo method.

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|---------------|--|---------|
| networks | List of networks and access types enabled for SNMP. Note: networks is only displayed if SNMP v3 is disabled. | network |
| enabled | Indicates if the nodes in the cluster are configured for SNMP. Possible values: • true • false | boolean |
| snmpV3Enabled | If the node in the cluster is configured for SNMP v3. Possible values: • true • false | boolean |
| usmUsers | If SNMP v3 is enabled, a list of user access parameters for SNMP is returned from the cluster. This is returned instead of the networks parameter. | usmUser |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetSnmpInfo",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

New since version

9.6

- GetSnmpState
- SetSnmpACL

GetSnmpState

You can use the GetSnmpState method to get the current state of the SNMP feature.

Parameters

This method has no input parameters.

Return values

| Name | Description | Туре |
|---------------|---|---------|
| enabled | • true • false Default value is false. Returns true if the nodes in the cluster are configured for SNMP. | boolean |
| snmpV3Enabled | Possible values: • true • false Default value is false. Returns true if the nodes in the cluster are configured for SNMP v3. | boolean |

Requests for this method are similar to the following example:

```
{
   "method": "GetSnmpState",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
"result" : {
   "enabled": true,
   "snmpV3Enabled": false
   }
}
```

New since version

9.6

SetSnmpACL

GetSnmpTrapInfo

You can use the GetSnmpTrapInfo method to get current SNMP trap configuration information.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|----------------------------------|---|-------------------------|
| trapRecipients | List of hosts that are to receive the traps generated by the cluster. | snmpTrapRecipient array |
| clusterFaultTrapsEnabled | The value true indicates that a solidFireClusterFaultNotification is configured to be sent to the list of trap recipients when a cluster fault is logged. | boolean |
| clusterFaultResolvedTrapsEnabled | The value true indicates that a solidFireClusterFaultResolvedNotification is configured to be sent to the list of trap recipients when a cluster fault is resolved. | boolean |
| clusterEventTrapsEnabled | The value true indicates that a solidFireClusterEventNotification is configured to be sent to the list of trap recipients when a cluster event is logged. | boolean |

Request example

Requests for this method are similar to the following example:

```
{
   "method":"GetSnmpTrapInfo"
   "params":{},
   "id":1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "clusterEventTrapsEnabled": true,
    "clusterFaultResolvedTrapsEnabled": true,
    "clusterFaultTrapsEnabled": true,

GetSSLCertificate

You can use the GetSSLCertificate method to retrieve the SSL certificate that is currently active on the storage nodes of the cluster.

Parameters

This method has no input parameters.

Return values

| Name | Description | Туре |
|-------------|---|-------------|
| certificate | The full PEM-encoded text of the certificate. | string |
| details | The decoded information of the certificate. | JSON object |

Requests for this method are similar to the following example:

```
"method" : "GetSSLCertificate",
   "params" : {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "certificate": "----BEGIN CERTIFICATE----
```

10.0

ListProtectionDomainLevels

You can use the ListProtectionDomainLevels method to list the tolerance and resiliency levels of the storage cluster. Tolerance levels indicate the cluster's ability to continue reading and writing data in the event of a failure, and resiliency levels indicate the storage cluster's ability to automatically heal itself from one or more failures.

Parameter

This method has no input parameter.

Return values

| Name | Description | Туре |
|------------------------|--|-----------------------|
| protectionDomainLevels | A list of the different protection domain levels, where each supplies the storage cluster's tolerance and resiliency information. | protectionDomainLevel |

Requests for this method are similar to the following example:

```
"method": "ListProtectionDomainLevels",
   "params": {},
   "id" : 1
}
```

Response example

```
{
    "id": 1,
    "result": {
        "protectionDomainLevels": [
                "protectionDomainType": "node",
                "resiliency": {
                    "protectionSchemeResiliencies": [
                                 "protectionScheme": "doubleHelix",
                                 "sustainableFailuresForBlockData": 0,
                                 "sustainableFailuresForMetadata": 1
                            }
                    "singleFailureThresholdBytesForBlockData": 0,
                    "sustainableFailuresForEnsemble": 1
                },
                "tolerance": {
                    "protectionSchemeTolerances": [
                                 "protectionScheme": "doubleHelix",
                                 "sustainableFailuresForBlockData": 0,
                                 "sustainableFailuresForMetadata": 1
                            }
                    ],
```

```
"sustainableFailuresForEnsemble": 1
                }
            },
                "protectionDomainType": "chassis",
                "resiliency": {
                    "protectionSchemeResiliencies": [
                                 "protectionScheme": "doubleHelix",
                                 "sustainableFailuresForBlockData": 0,
                                 "sustainableFailuresForMetadata": 1
                    ],
                    "singleFailureThresholdBytesForBlockData": 0,
                    "sustainableFailuresForEnsemble": 1
                },
                "tolerance": {
                    "protectionSchemeTolerances": [
                                 "protectionScheme": "doubleHelix",
                                 "sustainableFailuresForBlockData": 0,
                                 "sustainableFailuresForMetadata": 1
                    1,
                    "sustainableFailuresForEnsemble": 1
                }
        1
    }
}
```

RemoveSSLCertificate

You can use the RemoveSSLCertificate method to remove the user SSL certificate and private key for the storage nodes in the cluster. After the certificate and private key are removed, the storage nodes are configured to use the default certificate and private key.

Parameters

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method" : "RemoveSSLCertificate",
    "params" : {},
    "id" : 3
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id" : 3,
    "result" : {}
}
```

New since version

10.0

ResetNetworkConfig

You can use the ResetNetworkConfig method to help resolve network configuration issues for an individual node. This method resets an individual node's network configuration to the factory default settings.

Parameters

This method has no input parameters.

Return value

This method has no return values.

Request example

```
{
   "method": "ResetNetworkConfig",
   "params": {},
   "id" : 1
}
```

This method does not return a response.

New since version

11.0

ResetSupplementalTlsCiphers

You can use the ResetSupplementalTlsCiphers method to restore the list of supplemental TLS ciphers to the default. You can use this method on the entire cluster.

Parameter

This method has no input parameters.

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ResetSupplementalTlsCiphers",
   "params": {},
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

New since version

11.3

SetClusterStructure

You can use the SetClusterStructure method to restore the storage cluster configuration information from a backup. When you call the method, you pass the clusterStructure object containing the configuration information you want to restore as the params parameter.

Parameter

This method has the following input parameter:

| Name | Description | Туре |
|--------|---|------------------|
| params | A JSON object containing the current storage cluster configuration information. | clusterStructure |

Return values

This method has the following return values:

| Name | Description | Туре |
|--------|-----------------------------|-------------|
| result | Asynchronous result handle. | asyncHandle |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "SetClusterStructure",
  "params": <insert clusterStructure object here>,
  "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result" : {
   "asyncHandle": 1
   }
}
```

New since version

10.3

SetLldpConfig

You can use the SetLldpConfig method to configure the Link Layer Discovery Protocol (LLDP) settings for a storage cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|---------|---------------|----------|
| enableOtherProtocol s | Enable automatic use of other discovery protocols - CDP, FDP, EDP, and SONMP. | boolean | true | No |
| enableMed | Enable Media Endpoint Discovery (LLDP-MED). | boolean | false | No |
| enableLldp | Enable or disable LLDP. | boolean | true | No |

Return values

This method has the following return value:

| Name | Description | Туре |
|------------|---|-------------|
| IldpConfig | Information about the current storage cluster LLDP configuration, including newly changed settings. | JSON object |

Request example

```
"id": 3920,
"method":"SetLldpConfig",
    "params": {
        "lldpConfig": {
            "enableMed": true
        }
    }
}
```

This method returns a response similar to the following example:

```
"id": 3920,
"result": {
    "lldpConfig": {
        "enableLldp": true,
        "enableMed": true,
        "enableOtherProtocols": true
    }
}
```

SetNtpInfo

You can use the SetNtpInfo method to configure NTP on cluster nodes. The values you set with this interface apply to all nodes in the cluster. If an NTP broadcast server periodically broadcasts time information on your network, you can optionally configure nodes as broadcast clients.

Parameters

Ensure that you use NTP servers that are internal to your network, rather than the installation defaults.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------|--|--------------|---------------|----------|
| servers | List of NTP servers to add to each node NTP configuration. | string array | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------------|--|---------|---------------|----------|
| broadcastclient | Enables every node in the cluster as a broadcast client. | boolean | false | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "SetNtpInfo",
"params": {
    "servers" : [
        "ntpserver1.example.org",
        "ntpserver2.example.org",
        "ntpserver3.example.org"
    ],
    "broadcastclient" : false
},
"id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
    "id" : 1,
    "result" : {}
}
```

New since version

9.6

SetProtectionDomainLayout

You can use the SetProtectionDomainLayout method to assign nodes to custom protection domains.

Information must be provided for all active nodes in the cluster and no information can be provided for inactive

nodes. All nodes in a given chassis must be assigned to the same custom protection domain. The same protectionDomainType must be supplied for all nodes. protectionDomainTypes that are not custom, such as node and chassis, should not be included. If either of these are provided, then the custom protection domains are ignored and an appropriate error is returned.

Custom protection domains are not supported with the following configurations:

- · Storage clusters containing shared chassis
- Two-node storage clusters

The method returns an error when used on storage clusters with these configurations.

Parameter

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------------------|--|--|---------------|----------|
| protectionDomainLa yout | Protection domain information for each node. | JSON list of nodeProtectionDom ains objects. | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------------|---|---|
| protectionDomainLayout | List of nodes, each with its associated protection domains. | JSON list of nodeProtectionDomains objects. |

Request example

```
"id": 1,
"method": "SetProtectionDomainLayout",
"params": {
  "protectionDomainLayout": [
    {
      "nodeID": 1,
      "protectionDomains": [
          "protectionDomainName": "Rack-1",
          "protectionDomainType": "custom"
    },
      "nodeID": 2,
      "protectionDomains": [
          "protectionDomainName": "Rack-1",
          "protectionDomainType": "custom"
    },
      "nodeID": 3,
      "protectionDomains": [
          "protectionDomainName": "Rack-2",
          "protectionDomainType": "custom"
      1
    },
      "nodeID": 4,
      "protectionDomains": [
          "protectionDomainName": "Rack-2",
          "protectionDomainType": "custom"
```

This method returns a response similar to the following example:

```
"id": 1,
"result": {
  "protectionDomainLayout": [
      "nodeID": 1,
      "protectionDomains": [
          "protectionDomainName": "QTFCR2914008D",
          "protectionDomainType": "chassis"
        },
          "protectionDomainName": "Rack-1",
          "protectionDomainType": "custom"
        }
      1
    },
      "nodeID": 2,
      "protectionDomains": [
          "protectionDomainName": "QTFCR291500EA",
          "protectionDomainType": "chassis"
        },
          "protectionDomainName": "Rack-1",
          "protectionDomainType": "custom"
      ]
    },
      "nodeID": 3,
      "protectionDomains": [
          "protectionDomainName": "QTFCR291500C3",
          "protectionDomainType": "chassis"
        },
          "protectionDomainName": "Rack-2",
          "protectionDomainType": "custom"
        }
      ]
```

New since version

12.0

SetRemoteLoggingHosts

You can use the <code>SetRemoteLoggingHosts</code> method to configure remote logging from the nodes in the storage cluster to a centralized log server or servers. Remote logging is performed over TCP using the default port 514. This API does not add to the existing logging hosts. Rather, it replaces what currently exists with new values specified by this API method. You can use <code>GetRemoteLoggingHosts</code> to determine what the current logging hosts are and then use <code>SetRemoteLoggingHosts</code> to set the desired list of current and new logging hosts.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------------------|---------------|----------|
| remoteHosts | List of hosts that are log message recipients. | loggingServer array | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{
    "id" : 1,
    "result" : {}
}
```

New since version

9.6

Find more information

GetRemoteLoggingHosts

SetSnmpACL

You can use the <code>SetSnmpACL</code> method to configure SNMP access permissions on the cluster nodes. The values you set with this interface apply to all nodes in the cluster, and the values that are passed replace all values set in any previous call to <code>SetSnmpACL</code>. Also note that the values set with this interface replace all network or usmUsers values set with the <code>SetSnmpInfo</code> method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------|---|---------|---------------|----------|
| networks | List of networks and what type of access they have to the SNMP servers running on the cluster nodes. See SNMP network object for possible networks values. This parameter is required if SNMP v3 is disabled. | network | None | No |
| usmUsers | List of users and the type of access they have to the SNMP servers running on the cluster nodes. This parameter is required if SNMP v3 is enabled. | usmUser | None | No |

Return values

This method has no return values.

Request example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

New since version

9.6

Find more information

SetSnmpInfo

SetSnmpInfo

You can use the SetSnmpInfo method to configure SNMP version 2 and version 3 on cluster nodes. The values you set with this interface apply to all nodes in the cluster, and the values that are passed replace all values set in any previous call to SetSnmpInfo.

Parameters

SetSnmpInfo is deprecated for Element versions 6.0 and later. Use the EnableSnmp and SetSnmpACL methods instead.

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|--|---------------|---------------|----------|
| networks | List of networks and what type of access they have to the SNMP servers running on the cluster nodes. See the SNMP network object for possible values. This parameter is required for SNMP v2 only. | network array | None | No |
| enabled | If set to true, SNMP is enabled on each node in the cluster. | boolean | false | No |
| snmpV3Enabled | If set to true, SNMP v3 is enabled on each node in the cluster. | boolean | false | No |
| usmUsers | If SNMP v3 is enabled, this value must be passed in place of the networks parameter. This parameter is required for SNMP v3 only. | usmUser | None | No |

Return values

This method has no return values.

Request example with SNMP v3 enabled

```
{
"method":"SetSnmpInfo",
"params":{
    "enabled":true,
    "usmUsers":[
        {
             "name":"user1",
                 "access":"rouser",
                  "secLevel":"auth",
                  "password":"namex1",
                  "passphrase":"yourpassphrase"
        }
        ]
        },
        "id":1
}
```

Request example with SNMP v2 enabled

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1
  "result" :{
  }
}
```

New since version

9.6

SetSnmpTrapInfo

You can use the <code>SetSnmpTrapInfo</code> method to enable and disable the generation of cluster SNMP notifications (traps) and to specify the set of hosts that receive the notifications. The values you pass with each <code>SetSnmpTrapInfo</code> method call replace all values set in any previous call.

Parameters

This method has the following input parameters:

| Name | Description | Туре |
|----------------------------------|---|-------------------------|
| trapRecipients | List of hosts that are to receive the traps generated by the storage cluster. At least one object is required if any one of the trap types is enabled. This parameter is required only if any boolean parameters are set to true. (No default value. Not required.) | snmpTrapRecipient array |
| clusterFaultTrapsEnabled | If set to true, a corresponding cluster fault notification is sent to the configured list of trap recipients when a cluster fault is logged. (Default value: false. Not required.) | boolean |
| clusterFaultResolvedTrapsEnabled | If set to true, a corresponding cluster fault resolved notification is sent to the configured list of trap recipients when a cluster fault is resolved. (Default value: false. Not required.) | boolean |

| Name | Description | Туре |
|--------------------------|--|---------|
| clusterEventTrapsEnabled | If set to true, a corresponding cluster event notification is sent to the configured list of trap recipients when a cluster event is logged. (Default value: false. Not required.) | boolean |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
"method":"SetSnmpTrapInfo",
"params":{
    "clusterFaultTrapsEnabled":true,
    "clusterFaultResolvedTrapsEnabled":true,
    "trapRecipients":[
    {
        "host":"192.30.0.10",
        "port":162,
        "community":"public"
    }
}

SetSSLCertificate

You can use the SetSSLCertificate method to set a user SSL certificate and private key for the storage nodes in the cluster.

After using the API, you must reboot the management node.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|---|--------|---------------|----------|
| certificate | The PEM-encoded text version of the certificate. Note: When setting a node or cluster certificate, the certificate must include the extendedKeyUsage extension for serverAuth. This extension allows the certificate to be used without error on common operating systems and browsers. If the extension is not present, the API will reject the certificate as invalid. | string | None | Yes |
| privateKey | The PEM-encoded text version of the private key. | string | None | Yes |

Return values

This method has no return values.

Request example

```
"method" : "SetSSLCertificate",
"params" : {
    "privateKey": "----BEGIN RSA PRIVATE KEY----
```

\nMIIEowIBAAKCAQEA8U+28fnLKQNWEWMR6akeDKuehSpS79odLGigI18qlCV/AUY5\nZLjqsT jBvTJVRv44yoCTgNrx36U7FHP4t6P/Si0aYr4ovx15wDpEM3Qyy5JPB7Je\nlOB6AD7fmiTweP 20HRYpZvY+Uz7LYEFCmrqpGZQF3iOSIcBHtLKE5186JVT6j5dq\n6yjUGQO352ylc9HXHcn6lb /jyl0DmVNUZ0caQwAmIS3Jmoyx+zj/Ya4WKq+2SqTA\nX7bX0F3wHHfXnZlHnM8fET5N/9A+K6 1S7dq9cyXu4afXcgKy14JiNBvqbBjhqJtE\n76yAy6rTHu0xM3jjdkcb9Y8miNzxF+ACq+itaw IDAQABAoIBAH1jlIZr6/sltqVW\nO0qVC/49dyNu+KWVSq92ti9rFe7hBPueh9qklh78hP9Qli tLkir3YK4GFsTFUMux\n7z1NRCxA/4LrmLSkAjW2kRXDfV12bwZq0ua9NefGw92O8D2OZvbuOx k7Put2p6se\nfgNzSjf2SI5DIX3UMe5dDN5FByu52CJ9mI4U16ngbWln2wc4nsxJg0aAEkzB7w ng\nt+Am5/Vu1LI6rGiG6oHEW0oGSuHl1esIyXXa2hqkU+1+iF2iGRMTiXac4C8d11NU\nWGIR CXFJAmsAQ+hQm7pmtsKdEqumj/PIoGXf0BoFVEWaIJIMEqnfuLZp8IelJQXn\nSFJbk2ECqYEA +d5ooU4thZXylWHUZqomaxyzOruA1T53UeH69HiFTrLjvfwuaiqj\nlHzPlhms6hxexwz1dzAp gog/NOM+2bAc0rn0dqvtV4doejtlDZKRqrNCf/cuN2QX\njaCJClCWau3sEHCckLOhWeY4HaPS oWq0GKLmKkKDChB4nWUYq3qSWQkCqYEA9zuN\nHW8GPS+yjixeKXmkKO0x/vvxzR+J5HH5znaI Hss48THyhzXpLr+v30Hy2h0yAlBS\nny5Ja6wsomb0mVe4NxVtVawq2E9vVvTa1UC+TNmFBBuL RPfjcnjDerrSuQ5lYY+M\nC9MJtXGfhp//G0bzwsRzZxOBsUJb15tppaZIs9MCgYAJricpkKjM 0x1Z1jdvXsos\nPilnbho4qLngrzuUuxKXEPEnzBxUOqCpwQgdzZLYYw788TCVVIVXLEYem2s0 7dDA\nDTo+WrzQNkvC6IgqtXH1RgqegIoG1VbgQsbsYmDhdaQ+os4+AOeQXw3vgAhJ/qNJ\njQ 4Ttw3ylt7FYkRH26ACWQKBgQC74Zmf4JuRLAo5WSZFxpcmMvtnlvdutqUH4kXA\nzPssy6t+QE La1fFbAXkZ5Pg1ITK752aiaX6KQNG6qRsA3VS1J6drD9/2AofOQU17\n+jOkGzmmoXf49Zj3iS akwg0ZbQNGXNxEsCAUr0BYAobPp9/fB4PbtUs99fvtocFr\njS562QKBgCb+JMDP5q7jpUuspj Oobd/ZS+MsomE+gFAMBJ71KFQ7KuoNezNFO+ZE\n3rnR8AqAm4VMzqRahs2PWNe2H14J4hKu96 qNpNHbsW1NjXdAL9P7oqQIrhGLVdhX\nInDXvTgXMdMoet4BKnftelrXFKHgGqXJoczq4JWzGS IHNqvkrH60\n----END RSA PRIVATE KEY----\n",

SnmpSendTestTraps

SnmpSendTestTraps enables you to test SNMP functionality for a cluster. This method instructs the cluster to send test SNMP traps to the currently configured SNMP manager.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|---------------------|--------|
| status | Status of the test. | string |

Request example

```
"method": "SnmpSendTestTraps",
    "params": {},
    "id": 1
}
```

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {
        "status": "complete"
    }
}
```

New since version

9.6

TestAddressAvailability

You can use the TestAddressAvailability method to check to see if a certain IP address is in use on an interface within the storage cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------|--|---------|---------------|----------|
| interface | The target network interface (such as eth0, Bond10G, etc). | string | None | Yes |
| address | The IP address to scan for on the target interface. | string | None | Yes |
| virtualNetworkTag | The target VLAN ID. | integer | None | No |
| timeout | The timeout in seconds for testing the target address. | integer | 5 | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|------------------------|--------|
| address | The IP address tested. | string |

| available | True if the requested IP address is in use, and false if it is not. | boolean |
|-----------|---|---------|
|-----------|---|---------|

Request example

Requests for this method are similar to the following example:

```
"method": "TestAddressAvailability",
"params": {
    "interface": "Bond10G",
    "address": "10.0.0.1",
    "virtualNetworkTag": 1234
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
    "result": {
        "address":"10.0.0.1",
        "available": true
}
```

New since version

11.0

Multitenant networking API methods

Multitenant networking in Element storage clusters allows traffic between multiple clients that are on separate logical networks to be connected to one Element storage cluster without layer 3 routing.

Connections to the storage cluster are segregated in the networking stack through the use of VLAN tagging.

Prerequisites for setting up a multitenant virtual network

- You must have identified the block of client network IP addresses to be assigned to the virtual networks on the storage nodes.
- You must have identified a client storage network IP (SVIP) address to be used as an endpoint for all

Virtual networking order of operations

1. Use the AddVirtualNetwork method to bulk provision the IP addresses you enter.

After you add a virtual network, the cluster automatically performs the following steps:

- Each storage node creates a virtual network interface.
- Each storage node is assigned a VLAN address that can be routed to using the virtual SVIP.
- VLAN IP addresses persist on each node in the event of a node reboot.
- 2. When the virtual network interface and VLAN addresses have been assigned, you can assign client network traffic to the virtual SVIP.

- Documentation for earlier versions of NetApp SolidFire and Element products

Virtual network naming conventions

NetApp Element storage systems use monotonically increasing numbers as unique identifiers for all objects in the system.

When you create a new volume, the new volumeID is an increment of exactly 1. This convention holds true with virtual networks in storage clusters running Element software. The first virtual network you create in an Element cluster has a VirtualNetworkID of 1. This ID is not the same thing as a VLAN tag number.

You can use VirtualNetworkID and the VirtualNetworkTag (VLAN tag) interchangeably where noted in the API methods.

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

AddVirtualNetwork

You can use the AddVirtualNetwork method to add a new virtual network to a cluster configuration.

When you add a virtual network, an interface for each node is created and each interface requires a virtual network IP address. The number of IP addresses you specify as a parameter for this API method must be

equal to or greater than the number of nodes in the cluster. The system bulk provisions virtual network addresses and assigns them to individual nodes automatically. You do not need to assign virtual network addresses to nodes manually.

The AddVirtualNetwork method is used only to create a new virtual network. If you want to make changes to an existing virtual network, use the ModifyVirtualNetwork method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------|---|-------------------|---------------|----------|
| addressBlocks | Unique range of IP addresses to include in the virtual network. Required members for the object: • start: The start of the IP address range. (string) • size: The number of IP addresses to include in the block. (integer) | JSON object array | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| gateway | The IP address of a gateway of the virtual network. This parameter is valid only if the namespace parameter is set to true. | string | None | No |
| name | A user-defined name for the new virtual network. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------|---|---------|---------------|----------|
| namespace | When set to true, enables the Routable Storage VLANs functionality by creating and configuring a namespace and the virtual network contained by it. | boolean | None | No |
| netmask | Unique network mask for the virtual network being created. | string | None | Yes |
| svip | Unique storage IP address for the virtual network being created. | string | None | Yes |
| virtualNetworkTag | A unique virtual network (VLAN) tag. Supported values are 1 through 4094. | integer | None | Yes |

Note: Virtual network parameters must be unique to each virtual network when you set namespace to false.

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|--|---------|
| virtualNetworkID | The virtual network ID of the new virtual network. | integer |

Request example

```
{
  "method": "AddVirtualNetwork",
  "params": {
    "virtualNetworkTag": 2010,
    "name": "network1",
    "addressBlocks" : [
        { "start": "192.86.5.1", "size": 10 },
        { "start": "192.86.5.50", "size": 20 }
    ],
    "netmask": "255.255.192.0",
    "gateway" : "10.0.1.254",
    "svip" : "192.86.5.200",
    "attributes" : {}
    "namespace" : true
  },
"id": 1
}
```

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result":
        {
            "virtualNetworkID": 5
        }
}
```

New since version

9.6

ModifyVirtualNetwork

You can use the ModifyVirtualNetwork method to change the attributes of an existing virtual network.

This method enables you to add or remove address blocks, change the netmask, or modify the name or description of the virtual network. You can also use it to enable or disable namespaces, as well as add or remove a gateway if namespaces are enabled on the virtual network.

This method requires either the virtualNetworkID or the virtualNetworkTag as a parameter, but not both.

CAUTION:

Enabling or disabling the Routable Storage VLANs functionality for an existing virtual network by changing the namespace parameter disrupts any traffic handled by the virtual network. It is best if you change the namespace parameter during a scheduled maintenance window.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------|--|---------|---------------|----------|
| virtualNetworkID | Unique identifier of the virtual network to modify. This is the virtual network ID assigned by the cluster. | integer | None | No |
| virtualNetworkTag | The network tag that identifies the virtual network to modify. | integer | None | No |

| addressBlocks | The new address block to set for this virtual network. This might include new address blocks to add to the existing object or omit unused address blocks that need to be removed. Alternatively, you can extend or reduce the size of existing address blocks. You can only increase the size of the starting addressBlocks for a Virtual Network object; you can never decrease it. Required members for this object: • start: The start of the IP address range. (string) • size: The number of IP addresses to include in the block. (integer) | JSON object | None | No |
|---------------|---|-------------|------|----|
| gateway | The IP address of a gateway of the virtual network. This parameter is valid only if the namespace parameter is set to true. | string | None | No |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| name | The new name for the virtual network. | string | None | No |

| namespace | When set to true, enables the Routable Storage VLANs functionality by recreating the virtual network and configuring a namespace to contain it. When set to false, disables the VRF functionality for the virtual network. Changing this value disrupts traffic running through this virtual network. | boolean | None | No |
|-----------|---|---------|------|----|
| netmask | New network mask for this virtual network. | string | None | No |
| svip | The storage virtual IP address for this virtual network. The SVIP for a virtual network cannot be changed. You must create a new virtual network to use a different SVIP address. | string | None | No |

Return values

This method has no return values.

Request example

```
{
  "method": "ModifyVirtualNetwork",
  "params": {
    "virtualNetworkID": 2,
    "name": "ESX-VLAN-3112",
    "addressBlocks": [
      "start": "10.1.112.1",
     "size": 20
     },
      "start": "10.1.112.100",
     "size": 20
    }
  ],
    "netmask": "255.255.255.0",
    "gateway": "10.0.1.254",
    "svip": "10.1.112.200",
    "attributes": {}
  },
  "id":1
}
```

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
  }
}
```

New since version

9.6

ListVirtualNetworks

You can use the ListVirtualNetworks method to list all configured virtual networks for the cluster.

You can use this method to verify the virtual network settings in the cluster. There are no required parameters for this method. However, to filter the results, you can pass one or more virtualNetworkID or virtualNetworkTag values.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------|--|---------------|---------------|----------|
| virtualNetworkID | Network ID to filter the list for a single virtual network. | integer | None | No |
| virtualNetworkTag | Network tag to filter the list for a single virtual network. | integer | None | No |
| virtualNetworkIDs | Network IDs to include in the list. | integer array | None | No |
| virtualNetworkTags | Network tag to include in the list. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------------|---|----------------|
| virtualNetworks | Object containing virtual network IP addresses. | virtualNetwork |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVirtualNetworks",
   "params": {
       "virtualNetworkIDs": [5,6]
    },
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
```

```
"result": {
   "virtualNetworks": [
  "addressBlocks": [
   "available": "11000000",
   "size": 8,
   "start": "10.26.250.207"
],
   "attributes": null,
   "gateway": "10.26.250.254",
   "name": "2250",
   "namespace": false,
   "netmask": "255.255.255.0",
   "svip": "10.26.250.200",
   "virtualNetworkID": 2250
  },
    "addressBlocks": [
    "available": "11000000",
    "size": 8,
    "start": "10.26.241.207"
 ],
    "attributes": null,
    "gateway": "10.26.241.254",
    "name": "2241",
    "namespace": false,
    "netmask": "255.255.255.0",
    "svip": "10.26.241.200",
    "virtualNetworkID": 2241
  },
 {
    "addressBlocks": [
    "available": "11000000",
    "size": 8,
    "start": "10.26.240.207"
  }
 ],
    "attributes": null,
    "gateway": "10.26.240.254",
    "name": "2240",
    "namespace": false,
```

```
"netmask": "255.255.255.0",
    "svip": "10.26.240.200",
    "virtualNetworkID": 2240
    },
    {
    }
}
```

9.6

RemoveVirtualNetwork

You can use the RemoveVirtualNetwork method to remove a previously added virtual network.

This method requires either the virtualNetworkID or the virtualNetworkTag as a parameter, but not both.

You cannot remove a virtual network if there are initiators associated with it. Disassociate the initiators first, and then remove the virtual network.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------|--|---------|---------------|----------|
| virtualNetworkID | Network ID that identifies the virtual network to remove. | integer | None | Yes |
| virtualNetworkTag | Network tag that identifies the virtual network to remove. | integer | None | Yes |

Return values

This method has no return values.

Request example

```
{
   "method": "RemoveVirtualNetwork",
   "params": {
      "virtualNetworkID": 5
    }
}
```

This method returns a response similar to the following example:

```
{
   "id": 1,
   "result": {}
}
```

CancelClone

You can use the CancelClone method to stop an ongoing volume clone or volume copy process. When you cancel a group clone operation, the system completes and removes the operation's associated asyncHandle.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------|--|---------|---------------|----------|
| cloneID | The cloneID for the ongoing clone process. | integer | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
   "method": "CancelClone",
   "params": {
       "cloneID" : 5,
   },
   "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

New since version

9.6

CancelGroupClone

You can use the CancelGroupClone method to stop an ongoing clone process occurring on a group of volumes. When you cancel a group clone operation, the system completes and removes the operation's associated asyncHandle.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------|--|---------|---------------|----------|
| groupCloneID | The cloneID for the ongoing clone process. | integer | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
{
    "method": "CancelGroupClone",
    "params": {
        "cloneID" : 5,
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result" : {}
}
```

New since version

9.6

CloneMultipleVolumes

You can use the CloneMultipleVolumes method to create a clone of a group of specified volumes. You can assign a consistent set of characteristics to a group of multiple volumes when they are cloned together.

Before using the groupSnapshotID parameter to clone the volumes in a group snapshot, you must first create the group snapshot using the CreateGroupSnapshot API method or the web UI. Using groupSnapshotID is

optional when cloning multiple volumes.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------------------------|--|---------|---------------|----------|
| access | New default access method for the new volumes if not overridden by information passed in the volume's array. | string | None | No |
| enableSnapMirrorRe plication | Determines whether the volume can be used for replication with SnapMirror endpoints. Possible values: • true • false | boolean | false | No |
| groupSnapshotID | ID of the group snapshot to use as a basis for the clone. | integer | None | No |
| newAccountID | New account ID for the volumes if not overridden by information passed in the volumes array. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|---------|---|-------------------|---------------|----------------|
| volumes | Collection of members that you specify for the new volumes. Members: • volumeID: (Required) • access: (Optional) Can be one of readOnly, readWrite, locked, or replicationTarget • attributes: (Optional) List of name-value pairs in JSON object format. • name: (Optional) New name for the clone. • newAccountID: (Optional) Account ID for the new volumes. • newSize: (Optional) Total size of the volume, in bytes. Size is rounded up to the nearest megabyte. If optional members are not specified, the values are inherited from the source volumes. | JSON object array | None | Yes (volumeID) |

Return values

This method has the following return values:

| Name Description Type | |
|-----------------------|--|
|-----------------------|--|

| asyncHandle | A value returned from an asynchronous method call. | integer |
|--------------|--|-------------------|
| groupCloneID | Unique ID of the new group clone. | integer |
| members | List of volumeIDs for the source and destination volume pairs. | JSON object array |

Request example

Requests for this method are similar to the following example:

Response example

```
{
  "id": 1,
  "result": {
    "asyncHandle": 12,
    "groupCloneID": 4,
    "members": [
      "srcVolumeID": 5,
      "volumeID": 29
     },
      "srcVolumeID": 18,
      "volumeID": 30
     },
     {
      "srcVolumeID": 20,
      "volumeID": 31
    ]
}
```

9.6

CloneVolume

You can use the CloneVolume method to create a copy of a volume. This method is asynchronous and might take a variable amount of time to complete.

The cloning process begins immediately when you make the <code>CloneVolume</code> request and is representative of the state of the volume when the API method is issued. You can use the <code>GetAsyncResult</code> method to determine when the cloning process is complete and the new volume is available for connections. You can use <code>ListSyncJobs</code> to see the progress of creating the clone. The initial attributes and quality of service settings for the volume are inherited from the volume being cloned. You can change these settings with <code>ModifyVolume</code>.

Cloned volumes do not inherit volume access group membership from the source volume.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|-------------|---------------|----------|
| access | Access allowed for the new volume. If a value is not specified, the access value does not change. Possible values: • readOnly: (Optional) Only read operations are allowed. • readWrite: (Optional) Reads and writes are allowed. • locked: (Optional) No reads or writes are allowed. If not specified, the access value of the volume being cloned is used. • replicationT arget: (Optional) Identify a volume as the target volume for a paired set of volumes. If the volume is not paired, the access status is locked. | string | None | No |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |

| Name | Description | Туре | Default value | Required |
|---------------------------------|---|---------|---|----------|
| enable512e | Specifies whether the new volume should use 512-byte sector emulation. If unspecified, the setting of the volume being cloned is used. | boolean | Setting of original volume | No |
| enableSnapMirrorRe plication | Determines whether the volume can be used for replication with SnapMirror endpoints. Possible values: • true • false | boolean | false | No |
| name | Name of the new cloned volume; must be 1 to 64 characters in length. | string | None | Yes |
| newAccountID | AccountID for the owner of the new volume. If unspecified, the accountID of the owner of the volume being cloned is used. | integer | AccountID of the owner of original volume | No |
| newSize | New size of the volume, in bytes. Might be greater or less than the size of the volume being cloned. If not specified, the volume size is not changed. Size is rounded up to the nearest 1MB in size. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|------------|--|---------|---------------|----------|
| snapshotID | ID of the snapshot that is used as the source of the clone. If no ID is provided, the current active volume is used. | integer | None | No |
| volumeID | VolumeID for the volume to be cloned. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|---|-------------|
| asyncHandle | The handle value used to obtain the operation result. | integer |
| cloneID | The cloneID for the newly cloned volume. | integer |
| curve | The QoS curve values applied to the clone. | JSON object |
| volume | An object containing information about the newly cloned volume. | volume |
| volumeID | VolumeID for the newly cloned volume. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "CloneVolume",
"params": {
    "volumeID" : 5,
    "name" : "mysqldata-snapshot1",
    "access" : "readOnly"
},
"id" : 1
}
```

Response example

```
{
 "id": 1,
 "result": {
      "asyncHandle": 42,
     "cloneID": 37,
     "volume": {
          "access": "readOnly",
          "accountID": 1,
          "attributes": {},
          "blockSize": 4096,

CopyVolume

You can use the <code>CopyVolume</code> method to overwrite the data contents of an existing volume with the data contents of another volume (or snapshot). Attributes of the destination volume such as IQN, QoS settings, size, account, and volume access group membership are not changed. The destination volume must already exist and must be the same size as the source volume.

It is best if clients unmount the destination volume before the operation begins. If the destination volume is modified during the operation, the changes are lost. This operation can take a variable amount of time to complete. You can use the GetAsyncResult method to determine when the process has finished, and ListSyncJobs to see the progress of the copy.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------|--|---------|---------------|----------|
| dstVolumeID | VolumeID of the volume to overwrite. | integer | None | Yes |
| volumeID | VolumeID of the volume to be read from. | integer | None | Yes |
| snapshotID | ID of the snapshot that is used as the source of the clone. If no ID is provided, the current active volume is used. | integer | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|---|---------|
| asyncHandle | Handle value used to obtain the operation result. | integer |
| cloneID | CloneID for the newly cloned volume. | integer |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "CopyVolume",
    "params": {
        "volumeID" : 3,
        "dstVolumeID" : 2
    },
    "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
   "result": {
       "asyncHandle": 9,
       "cloneID": 5
    }
}
```

CreateQoSPolicy

You can use the CreateQoSPolicy method to create a QoSPolicy object that you can later apply to a volume upon creation or modification. A QoS policy has a unique ID, a name, and QoS settings.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------|---|--------|---------------|----------|
| name | The name of the QoS policy; for example, gold, platinum, or silver. | string | None | Yes |
| qos | The QoS settings that this policy represents. | QoS | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|-------------------------------------|-----------|
| qosPolicy | The newly created QoSPolicy object. | QoSPolicy |

Request example

Requests for this method are similar to the following example:

```
"id": 68,
   "method": "CreateQoSPolicy",
   "params": {
        "name": "bronze",
        "qos": {
             "minIOPS": 50,
             "maxIOPS": 15000,
             "burstIOPS": 15000
        }
    }
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 68,
  "result": {
    "qosPolicy": {
      "name": "bronze",
      "qos": {
        "burstIOPS": 15000,
        "burstTime": 60,
        "curve": {
          "4096": 100,
          "8192": 160,
          "16384": 270,
          "32768": 500,
          "65536": 1000,
          "131072": 1950,
          "262144": 3900,
          "524288": 7600,
          "1048576": 15000
        },
        "maxIOPS": 15000,
        "minIOPS": 50
      "qosPolicyID": 2,
      "volumeIDs": []
    }
  }
}
```

New since version

10.0

CreateVolume

You can use the CreateVolume method to create a new, empty volume on the cluster. As soon as the volume is created, the volume is available for connection via iSCSI.

Volumes created without specified QoS values use the default values. You can view default values for a volume by using the <code>GetDefaultQoS</code> method.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------------------|--|-------------|---------------|----------|
| access | The access mode for the volume. If this parameter is included, the only supported value is snapMirrorTarge t. | string | None | No |
| accountID | The ID of the account that owns this volume. | integer | None | Yes |
| associateWithQo SPolicy | Associate the volume with the specified QoS policy. Possible values: • true: Associate the volume with the QoS policy specified in the QoSPolicyID parameter. • false: Do not associate the volume with the QoS policy specified in the QoS policy specified in the QoSPolicyID parameter. When false, any existing policy association is removed, regardless of whether you specify a QoS policy in the QoSPolicy parameter. | boolean | true | No |
| attributes | List of name-value pairs in JSON object format. The total attribute size must be less than 1000B, or 1KB, including JSON formatting characters. | JSON object | None | No |

| Name | Description | Туре | Default value | Required |
|---------------------------------|--|---------|---------------|----------|
| enable512e | Enable 512-byte sector emulation. Possible values: true: The volume provides 512-byte sector emulation. false: 512e emulation is not enabled. | boolean | None | Yes |
| enableSnapMirro rReplication | Determines whether the volume can be used for replication with SnapMirror endpoints. Possible values: • true • false | boolean | false | No |
| fifoSize | Specifies the maximum number of First-In-First-Out (FIFO) snapshots supported by the volume. Note that FIFO and non-FIFO snapshots both use the same pool of available snapshot slots on a volume. Use this option to limit FIFO snapshot consumption of the available snapshot slots. If omitted, the value defaults to 24. | integer | 24 | No |

| Name | Description | Туре | Default value | Required |
|-------------|--|------------|---------------|----------|
| minFifoSize | Specifies the minimum number of First-In-First-Out (FIFO) snapshot slots reserved by the volume. This guarantees that if you are using both FIFO snapshots and non-FIFO snapshots on a volume that the non-FIFO snapshots do not unintentionally consume too many FIFO slots. It also ensures that at least this many FIFO snapshots are always available. Since FIFO and non-FIFO snapshots share the same pool, the minFifoSize reduces the total number of possible non-FIFO snapshots by the same amount. If omitted, the value defaults to 0. | integer | 0 | No |
| name | Name of the volume access group (may be user-specified). Not required to be unique, but recommended. Must be 1 to 64 characters in length. | string | None | Yes |
| qos | The initial quality of service settings for this volume. Default values are used if none are specified. Possible values: • minIOPS • maxIOPS • burstIOPS | QoS object | None | No |

| Name | Description | Туре | Default value | Required |
|-------------|---|---------|---------------|----------|
| qosPolicyID | The ID for the policy whose QoS settings should be applied to the specified volumes. This parameter is mutually exclusive with the qos parameter. | integer | None | No |
| totalSize | Total size of the volume, in bytes. Size is rounded up to the nearest megabyte. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|----------|---|-------------|
| volume | Object containing information about the newly created volume. | volume |
| volumeID | The volumeID for the newly created volume. | integer |
| curve | The curve is a set of key-value pairs. The keys are the I/O sizes in bytes. The values represent the cost of performing an IOP at a specific I/O size. The curve is calculated relative to a 4096 byte operation set at 100 IOPS. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "CreateVolume",
   "params": {
      "name": "mysqldata",
      "accountID": 1,
      "totalSize": 107374182400,

GetDefaultQoS

CreateBackupTarget

You can use CreateBackupTarget to create and store backup target information so that you do not need to re-enter it each time a backup is created.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|---|-------------|---------------|------------------------|
| name | Name for the backup target. | string | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | Yes (but can be empty) |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------|--|---------|
| backupTargetID | Unique identifier assigned to the new backup target. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateBackupTarget",
    "params": {
        "name": "mytargetbackup"
     },
"id": 1
}
```

Response example

```
{
    "id": 1,
    "result": {
        "backupTargetID": 1
    }
}
```

9.6

DeleteQoSPolicy

You can use the DeleteQoSPolicy method to delete a QoS policy from the system. The QoS settings for all volumes created or modified with this policy are unaffected.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|---|---------|---------------|----------|
| qosPolicyID | The ID of the QoS policy to be deleted. | integer | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"id": 663,
  "method": "DeleteQoSPolicy",
  "params": {
     "qosPolicyID": 4
}
```

Response example

```
{
  "id": 663,
  "result": {}
}
```

9.6

DeleteVolume

You can use the DeleteVolume method to mark an active volume for deletion. When marked, the volume is purged (permanently deleted) after the cleanup interval elapses.

After making a request to delete a volume, any active iSCSI connections to the volume are immediately terminated and no further connections are allowed while the volume is in this state. A marked volume is not returned in target discovery requests.

Any snapshots of a volume that has been marked for deletion are not affected. Snapshots are kept until the volume is purged from the system. If a volume is marked for deletion and has a bulk volume read or bulk volume write operation in progress, the bulk volume read or write operation is stopped.

If the volume you delete is paired with a volume, replication between the paired volumes is suspended and no data is transferred to it or from it while in a deleted state. The remote volume the deleted volume was paired with enters into a PausedMisconfigured state and data is no longer sent to it or from the deleted volume. Until the deleted volume is purged, it can be restored and data transfers resume. If the deleted volume gets purged from the system, the volume it was paired with enters into a StoppedMisconfigured state and the volume pairing status is removed. The purged volume becomes permanently unavailable.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|---------------------------------|---------|---------------|----------|
| volumeID | The ID of the volume to delete. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|----------|---|---------|
| volume | Object containing information about the deleted volume. | volume |
| volumeID | The volumeID of the deleted volume. | integer |

| p. b. c. s. | The curve is a set of key-value pairs. The keys are the I/O sizes in bytes. The values represent the cost of performing an IOP at a specific I/O size. The curve is calculated relative to a 4096 byte operation set at 100 IOPS. | JSON object |
|----------------------|---|-------------|

      "totalSize": 1000341504,
      "virtualVolumeID": null,
      "volumeAccessGroups": [
        1
      ],
      "volumeID": 5,
      "volumePairs": []
  }
}
```

9.6

DeleteVolumes

You can use the DeleteVolumes method to mark multiple (up to 500) active volumes for deletion. When marked, the volume is purged (permanently deleted) after the cleanup interval elapses.

After making a request to delete volumes, any active iSCSI connections to the volumes are immediately terminated and no further connections are allowed while the volumes are in this state. A marked volume is not returned in target discovery requests.

Any snapshots of a volume that has been marked for deletion are not affected. Snapshots are kept until the volume is purged from the system. If a volume is marked for deletion and has a bulk volume read or bulk volume write operation in progress, the bulk volume read or write operation is stopped.

If the volumes you delete are paired with a volume, replication between the paired volumes is suspended and

no data is transferred to them or from them while in a deleted state. The remote volumes the deleted volumes were paired with enter into a PausedMisconfigured state and data is no longer sent to them or from the deleted volumes. Until the deleted volumes are purged, they can be restored and data transfers resume. If the deleted volumes are purged from the system, the volumes they were paired with enter into a StoppedMisconfigured state and the volume pairing status is removed. The purged volumes become permanently unavailable.

Parameters

This method has the following input parameters.

At least one of the following parameters are required, and you must use only one of the parameters (they are all mutually exclusive with one another).

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------------|---------------|-----------|
| volumeIDs | The list of IDs of the volumes to delete from the system. | integer array | None | See Note. |
| volumeAccessGroup IDs | A list of volume access group IDs. All of the volumes from all of the volume access groups you specify in this list are deleted from the system. | integer array | None | See Note. |
| accountIDs | A list of account IDs. All volumes from these accounts are deleted from the system. | integer array | None | See Note. |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|---|-------------|
| volumes | Information about the newly deleted volume. | volume |
| curve | The curve is a set of key-value pairs. The keys are the I/O sizes in bytes. The values represent the cost of performing an IOP at a specific I/O size. The curve is calculated relative to a 4096 byte operation set at 100 IOPS. | JSON object |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "DeleteVolumes",
    "params": {
        "accountIDs" : [1, 2, 3]
    },
    "id" : 1
}
```

Response example

```
{
  "id" : 1,
  "result": {
    "volumes" : [ {
      "access": "readWrite",
      "accountID": 1,
      "attributes": {},
      "blockSize": 4096,
      "createTime": "2015-03-06T18:50:56Z",
      "deleteTime": "",
      "enable512e": False,
      "ign": "ign.2010-01.com.solidfire:pzsr.vclient-030-v00001.1",
      "name": "vclient-030-v00001",
      "qos": {
        "burstIOPS": 15000,
        "burstTime": 60,
        "curve": {},
        "maxIOPS": 15000,
        "minIOPS": 100
      },
      "purgeTime": "",
      "sliceCount": 1,
      "scsiEUIDeviceID": "707a73720000001f47acc0100000000",

      "volumePairs": [],
      "volumeID": 1
    } ]
 }
}
```

9.6

GetBackupTarget

You can use the GetBackupTarget method to return information about a specific backup target that you have created.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------|--|-------------|---------------|----------|
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| backupTargetID | Unique identifier assigned to the backup target. | integer | None | Yes |
| name | Name of the backup target. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------------|---|-------------|
| backupTarget | List of name-value pairs in JSON object format. | JSON object |

Request example

Requests for this method are similar to the following example:

```
"id": 1,
   "method": "GetBackupTarget",
   "params": {
        "backupTargetID": 1
    }
}
```

Response example

9.6

GetVolumeStats

You can use the GetVolumeStats method to get high-level activity measurements for a single volume. Values are cumulative from the creation of the volume.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|---|---------|---------------|----------|
| volumeID | Specifies the volume for which statistics are gathered. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|------------------------------|-------------|
| volumeStats | Volume activity information. | volumeStats |

Request example

Requests for this method are similar to the following example:

```
"method": "GetVolumeStats",
   "params": {
       "volumeID": 32
},
   "id": 1
}
```

Response example

```
{
 "id": 1,
  "result": {
    "volumeStats": {
      "accountID": 1,
      "actualIOPS": 0,
      "asyncDelay": null,
      "averageIOPSize": 0,
      "burstIOPSCredit": 0,
      "clientQueueDepth": 0,
      "desiredMetadataHosts": null,
      "latencyUSec": 0,
      "metadataHosts": {
        "deadSecondaries": [],
        "liveSecondaries": [
          32
        ],
        "primary": 60
      },
      "nonZeroBlocks": 0,
      "readBytes": 0,
      "readBytesLastSample": 0,
      "readLatencyUSec": 0,
      "readOps": 0,
      "readOpsLastSample": 0,
      "samplePeriodMSec": 0,
      "throttle": 0,
      "timestamp": "2016-04-01T21:01:39.130840Z",
      "unalignedReads": 0,
      "unalignedWrites": 0,
      "volumeAccessGroups": [],
      "volumeID": 1,
      "volumeSize": 5000658944,
      "volumeUtilization": 0,
      "writeBytes": 0,
      "writeBytesLastSample": 0,
      "writeLatencyUSec": 0,
      "writeOps": 0,
      "writeOpsLastSample": 0,
      "zeroBlocks": 1220864
 }
}
```

9.6

GetDefaultQoS

You can use the GetDefaultQoS method to get the default quality of service (QoS) values for a newly created volume.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|------|-------------------------|------|
| QoS | The default QoS values. | QoS |

Request example

Requests for this method are similar to the following example:

```
"method": "GetDefaultQoS",
    "params": {},
    "id" : 1
}
```

Response example

```
{
   "id" : 1,
   "result" : {
      "burstIOPS" : 15000,
      "burstTime" : 60,
      "curve" : {
         "1048576" : 15000,
         "131072" : 1900,
         "16384" : 270,
         "262144" : 3000,
         "32768" : 500,
         "4096" : 100,
         "524288" : 7500,
         "65536" : 1000,
         "8192" : 160
      },
      "maxIOPS" : 15000,
      "minIOPS" : 100
}
```

9.6

GetQoSPolicy

You can use the <code>GetQoSPolicy</code> method to get details about a specific QoS policy from the system.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-------------|---------------------------------------|---------|---------------|----------|
| qosPolicyID | The ID of the policy to be retrieved. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|--------------------------------------|-----------|
| qosPolicy | Details of the requested QoS policy. | QoSPolicy |

Request example

Requests for this method are similar to the following example:

```
"method": "GetQoSPolicy",
    "params": {
         "qosPolicyID": 2
    },
    "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "qosPolicy": {
      "name": "bronze",
      "qos": {
        "burstIOPS": 15002,
        "burstTime": 60,
        "curve": {
          "4096": 100,
          "8192": 160,
          "16384": 270,
          "32768": 500,
          "65536": 1000,
          "131072": 1950,
          "262144": 3900,
          "524288": 7600,
          "1048576": 15000
        } ,
        "maxIOPS": 15002,
        "minIOPS": 51
      "qosPolicyID": 2,
      "volumeIDs": [
          2
      ]
  }
```

10.0

GetVolumeCount

You can use the <code>GetVolumeCount</code> method to get the number of volumes currently in the system.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|--|---------|
| count | The number of volumes currently in the system. | integer |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "GetVolumeCount",
        "params": {
     },
        "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "count": 7
  }
}
```

New since version

9.6

GetVolumeEfficiency

You can use the GetVolumeEfficiency method to get information about a volume. Only the volume you give as a parameter in this API method is used to compute the capacity.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|---------|---------------|----------|
| volumeID | Specifies the volume for which capacity is computed. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------------|---|----------------------|
| compression | The amount of space being saved by compressing data on a single volume. Stated as a ratio, where 1 means data has been stored without being compressed. | float |
| deduplication | The amount of space being saved on a single volume by not duplicating data. Stated as a ratio. | float |
| missingVolumes | The volumes that could not be queried for efficiency data. Missing volumes can be caused by Garbage Collection (GC) being less than an hour old, temporary network loss or restarted services since the GC cycle. | integer array |
| thinProvisioning | The ratio of space used to the amount of space allocated for storing data. Stated as a ratio. | float |
| timestamp | The last time efficiency data was collected after GC. | ISO 8601 data string |

Request example

Requests for this method are similar to the following example:

```
"method": "GetVolumeEfficiency",
   "params": {
       "volumeID": 606
},
   "id": 1
}
```

Response example

```
"id": 1,
"result": {
    "compression": 2.001591240821456,
    "deduplication": 1,
    "missingVolumes": [],
    "thinProvisioning": 1.009861932938856,
    "timestamp": "2014-03-10T16:06:33Z"
}
```

9.6

ListActiveVolumes

You can use the ListActiveVolumes method to get the list of active volumes currently in the system. The list of volumes is sorted in VolumeID order and can be returned in multiple parts (pages).

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|---|---------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response, by default. To exclude virtual volumes, set to false. | boolean | true | No |
| startVolumeID | Starting VolumeID to return. If no volume exists with this VolumeID, the next volume by VolumeID order is used as the start of the list. To page through the list, pass the VolumeID of the last volume in the previous response + 1. | integer | 0 | No |

| Name | Description | Туре | Default value | Required |
|-------|--|---------|---------------|----------|
| limit | Maximum number of volume info objects to return. 0 (zero) returns all volumes (unlimited). | integer | (unlimited) | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|-------------------------|--------------|
| volumes | List of active volumes. | volume array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListActiveVolumes",
    "params": {
        "startVolumeID" : 0,
        "limit" : 1000
     },
     "id" : 1
}
```

Response example

Due to the length of this response example, it is documented in a supplementary topic.

New since version

9.6

ListBackupTargets

You can use the ListBackupTargets method to get information about all backup targets that have been created.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------|--|-------------|
| backupTargets | Objects returned for each backup target. Included objects: | JSON object |
| | attributes: List of name-value pairs in JSON object format. (JSON object) | |
| | backupTargetID: Unique identifier assigned to the backup target. (integer) | |
| | name: Name of the backup target. (string) | |

Request example

Requests for this method are similar to the following example:

```
"method": "ListBackupTargets",
    "params": {},
    "id": 1
}
```

Response example

9.6

ListBulkVolumeJobs

You can use the ListBulkVolumeJobs method to get information about each bulk volume read or write operation that is occurring in the system.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------|---|---------------------|
| bulkVolumeJobs | An array of information for each bulk volume job. | bulkVolumeJob array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListBulkVolumeJobs",
    "params": {
      },
      "id" : 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "bulkVolumeJobs": [
          "attributes": {
            "blocksPerTransfer": 1024,
            "firstPendingLba": 216064,
            "nLbas": 2441472,
            "nextLba": 226304,
            "pendingLbas": "[220160, 223232, 221184, 224256, 217088,
225280, 222208, 218112, 219136, 216064]",
            "percentComplete": 8,
            "startLba": 0
          },
          "bulkVolumeID": 2,
          "createTime": "2015-05-07T14:52:17Z",
          "elapsedTime": 44,
          "format": "native",
          "key": "eaffb0526d4fb47107061f09bfc9a806",
          "percentComplete": 8,
          "remainingTime": 506,
          "script": "bv internal.py",
          "snapshotID": 509,
          "srcVolumeID": 3,
          "status": "running",
          "type": "read"
   }
}
```

9.6

ListDeletedVolumes

You can use the ListDeletedVolumes method to retrieve the list of volumes that have been marked for deletion and purged from the system.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------------|---|---------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response, by default. To exclude virtual volumes, set to false. | boolean | true | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|--------------------------|--------------|
| volumes | List of deleted volumes. | volume array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListDeletedVolumes",
   "params": {},
   "id" : 1
}
```

Response example

Responses for this method are similar to the following example:

```
{
    "id": 1,
    "result": {
        "volumes": [
            {
                "access": "readWrite",
                "accountID": 2,
                "attributes": {},
                "blockSize": 4096,
                "createTime": "2018-06-24T03:13:13Z",

            }
       ]
   }
}
```

9.6

ListQoSPolicies

You can use the ListQoSPolicies method to list the settings of all QoS policies on the system.

Parameters

This method has no input parameters.

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|--|-----------------|
| qosPolicies | A list of details about each QoS policy. | QoSPolicy array |

Request example

Requests for this method are similar to the following example:

```
"id": 231,
  "method": "ListQoSPolicies",
  "params": {}
}
```

Response example

```
"8192": 160,
            "16384": 270,
            "32768": 500,
            "65536": 1000,
            "131072": 1950,
            "262144": 3900,
            "524288": 7600,
           "1048576": 15000
          },
          "maxIOPS": 14000,
          "minIOPS": 50
        "qosPolicyID": 1,
        "volumeIDs": [
         1
        ]
      },
        "name": "bronze",
        "qos": {
          "burstIOPS": 15000,
          "burstTime": 60,

ListSyncJobs

You can use the ListSyncJobs method to get information about synchronization jobs that are running on an Element storage cluster. This method returns information about slice, clone, block, and remote synchronization jobs.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|--|---------------|
| syncJobs | List of objects describing synchronization processes that are currently running in the system. | syncJob array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListSyncJobs",
   "params": { },
   "id" : 1
}
```

Response example

```
"id":1,
"result":{
    "syncJobs":[
    {
        "bytesPerSecond":275314.8834458956,
        "currentBytes":178257920,
        "dstServiceID":36,
        "elapsedTime":289.4568382049871,
        "percentComplete":8.900523560209423,
```

```

ListVolumeQoSHistograms

You can use the ListVolumeQoSHistograms method to generate a histogram of volume QoS usage for one volume or multiple volumes. This enables you to better understand how volumes are using QoS.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------|---|---------------|---------------|----------|
| volumeIDs | An optional list of volume IDs specifying which volumes should have QoS histograms generated. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------|--|-------------------|
| qosHistograms | A list of objects describing volume usage for one or more volumes. | JSON object array |

Request example

Requests for this method are similar to the following example:

Response example

ListVolumes

You can use the ListVolumes method to get a list of volumes that are in a cluster. You can specify the volumes you want to return in the list by using the available parameters.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------------|---------------|----------|
| accounts | Only volumes owned by the accounts you specify here are returned. Mutually exclusive with the volumeIDs parameter. | integer array | None | No |
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |

| Name | Description | Туре | Default value | Required |
|---------------|---|---------------|---------------|----------|
| isPaired | Returns volumes that are paired or not paired. Possible values: • true: Returns all paired volumes. • false: Returns all volumes not paired. | boolean | None | No |
| limit | Enables you to set the maximum number of volume results that are returned. Mutually exclusive with the volumeIDs parameter. | integer | 10000 | No |
| startVolumeID | Only volumes with an ID greater than or equal to this value are returned. Mutually exclusive with the volumeIDs parameter. | integer | None | No |
| volumeIDs | A list of volume IDs. If you specify this parameter, other parameters operate only on this set of volumes. Mutually exclusive with the accounts, startVolumeID, and limit parameters. | integer array | No | No |
| volumeName | Only volume object information matching the volume name is returned. | string | No | No |

| Name | Description | Туре | Default value | Required |
|--------------|--|--------|---------------|----------|
| volumeStatus | Only volumes with a status equal to the status value are returned. Possible values: • creating • snapshotting • active • deleted | string | No | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|------------------|--------------|
| volumes | List of volumes. | volume array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVolumes",
    "params": {
        "volumeIDs": [1],
        "volumeStatus": "active",
        "isPaired": "false"
    },
    "id": 1
}
```

Response example

```

       ]
   }
}
```

9.6

ListVolumeStats

You can use the ListVolumeStats method to get high-level activity measurements for a single volume, list of volumes, or all volumes (if you omit the volumeIDs parameter). Measurement values are cumulative from the creation of the volume.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |
| volumeIDs | A list of volumes from which to retrieve activity information. | integer array | No | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|--------------------------------------|-------------------|
| volumeStats | List of volume activity information. | volumeStats array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVolumeStats",
    "params": {
        "volumeIDs": [1]
    },
    "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "volumeStats": [
        "accountID": 1,
        "actualIOPS": 0,
        "asyncDelay": null,
        "averageIOPSize": 0,
        "burstIOPSCredit": 30000,
        "clientQueueDepth": 0,
        "desiredMetadataHosts": null,
        "latencyUSec": 0,

9.6

ListVolumesForAccount

You can use the ListVolumesForAccount method to list active and (pending) deleted volumes for an account.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |
| accountID | All volumes owned by this accountID are returned. | integer | No | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------|-----------------------------|--------------|
| volumes | List of volume information. | volume array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListVolumesForAccount",
   "params": {
       "accountID" : 1
   },
   "id" : 1
}
```

Response example

Responses for this method are similar to the following example:

```
{
    "id": 1,
    "result": {
        "volumes": [
            {
                "access": "readWrite",
                "accountID": 1,
                "attributes": {},
                "blockSize": 4096,
                "createTime": "2018-07-22T16:15:25Z",
                "deleteTime": "",
                "enable512e": false,
                "ign": "ign.2010-01.com.solidfire:0oto.test1.25",

                "volumeID": 25,
                "volumePairs": []
            }
       ]
   }
}
```

9.6

ListVolumeStatsByAccount

You can use the ListVolumeStatsByAccount method to list high-level volume activity measurements for every account. Values are summed from all volumes owned by the account.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |
| accounts | A list of account IDs for which to return volume statistics. If omitted, statistics for all accounts are returned. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|--|-------------------|
| volumeStats | List of volume activity information for each account. Note: The volumeID member is 0 for each entry, as the values represent the summation of all volumes owned by the account. | volumeStats array |

Request example

Requests for this method are similar to the following example:

```
{
"method": "ListVolumeStatsByAccount",
   "params": {"accounts": [3]},
   "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
 "result": {
    "volumeStats": [
        "accountID": 3,
        "nonZeroBlocks": 155040175,
        "readBytes": 3156273328128,
        "readBytesLastSample": 0,
        "readOps": 770574543,
        "readOpsLastSample": 0,

9.6

List Volume Stats By Virtual Volume

You can use the ListVolumeStatsByVirtualVolume method to list volume statistics

for any volumes in the system that are associated with virtual volume. Statistics are cumulative from the creation of the volume.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------------|---|-------------------|---------------|----------|
| virtualVolumeIDs | A list of one or more virtual volume IDs for which to retrieve information. If you specify this parameter, the method returns information about only these virtual volumes. | UUID string array | No | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|--|-------------------|
| volumeStats | A list of objects containing activity information for each virtual volume in the system. | volumeStats array |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListVolumeStatsByVirtualVolume",
  "params": {},
  "id": 1
}
```

Response example

```

}
```

9.6

ListVolumeStatsByVolume

You can use the ListVolumeStatsByVolume method to list high-level activity measurements for every volume, by volume. Values are cumulative from the creation of the volume.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------------|--|---------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|--------------------------------------|-------------------|
| volumeStats | List of volume activity information. | volumeStats array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVolumeStatsByVolume",
   "params": {},
   "id" : 1
}
```

Response example

```
"actualIOPS": 0,
      "asyncDelay": null,
      "averageIOPSize": 4096,
      "burstIOPSCredit": 30000,
      "clientQueueDepth": 0,
      "desiredMetadataHosts": null,
      "latencyUSec": 0,
      "metadataHosts": {
        "deadSecondaries": [],
        "liveSecondaries": [
            16
        ],
        "primary": 12
      },
      "nonZeroBlocks": 7499205,
      "readBytes": 159012818944,
      "readBytesLastSample": 0,
      "readLatencyUSec": 0,
      "readOps": 38821489,
      "readOpsLastSample": 0,
      "samplePeriodMSec": 500,
      "throttle": 0,
      "timestamp": "2016-10-17T20:55:31.087537Z",
      "unalignedReads": 0,
      "unalignedWrites": 0,
      "volumeAccessGroups": [
       1
      ],
      "volumeID": 1,
      "volumeSize": 53687091200,
      "volumeUtilization": 0,
      "writeBytes": 52992585728,
      "writeBytesLastSample": 0,
      "writeLatencyUSec": 0,
      "writeOps": 12937643,
      "writeOpsLastSample": 0,
      "zeroBlocks": 5607995
  ]
}
```

9.6

ListVolumeStatsByVolumeAccessGroup

You can use the ListVolumeStatsByVolumeAccessGroup method to list total activity measurements for all of the volumes that are members of the specified volume access groups.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|---------------------------|---|---------------|---------------|----------|
| includeVirtualVolum es | Virtual volumes are included in the response by default. To exclude virtual volumes, set to false. | boolean | true | No |
| volumeAccessGroup s | An array of VolumeAccessGrou pIDs for which volume activity is returned. If omitted, statistics for all volume access groups are returned. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------|---|-------------|
| volumeStats | List of volume activity information for all volumes in the specified volume access group. Note: The volumeID member is 0 for each entry, because the values represent the summation of all volumes owned by the account. | volumeStats |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVolumeStatsByVolumeAccessGroup",
    "params": {"volumeAccessGroups": [1]},
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
  "result": {
    "volumeStats": [
      {
        "accountID": 0,
        "nonZeroBlocks": 149366393,
        "readBytes": 3156273328128,
        "readBytesLastSample": 0,
        "readOps": 770574543,
        "readOpsLastSample": 0,
        "samplePeriodMSec": 500,
        "timestamp": "2016-10-17T21:04:10.712370Z",
        "unalignedReads": 0,
        "unalignedWrites": 0,
        "volumeAccessGroups": [
        ],
        "volumeID": 0,
        "volumeSize": 1073741824000,
        "writeBytes": 1051988406272,
        "writeBytesLastSample": 0,
        "writeOps": 256833107,
        "writeOpsLastSample": 0,
        "zeroBlocks": 112777607
  }
}
```

9.6

ModifyBackupTarget

You can use the ModifyBackupTarget method to change attributes of a backup target.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------|---|-------------|---------------|----------|
| backupTargetID | Unique target ID for the target to modify. | integer | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| name | New name for the backup target. | string | None | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "ModifyBackupTarget",
"params": {
    "backupTargetID" : 1,
    "name": "yourtargetS3"
    "attributes" : {
        "size" : 500,
    }
},
"id": 1
}
```

Response example

```
{
    "id": 1,
    "result": {}
}
```

9.6

ModifyQoSPolicy

You can use the ModifyQoSPolicy method to modify an existing QoS policy on the system.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------|--|------------|---------------|----------|
| qosPolicyID | The ID of the policy to be modified. | integer | None | Yes |
| name | If supplied, the name of the QoS policy (e.g. gold, platinum, silver) is changed to this value. | string | None | No |
| qos | If supplied, the QoS settings for this policy are changed to these settings. You can supply partial QoS values and only change some of the QoS settings. | QoS object | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|-----------|---|-----------|
| qosPolicy | Details of the newly modified QoS policy. | QoSPolicy |

Request example

Requests for this method are similar to the following example:

```
"id": 1950,
    "method": "ModifyQoSPolicy",
    "params": {
        "qosPolicyID": 2,
        "qos": {
             "minIOPS": 51,
             "maxIOPS": 15002,
             "burstIOPS": 15002
        }
    }
}
```

Response example

```
{
 "id": 1950,
 "result": {
    "qosPolicy": {
      "name": "bronze",
      "qos": {
        "burstIOPS": 15002,
        "burstTime": 60,
        "curve": {
          "4096": 100,
          "8192": 160,
          "16384": 270,
          "32768": 500,
          "65536": 1000,
          "131072": 1950,
          "262144": 3900,
          "524288": 7600,
          "1048576": 15000
        },
        "maxIOPS": 15002,
        "minIOPS": 51
      "qosPolicyID": 2,
      "volumeIDs": [
      1
```

10.0

ModifyVolume

You can use the ModifyVolume method to modify settings on an existing volume. You can make modifications to one volume at a time and changes take place immediately.

If you do not specify QoS values when you modify a volume, they remain the same as before the modification. You can retrieve default QoS values for a newly created volume by running the GetDefaultQoS method.

When you need to increase the size of a volume that is being replicated, do so in the following order to prevent replication errors:

1. Increase the size of the volume with replicationTarget access.

2. Increase the size of the source or the volume with readWrite access.

Ensure that both the target and source volumes are the same size.

If you change the access status to locked or replicationTarget, all existing iSCSI connections are terminated.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------|---|---------|---------------|----------|
| volumeID | The volumeID for the volume to be modified. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------|--|---------|---------------|----------|
| access | Access allowed for the volume. Possible values: • readOnly: Only read operations are allowed. • readWrite: Reads and writes are allowed. • locked: No reads or writes are allowed. If not specified, the access value does not change. • replicationT arget: Identify a volume as the target volume for a paired set of volumes. If the volume is not paired, the access status is locked. If a value is not specified, the access value does not change. • snapMirrorTa rget: Identify a volume as the target volume for SnapMirror replication. | string | None | No |
| accountID | The accountID to which the volume is reassigned. If none is specified, the previous account name is used. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|-------------------------|--|-----------------|---------------|----------|
| associateWithQoSP olicy | Associate the volume with the specified QoS policy. Possible values: • true: Associate the volume with the QoS policy specified in the QoSPolicyID parameter. • false: Do not associate the volume with the QoS policy specified in the QoS policy specified in the QoSPolicyID parameter. When false, any existing policy association is removed, regardless of whether you specify a QoS policy in the QoSPolicy parameter. | boolean | None | No |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| createTime | An ISO 8601 date string to set as the new volume creation date. Required if setCreateTime is set to true. | ISO 8601 string | None | No |

| Name | Description | Туре | Default value | Required |
|---------------------------------|--|---------|---------------|----------|
| enableSnapMirrorRe plication | Determines whether the volume can be used for replication with SnapMirror endpoints. Possible values: • true • false | boolean | false | No |
| fifoSize | Specifies the maximum number of First-In-First-Out (FIFO) snapshots supported by the volume. Note that FIFO and non-FIFO snapshots both use the same pool of available snapshot slots on a volume. Use this option to limit FIFO snapshot consumption of the available snapshot slots. Note that you cannot modify this value to be less than the current FIFO snapshot count. | integer | None | No |
| minFifoSize | Specifies the number of snapshot slots that are reserved for only First-In-First-Out (FIFO) snapshots. Since FIFO and non-FIFO snapshots share the same pool, the minFifoSize parameter reduces the total number of possible non-FIFO snapshots by the same amount. Note that you cannot modify this value so that it conflicts with the current non-FIFO snapshot count. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|---------------|---|---------|---------------|----------|
| mode | Volume replication mode. Possible values: • asynch: Waits for system to acknowledge that data is stored on source before writing to the target. • sync: Does not wait for data transmission acknowledgment from source to begin writing data to the target. | string | None | No |
| qos | The new quality of service settings for this volume. If not specified, the QoS settings are not changed. Possible values: • minIOPS • maxIOPS • burstIOPS | QoS | None | No |
| qosPolicyID | The ID for the policy whose QoS settings should be applied to the specified volumes. This parameter is mutually exclusive with the qos parameter. | integer | None | No |
| setCreateTime | Set to true to change the recorded date of volume creation. | boolean | None | No |

| Name | Description | Туре | Default value | Required |
|-----------|---|---------|---------------|----------|
| totalSize | The new size of the volume in bytes. 10000000000 is equal to 1GB. Size is rounded up to the nearest megabyte in size. This parameter can only be used to increase the size of a volume. | integer | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------|--|--------|
| | Object containing information about the newly modified volume. | volume |

Request example

```
"method": "ModifyVolume",
  "params": {
     "volumeID": 5,

GetDefaultQoS

ModifyVolumes

You can use the ModifyVolumes method to configure up to 500 existing volumes at one time. Changes take place immediately. If ModifyVolumes fails to modify any of the specified volumes, none of the specified volumes are changed.

If you do not specify QoS values when you modify volumes, the QoS values for each volume remain unchanged. You can retrieve default QoS values for a newly created volume by running the <code>GetDefaultQoS</code> method.

When you need to increase the size volumes that are being replicated, do so in the following order to prevent replication errors:

- 1. Increase the size of the volume with replication Target access.
- 2. Increase the size of the source or the volume with readWrite access.

Ensure that both the target and source volumes are the same size.

If you change the access status to locked or replicationTarget, all existing iSCSI connections are terminated.

Parameters

This method has the following input parameters:

| Name Description Type Default value Required |
|--|
|--|

| accountID | Access allowed for the volumes. Possible values: • readOnly: Only read operations are allowed. • readWrite: Reads and writes are allowed. • locked: No reads or writes are allowed. If not specified, the access value does not change. • replicationT arget: Identify a volume as the target volume for a paired set of volumes. If the volume is not paired, the access status is locked. If a value is not specified, the access value does not change. The accountID to | integer | None | No |
|-----------|--|---------|--------|-----|
| docountib | which the volumes are reassigned. If none is specified, the previous account name is used. | integer | INOTIC | 110 |

| associateWithQoSP olicy | Associate the volume with the specified QoS policy. Possible values: • true: Associate the volume with the QoS policy specified in the QoSPolicyID parameter. • false: Do not associate the volume with the QoS policy specified in the QoS policy specified in the QoSPolicyID parameter. When false, any existing policy association is removed, regardless of whether you specify a QoS policy in the QoSPolicy parameter. | boolean | None | No |
|---------------------------------|---|-----------------|-------|----|
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| createTime | An ISO 8601 date string to set as the new volume creation date. Required if setCreateTime is set to true. | ISO 8601 string | None | No |
| enableSnapMirrorRe plication | Determines whether the volume can be used for replication with SnapMirror endpoints. Possible values: • true • false | boolean | false | No |

| fifoSize | Specifies the maximum number of First-In-First-Out (FIFO) snapshots supported by the volume. Note that FIFO and non-FIFO snapshots both use the same pool of available snapshot slots on a volume. Use this option to limit FIFO snapshot consumption of the available snapshot slots. Note that you cannot modify this value to be less than the current FIFO snapshot count. | integer | None | No |
|-------------|--|---------|------|----|
| minFifoSize | Specifies the number of snapshot slots that are reserved for only First-In-First-Out (FIFO) snapshots. Since FIFO and non-FIFO snapshots share the same pool, the minFifoSize parameter reduces the total number of possible non-FIFO snapshots by the same amount. Note that you cannot modify this value so that it conflicts with the current non-FIFO snapshot count. | integer | None | No |

| mode | Volume replication mode. Possible values: • asynch: Waits for system to acknowledge that data is stored on source before writing to the target. • sync: Does not wait for data transmission acknowledgment from source to begin writing data to the target. | string | None | No |
|---------------|---|---------|------|----|
| qos | The new quality of service settings for the volumes. If not specified, the QoS settings are not changed. Possible values: • minIOPS • maxIOPS • burstIOPS | QoS | None | No |
| qosPolicyID | The ID for the policy whose QoS settings should be applied to the specified volumes. This parameter is mutually exclusive with the qos parameter. | integer | None | No |
| setCreateTime | Set to true to change the recorded date of volume creation. | boolean | None | No |

| totalSize | The new size of the volumes in bytes. 10000000000 is equal to 1GB. Size is rounded up to the nearest megabyte in size. This parameter can only be used to increase the size of a volume. | integer | None | No |
|-----------|--|---------------|------|-----|
| volumeIDs | A list of volumeIDs for the volumes to be modified. | integer array | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|--------|--|--------------|
| volume | An array of objects containing information about each newly modified volume. | volume array |

GetDefaultQoS

PurgeDeletedVolume

You can use the PurgeDeletedVolume method to immediately and permanently purge a volume that has been deleted. You must delete a volume using DeleteVolume before it can be purged.

Volumes are purged automatically after a period of time, so usage of this method is not typically required.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|---------|---------------|----------|
| volumeID | The volumeID of the volume to be purged. | integer | No | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "PurgeDeletedVolume",
    "params": {
        "volumeID" : 5
},
        "id" : 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
   "result": {}
}
```

New since version

9.6

Find more information

DeleteVolume

PurgeDeletedVolumes

You can use the PurgeDeletedVolumes method to immediately and permanently purge volumes that have been deleted; you can use this method to purge up to 500 volumes at one time.

You must delete volumes using <code>DeleteVolumes</code> before they can be purged. Volumes are purged automatically after a period of time, so usage of this method is not typically required.

If you purge a large number of volumes at one time, or if the volumes you purge each have many associated snapshots, the method might fail and return the error "xDBConnectionLoss". If this happens, retry the method call again with fewer volumes.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------------|---------------|----------|
| volumeIDs | A list of volumeIDs of volumes to be purged from the system. | integer array | No | No |
| accountIDs | A list of accountIDs. All of the volumes from all of the specified accounts are purged from the system. | integer array | No | No |
| volumeAccessGroup IDs | A list of volumeAccessGroup IDs. All of the volumes from all of the specified volume access groups are purged from the system. | integer array | No | No |

Note: You can specify only one of the above parameters per method call. Specifying more than one, or none, results in an error.

Return values

This method has no return values.

Request example

```
"method": "PurgeDeletedVolumes",
    "params": {
        "accountIDs" : [1, 2, 3]
    },
    "id" : 1
}
```

This method returns a response similar to the following example:

```
{
  "id" : 1,
  "result": {}
}
```

New since version

9.6

DeleteVolumes

RemoveBackupTarget

You can use the RemoveBackupTarget method to remove backup targets.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------------|---|---------|---------------|----------|
| backupTargetID | Unique target ID of the target to remove. | integer | None | Yes |

Return values

This method has no return values.

Request example

This method returns a response similar to the following example:

```
{
    "id": 1,
    "result": {}
}
```

New since version

9.6

RestoreDeletedVolume

You can use the RestoreDeletedVolume method to mark a deleted volume as active again. This action makes the volume immediately available for iSCSI connection.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|----------|--|---------|---------------|----------|
| volumeID | The volumeID of the deleted volume to restore. | integer | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "RestoreDeletedVolume",
   "params": {
        "volumeID" : 5
},
      "id" : 1
}
```

Response example

```
"id" : 1,
"result": {}
}
```

New since version

9.6

SetDefaultQoS

You can use the SetDefaultQoS method to configure the default Quality of Service (QoS) values (measured in inputs and outputs per second, or IOPS) for a volume.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------|--|---------|---------------|----------|
| minIOPS | The minimum number of sustained IOPS that are provided by the cluster to a volume. | integer | None | No |
| maxIOPS | The maximum number of sustained IOPS that are provided by the cluster to a volume. | integer | None | No |
| burstIOPS | The maximum number of IOPS allowed in a short burst scenario. | integer | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|--|---------|
| minIOPS | The minimum number of sustained IOPS that are provided by the cluster to a volume. | integer |

| Name | Description | Туре |
|-----------|--|---------|
| maxIOPS | The maximum number of sustained IOPS that are provided by the cluster to a volume. | integer |
| burstIOPS | The maximum number of IOPS allowed in a short burst scenario. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "SetDefaultQoS",
    "params": {
         "burstIOPS":8000,
         "maxIOPS":1000,
         "minIOPS":200
     },
     "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id":1,
    "result": {
        "burstIOPS":8000,
        "maxIOPS":1000,
        "minIOPS":200
}
```

9.6

StartBulkVolumeRead

You can use the StartBulkVolumeRead method to start a bulk volume read session on a specified volume.

Only two bulk volume processes can run simultaneously on a volume. When you initialize the session, data is

read from a SolidFire storage volume to be stored on an external backup source. The external data is accessed by a web server running on an Element storage node. Server interaction information for external data access is passed by a script running on the storage system.

At the start of a bulk volume read operation, a snapshot of the volume is made and the snapshot is deleted when the read has completed. You can also read a snapshot of the volume by entering the ID of the snapshot as a parameter. When you read a previous snapshot, the system does not create a new snapshot of the volume, nor does it delete the previous snapshot when the read completes.

This process creates a new snapshot if the ID of an existing snapshot is not provided. Snapshots can be created if cluster fullness is at stage 2 or 3. Snapshots are not created when cluster fullness is at stage 4 or 5.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|---------|---------------|----------|
| format | The format of the volume data. Can be either: • uncompressed: Every byte of the volume is returned without any compression. • native: Opaque data is returned that is smaller and more efficiently stored and written on a subsequent bulk volume write. | string | None | Yes |
| volumeID | The ID of the volume to be read. | integer | None | Yes |
| snapshotID | The ID of a previously created snapshot used for bulk volume reads. If no ID is entered, a snapshot of the current active volume image is made. | integer | None | No |

| Name | Description | Туре | Default value | Required |
|------------------|--|-------------|---------------|----------|
| script | The name of an executable script. If no script name is given, the key and URL are necessary to access Element storage nodes. The script is run on the primary node, and the key and URL are returned to the script so the local web server can be contacted. | string | None | No |
| scriptParameters | JSON parameters to pass to the script. | JSON object | None | No |
| attributes | JSON attributes for the bulk volume job. | JSON object | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|--|---------|
| asyncHandle | The ID of the asynchronous process to be checked for completion. | integer |
| key | Opaque key uniquely identifying the session. | string |
| url | URL to access the node's web server. | string |

Request example

```
"method": "StartBulkVolumeRead",
"params": {
    "volumeID" : 5,
    "format" : "native",
    "snapshotID" : 2
},
"id": 1
}
```

This method returns a response similar to the following example:

```
"id" : 1,
"result" : {
    "asyncHandle" : 1,
    "key" : "11eed8f086539205beeaadd981aad130",
    "url" : "https://127.0.0.1:44000/"
}
```

New since version

9.6

StartBulkVolumeWrite

You can use the StartBulkVolumeWrite method to start a bulk volume write session on a specified volume.

Only two bulk volume processes can run simultaneously on a volume. When you initialize the session, data is written to an Element storage volume from an external backup source. The external data is accessed by a web server running on an Element storage node. Server interaction information for external data access is passed by a script running on the storage system.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------------|--|-------------|---------------|----------|
| format | The format of the volume data. Can be either: • uncompressed: Every byte of the volume is returned without any compression. • native: Opaque data is returned that is smaller and more efficiently stored and written on a subsequent bulk volume write. | string | None | Yes |
| volumeID | The ID of the volume to be written to. | integer | None | Yes |
| script | The name of an executable script. If no script name is given, the key and URL are necessary to access Element storage nodes. The script is run on the primary node, and the key and URL are returned to the script so the local web server can be contacted. | string | None | No |
| scriptParameters | JSON parameters to pass to the script. | JSON object | None | No |
| attributes | JSON attributes for the bulk volume job. | JSON object | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|-------------|--|---------|
| asyncHandle | The ID of the asynchronous process to be checked for completion. | integer |
| key | Opaque key uniquely identifying the session. | string |
| url | URL to access the node's web server. | string |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "StartBulkVolumeWrite",
    "params": {
        "volumeID" : 5,
        "format" : "native",
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id" : 1,
   "result" : {
        "asyncHandle" : 1,
        "key" : "11eed8f086539205beeaadd981aad130",
        "url" : "https://127.0.0.1:44000/"
    }
}
```

New since version

9.6

UpdateBulkVolumeStatus

You can use the <code>UpdateBulkVolumeStatus</code> method to update the status of a bulk

volume job that you started with the StartBulkVolumeRead or StartBulkVolumeWrite methods.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------|--|-------------|---------------|----------|
| key | The key assigned during initialization of a StartBulkVolumeRe ad or StartBulkVolumeWrit e session. | string | None | Yes |
| status | The system sets the status of the given bulk volume job. Possible values: • running: Jobs that are still active. • complete: Jobs that are done. • failed: Jobs that have failed. | string | None | Yes |
| percentComplete | The completed progress of the bulk volume job as a percentage. | string | None | No |
| message | Returns the status of the bulk volume job when the job has completed. | string | None | No |
| attributes | JSON attributes; updates what is on the bulk volume job. | JSON object | None | No |

Return values

This method has the following return values:

| me Description | Туре |
|----------------|------|
|----------------|------|

| status | Status of the session requested. Returned status: • preparing • active • done • failed | string |
|------------|--|--------|
| attributes | Returns attributes that were specified in the method call. Values are returned whether they have changed or not. | string |
| url | The URL to access the node's web server; provided only if the session is still active. | string |

Request example

Requests for this method are similar to the following example:

Response example

```
"id" : 1,
   "result": {
        "status" : "running",
        "url" : "https://10.10.23.47:8443/"
     }
}
```

AddInitiatorsToVolumeAccessGroup

You can use the AddInitiatorsToVolumeAccessGroup method to add initiators to a specified volume access group.

The accepted format of an initiator IQN is iqn.yyyy-mm, where y and m are digits, followed by text which must only contain digits, lower-case alphabetic characters, a period (.), colon (:) or dash (-). See the following example:

```
iqn.2010-01.com.solidfire:17oi.solidfire-0.1
```

The accepted format of a Fibre Channel initiator WWPN is Aa:bB:CC:dd:11:22:33:44, or AabBCCdd11223344. See the following example:

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------|--|--|---------------|----------|
| initiators | List of initiator IDs or names (IQNs and WWPNs) to include in the volume access group. If you pass a list of initiator names, the initiators are created if they do not already exist. If you pass a list of initiator IDs, the method returns an error if any of the initiators does not already exist. Passing initiator names is deprecated; you should use initiator IDs whenever possible. | integer array or string array (deprecated) | | Yes |
| volumeAccessGroup ID | The ID of the volume access group to add the initiator. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|-------------------|
| volumeAccessGroup | An object containing information about the newly modified volume access group. | volumeAccessGroup |

Request example

```
"id": 13171,
  "method": "AddInitiatorsToVolumeAccessGroup",
  "params": {
     "initiators": [116,117],
     "volumeAccessGroupID": 96
}
```

This method returns a response similar to the following example:

```
{
 "id": 13171,
 "result": {
   "volumeAccessGroup": {
     "attributes": {},
     "deletedVolumes": [
        327
     ],
     "initiatorIDs": [
       116,
       117
     ],
     "initiators": [
        "iqn.1993-08.org.debian:01:181324777",
       "ign.1993-08.org.debian:01:181324888"
     ],
      "name": "northbanktest",
      "volumeAccessGroupID": 96,
      "volumes": [
       346
   }
```

${\bf AddVolumes ToVolume Access Group}$

You can use the AddVolumesToVolumeAccessGroup method to add volumes to a

specified volume access group.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------|---|---------------|---------------|----------|
| volumes | List of volumeIDs to add to the volume access group. | integer array | None | Yes |
| volumeAccessGroup ID | VolumeAccessGrou pID of the volume access group to which volumes are added. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|-------------------|
| volumeAccessGroup | An object containing information about the newly modified volume access group. | volumeAccessGroup |

Request example

Requests for this method are similar to the following example:

```
"method": "AddVolumesToVolumeAccessGroup",
    "params": {
        "volumeAccessGroupID": 96,
        "volumes": [1,2]
    },
    "id": 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "volumeAccessGroup": {
      "attributes": {},
      "deletedVolumes": [
        346
      1,
      "initiatorIDs": [
        116,
        117
      1,
      "initiators": [
        "iqn.1993-08.org.debian:01:181324777",
        "iqn.1993-08.org.debian:01:181324888"
      ],
      "name": "northbanktest",
      "volumeAccessGroupID": 96,
      "volumes": [
        1,
        2
  }
}
```

New since version

9.6

CreateVolumeAccessGroup

You can use CreateVolumeAccessGroup to create a new volume access group. When you create the volume access group, you need to give it a name, and you can optionally enter initiators and volumes.

Any initiator IQN that you add to the volume access group is able to access any volume in the group without CHAP authentication.

Cloned volumes do not inherit volume access group membership from the source volume.

Consider the following when you create volume access groups:

- · A volume access group can contain up to 64 initiator IQNs.
- An initiator can only belong to one volume access group.
- A volume access group can contain up to 2000 volumes.

• Each volume access group can belong to a maximum of four volume access groups.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|---|--|---------------|----------|
| initiators | List of initiator IDs or names (IQNs and WWPNs) to include in the volume access group. If you pass a list of initiator names, the initiators are created if they do not already exist. If you pass a list of initiator IDs, the method returns an error if any of the initiators does not already exist. Passing initiator names is deprecated; you should use initiator IDs whenever possible. | integer array or string array (deprecated) | | No |
| name | Name of the volume access group. Not required to be unique, but recommended. Must be 1 to 64 characters in length. | string | None | Yes |
| volumes | List of volumeIDs to include in the volume access group. | integer array | | No |
| attributes | List of name-value pairs in JSON object format. | JSON object | 8 | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|------|-------------|------|
|------|-------------|------|

| volumeAccessGroup | An object containing information about the newly created volume access group. | volumeAccessGroup |
|---------------------|---|-------------------|
| volumeAccessGroupID | The ID of the newly created volume access group. | integer |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateVolumeAccessGroup",
"params": {
    "name": "myaccessgroup",
    "initiators": ["iqn.1993-08.org.debian: 01: a31b1d799d5c"],
    "volumes": [327],
    "attributes": {}
}
```

Response example

```
{
 "id": null,
  "result": {
    "volumeAccessGroup": {
      "attributes": {},
      "deletedVolumes": [],
      "initiatorIDs": [
        95
      ],
      "initiators": [
        "iqn.1993-08.org.debian: 01: a31b1d799d5c"
      ],
      "name": "myaccessgroup",
      "volumeAccessGroupID": 96,
      "volumes": [
        327
      ]
    "volumeAccessGroupID": 96
}
```

DeleteVolumeAccessGroup

You can use DeleteVolumeAccessGroup to delete a volume access group.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------------------|--|---------|---------------|----------|
| volumeAccessGroup ID | The ID of the volume access group to be deleted. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|-------------------------|--|---------|---------------|----------|
| deleteOrphanInitiato rs | Specifies whether to delete initiator objects or not. Possible values: • true: Delete initiator objects after they are removed from a volume access group. • false: Do not delete initiator objects after they are removed from a volume access group. This is the default. | boolean | false | No |
| force | Adding this flag will force the volume access group to be deleted even though it has a Virtual Network ID or Tag. Possible values: • true: Volume access group will be deleted. • false: Default. Do not delete the volume access group if it has a Virtual Network ID or Tag. | boolean | false | No |

Return values

This method does not have return values.

Request example

Requests for this method are similar to the following example:

```
{
    "method": "DeleteVolumeAccessGroup",
    "params": {
         "force": true,
         "volumeAccessGroupID" : 3
},
    "id" : 1
}
```

This method returns a response similar to the following example:

```
{
   "id" : 1,
   "result": {}
}
```

New since version

9.6

ListVolumeAccessGroups

You can use the ListVolumeAccessGroups method to get information about the volume access groups that are currently in the system.

Parameters

| Name | Description | Туре | Default value | Required |
|-------|---|------|---------------|----------|
| limit | Maximum number of volumeAccessGroup objects to return. Mutually exclusive with the volumeAccessGroup s parameter. | Ğ | Unlimited | No |

| Name | Description | Туре | Default value | Required |
|------------------------------|---|---------------|---------------|----------|
| startVolumeAccess GroupID | The volume access group ID at which to begin the listing. Mutually exclusive with the volumeAccessGroup s parameter. | integer | 0 | No |
| volumeAccessGroup s | List of volumeAccessGroup ID values to retrieve. Mutually exclusive with the startVolumeAccess GroupID and limit parameters. | integer array | | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|----------------------------|---|-------------------------|
| volumeAccessGroups | A list of objects describing each volume access group. | volumeAccessGroup array |
| volumeAccessGroupsNotFound | A list of volume access groups not found by the system. Present if you used the volumeAccessGroups parameter and the system was unable to find one or more volume access groups that you specified. | integer array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVolumeAccessGroups",
   "params": {
        "startVolumeAccessGroupID": 3,
        "limit" : 1
    },
    "id" : 1
}
```

This method returns a response similar to the following example:

RemoveVolumesFromVolumeAccessGroup

You can use the RemoveVolumesFromVolumeAccessGroup method to remove volumes from a specified volume access group.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-------------------------|--|---------------|---------------|----------|
| volumeAccessGroup ID | VolumeAccessGrou pID to remove volumes from. | integer | None | Yes |
| volumes | VolumeIDs of volumes to remove from the volume access group. | integer array | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|-------------------|
| volumeAccessGroup | An object containing information about the newly modified volume access group. | volumeAccessGroup |

Request example

Requests for this method are similar to the following example:

```
"method": "RemoveVolumesFromVolumeAccessGroup",
   "params": {
       "volumeAccessGroupID": 96,
       "volumes": [1,2]
},
   "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
  "result": {
    "volumeAccessGroup": {
      "attributes": {},
      "deletedVolumes": [
        346
      ],
      "initiatorIDs": [

        117
      ],
      "initiators": [
        "iqn.1993-08.org.debian:01:181324777",
        "iqn.1993-08.org.debian:01:181324888"
      ],
      "name": "northbanktest",
      "volumeAccessGroupID": 96,
      "volumes": []
 }
}
```

9.6

RemoveInitiatorsFromVolumeAccessGroup

You can use the RemoveInitiatorsFromVolumeAccessGroup method to remove initiators from a specified volume access group.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------------------|---|---|---------------|----------|
| volumeAccessGroup ID | The ID of the volume access group from which initiators are removed. | integer | None | Yes |
| initiators | List of initiator IDs or names (IQNs and WWPNs) to include in the volume access group. If you pass a list of initiator names, the initiators are created if they do not already exist. If you pass a list of initiator IDs, the method returns an error if any of the initiators does not already exist. Passing initiator names is deprecated; you should use initiator IDs whenever possible. | integer array (recommended) or string array (deprecated) | None | No |

| Name | Description | Туре | Default value | Required |
|----------------------|---|---------|---------------|----------|
| deleteOrphanInitiato | Specifies whether to delete initiator objects after they are removed from a volume access group or not. Possible values: • true: Delete initiator objects after they are removed from a volume access group. | boolean | false | No |
| | false: Do not delete initiator objects after they are removed from a volume access group. This is the default. | | | |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|-------------------|
| volumeAccessGroup | An object containing information about the newly modified volume access group. | volumeAccessGroup |

Request example

Requests for this method are similar to the following example:

```
"id": 13171,
  "method": "RemoveInitiatorsFromVolumeAccessGroup",
  "params": {
    "initiators": [114,115],
    "volumeAccessGroupID": 96
}
}
```

This method returns a response similar to the following example:

```
{
  "id": 13171,
  "result": {
    "volumeAccessGroup": {
      "attributes": {},
      "deletedVolumes": [
        327
      1,

9.6

ModifyVolumeAccessGroup

You can use the ModifyVolumeAccessGroup method to update initiators and add or remove volumes from a volume access group.

If a specified initiator or volume is a duplicate of what currently exists, the volume access group is left as-is. If you do not specify a value for volumes or initiators, the current list of initiators and volumes is not changed.

Parameters

| Name | Description | Туре | Default value | Required |
|-------------------------|--|---------|---------------|----------|
| volumeAccessGroup ID | The ID of the volume access group to modify. | integer | None | Yes |
| name | The new name for this volume access group. | string | None | No |

| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
|-------------------------|--|---|-------|----|
| initiators | List of initiator IDs or names (IQNs and WWPNs) to include in the volume access group. If you pass a list of initiator names, the initiators are created if they do not already exist. If you pass a list of initiator IDs, the method returns an error if any of the initiators does not already exist. Passing initiator names is deprecated; you should use initiator IDs whenever possible. | integer array (recommended) or string array (deprecated) | None | No |
| deleteOrphanInitiato rs | Specifies whether to delete initiator objects after they are removed from a volume access group or not. Possible values: • true: Delete initiator objects after they are removed from a volume access group. • false: Do not delete initiator objects after they are removed from a volume access group. • false: Do not delete initiator objects after they are removed from a volume access group. This is the default. | boolean | false | No |

| , | volumes | A list of volume IDs | integer array | None | volumeAccessGroup |
|---|---------|-----------------------|---------------|------|-------------------|
| | | of volumes to modify. | | | |
| | | , | | | |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|-------------------|
| volumeAccessGroup | An object containing information about the newly modified volume access group. | volumeAccessGroup |

Request example

Requests for this method are similar to the following example:

Response example

This method returns a response similar to the following example:

```
{
  "id": null,
  "result": {
    "volumeAccessGroup": {
      "attributes": {},
      "deletedVolumes": [
        327
      1,
      "initiatorIDs": [
        114,
        115
      1,
      "initiators": [
        "iqn.1998-01.com.vmware:desk1-esx1-577b283a",
        "iqn.1998-01.com.vmware:donesq-esx1-421b281b"
      ],

${\bf Get Volume Access Group Efficiency}$

You can use the <code>GetVolumeAccessGroupEfficiency</code> method to get efficiency information about a volume access group. Only the volume access group you provide as the parameter in this API method is used to compute the capacity.

Parameter

| Name | Description | Туре | Default value | Required |
|-------------------------|---|---------|---------------|----------|
| volumeAccessGroup ID | Specifies the volume access group for which capacity is computed. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|---|----------------------|
| compression | The amount of space saved by data compression for all volumes in the volume access group. Stated as a ratio where a value of 1 means data has been stored with no compression. | float |
| deduplication | The amount of space saved by not duplicating data for all volumes in the volume access group. Stated as a ratio. | float |
| thinProvisioning | The ratio of space used to the amount of space allocated for storing data. Stated as a ratio. | float |
| timestamp | The last time efficiency data was collected after garbage collection. | ISO 8601 data string |
| missingVolumes | The volumes that could not be queried for efficiency data. Missing volumes can be caused by a recent garbage collection, temporary network loss or restarted services since the garbage collection cycle. | integer array |

Request example

Requests for this method are similar to the following example:

```
"method": "GetVolumeAccessGroupEfficiency",
    "params": {
        "volumeAccessGroupID": 1
    },
    "id": 1
}
```

This method returns a response similar to the following example:

```
"id": 1,
"result": {
    "compression": 2.006012925331075,
    "deduplication": 1,
    "missingVolumes": [],
    "thinProvisioning": 1.009861932938856,
    "timestamp": "2014-03-10T17:05:27Z"
}

Volume snapshot API methods

Element software volume snapshot API methods enable you to manage volume snapshots. You can create, modify, clone, and delete volume snapshots using the volume snapshot API methods.

- Snapshots overview
- CreateGroupSnapshot
- CreateSchedule
- CreateSnapshot
- DeleteGroupSnapshot
- DeleteSnapshot
- GetSchedule
- ListGroupSnapshots
- ListSchedules

- ListSnapshots
- ModifyGroupSnapshot
- ModifySchedule
- ModifySnapshot
- RollbackToGroupSnapshot
- RollbackToSnapshot

Find more information

- Documentation for earlier versions of NetApp SolidFire and Element products

Snapshots overview

A volume snapshot is a point-in-time copy of a volume. You can use snapshots to roll a volume back to the state it was in at the time the snapshot was created.

You can group volume snapshots together so that related volumes can be backed up or rolled back in a consistent manner. A group snapshot captures a point-in-time image of all volume slice files. You can then use the image to roll back a group of volumes to a point-in-time state and ensure that all data is consistent across all volumes in the group.

You can schedule volume snapshots to occur autonomously at defined intervals. You can define intervals by time, days of the week, or days of the month. You can also use scheduled snapshots to ensure snapshots are backed up to remote storage for archiving purposes.

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

CreateGroupSnapshot

You can use CreateGroupSnapshot to create a point-in-time copy of a group of volumes.

You can use this snapshot later as a backup or rollback to ensure the data on the group of volumes is consistent for the point in time that you created the snapshot.

CLUSTER_FULLNESS

You can create snapshots if cluster fullness is at stage 1, 2, or 3. You cannot create snapshots when cluster fullness reaches stage 4 or 5.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|--|-------------|---------------|----------|
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| enableRemoteRep lication | Specifies whether the snapshot will be replicated to remote storage or not. Possible values: true: The snapshot will be replicated to remote storage. false: The snapshot will not be replicated to remote storage. | boolean | false | No |
| ensureSerialCre | Specifies that the snapshot should not be created if a previous snapshot replication is in progress. Possible values are: • true: This ensures that only one snapshot is being replicated at a time. The creation of a new snapshot will fail if a previous snapshot replication is still in progress. • false: Default. This snapshot creation is allowed if another snapshot replication is still in progress. | boolean | false | No |

| Name | Description | Туре | Default value | Required |
|----------------|--|----------------------|---------------|----------|
| expirationTime | Specify the time after which the snapshot can be removed. Cannot be used with retention. If neither expirationTime, or retention are specified, the snapshot will not expire. The time format is an ISO 8601 date string for time based expiration, otherwise it will not expire. A value of null causes the snapshot to be retained permanently. A value of fifo causes the snapshot to be preserved on a First-In-First-Out (FIFO) basis, relative to other FIFO snapshots on the volume. The API will fail if no FIFO space is available. | ISO 8601 date string | None | No |
| name | The name of the group snapshot. If no name is entered, the date and time the group snapshot was taken is used. The maximum name length allowed is 255 characters. | string | None | No |

| Name | Description | Туре | Default value | Required |
|-----------------|--|----------------|---------------|----------|
| retention | This parameter is same as the expirationTime parameter, except the time format is HH:mm:ss. If neither expirationTime nor retention are specified, the snapshot will not expire. | string | None | No |
| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |
| volumes | Unique ID of the volume image from which to copy. | volumeID array | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------|---|-------------------|
| members | List of checksum, volumeIDs, and snapshotIDs for each member of the group. Valid values: • checksum: A small string representation of the data in the stored snapshot. This checksum can be used later to compare other snapshots to detect errors in the data. (string) | JSON object array |
| | snapshotID: Unique ID of a snapshot from which the new snapshot is made. The snapshotID must be from a snapshot on the given volume. (integer) volumeID: The source volume ID for the snapshot. (integer) | |

| groupSnapshotID | Unique ID of the new group snapshot. | groupSnapshot ID |
|-----------------|---|------------------|
| groupSnapshot | Object containing information about the newly created group snapshot. | groupSnapshot |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateGroupSnapshot",
    "params": {
        "volumes": [1,2]
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```

9.6

CreateSchedule

You can use CreateSchedule to schedule an automatic snapshot of a volume at a defined interval.

You can use the created snapshot later as a backup or rollback to ensure the data on a volume or group of volumes is consistent for the point in time in which the snapshot was created. If you schedule a snapshot to run at a time period that is not divisible by 5 minutes, the snapshot will run at the next time period that is divisible by 5 minutes. For example, if you schedule a snapshot to run at 12:42:00 UTC, it will run at 12:45:00 UTC. You cannot schedule a snapshot to run at intervals of less than 5 minutes.

You can create snapshots if cluster fullness is at stage 1, 2, or 3. You cannot create snapshots when cluster fullness reaches stage 4 or 5.

Parameters

| Name | Description | Туре | Default value | Required |
|---------------|--|-------------|---------------|----------|
| attributes | Use the "frequency" string to indicate the frequency of the snapshot. Possible values: • Days of Week • Days of Month • Time Interval | JSON object | None | No |
| hasError | Help with description needed | boolean | false | No |
| hours | Number of hours between recurring snapshots or hour in GMT time that the snapshot will occur in Days of Week or Days of Month mode. Valid values are 0 through 23. | integer | None | No |
| lastRunStatus | The result or status of the last scheduled snapshot creation. | string | None | No |

| Name | Description | Туре | Default value | Required |
|-----------|--|---------|---------------|----------|
| name | The name of the snapshot. If no name is entered, the date and time the group snapshot was taken is used. The maximum name length allowed is 244 characters. | string | None | No |
| minutes | Number of minutes between recurring snapshots or the minute in GMT time that the snapshot will occur in Days of Week or Days of Month mode. Valid values are 5 through 59. | integer | None | No |
| paused | Indicates if the schedule should be paused or not. Valid values: • true • false | boolean | None | No |
| recurring | Indicates if the schedule will be recurring or not. Valid values are: • true • false | boolean | None | No |

| Name | Description | Туре | Default value | Required |
|-----------------|---|---------|---------------|----------|
| runNextInterval | Specifies whether or not to run the snapshot the next time the scheduler is active. When set to true, the scheduled snapshot runs the next time the scheduler is active and resets back to false. Valid values are: • true • false | boolean | false | No |
| scheduleName | Unique name for the schedule. The maximum schedule name length allowed is 244 characters. | string | None | Yes |
| scheduleType | Indicates the type of schedule to create. Valid value is snapshot. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|--------------|---|-------------|---------------|----------|
| scheduleInfo | The unique name given to the schedule, the retention period for the snapshot that was created, and the volume ID of the volume from which the snapshot was created. Valid values: | JSON object | None | Yes |
| | volumeID: The ID of the volume to be included in the snapshot. (integer) | | | |
| | volumes: A list of volume IDs to be included in the group snapshot. (integer array) | | | |
| | name: The snapshot name to be used. (string) | | | |
| | enableRemote Replication: Indicates if the snapshot should be included in remote replication. (boolean) | | | |
| | • retention: The amount of time the snapshot will be retained in HH:mm:ss. If empty, the snapshot is retained forever. (string) | | | |
| 696 | • fifo: The snapshot is retained on a First-In-First-Out (FIFO) basis. (string) | | | |

Creation:

| Name | Description | Туре | Default value | Required |
|-----------------|--|----------------------|---------------|---|
| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |
| startingDate | Time after which the schedule will be run. If not set, the schedule starts immediately. Formatted in UTC time. | ISO 8601 date string | None | No |
| toBeDeleted | Specifies that this snapshot schedule should be deleted after snapshot creation is completed. | boolean | false | No |
| monthdays | The days of the month that a snapshot will be made. Valid values are 1 through 31. | integer array | None | Yes (if scheduling for days of the month) |

| Name | Description | Туре | Default value | Required |
|----------|---|-------------------|---------------|--|
| weekdays | Day of the week the snapshot is to be created. Required values (if used): • Day: 0 through 6 (Sunday through Saturday) • Offset: for each possible week in a month, 1 through 6 (If greater than 1, only matched on the Nth-1 day of the week. For example, offset:3 for Sunday means the third Sunday of the month, while offset:4 for Wednesday means the fourth Wednesday of the month. Offset:0 means no action is taken. Offset:1 (default) means that the snapshot is created for this day of the week, regardless of where it falls in the month) | JSON object array | None | Yes (if scheduling for days of the week) |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|--|----------|
| scheduleID | ID of the schedule created. | integer |
| schedule | An object containing information about the newly created schedule. | schedule |

Request example 1

The following example schedule has the following parameters:

- No start hours or minutes are specified so the schedule starts as closely as possible to midnight (00:00:00Z).
- It is not recurring (will only run once).
- It runs once on either the first Sunday or Wednesday following June 1, 2015, UTC 19:17:15Z (whichever day comes first).
- It includes only one volume (volumeID = 1).

```
"method": "CreateSchedule",
  "params":{
    "hours":0,
    "minutes":0,
    "paused":false,
    "recurring": false,
    "scheduleName": "MCAsnapshot1",
    "scheduleType": "snapshot",
    "attributes":{
      "frequency": "Days Of Week"
    },
    "scheduleInfo":{
      "volumeID":"1",
      "name": "MCA1"
    "monthdays":[],
    "weekdays":[
      {
        "day":0,
        "offset":1
      },
        "day":3,
        "offset":1
      }
    ],
    "startingDate":"2015-06-01T19:17:54Z"
  },
   "id":1
}
}
}
```

The above request returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "schedule": {
      "attributes": {
        "frequency": "Days Of Week"
      } ,
      "hasError": false,
      "hours": 0,
      "lastRunStatus": "Success",
      "lastRunTimeStarted": null,
      "minutes": 0,
      "monthdays": [],
      "paused": false,
      "recurring": false,
      "runNextInterval": false,
      "scheduleID": 4,
      "scheduleInfo": {
       "name": "MCA1",
       "volumeID": "1"
      },
      "scheduleName": "MCAsnapshot1",
      "scheduleType": "Snapshot",
      "startingDate": "2015-06-01T19:17:54Z",
      "toBeDeleted": false,
      "weekdays": [
          "day": 0,
         "offset": 1
        },
         "day": 3,
         "offset": 1
       }
      ]
    },
    "scheduleID": 4
 }
}
```

Request example 2

The following example schedule has the following parameters:

- It is recurring (will run at each scheduled interval of the month at the specified time).
- It runs on the 1st, 10th, 15th and 30th of each month following the starting date.
- It runs at 12:15 PM on each day it is scheduled to occur.
- It includes only one volume (volumeID = 1).

```
{
  "method": "CreateSchedule",
    "params":{
      "hours":12,
      "minutes":15,
      "paused":false,
      "recurring":true,
      "scheduleName": "MCASnapshot1",
      "scheduleType": "snapshot",
      "attributes":{
        "frequency": "Days Of Month"
      },
      "scheduleInfo":{
        "volumeID":"1"
      } ,
      "weekdays":[
      ],
      "monthdays":[
        1,
        10,
        15,
        30
      ],
      "startingDate":"2015-04-02T18:03:15Z"
    },
    "id":1
}
```

Response example 2

The above request returns a response similar to the following example:

```
{
 "id": 1,
  "result": {
    "schedule": {
      "attributes": {
        "frequency": "Days Of Month"
      },
      "hasError": false,
      "hours": 12,
      "lastRunStatus": "Success",
      "lastRunTimeStarted": null,
      "minutes": 15,
      "monthdays": [
        1,
        10,
        15,
        30
      ],
      "paused": false,
      "recurring": true,
      "runNextInterval": false,
      "scheduleID": 5,
      "scheduleInfo": {
        "volumeID": "1"
      },
      "scheduleName": "MCASnapshot1",
      "scheduleType": "Snapshot",
      "startingDate": "2015-04-02T18:03:15Z",
      "toBeDeleted": false,
      "weekdays": []
    },
      "scheduleID": 5
  }
}
```

Request example 3

The following example schedule has the following parameters:

- It starts within 5 minutes of the scheduled interval on April 2, 2015.
- It is recurring (will run at each scheduled interval of the month at the specified time).
- It runs on the second, third, and fourth of each month following the starting date.
- It runs at 14:45 PM on each day it is scheduled to occur.
- It includes a group of volumes (volumes = 1 and 2).

```
{
 "method": "CreateSchedule",
 "params":{
    "hours":14,
    "minutes":45,
    "paused":false,
    "recurring":true,
    "scheduleName": "MCASnapUser1",
    "scheduleType": "snapshot",
    "attributes":{
      "frequency": "Days Of Month"
    },
    "scheduleInfo":{
      "volumes": [1,2]
    "weekdays":[],
    "monthdays": [2,3,4],
    "startingDate":"2015-04-02T20:38:23Z"
 },
 "id":1
}
```

The above request returns a response similar to the following example:

```
{
 "id": 1,
 "result": {
    "schedule": {
      "attributes": {
        "frequency": "Days Of Month"
      },
      "hasError": false,
      "hours": 14,
      "lastRunStatus": "Success",
      "lastRunTimeStarted": null,
      "minutes": 45,
      "monthdays": [
        2,
        3,
        4
      ],
      "paused": false,
      "recurring": true,
      "runNextInterval": false,
      "scheduleID": 6,
      "scheduleInfo": {
        "volumes": [
          1,
          2
       1
      },
      "scheduleName": "MCASnapUser1",
      "scheduleType": "Snapshot",
      "startingDate": "2015-04-02T20:38:23Z",
      "toBeDeleted": false,
      "weekdays": []
    "scheduleID": 6
  }
```

9.6

CreateSnapshot

You can use CreateSnapshot to create a point-in-time copy of a volume. You can create a snapshot from any volume or from an existing snapshot.

If you do not provide a SnapshotID with this API method, a snapshot is created from the volume's active branch. If the volume from which the snapshot is created is being replicated to a remote cluster, the snapshot can also be replicated to the same target. Use the enableRemoteReplication parameter to enable snapshot replication.

You can create snapshots if cluster fullness is at stage 1, 2, or 3. You cannot create snapshots when cluster fullness reaches stage 4 or 5.

Parameters

| Name | Description | Туре | Default value | Required |
|--------------------------|---|-------------|---------------|----------|
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| enableRemoteRep lication | Specifies whether the snapshot will be replicated to remote storage or not. Possible values: true: The snapshot will be replicated to remote storage. false: The snapshot will not be replicated to remote storage. | boolean | false | No |

| Name | Description | Туре | Default value | Required |
|--------------------------|--|---------|---------------|----------|
| ensureSerialCre ation | Specifies that the snapshot should not be created if a previous snapshot replication is in progress. Possible values are: | boolean | false | No |
| | • true: This ensures that only one snapshot is being replicated at a time. The creation of a new snapshot will fail if a previous snapshot replication is still in progress. | | | |
| | • false: Default. This snapshot creation is allowed if another snapshot replication is still in progress. | | | |

| Name | Description | Туре | Default value | Required |
|----------------|---|--------|---------------|----------|
| expirationTime | Specify the time after which the snapshot can be removed. Cannot be used with retention. If neither expirationTime or retention are specified the snapshot will not expire. The time format is an ISO 8601 date string for time based expiration, otherwise it will not expire. A value of null causes the snapshot to be retained permanently. A value of fifo causes the snapshot to be preserved on a First-In-First-Out basis, relative to other FIFO snapshots on the volume. The API will fail if no FIFO space is available. | string | None | No |
| name | The name of the snapshot. If no name is entered, the date and time the snapshot was taken is used. The maximum name length allowed is 255 characters. | string | None | No |

| Name | Description | Туре | Default value | Required |
|-----------------|--|---------|---------------|----------|
| retention | This parameter is same as the expirationTime parameter, except the time format is HH:mm:ss. If neither expirationTime nor retention are specified, the snapshot will not expire. | string | None | No |
| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |
| snapshotID | Unique ID of a snapshot from which the new snapshot is made. The snapshotID passed must be a snapshot on the given volume. | integer | None | No |
| volumeID | Unique ID of the volume image from which to copy. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|--|-------------|
| checksum | A string that represents the correct digits in the stored snapshot. This checksum can be used later to compare other snapshots to detect errors in the data. | string |
| snapshotID | Unique ID of the new snapshot. | Snapshot ID |
| snapshot | An object containing information about the newly created snapshot. | snapshot |

Request example

Requests for this method are similar to the following example:

```
{
    "method": "CreateSnapshot",
    "params": {
        "volumeID": 1
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
"id": 1,
  "result": {
    "checksum": "0x0",
      "snapshot": {
        "attributes": {},
        "checksum": "0x0",
        "createTime": "2016-04-04T17:14:03Z",
        "enableRemoteReplication": false,
        "expirationReason": "None",
        "expirationTime": null,
        "groupID": 0,
        "groupSnapshotUUID": "00000000-0000-0000-0000-0000000000",
        "name": "2016-04-04T17:14:03Z",
        "snapshotID": 3110,
        "snapshotUUID": "6f773939-c239-44ca-9415-1567eae79646",
        "status": "done",
        "totalSize": 5000658944,
        "virtualVolumeID": null,
        "volumeID": 1
      },
        "snapshotID": 3110
  }
}
```

Exception

An xNotPrimary exception is displayed when the <code>CreateSnapshot</code> API is called and the snapshot fails to get created. This is expected behavior. Retry the <code>CreateSnapshot</code> API call.

9.6

DeleteGroupSnapshot

You can use DeleteGroupSnapshot to delete a group snapshot.

You can use the saveMembers parameter to preserve all the snapshots that were made for the volumes in the group, but the group association will be removed.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|-----------------|--|---------|---------------|----------|
| groupSnapshotID | Unique ID of the group snapshot. | integer | None | Yes |
| saveMembers | Specifies what to delete when you delete a group snapshot. Valid values: • true: Snapshots are kept, but the group association is removed. • false: The group and snapshots are deleted. | boolean | false | No |

Return value

This method has no return value.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteGroupSnapshot",
    "params": {
        "groupSnapshotID": 10,
        "saveMembers" : true
        },
        "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {}
}
```

New since version

9.6

DeleteSnapshot

You can use the DeleteSnapshot method to delete a snapshot.

A snapshot that is currently the active snapshot cannot be deleted. You must rollback and make another snapshot active before the current snapshot can be deleted.

Parameters

| Name | Description | Туре | Default value | Required |
|------------|-----------------------------------|---------|---------------|----------|
| snapshotID | The ID of the snapshot to delete. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|----------------------------|--|---------|---------------|----------|
| overrideSnapMirror Hold | Override the lock placed on snapshots during replication. You can use this parameter to delete stale SnapMirror snapshots after the associated SnapMirror relationship has been deleted. | boolean | false | No |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteSnapshot",
"params": {
    "snapshotID": 8,
    "overrideSnapMirrorHold": true
},
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {}
}
```

New since version

Find more information

RollbackToSnapshot

GetSchedule

You can use GetSchedule to get information about a scheduled snapshot.

You can see information about a specific schedule if there are many snapshot schedules in the system. You also retrieve information about more than one schedule with this method by specifying additional IDs in the scheduleID parameter.

Parameter

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|------------|---|---------|---------------|----------|
| scheduleID | Unique ID of the schedule or multiple schedules to display. | integer | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|----------------------------------|----------------|
| schedule | An array of schedule attributes. | schedule array |

Request example

Requests for this method are similar to the following example:

Response example

```
{
 "id": 1,
  "result": {
    "schedule": {
      "attributes": {
        "frequency": "Time Interval"
       "hasError": false,
       "hours": 0,
       "lastRunStatus": "Success",
       "lastRunTimeStarted": "2015-03-23T21:25:00Z",
       "minutes": 2,
       "monthdays": [],
       "paused": false,
       "recurring": true,
       "runNextInterval": false,
       "scheduleID": 2,
       "scheduleInfo": {
          "name": "MCA2",
          "volumeID": "3"
       },
       "scheduleName": "MCAsnapshot2",
       "scheduleType": "Snapshot",
       "startingDate": "2015-03-23T19:28:57Z",
       "toBeDeleted": false,
       "weekdays": []
   }
```

9.6

ListGroupSnapshots

You can use ListGroupSnapshots method to return information about all group snapshots that have been created.

Parameters

| Name | Description | Туре | Default value | Required |
|-----------------|--|----------------|---------------|----------|
| groupSnapshotID | Retrieve information for an individual group snapshot ID. | integer | None | No |
| volumes | An array of unique volume IDs to query. If you do not specify this parameter, all group snapshots on the cluster are included. | volumeID array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------------|---|---------------------|
| groupSnapshots | A list of objects containing information about each group snapshot. | groupSnapshot array |

Request example

Requests for this method are similar to the following example:

Response example

```
{
   "groupSnapshots": [
     {
        "status": "Done",
```

```
"remoteStatuses": [
                "volumePairUUID": "abcdef-1234-5678-90ab-cdef0123",
                "remoteStatus": "Present"
          1,
          "attributes": {},
          "groupSnapshotID": 1,
          "createTime": "2014-06-17T17:35:05Z",
          "members": [
              {
                "snapshotUUID": "abcdef-1234-5678-90ab-cdef0123",
                "expirationReason": "None",
                "virtualVolumeID": "abcdef-1234-5678-90ab-cdef0123",
                "groupID": 1,
                "createTime": "2014-06-17T17:35:05Z",
                "totalSize": 1,
                "snapMirrorLabel": "test1",
                "volumeName": "test1",
                "instanceCreateTime": "2014-06-17T17:35:05Z",
                "volumeID": 1,
                "checksum": "0x0",
                "attributes": {},
                "instanceSnapshotUUID": "abcdef-1234-5678-90ab-cdef0123",
                "snapshotID": 1,
                "status": "Done",
                "groupSnapshotUUID": "abcdef-1234-5678-90ab-cdef0123",
                "expirationTime": "2014-06-17T17:35:05Z",
                "enableRemoteReplication": true,
                "name": "test1",
                "remoteStatuses": [
                        "volumePairUUID": "abcdef-1234-5678-90ab-
cdef0123",
                        "remoteStatus": "Present"
                  ]
              }
          1,
          "enableRemoteReplication": true,
          "name": "test1",
          "groupSnapshotUUID": "abcdef-1234-5678-90ab-cdef0123"
    ]
}
```

9.6

ListSchedules

You can use ListSchedules to get information about all scheduled snapshots that have been created.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|---|----------------|
| schedules | A list of the schedules currently on the cluster. | schedule array |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListSchedules",
     "params": {},

"id": 1
}
```

Response example

```
"lastRunTimeStarted": null,
    "minutes": 1,
    "monthdays": [],
    "paused": false,
    "recurring": false,
    "runNextInterval": false,
    "scheduleID": 3,
    "scheduleInfo": {
         "name": "Wednesday Schedule",
         "retention": "00:02:00",
         "volumeID": "2"
   },
   "scheduleName": "Vol2Schedule",
  "scheduleType": "Snapshot",
  "startingDate": "2015-03-23T20:08:33Z",
  "toBeDeleted": false,
  "weekdays": [
      {
        "day": 3,
        "offset": 1
      }
 ]
},
{
  "attributes": {
       "frequency": "Time Interval"
   "hasError": false,
   "hours": 0,
   "lastRunStatus": "Success",
   "lastRunTimeStarted": "2015-03-23T21:40:00Z",
   "minutes": 2,
   "monthdays": [],
   "paused": false,
    "recurring": true,
    "runNextInterval": false,
    "scheduleID": 2,
    "scheduleInfo": {
         "name": "MCA2",
        "volumeID": "3"
    },
    "scheduleName": "MCAsnapshot2",
    "scheduleType": "Snapshot",
    "startingDate": "2015-03-23T19:28:57Z",
    "toBeDeleted": false,
    "weekdays": []
```

```
}
]
}
}
```

9.6

ListSnapshots

You can use ListSnapshots to return the attributes of each snapshot taken on the volume.

Information about snapshots that reside on the target cluster will be displayed on the source cluster when this method is called from the source cluster.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|------------|--|---------|---------------|----------|
| volumeID | Retrieves snapshots for a volume. If volumeID is not provided, all snapshots for all volumes are returned. | integer | None | No |
| snapshotID | Retrieves information for an individual snapshot ID. | integer | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-----------|---|----------------|
| snapshots | Information about each snapshot for each volume. If volumeID is not provided, all snapshots for all volumes are returned. Snapshots that are in a group are returned with a group ID. | snapshot array |

Request example

Requests for this method are similar to the following example:

Response example

```
"id": 1,
"result": {
  "snapshots": [
      {
        "attributes": {},
        "checksum": "0x0",
        "createTime": "2015-05-08T13:15:00Z",
        "enableRemoteReplication": true,
        "expirationReason": "None",
        "expirationTime": "2015-05-08T21:15:00Z",
        "groupID": 0,
        "groupSnapshotUUID": "00000000-0000-0000-0000-0000000000",
        "name": "Hourly",
        "remoteStatuses": [
              "remoteStatus": "Present",
              "volumePairUUID": "237e1cf9-fb4a-49de-a089-a6a9a1f0361e"
       ],
        "snapshotID": 572,
        "snapshotUUID": "efa98e40-cb36-4c20-a090-a36c48296c14",
        "status": "done",
        "totalSize": 10000269312,
        "volumeID": 1
      }
   1
 }
}
```

9.6

ModifyGroupSnapshot

You can use ModifyGroupSnapshot to change the attributes of a group of snapshots. You can also use this method to enable snapshots created on the read/write (source) volume to be remotely replicated to a target storage system.

Parameters

| Name | Description | Туре | Default value | Required |
|-----------------------------|--|---------|---------------|----------|
| enableRemoteRepli cation | Use to enable the snapshot created to be replicated to a remote cluster. Possible values: true: The snapshot will be replicated to remote storage. false: The snapshot will not be replicated to remote storage. | boolean | false | No |

| expirationTime | Specify the time after which the snapshot can be removed. Cannot be used with retention. If neither expirationTime, or retention on the original snapshot, are specified, the snapshot will not expire. The time format is an ISO 8601 date string for time based expiration, otherwise it will not expire. A value of null causes the snapshot to be retained permanently. A value of fifo causes the snapshot to be preserved on a First-In-First-Out (FIFO) basis, relative to other FIFO snapshots on the volume. The API will fail if no FIFO space is available. | ISO 8601 date string | None | No |
|-----------------|--|----------------------|------|-----|
| name | The name of the group snapshot. If no name is entered, the date and time the group snapshot was taken is used. The maximum name length allowed is 255 characters. | string | None | No |
| groupSnapshotID | The ID of the group of snapshots. | string | None | Yes |
| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|---------------|--|---------------|
| groupSnapshot | Object containing information about the newly modified group snapshot. | groupSnapshot |

Request example

Requests for this method are similar to the following example:

```
"id": 695,
"method": "ModifyGroupSnapshot",
"params": {
    "groupSnapshotID": 3,
    "enableRemoteReplication": true,
    "expirationTime": "2016-04-08T22:46:25Z"
}
```

Response example

```
{
  "id": 695,
  "result": {
    "groupSnapshot": {
      "attributes": {},
      "createTime": "2016-04-06T17:31:41Z",
      "groupSnapshotID": 3,
      "groupSnapshotUUID": "8b2e101d-c5ab-4a72-9671-6f239de49171",
      "members": [
          "attributes": {},
          "checksum": "0x0",
          "createTime": "2016-04-06T17:31:41Z",
          "enableRemoteReplication": true,
          "expirationReason": "None",
          "expirationTime": "2016-04-08T22:46:25Z",
          "groupID": 3,
          "groupSnapshotUUID": "8b2e101d-c5ab-4a72-9671-6f239de49171",
          "name": "grpsnap1-2",
          "snapshotID": 2,
          "snapshotUUID": "719b162c-e170-4d80-b4c7-1282ed88f4e1",
          "status": "done",
          "totalSize": 1000341504,
          "virtualVolumeID": null,
          "volumeID": 2
        }
      ],
      "name": "grpsnap1",
      "status": "done"
  }
}
```

9.6

ModifySchedule

You can use ModifySchedule to change the intervals at which a scheduled snapshot occurs. You can also delete or pause a schedule by using this method.

Parameters

| Name | Description | Туре | Default value | Required |
|---------------|---|-------------|---------------|----------|
| attributes | Use to change the frequency of the snapshot occurrence. Possible values: Days of Week Days of Month Time Interval | JSON object | None | No |
| hours | Number of hours between snapshots or hour at which the snapshot will occur in Days of Week or Days of Month mode. Valid values are 0 through 24. | string | None | No |
| name | The name of the snapshot. If no name is entered, the date and time the group snapshot was taken is used. The maximum name length allowed is 244 characters. | string | None | No |
| minutes | Number of minutes between snapshots or minute at which snapshot will occur in Days of Week or Days of Month mode. Valid values are 0 through 59. | integer | None | No |
| lastRunStatus | The result or status of the last scheduled snapshot creation. | string | None | No |

| paused | Indicates if the schedule should be paused or not. Valid values: • true • false | boolean | None | No |
|-----------------|---|---------|-------|-----|
| recurring | Indicates if the schedule will be recurring or not. Valid values are: • true • false | boolean | None | No |
| runNextInterval | Use to choose whether or not to run the snapshot the next time the scheduler is active. Valid values: true false When set to true, the scheduled snapshot runs the next time the scheduler is active, and then resets back to false. | boolean | false | No |
| scheduleID | Unique ID of the schedule. | integer | None | Yes |
| scheduleName | Unique name for the schedule. The maximum schedule name length allowed is 244 characters. | string | None | No |
| scheduleType | Indicates the type of schedule to create. The only supported value is snapshot. | string | None | Yes |

| given to the schedule, the retention period for the snapshot that was created, and the volume ID of the volume from which the snapshot was created. Valid values: • enableRemote Replication: | | |
|--|--|----|
| the snapshot that was created, and the volume ID of the volume from which the snapshot was created. Valid values: • enableRemote | | |
| was created, and the volume ID of the volume from which the snapshot was created. Valid values: • enableRemote | | |
| the volume ID of the volume from which the snapshot was created. Valid values: • enableRemote | | |
| the snapshot was created. Valid values: • enableRemote | | |
| <pre>created. Valid values: • enableRemote</pre> | | |
| <pre>values: • enableRemote</pre> | | |
| • enableRemote | | |
| | | |
| Replication: | | |
| Indicates if the | | |
| snapshot should | | |
| be included in | | |
| remote | | |
| replication. | | |
| (boolean) | | |
| • ensureSerial Creation: | | |
| Specifies | | |
| whether a new | | |
| snapshot | | |
| creation should be allowed if a | | |
| previous | | |
| snapshot | | |
| replication is in | | |
| progress. (boolean) | | |
| • name: The | | |
| snapshot name | | |
| to be used. | | |
| (string) | | |
| • retention: | | |
| The amount of time the | | |
| snapshot is | | |
| retained. | | |
| Depending on | | |
| the time, it displays in one | | |
| of the following | | |
| formats: | | |
| ° fifo: The | | |
| snapshot is | | |
| retained on a First-In- | | |
| First-Out | | |
| (FIFO) | | |
| basis. If empty, the | | |
| snapshot is | | 72 |

retained

| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |
|-----------------|---|----------------------|------|-----|
| toBeDeleted | Indicates if the schedule is marked for deletion. Valid values: • true • false | boolean | None | No |
| startingDate | Indicates the date the first time the schedule began or will begin. | ISO 8601 date string | None | No |
| monthdays | The days of the month that a snapshot will be made. Valid values are 1 through 31. | integer array | None | Yes |
| weekdays | Day of the week the snapshot is to be created. The day of the week starts at Sunday with the value of 0 and an offset of 1. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|--|----------|
| schedule | An object containing the modified schedule attributes. | schedule |

Request example

```
"method": "ModifySchedule",
"params": {
    "scheduleName" : "Chicago",
    "scheduleID" : 3
    },
"id": 1
}
```

Response example

```
"id": 1,
 "result": {
    "schedule": {
      "attributes": {
        "frequency": "Days Of Week"
            },
      "hasError": false,
      "hours": 5,
      "lastRunStatus": "Success",
      "lastRunTimeStarted": null,
      "minutes": 0,
      "monthdays": [],
      "paused": false,
      "recurring": true,
      "runNextInterval": false,
      "scheduleID": 3,
      "scheduleInfo": {
        "volumeID": "2"
            },
      "scheduleName": "Chicago",
      "scheduleType": "Snapshot",
      "startingDate": null,
      "toBeDeleted": false,
      "weekdays": [
          "day": 2,
          "offset": 1
 }
}
```

9.6

ModifySnapshot

You can use ModifySnapshot to change the attributes currently assigned to a snapshot. You can also use this method to enable snapshots created on the read/write (source) volume to be remotely replicated to a target storage cluster running Element software.

Parameters

| Name | Description | Туре | Default value | Required |
|-----------------------------|--|---------|---------------|----------|
| enableRemoteRepli cation | Use to enable the snapshot created to be replicated to a remote storage cluster. Possible values: • true: The | boolean | false | No |
| | snapshot will be replicated to remote storage. | | | |
| | false:The snapshot will not be replicated to remote storage. | | | |

| expirationTime | Specify the time after which the snapshot can be removed. Cannot be used with retention. If neither | ISO 8601 date string | None | No |
|-----------------|--|----------------------|------|-----|
| | expirationTime, or retention on the original snapshot, are specified, the snapshot will not expire. The time format is an ISO 8601 date string for time based expiration, otherwise it will not expire. A value of null causes the snapshot to be retained permanently. A value of fifo causes the snapshot to be preserved on a First-In-First-Out (FIFO) basis, relative to other FIFO snapshots on the volume. The API will fail if no FIFO space is available. | | | |
| name | The name of the snapshot. If no name is entered, the date and time the snapshot was taken is used. The maximum name length allowed is 255 characters. | string | None | No |
| snapMirrorLabel | The label used by SnapMirror software to specify the snapshot retention policy on a SnapMirror endpoint. | string | None | No |
| snapshotID | Identifier of the snapshot. | string | None | Yes |

Return value

This method has the following return value:

| Name | Description | Туре |
|----------|---|----------|
| snapshot | An object containing information about the newly modified snapshot. | snapshot |

Request example

Requests for this method are similar to the following example:

```
"method": "ModifySnapshot",
"params": {
    "snapshotID": 3114,
    "enableRemoteReplication": "true",
    "name" : "Chicago"
},
"id": 1
}
```

Response example

```
{
  "id": 1,
  "result": {
    "snapshot": {
      "attributes": {},
      "checksum": "0x0",
      "createTime": "2016-04-04T17:26:20Z",
      "enableRemoteReplication": true,
      "expirationReason": "None",
      "expirationTime": null,
      "groupID": 0,
      "groupSnapshotUUID": "00000000-0000-0000-0000-0000000000",
      "name": "test1",
      "snapshotID": 3114,
      "snapshotUUID": "5809a671-4ad0-4a76-9bf6-01cccf1e65eb",
      "status": "done",
      "totalSize": 5000658944,
      "virtualVolumeID": null,
      "volumeID": 1
}
```

9.6

RollbackToGroupSnapshot

You can use RollbackToGroupSnapshot to roll back all individual volumes in a snapshot group to each volume's individual snapshot.

Rolling back to a group snapshot creates a temporary snapshot of each volume within the group snapshot.

- Creating a snapshot is allowed if cluster fullness is at stage 1, 2, or 3. Snapshots are not created when cluster fullness is at stage 4 or 5.
- Rolling back volumes to a group snapshot might fail when slice synchronization is in progress. Retry RollbackToGroupSnapshot after syncing completes.

Parameters

| Name | Description | Туре | Default value | Required |
|----------------------|--|-------------|---------------|----------|
| groupSnapshotID | Unique ID of the group snapshot. | integer | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON object | None | No |
| name | Name for the group snapshot of the volume's current state that is created if saveCurrentState is set to true. If you do not give a name, then the name of the snapshots (group and individual volume) are set to a timestamp of the time that the rollback occurred. | string | None | No |
| saveCurrentStat e | Specifies whether to save the previous active volume image or not. Valid values: • true: The previous active volume image is kept. • false: The previous active volume image is deleted. | boolean | false | No |

Return values

This method has the following return values:

| Name | Description | Туре | |
|------|-------------|------|--|
|------|-------------|------|--|

| members | An array containing volumeIDs and snapshotIDs of members of the group snapshot. Values: • checksum: A small string representation of the data in the stored snapshot. This checksum can be used later to compare other snapshots to detect errors in the data. (string) • snapshotID: Unique ID of a snapshot from which the new snapshot is made. The snapshotID must be a snapshot on the given volume. (integer) • volumeID: The source volume ID for the snapshot. (integer) | JSON object array |
|-----------------|---|-------------------|
| groupSnapshotID | If saveCurrentState was set to false, this value is null. If saveCurrentState was set to true, the unique ID of the newly created group snapshot. | integer |
| groupSnapshot | If saveCurrentState was set to false, this value is null. If saveCurrentState was set to true, an object containing information about the group snapshot which RollbackToGroupSnapshot just rolled back to. | groupSnapshot |

Request example

Requests for this method are similar to the following example:

```
"id": 438,
  "method": "RollbackToGroupSnapshot",
  "params": {
     "groupSnapshotID": 1,
     "name": "grpsnap1",
     "saveCurrentState": true
}
```

Response example

```
{
  "id": 438,
  "result": {
    "groupSnapshot": {
      "attributes": {},
      "createTime": "2016-04-06T17:27:17Z",
      "groupSnapshotID": 1,
      "groupSnapshotUUID": "468fe181-0002-4b1d-ae7f-8b2a5c171eee",
      "members": [
          "attributes": {},
          "checksum": "0x0",
          "createTime": "2016-04-06T17:27:17Z",
          "enableRemoteReplication": false,
          "expirationReason": "None",
          "expirationTime": null,
          "groupID": 1,
          "groupSnapshotUUID": "468fe181-0002-4b1d-ae7f-8b2a5c171eee",
          "name": "2016-04-06T17:27:17Z",
          "snapshotID": 4,
          "snapshotUUID": "03563c5e-51c4-4e3b-a256-a4d0e6b7959d",
          "status": "done",
          "totalSize": 1000341504,
          "virtualVolumeID": null,
          "volumeID": 2
       }
      ],
      "name": "2016-04-06T17:27:17Z",
      "status": "done"
    },
    "groupSnapshotID": 3,
    "members": [
        "checksum": "0x0",
        "snapshotID": 2,
        "snapshotUUID": "719b162c-e170-4d80-b4c7-1282ed88f4e1",
        "volumeID": 2
      }
    ]
  }
}
```

9.6

RollbackToSnapshot

You can use the RollbackToSnapshot method to make an existing snapshot of the active volume image. This method creates a new snapshot from an existing snapshot.

The new snapshot becomes active and the existing snapshot is preserved until it is manually deleted. The previously active snapshot is deleted unless you set the saveCurrentState parameter to true.

CLUSTER_FULLNESS

- You can create snapshots if cluster fullness is at stage 1, 2, or 3. You cannot create snapshots when cluster fullness reaches stage 4 or 5.
- Rolling back a volume to a snapshot might fail when slice synchronization is in progress. Retry RollbackToSnapshot after syncing completes.

Parameters

| Name | Description | Туре | Default value | Required |
|------------|--|-----------------|---------------|----------|
| volumeID | VolumeID for the volume. | integer | None | Yes |
| attributes | List of name-value pairs in JSON object format. | JSON attributes | None | No |
| name | Name for the snapshot. If no name is given, the name of the snapshot being rolled back to is used with "- copy" appended to the end of the name. | string | None | No |
| snapshotID | ID of a previously created snapshot on the given volume. | integer | None | Yes |

| Name | Description | Туре | Default value | Required |
|------------------|---|---------|---------------|----------|
| saveCurrentState | Specifies whether to save previous active volume image or not. Valid values: | boolean | false | No |
| | true: The previous active volume image is kept. | | | |
| | false: The previous active volume image is deleted. | | | |

Return values

This method has the following return values:

| Name | Description | Туре |
|------------|--|----------|
| checksum | A small string representation of the data in the stored snapshot. | string |
| snapshotID | If saveCurrentState was set to false, this value is null. If saveCurrentState was set to true, the unique ID of the newly created snapshot. | integer |
| snapshot | If saveCurrentState was set to false, this value is null. If saveCurrentState was set to true, an object containing information about the newly created snapshot. | snapshot |

Request example

Requests for this method are similar to the following example:

```
"method": "RollbackToSnapshot",
"params": {
    "volumeID": 1,
    "snapshotID": 3114,
    "saveCurrentState": true
},
"id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
 "id": 1,
 "result": {
   "checksum": "0x0",
   "snapshot": {
     "attributes": {},
     "checksum": "0x0",
     "createTime": "2016-04-04T17:27:32Z",
     "enableRemoteReplication": false,
     "expirationReason": "None",
     "expirationTime": null,
     "groupID": 0,
     "groupSnapshotUUID": "00000000-0000-0000-0000-0000000000",
     "name": "test1-copy",
     "snapshotID": 1,
     "snapshotUUID": "30d7e3fe-0570-4d94-a8d5-3cc8097a6bfb",
     "status": "done",
     "totalSize": 5000658944,
     "virtualVolumeID": null,
     "volumeID": 1
   },
   "snapshotID": 1
```

9.6

Virtual volume API methods

Element software virtual volume API methods enable you to manage virtual volumes (VVols). You can view existing VVols with these API methods as well as create, modify, and delete virtual volume storage containers. Although you cannot use these methods to operate on normal volumes, you can use the normal volume API methods to list information about VVols.

- CreateStorageContainer
- DeleteStorageContainers
- GetStorageContainerEfficiency
- GetVirtualVolumeCount
- ListProtocolEndpoints
- ListStorageContainers
- ListVirtualVolumeBindings
- ListVirtualVolumeHosts
- ListVirtualVolumes
- ListVirtualVolumeTasks
- ModifyStorageContainer

Find more information

- SolidFire and Element Software Documentation
- Documentation for earlier versions of NetApp SolidFire and Element products

CreateStorageContainer

You can use the CreateStorageContainer method to create a Virtual Volume (VVol) storage container. You can use storage containers for reporting and resource allocation. You need to create at least one storage container to use the Virtual Volumes feature.

Parameters

| Name | Description | Туре | Default value | Required |
|------|--|--------|---------------|----------|
| name | Name of the storage container. Follows Element software account naming restrictions. | string | None | Yes |

| Name | Description | Туре | Default value | Required |
|-----------------|---|---------|---------------|----------|
| accountID | Non-storage container account that will become a storage container. | integer | None | No |
| initiatorSecret | The secret for CHAP authentication for the initiator. | string | None | No |
| targetSecret | The secret for CHAP authentication for the target. | string | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------------------|--|------------------|
| storageContainer | Object containing Information about the newly created storage container. | storageContainer |

Request example

Requests for this method are similar to the following example:

```
"method": "CreateStorageContainer",
    "params": {
         "name" : "example"
     },
     "id": 1
}
```

Response example

```
"id": 1,
"result": {
    "storageContainer": {
        "accountID": 8,
        "initiatorSecret": "rVTOi25^H.d;cP}1",
        "name": "example",
        "protocolEndpointType": "SCSI",
        "status": "active",
        "storageContainerID": "a9ec1138-e386-4a44-90d7-b9acbbc05176",
        "targetSecret": "6?AEIxWpvo6,!boM"
    }
}
```

9.6

DeleteStorageContainers

You can use the DeleteStorageContainers method to remove up to 2000 Virtual Volume (VVol) storage containers from the system at one time. The storage containers you remove must not contain any VVols.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------|--|------------|---------------|----------|
| storageContainerIDs | A list of IDs of the storage containers to delete. You can specify up to 2000 IDs in the list. | UUID array | None | Yes |

Return values

This method has no return values.

Request example

Requests for this method are similar to the following example:

```
"method": "DeleteStorageContainers",
    "params": {
        "storageContainerIDs" : ["a9ec1138-e386-4a44-90d7-b9acbbc05176"]
    },
    "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {}
}
```

New since version

9.6

GetStorageContainerEfficiency

You can use the GetStorageContainerEfficiency method to retrieve efficiency information about a virtual volume storage container.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------|---|---------|---------------|----------|
| storageContainerID | The ID of the storage container for which to retrieve efficiency information. | integer | None | Yes |

Return values

This method has the following return values:

| Name | Description | Туре |
|------|-------------|------|
|------|-------------|------|

| compression | The amount of space saved by data compression for all virtual volumes in the storage container. Stated as a ratio where a value of 1 means data has been stored with no compression. | float |
|------------------|--|----------------------|
| deduplication | The amount of space saved by not duplicating data for all virtual volumes in the storage container. Stated as a ratio. | float |
| missingVolumes | The virtual volumes that could not be queried for efficiency data. Missing volumes can be caused by the Garbage Collection (GC) cycle being less than an hour old, temporary loss of network connectivity, or restarted services since the GC cycle. | integer array |
| thinProvisioning | The ratio of space used to the amount of space allocated for storing data. Stated as a ratio. | float |
| timestamp | The last time efficiency data was collected after GC. | ISO 8601 data string |

Request example

Requests for this method are similar to the following example:

```
"method": "GetStorageContainerEfficiency",
"params": {
    "storageContainerID" : "6c95e24f-9f0b-4793-affb-5a4bc6c3d7e1"
},
"id" : 1
}
```

Response example

```
"id": 1,
"result": {
    "compression": 1,
    "deduplication": 1,
    "missingVolumes": [],
    "thinProvisioning": 1,
    "timestamp": "2016-04-12T15:39:49Z"
}
```

9.6

GetVirtualVolumeCount

You can use the GetVirtualVolumeCount method to retrieve the number of virtual volumes currently in the system.

Parameters

This method has no input parameters.

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|--|---------|
| count | The number of virtual volumes currently in the system. | integer |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "GetVirtualVolumeCount",
     "params": {
    },
     "id": 1
}
```

Response example

This method returns a response similar to the following example:

```
{
  "id": 1,
  "result": {
    "count": 5
  }
}
```

New since version

9.6

ListProtocolEndpoints

You can use the ListProtocolEndpoints method to retrieve information about all protocol endpoints in the cluster. Protocol endpoints govern access to their associated virtual volume storage containers.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------|--|----------------------------------|---------------|----------|
| protocolEndpointIDs | A list of protocol endpoint IDs for which to retrieve information. If you omit this parameter, the method returns information about all protocol endpoints. | protocolEndpointID UUID array | None | No |

Return values

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|------------------------|
| protocolEndpoints | List of objects containing information about each protocol endpoint in the system. | protocolEndpoint array |

Request example

Requests for this method are similar to the following example:

```
"id": 1,
"method": "ListProtocolEndpoints",
"params": {}
}
```

Response example

```
{
 "id": 1,
 "result": {
    "protocolEndpoints": [
        "primaryProviderID": 1,
        "protocolEndpointID": "1387e257-d2e3-4446-be6d-39db71583e7b",
        "protocolEndpointState": "Active",
        "providerType": "Primary",
        "scsiNAADeviceID": "6f47acc200000016970687200000000",
        "secondaryProviderID": 2
      },
        "primaryProviderID": 2,
        "protocolEndpointID": "1f16ed86-3f31-4c76-b004-a1251187700b",
        "protocolEndpointState": "Active",
        "providerType": "Primary",
        "scsiNAADeviceID": "6f47acc2000000026970687200000000",
        "secondaryProviderID": 3
      },
        "primaryProviderID": 4,
        "protocolEndpointID": "c6458dfe-9803-4350-bb4e-68a3feb7e830",
        "protocolEndpointState": "Active",
        "providerType": "Primary",
        "scsiNAADeviceID": "6f47acc2000000046970687200000000",
        "secondaryProviderID": 1
      },
        "primaryProviderID": 3,
        "protocolEndpointID": "f3e7911d-0e86-4776-97db-7468c272213f",
        "protocolEndpointState": "Active",
        "providerType": "Primary",
        "scsiNAADeviceID": "6f47acc2000000036970687200000000",
        "secondaryProviderID": 4
   ]
```

9.6

ListStorageContainers

You can use the ListStorageContainers method to retrieve information about all virtual volume storage containers known to the system.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|---------------------|---|------------|---------------|----------|
| storageContainerIDs | A list of storage container IDs for which to retrieve information. If you omit this parameter, the method returns information about all storage containers in the system. | UUID array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------------------|--|------------------------|
| storageContainers | List of objects containing information about all storage containers in the system. | storageContainer array |

Request example

Requests for this method are similar to the following example:

```
{
   "method": "ListStorageContainers",
   "params": {
       "storageContainerIDs": ["efda8307-b916-4424-979e-658a3f16894d"]
    },
    "id": 1
}
```

Response example

9.6

ListVirtualVolumeBindings

You can use the ListVirtualVolumeBindings method to get a list of all virtual volumes in the cluster that are bound to protocol endpoints.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|-----------------------------|---|---------------|---------------|----------|
| virtualVolumeBindin gIDs | A list of virtual volume binding IDs for which to retrieve information. If you omit this parameter, the method returns information about all virtual volume bindings. | integer array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|------|---|---------|
| | A list of objects describing all virtual volumes in the cluster that are bound to protocol endpoints. | binding |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListVirtualVolumeBindings",
     "params": {
     },
     "id": 1
}
```

Response example

This method returns a response similar to the following example:

New since version

9.6

ListVirtualVolumeHosts

You can use the ListVirtualVolumeHosts method to get a list of all virtual volume hosts known to the cluster. A virtual volume host is a VMware ESX host that has initiated a session with the VASA API provider.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|-----------------------------------|---------------|----------|
| virtualVolumeHostID s | A list of virtual volume host IDs for which to retrieve information. If you omit this parameter, the method returns information about all virtual volume hosts. | virtualVolumeHostID UUID array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|---|------------|
| hosts | A list of objects describing the virtual volume hosts in the cluster. | host array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVirtualVolumeHosts",
    "params": {
    },
    "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "hosts": [
     {
        "bindings": [],
        "clusterID": "5ebdb4ad-9617-4647-adfd-c1013578483b",
        "hostAddress": "172.30.89.117",
        "initiatorNames": [
          "iqn.1998-01.com.vmware:zdc-dhcp-0-c-29-d6-4b-f1-1a0cd614",
          "ign.1998-01.com.vmware:zdc-dhcp-0-c-29-d6-4b-f1-5bcf9254"
        ],
        "virtualVolumeHostID": "564de1a4-9a99-da0f-8b7c-3a41dfd64bf1",
        "visibleProtocolEndpointIDs": [
          "5dd53da0-b9b7-43f9-9b7e-b41c2558e92b"
 }
}
```

9.6

ListVirtualVolumes

You can use the ListVirtualVolumes method to list the virtual volumes currently in the system. You can use this method to list all virtual volumes, or only list a subset.

Parameters

This method has the following input parameters:

| Name | Description | Туре | Default value | Required |
|----------------------|---|----------|---------------|----------|
| details | The level of detail in the response. Possible values: • true: Include more details about each VVol in the response. • false: Include the standard level of detail about each VVol in the response. | boolean | False | No |
| limit | The maximum number of virtual volumes to list. | integer | 10000 | No |
| recursive | Specifies whether to include information about the children of each VVol in the response or not. Possible values: • true: Include information about the children of each VVol in the response. • false: Do not include information about the children of each VVol in the response. | boolean | False | No |
| startVirtualVolumeID | The ID of the virtual volume at which to begin the list in the response. | UUIDType | None | No |

| Name | Description | Туре | Default value | Required |
|------------------|--|-------------------------------|---------------|----------|
| virtualVolumeIDs | A list of virtual volume IDs for which to retrieve information. If you omit this parameter, the method returns information about only these virtual volumes. | virtualVolumeID UUID array | None | No |

Return values

This method has the following return values:

| Name | Description | Туре |
|---------------------|---|---------------------|
| nextVirtualVolumeID | The ID of the next virtual volume in the list. | UUID |
| virtualVolumes | A list of objects describing the virtual volumes currently in the system. | virtualVolume array |

Request example

Requests for this method are similar to the following example:

```
"method": "ListVirtualVolumes",
    "params": {
    },
    "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "nextVirtualVolumeID": "00000000-0000-0000-0000-00000000000",
    "virtualVolumes": [

9.6

ListVirtualVolumeTasks

You can use the ListVirtualVolumeTasks method to get a list of virtual volume tasks in the system.

Parameters

This method has the following input parameter:

| Name | Description | Туре | Default value | Required |
|--------------------------|---|------------|---------------|----------|
| virtualVolumeTaskID s | A list of virtual volume task IDs for which to retrieve information. If you omit this parameter, the method returns information about all virtual volume tasks. | UUID array | None | No |

Return value

This method has the following return value:

| Name | Description | Туре |
|-------|---|------------|
| tasks | A list of objects describing the virtual volume tasks in the cluster. | task array |

Request example

Requests for this method are similar to the following example:

```
{
  "method": "ListVirtualVolumeTasks",
     "params": {
    },
    "id": 1
}
```

Response example

```
{
 "id": 1,
 "result": {
    "tasks": [
        "cancelled": false,
        "cloneVirtualVolumeID": "fafeb3a0-7dd9-4c9f-8a07-80e0bbf6f4d0",
        "operation": "clone",
        "parentMetadata": {
          "SFProfileId": "f4e5bade-15a2-4805-bf8e-52318c4ce443",
          "SFgenerationId": "0",
          "VMW ContainerId": "abaab415-bedc-44cd-98b8-f37495884db0",
          "VMW GosType": "windows7Server64Guest",
          "VMW VVolName": "asdf.vmdk",
          "VMW VVolNamespace": "/vmfs/volumes/vvol:abaab415bedc44cd-

  }
}
```

9.6

ModifyStorageContainer

You can use the ModifyStorageContainer method to make changes to an existing virtual volume storage container.

Parameters

This method has the following input parameters:

| storageContainerID | The unique ID of the virtual volume storage container to modify. | UUID | None | Yes |
|--------------------|--|--------|------|-----|
| initiatorSecret | The new secret for CHAP authentication for the initiator. | string | None | No |
| targetSecret | The new secret for CHAP authentication for the target. | string | None | No |

Return values

This method has the following return value:

| Name | Description | Туре |
|------------------|--|------------------|
| storageContainer | Information about the newly created storage container. | storageContainer |

Request example

Requests for this method are similar to the following example:

```
"method": "ModifyStorageContainer",
    "params": {
        "storageContainerID": "6c95e24f-9f0b-4793-affb-5a4bc6c3d7e1",
        "targetSecret": "0,IM;tOQdn9$JJ*8"
     },
     "id": 1
}
```

Response example

```
"id": 1,
"result": {
    "storageContainer": {
        "accountID": 8,
        "initiatorSecret": "T$|5TO>2IY5sk4@k",
        "name": "doctest1",
        "protocolEndpointType": "SCSI",
        "status": "active",
        "storageContainerID": "6c95e24f-9f0b-4793-affb-5a4bc6c3d7e1",
        "targetSecret": "O,IM;tOQdn9$JJ*8"
    }
}
```

9.6

Access control

The Element API methods available vary based on the type of access you set.

accounts

The following methods are available to the accounts access type:

| AddAccount |
|----------------------|
| GetAccountByID |
| ModifyAccount |
| GetAccountByName |
| ListAccounts |
| GetAccountEfficiency |
| RemoveAccount |

administrator

All methods are available to the administrator access type.

clusterAdmin

The following methods are available to the cluster admin access type:

| AddClusterAdmin |
|----------------------------------|
| ListBackupTargets |
| AddInitiatorsToVolumeAccessGroup |
| ListBulkVolumeJobs |
| AddLdapClusterAdmin |
| ListClusterAdmins |
| AddVirtualNetwork |
| ListClusterPairs |
| AddVirtualNetwork |
| ListNodeFibreChannelPortInfo |
| AddVolumetoVolumeAccessGroup |
| ListBackupTargets |
| CloneMultipleVolumes |
| ListDriveHardware |
| CompleteClusterPairing |
| ListFibreChannelSessions |
| CompleteVolumePairing |
| ListFibreChannelPortInfo |
| CreateBackupTarget |
| ListGroupSnapshots |
| CreateSchedule |

| ListActivePairedVolumes |
|---------------------------------------|
| CreateSnapshot |
| ModifyBackupTarget |
| CreateSupportBundle |
| ModifyClusterAdmin |
| CreateClusterSupportBundle |
| ModifyGroupSnapshot |
| CreateGroupSnapshot |
| ModifyClusterFullThreshold |
| CreateVolumeAccessGroup |
| ModifyVolumeAccessGroup |
| DeleteAllSupportBundles |
| ModifyVolumeAccessGroupLunAssignments |
| DeleteSnapshot |
| ModifyVolumePair |
| DeleteGroupSnapshot |
| ModifyVirtualNetwork |
| DeleteVolumeAccessGroup |
| RemoveClusterAdmin |
| DisableEncryptionAtRest |
| RemoveVolumePair |
| DisableLdapAuthentication |
| |

| RemoveVirtualNetwork |
|---------------------------------------|
| DisableSnmp |
| RemoveVolumesFromVolumeAccessGroup |
| EnableEncryptionAtRest |
| RemoveInitiatorsFromVolumeAccessGroup |
| EnableLdapAuthentication |
| RollbackToSnapshot |
| EnableSnmp |
| RollbackToGroupSnapshot |
| GetBackupTarget |
| SetLoginSessionInfo |
| GetClusterFullThreshold |
| SetNtpInfo |
| GetClusterMasterNodeID |
| SetSnmpACL |
| GetHardwareConfig |
| SetSnmpInfo |
| GetLdapConfiguration |
| SetSnmpTrapInfo |
| GetLoginSessionInfo |
| SetRemoteLoggingHosts |
| GetNtpInfo |
| |

| Shutdown |
|--|
| GetNvramInfo |
| StartBulkVolumeRead |
| GetRawStats |
| StartBulkVolumeWrite |
| GetSnmpACL |
| StartClusterPairing |
| GetVolumeAccessGroupEfficiency |
| StartVolumePairing |
| GetVolumeAccessLunAssignments |
| TestLdapAuthentication |
| GetVirtualNetwork |
| drives |
| The following methods are available to the drives access type: |
| ListDrives |
| RemoveDrives |
| AddDrives |
| SecureEraseDrives |
| nodes |
| The following methods are available to the nodes access type: |
| AddNodes |
| ListPendingNodes |

| ListActiveNodes | |
|-----------------|--|
| RemoveNodes | |

read

The following methods are available to the read access type:

| GetAccountByID |
|------------------------|
| ListCloneJobs |
| GetAccountByName |
| ListDeletedVolumes |
| GetAsyncResult |
| ListDriveHardware |
| GetClusterCapacity |
| ListDrives |
| GetDefaultQoS |
| ListEvents |
| GetDriveStats |
| ListISCSISessions |
| GetSoftwareUpgrade |
| ListPendingNodes |
| GetVolumeStats |
| ListSyncJobs |
| ListAccounts |
| ListVolumeAccessGroups |
| |

| ListActiveNodes |
|------------------------------------|
| ListVolumeStatsByAccount |
| ListActiveNodes |
| ListVolumeStatsByVolume |
| ListActiveVolumes |
| ListVolumeStatsByVolumeAccessGroup |
| ListAllNodes |
| ListVolumesForAccount |
| ListBackupTargets |

reporting

The following methods are available to the reporting access type:

| ClearClusterFaults |
|------------------------|
| GetVolumeEfficiency |
| GetAccountEfficiency |
| GetVolumeStats |
| GetClusterCapacity |
| ListCloneJobs |
| GetClusterHardwareInfo |
| ListClusterFaults |
| GetClusterInfo |
| ListClusterPairs |
| GetClusterMasterNodeID |
| |

| ListDriveHardware |
|------------------------------------|
| GetClusterStats |
| ListEvents |
| GetDriveHardwareInfo |
| ListISCSISessions |
| GetDriveStats |
| ListSchedules |
| GetNetworkConfig |
| ListServices |
| GetNodeHardwareInfo |
| ListSyncJobs |
| GetNodeStats |
| ListVirtualNetworks |
| GetSnmpInfo |
| ListVolumeStatsByAccount |
| GetSnmpTrapInfo |
| ListVolumeStatsByVolume |
| GetVolumeAccessGroupEfficiency |
| ListVolumeStatsByVolumeAccessGroup |

repositories

The ListAllNodes method is available to the repositories access type.

volumes

The following methods are available to the volumes access type:

| CreateVolume |
|-----------------------|
| DeleteVolume |
| ModifyBackupTarget |
| CloneVolume |
| DeleteVolumePairing |
| ModifyVolumes |
| CloneMultipleVolumes |
| GetBackupTarget |
| ModifyVolumePair |
| CreateBackupTarget |
| GetDefaultQoS |
| PurgeDeletedVolume |
| CreateSnapshot |
| ListActiveVolumes |
| RemoveBackupTarget |
| CreateGroupSnapshot |
| ListBackupTarget |
| RemoveVolumePair |
| CompleteVolumePairing |
| ListGroupSnapshots |
| RestoreDeletedVolume |
| CloneMultipleVolumes |
| |

| ListVolumesForAccount |
|-------------------------|
| RollbackToGroupSnapshot |
| DeleteGroupSnapshot |
| ListDeletedVolumes |
| RollbackToSnapshot |
| DeleteSnapshot |
| ListGroupSnapshots |
| StartBulkVolumeRead |
| StartBulkVolumeWrite |
| StartVolumePairing |
| UpdateBulkVolumeStatus |
| |

write

The following methods are available to the write access type:

| AddDrives |
|---------------------------------------|
| RemoveNodes |
| AddNodes |
| RemoveAccount |
| AddAccount |
| RemoveVolumesFromVolumeAccessGroup |
| AddVolumeToVolumeAccessGroup |
| RemoveInitiatorsFromVolumeAccessGroup |
| AddInitiatorsToVolumeAccessGroup |

| DeleteVolumeAccessGroup |
|-------------------------|
| CreateVolumeAccessGroup |
| DeleteVolume |
| ModifyVolumeAccessGroup |
| RestoreDeletedVolume |
| ModifyAccount |
| PurgeDeletedVolume |
| CreateVolume |
| ModifyVolume |
| CloneVolume |
| GetAsyncResult |
| RemoveDrives |

Response examples

Complete response examples are provided here.

- GetConfig
- GetClusterHardwareInfo
- GetLldpInfo
- GetNetworkConfig
- GetNodeHardwareInfo (output for iSCSI)
- GetNodeHardwareInfo (output for Fibre Channel nodes)
- GetNvramInfo
- ListActiveNodes
- ListActiveVolumes
- · TestHardwareConfig

GetConfig

The GetConfig method returns a response similar to the following example. Due to length, the response contains information for one node of the cluster only.

```
{
    "id": 1,
    "result": {
        "config": {

GetNvramInfo

The GetNvramInfo method returns a response similar to the following example.

```
id: 1,
result: {
  nvramInfo: {
    details: {
       errors: {
         numOfErrorLogEntries: "0"
       },
       extended: {
          dialogVersion: "4",
          event: [
             {
                 name: "flushToFlash",
