Data protection for Container Apps in OpenShift Container Platform using OpenShift API for Data Protection (OADP)

This section of the reference document provides details for creating backups of Container Apps using the OpenShift API for Data Protection (OADP) with Velero on NetApp ONTAP S3 or NetApp StorageGRID S3. The backups of namespace scoped resources including Persistent Volumes(PVs) of the app are created using CSI Trident Snapshots.

The persistent storage for container apps can be backed by ONTAP storage integrated to the OpenShift Cluster using [Trident CSI](#). In this section we use [OpenShift API for Data Protection \(OADP\)](#) to perform backup of apps including its data volumes to

- ONTAP Object Storage
- StorageGrid

We then restore from the backup when needed. Please note that the app can be restored only to the cluster from where the backup was created.

OADP enables backup, restore, and disaster recovery of applications on an OpenShift cluster. Data that can be protected with OADP include Kubernetes resource objects, persistent volumes, and internal images.

Red Hat OpenShift has leveraged the solutions developed by the OpenSource communities for data protection. [Velero](#) is an open-source tool to safely backup and restore, perform disaster recovery, and migrate Kubernetes cluster resources and persistent volumes. To use Velero easily, OpenShift has developed the OADP operator and the Velero plugin to integrate with the CSI storage drivers. The core of the OADP APIs that are exposed are based on the Velero APIs. After installing the OADP operator and configuring it, the

backup/restore operations that can be performed are based on the operations exposed by the Velero API.

OADP 1.3 is available from the operator hub of OpenShift cluster 4.12 and later. It has a built-in Data Mover that can move CSI volume snapshots to a remote object store. This provides portability and durability by moving snapshots to an object storage location during backup. The snapshots are then available for restoration after disasters.

The following are the versions of the various components used for the examples in this section

- OpenShift Cluster 4.14
- OADP Operator 1.13 provided by Red Hat
- Velero CLI 1.13 for Linux
- Trident 24.02
- ONTAP 9.12
- postgresql installed using helm.

[Trident CSI](#)

[OpenShift API for Data Protection \(OADP\)](#)

[Velero](#)

Installation of OpenShift API for Data Protection (OADP) Operator

This section outlines the installation of OpenShift API for Data Protection (OADP) Operator.

Prerequisites

- A Red Hat OpenShift cluster (later than version 4.12) installed on bare-metal infrastructure with RHCOS worker nodes
- A NetApp ONTAP cluster integrated with the cluster using Trident
- A Trident backend configured with an SVM on ONTAP cluster
- A StorageClass configured on the OpenShift cluster with Trident as the provisioner
- Trident Snapshot class created on the cluster
- Cluster-admin access to Red Hat OpenShift cluster
- Admin access to NetApp ONTAP cluster
- An application eg. postgresql deployed on the cluster
- An admin workstation with tridentctl and oc tools installed and added to \$PATH

Steps to install OADP Operator

1. Go to the Operator Hub of the cluster and select Red Hat OADP operator. In the Install page, use all the default selections and click install. On the next page, again use all the defaults and click Install. The OADP operator will be installed in the namespace openshift-adp.

Version 1.3.0

Capability level

- Basic Install
- Seamless Upgrades
- Full Lifecycle
- Deep Insights
- Auto Pilot

OpenShift API for Data Protection (OADP) operator sets up and installs Velero on the OpenShift platform, allowing users to backup and restore applications.

Backup and restore Kubernetes resources and internal images, at the granularity of a namespace, using a version of Velero appropriate for the installed version of OADP.

OADP backs up Kubernetes objects and internal images by saving them as an archive file on object storage. OADP backs up persistent volumes (PVs) by creating snapshots with the native cloud snapshot API or with the Container Storage Interface (CSI). For cloud providers that do not support snapshots, OADP backs up resources and PV data with Restic or Kopia.

Installed Operators

Installed Operators are represented by ClusterServiceVersions within this Namespace. For more information, see the [Understanding Operators documentation](#) or [Operator and ClusterServiceVersion using the Operator SDK](#).

Name	Namespace	Managed Namespaces	Status
 OpenShift Virtualization 4.14.4 provided by Red Hat	 openshift-cnv	 openshift-cnv	 Succeeded Up to date
 OADP Operator 1.3.0 provided by Red Hat	 openshift-adp	 openshift-adp	 Succeeded Up to date
 Package Server 0.0.1-snapshot provided by	 openshift-operator-lifecycle-manager	 openshift-operator-lifecycle-manager	 Succeeded

Prerequisites for Velero configuration with Ontap S3 details

After the installation of the operator succeeds, configure the instance of Velero.

Velero can be configured to use S3 compatible Object Storage. Configure ONTAP S3 using the procedures shown in the [Object Storage Management section of ONTAP documentation](#). You will need the following information from your ONTAP S3 configuration to integrate with Velero.

- A Logical Interface (LIF) that can be used to access S3
- User credentials to access S3 that includes the access key and the secret access key
- A bucket name in S3 for backups with access permissions for the user
- For secure access to the Object storage, TLS certificate should be installed on the Object Storage server.

Prerequisites for Velero configuration with StorageGrid S3 details

Velero can be configured to use S3 compatible Object Storage. You can configure StorageGrid S3 using the procedures shown in the [StorageGrid documentation](#). You will need the following information from your StorageGrid S3 configuration to integrate with Velero.

- The endpoint that can be used to access S3
- User credentials to access S3 that includes the access key and the secret access key
- A bucket name in S3 for backups with access permissions for the user
- For secure access to the Object storage, TLS certificate should be installed on the Object Storage server.

Steps to configure Velero

- First, create a secret for an ONTAP S3 user credential or StorageGrid Tenant user credentials. This will be used to configure Velero later. You can create a secret from the CLI or from the web console. To create a secret from the web console, select Secrets, then click on Key/Value Secret. Provide the values for the credential name, key and the value as shown. Be sure to use the Access Key Id and Secret Access Key of your S3 user. Name the secret appropriately. In the sample below, a secret with ONTAP S3 user credentials named ontap-s3-credentials is created.

The screenshot shows the OpenShift web console interface. The left sidebar is titled 'Installed Operators' and includes 'Workloads' (Pods, Deployments, DeploymentConfigs, StatefulSets, Secrets, ConfigMaps) and 'Secrets' (which is currently selected). The main content area is titled 'Project: openshift-adp' and shows a 'Secrets' list. The list has columns for 'Name', 'Type', 'S...', and 'Created'. Two secrets are listed: 'builder-dockercfg-7g8ww' (Type: kubernetes.io/dockercfg) and 'builder-token-rrn4s' (Type: kubernetes.io/service-account-token). A context menu is open on the right, with 'Create' selected. The menu options are: 'Key/value secret', 'Image pull secret', 'Source secret', 'Webhook secret', and 'From YAML'.

Name	Type	S...	Created
builder-dockercfg-7g8ww	kubernetes.io/dockercfg	1	Apr 11, 2024, 10:52 AM
builder-token-rrn4s	kubernetes.io/service-account-token	4	Apr 11, 2024, 10:52 AM

Project: openshift-adp ▾

Edit key/value secret

Key/value secrets let you inject sensitive data into your application as files or environment variables.

Secret name *
ontap-s3-credentials

Unique name of the new secret.

cloud

Value
Drag and drop file with your value here or browse to upload it.

[default]
aws_access_key_id=
aws_secret_access_key=

[+ Add key/value](#)

Save **Cancel**

To create a secret named sg-s3-credentials from the CLI you can use the following command.

```
# oc create secret generic sg-s3-credentials --namespace openshift-adp --from-file  
cloud=cloud-credentials.txt
```

Where credentials.txt file contains the Access Key Id and the Secret Access Key of the S3 user in the following format:

```
[default]  
aws_access_key_id=< Access Key ID of S3 user>  
aws_secret_access_key=<Secret Access key of S3 user>
```

- Next, to configure Velero, select Installed Operators from the menu item under Operators, click on OADP operator, and then select the **DataProtectionApplication** tab.

Installed Operators

Installed Operators are represented by ClusterServiceVersions within this Namespace. For more information, see the [Understanding Operators documentation](#). Or create an Operator and ClusterServiceVersion using the [Operator SDK](#).

Sample yaml file for configuring Velero with ONTAP S3 as the backupLocation

```

spec:
  backupLocations:
    - velero:
        config:
          insecureSkipTLSVerify: 'false' ->use this for https
          communication with ONTAP S3
          profile: default
          region: us-east-1
          s3ForcePathStyle: 'true' ->This allows use of IP in s3URL
          s3Url: 'https://10.61.181.161' ->Ensure TLS certificate for S3
          is configured
        credential:
          key: cloud
          name: ontap-s3-credentials -> previously created secret
        default: true
        objectStorage:
          bucket: velero -> Your bucket name previously created in S3 for
          backups
          prefix: container-demo-backup ->The folder that will be created
          in the bucket
          caCert: <base64 encoded CA Certificate installed on ONTAP
          Cluster with the SVM Scope where the bucker exists>
        provider: aws
      configuration:
        nodeAgent:
          enable: true
          uploaderType: kopia
          #default Data Mover uses Kopia to move snapshots to Object Storage
        velero:
          defaultPlugins:
            - csi ->This plugin to use CSI snapshots
            - openshift
            - aws
            - kubevirt -> This plugin to use Velero with OIpenShift
          Virtualization

```

Sample yaml file for configuring Velero with StorageGrid S3 as the backupLocation

```

spec:
  backupLocations:
    - velero:
        config:
          insecureSkipTLSVerify: 'true'
          profile: default
          region: us-east-1 ->region of your StorageGrid system
          s3ForcePathStyle: 'True'
          s3Url: 'https://172.21.254.25:10443' ->the IP used to access S3
        credential:
          key: cloud
          name: sg-s3-credentials ->secret created earlier
        default: true
        objectStorage:
          bucket: velero
          prefix: demobackup
          provider: aws
      configuration:
        nodeAgent:
          enable: true
          uploaderType: kopia
      velero:
        defaultPlugins:
          - csi
          - openshift
          - aws
          - kubevirt

```

The spec section in the yaml file should be configured appropriately for the following parameters similar to the example above

backupLocations

ONTAP S3 or StorageGrid S3 (with its credentials and other information as shown in the yaml) is configured as the default BackupLocation for velero.

snapshotLocations

If you use Container Storage Interface (CSI) snapshots, you do not need to specify a snapshot location because you will create a VolumeSnapshotClass CR to register the CSI driver. In our example, you use Trident CSI and you have previously created VolumeSnapshotClass CR using the Trident CSI driver.

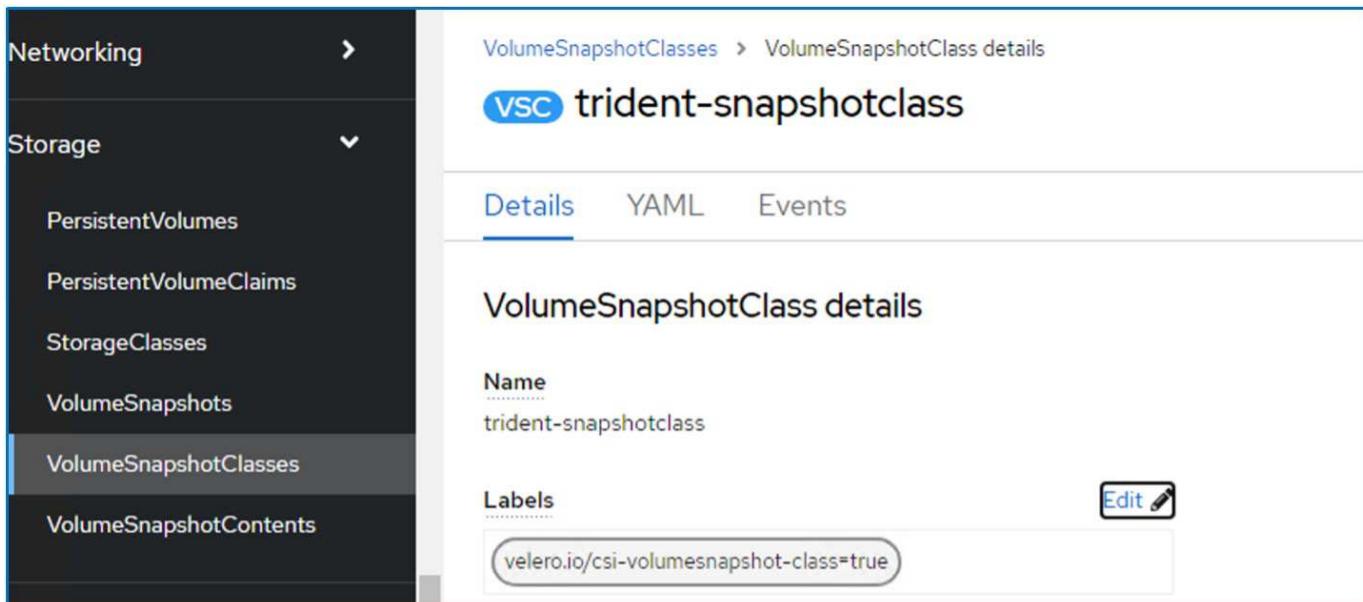

Enable CSI plugin

Add csi to the defaultPlugins for Velero to back up persistent volumes with CSI snapshots.

The Velero CSI plugins, to backup CSI backed PVCs, will choose the VolumeSnapshotClass in the cluster that has **velero.io/csi-volumesnapshot-class** label set on it. For this

- You must have the trident VolumeSnapshotClass created.
- Edit the label of the trident-snapshotclass and set it to

`velero.io/csi-volumesnapshot-class=true` as shown below.

Creating on-demand backup for Apps in OpenShift Container Platform

This section outlines how to create on-demand backup for VMs in OpenShift Virtualization.

Steps to create a backup of an App

To create an on-demand backup of an app (app metadata and persistent volumes of the app), click on the **Backup** tab to create a Backup Custom Resource (CR). A sample yaml is provided to create the Backup CR. Using this yaml, the app and its persistent storage in the specified namespace will be backed up. Additional parameters can be set as shown in the [documentation](#).

A snapshot of the persistent volumes and the app resources in the namespace specified will be created by the CSI. This snapshot will be stored in the backup location specified in the yaml. The backup will remain in the system for 30 days as specified in the ttl.

```

spec:
  csiSnapshotTimeout: 10m0s
  defaultVolumesToFsBackup: false
  includedNamespaces:
    - postgresql ->namespace of the app
  itemOperationTimeout: 4h0m0s
  snapshotMoveData: false
  storageLocation: velero-container-backup-ontap-1 -->this is the
  backupStorageLocation previously created when Velero is configured.
  ttl: 720h0m0s

```

Once the backup completes, its Phase will show as completed.

The screenshot shows the OpenShift Operator Details interface for the OADP Operator. The 'Backup' tab is selected. A backup named 'backup1' is listed with the status 'Phase: Completed'. The 'Labels' column shows 'velero.io/storage-location=velero-demo-1'.

Name	Kind	Status	Labels
backup1	Backup	Phase: Completed	velero.io/storage-location=velero-demo-1

You can inspect the backup in the Object storage with the help of an S3 browser application. The path of the backup shows up in the configured bucket with the prefix name (velero/container-demo-backup). You can see the contents of the backup includes the volume snapshots, logs, and other metadata of the application.

In StorageGrid, you can also use the S3 console that is available from the Tenant Manager to view the backup objects.

Creating scheduled backups for Apps

To create backups on a schedule, you need to create a Schedule CR.

The schedule is simply a Cron expression allowing you to specify the time at which you want to create the backup. A sample yaml to create a Schedule CR is shown below.

```
apiVersion: velero.io/v1
kind: Schedule
metadata:
  name: schedule1
  namespace: openshift-adp
spec:
  schedule: 0 7 * * *
  template:
    includedNamespaces:
      - postgresql
  storageLocation: velero-container-backup-ontap-1
```

The Cron expression 0 7 * * * means a backup will be created at 7:00 every day.

The namespaces to be included in the backup and the storage location for the backup are also specified. So instead of a Backup CR, Schedule CR is used to create a backup at the specified time and frequency.

Once the schedule is created, it will be Enabled.

Migrate an App from one cluster to another

Velero's backup and restore capabilities make it a valuable tool for migrating your data between clusters. This section describes how to migrate app(s) from one cluster to another by creating a backup of the app in Object storage from one cluster and then restoring the app from the same object storage to another cluster. .

Backup from first cluster

Prerequisites on Cluster 1

- Trident must be installed on the cluster.
- A trident backend and Storage class must be created.
- OADP operator must be installed on the cluster.
- The DataProtectionApplication should be configured.

Use the following spec to configure the DataProtectionApplication object.

```
spec:
  backupLocations:
    - velero:
        config:
          insecureSkipTLSVerify: 'false'
          profile: default
          region: us-east-1
          s3ForcePathStyle: 'true'
          s3Url: 'https://10.61.181.161'
        credential:
          key: cloud
          name: ontap-s3-credentials
        default: true
        objectStorage:
          bucket: velero
          caCert: <base-64 encoded tls certificate>
          prefix: container-backup
          provider: aws
      configuration:
        nodeAgent:
          enable: true
          uploaderType: kopia
        velero:
          defaultPlugins:
            - csi
            - openshift
            - aws
            - kubevirt
```

- Create an application on the cluster and take a backup of this application.
As an example, install a postgres application.

```
[root@localhost ~]# oc get nodes
NAME      STATUS    ROLES          AGE      VERSION

Restore the app on this cluster from the backup. Use the following yaml to create the Restore CR.

```
apiVersion: velero.io/v1
kind: Restore
apiVersion: velero.io/v1
metadata:
  name: restore
  namespace: openshift-adp
spec:
  backupName: backup
  restorePVs: true
```

When the restore is completed, you will see that the postgresql app is running on this cluster and is associated with the pvc and a corresponding pv. The state of the app is the same as when the backup was taken.

Restore an App from a backup

This section describes how to restore app(s) from a backup.

Prerequisites

To restore from a backup, let us assume that the namespace where the app existed got accidentally deleted.

```
[root@localhost ~]# oc get pods -n postgresql
NAME        READY   STATUS    RESTARTS   AGE
postgresql-0 1/1     Running   0          102s
[root@localhost ~]# oc delete ns postgresql
namespace "postgresql" deleted

[root@localhost ~]#
[root@localhost ~]#
[root@localhost ~]# oc get pods -n postgresql
No resources found in postgresql namespace.
[root@localhost ~]#
```

Restore to the same namespace

To restore from the backup that we just created, we need to create a Restore Custom Resource (CR). We need to provide it a name, provide the name of the backup that we want to restore from and set the restorePVs to true. Additional parameters can be set as shown in the [documentation](#). Click on Create button.

The screenshot shows the 'Operator details' page for the 'OADP Operator'. The 'Restore' tab is selected. A 'Create Restore' button is visible on the right. The page displays a YAML configuration for a restore operation.

```
apiVersion: velero.io/v1
kind: Restore
apiVersion: velero.io/v1
metadata:
  name: restore
  namespace: openshift-adp
spec:
  backupName: backup-postgresql-ontaps3
  restorePVs: true
```

```
apiVersion: velero.io/v1
kind: Restore
apiVersion: velero.io/v1
metadata:
  name: restore
  namespace: openshift-adp
spec:
  backupName: backup-postgresql-ontaps3
  restorePVs: true
```

When the phase shows completed, you can see that the app has been restored to the state when the snapshot was taken. The app is restored to the same namespace.

The screenshot shows the 'Operator details' page for the 'OADP Operator'. The 'Restore' tab is selected. A 'Create Restore' button is visible on the right. The page displays a table of restore operations. One entry is shown with a status of 'Completed'.

Name	Kind	Status	Labels
restore1	Restore	Phase: ✓ Completed	No labels

```
[root@localhost ~]#  
[root@localhost ~]# oc get pods -n postgresql  
No resources found in postgresql namespace.  
[root@localhost ~]# oc get pods -n postgresql  
NAME READY STATUS RESTARTS AGE  
postgresql-0 0/1 ContainerCreating 0 16s  
[root@localhost ~]# oc get pods -n postgresql  
NAME READY STATUS RESTARTS AGE  
postgresql-0 0/1 Running 0 22s  
[root@localhost ~]# oc get pods -n postgresql  
NAME READY STATUS RESTARTS AGE  
postgresql-0 0/1 Running 0 29s  
[root@localhost ~]# oc get pods -n postgresql  
NAME READY STATUS RESTARTS AGE  
postgresql-0 1/1 Running 0 37s  
[root@localhost ~]#
```

Restore to a different namespace

To restore the App to a different namespace, you can provide a `namespaceMapping` in the yaml definition of the Restore CR.

The following sample yaml file creates a Restore CR to restore an App and its persistent storage from the `postgresql` namespace, to the new namespace `postgresql-restored`.

```
apiVersion: velero.io/v1
kind: Restore
metadata:
  name: restore-to-different-ns
  namespace: openshift-adp
spec:
  backupName: backup-postgresql-ontaps3
  restorePVs: true
  includedNamespaces:
  - postgresql
  namespaceMapping:
    postgresql: postgresql-restored
```

When the phase shows completed, you can see that the app has been restored to the state when the snapshot was taken. The App is restored to a different namespace as specified in the yaml.

Name	Status	Conditions	Node
VM rhel9-demo-vm2	Running		ocp-worker1

Restore to a different storage class

Velero provides a generic ability to modify the resources during restore by specifying json patches. The json patches are applied to the resources before they are restored. The json patches are specified in a configmap and the configmap is referenced in the restore command. This feature enables you to restore using different storage class.

In the example below, the app, during deployment uses `ontap-nas` as the storage class for its persistent volumes. A backup of the app named `backup-postgresql-ontaps3` is created.

Project: virtual-machines-demo

Name	Kind	Status
B backup1	Backup	Phase: ✓ Completed

Simulate a loss of the app by uninstalling the app.

To restore the VM using a different storage class, for example, `ontap-nas-eco` storage class, you need to do the following two steps:

Step 1

Create a config map (console) in the `openshift-adp` namespace as follows:

Fill in the details as shown in the screenshot:

Select namespace : `openshift-adp`

Name: change-ontap-sc (can be any name)

Key: change-ontap-sc-config.yaml:

Value:

```
version: v1
resourceModifierRules:
- conditions:
  groupResource: persistentvolumeclaims
  resourceNameRegex: "data-postgresql*"
  namespaces:
  - postgresql
patches:
- operation: replace
  path: "/spec/storageClassName"
  value: "ontap-nas-eco"
```

Project: openshift-adp

Edit ConfigMap

Config maps hold key-value pairs that can be used in pods to read application configuration.

Configure via: Form view YAML view

Name *

change-storage-class-config

A unique name for the ConfigMap within the project

Immutable
Immutable, if set to true, ensures that data stored in the ConfigMap cannot be updated

Data

Data contains the configuration data that is in UTF-8 range

[Remove key/value](#)

Key *

change-storage-class-config.yaml

Value

Drag and drop file with your value here or browse to upload it.

version: v1
resourceModifierRules:
- conditions:

[+ Add key/value](#)

The resulting config map object should look like this (CLI):

```

# kubectl describe cm/change-storage-class-config -n openshift-adp
Name:           change-storage-class-config
Namespace:      openshift-adp
Labels:         velero.io/change-storage-class=RestoreItemAction
                velero.io/plugin-config=
Annotations:   <none>

Data
====

change-storage-class-config.yaml:
-----
version: v1
resourceModifierRules:
- conditions:
  groupResource: persistentvolumeclaims
  resourceNameRegex: "^.rhel.*"
  namespaces:
  - virtual-machines-demo
  patches:
  - operation: replace
    path: "/spec/storageClassName"
    value: "ontap-nas-eco"

BinaryData
=====

Events:  <none>

```

This config map will apply the resource modifier rule when the restore is created. A patch will be applied to replace the storage class name to ontap-nas-eco for all persistent volume claims starting with rhel.

Step 2

To restore the VM use the following command from the Velero CLI:

```
#velero restore create restore1 --from-backup backup1 --resource
-modifier-configmap change-storage-class-config -n openshift-adp
```

The app is restored in the same namespace with the persistent volume claims created using the storage class ontap-nas-eco.

Deleting backups and restores in using Velero

This section outlines how to delete backups and restores of Apps in OpenShift container platform using Velero.

List all backups

You can list all Backup CRs by using the OC CLI tool or the Velero CLI tool.

Download the Velero CLI as given in the instructions in the [Velero documentation](#).

```
[root@localhost ~]# oc get backups -n openshift-adp
NAME          AGE
backup-postgresql-ontaps3  23h
backup2        26s
schedule1-20240717070005  6h42m
[root@localhost ~]# velero get backups -n openshift-adp
NAME          STATUS    ERRORS   WARNINGS   CREATED          EXPIRES   STORAGE LOCATION   SELECTOR
backup-postgresql-ontaps3  Completed  0        0          2024-07-16 10:01:08 -0400 EDT  29d       velero-container-backup-ontap-1  <none>
backup2        Completed  0        0          2024-07-17 09:42:32 -0400 EDT  29d       velero-container-backup-ontap-1  <none>
schedule1-20240717070005  Completed  0        0          2024-07-17 03:00:05 -0400 EDT  29d       velero-container-backup-ontap-1  <none>
[root@localhost ~]#
```

Deleting a backup

You can delete a Backup CR without deleting the Object Storage data by using the OC CLI tool. The backup will be removed from the CLI/Console output. However, since the corresponding backup is not removed from the object storage, it will re-appear in the CLI/console output.

```
[root@localhost ~]# oc delete backup backup2 -n openshift-adp
backup.velero.io "backup2" deleted
[root@localhost ~]# oc get backups -n openshift-adp
NAME                      AGE
backup-postgresql-ontaps3  23h
schedule1-20240717070005   6h49m
[root@localhost ~]# oc get backups -n openshift-adp
NAME                      AGE
backup-postgresql-ontaps3  23h
backup2                    24s
schedule1-20240717070005   6h50m
[root@localhost ~]#
```

If you want to delete the Backup CR AND the associated object storage data, you can do so by using the Velero CLI tool.

```
[root@localhost ~]# velero get backups -n openshift-adp
NAME      STATUS  ERRORS  WARNINGS  CREATED          EXPIRES  STORAGE LOCATION  SELECTOR
backup-postgresql-ontaps3  Completed  0        0        2024-07-16 10:01:08 -0400 EDT  29d      velero-container-backup-ontap-1  <none>
backup2    Completed  0        0        2024-07-17 09:42:32 -0400 EDT  29d      velero-container-backup-ontap-1  <none>
schedule1-20240717070005  Completed  0        0        2024-07-17 03:00:05 -0400 EDT  29d      velero-container-backup-ontap-1  <none>
[root@localhost ~]# velero delete backup backup2 -n openshift-adp
Are you sure you want to continue (Y/N)? Y
Request to delete backup "backup2" submitted successfully.
The backup will be fully deleted after all associated data (disk snapshots, backup files, restores) are removed.
[root@localhost ~]# velero get backups -n openshift-adp
NAME      STATUS  ERRORS  WARNINGS  CREATED          EXPIRES  STORAGE LOCATION  SELECTOR
backup-postgresql-ontaps3  Completed  0        0        2024-07-16 10:01:08 -0400 EDT  29d      velero-container-backup-ontap-1  <none>
schedule1-20240717070005  Completed  0        0        2024-07-17 03:00:05 -0400 EDT  29d      velero-container-backup-ontap-1  <none>
[root@localhost ~]#
```

Deleting the Restore

You can delete the Restore CR Object by using either the OC CLI or the Velero CLI

```
[root@localhost ~]# velero get restore -n openshift-adp
NAME      BACKUP      STATUS  STARTED          COMPLETED         ERRORS  WARNINGS  CREATED          SELECTOR
restore  backup-postgresql-ontaps3  Completed  2024-07-16 14:59:22 -0400 EDT  2024-07-16 14:59:45 -0400 EDT  0        10        2024-07-16 14:59:22 -0400 EDT  <none>
restore1 backup-postgresql-ontaps3  Completed  2024-07-16 16:36:37 -0400 EDT  2024-07-16 16:36:59 -0400 EDT  0        9        2024-07-16 16:36:37 -0400 EDT  <none>
[root@localhost ~]# velero restore delete restore1 -n openshift-adp
Are you sure you want to continue (Y/N)? Y
Request to delete restore "restore1" submitted successfully.
The restore will be fully deleted after all associated data (restore files in object storage) are removed.
[root@localhost ~]# velero get restore -n openshift-adp
NAME      BACKUP      STATUS  STARTED          COMPLETED         ERRORS  WARNINGS  CREATED          SELECTOR
restore  backup-postgresql-ontaps3  Completed  2024-07-16 14:59:22 -0400 EDT  2024-07-16 14:59:45 -0400 EDT  0        10        2024-07-16 14:59:22 -0400 EDT  <none>
[root@localhost ~]#
[root@localhost ~]# oc delete restore restore -n openshift-adp
restore.velero.io "restore" deleted
[root@localhost ~]# oc get restore -n openshift-adp
No resources found in openshift-adp namespace.
[root@localhost ~]# velero get restore -n openshift-adp
[root@localhost ~]#
```
