FlexPod Hybrid Cloud for Google Cloud Platform with NetApp Cloud Volumes ONTAP and Cisco Intersight

TR-4939: FlexPod Hybrid Cloud for Google Cloud Platform with NetApp Cloud Volumes ONTAP and Cisco Intersight

Ruchika Lahoti, NetApp

Introduction

Protecting data with disaster recovery (DR) is a critical goal for businesses continuity. DR allows organizations to failover their business operations to a secondary location and later recover and failback to the primary site efficiently and reliably. Multiple concerns like natural disaster, network failures, software vulnerabilities, and human error make developing a DR strategy a top IT priority.

For DR, all workloads running on the primary site must be faithfully reproduced on the DR site. An organization must also have an up-to-date copy of all enterprise data, including database, file services, NFS and iSCSI storage, and so on. Because data in the production environment is constantly updated, changes must be transferred to the DR site on a regular basis.

Deploying DR environments is challenging for most organizations because of the requirement for infrastructure and site independence. The number of resources needed and the costs of setting up, testing, and maintaining a secondary data center can be very high, typically approaching the cost of the entire production environment. It is challenging to keep a minimal data footprint with adequate protection, while continuously synchronizing data and establishing seamless failover and failback. After building out the DR site, the challenge then becomes to replicate data from the production environment and to keep it synchronized going forward.

This technical report brings together the FlexPod converged infrastructure solution, NetApp Cloud Volumes ONTAP on Google Cloud, and Cisco Intersight to form a hybrid cloud data center for DR. In this solution we discuss designing and executing an on-premises ONTAP workflow using Cisco Intersight Cloud Orchestrator. We also discuss deploying NetApp Cloud Volumes ONTAP and orchestrating and automating data replication and DR between FlexPod and Cloud Volumes ONTAP using the Cisco Intersight Service for HashiCorp Terraform.

The following figure provide a solution overview.

This solution provides multiple advantages, including:

- **Orchestration and automation.** Cisco Intersight simplifies the day-to-day operations of FlexPod hybrid cloud infrastructure by providing consistent orchestration frameworks that are delivered via automation.
- **Customized Protection**. Cloud Volumes ONTAP provides block-level data replication from ONTAP to the cloud that keeps the destination up to date through incremental updates. Users can specify a synchronization schedule of every 5 minutes or every hour, for example, based on changes at the source that are transferred over.
- Seamless failover and failback. When a disaster occurs, storage administrators can quickly failover to the cloud volumes. When the primary site is recovered, the new data created in the DR environment is synchronized back to the source volumes, re-establishing secondary data replication.
- Efficiency: The storage space and costs for the secondary cloud copy are optimized through the use of data compression, thin provisioning, and deduplication. Data is transferred at the block-level in a compressed and deduplicated form, improving transfer speed. Data is also automatically tiered to low-cost object storage and only brought back to high-performance storage when accessed, such as in a DR scenario. This significantly reduces ongoing storage costs.
- **Increased IT productivity.** Using Intersight as the single secure, enterprise-grade platform for infrastructure and application lifecycle management simplifies configuration management and automation of manual tasks at scale for the solution.

Audience

The audience for this document includes, but is not limited to; sales engineers, field consultants, professional services, IT managers, partner engineers, site reliability engineers, cloud architects, cloud engineers, and customers who want to take advantage of an infrastructure built to deliver IT efficiency and enable IT innovation.

Solution topology

This section describes the logical topology of the solution. The following figure represents the solution topology of the on-premises FlexPod environment, NetApp Cloud Volumes ONTAP running on Google Cloud, Cisco Intersight, and NetApp Cloud Manager.

The control planes and data planes are clearly indicated between the endpoints. The data plane uses a secure site-to-site VPN connection to connect the ONTAP instance running on FlexPod All Flash FAS to the NetApp Cloud Volumes ONTAP instance on Google Cloud.

The replication of workload data from FlexPod to NetApp Cloud Volumes ONTAP is handled by NetApp SnapMirror, and the overall process is orchestrated using Cisco Intersight Cloud Orchestrator for both the onpremises and cloud environments. Cisco Intersight Cloud Orchestrator consumes Terraform Resource Providers for NetApp Cloud Manager to carry out operations related to NetApp Cloud Volumes ONTAP deployment and establish data replication relationships.

The optional backup and tiering of cold data residing in the NetApp Cloud Volumes ONTAP instance to Google Cloud Storage is also supported with this solution.

Next: Solution components.

Solution components

Previous: Solution overview.

FlexPod

FlexPod is a defined set of hardware and software that forms an integrated foundation for both virtualized and non-virtualized solutions. FlexPod includes NetApp ONTAP storage, Cisco Nexus networking, Cisco MDS storage networking, and Cisco Unified Computing System (Cisco UCS). The design is flexible enough that the networking, computing, and storage can fit into one data center rack, or it can be deployed according to a

customer's data center design. Port density allows the networking components to accommodate multiple configurations.

Cisco Intersight

Cisco Intersight is a SaaS platform that delivers intelligent automation, observability, and optimization for traditional and cloud-native applications and infrastructure. The platform helps to drive change with IT teams and delivers an operating model designed for hybrid cloud. Cisco Intersight provides the following benefits:

- **Faster delivery.** Delivered as a service from the cloud or in the customer's data center with frequent updates and continued innovation, due to an agile-based software development model. This way the customer can focus on accelerating delivery for line-of-business.
- **Simplified operations.** Simplify operations by using a single secure SaaS-delivered tool with common inventory, authentication, and APIs to work across the full stack and all locations, eliminating silos across teams. From managing physical servers and hypervisors on-premises, to VMs, K8s, serverless, automation, optimization, and cost control across both on-premises and public clouds.
- **Continuous optimization.** Continuously optimize your environment by using intelligence provided by Cisco Intersight across every layer, as well as Cisco TAC. This intelligence is converted into recommended and automatable actions so you can adapt real-time to every change: from moving workloads and monitoring health of physical servers to cost reduction recommendations the public clouds you work with.

There are two modes of management operations possible with Cisco Intersight: UCSM Managed Mode (UMM) and Intersight Managed Mode (IMM). You can select native UMM or IMM for fabric-attached Cisco UCS systems during initial setup of fabric interconnects. In this solution, native IMM is used.

Cisco Intersight licensing

Cisco Intersight uses a subscription-based license with multiple tiers.

Cisco Intersight license tiers are as follows:

- Cisco Intersight Essentials. Includes all base functionality plus the following features:
 - Cisco UCS Central
 - · Cisco IMC Supervisor entitlement
 - · Policy-based configuration with Server Profiles
 - Firmware management
 - Valuation of compatibility with the Hardware Compatibility List (HCL)
- **Cisco Intersight Advantage.** Includes of the features and functionality of the Essentials tier plus the following features:
 - Widgets, inventory, capacity, utilization features, and cross-domain inventory correlation across physical compute, network, storage, VMware virtualization, and AWS public cloud.
 - The Cisco Security Advisory service where customers can receive important security alerts and field notices about impacted endpoint devices.
- **Cisco Intersight Premier.** In addition to the capabilities provided in the Advantage tier, Cisco Intersight Premier offers the following:
 - Intersight Cloud Orchestrator (ICO) for Cisco and third-party compute, network, storage, integrated systems, virtualization, container, and public-cloud platforms
 - Full subscription entitlement for Cisco UCS Director at no additional cost.

More information about Intersight Licensing and features supported in each licensing can be found here.

In this solution, we use Intersight Cloud Orchestrator and Intersight Service for HashiCorp Terraform. These features are available for users with the Intersight Premier license, so this licensing tier must be enabled.

Terraform Cloud Integration with ICO

You can use Cisco Intersight Cloud Orchestrator (ICO) to create and execute workflows that call Terraform Cloud (TFC) APIs. The Invoke Web API Request task supports Terraform Cloud as a target, and it can be configured with Terraform Cloud APIs using HTTP methods. So, the workflow can have a combination of tasks that calls multiple Terraform Cloud APIs using generic API tasks and other operations. You need a Premier license to use the ICO feature.

Cisco Intersight Assist

Cisco Intersight Assist helps you add endpoint devices to Cisco Intersight. A data center could have multiple devices that do not connect directly with Cisco Intersight. Any device that is supported by Cisco Intersight but does not connect directly to it requires a connection mechanism. Cisco Intersight Assist provides that connection mechanism and helps you add devices into Cisco Intersight.

Cisco Intersight Assist is available within the Cisco Intersight Virtual Appliance, which is distributed as a deployable virtual machine contained within an Open Virtual Appliance (OVA) file format. You can install the appliance on an ESXi server. For more information, see the Cisco Intersight Virtual Appliance Getting Started Guide.

After claiming Intersight Assist into Intersight, you can claim endpoint devices using the Claim Through Intersight Assist option. For more information, see <u>Getting Started</u>.

NetApp Cloud Volumes ONTAP

- Leveraging built-in data deduplication, data compression, thin provisioning, and cloning to minimize storage costs.
- Providing enterprise reliability and continuous operations in case of failures in your cloud environment.
- Cloud Volumes ONTAP uses NetApp SnapMirror, industry-leading replication technology, to replicate onpremises data to the cloud so it's easy to have secondary copies available for multiple use cases.
- Cloud Volumes ONTAP also integrates with the Cloud Backup service to deliver backup and restore capabilities for protection and long-term archiving of your cloud data.
- Switching between high and low-performance storage pools on-demand without taking applications offline.
- Providing consistency of Snapshot copies using NetApp SnapCenter.
- Cloud Volumes ONTAP supports data encryption and provides protection against viruses and ransomware.
- Integration with Cloud Data Sense helps you understand data context and identify sensitive data.

Cloud Central

Cloud Central provides a centralized location to access and manage NetApp cloud data services. These services enable you to run critical applications in the cloud, create automated DR sites, back up your SaaS data, and effectively migrate and control data across multiple clouds. For more information, see Cloud Central.

Cloud Manager

Cloud Manager is an enterprise-class, SaaS-based management platform that enables IT experts and cloud architects to centrally manage their hybrid multi-cloud infrastructure using NetApp cloud solutions. It provides a centralized system for viewing and managing your on-premises and cloud storage to support multiple hybrid-cloud providers and accounts. For more information, see Cloud Manager.

Connector

Connector enables Cloud Manager to manage resources and processes within a public cloud environment. A Connector instance is required to use many features provided by Cloud Manager and can be deployed in the cloud or on-premises network. Connector is supported in the following locations:

- AWS
- Microsoft Azure
- Google Cloud
- On premises

NetApp Active IQ Unified Manager

NetApp Active IQ Unified Manager allows you to monitor your ONTAP storage clusters from a single, redesigned, intuitive interface that delivers intelligence from community wisdom and AI analytics. It provides comprehensive operational, performance, and proactive insights into the storage environment and the virtual machines running on it. When an issue occurs with the storage infrastructure, Unified Manager can notify you about the details of the issue to help identify the root cause. The virtual machine dashboard gives you a view into the performance statistics for the VM so that you can investigate the entire I/O path from the vSphere host down through the network and finally to the storage.

Some events also provide remedial actions that you can take to rectify the issue. You can configure custom alerts for events so that when issues occur, you are notified through email and SNMP traps. Active IQ Unified Manager enables planning for the storage requirements of your users by forecasting capacity and usage trends to proactively act before issues arise, preventing reactive short-term decisions that can lead to additional problems in the long term.

VMware vSphere

VMware vSphere is a virtualization platform for holistically managing large collections of infrastructures (resources including CPUs, storage, and networking) as a seamless, versatile, and dynamic operating environment. Unlike traditional operating systems that manage an individual machine, VMware vSphere aggregates the infrastructure of an entire data center to create a single powerhouse with resources that can be allocated quickly and dynamically to any application in need.

For more information about VMware vSphere, follow this link.

VMware vSphere vCenter

VMware vCenter Server provides unified management of all hosts and VMs from a single console and aggregates performance monitoring of clusters, hosts, and VMs. VMware vCenter Server gives administrators a deep insight into the status and configuration of compute clusters, hosts, VMs, storage, the guest OS, and other critical components of a virtual infrastructure. VMware vCenter manages the rich set of features available in a VMware vSphere environment.

Hardware and software versions

This hybrid cloud solution can be extended to any FlexPod environment that is running supported versions of software, firmware, and hardware as defined in the NetApp Interoperability Matrix Tool and the Cisco UCS Hardware Compatibility List.

The FlexPod solution that is used as a baseline platform in our on-premises environment was deployed according to the guidelines and specifications described here.

The network within this environment is ACI- based. For more information, see here.

- See the following links for more information:
- NetApp Interoperability Matrix Tool
- VMware Compatibility Guide
- Cisco UCS Hardware and Software Interoperability Tool

The following table shows the FlexPod hardware and software revisions.

Component	Product	Version
Compute	Cisco UCS X210C-M6	5.0(1b)
	Cisco UCS Fabric Interconnects 6454	4.2(2a)
Network	Cisco Nexus 9332C (Spine)	14.2(7s)
	Cisco Nexus 9336C-FX2 (Leaf)	14.2(7s)
	Cisco ACI	4.2(7s)
Storage	NetApp AFF A220	9.11.1
	NetApp ONTAP Tools for VMware vSphere	9.10
	NetApp NFS Plugin for VMware VAAI	2.0-15
	Active IQ Unified Manager	9.11
Software	vSphere ESXi	7.0(U3)
	VMware vCenter Appliance	7.0.3
	Cisco Intersight Assist Virtual Appliance	1.0.11-306

The execution of Terraform configurations happens on the Terraform Cloud for Business account. Terraform configuration uses the Terraform provider for NetApp Cloud Manager.

The following table lists the vendors, products, and versions.

Component	Product	Version
HashiCorp	Terraform	1.2.7

The following table shows the Cloud Manager and Cloud Volumes ONTAP versions.

Component	Product	Version
NetApp	Cloud Volumes ONTAP	9.11
	Cloud Manager	3.9.21

Next: Installation and configuration - Deploy FlexPod.

Installation and configuration

Deploy FlexPod

Previous: Solution components.

To understand the FlexPod design and deployment details, including the configuration of various elements of design and associated best practices, see Cisco Validated Designs for FlexPod.

FlexPod can be deployed in both UCS Managed Mode and Cisco Intersight Managed Mode. If you are deploying FlexPod in UCS Managed Mode, the latest Cisco Validated Design can be found here.

Cisco Unified Compute System (Cisco UCS) X-Series is a brand new modular compute system, configured and managed from the cloud. It is designed to meet the needs of modern applications and to improve operational efficiency, agility, and scale through an adaptable, future-ready, modular design. The design guidance around incorporating the Cisco Intersight- managed UCS X-Series platform within FlexPod infrastructure can be found here.

FlexPod with Cisco ACI deployment can be found here.

Next: Cisco Intersight configuration.

Cisco Intersight configuration

Previous: Deploy FlexPod.

To configure Cisco Intersight and Intersight Assist, see the Cisco Validated Designs for FlexPod found here.

Next: Terraform Cloud Integration with ICO prerequisite.

Terraform Cloud Integration with ICO prerequisite

Previous: Cisco Intersight configuration.

Procedure 1: Connect Cisco Intersight and Terraform Cloud

- 1. Claim or create a Terraform cloud target by providing the relevant Terraform Cloud account details.
- 2. Create a Terraform Cloud Agent target for private clouds so that customers can install the agent in the data center and enable communication with Terraform Cloud.

For more information, follow this link.

Procedure 2: Generate user token

As a part of adding a target for Terraform Cloud, you must provide the username and API token from the Terraform Cloud settings page.

- 1. Login to Terraform Cloud and go to User Tokens: https://app.terraform.io/app/settings/tokens.
- 2. Click Create a new API token.
- 3. Assign a name to remember and save the token in a secure place.

Procedure 3: Claim Terraform Cloud Target

- 1. Log into Intersight with Account Administrator, Device Administrator, or Device Technician privileges.
- 2. Navigate to ADMIN > Targets > Claim a New Target.
- 3. In Categories, click Cloud.
- 4. Click Terraform Cloud and click Start.

ADMIN > Targets > Claim a New Target			🗅 🗖 10 🔺 5 🕞 🤤
		Select Target Type	
	Filters	Q, Search	
	Available for Claiming	Cloud	
	Categories All Cloud Cloud Native Compute / Fabric Database Guest OS Process / APM Hypervisor Hypervisor Network Orchestrator Platform Services Storage	Amazon Web Services Amazon Web Services Billing Microsoft Arure Service Principal Google Cloud Platform Billing	Coogle Cloud Platform

- 5. Enter a name for the target, your username for the Terraform Cloud, the API token, and a default organization in Terraform Cloud as displayed in the following image.
- 6. In the **Default Managed Hosts** field, make sure to add the following links along with other managed hosts:
 - github.com
 - · github-releases.githubusercontent.com

Terraform Cloud Username *		Terraform Cloud API Token	
abhinav3	0		/ 0
Default Terraform Cloud Organization *		Default Managed Hosts	
cisco-intersight-gc		github.com,github-releases.githubusercontent.com	

If everything is correctly entered, you will see your Terraform Cloud target displayed in the **Intersight Targets** section.

Procedure 4: Add Terraform Cloud agents

Prerequisites:

- Terraform Cloud target.
- Claimed Intersight Assist into Intersight before deploying the Terraform Cloud Agent.

You can only claim five agents for each Assist.

After you have created the connection to Terraform, you must spin up a Terraform Agent to execute the Terraform code.

- 1. Click **Claim Terraform Cloud Agent** from the drop-down list of your Terraform Cloud target.
- 2. Enter the details for the Terraform Cloud agent. The following screenshot shows the configuration details for Terraform agent.

Terra	form Clo	ud target	
	v 0		
		Terraform Cloud Agent Pool Name *	
		flexpod-solution-agent-pool	
<u> </u>			
0	+		
	_ ₫	0 ~ 0 0	v v

(j)

You can update any Terraform Agent property. If the target is in the **Not Connected** state and has never been in the **Connected** state, then a token has not been generated for the Terraform agent.

After the agent validation succeeds and an agent token is generated, you are unable to reconfigure the Organization and/or Agent Pool. Successful deployment of a Terraform agent is indicated by a status of **Connected**.

After you have enabled and claimed the Terraform Cloud integration, you can deploy one or more Terraform Cloud agents in Cisco Intersight Assist. The Terraform Cloud agent is modelled as a child target of the Terraform Cloud target. When you claim the agent target, you see a message to indicate that the target claim is in progress.

After a few seconds, the target is moved to the **Connected** state, and the Intersight platform routes HTTPS packets from the agent to the Terraform Cloud gateway.

Your Terraform Agent should be correctly claimed and should show up under targets as **Connected**.

Next: Configure Public Cloud Service provider.

Configure Public Cloud Service provider

Previous: Terraform Cloud Integration with ICO prerequisite.

Procedure 1: Access NetApp Cloud Manager

To access NetApp Cloud Manager and other cloud services, you need to sign up on NetApp Cloud Central.

For setting up workspaces and users in the Cloud Central account, click here.

Procedure 2: Deploy Connector

To deploy Connector in Google Cloud, see this link.

Next: Automated deployment of Hybrid Cloud NetApp Storage.

Automated deployment of Hybrid Cloud NetApp Storage

Previous: Configure Public Cloud Service provider.

Google Cloud

You must first enable APIs and create a service account that provides Cloud Manager with permissions to deploy and manage Cloud Volumes ONTAP systems that are in the same project as the Connector or in different projects.

Before you deploy a connector in a Google Cloud project, make sure that the connector isn't running on your premises or in a different cloud provider.

Two sets of permissions must be in place before you deploy a Connector directly from Cloud Manager:

- You need to deploy Connector using a Google account that has permissions to launch the Connector VM instance from Cloud Manager.
- When deploying Connector, you are prompted to select the VM instance. Cloud Manager gets permissions from the service account to create and manage Cloud Volumes ONTAP systems on your behalf. Permissions are provided by attaching a custom role to the service account. You need to set up two YAML files that include the required permissions for the user and the service account. Learn how to use the YAML files to set up permissions here.

See this detailed video for all required prerequisites.

Cloud Volumes ONTAP deployment modes and architecture

Cloud Volumes ONTAP is available in Google Cloud as a single- node system and as a high-availability (HA) pair of nodes. Based on the requirements, we can choose the Cloud Volumes ONTAP deployment mode. Upgrading a single node system to an HA pair is not supported. If you want to switch between a single- node system and an HA pair, then you must deploy a new system and replicate data from the existing system to the new system.

Highly available Cloud Volumes ONTAP in Google Cloud

Google Cloud supports deployment of resources across multiple geographical regions and multiple zones within a region. The HA deployment consists of two ONTAP nodes that use powerful n1-standard or n2-standard machine types available in Google Cloud. Data is synchronously replicated between the two Cloud Volumes ONTAP nodes to provide availability in the event of a failure. HA deployment of Cloud Volumes ONTAP requires four VPCs and a private subnet in each VPC. The subnets in the four VPCs should be provisioned with non-overlapping CIDR ranges.

The four VPCs are used for the following purposes:

- VPC 0 enables inbound communication to data and Cloud Volumes ONTAP nodes.
- VPC 1 provides cluster connectivity between Cloud Volumes ONTAP nodes.
- VPC 2 allows for non-volatile ram (NVRAM) replication between nodes.

• VPC 3 is used for connectivity to the HA mediator instance and disk replication traffic for node rebuilds.

The following image shows a highly available Cloud Volumes ONTAP in Goggle Cloud.

For details, see this link.

For networking requirements for Cloud Volumes ONTAP in Google Cloud, see this link.

For details about data tiering, see this link.

Set up environment prerequisites

The automated creation of Cloud Volumes ONTAP clusters, SnapMirror configuration between an on-premises volume and a Cloud volume, creating a cloud volume, and so on are performed using Terraform configuration. These Terraform configurations are hosted on a Terraform Cloud for Business account. Using Intersight Cloud Orchestrator, you orchestrate tasks like creating a workspace in a Terraform Cloud for Business account, add all required variables to the workspace, execute a Terraform Plan, and so on.

For these automation and orchestration tasks, there are a few requirements and data needed, as is described in the following sections.

GitHub repository

You need a GitHub account to host your Terraform code. Intersight Orchestrator creates a new workspace in the Terraform Cloud for Business account. This workspace is configured with a version control workflow. For this purpose, you need to keep the Terraform configuration in a GitHub repository and provide it as an input while creating the workspace.

This GitHub link provides the Terraform configuration with various resources. You can fork this repository and make a copy in your GitHub account.

In this repository, provider.tf has the definition for the required Terraform provider. Terraform provider for NetApp Cloud Manager is used.

variables.tf has all the variable declarations. The value for these variables is input as the Intersight Cloud Orchestrator's workflow input. This provides a convenient way to pass values to a workspace and execute the Terraform configuration.

resources.tf defines the various resources needed to add an on-premises ONTAP to the working environment, create a single node Cloud Volumes ONTAP cluster on Google Cloud, establish a SnapMirror relationship between on-premises and Cloud Volumes ONTAP, create a cloud volume on Cloud Volumes ONTAP, and so on.

In this repository:

- provider.tf has NetApp Cloud Manager as a definition for the required Terraform provider.
- variables.tf has the variable declarations that are used as input for the Intersight Cloud Orchestrator workflow. This provides a convenient way to pass values to workspace and execute Terraform configuration.
- resources.tf defines various resources to add an on-premises ONTAP to the working environment, create a single- node Cloud Volumes ONTAP cluster on Google Cloud, establish a SnapMirror relationship between on-premises and Cloud Volumes ONTAP, create a cloud volume on Cloud Volumes ONTAP, and so on.

You can add an additional resource block to create multiple volumes on Cloud Volumes ONTAP or use count or for each Terraform constructs.

To connect Terraform workspaces, modules, and policy sets to git repositories containing Terraform configurations, Terraform Cloud needs access to your GitHub repo.

Add a client, and the OAuth Token ID of the client is used as one of the Intersight Cloud Orchestrator's workflow input.

- 1. Log in to your Terraform Cloud for Business account. Navigate to **Settings > Providers**.
- 2. Click Add a VCS provider.
- 3. Select your version.
- 4. Follow the steps under Set up provider.
- 5. You see the added client in VCS Providers. Make a note of the OAuth Token ID.

Refresh token for NetApp Cloud Manager API operations

In addition to the web browser interface, Cloud Manager has a REST API that provides software developers with direct access to the Cloud Manager functionality through the SaaS interface. The Cloud Manager service

consists of several distinct components that collectively form an extensible development platform. The refresh token enables you to generate access tokens that you add to the Authorization header for each API call.

Without calling an API directly, the netapp-cloudmanager provider uses a refresh token and translates the Terraform resources into corresponding API calls. You need to generate a refresh token for NetApp Cloud Manager API operations from NetApp Cloud Central.

You need the client ID of the Cloud Manager Connector to create resources on Cloud Manager such as creating a Cloud Volumes ONTAP cluster, configuring SnapMirror, and so on.

- 1. Log into Cloud Manager: https://cloudmanager.netapp.com/.
- 2. Click Connector.
- 3. Click Manage Connectors.
- 4. Click the ellipses and copy the Connector ID.

Develop Cisco Intersight Cloud Orchestrator workflow

Cisco Intersight Cloud Orchestrator is available in Cisco Intersight if:

- You have installed the Intersight Premier license.
- You are either an account administrator, storage administrator, virtualization administrator, or server administrator and have a minimum of one server assigned to you.

Workflow Designer

The Workflow Designer helps you create new workflows (as well as tasks and data types) and edit existing workflows to manage targets in Cisco Intersight.

To launch the Workflow Designer, go to **Orchestration > Workflows**. A dashboard displays the following details under the tabs **My Workflows**, **Sample Workflows**, and **All Workflows**:

- Validation Status
- Last Execution Status
- Top Workflows by Execution Count
- Top Workflow Categories
- Number of System Defined Workflows
- Top Workflows by Targets

Using the dashboard, you can create, edit, clone, or delete a tab. To create your own custom view tab, click +, specify a name, and then select the required parameters that need to be displayed in the columns, tag columns, and widgets. You can rename a tab if it doesn't have a **Lock** icon.

Under the dashboard is a tabular list of workflows displaying the following information:

- Display Name
- Description
- System Defined
- Default Version
- Executions

- Last Execution Status
- Validation Status
- Last Update
- Organization

The Actions column allows you to perform the following actions:

- Execute. Executes the workflow.
- History. Displays workflow execution history.
- Manage Versions. Create and manage versions for workflows.
- Delete. Delete a workflow.
- Retry. Retry a failed workflow.

Workflow

Create a workflow that consists of the following steps:

- Defining a workflow. Specify the display name, description, and other important attributes.
- **Define workflow inputs and workflow outputs.** Specify which input parameters are mandatory for the workflow execution, and the outputs generated on successful execution
- Add workflow tasks. Add one or more workflow tasks in the Workflow Designer that are needed for the workflow to carry out its function.
- *Validate the workflow. *Validate a workflow to ensure that there are no errors in connecting task inputs and outputs.

Create workflows for on-premises FlexPod storage

To configure a workflow for on-premises FlexPod storage, see this link.

Next: DR workflow.

DR workflow

Previous: Automated deployment of Hybrid Cloud NetApp Storage.

The sequence of steps are as follows:

- 1. Define the workflow.
 - Create a short, user-friendly name for the workflow, such as Disaster Recovery Workflow.
- 2. Define the workflow input. The inputs we take for this workflow include the following:
 - · Volume options (volume name, mount path)
 - Volume capacity
 - · Data center associated with the new datastore
 - · Cluster on which the datastore is hosted
 - · Name for the new datastore to create in vCenter
 - $\,\circ\,$ Type and version of the new datastore

- Name of the Terraform organization
- Terraform workspace
- Description of the Terraform workspace
- · Variables (sensitive and nonsensitive) required to execute Terraform configuration
- $\,\circ\,$ Reason for starting the plan
- 3. Add the workflow tasks.

The tasks related to operations in FlexPod include the following:

- Create volume in FlexPod.
- Add storage export policy to the created volume.
- Map the newly created volume to a datastore in VMware vCenter.

The tasks related to creating Cloud Volumes ONTAP cluster:

- · Add Terraform workspace
- Add Terraform variables
- Add Terraform sensitive variables
- Start new Terraform plan
- Confirm Terraform run
- 4. Validate the workflow.

Procedure 1: Create the workflow

- 1. Click Orchestration from the left navigation pane and click Create Workflow.
- 2. In the General tab:
 - a. Provide the display name (Disaster Recovery Workflow).
 - b. Select the organization, set tags, and provide a description.
- 3. Click Save.

General Designer Mapping Ca	tole History						
		Display Name * Disaster Recovery Workflow	w	•	Reference Name* DisasterRecoveryWorkflow

		Workflow Inputs Workf	fow Variables WorkRow Outputs				
		Ace Workflow Input					

Procedure 2. Create a new volume in FlexPod

- 1. Go to the **Designer** tab and click **Tasks** from the **Tools** section.
- 2. Drag and drop the **Storage > New Storage Volume** task from the **Tools** section into the **Design** area.
- 3. Click New Storage Volume.

4. In the **Task Properties** area, click the **General** tab. Optionally, you can change the name and description for this task. In this example, the name of the task is **Create Volume in FlexPod**.

- 25. Click Map.
- 26. With Connector, create a connection between the **Start** and **Create Volume in FlexPod** tasks, and click **Save**.

Ignore the error for now. This error displays because there is no connectivity between the tasks **Create Volume in FlexPod** and **Success** which is required to specify the successful transition.

Procedure 3: Add storage export policy

- 1. Go to the **Designer** tab and click **Tasks** from the **Tools** section.
- 2. Drag and drop the **Storage > Add Storage Export Policy to Volume** task from the **Tools** section in the **Design** area.
- 3. Click **Add Storage Export Policy to Volume**. In the **Task Properties** area, click the **General** tab. Optionally, you can change the name and description for this task. In this example, the name of the task is Add Storage Export Policy.
- 4. Use Connector to make a connection between the tasks **Create Volume in FlexPod** and **Add Storage Export Policy**. Click **Save**.

23. Add all the Terraform Variables as shown in the following table. You can also provide a default value.

Terraform variable name	Description
name_of_on-prem-ontap	Name of the on-premises ONTAP (FlexPod)

Terraform variable name	Description
on-prem-ontap_cluster_ip	The IP address of the storage cluster management interface
on-prem-ontap_user_name	Admin username for the storage cluster
Zone	GCP region where the working environment will be created
subnet_id	GCP subnet id where the working environment will be created
vpc_id	The VPC ID where the working environment will be created
capacity_package_name	The type of license to use
source_volume	The name of the source volume
source_storage_vm_name	The name of the source SVM
destination_volume	Name of volume on Cloud Volumes ONTAP
schedule_of_replication	The default is 1 hour
name_of_volume_to_create_on_cvo	Name of the cloud volume
workspace_id	The workspace_id where the working environment will be created
Project_id	The project_id where the working environment will be created
name_of_cvo_cluster	The name of the Cloud Volumes ONTAP working environment
gcp_service_account	gcp_service_account of Cloud Volumes ONTAP working environment

24. Click **Map** and then **Save**.

This completes the task of adding the required Terraform variables to the workspace. Next, add the required sensitive Terraform variables to the workspace. You can also combine both into a single task.

### Procedure 7: Add sensitive variables to a workspace

- 1. Go to the **Designer** tab and click **Workflows** from the **Tools** section.
- 2. Drag and drop the **Terraform > Add Terraform Variables** workflow from the **Tools** section in the **Design** area.
- 3. Use Connector to connect the two Add Terraform Workspace tasks. Click Save.

A warning appears indicating that the two tasks have the same name. Ignore the error for now because you change the task name in the next step.

4. Click Add Terraform Variables. In the Workflow Properties area, click the General tab. Change the name to Add Terraform Sensitive Variables.

- 5. In the Task Properties area, click Inputs.
- 6. Click Map in the Terraform Cloud Target field.
- 7. Choose **Static Value** and click **Select Terraform Cloud Target**. Select the Terraform Cloud for Business account that was added in the section "Configuring Cisco Intersight Service for HashiCorp Terraform."
- 8. Click Map.

- 9. Click Map in the Workspace ID field.
- 10. Choose Direct Mapping and click Task Output.
- 11. Click Task Name and then click Add Terraform Workspace.

	<b>A</b>	Map Task Input Configure/Assign the value from available options.	
Type of Mapping Input Direct Mapping	¥ @		
Map the workflow input, variable Map to Task Output Task Name *- Add Targe form Workgappe	v o Outou	it Name *	
Add Terraform Vorkspace Add Terraform Variable Add Terraform Variable Add Terraform Workapace Map volume to datastore			
Add Storage Export Policy to Volume Create volume in FlexPod			
			Map

- 12. Click Output Name, Workspace ID, and then Map.
- 13. Click Map in the Reason for starting plan field.
- 14. Choose Direct Mapping and then click Workflow Input.
- 15. Click Input Name and then Create Workflow Input.
- 16. In the Add Input wizard, complete the following steps:
  - a. Provide a display name and reference name (optional).
  - b. Make sure to select String for the Type.
  - c. Click Set Default Value and Override.
  - d. Input a default value for Reason for starting plan and click Add.

🔀 Required 💿						
Collection/Multipl	e 💿

### 20. Click Map.

21. Click Save.

This completes the task of adding a Terraform Plan in Terraform Cloud for Business account. Next, create a sleep task for a few seconds.

## Procedure 9: Sleep task for synchronization

Terraform Apply requires RunID, which is generated as a part of the Terraform Plan task. Waiting a few seconds between the Terraform Plan and Terraform Apply actions avoids timing issues.

- 1. Go to the **Designer** tab and click **Tasks** from the **Tools** section.
- 2. Drag and drop the Core Tasks > Sleep Task from the Tools section in the Design area.
- 3. Use Connector to connect the tasks Start New Terraform Plan and Sleep Task. Click Save.

	🔺 Invalid 🛛	I error found. Resolve errors to execute.	Actions
		Sleep Task	×

Add Terraform samaltin	e Variable	Task Details Pauses the current workflow for the specifi	ed duration.
	Sleep Task CostTast		
	Las	st saved 2 minutes ago	Execute

- 4. Click **Sleep Task**. In the **Task Properties** area, click the **General** tab. Optionally, you can change the name and description for this task. In this example, the name of the task is **Synchronize**.
- 5. In the Task Properties area, click Inputs.
- 6. Click Map in the Sleep Time in Seconds field.
- 7. Choose Static Value and input 15 in for the Sleep Time in Seconds.

Type of Mapping			
Input			
Static Value	v ©		
Sleep Time in Seconds *			
15		0	
		1 - 600	

- 8. Click Map.
- 9. Click Save.

This completes the sleep task. Next, create the last task of this workflow, confirming and applying the Terraform Run.

### Procedure 10: Confirm and apply Terraform Run

- 1. Go to the **Designer** tab and click **Tasks** from the **Tools** section.
- 2. Drag and drop the **Terraform Cloud > Confirm and Apply Terraform Run** task from the **Tools** section in the **Design** area.
- 3. Use connector to connect the tasks Synchronize and Confirm and Apply Terraform Run. Click Save.
- 4. Click **Confirm** and **Apply Terraform Run**. In the **Task Properties** area, click the **General** tab. Optionally, you can change the name and description for this task.

- 5. In the Task Properties area, click Inputs.
- 6. Click Map in the Terraform Cloud Target field.
- 7. Choose **Static Value** and click **Select Terraform Cloud Target**. Select the Terraform Cloud for Business account that was added in Configure Cisco Intersight Service for HashiCorp Terraform."
- 8. Click Map.
- 9. Click Map in the Run ID field.
- 10. Choose Direct Mapping and click Task Output.
- 11. Click Task Name and click Start New Terraform Plan.
- 12. Click Output Name and then click Run ID.

	Confirm and Apply Terraform R_ Terraform Cloud

This completes the Confirm and Apply Terraform Run task. Use Connector to connect between the **Confirm and Apply Terraform Run** task and the **Success** and **Failed** tasks.

## Procedure 11: Import a Cisco-built workflow

Cisco Intersight Cloud Orchestrator enables you to export workflows from a Cisco Intersight account to your system and then import them to another account. A JSON file was created by exporting the built workflow that can be imported to your account.

A JSON file for the workflow component is available in the GitHub repository.
# Terraform execution from controller

# Previous: DR workflow.

We can execute the Terraform plan using a controller. You can skip this section if you have already executed your Terraform plan using an ICO workflow.

# Prerequisites

Setup of the solution begins with a management workstation that has access to the Internet and with a working installation of Terraform.

A guide for installing Terraform can be found here.

#### **Clone GitHub repo**

The first step in the process is to clone the GitHub repo to a new empty folder on the management workstation. To clone the GitHub repository, complete the following steps:

- 1. From the management workstation, create a new folder for the project. Create a new folder inside this folder named /root/snapmirror-cvo and Clone the GitHub repo into it.
- Open a command-line or console interface on the management workstation and change directories to the new folder just created.
- 3. Clone the GitHub collection using the following command:

```
Git clone https://github.com/NetApp-Automation/FlexPod-hybrid-cloud-for-GCP-with-Intersight-and-CVO
```

1. Change directories to the new folder named snapmirror-cvo.

#### **Terraform execution**

- Init. Initialize the (local) Terraform environment. Usually executed only once per session.
- **Plan.** Compare the terraform state with the as-in state in the cloud and build and display an execution plan. This does not change the deployment (read-only).
- Apply. Apply the plan from the plan phase. This potentially changes the deployment (read and write).
- **Destroy.** All resources that are governed by this specific terraform environment.

For details, see here.

Next: Solution validation.

# **Solution validation**

Previous: Terraform execution from controller.

In this section, we revisit the solution with a sample data-replication workflow and take a few measurements to verify the integrity of data replication from the NetApp ONTAP instance running in FlexPod to NetApp Cloud Volumes ONTAP running on Google Cloud.

We used the Cisco Intersight workflow orchestrator in this solution and will continue to use this for our use case.

Notably, the limited set of Cisco Intersight workflows used in this solution do not represent the full set of workflows that Cisco Intersight is equipped with. You can create custom workflows based on your specific requirements and have them triggered from Cisco Intersight.

To perform the validation of a successful DR scenario, first move data from a volume in ONTAP that is part of FlexPod to Cloud Volumes ONTAP using SnapMirror. Then you can attempt to access the data from the Google cloud compute instance followed by a data integrity check.

The following high-level steps are used to verify the success criteria of this solution:

- 1. Generate an SHA256 checksum on the sample dataset that is present in an ONTAP volume in FlexPod.
- 2. Set up a volume SnapMirror relationship between ONTAP in FlexPod and Cloud Volumes ONTAP.
- 3. Replicate the sample dataset from FlexPod to Cloud Volumes ONTAP.
- 4. Break the SnapMirror relationship and promote the volume in Cloud Volumes ONTAP to production.
- 5. Map the Cloud Volumes ONTAP volume with the dataset to a compute instance in Google Cloud.
- 6. Generate an SHA256 checksum on the sample dataset in Cloud Volumes ONTAP.
- 7. Compare the checksum on the source and destination; presumably, the checksums on both sides match.

To execute the on-premises workflow, complete the following steps:

1. Create a workflow in Intersight for on-premises FlexPod.

2. Provide the required inputs and execute the workflow.

Execute Workflow: Configureon-premFlexpodstorage	4	2 📫 107 🛕 99	<b>₽ 4</b> 2	۹. ©	⑦ Ruchika Luhoti 🔔

0	ඳී Clone	Mount Come-und	1	NFO		CAPACITY				
0	C Restore from Snapshot copy	Change Disk Type & Tiering Policy		lisk Type Fiering Policy	None	1 GB		328 K8 Disk Used		
đ	Create a Snapshot copy					Autocanno				
*									_	

Mount Volume dr_dest_volume_on_gcp		
Go to your Linux machine and enter this mount command		
<pre>mount 172.30.116.153:/dr_dest_volume_on_gcp <dest< pre=""></dest<></pre>	Г Сору	

12. Mount the volume to a compute instance, verify that the data is present in the destination volume, and generate the SHA256 checksum of the sample_dataset_2GB file.

- 13. Compare the checksum values at both the source (FlexPod) and the destination (Cloud Volumes ONTAP).
- 14. The checksums match to the source and destination.

You can confirm that the data replication from the source to the destination was completed successfully and the data integrity was maintained. This data can now be safely consumed by the applications to serve clients while the source site goes through restoration.

Next: Conclusion.

# Conclusion

Previous: Solution validation.

In this solution, the NetApp Cloud Data service, Cloud Volumes ONTAP, and FlexPod Datacenter infrastructure were used to build a DR solution with a public cloud powered by the Cisco Intersight Cloud Orchestrator. The FlexPod solution has constantly evolved to enable customers to modernize their applications and business-delivery processes. With this solution, you can build a BCDR plan with the public cloud as your go-to location for a transient or full-time DR plan while keeping the cost of the DR solution low.

Data replication between on-premises FlexPod and NetApp Cloud Volumes ONTAP was handled by proven SnapMirror technology, but you can also select other NetApp data- transfer and synchronization tools like Cloud Sync for your data mobility requirements. Security of the data in-flight provided by built-in encryption technologies based on TLS/AES.

Whether you have a temporary DR plan for an application or a full-time DR plan for a business, the portfolio of products used in this solution can meet both requirements at scale. Powered by Cisco Intersight Workflow Orchestrator, the same can be automated with prebuilt workflows that not just eliminate the need to rebuild processes but also accelerate the implementation of a BCDR plan.

The solution enables the management of FlexPod on-premises and data replication across a hybrid cloud in a very easy and convenient manner with automation and orchestration provided by Cisco Intersight Cloud Orchestrator.
