Oracle Database

TR-4990: Quick Recovery of Oracle VLDB with Incremental Merge on ANF

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Recovering a Very Large Database (VLDB) in Oracle using the Oracle Recovery Manager (RMAN) backup tool can be a highly challenging task. The database restoration process from backup media in the event of a failure can be time-consuming, delaying the database recovery and potentially impacting your Service Level Agreement (SLA) significantly. However, starting from version 10g, Oracle introduced a RMAN feature that allows users to create staged image copies of the Oracle database data files on additional disk storage located on the DB server host. These image copies can be incrementally updated using RMAN on a daily basis. In the case of a failure, the Database Administrator (DBA) can swiftly switch the Oracle database from the failed media to the image copy, eliminating the need for a complete database media restore. The result is a greatly improved SLA, albeit at the cost of doubling the required database storage.

If you are keen on SLA for your VLDB and contemplating moving the Oracle database to a public cloud such as Azure, you could set up a similar database protection structure using resources such as Microsoft Azure NetApp Files (ANF) for staging your standby database image copy. In this documentation, we demonstrate how to provision and export an NFS file system from ANF capacity pool to be mounted on an Oracle database server for staging a standby database copy for quick recovery in the event of a primary storage failure.

This solution addresses the following use cases:

• An Oracle VLDB image copy incremental merge via RMAN on NFS mount point off Microsoft ANF capacity pool storage.
• Quick recovery of an Oracle VLDB in the event of a failure on the same Azure database server VM.
• Quick recovery of an Oracle VLDB in the event of a failure on a standby Azure database server VM.

Audience

This solution is intended for the following people:

• A DBA who sets up Oracle VLDB image copy incremental merge via RMAN in Azure for faster database recovery.
• A database solution architect who tests Oracle workloads in the Azure public cloud.
• A storage administrator who manages Oracle databases deployed to ANF capacity pool storage.
• An application owner who would like to stand up Oracle databases in Azure cloud environment.

Solution test and validation environment

The testing and validation of this solution was performed in a Microsoft ANF capacity pool storage and Azure VM compute environment that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].
Architecture

Oracle VLDB Incremental Merge via RMAN on ANF

Key factors for deployment consideration

- Oracle VLDB storage layout for RMAN incremental merge. In our tests and validations, the NFS volume for Oracle incremental backup and merge is allocated from a single ANF capacity pool, which has
100 TiB per volume, and 1000 TiB total capacity limit. For deployment over the thresholds, multiple volumes, and ANF capacity pools can be concatenated in parallel with multiple NFS mount points to provide higher capacity.

- **Oracle recoverability using RMAN incremental merge.** The RMAN incremental backup and merge is generally executed at user defined frequency based on your RTO and RPO objectives. If there are total loss of primary data storage and/or archived logs, the data loss can occur. The Oracle database can be recovered up to last incremental backup that is available from ANF database backup image copy. To minimize the data loss, Oracle flash recovery area can be setup on ANF NFS mount point and archived logs are backed up to ANF NFS mount along with database image copy.

- **Running Oracle VLDB off ANF NFS file system.** Unlike other bulk storage for database backup, Microsoft ANF is a cloud enabled production grade storage that delivers high level of performance and storage efficiency. Once Oracle VLDB switches over from primary storage to image copy on ANF NFS file system, database performance can be maintained at high level while the primary storage failure is addressed. You can take comfort to know that user application experience does not suffer as the result of primary storage failure.

- **Azure compute instances.** In these tests and validations, we used Standard_B4ms Azure VMs as the Oracle database servers. There are other Azure VMs that may be optimized and better suited for database workload. You also need to size the Azure VM appropriately for the number of vCPUs and the amount of RAM based on actual workload requirements.

- **ANF capacity pool service level.** ANF capacity pool offers three service level: Standard, Premium, Ultra. By default, an auto QoS applies to a volume created within a capacity pool, which restricts the throughput on the volume. The throughput on a volume can be manually adjusted based on the size of capacity pool and service level.

- **dNFS configuration.** dNFS is built into Oracle kernel and is known to dramatically increase Oracle database performance when Oracle is deployed to NFS storage. dNFS is packaged into Oracle binary but is not turned on by default. It should be turned on for any Oracle database deployment on NFS. For multiple ANF capacity pools deployment for a VLDB, dNFS multi-paths to different ANF capacity pools storage should be properly configured.

### Solution deployment

It is assumed that you already have your Oracle VLDB deployed in Azure cloud environment within a VNet. If you need help on Oracle deployment in Azure, please refer to following technical reports for help.

- Simplified, Automated Oracle Deployment on Azure NetApp Files with NFS
- Oracle Database Deployment and Protection on Azure NetApp Files

Your Oracle VLDB can be running either on an ANF storage or any other storage of choices within the Azure cloud ecosystem. The following section provides step-by-step deployment procedures for setting up RMAN incremental merge to an image copy of an Oracle VLDB that is staging in an NFS mount off ANF storage.

### Prerequisites for deployment
Deployment requires the following prerequisites.

1. An Azure account has been set up, and the necessary Azure VNet and network segments have been created within your Azure account.

2. From the Azure portal console, you must deploy two Azure VM instances, one as the primary Oracle DB server and an optional standby DB server. See the architecture diagram in the previous section for more details about the environment setup. Also review the Azure Virtual Machine series for more information.

3. From the Azure portal console, deploy ANF storage to host the NFS volumes that stores the Oracle database standby image copy. If you are not familiar with the deployment of ANF, see the documentation Quickstart: Set up Azure NetApp Files and create an NFS volume for step-by-step instructions.

Ensure that you have allocated at least 128G in Azure VM root volume in order to have sufficient space to stage Oracle installation files.

Provision and export NFS volume to be mounted on primary Oracle VLDB server
In this section, we show provisioning an NFS volume from an ANF capacity pool via Azure portal console. Repeat the procedures on other ANF capacity pools if more than one ANF capacity pools are set up to accommodate the size of the database.

1. First, from Azure portal console, navigating to ANF capacity pool that is used to stage Oracle VLDB image copy.

2. From selected capacity pool - database, click Volumes and then, Add volume to launch add-volume workflow.

3. Fill in Volume name, Quota, Virtual network, and Delegated subnet to move to Protocol page.
4. Take a note of the file path, enter allowed clients CIDR range, and enable Root Access for the volume.
5. Add a volume tag if desired.
6. Review and create the volume.
7. Login to primary Oracle VLDB server as a user with sudo privilege and mount the NFS volume exported from ANF storage. Change to your ANF NFS server IP address and file path as necessary. The ANF NFS server IP address can be retrieved from ANF volume console page.

```
sudo mkdir /nfsanf
```
sudo mount 172.30.136.68:/ora-01-u02-copy /nfsanf -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,nointr

8. Change mount point ownership to oracle:oinstall, change to your oracle user name and primary group as necessary.

sudo chown oracle:oinstall /nfsanf

Setup Oracle RMAN incremental merge to image copy on ANF
RMAN incremental merge update the staging database data files image copy continuously at every incremental backup/merge interval. The image copy of database backup will be as up to date as the frequency you execute the incremental backup/merge. So, take into consideration of database performance, your RTO and RPO objectives when deciding the frequency of RMAN incremental backup and merge.

1. Login to primary Oracle VLDB server as oracle user.
2. Create an oracopy directory under mount point /nfsanf to store oracle data files image copies and archlog directory for Oracle flash recovery area.

```
mkdir /nfsanf/oracopy
mkdir /nfsanf/archlog
```

3. Login to Oracle database via sqlplus, enable block change tracking for faster incremental backup and change Oracle flash recovery area to ANF NFS mount if it is currently on primary storage. This allows the RMAN default control file/spfile autobackup and archived logs to be backed up to ANF NFS mount for recovery.

```
sqlplus / as sysdba

From sqlplus prompt, execute following command.

```
alter database enable block change tracking using file '/nfsanf/oracopy/bct_ntap1.ctf'

alter system set db_recovery_file_dest='/nfsanf/archlog/' scope=both;
```

Expected output:
4. Create a RMAN backup and incremental merge script. The script allocates multiple channels for parallel RMAN backup and merge. First execution would generate the initial full baseline image copy. In a complete run, it first purges obsolete backups that are outside of retention window to keep staging area clean. It then switches current log file before merge and backup. The incremental backup follows the merge so that the database image copy is trailing current database state by one backup/merge cycle. The merge and backup order can be reversed for quicker recovery at user’s preference. The RMAN script can be integrated into a simple shell script to be executed from crontab on the primary DB server. Ensure control file autobackup is on in RMAN setting.
vi /home/oracle/rman_bkup_merge.cmd

Add following lines:

```
RUN
{
    allocate channel c1 device type disk format '/nfsanf/oracopy/%U';
    allocate channel c2 device type disk format '/nfsanf/oracopy/%U';
    allocate channel c3 device type disk format '/nfsanf/oracopy/%U';
    allocate channel c4 device type disk format '/nfsanf/oracopy/%U';
    delete obsolete;
    sql 'alter system archive log current';
    recover copy of database with tag 'OraCopyBKUPonANF_level_0';
    backup incremental level 1 copies=1 for recover of copy with tag 'OraCopyBKUPonANF_level_0' database;
}
```

5. At the primary Oracle VLDB server, login to RMAN locally as oracle user with or without RMAN catalog. In this demonstration, we are not connecting to a RMAN catalog.

```
rmans target / nocatalog;
```

output:

```
[oracle@ora-01 ~]$ rman target / nocatalog

Recovery Manager: Release 19.0.0.0.0 - Production on Wed Mar 20 16:54:24 2024
Version 19.18.0.0.0

Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights reserved.

connected to target database: NTAP1 (DBID=2441823937)
using target database control file instead of recovery catalog
```

6. From RMAN prompt, execute the script. First execution creates a baseline database image copy and subsequent executions merge and update the baseline image copy incrementally. The following is how to execute the script and the typical output. Set the number of channels to match the CPU cores on the host.

```
RMAN> @/home/oracle/rman_bkup_merge.cmd
RMAN> RUN
```
allocate channel c1 device type disk format '/nfsanf/oracopy/%U';
allocate channel c2 device type disk format '/nfsanf/oracopy/%U';
allocate channel c3 device type disk format '/nfsanf/oracopy/%U';
allocate channel c4 device type disk format '/nfsanf/oracopy/%U';
delete obsolete;
sql 'alter system archive log current';
recover copy of database with tag 'OraCopyBKUPonANF_level_0';
backup incremental level 1 copies=1 for recover of copy with tag 'OraCopyBKUPonANF_level_0' database;
}

allocated channel: c1
channel c1: SID=142 device type=DISK

allocated channel: c2
channel c2: SID=277 device type=DISK

allocated channel: c3
channel c3: SID=414 device type=DISK

allocated channel: c4
channel c4: SID=28 device type=DISK

RMAN retention policy will be applied to the command
RMAN retention policy is set to redundancy 1

RMAN>
```

This completes the setup of an Oracle VLDB standby image copy backup and merge.

Switch Oracle VLDB to image copy for quick recovery
In the event of a failure due to primary storage issue such as data loss or corruption, database can be quickly switched over to image copy on ANF NFS mount and recovered to current state without database restore. Eliminating media restoration speeds up the database recovery tremendously for a VLDB. This use case assumes that the Oracle VLDB DB server is intact and database control file, archived and current logs are all available for recovery.

1. Login to Azure primary VLDB server host as oracle user and create a test table before switch over.

```
[oracle@ora-01 ~]$ sqlplus / as sysdba

```

```
6. From SQL plus, check the content of test table we have inserted before the switch over to copy.
SQL> alter session set container=ntap1_pdb1;
Session altered.
SQL> select * from test;

<table>
<thead>
<tr>
<th>ID</th>
<th>DT</th>
<th>EVENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21-MAR-24 03.15.03.000000 PM</td>
<td>test oracle incremental merge switch to copy</td>
</tr>
</tbody>
</table>

7. You could run the Oracle VLDB in ANF NFS mount for an extended period of time while maintaining expected performance level. When the primary storage issue is fixed, you can swing back to it by reversing the incremental backup merge processes with minimal downtime.

**Oracle VLDB recovery from image copy to a standby DB server**
In the event of a failure where both the primary storage and primary DB server host are lost, recovery cannot be performed from the original server. However, your Oracle database backup image copy available on the ANF NFS file system comes in handy. You can quickly recover the primary database to a standby DB server if one is available, using the backup image copy. In this section, we will demonstrate the step-by-step procedures for such recovery.

1. Insert a row to test table we have created previously for Oracle VLDB restoring to alternative host validation.
2. As oracle user, run RMAN incremental backup and merge to flush the transaction to backup set on ANF NFS mount.
3. Shutdown primary VLDB server host to simulate a total failure of storage and DB server host.

4. On the standby DB server ora-02 with same OS and version, OS kernel should be patched up as primary VLDB server host. Also, the same version and patches of Oracle has been installed and configured on standby DB server with software only option.

5. Configure oracle environment similarly to primary VLDB server ora_01, such as oratab, and oracle user .bash_profile etc. It is a good practice to backup those files to ANF NFS mount point.

6. The Oracle database backup image copy on ANF NFS file system is then mounted on the standby DB server for recovery. The following procedures demonstrate the process details.

As azureuser, create the mount point.

```
sudo mkdir /nfsanf
```

As azureuser, mount the NFS volume that stored Oracle VLDB backup image copy.

```
sudo mount 172.30.136.68:/ora-01-u02-copy /nfsanf -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,nointr
```

7. Validate the Oracle database backup image copy on ANF NFS mount point.

```
[oracle@ora-02 ~]$ ls -l /nfsanf/oracopy/
total 400452728
-rw-r----- 1 oracle oinstall 461381632 Mar 21 23:47 data_D-NTAP1_I-2441823937_TS-SYSAUX_FNO-6_242m9oan
-rw-r----- 1 oracle oinstall 419438592 Mar 21 23:49 data_D-NTAP1_I-2441823937_TS-SYSTEM_FNO-5_282m9oem
-rw-r----- 1 oracle oinstall 246423552 Mar 21 23:49 data_D-NTAP1_I-2441823937_TS-UNDOTBS1_FNO-8_292m9oem
```
8. Verify the available Oracle archived logs on the ANF NFS mount for recovery and note the last log file log sequency number. In this case, it is 10. Our recovery point is up to log sequency number 11.
9. As oracle user, set ORACLE_HOME variable to current Oracle installation on standby DB server ora-02, ORACLE_SID to primary Oracle instance SID. In this case, it is NTAP1.

```
[oracle@ora-02 ~]$ export ORACLE_HOME=/u01/app/oracle/product/19.0.0/NTAP2
[oracle@ora-02 ~]$ export ORACLE_SID=NTAP1
[oracle@ora-02 ~]$ export PATH=$PATH:$ORACLE_HOME/bin
```

10. As oracle user, create a generic Oracle init file in $ORACLE_HOME/dbs directory with proper admin directories configured. Most importantly, have Oracle flash recovery area point to ANF NFS mount path as defined in primary Oracle VLDB server. flash recovery area configuration is demonstrated in section Setup Oracle RMAN incremental merge to image copy on ANF. Set the Oracle control file to ANF NFS file system.

```
vi $ORACLE_HOME/dbs/initNTAP1.ora
```

With following example entries:
The above init file should be replaced by restored backup init file from primary Oracle VLDB server in the case of discrepancy.

11. As oracle user, launch RMAN to run Oracle recovery on the standby DB server host. First, start the Oracle instance in nomount state.
12. Set database ID. The database ID can be retrieved from Oracle file name of image copy on ANF NFS mount point.

RMAN> set dbid = 2441823937;
executing command: SET DBID

13. Restore controlfile from autobackup. If Oracle controlfile and spfile autobackup is enabled, they are backed up in every incremental backup and merge cycle. The latest backup will be restored if multiple copies are available.
RMAN> restore controlfile from autobackup;

Starting restore at 22-MAR-24
allocated channel: ORA_DISK_1
channel ORA_DISK_1: SID=2 device type=DISK

recovery area destination: /nfsanf/archlog/
database name (or database unique name) used for search: NTAP1
channel ORA_DISK_1: AUTOBACKUP

c_media recovery complete, elapsed time: 00:01:17
Finished recover at 22-MAR-24

RMAN> exit

Recovery Manager complete.

For faster recovery, enable parallel sessions with recovery_parallelism parameter or specify degree of parallel in recovery command for database recovery: RECOVER DATABASE PARALLEL (DEGREE d INSTANCES DEFAULT); In general, degrees of parallelism should be equal to number of CPU cores on the host.

18. Exit RMAN, login to Oracle as oracle user via sqlplus to open database and reset log after an incomplete recovery.

 1  21-MAR-24 03.15.03.000000 PM
 test oracle incremental merge switch to copy

 2  22-MAR-24 02.22.06.000000 PM
 test recovery on a new Azure VM host with image copy on ANF

20. Drop invalid tempfiles and add new tempfiles to temp tablespaces.

SQL> select name from v$tempfile;

NAME
SQL> alter tablespace temp add tempfile /
 nfSANF/oracopy/ntap1_pdb1_temp01.dbf size 100M;
Tablespace altered.

SQL> select name from v$tempfile;
NAME
------------------------
/u02/oradata/NTAP1/NTAP1_pdb1/temp01.dbf
/u02/oradata/NTAP1/NTAP1_pdb1/temp02.dbf
/nfsanf/oracopy/ntap1_pdb1_temp01.dbf

SQL> alter database tempfile /
    /u02/oradata/NTAP1/NTAP1_pdb1/temp01.dbf' offline;
Database altered.

SQL> alter database tempfile /
    '/u02/oradata/NTAP1/NTAP1_pdb1/temp01.dbf' drop;
Database altered.

SQL> alter database tempfile /
    '/u02/oradata/NTAP1/NTAP1_pdb1/temp02.dbf' offline;
Database altered.

SQL> alter database tempfile /
    '/u02/oradata/NTAP1/NTAP1_pdb1/temp02.dbf' drop;
Database altered.

SQL> select name from v$tempfile;
NAME
------------------------
/nfsanf/oracopy/ntap1_pdb1_temp01.dbf

SQL>
21. Other post recovery tasks

- Add ANF NFS mount to fstab so that the NFS file system will be mounted when DB server host rebooted.

    As azureuser, sudo vi /etc/fstab and add following entry:

    172.30.136.68:/ora-01-u02-copy       /nfsanf        nfs
    rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,noin
    tr 0       0

- Update the Oracle init file from primary database init file backup that is restored to /tmp/archive and create spfile as needed.

This completes the Oracle VLDB database recovery from backup image copy on ANF NFS file system to a standby DB server host.

Where to find additional information

To learn more about the information described in this document, review the following documents and/or websites:

TR-4987: Simplified, Automated Oracle Deployment on Azure NetApp Files with NFS

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Running performance-intensive and latency-sensitive Oracle workloads in the cloud can be challenging. Azure NetApp Files (ANF) makes it easy for enterprise line-of-business (LOB) and storage professionals to migrate and run demanding Oracle workloads without code change. Azure NetApp Files is widely used as the underlying shared file-storage service in various scenarios, such as new deployment or migration (lift and shift) of Oracle databases from on-premises to Azure.

This documentation demonstrates the simplified deployment of Oracle databases in Azure NetApp files via
NFS mounts using Ansible automation. The Oracle database deploys in a container database (CDB) and pluggable databases (PDB) configuration with Oracle dNFS protocol enabled to boost performance. Furthermore, the on-premises Oracle single instance database or PDB can be migrated into a newly deployed container database in Azure using automated PDB relocation methodology with minimal service interruption. It also provides information on fast Oracle database backup, restore, and clone with NetApp SnapCenter UI tool in Azure Cloud.

This solution addresses the following use cases:

- Automated Oracle container database deployment on Azure NetApp files
- Automated Oracle database migration between on-premises and Azure cloud

**Audience**

This solution is intended for the following people:

- A DBA who would like to deploy Oracle on Azure NetApp Files.
- A database solution architect who would like to test Oracle workloads on Azure NetApp Files.
- A storage administrator who would like to deploy and manage an Oracle database on Azure NetApp Files.
- An application owner who would like to stand up an Oracle database on Azure NetApp Files.

**Solution test and validation environment**

The testing and validation of this solution were performed in a lab setting that might not match the final deployment environment. See the section [Key Factors for Deployment Consideration] for more information.

</tbody>
</table>

## Key factors for deployment consideration

- **Oracle database storage layout.** In this automated Oracle deployment, we provision three database volumes for each database to host Oracle binary, data, and logs by default. The volumes are mounted on Oracle DB server as /u01 - binary, /u02 - data, /u03 - logs via NFS. Dual control files are configured on /u02 and /u03 mount points for redundancy.

- **Multiple DB servers deployment.** The automation solution can deploy an Oracle container database to multiple DB servers in a single Ansible playbook run. Regardless of the number of DB servers, the playbook execution remains the same. You can deploy multiple container databases to a single VM.
instance by repeating the deployment with different database instance IDs (Oracle SID). But ensure there is sufficient memory on the host to support deployed databases.

• **dNFS configuration.** By using dNFS (available since Oracle 11g), an Oracle database running on an Azure Virtual Machine can drive significantly more I/O than the native NFS client. Automated Oracle deployment configures dNFS on NFSv3 by default.

• **Allocate large size volume to speed up deployment.** ANF file system IO throughput is regulated based on the size of volume. For initial deployment, allocate large size volumes can speed up the deployment. The volumes subsequently can be downsized dynamically without application impact.

• **Database backup.** NetApp provides a SnapCenter software suite for database backup, restore, and cloning with a user-friendly UI interface. NetApp recommends implementing such a management tool to achieve fast (under a minute) snapshot backup, quick (minutes) database restore, and database clone.

**Solution deployment**

The following sections provide step-by-step procedures for automated Oracle 19c deployment and database migration on Azure NetApp Files with directly mounted database volumes via NFS to Azure VMs.

**Prerequisites for deployment**
Deployment requires the following prerequisites.

1. An Azure account has been set up, and the necessary VNet and network segments have been created within your Azure account.

2. From the Azure cloud portal, deploy Azure Linux VMs as Oracle DB servers. Create an Azure NetApp Files capacity pool and database volumes for Oracle database. Enable VM SSH private/public key authentication for azureuser to DB servers. See the architecture diagram in the previous section for details about the environment setup. Also referred to Step-by-Step Oracle deployment procedures on Azure VM and Azure NetApp Files for detailed information.

   For Azure VMs deployed with local disk redundancy, ensure that you have allocated at least 128G in the VM root disk to have sufficient space to stage Oracle installation files and add OS swap file. Expand /tmplv and /rootlv OS partition accordingly. Ensure the database volume naming follows the VMname-u01, VMname-u02, and VMname-u03 convention.

   ```bash
   sudo lvresize -r -L +20G /dev/mapper/rootvg-rootlv
   
   sudo lvresize -r -L +10G /dev/mapper/rootvg-tmlv
   ```

3. From the Azure cloud portal, provision a Windows server to run the NetApp SnapCenter UI tool with the latest version. Refer to the following link for details: Install the SnapCenter Server

4. Provision a Linux VM as the Ansible controller node with the latest version of Ansible and Git installed. Refer to the following link for details: Getting Started with NetApp solution automation in section - Setup the Ansible Control Node for CLI deployments on RHEL / CentOS or Setup the Ansible Control Node for CLI deployments on Ubuntu / Debian.

   The Ansible controller node can locate either on-premises or in Azure cloud as far as it can reach Azure DB VMs via ssh port.

5. Clone a copy of the NetApp Oracle deployment automation toolkit for NFS.

   ```bash
   git clone https://bitbucket.ngage.netapp.com/scm/ns-bb/na_oracle_deploy_nfs.git
   ```

6. Stage following Oracle 19c installation files on Azure DB VM /tmp/archive directory with 777 permission.

   ```makefile
   installer_archives:
   - "LINUX.X64_193000_db_home.zip"
   - "p34765931_190000_Linux-x86-64.zip"
   - "p6880880_190000_Linux-x86-64.zip"
   ```
7. Watch the following video:

Simplified and automated Oracle deployment on Azure NetApp Files with NFS

Automation parameter files

Ansible playbook executes database installation and configuration tasks with predefined parameters. For this Oracle automation solution, there are three user-defined parameter files that need user input before playbook execution.

- **hosts** - define targets that the automation playbook is running against.
- **vars/vars.yml** - the global variable file that defines variables that apply to all targets.
- **host_vars/host_name.yml** - the local variable file that defines variables that apply only to a named target. In our use case, these are the Oracle DB servers.

In addition to these user-defined variable files, there are several default variable files that contain default parameters that do not require change unless necessary. The following sections show how to configure the user-defined variable files.

Parameter files configuration
1. Ansible target `hosts` file configuration:

```yaml
[oracle]
ora-01 ansible_host=10.61.180.21 ansible_ssh_private_key_file=ora-01.pem
ora-02 ansible_host=10.61.180.23 ansible_ssh_private_key_file=ora-02.pem
```

2. Global `vars/vars.yml` file configuration
Oracle 19c deployment user configuration variables

Consolidate all variables from ANF, linux and oracle

# Prerequisite to create three volumes in NetApp storage pool from cloud dashboard with following naming convention:
# db_hostname-u01 - Oracle binary
# db_hostname-u02 - Oracle data
# db_hostname-u03 - Oracle redo
# It is important to strictly follow the name convention or the automation will fail.

# NFS lif ip address to access database volumes in ANF storage pool (retrievable from cloud dashboard)

nfs_lif: 172.30.136.68

# Linux env specific config variables

redhat_sub_username: XXXXXXXX
redhat_sub_password: XXXXXXXX

# Database domain name

db_domain: solutions.netapp.com

# Set initial password for all required Oracle passwords. Change them after installation.

initial_pwd_all: XXXXXXXX

3. Local DB server host_vars/host_name.yml configuration such as ora_01.yml, ora_02.yml ...
# User configurable Oracle host specific parameters

# Enter container database SID. By default, a container DB is created with 3 PDBs within the CDB

oracle_sid: NTAP1

# Enter database shared memory size or SGA. CDB is created with SGA at 75% of memory_limit, MB. The grand total of SGA should not exceed 75% available RAM on node.

memory_limit: 8192

Playbook execution
There are a total of five playbooks in the automation toolkit. Each performs different task blocks and serves different purposes.

0-all_playbook.yml - execute playbooks from 1-4 in one playbook run.
1-ansible_requirements.yml - set up Ansible controller with required libs and collections.
2-linux_config.yml - execute Linux kernel configuration on Oracle DB servers.
4-oracle_config.yml - install and configure Oracle on DB servers and create a container database.
5-destroy.yml - optional to undo the environment to dismantle all.

There are three options to run the playbooks with the following commands.

1. Execute all deployment playbooks in one combined run.

   ```
   ansible-playbook -i hosts 0-all_playbook.yml -u azureuser -e @vars/vars.yml
   ```

2. Execute playbooks one at a time with the number sequence from 1-4.

   ```
   ansible-playbook -i hosts 1-ansible_requirements.yml -u azureuser -e @vars/vars.yml
   ```

   ```
   ansible-playbook -i hosts 2-linux_config.yml -u azureuser -e @vars/vars.yml
   ```

   ```
   ansible-playbook -i hosts 4-oracle_config.yml -u azureuser -e @vars/vars.yml
   ```

3. Execute 0-all_playbook.yml with a tag.

   ```
   ansible-playbook -i hosts 0-all_playbook.yml -u azureuser -e @vars/vars.yml -t ansible_requirements
   ```

   ```
   ansible-playbook -i hosts 0-all_playbook.yml -u azureuser -e @vars/vars.yml -t linux_config
   ```
4. Undo the environment

```
ansible-playbook -i hosts 5-destroy.yml -u azureuser -e @vars/vars.yml
```

Post execution validation
After the playbook run, login to the Oracle DB server VM to validate that Oracle is installed and configured and a container database is created successfully. Following is an example of Oracle database validation on host ora-01.

1. Validate NFS mounts

```bash
[azureuser@ora-01 ~]$ cat /etc/fstab
#
#/etc/fstab
#/ Created by anaconda on Thu Sep 14 11:04:01 2023
#
#/ Accessible filesystems, by reference, are maintained under
#/ /dev/disk/.
#/ See man pages fstab(5), findfs(8), mount(8) and/or blkid(8) for
#/ more info.
#
#/ After editing this file, run systemctl daemon-reload to update
#/ systemd
#/ units generated from this file.
#
/dev/mapper/rootvg-rootlv / xfs defaults 0 0
UUID=268633bd-f9bb-446d-9a1d-8fca4609a1e1 /boot
xfs defaults 0 0
UUID=89D8-B037 /boot/efi vfat
defaults,uid=0,gid=0,umask=077,shortname=winnt 0 2
/dev/mapper/rootvg-homelv /home xfs defaults 0 0
/dev/mapper/rootvg-tmplv /tmp xfs defaults 0 0
/dev/mapper/rootvg-usrlv /usr xfs defaults 0 0
/dev/mapper/rootvg-varlv /var xfs defaults 0 0
/mnt/swapfile swap swap defaults 0 0
172.30.136.68:/ora-01-u01 /u01 nfs

The command completed successfully

3. Validate Oracle database and dNFS

[oracle@ora-01 ~]$ cat /etc/oratab
#
# This file is used by ORACLE utilities. It is created by root.sh
# and updated by either Database Configuration Assistant while creating
# a database or ASM Configuration Assistant while creating ASM
# A colon, ':', is used as the field terminator. A new line terminates
# the entry. Lines beginning with a pound sign, '#', are comments.
#
# Entries are of the form:
#   $ORACLE_SID:$ORACLE_HOME:<N|Y>:
#
# The first and second fields are the system identifier and home
directory of the database respectively. The third field indicates
# to the dbstart utility that the database should, "Y", or should
# not,  "N", be brought up at system boot time.
#
# Multiple entries with the same $ORACLE_SID are not allowed.
#
# NTAP1:/u01/app/oracle/product/19.0.0/NTAP1:Y

4. Login to Oracle Enterprise Manager Express to validate database.
Migrate Oracle database to Azure

Oracle database migration from on-premises to the cloud is a heavy-lifting. Using the right strategy and automation can smooth the process and minimize service interruption and downtime. Follow this detailed instruction Database migration from on-premises to Azure cloud to guide your database migration journey.

Oracle backup, restore, and clone with SnapCenter

NetApp recommends SnapCenter UI tool to manage Oracle database deployed in Azure cloud. Please refer to TR-4988: Oracle Database Backup, Recovery, and Clone on ANF with SnapCenter for details.
Where to find additional information

To learn more about the information described in this document, review the following documents and/or websites:

- Oracle Database Backup, Recovery, and Clone on ANF with SnapCenter
  [Oracle Database Backup, Recovery, and Clone on ANF with SnapCenter](https://docs.oracle.com/en/database/oracle/oracle-database/19/ladbi/)

TR-4986: Simplified, Automated Oracle Deployment on Amazon FSx ONTAP with iSCSI

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Amazon FSx for NetApp ONTAP is a storage service that allows you to launch and run fully managed NetApp ONTAP file systems in the AWS Cloud. It provides the familiar features, performance, capabilities, and APIs of NetApp file systems with the agility, scalability, and simplicity of a fully managed AWS service. It empowers you to run the most demanding database workload, such as Oracle, in the AWS cloud with peace of mind.

This documentation demonstrates the simplified deployment of Oracle databases in an Amazon FSx ONTAP file system using Ansible automation. The Oracle database is deployed in a standalone ReStart configuration with iSCSI protocol for data access and Oracle ASM for database storage disks management. It also provides information on Oracle database backup, restore, and clone using the NetApp SnapCenter UI tool for storage-efficient database operation in AWS Cloud.

This solution addresses the following use cases:

- Automated Oracle database deployment on Amazon FSx ONTAP file system
- Oracle database backup and restore on Amazon FSx ONTAP file system using NetApp SnapCenter tool
- Oracle database clone for dev/test or other use cases on Amazon FSx ONTAP file system using NetApp SnapCenter tool

Audience

This solution is intended for the following people:
• A DBA who would like to deploy Oracle on Amazon FSx ONTAP file system.
• A database solution architect who would like to test Oracle workloads on Amazon FSx ONTAP file system.
• A storage administrator who would like to deploy and manage an Oracle database on Amazon FSx ONTAP file system.
• An application owner who would like to stand up an Oracle database on Amazon FSx ONTAP file system.

Solution test and validation environment

The testing and validation of this solution were performed in a lab setting that might not match the final deployment environment. See the section [Key Factors for Deployment Consideration] for more information.

Key factors for deployment consideration

- **Oracle database storage layout.** In this automated Oracle deployment, we provision four database volumes to host Oracle binary, data, and logs by default. A single lun in a volume allocates to Oracle binary. We then create two ASM disk groups from data and logs luns. Within the +DATA asm disk group, we provision two data volumes with two luns in a volume. Within the +LOGS asm disk group, we create two luns in a log volume. Multiple luns laid out within an ONTAP volume provides better performance in general.

- **Multiple DB servers deployment.** The automation solution can deploy an Oracle container database to multiple DB servers in a single Ansible playbook run. Regardless of the number of DB servers, the playbook execution remains the same. You can deploy multiple container databases to a single EC2 instance with different database instance IDs (Oracle SID). But ensure there is sufficient memory on the host to support deployed databases.

- **iSCSI configuration.** The EC2 instance database server connects to FSx storage with the iSCSI protocol. EC2 instances generally deploy with a single network interface or ENI. The single NIC interface carries both iSCSI and application traffic. It is important to gauge the Oracle database peak I/O throughput requirement by carefully analyzing the Oracle AWR report in order to choose the right EC2 compute instance that meets both application and iSCSI traffic-throughput requirements. Also, AWS EC2 generally limits each TCP flow to 5 Gbps. Each iSCSI path provides 5 Gbps (625 MBps) of bandwidth, and multiple iSCSI connections may be required to support higher throughput requirements.

- **Oracle ASM redundancy level to use for each Oracle ASM disk group that you create.** Because the Amazon FSx ONTAP is HA enabled for data protection at the cluster disk level, you should use External Redundancy, which means that the option does not allow Oracle ASM to mirror the contents of the disk group.

- **Database backup.** NetApp provides a SnapCenter software suite for database backup, restore, and cloning with a user-friendly UI interface. NetApp recommends implementing such a management tool to
achieve fast (under a minute) SnapShot backup, quick (minutes) database restore, and database clone.

Solution deployment

The following sections provide step-by-step procedures for automated Oracle 19c deployment and protection on Amazon FSx ONTAP file system with directly mounted database luns via iSCSI to EC2 instance VM in a single node Restart configuration with Oracle ASM as database volume manager.

Prerequisites for deployment
Deployment requires the following prerequisites.

1. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account.

2. From the AWS EC2 console, deploy EC2 Linux instances as Oracle DB servers. Enable SSH private/public key authentication for ec2-user. See the architecture diagram in the previous section for details about the environment setup. Also review the User Guide for Linux instances for more information.

3. From the AWS FSx console, provision an Amazon FSx ONTAP file system that meets the requirements. Review the documentation Creating FSx for ONTAP file systems for step-by-step instructions.

4. Steps 2 and 3 can be performed using the following Terraform automation toolkit, which creates an EC2 instance named ora_01 and an FSx file system named fsx_01. Review the instruction carefully and change the variables to suit your environment before execution. The template can be easily revised for your own deployment requirements.

   ```
   git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
   ```

5. Provision an EC2 Linux instance as the Ansible controller node with the latest version of Ansible and Git installed. Refer to the following link for details: Getting Started with NetApp solution automation in section -

   Setup the Ansible Control Node for CLI deployments on RHEL / CentOS or
   Setup the Ansible Control Node for CLI deployments on Ubuntu / Debian.

6. Provision a Windows server to run the NetApp SnapCenter UI tool with the latest version. Refer to the following link for details: Install the SnapCenter Server

7. Clone a copy of the NetApp Oracle deployment automation toolkit for iSCSI.

   ```
   git clone https://bitbucket.ngage.netapp.com/scm/ns-bb/na_oracle_deploy_iscsi.git
   ```

8. Stage following Oracle 19c installation files on EC2 instances /tmp/archive directory.

   ```
   installer_archives:
   - "LINUX.X64_193000_grid_home.zip"
   - "p34762026_190000_Linux-x86-64.zip"
   - "LINUX.X64_193000_db_home.zip"
   - "p34765931_190000_Linux-x86-64.zip"
   - "p6880880_190000_Linux-x86-64.zip"
   ```

   Ensure that you have allocated at least 50G in Oracle VM root volume to have sufficient space to stage Oracle installation files.

9. Watch the following video:
Simplified and automated Oracle deployment on Amazon FSx ONTAP with iSCSI

Automation parameter files

Ansible playbook executes database installation and configuration tasks with predefined parameters. For this Oracle automation solution, there are three user-defined parameter files that need user input before playbook execution.

- hosts - define targets that the automation playbook is running against.
- vars/vars.yml - the global variable file that defines variables that apply to all targets.
- host_vars/host_name.yml - the local variable file that defines variables that apply only to a named target. In our use case, these are the Oracle DB servers.

In addition to these user-defined variable files, there are several default variable files that contain default parameters that do not require change unless necessary. The following sections show how to configure the user-defined variable files.

Parameter files configuration
1. Ansible target hosts file configuration:

```yaml
# Enter Amazon FSx ONTAP management IP address
[ontap]
172.16.9.32

# Enter name for ec2 instance (not default IP address naming) to be deployed one by one, follow by ec2 instance IP address, and ssh private key of ec2-user for the instance.
[oracle]
ora_01 ansible_host=10.61.180.21 ansible_ssh_private_key_file =ora_01.pem
ora_02 ansible_host=10.61.180.23 ansible_ssh_private_key_file =ora_02.pem
```

2. Global vars/vars.yml file configuration

```yaml
# Enter the supported ONTAP platform: on-prem, aws-fsx.
ontap_platform: aws-fsx

# Enter ONTAP cluster management user credentials
username: "fsxadmin"
password: "xxxxxxxxx"
```
# Enter RHEL subscription to enable repo
redhat_sub_username: xxxxxxxx
redhat_sub_password: "xxxxxxxx"

###                   Oracle DB env specific config variables
###

# Enter Database domain name
db_domain: solutions.netapp.com

# Enter initial password for all required Oracle passwords. Change them after installation.
initial_pwd_all: xxxxxxxx

3. Local DB server host_vars/host_name.yml configuration such as ora_01.yml, ora_02.yml ...

# User configurable Oracle host specific parameters

# Enter container database SID. By default, a container DB is created with 3 PDBs within the CDB
oracle_sid: NTAP1

# Enter database shared memory size or SGA. CDB is created with SGA at 75% of memory_limit, MB. The grand total of SGA should not exceed 75% available RAM on node.
memory_limit: 8192

Playbook execution
There are a total of six playbooks in the automation toolkit. Each performs different task blocks and serves different purposes.

0-all_playbook.yml - execute playbooks from 1-4 in one playbook run.
1-ansible_requirements.yml - set up Ansible controller with required libs and collections.
2-linux_config.yml - execute Linux kernel configuration on Oracle DB servers.
3-ontap_config.yml - configure ONTAP svm/volumes/luns for Oracle database and grant DB server access to luns.
4-oracle_config.yml - install and configure Oracle on DB servers for grid infrastructure and create a container database.
5-destroy.yml - optional to undo the environment to dismantle all.

There are three options to run the playbooks with the following commands.

1. Execute all deployment playbooks in one combined run.

   ansible-playbook -i hosts 0-all_playbook.yml -u ec2-user -e @vars/vars.yml

2. Execute playbooks one at a time with the number sequence from 1-4.

   ansible-playbook -i hosts 1-ansible_requirements.yml -u ec2-user -e @vars/vars.yml

   ansible-playbook -i hosts 2-linux_config.yml -u ec2-user -e @vars/vars.yml

   ansible-playbook -i hosts 3-ontap_config.yml -u ec2-user -e @vars/vars.yml

   ansible-playbook -i hosts 4-oracle_config.yml -u ec2-user -e @vars/vars.yml

3. Execute 0-all_playbook.yml with a tag.
ansible-playbook -i hosts 0-all_playbook.yml -u ec2-user -e @vars/vars.yml -t ansible_requirements

ansible-playbook -i hosts 0-all_playbook.yml -u ec2-user -e @vars/vars.yml -t linux_config

ansible-playbook -i hosts 0-all_playbook.yml -u ec2-user -e @vars/vars.yml -t ontap_config

ansible-playbook -i hosts 0-all_playbook.yml -u ec2-user -e @vars/vars.yml -t oracle_config

4. Undo the environment

ansible-playbook -i hosts 5-destroy.yml -u ec2-user -e @vars/vars.yml

Post execution validation
After the playbook run, login to the Oracle DB server as oracle user to validate that Oracle grid infrastructure and database are created successfully. Following is an example of Oracle database validation on host ora_01.

1. Validate Oracle container database on EC2 instance

```
[admin@ansiblectl na_oracle_deploy_iscsi]$ ssh -i ora_01.pem ec2-user@172.30.15.40
Last login: Fri Dec 8 17:14:21 2023 from 10.61.180.18
[ec2-user@ip-172-30-15-40 ~]$ uname -a

Purpose

NetApp ASA systems deliver modern solutions to your SAN infrastructure. They simplify at scale and enable you to accelerate your business-critical applications such as databases, make sure that your data is always available (99.9999% uptime), and reduce TCO and carbon footprint. The NetApp ASA systems include A-Series models designed for the most performance-demanding applications and C-Series models optimized for cost-effective, large-capacity deployments. Together, the ASA A-Series and C-Series systems deliver exceptional performance to improve customer experience and reduce time to results, keep business-critical data available, protected, and secure, and provide more effective capacity for any workload, backed by the industry’s most effective guarantee.

This documentation demonstrates the simplified deployment of Oracle databases in a SAN environment built with ASA systems using Ansible automation. The Oracle database is deployed in a standalone ReStart configuration with iSCSI protocol for data access and Oracle ASM for database disks management on the ASA storage array. It also provides information on Oracle database backup, restore, and clone using the NetApp SnapCenter UI tool for storage-efficient database operation in NetApp ASA systems.

This solution addresses the following use cases:

• Automated Oracle database deployment in NetApp ASA systems as primary database storage
• Oracle database backup and restore in NetApp ASA systems using NetApp SnapCenter tool
• Oracle database clone for dev/test or other use cases in NetApp ASA systems using NetApp SnapCenter tool

Audience

This solution is intended for the following people:

• A DBA who would like to deploy Oracle in NetApp ASA systems.
• A database solution architect who would like to test Oracle workloads in NetApp ASA systems.
• A storage administrator who would like to deploy and manage an Oracle database on NetApp ASA systems.
• An application owner who would like to stand up an Oracle database in NetApp ASA systems.

Solution test and validation environment

The testing and validation of this solution were performed in a lab setting that might not match the final deployment environment. See the section [Key Factors for Deployment Consideration] for more information.
Architecture

Simplified, Automated Oracle Database Deployment on NetApp ASA with iSCSI

Key factors for deployment consideration

- **Oracle database storage layout.** In this automated Oracle deployment, we provision four database volumes to host Oracle binary, data, and logs by default. We then create two ASM disk groups from data and logs luns. Within the +DATA asm disk group, we provision two data luns in a volume on each ASA A400 cluster node. Within the +LOGS asm disk group, we create two luns in a log volume on a single ASA A400 node. Multiple luns laid out within an ONTAP volume provides better performance in general.

- **Multiple DB servers deployment.** The automation solution can deploy an Oracle container database to multiple DB servers in a single Ansible playbook run. Regardless of the number of DB servers, the playbook execution remains the same. In the event of multi-DB server deployments, the playbook builds with an algorithm to place database luns on dual controllers of ASA A400 optimally. The binary and logs luns of odd number DB server in server hosts index place on controller 1. The binary and logs luns of even number DB server in the server hosts index place on controller 2. The DB data luns evenly distributed to two controllers. Oracle ASM combines the data luns on two controllers into a single ASM disk group to fully utilize the processing power of both controllers.

- **iSCSI configuration.** The database VMs connect to ASA storage with the iSCSI protocol for storage access. You should configure dual paths on each controller node for redundancy and set up iSCSI multi-path on the DB server for multi-path storage access. Enable jumbo frame on storage network to maximize performance and throughput.

- **Oracle ASM redundancy level to use for each Oracle ASM disk group that you create.** Because the ASA A400 configures storage in RAID DP for data protection at the cluster disk level, you should use **External Redundancy**, which means that the option does not allow Oracle ASM to mirror the contents of the disk group.

- **Database backup.** NetApp provides a SnapCenter software suite for database backup, restore, and cloning with a user-friendly UI interface. NetApp recommends implementing such a management tool to achieve fast (under a minute) SnapShot backup, quick (minutes) database restore, and database clone.

Solution deployment

The following sections provide step-by-step procedures for automated Oracle 19c deployment and protection in NetApp ASA A400 with directly mounted database luns via iSCSI to DB VM in a single node Restart configuration with Oracle ASM as database volume manager.

Prerequisites for deployment

Deployment requires the following prerequisites.

1. It is assumed that the NetApp ASA storage array has been installed and configured. This includes iSCSI broadcast domain, LACP interface groups a0a on both controller nodes, iSCSI VLAN ports (a0a-<iscsi-a-vlan-id>, a0a-<iscsi-b-vlan-id>) on both controller nodes. The following link provides detailed step-by-step instructions if help is needed. Detailed guide - ASA A400

2. Provision a Linux VM as an Ansible controller node with the latest version of Ansible and Git installed. Refer to the following link for details: Getting Started with NetApp solution automation in section - Setup the Ansible Control Node for CLI deployments on RHEL / CentOS or Setup the Ansible Control Node for CLI deployments on Ubuntu / Debian.

3. Clone a copy of the NetApp Oracle deployment automation toolkit for iSCSI.

```bash
git clone https://bitbucket.ngage.netapp.com/scm/ns-bb/na_oracle_deploy_iscsi.git
```

4. Provision a Windows server to run the NetApp SnapCenter UI tool with the latest version. Refer to the following link for details: Install the SnapCenter Server

5. Build two RHEL Oracle DB servers either bare metal or virtualized VM. Create an admin user on DB servers with sudo without password privilege and enable SSH private/public key authentication between Ansible host and Oracle DB server hosts. Stage following Oracle 19c installation files on DB servers /tmp/archive directory.

```text
installer_archives:
- "LINUX.X64_193000_grid_home.zip"
- "p34762026_190000_Linux-x86-64.zip"
- "LINUX.X64_193000_db_home.zip"
- "p34765931_190000_Linux-x86-64.zip"
- "p6880880_190000_Linux-x86-64.zip"
```

Ensure that you have allocated at least 50G in Oracle VM root volume to have sufficient space to stage Oracle installation files.

6. Watch the following video:

Simplified and automated Oracle deployment on NetApp ASA with iSCSI

Automation parameter files
Ansible playbook executes database installation and configuration tasks with predefined parameters. For this Oracle automation solution, there are three user-defined parameter files that need user input before playbook execution.

- **hosts** - define targets that the automation playbook is running against.
- **vars/vars.yml** - the global variable file that defines variables that apply to all targets.
- **host_vars/host_name.yml** - the local variable file that defines variables that apply only to a local target. In our use case, these are the Oracle DB servers.

In addition to these user-defined variable files, there are several default variable files that contain default parameters that do not require change unless necessary. The following sections show how the user-defined variable files are configured.

**Parameter files configuration**
1. Ansible target hosts file configuration:

```yaml
# Enter NetApp ASA controller management IP address
[ontap]
172.16.9.32

# Enter Oracle servers names to be deployed one by one, follow by each Oracle server public IP address, and ssh private key of admin user for the server.
[oracle]
ona_01 ansible_host=10.61.180.21 ansible_ssh_private_key_file =ora_01.pem
orna_02 ansible_host=10.61.180.23 ansible_ssh_private_key_file =ora_02.pem
```

2. Global vars/vars.yml file configuration

```yaml
# Enter the supported ONTAP platform: on-prem, aws-fsx.
ontap_platform: on-prem

# Enter ONTAP cluster management user credentials
username: "xxxxxxxx"
password: "xxxxxxxx"

# Enter Oracle SVM iSCSI lif addresses. Each controller configures
```
with dual paths iscsi_a, iscsi_b for redundancy

ora_iscsi_lif_mgmt:
  - {name: '{{ svm_name }}_mgmt', address: 172.21.253.220, netmask: 255.255.255.0, vlan_name: ora_mgmt, vlan_id: 3509}

ora_iscsi_lifs_node1:
  - {name: '{{ svm_name }}_lif_1a', address: 172.21.234.221, netmask: 255.255.255.0, vlan_name: ora_iscsi_a, vlan_id: 3490}
  - {name: '{{ svm_name }}_lif_1b', address: 172.21.235.221, netmask: 255.255.255.0, vlan_name: ora_iscsi_b, vlan_id: 3491}

ora_iscsi_lifs_node2:
  - {name: '{{ svm_name }}_lif_2a', address: 172.21.234.223, netmask: 255.255.255.0, vlan_name: ora_iscsi_a, vlan_id: 3490}
  - {name: '{{ svm_name }}_lif_2b', address: 172.21.235.223, netmask: 255.255.255.0, vlan_name: ora_iscsi_b, vlan_id: 3491}

# Enter RHEL subscription to enable repo
redhat_sub_username: xxxxxxxx
redhat_sub_password: "xxxxxxxx"

# Enter Database domain name
db_domain: solutions.netapp.com

# Enter initial password for all required Oracle passwords. Change them after installation.
initial_pwd_all: xxxxxxxx

3. Local DB server host_vars/host_name.yml configuration
# User configurable Oracle host specific parameters

# Enter container database SID. By default, a container DB is created with 3 PDBs within the CDB
oracle_sid: NTAP1

# Enter database shared memory size or SGA. CDB is created with SGA at 75% of memory_limit, MB. The grand total of SGA should not exceed 75% available RAM on node.
memory_limit: 8192

---

**Playbook execution**
There are a total of six playbooks in the automation toolkit. Each performs different task blocks and serves different purposes.

0-all_playbook.yml - execute playbooks from 1-4 in one playbook run.
1-ansible_requirements.yml - set up Ansible controller with required libs and collections.
2-linux_config.yml - execute Linux kernel configuration on Oracle DB servers.
3-ontap_config.yml - configure ONTAP svm/volumes/luns for Oracle database and grant DB server access to luns.
4-oracle_config.yml - install and configure Oracle on DB servers for grid infrastructure and create a container database.
5-destroy.yml - optional to undo the environment to dismantle all.

There are three options to run the playbooks with the following commands.

1. Execute all deployment playbooks in one combined run.

   ansible-playbook -i hosts 0-all_playbook.yml -u admin -e @vars/vars.yml

2. Execute playbooks one at a time with the number sequence from 1-4.

   ansible-playbook -i hosts 1-ansible_requirements.yml -u admin -e @vars/vars.yml

   ansible-playbook -i hosts 2-linux_config.yml -u admin -e @vars/vars.yml

   ansible-playbook -i hosts 3-ontap_config.yml -u admin -e @vars/vars.yml

   ansible-playbook -i hosts 4-oracle_config.yml -u admin -e @vars/vars.yml

3. Execute 0-all_playbook.yml with a tag.
ansible-playbook -i hosts 0-all_playbook.yml -u admin -e @vars/vars.yml -t ansible_requirements

ansible-playbook -i hosts 0-all_playbook.yml -u admin -e @vars/vars.yml -t linux_config

ansible-playbook -i hosts 0-all_playbook.yml -u admin -e @vars/vars.yml -t ontap_config

ansible-playbook -i hosts 0-all_playbook.yml -u admin -e @vars/vars.yml -t oracle_config

4. Undo the environment

ansible-playbook -i hosts 5-destroy.yml -u admin -e @vars/vars.yml

Post execution validation
After the playbook run, login to the Oracle DB server as oracle user to validate that Oracle grid infrastructure and database are created successfully. Following is an example of Oracle database validation on host ora_01.

1. Validate the grid infrastructure and resources created.

```
[oracle@ora_01 ~]$ df -h
Filesystem      Size  Used Avail Use% Mounted on
devtmpfs        7.7G   40K  7.7G   1% /dev
 tmpfs           7.8G  1.1G  6.7G  15% /dev/shm
 tmpfs           7.8G  312M  7.5G   4% /run
 tmpfs           7.8G   0  7.8G   0% /sys/fs/cgroup
/dev/mapper/rhel-root  44G  38G  6.8G  85% /
/dev/sda1         1014M  258M  757M  26% /boot
tmpfs            1.6G   12K  1.6G   1% /run/user/42
tmpfs            1.6G  4.0K  1.6G   1% /run/user/1000
/dev/mapper/ora_01_biny_01p1  40G   21G   20G  52% /u01
[oracle@ora_01 ~]$ asm
[oracle@ora_01 ~]$ crsctl stat res -t
```

```
---
Name        Target  State        Server                   State

TR-4979: Simplified, Self-managed Oracle in VMware Cloud on AWS with guest-mounted FSx ONTAP

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Enterprises have been running Oracle on VMware in private data centers for decades. VMware Cloud (VMC) on AWS provides a push-button solution to bring VMware’s enterprise-class Software-Defined Data Center (SDDC) software to the AWS Cloud’s dedicated, elastic, bare-metal infrastructure. AWS FSx ONTAP offers premium storage to VMC SDDC and a data fabric that enables customers to run business-critical applications such as Oracle across vSphere®-based private, public, and hybrid cloud environments, with optimized access to AWS services. Whether it is an existing or new Oracle workload, VMC on AWS provides a familiar, simplified, and self-managed Oracle environment on VMware with all the benefits of AWS cloud while deferring all platform management and optimization to VMware.

This documentation demonstrates the deployment and protection of an Oracle database in a VMC environment with Amazon FSx ONTAP as primary database storage. Oracle database can be deployed to VMC on FSx storage as direct VM guest-mounted LUNs or NFS-mounted VMware VMDK datastore disks. This technical report focuses on Oracle database deployment as direct guest-mounted FSx storage to VMs in the VMC cluster with the iSCSI protocol and Oracle ASM. We also demonstrate how to use the NetApp SnapCenter UI tool to backup, restore, and clone an Oracle database for dev/test or other use cases for storage-efficient database operation in the VMC on AWS.

This solution addresses the following use cases:

• Oracle database deployment in VMC on AWS with Amazon FSx ONTAP as primary database storage
• Oracle database backup and restore in VMC on AWS using NetApp SnapCenter tool
• Oracle database clone for dev/test or other use cases in VMC on AWS using NetApp SnapCenter tool

Audience

This solution is intended for the following people:

• A DBA who would like to deploy Oracle in VMC on AWS with Amazon FSx ONTAP
• A database solution architect who would like to test Oracle workloads in VMC on the AWS cloud
• A storage administrator who would like to deploy and manage an Oracle database deployed to VMC on AWS with Amazon FSx ONTAP
• An application owner who would like to stand up an Oracle database in VMC on the AWS cloud

Solution test and validation environment

The testing and validation of this solution was performed in a lab environment with VMC on AWS that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].

Key factors for deployment consideration

• **FSx to VMC connectivity.** When you deploy your SDDC on VMware Cloud on AWS, it is created within an AWS account and a VPC dedicated to your organization and managed by VMware. You must also connect the SDDC to an AWS account belonging to you, called the customer AWS account. This connection allows your SDDC to access AWS services belonging to your customer account. FSx for ONTAP is an AWS service deployed in your customer account. Once the VMC SDDC is connected to your customer account, FSx storage is available to VMs in VMC SDDC for direct guest mount.

• **FSx storage HA clusters single- or multi-zone deployment.** In these tests and validations, we deployed an FSx HA cluster in a single AWS availability zone. NetApp also recommends deploying FSx for NetApp ONTAP and VMware Cloud on AWS in the same availability zone to achieve better performance and avoid data transfer charges between availability zones.

• **FSx storage cluster sizing.** An Amazon FSx for ONTAP storage file system provides up to 160,000 raw SSD IOPS, up to 4Gb/s throughput, and a maximum of 192TiB capacity. However, you can size the cluster in terms of provisioned IOPS, throughput, and storage limit (minimum 1,024 GiB) based on your actual requirements at the time of deployment. The capacity can be adjusted dynamically on the fly without affecting application availability.

• **Oracle data and logs layout.** In our tests and validations, we deployed two ASM disk groups for data and logs respectively. Within the +DATA asm disk group, we provisioned four LUNs in a data volume. Within the +LOGS asm disk group, we provisioned two LUNs in a log volume. In general, multiple LUNs laid out within an Amazon FSx for ONTAP volume provide better performance.

• **iSCSI configuration.** The database VMs in VMC SDDC connect to FSx storage with the iSCSI protocol. It is important to gauge the Oracle database peak I/O throughput requirement by carefully analyzing the Oracle AWR report to determine the application and iSCSI traffic-throughput requirements. NetApp also recommends allocating four iSCSI connections to both FSx iSCSI endpoints with multipath properly configured.

• **Oracle ASM redundancy level to use for each Oracle ASM disk group that you create.** Because FSx ONTAP already mirrors the storage on the FSx cluster level, you should use External Redundancy, which means that the option does not allow Oracle ASM to mirror the contents of the disk group.
• **Database backup.** NetApp provides a SnapCenter software suite for database backup, restore, and cloning with a user-friendly UI interface. NetApp recommends implementing such a management tool to achieve fast (under a minute) SnapShot backup, quick (minutes) database restore, and database clone.

**Solution deployment**

The following sections provide step-by-step procedures for Oracle 19c deployment in VMC on AWS with directly mounted FSx ONTAP storage to DB VM in a single node Restart configuration with Oracle ASM as database volume manager.

**Prerequisites for deployment**
Deployment requires the following prerequisites.

1. A software-defined data center (SDDC) using VMware Cloud on AWS has been created. For detailed instruction on how to create an SDDC in VMC, please refer to VMware documentation *Getting Started With VMware Cloud on AWS*.

2. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account. The AWS account is linked to your VMC SDDC.

3. From the AWS EC2 console, deploying an Amazon FSx for ONTAP storage HA clusters to host the Oracle database volumes. If you are not familiar with the deployment of FSx storage, see the documentation *Creating FSx for ONTAP file systems* for step-by-step instructions.

4. The above step can be performed using the following Terraform automation toolkit, which creates an EC2 instance as a jump host for SDDC in VMC access via SSH and an FSx file system. Review instructions carefully and change the variables to suit your environment before execution.

   ```
   git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
   ```

5. Build VMs in VMware SDDC on AWS for hosting your Oracle environment to be deployed in VMC. In our demonstration, we have built two Linux VMs as Oracle DB servers, one Windows server for the SnapCenter server, and one optional Linux server as an Ansible controller for automated Oracle installation or configuration if desired. Following is a snapshot of the lab environment for the solution validation.

6. Optionally, NetApp also provides several automation toolkits to run Oracle deployment and configuration when applicable. Refer to *DB Automation Toolkits* for more information.

   Ensure that you have allocated at least 50G in Oracle VM root volume in order to have sufficient space to stage Oracle installation files.
DB VM kernel configuration
With the prerequisites provisioned, login to the Oracle VM as an admin user via SSH and sudo to the root user to configure the Linux kernel for Oracle installation. Oracle install files can be staged in an AWS S3 bucket and transferred into the VM.

1. Create a staging directory `/tmp/archive` folder and set the 777 permission.

```
mkdir /tmp/archive
chmod 777 /tmp/archive
```

2. Download and stage the Oracle binary installation files and other required rpm files to the `/tmp/archive` directory.

See the following list of installation files to be stated in `/tmp/archive` on the DB VM.

```
[admin@ora_02 ~]$ ls -l /tmp/archive/
total 10539364
-rw-rw-r--. 1 admin  admin         19112 Oct  4 17:04 compat-libcap1-1.10-7.el7.x86_64.rpm
-rw-rw-r--. 1 admin  admin 3059705302 Oct  4 17:10 LINUX.X64_193000_db_home.zip
-rw-rw-r--. 1 admin  admin    2889184573 Oct  4 17:11 LINUX.X64_193000_grid_home.zip
-rw-rw-r--. 1 admin  admin        589145 Oct  4 17:04 netapp_linux_unified_host_utilities-7-1.x86_64.rpm
-rw-rw-r--. 1 admin  admin   31828 Oct  4 17:04 oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
-rw-rw-r--. 1 admin  admin   2872741741 Oct  4 17:12 p34762026_190000_Linux-x86-64.zip
-rw-rw-r--. 1 admin  admin   1843577895 Oct  4 17:13 p34765931_190000_Linux-x86-64.zip
-rw-rw-r--. 1 admin  admin   124347218 Oct  4 17:13 p6880880_190000_Linux-x86-64.zip
-rw-rw-r--. 1 admin  admin   257136 Oct  4 17:04 policycoreutils-python-utils-2.9-9.el8.noarch.rpm
[admin@ora_02 ~]$ 
```

3. Install Oracle 19c preinstall RPM, which satisfies most kernel configuration requirements.

```
yum install /tmp/archive/oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
```
4. Download and install the missing `compat-libcap1` in Linux 8.

```bash
yum install /tmp/archive/compat-libcap1-1.10-7.el7.x86_64.rpm
```

5. From NetApp, download and install NetApp host utilities.

```bash
yum install /tmp/archive/netapp_linux_unified_host_utilities-7-1.x86_64.rpm
```

```bash
yum install /tmp/archive/policycoreutils-python-utils-2.9-9.el8.noarch.rpm
```

7. Install open JDK version 1.8.

```bash
yum install java-1.8.0-openjdk.x86_64
```

8. Install iSCSI initiator utils.

```bash
yum install iscsi-initiator-utils
```

9. Install `sg3_utils`.

```bash
yum install sg3_utils
```

10. Install `device-mapper-multipath`.

```bash
yum install device-mapper-multipath
```

11. Disable transparent hugepages in the current system.

```bash
echo never > /sys/kernel/mm/transparent_hugepage/enabled

echo never > /sys/kernel/mm/transparent_hugepage/defrag
```

12. Add the following lines in `/etc/rc.local` to disable transparent hugepage after reboot.

```bash
120
```
13. Disable selinux by changing **SELINUX=enforcing** to **SELINUX=disabled**. You must reboot the host to make the change effective.

```bash
vi /etc/sysconfig/selinux
```

14. Add the following lines to **limit.conf** to set the file descriptor limit and stack size.

```bash
vi /etc/security/limits.conf
```

```plaintext
* hard nofile 65536
* soft stack 10240
```

15. Add swap space to DB VM if there is no swap space configured with this instruction: **How do I allocate memory to work as swap space in an Amazon EC2 instance by using a swap file?** The exact amount of space to add depends on the size of RAM up to 16G.

16. Change **node.session.timeo.replacement_timeout** in the **iscsi.conf** configuration file from 120 to 5 seconds.

```bash
vi /etc/iscsi/iscsid.conf
```

17. Enable and start the iSCSI service on the EC2 instance.

```bash
systemctl enable iscsid
```

```bash
systemctl start iscsid
```
18. Retrieve the iSCSI initiator address to be used for database LUN mapping.

```
cat /etc/iscsi/initiatorname.iscsi
```

19. Add the asm groups for asm management user (oracle).

```
groupadd asmadmin

groupadd asmdba

groupadd asmoper
```

20. Modify the oracle user to add asm groups as secondary groups (the oracle user should have been created after Oracle preinstall RPM installation).

```
usermod -a -G asmadmin oracle

usermod -a -G asmdba oracle

usermod -a -G asmoper oracle
```

21. Stop and disable the Linux firewall if it is active.

```
systemctl stop firewalld

systemctl disable firewalld
```

22. Enable password-less sudo for admin user by uncommenting # %wheel ALL=(ALL) NOPASSWD: ALL line in /etc/sudoers file. Change the file permission to make the edit.

```
chmod 640 /etc/sudoers

vi /etc/sudoers
```
23. Reboot the EC2 instance.

Provision and map FSx ONTAP LUNs to the DB VM
Provision three volumes from the command line by login to FSx cluster as fsxadmin user via ssh and FSx cluster management IP. Create LUNs within the volumes to host the Oracle database binary, data, and logs files.

1. Log into the FSx cluster through SSH as the fsxadmin user.

```bash
ssh fsxadmin@10.49.0.74
```

2. Execute the following command to create a volume for the Oracle binary.

```bash
vol create -volume ora_02_biny -aggregate aggr1 -size 50G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

3. Execute the following command to create a volume for Oracle data.

```bash
vol create -volume ora_02_data -aggregate aggr1 -size 100G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

4. Execute the following command to create a volume for Oracle logs.

```bash
vol create -volume ora_02_logs -aggregate aggr1 -size 100G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

5. Validate the volumes created.

```bash
vol show ora*
```

Output from the command:

<table>
<thead>
<tr>
<th>Vserver</th>
<th>Volume</th>
<th>Aggregate</th>
<th>State</th>
<th>Type</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>nim</td>
<td>ora_02_biny</td>
<td>aggr1</td>
<td>online</td>
<td>RW</td>
<td>50GB</td>
</tr>
<tr>
<td>22.98GB</td>
<td>51%</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>nim</td>
<td>ora_02_data</td>
<td>aggr1</td>
<td>online</td>
<td>RW</td>
<td>100GB</td>
</tr>
<tr>
<td>18.53GB</td>
<td>80%</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>nim</td>
<td>ora_02_logs</td>
<td>aggr1</td>

<td>RW</td>
<td>50GB</td>
</tr>
<tr>
<td>7.98GB</td>
<td>83%</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
6. Create a binary LUN within the database binary volume.

```bash
lun create -path /vol/ora_02_biny/ora_02_biny_01 -size 40G -ostype linux
```

7. Create data LUNs within the database data volume.

```bash
lun create -path /vol/ora_02_data/ora_02_data_01 -size 20G -ostype linux
```

```bash
lun create -path /vol/ora_02_data/ora_02_data_02 -size 20G -ostype linux
```

```bash
lun create -path /vol/ora_02_data/ora_02_data_03 -size 20G -ostype linux
```

```bash
lun create -path /vol/ora_02_data/ora_02_data_04 -size 20G -ostype linux
```

8. Create log LUNs within the database logs volume.

```bash
lun create -path /vol/ora_02_logs/ora_02_logs_01 -size 40G -ostype linux
```

```bash
lun create -path /vol/ora_02_logs/ora_02_logs_02 -size 40G -ostype linux
```

9. Create an igroup for the EC2 instance with the initiator retrieved from step 14 of the EC2 kernel configuration above.

```bash
igroup create -igroup ora_02 -protocol iscsi -ostype linux
```

10. Map the LUNs to the igroup created above. Increment the LUN ID sequentially for each additional LUN.

```bash
lun map -igroup ora_02 -lun ora_02_biny_01
lun map -igroup ora_02 -lun ora_02_data_01
lun map -igroup ora_02 -lun ora_02_data_02
lun map -igroup ora_02 -lun ora_02_data_03
lun map -igroup ora_02 -lun ora_02_data_04
lun map -igroup ora_02 -lun ora_02_logs_01
lun map -igroup ora_02 -lun ora_02_logs_02
```
lun map -path /vol/ora_02_biny/ora_02_biny_01 -igroup ora_02
-vserver svm_ora -lun-id 0
lun map -path /vol/ora_02_data/ora_02_data_01 -igroup ora_02
-vserver svm_ora -lun-id 1
lun map -path /vol/ora_02_data/ora_02_data_02 -igroup ora_02
-vserver svm_ora -lun-id 2
lun map -path /vol/ora_02_data/ora_02_data_03 -igroup ora_02
-vserver svm_ora -lun-id 3
lun map -path /vol/ora_02_data/ora_02_data_04 -igroup ora_02
-vserver svm_ora -lun-id 4
lun map -path /vol/ora_02_logs/ora_02_logs_01 -igroup ora_02
-vserver svm_ora -lun-id 5
lun map -path /vol/ora_02_logs/ora_02_logs_02 -igroup ora_02
-vserver svm_ora -lun-id 6

11. Validate the LUN mapping.

mapping show

This is expected to return:

FsxId0c00ce0d373fd1::> mapping show
(lun mapping show)

<table>

</tbody>
</table>
DB VM storage configuration
Now, import and set up the FSx ONTAP storage for the Oracle grid infrastructure and database installation on the VMC database VM.

1. Login to the DB VM via SSH as the admin user using Putty from Windows jump server.

2. Discover the FSx iSCSI endpoints using either SVM iSCSI IP address. Change to your environment-specific portal address.

   ```bash
   sudo iscsiadm iscsiadm --mode discovery --op update --type sendtargets --portal 10.49.0.12
   ```

3. Establish iSCSI sessions by logging into each target.

   ```bash
   sudo iscsiadm --mode node -l all
   ```

   The expected output from the command is:

   ```
   [ec2-user@ip-172-30-15-58 ~]$ sudo iscsiadm --mode node -l all
   Logging in to [iface: default, target: iqn.1992-08.com.netapp:sn.1f795e65c74911edeb785affbf0a2b26e:vs.3, portal: 10.49.0.12,3260]
   ```

4. View and validate a list of active iSCSI sessions.

   ```bash
   sudo iscsiadm --mode session
   ```

   Return the iSCSI sessions.

   ```
   [ec2-user@ip-172-30-15-58 ~]$ sudo iscsiadm --mode session
   tcp: [1] 10.49.0.186:3260,1028 ign.1992-08.com.netapp:sn.545a38bf06ac11ee8503e395ab90d704:vs.3 (non-flash)
   ```
5. Verify that the LUNs were imported into the host.

```bash
sudo sanlun lun show
```

This will return a list of Oracle LUNs from FSx.

```bash
[admin@ora_02 ~]$ sudo sanlun lun show
controller(7mode/E-Series)/
device   host   lun
vserver(cDOT/FlashRay) lun-pathname
filename   adapter protocol size product
--------------------------------------------------------------------
   nim   /vol/ora_02_logs/ora_02_u03_02
   /dev/sdo  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_logs/ora_02_u03_01
   /dev/sdn  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_04
   /dev/sdm  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_03
   /dev/sdl  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_02
   /dev/sdk  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_01
   /dev/sdj  host34  iSCSI  20g    cDOT
   nim   /vol/ora_02_biny/ora_02_u01_01
   /dev/sdi  host34  iSCSI  40g    cDOT
   nim   /vol/ora_02_logs/ora_02_u03_02
   /dev/sdh  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_logs/ora_02_u03_01
   /dev/sdg  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_04
   /dev/sdf  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_03
   /dev/sde  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_02
   /dev/sdd  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_data/ora_02_u02_01
   /dev/sdc  host33  iSCSI  20g    cDOT
   nim   /vol/ora_02_biny/ora_02_u01_01
   /dev/sdb  host33  iSCSI  40g    cDOT
```

6. Configure the `multipath.conf` file with following default and blacklist entries.
sudo vi /etc/multipath.conf

Add following entries:

```bash
defaults {
    find_multipaths yes
    user_friendly_names yes
}

blacklist {
    devnode "^(ram|raw|loop|fd|md|dm-|sr|scd|st)[0-9]*"
    devnode "^hd[a-z]"
    devnode "^cciss.*"
}
```

7. Start the multipath service.

```bash
sudo systemctl start multipathd
```

Now multipath devices appear in the `/dev/mapper` directory.

```
[ec2-user@ip-172-30-15-58 ~]$ ls -l /dev/mapper
 total 0
 lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c574235472455534e68512d -> ../dm-0

 crw------- 1 root root 10, 236 Mar 21 18:19 control
```

8. Log into the FSx ONTAP cluster as the fsxadmin user via SSH to retrieve the serial-hex number for each LUN starting with 6c574xx..., the HEX number starts with 3600a0980, which is the AWS vendor ID.
lun show -fields serial-hex

and return as follow:

<table>
<thead>
<tr>
<th>vserver</th>
<th>path</th>
<th>serial-hex</th>
</tr>
</thead>
<tbody>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_biny/ora_02_biny_01</td>
<td>6c574235472455534e68512d</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_data/ora_02_data_01</td>
<td>6c574235472455534e685141</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_data/ora_02_data_02</td>
<td>6c574235472455534e685142</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_data/ora_02_data_03</td>
<td>6c574235472455534e685143</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_data/ora_02_data_04</td>
<td>6c574235472455534e685144</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_logs/ora_02_logs_01</td>
<td>6c574235472455534e685145</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_02_logs/ora_02_logs_02</td>
<td>6c574235472455534e685146</td>
</tr>
</tbody>
</table>

7 entries were displayed.

9. Update the /dev/multipath.conf file to add a user-friendly name for the multipath device.

sudo vi /etc/multipath.conf

with following entries:
multipaths {
  multipath {
    wwid            3600a09806c574235472455534e68512d
    alias           ora_02_biny_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685141
    alias           ora_02_data_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685142
    alias           ora_02_data_02
  }
  multipath {
    wwid            3600a09806c574235472455534e685143
    alias           ora_02_data_03
  }
  multipath {
    wwid            3600a09806c574235472455534e685144
    alias           ora_02_data_04
  }
  multipath {
    wwid            3600a09806c574235472455534e685145
    alias           ora_02_logs_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685146
    alias           ora_02_logs_02
  }
}

10. Reboot the multipath service to verify that the devices under /devmapper have changed to LUN names versus serial-hex IDs.

    sudo systemctl restart multipathd

    Check /dev/mapper to return as following:
11. Partition the binary LUN with a single primary partition.

```
sudo fdisk /devmapper/ora_02_biny_01
```

12. Format the partitioned binary LUN with an XFS file system.

```
sudo mkfs.xfs /dev/mapper/ora_02_biny_01p1
```

13. Mount the binary LUN to /u01.

```
sudo mkdir /u01

sudo mount -t xfs /dev/mapper/ora_02_biny_01p1 /u01
```

14. Change /u01 mount point ownership to the oracle user and it's associated primary group.

```
sudo chown oracle:oinstall /u01
```

15. Find the UUI of the binary LUN.

```
sudo blkid /dev/mapper/ora_02_biny_01p1
```
16. Add a mount point to `/etc/fstab`.

```
sudo vi /etc/fstab
```

Add the following line.

```
UUID=d89fb1c9-4f89-4de4-b4d9-17754036d11d       /u01    xfs
defaults,nofail 0       2
```

17. As the root user, add the udev rule for Oracle devices.

```
vi /etc/udev/rules.d/99-oracle-asmdevices.rules
```

Include following entries:

```
ENV{DM_NAME}=="ora*", GROUP=="oinstall", OWNER=="oracle",
MODE=="660"
```

18. As the root user, reload the udev rules.

```
udevdadm control --reload-rules
```

19. As the root user, trigger the udev rules.

```
udevdadm trigger
```

20. As the root user, reload multipathd.

```
systemctl restart multipathd
```

21. Reboot the EC2 instance host.

**Oracle grid infrastructure installation**
1. Log into the DB VM as the admin user via SSH and enable password authentication by uncommenting `PasswordAuthentication yes` and then commenting out `PasswordAuthentication no`.

   ```bash
   sudo vi /etc/ssh/sshd_config
   ```

2. Restart the sshd service.

   ```bash
   sudo systemctl restart sshd
   ```

3. Reset the Oracle user password.

   ```bash
   sudo passwd oracle
   ```

4. Log in as the Oracle Restart software owner user (oracle). Create an Oracle directory as follows:

   ```bash
   mkdir -p /u01/app/oracle
   ```

   ```bash
   mkdir -p /u01/app/oraInventory
   ```

5. Change the directory permission setting.

   ```bash
   chmod -R 775 /u01/app
   ```

6. Create a grid home directory and change to it.

   ```bash
   mkdir -p /u01/app/oracle/product/19.0.0/grid
   ```

   ```bash
   cd /u01/app/oracle/product/19.0.0/grid
   ```

7. Unzip the grid installation files.

   ```bash
   unzip -q /tmp/archive/LINUX.X64_193000_grid_home.zip
   ```

8. From grid home, delete the OPatch directory.
9. From grid home, unzip `p6880880_190000_Linux-x86-64.zip`.

   ```bash
   unzip -q /tmp/archive/p6880880_190000_Linux-x86-64.zip
   ```

10. From grid home, revise `cv/admin/cvu_config`, uncomment and replace `CV_ASSUME_DISTID=OEL5` with `CV_ASSUME_DISTID=OL7`.

    ```bash
    vi cv/admin/cvu_config
    ```

11. Prepare a `gridsetup.rsp` file for silent installation and place the rsp file in the `/tmp/archive` directory. The rsp file should cover sections A, B, and G with the following information:

    ```ini
    INVENTORY_LOCATION=/u01/app/oraInventory
    oracle.install.option=HA_CONFIG
    ORACLE_BASE=/u01/app/oracle
    oracle.install.asm.OSDBA=asmdba
    oracle.install.asm.OSOPER=asmoper
    oracle.install.asm.OSASM=asmadmin
    oracle.install.asm.SYSASMPassword="SetPWD"
    oracle.install.asm.diskGroup.name=DATA
    oracle.install.asm.diskGroup.redundancy=EXTERNAL
    oracle.install.asm.diskGroup.AUSize=4
    oracle.install.asm.diskGroup.disks=/dev/mapper/ora_02_data_01,/dev/mapper/ora_02_data_02,/dev/mapper/ora_02_data_03,/dev/mapper/ora_02_data_04
    oracle.install.asm.diskGroup.diskDiscoveryString=/dev/mapper/*
    oracle.install.asm.monitorPassword="SetPWD"
    oracle.install.asm.configureAFD=true
    ```

12. Log into the EC2 instance as the root user and set `ORACLE_HOME` and `ORACLE_BASE`.

    ```bash
    export ORACLE_HOME=/u01/app/oracle/product/19.0.0/
    export ORACLE_BASE=/tmp
    cd /u01/app/oracle/product/19.0.0/grid/bin
    ```
13. Initialize disk devices for use with the Oracle ASM filter driver.

```
./asmcmd afd_label DATA01 /dev/mapper/ora_02_data_01 --init
./asmcmd afd_label DATA02 /dev/mapper/ora_02_data_02 --init
./asmcmd afd_label DATA03 /dev/mapper/ora_02_data_03 --init
./asmcmd afd_label DATA04 /dev/mapper/ora_02_data_04 --init
./asmcmd afd_label LOGS01 /dev/mapper/ora_02_logs_01 --init
./asmcmd afd_label LOGS02 /dev/mapper/ora_02_logs_02 --init
```

14. Install `cvuqdisk-1.0.10-1.rpm`.

```
rpm -ivh /u01/app/oracle/product/19.0.0/grid/cv/rpm/cvuqdisk-1.0.10-1.rpm
```

15. Unset `$ORACLE_BASE`.

```
unset ORACLE_BASE
```

16. Log into the EC2 instance as the Oracle user and extract the patch in the `/tmp/archive` folder.

```
unzip -q /tmp/archive/p34762026_190000_Linux-x86-64.zip -d /tmp/archive
```

17. From grid home `/u01/app/oracle/product/19.0.0/grid` and as the oracle user, launch `gridSetup.sh` for grid infrastructure installation.

```
./gridSetup.sh -applyRU /tmp/archive/34762026/ -silent -responseFile /tmp/archive/gridsetup.rsp
```

18. As root user, execute the following script(s):
19. As root user, reload the multipathd.

    systemctl restart multipathd

20. As the Oracle user, execute the following command to complete the configuration:

    /u01/app/oracle/product/19.0.0/grid/gridSetup.sh -executeConfigTools -responseFile /tmp/archive/gridsetup.rsp -silent

21. As the Oracle user, create the LOGS disk group.

    bin/asmca -silent -sysAsmPassword 'yourPWD' -asmsnmpPassword 'yourPWD' -createDiskGroup -diskGroupName LOGS -disk 'AFD:LOGS*' -redundancy EXTERNAL -au_size 4

22. As the Oracle user, validate grid services after installation configuration.

    bin/crsctl stat res -t
<table>
<thead>
<tr>
<th>Name</th>
<th>Target</th>
<th>State</th>
<th>Server</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>

<td>STABLE</td>
</tr>
</tbody>
</table>

23. Validate ASM filter driver status.
24. Validate HA service status.

```
[oracle@ora_02 bin]$ ./crsctl check has
CRS-4638: Oracle High Availability Services is online
```
1. Log in as the Oracle user and unset $ORACLE_HOME and $ORACLE_SID if it is set.

```bash
unset ORACLE_HOME
unset ORACLE_SID
```

2. Create the Oracle DB home directory and change the directory to it.

```bash
mkdir /u01/app/oracle/product/19.0.0/cdb3
cd /u01/app/oracle/product/19.0.0/cdb3
```

3. Unzip the Oracle DB installation files.

```bash
unzip -q /tmp/archive/LINUX.X64_193000_db_home.zip
```

4. From the DB home, delete the OPatch directory.

```bash
rm -rf OPatch
```

5. From DB home, unzip p6880880_190000_Linux-x86-64.zip.

```bash
unzip -q /tmp/archive/p6880880_190000_Linux-x86-64.zip
```

6. From DB home, revise cv/admin/cvu_config and uncomment and replace CV_ASSUME_DISTID=OEL5 with CV_ASSUME_DISTID=OL7.

```bash
vi cv/admin/cvu_config
```

7. From the /tmp/archive directory, unpack the DB 19.18 RU patch.

```bash
unzip -q /tmp/archive/p34765931_190000_Linux-x86-64.zip -d /tmp/archive
```

8. Prepare the DB silent install rsp file in /tmp/archive/dbinstall.rsp directory with the following values:
9. From cdb3 home /u01/app/oracle/product/19.0.0/cdb3, execute silent software-only DB installation.

./runInstaller -applyRU /tmp/archive/34765931/ -silent -ignorePrereqFailure -responseFile /tmp/archive/dbinstall.rsp

10. As root user, run the root.sh script after software-only installation.

/u01/app/oracle/product/19.0.0/db1/root.sh

11. As oracle user, create the dbca.rsp file with the following entries:
gdbName=cdb3.demo.netapp.com
sid=cdb3
createAsContainerDatabase=true
numberOfPDBs=3
pdbName=cdb3_pdb
useLocalUndoForPDBs=true
pdbAdminPassword="yourPWD"
templateName=General_Purpose.dbc
sysPassword="yourPWD"
systemPassword="yourPWD"
dbsnmpPassword="yourPWD"
datafileDestination=+DATA
recoveryAreaDestination=+LOGS
storageType=ASM
diskGroupName=DATA
characterSet=AL32UTF8
nationalCharacterSet=AL16UTF16
listeners=LISTENER
databaseType=MULTIPURPOSE
automaticMemoryManagement=false
totalMemory=8192

12. As oracle user, launch DB creation with dbca.

    bin/dbca -silent -createDatabase -responseFile /tmp/archive/dbca.rsp

output:

3. Set the Oracle user `.bash_profile`.

```
vi ~/.bash_profile
```

Add following entries:

```
export ORACLE_HOME=/u01/app/oracle/product/19.0.0/db3
export ORACLE_SID=db3
export PATH=$PATH:$ORACLE_HOME/bin
alias asm='export ORACLE_HOME=/u01/app/oracle/product/19.0.0/grid;export ORACLE_SID=+ASM;export PATH=$PATH:$ORACLE_HOME/bin'
alias cdb3='export ORACLE_HOME=/u01/app/oracle/product/19.0.0/cdb3;export ORACLE_SID=cdb3;export PATH=$PATH:$ORACLE_HOME/bin'
alias cdb4='export ORACLE_HOME=/u01/app/oracle/product/19.0.0/cdb4;export ORACLE_SID=cdb4;export PATH=$PATH:$ORACLE_HOME/bin'
```

4. Validate the CDB/PDB created for cdb3.

```
cdb3
[oracle@ora_02 ~]$ sqlplus / as sysdba
```

```

11 rows selected.

6. Login to each cdb as sysdba with sqlplus and set the DB recovery destination size to the +LOGS disk group size for bothcdbs.

```sql
alter system set db_recovery_file_dest_size = 40G scope=both;
```

7. Login to each cdb as sysdba with sqlplus and enable archive log mode with following command sets in sequence.

```sql
sqlplus /as sysdba

shutdown immediate;

startup mount;
```
alter database archivelog;

alter database open;

This completes Oracle 19c version 19.18 Restart deployment on an Amazon FSx for ONTAP storage and a VMC DB VM. If desired, NetApp recommends relocating the Oracle control file and online log files to the +LOGS disk group.

**Oracle backup, restore, and clone with SnapCenter**

**SnapCenter Setup**
SnapCenter relies on a host-side plug-in on database VM to perform application-aware data protection management activities. For detailed information on NetApp SnapCenter plugin for Oracle, refer to this documentation What can you do with the Plug-in for Oracle Database. The following provides high level steps to setup SnapCenter for Oracle database backup, recovery, and clone.

1. Download the latest version of SnapCenter software from NetApp support site: NetApp Support Downloads.

2. As administrator, install latest java JDK from Get Java for desktop applications on SnapCenter server Windows host.

3. Login to SnapCenter UI via HTTPS port 8846 as installation user to configure SnapCenter for Oracle.

4. Update Hypervisor Settings in global settings.

5. Create Oracle database backup policies. Ideally, create a separate archive log backup policy to allow more frequent backup interval to minimize data loss in the event of a failure.

6. Add database server Credential for SnapCenter access to DB VM. The credential should have sudo privilege on a Linux VM or administrator privilege on a Windows VM.
7. Add FSx ONTAP storage cluster to Storage Systems with cluster management IP and authenticated via fsxadmin user ID.

8. Add Oracle database VM in VMC to Hosts with server credential created in previous step 6.

Ensure that the SnapCenter server name can be resolved to the IP address from the DB VM and DB VM name can be resolved to the IP address from the SnapCenter server.

Database backup
SnapCenter leverages FSx ONTAP volume snapshot for much quicker database backup, restore, or clone compared with traditional RMAN based methodology. The snapshots are application-consistent as the database is put in Oracle backup mode before a snapshot.

1. From the Resources tab, any databases on the VM are auto-discovered after the VM is added to SnapCenter. Initially, the database status shows as Not protected.

2. Create a resources group to backup the database in a logical grouping such as by DB VM etc. In this example, we created an ora_02_data group to do a full online database backup for all databases on VM ora_02. Resources group ora_02_log performs the backup of archived logs only on the VM. Creating a resources group also defines a schedule to execute the backup.

3. Resources group backup can also be triggered manually by clicking on Back up Now and executing the backup with the policy defined in the resources group.
4. The backup job can be monitored at the Monitor tab by clicking on the running job.
5. After a successful backup, the database status shows the job status and the most recent backup time.

6. Click on database to review the backup sets for each database.
Database recovery
SnapCenter provides a number of restore and recovery options for Oracle databases from snapshot backup. In this example, we demonstrate a point in time restoration to recover a dropped table by mistake. On VM ora_02, two databases cdb3, cdb4 share the same +DATA and +LOGS disk groups. Database restoration for one database does not impact the availability of the other database.

1. First, create a test table and insert a row into table to validate a point in time recovery.

   ```sql
   [oracle@ora_02 ~]$ sqlplus / as sysdba
   SQL*Plus: Release 19.0.0.0.0 - Production on Fri Oct 6 14:15:21 2023  
   Version 19.18.0.0.0  
   Copyright (c) 1982, 2022, Oracle.  All rights reserved.
   Connected to:  
   Oracle Database 19c Enterprise Edition Release 19.0.0.0.0 -  
   Production  
   Version 19.18.0.0.0  
   SQL> select name, open_mode from v$database;
   NAME      OPEN_MODE  
   --------- --------------------  
   CDB3      READ WRITE  
   SQL> show pdbs
   CON_ID CON_NAME                       OPEN_MODE  RESTRICTED  
   ---------- ------------------------------ ---------- ----------  
   2 PDB$SEED                       READ ONLY  NO  
   3 CDB3_PDB1                      READ WRITE NO  
   4 CDB3_PDB2                      READ WRITE NO  
   5 CDB3_PDB3                      READ WRITE NO
   SQL>
   SQL> alter session set container=cdb3_pdb1;
   Session altered.
   SQL> create table test (id integer, dt timestamp, event varchar(100));
   Table created.
   ```
2. We run a manual snapshot backup from SnapCenter. Then drop the table.
SQL> drop table test;
Table dropped.
SQL> commit;
Commit complete.
SQL> select current_timestamp from dual;
CURRENT_TIMESTAMP
------------------------------------------
06-OCT-23 03.26.30.169456 PM -07:00
SQL> select * from test;
select * from test
   *
ERROR at line 1:
ORA-00942: table or view does not exist

3. From backup set created from last step, take a note of the SCN number of log backup. Click on Restore to launch restore-recover workflow.

4. Choose restore scope.
5. Choose recovery scope up to the log SCN from last full database backup.
6. Specify any optional pre-scripts to run.
7. Specify any optional after-script to run.
8. Send a job report if desired.
9. Review the summary and click on Finish to launch the restoration and recovery.
10. From Oracle Restart grid control, we observe that while cdb3 is under restoration and recovery cdb4 is online and available.
11. **From** Monitor **tab**, open the job to review the details.
12. From DB VM ora_02, validate the dropped table is recovered after a successful recovery.

```
[oracle@ora_02 bin]$ sqlplus / as sysdba

SQL>
Database clone
In this example, the same backup sets is used to clone a database on the same VM in a different ORACLE_HOME. The procedures are equally applicable to clone a database from the backup to separate VM in VMC if needed.

1. Open the database cdb3 backup list. From a data backup of choice, click on Clone button to launch database clone workflow.

2. Name the clone database SID.
3. Select a VM in VMC as the target database host. Identical Oracle version should have been installed and configured on the host.
4. Select the proper ORACLE_HOME, user and group on the target host. Keep credential at default.
5. Change clone database parameters to meet configuration or resources requirements for the clone database.
6. Choose recovery scope. Until Cancel recovers the clone up to last available log file in the backup set.
7. Review the summary and launch the clone job.
8. Monitor the clone job execution from Monitor tab.
9. Cloned database is immediately registered in SnapCenter.
From DB VM ora_02, the cloned database is also registered in Oracle Restart grid control and the dropped test table is recovered in the cloned database cdb3tst as shown below.

```bash
[oracle@ora_02 ~]$ /u01/app/oracle/product/19.0.0/grid/bin/crshct
stat res -t

```

---

TR-4981: Oracle Active Data Guard Cost Reduction with Amazon FSx ONTAP

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Oracle Data Guard ensures high availability, data protection, and disaster recovery for enterprise data in a primary database and standby database replication configuration. Oracle Active Data Guard empowers users to access standby databases while data replication is active from the primary database to standby databases. Data Guard is a feature of Oracle Database Enterprise Edition. It does not require separate licensing. On the other hand, Active Data Guard is an Oracle Database Enterprise Edition Option therefore requires separate licensing. Multiple standby databases can receive data replication from a primary database in the Active Data Guard setup. However, each additional standby database requires an Active Data Guard license and extra storage as the size of primary database. The operational costs add up quickly.

If you are keen on cutting back cost of your Oracle database operation and are planning to set up an Active Data Guard in AWS, you should consider an alternative. Instead of Active Data Guard, use Data Guard to replicate from primary database to a single physical standby database on Amazon FSx ONTAP storage. Subsequently, multiple copies of this standby database can be cloned and opened for read/write access to serve many other use cases such as reporting, development, test etc. The net results effectively deliver functionalities of Active Data Guard while eliminating Active Data Guard license and extra storage cost for each additional standby database. In this documentation, we demonstrate how to setup an Oracle Data Guard with your existing primary database in AWS and place physical standby database on Amazon FSx ONTAP storage. The standby database is backed up via snapshot and cloned for read/write access for use cases as desired.

This solution addresses the following use cases:

• Oracle Data Guard between a primary database on any storage in AWS to standby database on Amazon FSx ONTAP storage.

• Clone the standby database while closed for data replication to serve use cases such as reporting, dev, test, etc.

Audience

This solution is intended for the following people:

• A DBA who set up Oracle Active Data Guard in AWS for high availability, data protection, and disaster recovery.

• A database solution architect interested in Oracle Active Data Guard configuration in the AWS cloud.

• A storage administrator who manages AWS FSx ONTAP storage that supports Oracle Data Guard.

• An application owner who like to stand up Oracle Data Guard in AWS FSx/EC2 environment.
**Solution test and validation environment**

The testing and validation of this solution was performed in an AWS FSx ONTAP and EC2 lab environment that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].

Key factors for deployment consideration

• **How Oracle Standby Database FlexClone Works.** AWS FSx ONTAP FlexClone provides shared copies of the same standby database volumes that are writable. The copies of the volumes are actually pointers that link back to original data blocks until a new write initiates on the clone. ONTAP then allocates new storage blocks for the new writes. Any read I/Os are serviced by original data blocks under active replication. Thus, the clone are very storage efficient that can be used for many other use cases with minimal and incremental new storage allocation for new write I/Os. This provides tremendous storage cost saving by substantially reducing Active Data Guard storage footprint. NetApp recommends to minimize FlexClone activities in the event of database switching over from primary storage to standby FSx storage in order to maintain Oracle performance at high level.

• **Oracle Software Requirements.** In general, a physical standby database must have the same Database Home version as the primary database including Patch Set Exceptions (PSEs), Critical Patch Updates (CPUs), and Patch Set Updates (PSUs), unless an Oracle Data Guard Standby-First Patch Apply process is in progress (as described in My Oracle Support note 1265700.1 at support.oracle.com)

• **Standby Database Directory Structure Considerations.** If possible, the data files, log files, and control files on the primary and standby systems should have the same names and path names and use Optimal Flexible Architecture (OFA) naming conventions. The archival directories on the standby database should also be identical between sites, including size and structure. This strategy allows other operations such as backups, switchovers, and failovers to execute the same set of steps, reducing the maintenance complexity.

• **Force Logging Mode.** To protect against unlogged direct writes in the primary database that cannot be propagated to the standby database, turn on FORCE LOGGING at the primary database before performing data file backups for standby creation.

• **Database Storage Management.** For operational simplicity, Oracle recommends that when you set up Oracle Automatic Storage Management (Oracle ASM) and Oracle Managed Files (OMF) in an Oracle Data Guard configuration that you set it up symmetrically on the primary and standby database(s).

• **EC2 compute instances.** In these tests and validations, we used an AWS EC2 t2.xlarge instance as the Oracle database compute instance. NetApp recommends using a M5 type EC2 instance as the compute instance for Oracle in production deployment because it is optimized for database workload. You need to size the EC2 instance appropriately for the number of vCPUs and the amount of RAM based on actual workload requirements.

• **FSx storage HA clusters single- or multi-zone deployment.** In these tests and validations, we deployed an FSx HA cluster in a single AWS availability zone. For production deployment, NetApp recommends deploying an FSx HA pair in two different availability zones. An FSx cluster is always provisioned in a HA pair that is sync mirrored in a pair of active-passive file systems to provide storage-level redundancy. Multi-zone deployment further enhances high availability in the event of failure in a single AWS zone.

• **FSx storage cluster sizing.** An Amazon FSx for ONTAP storage file system provides up to 160,000 raw
SSD IOPS, up to 4GBps throughput, and a maximum of 192TiB capacity. However, you can size the cluster in terms of provisioned IOPS, throughput, and the storage limit (minimum 1,024 GiB) based on your actually requirements at the time of deployment. The capacity can be adjusted dynamically on the fly without affecting application availability.

Solution deployment

It is assumed that you already have your primary Oracle database deployed in AWS EC2 environment within a VPC as the starting point for setting up Data Guard. The primary database is deployed using Oracle ASM for storage management. Two ASM disk groups - +DATA and +LOGS are created for Oracle data files, log files, and control file etc. For details on Oracle deployment in AWS with ASM, please refer to following technical reports for help.

- Oracle Database Deployment on EC2 and FSx Best Practices
- Oracle Database Deployment and Protection in AWS FSx/EC2 with iSCSI/ASM
- Oracle 19c in Standalone Restart on AWS FSx/EC2 with NFS/ASM

Your primary Oracle database can be running either on an FSx ONTAP or any other storage of choices within the AWS EC2 ecosystem. The following section provides step-by-step deployment procedures for setting up Oracle Data Guard between a primary EC2 DB instance with ASM storage to a standby EC2 DB instance with ASM storage.

Prerequisites for deployment

Deployment requires the following prerequisites.

1. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account.

2. From the AWS EC2 console, you need to deploy minimum three EC2 Linux instances, one as the primary Oracle DB instance, one as standby Oracle DB instance, and an clone target DB instance for reporting, dev, and test etc. See the architecture diagram in the previous section for more details about the environment setup. Also review the AWS User Guide for Linux instances for more information.

3. From the AWS EC2 console, deploy Amazon FSx for ONTAP storage HA clusters to host Oracle volumes that stores the Oracle standby database. If you are not familiar with the deployment of FSx storage, see the documentation Creating FSx for ONTAP file systems for step-by-step instructions.

4. Steps 2 and 3 can be performed using the following Terraform automation toolkit, which creates an EC2 instance named `ora_01` and an FSx file system named `fsx_01`. Review the instruction carefully and change the variables to suit your environment before execution. The template can be easily revised for your own deployment requirements.

```
    git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
```

Ensure that you have allocated at least 50G in EC2 instance root volume in order to have sufficient space to stage Oracle installation files.
Prepare the primary database for Data Guard
In this demonstration, we have setup a primary Oracle database called db1 on the primary EC2 DB instance with two ASM disk groups in standalone Restart configuration with data files in ASM disk group +DATA and flash recovery area in ASM disk group +LOGS. Following illustrates the detailed procedures for setting up primary database for Data Guard. All steps should be executed as database owner - oracle user.

1. Primary database db1 configuration on primary EC2 DB instance ip-172-30-15-45. The ASM disk groups can be on any type of storage within EC2 ecosystem.

```
[oracle@ip-172-30-15-45 ~]$ cat /etc/oratab

# This file is used by ORACLE utilities. It is created by root.sh
# and updated by either Database Configuration Assistant while creating
# a database or ASM Configuration Assistant while creating ASM instance.

# A colon, ':', is used as the field terminator. A new line terminates
# the entry. Lines beginning with a pound sign, '#', are comments.
#
# Entries are of the form:
#   $ORACLE_SID:$ORACLE_HOME:<N|Y>:
#
# The first and second fields are the system identifier and home
directory of the database respectively. The third field indicates
# to the dbstart utility that the database should, "Y", or should not,
# "N", be brought up at system boot time.
#
# Multiple entries with the same $ORACLE_SID are not allowed.
#
# +ASM:/u01/app/oracle/product/19.0.0/grid:N
db1:/u01/app/oracle/product/19.0.0/db1:N

[oracle@ip-172-30-15-45 ~]$ /u01/app/oracle/product/19.0.0/grid/bin/crsctl stat res -t

--------------------------------------------------------------------
---
Name           Target  State        Server                   State
details
--------------------------------------------------------------------

2. From sqlplus, enable forced logging on primary.

```sql
alter database force logging;
```

3. From sqlplus, enable flashback on primary. Flashback allows easy reinstate primary database as a standby after a failover.

```sql
alter database flashback on;
```
4. Configure redo transport authentication using Oracle password file - create a pwd file on the primary using orapwd utility if not set and copy over to standby database $ORACLE_HOME/dbs directory.

5. Create standby redo logs on the primary DB with same size as current online log file. Log groups are one more than online log file groups. The primary database can then quickly transition to the standby role and begin receiving redo data, if necessary.

```sql
alter database add standby logfile thread 1 size 200M;
```

Validate after standby logs addition:

```sql
SQL> select group#, type, member from v$logfile;
```

```
GROUP#  TYPE                  MEMBER
-------- ------- ---------------
  3 ONLINE +DATA/DB1/ONLINELOG/group_3.264.1145821513
  2 ONLINE +DATA/DB1/ONLINELOG/group_2.263.1145821513
  1 ONLINE +DATA/DB1/ONLINELOG/group_1.262.1145821513
  4 STANDBY +DATA/DB1/ONLINELOG/group_4.286.1146082751
  4 STANDBY +LOGS/DB1/ONLINELOG/group_4.258.1146082753
  5 STANDBY +DATA/DB1/ONLINELOG/group_5.287.1146082819
  5 STANDBY +LOGS/DB1/ONLINELOG/group_5.260.1146082821
  6 STANDBY +DATA/DB1/ONLINELOG/group_6.288.1146082825
  6 STANDBY +LOGS/DB1/ONLINELOG/group_6.261.1146082827
  7 STANDBY +DATA/DB1/ONLINELOG/group_7.289.1146082835
  7 STANDBY +LOGS/DB1/ONLINELOG/group_7.262.1146082835
```

11 rows selected.

6. From sqlplus, create a pfile from spfile for editing.

```sql
create pfile='/home/oracle/initdb1.ora' from spfile;
```

7. Revise the pfile and add following parameters.
8. From sqlplus, create spfile in ASM +DATA directory from revised pfile in /home/oracle directory.

create spfile='+DATA' from pfile='/home/oracle/initdb1.ora';

9. Locate the newly created spfile under +DATA disk group(using asmcmd utility if necessary). Use srvctl to modify grid to start database from new spfile as shown below.
10. Modify tnsnames.ora to add db_unique_name for name resolution.
# tnsnames.ora Network Configuration File:
/u01/app/oracle/product/19.0.0/db1/network/admin/tnsnames.ora
# Generated by Oracle configuration tools.

db1_NY =
  (DESCRIPTION =
    (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-45.ec2.internal)(PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SID = db1)
    )
  )

db1_LA =
  (DESCRIPTION =
    (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-67.ec2.internal)(PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SID = db1)
    )
  )

LISTENER_DB1 =
  (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-45.ec2.internal)(PORT = 1521))

11. Add data guard service name db1_NY_DGMGRL.demo.netapp for primary database to listener.ora file.
#Backup file is /u01/app/oracle/crsdata/ip-172-30-15-45/output/listener.ora.bak.ip-172-30-15-45.oracle line added by Agent

# listener.ora Network Configuration File:
/u01/app/oracle/product/19.0.0/grid/network/admin/listener.ora
# Generated by Oracle configuration tools.

LISTENER =
    (DESCRIPTION_LIST =
    (DESCRIPTION =
        (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-45.ec2.internal)(PORT = 1521))
        (ADDRESS = (PROTOCOL = IPC)(KEY = EXTPROC1521))
    )
)

SID_LIST_LISTENER =
    (SID_LIST =
        (SID_DESC =
            (GLOBAL_DBNAME = db1_NY_DGMGRL.demo.netapp.com)
            (ORACLE_HOME = /u01/app/oracle/product/19.0.0/db1)
            (SID_NAME = db1)
        )
    )

ENABLE_GLOBAL_DYNAMIC_ENDPOINT_LISTENER=ON  # line added by Agent
VALID_NODE_CHECKING_REGISTRATION_LISTENER=ON  # line added by Agent

1. Shutdown and restart database with srvctl and validate that data guard parameters are now active.

```bash
srvctl stop database -d db1

csrctl start database -d db1
```

This completes primary database setup for Data Guard.

Prepare standby database and activate Data Guard
Oracle Data Guard requires OS kernel configuration and Oracle software stacks including patch sets on standby EC2 DB instance to match with primary EC2 DB instance. For easy management and simplicity, the standby EC2 DB instance database storage configuration ideally should match with the primary EC2 DB instance as well, such as the name, number and size of ASM disk groups. Following are detail procedures for setting up the standby EC2 DB instance for Data Guard. All commands should be executed as oracle owner user id.

1. First, review the configuration of the primary database on primary EC2 instance. In this demonstration, we have setup a primary Oracle database called db1 on the primary EC2 DB instance with two ASM disk groups +DATA and +LOGS in standalone Restart configuration. The primary ASM disk groups may be on any type of storage within EC2 ecosystem.

2. Follow procedures in documentation TR-4965: Oracle Database Deployment and Protection in AWS FSx/EC2 with iSCSI/ASM to install and configure grid and Oracle on standby EC2 DB instance to match with primary database. The database storage should be provisioned and allocated to standby EC2 DB instance from FSx ONTAP with same storage capacity as primary EC2 DB instance. Stop at step 10 in Oracle database installation section. The standby database will be instantiated from primary database using dbca database duplication function.

3. Once Oracle software is installed and configured, from standby $ORACLE_HOME dbs directory, copy oracle password from primary database.

   scp oracle@172.30.15.45:/u01/app/oracle/product/19.0.0/db1/dbs/orapwdb1 .

4. Create tnsnames.ora file with following entries.
# tnsnames.ora Network Configuration File:
/u01/app/oracle/product/19.0.0/db1/network/admin/tnsnames.ora
# Generated by Oracle configuration tools.

db1_NY =
    (DESCRIPTION =
       (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-45.ec2.internal)(PORT = 1521))
       (CONNECT_DATA =
           (SERVER = DEDICATED)
           (SID = db1)
       )
    )

db1_LA =
    (DESCRIPTION =
       (ADDRESS = (PROTOCOL = TCP)(HOST = ip-172-30-15-67.ec2.internal)(PORT = 1521))
       (CONNECT_DATA =
           (SERVER = DEDICATED)
           (SID = db1)
       )
    )

5. Add DB data guard service name to listener.ora file.
6. Set oracle home and path.

```bash
export ORACLE_HOME=/u01/app/oracle/product/19.0.0/db1
```

```bash
export PATH=$PATH:$ORACLE_HOME/bin
```

7. Use dbca to instantiate standby database from primary database db1.
Prepate for db operation

9. Restart standby database in mount stage and execute following command to activate standby database managed recovery.
alter database recover managed standby database disconnect from session;

SQL> shutdown immediate;
Database closed.
Database dismounted.
ORACLE instance shut down.
SQL> startup mount;
ORACLE instance started.

Total System Global Area 8053062944 bytes
Fixed Size 9182496 bytes
Variable Size 1291845632 bytes
Database Buffers 6744440832 bytes
Redo Buffers 7593984 bytes
Database mounted.
SQL> alter database recover managed standby database disconnect from session;

Database altered.

10. Validate the standby database recovery status. Notice the recovery logmerger in APPLYING_LOG action.
This completes the Data Guard protection setup for db1 from primary to standby with managed standby recovery enabled.

Setup Data Guard Broker
Oracle Data Guard broker is a distributed management framework that automates and centralizes the creation, maintenance, and monitoring of Oracle Data Guard configurations. Following section demonstrate how to setup Data Guard Broker to manage Data Guard environment.

1. Start data guard broker on both primary and standby databases with following command via sqlplus.

```sql
alter system set dg_broker_start=true scope=both;
```

2. From primary database, connect to Data Guard Borker as SYSDBA.

```
[oracle@ip-172-30-15-45 db1]$ dgmgrl sys@db1_NY
DGMGRL for Linux: Release 19.0.0.0.0 - Production on Wed Aug 30 19:34:14 2023
Version 19.18.0.0.0

Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights reserved.

Welcome to DGMGRL, type "help" for information.
Password:
Connected to "db1_NY"
Connected as SYSDBA.
```

3. Create and enable Data Guard Broker configuration.
DGMGRL> create configuration dg_config as primary database is db1_NY
count identifier is db1_NY;
Configuration "dg_config" created with primary database "db1_ny"
DGMGRL> add database db1_LA as connect identifier is db1_LA;
Database "db1_la" added
DGMGRL> enable configuration;
Enabled.
DGMGRL> show configuration;

Configuration - dg_config

  Protection Mode: MaxPerformance
  Members:
    db1_ny - Primary database
      db1_la - Physical standby database

Fast-Start Failover: Disabled

Configuration Status:
SUCCESS   (status updated 28 seconds ago)

4. Validate database status within Data Guard Broker management framework.
DGMGRL> show database db1Ny;

Database - db1Ny

Role: PRIMARY
Intended State: TRANSPORT-ON
Instance(s):
  db1

Database Status:
SUCCESS

DGMGRL> show database db1La;

Database - db1La

Role: PHYSICAL STANDBY
Intended State: APPLY-ON
Transport Lag: 0 seconds (computed 1 second ago)
Apply Lag: 0 seconds (computed 1 second ago)
Average Apply Rate: 2.00 KByte/s
Real Time Query: OFF
Instance(s):
  db1

Database Status:
SUCCESS

DGMGRL>

In the event of a failure, Data Guard Broker can be used to failover primary database to standby instantaneously.

Clone standby database for other use cases
The key benefit of staging standby database on AWS FSx ONTAP in Data Guard is that it can be FlexCloned to serve many other use cases with minimal additional storage investment. In the following section, we demonstrate how to snapshot and clone the mounted and under recovery standby database volumes on FSx ONTAP for other purposes, such as DEV, TEST, REPORT, etc., using the NetApp SnapCenter tool.

Following are high level procedures to clone a READ/WRITE database from the managed physical standby database in Data Guard using SnapCenter. For detail instructions on how to setup and configure SnapCenter, please refer to Hybrid Cloud Database Solutions with SnapCenter relevant Oracle sections.

1. We begin with creating a test table and inserting a row into the test table on primary database. We will then validate if the transaction traverse down to standby and finally the clone.

```
[oracle@ip-172-30-15-45 db1]$ sqlplus / as sysdba

SQL*Plus: Release 19.0.0.0.0 - Production on Thu Aug 31 16:35:53 2023

</tr>
</tbody>
</table>

2. Add FSx storage cluster to Storage Systems in SnapCenter with FSx cluster management IP and fsxadmin credential.

3. Add AWS ec2-user to Credential in Settings.
4. Add standby EC2 DB instance and clone EC2 DB instance to hosts.

The clone EC2 DB instance should have similar Oracle software stacks installed and configured. In our test case, the grid infrastructure and Oracle 19C installed and configured but no database created.

5. Create a backup policy that is tailored for offline/mount full database backup.

6. Apply backup policy to protect standby database in Resources tab.

7. Click on database name to open the database backups page. Select a backup to be used for
database clone and click on Clone button to launch clone workflow.

8. Select Complete Database Clone and name the clone instance SID.

9. Select the clone host, which hosts the cloned database from standby DB. Accept the default for data files, control files, and redo logs. Two ASM disk groups will be created on the clone host that are corresponding to the disk groups on standby database.
10. No database credentials are needed for OS based authentication. Match Oracle home setting with what is configured on the clone EC2 database instance.
11. Change clone database parameters if needed and specify scripts to run before cloen if any.
12. Enter SQL to run after clone. In the demo, we executed commands to turn off database archive mode for a dev/test/report database.
13. Configure email notification if desired.
14. Review the summary, click Finish to start the clone.
15. Monitor clone job in **Monitor** tab. We observed that it took around 8 minutes to clone a database about 300GB in database volume size.
16. Validate the clone database from SnapCenter, which is immediately registered in Resources tab right after clone operation.

17. Query the clone database from clone EC2 instance. We validated that test transaction that occurred in primary database had traversed down to clone database.

TR-4973: Quick Recovery and Clone of Oracle VLDB with Incremental Merge on AWS FSx ONTAP

Allen Cao, Niyaz Mohamed, NetApp

Purpose

Recovering a Very Large Database (VLDB) in Oracle using the Oracle Recovery Manager (RMAN) backup tool can be a highly challenging task. The database restoration process from backup media in the event of a failure can be time-consuming, delaying the database recovery and potentially impacting your Service Level Agreement (SLA) significantly. However, starting from version 10g, Oracle introduced a RMAN feature that
allows users to create staged image copies of the Oracle database data files on additional disk storage located on the DB server host. These image copies can be incrementally updated using RMAN on a daily basis. In the case of a failure, the Database Administrator (DBA) can swiftly switch the Oracle database from the failed media to the image copy, eliminating the need for a complete database media restore. The result is a greatly improved SLA, albeit at the cost of doubling the required database storage.

If you are keen on SLA for your VLDB and contemplating moving the Oracle database to a public cloud such as AWS, you could set up a similar database protection structure using resources such as AWS FSx ONTAP for staging your standby database image copy. In this documentation, we demonstrate how to provision and export an NFS file system from AWS FSx ONTAP to be mounted on an Oracle database server for staging a standby database copy for quick recovery in the event of a primary storage failure.

Better yet, we also show how you could leverage NetApp FlexClone to create a copy of the same staging NFS file system for other use cases such as standing up a dev/test Oracle environment with this same standby database image copy without additional storage investment.

This solution addresses the following use cases:

- An Oracle VLDB image copy incremental merge via RMAN on NFS mount point off AWS FSx ONTAP storage.
- Quick recovery of an Oracle VLDB by switching to database image copy on FSx ONTAP storage in the event of failure.
- Clone FSx ONTAP NFS file system volume storing an Oracle VLDB image copy to be used for standing up another database instance for other use cases.

**Audience**

This solution is intended for the following people:

- A DBA who set up Oracle VLDB image copy incremental merge via RMAN in AWS for faster database recovery.
- A database solution architect who tests Oracle workloads in the AWS public cloud.
- A storage administrator who manages Oracle databases deployed to AWS FSx ONTAP storage.
- An application owner who would like to stand up Oracle databases in AWS FSx/EC2 environment.

**Solution test and validation environment**

The testing and validation of this solution was performed in an AWS FSx ONTAP and EC2 environment that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].

**Key factors for deployment consideration**

- **Oracle VLDB storage layout for RMAN incremental merge.** In our tests and validations, the NFS volume for Oracle incremental backup and merge is allocated from a single FSx file system, which has 4GBps throughput, 160,000 raw SSD IOPS, and 192TiB capacity limit. For deployment over the thresholds,
multiple FSx file systems can be concatenated in parallel with multiple NFS mount points to provide higher capacity.

- **Oracle recoverability using RMAN incremental merge.** The RMAN incremental backup and merge is generally executed at user defined frequency based on your RTO and RPO objectives. If there are total loss of primary data storage and/or archived logs, the data loss can occur. The Oracle database can be recovered up to last incremental backup that is available from FSx database backup image copy. To minimize the data loss, Oracle flash recovery area can be setup on FSx NFS mount point and archived logs are backed up to FSx NFS mount along with database image copy.

- **Running Oracle VLDB off FSx NFS file system.** Unlike other bulk storage for database backup, AWS FSx ONTAP is a cloud enabled production grade storage that delivers high level of performance and storage efficiency. Once Oracle VLDB switches over from primary storage to image copy on FSx ONTAP NFS file system, database performance can be maintained at high level while the primary storage failure is addressed. You can take comfort to know that user application experience does not suffer as the result of primary storage failure.

- **FlexClone Oracle VLDB image copy of NFS volume for other use cases.** AWS FSx ONTAP FlexClone provides shared copies of the same NFS data volume that are writable. Thus, they can be used for many other use cases while still maintaining the integrity of staging Oracle VLDB image copy even when Oracle database is switched over. This provides tremendous storage cost saving by substantially reducing VLDB storage footprint. NetApp recommends to minimize FlexClone activities in the event of database switching over from primary storage to database image copy in order to maintain Oracle performance at high level.

- **EC2 compute instances.** In these tests and validations, we used an AWS EC2 t2.xlarge instance as the Oracle database compute instance. NetApp recommends using an M5 type EC2 instance as the compute instance for Oracle in production deployment because it is optimized for database workload. You need to size the EC2 instance appropriately for the number of vCPUs and the amount of RAM based on actual workload requirements.

- **FSx storage HA clusters single- or multi-zone deployment.** In these tests and validations, we deployed an FSx HA cluster in a single AWS availability zone. For production deployment, NetApp recommends deploying an FSx HA pair in two different availability zones. An FSx HA cluster is alway provisioned in a HA pair that is sync mirrored in a pair of active-passive file systems to provide storage-level redundancy. Multi-zone deployment further enhances high availability in the event of failure in a single AWS zone.

- **FSx storage cluster sizing.** An Amazon FSx for ONTAP storage file system provides up to 160,000 raw SSD IOPS, up to 4GBps throughput, and a maximum of 192TiB capacity. However, you can size the cluster in terms of provisioned IOPS, throughput, and the storage limit (minimum 1,024 GiB) based on your actually requirements at the time of deployment. The capacity can be adjusted dynamically on the fly without affecting application availability.

- **dNFS configuration.** dNFS is built into Oracle kernel and is known to dramatically increase Oracle database performance when Oracle is deployed to NFS storage. dNFS is packaged into Oracle binary but is not turned on by default. It should be turned on for any Oracle database deployment on NFS. For multiple FSx file systems deployment for a VLDB, dNFS multi-path to different FSx NFS file systems should be properly configured.

**Solution deployment**

It is assumed that you already have your Oracle VLDB deployed in AWS EC2 environment within a VPC. If you need help on Oracle deployment in AWS, please refer to following technical reports for help.

- Oracle Database Deployment on EC2 and FSx Best Practices
- Oracle Database Deployment and Protection in AWS FSx/EC2 with iSCSI/ASM
- Oracle 19c in Standalone Restart on AWS FSx/EC2 with NFS/ASM
Your Oracle VLDB can be running either on a FSx ONTAP or any other storage of choices within the AWS EC2 ecosystem. The following section provides step-by-step deployment procedures for setting up RMAN incremental merge to an image copy of an Oracle VLDB that is staging in an NFS mount off AWS FSx ONTAP storage.

**Prerequisites for deployment**

Deployment requires the following prerequisites.

1. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account.

2. From the AWS EC2 console, you must deploy two EC2 Linux instances, one as the primary Oracle DB server and an optional alternative clone target DB server. See the architecture diagram in the previous section for more details about the environment setup. Also review the User Guide for Linux instances for more information.

3. From the AWS EC2 console, deploy Amazon FSx for ONTAP storage HA clusters to host the NFS volumes that store the Oracle database standby image copy. If you are not familiar with the deployment of FSx storage, see the documentation Creating FSx for ONTAP file systems for step-by-step instructions.

4. Steps 2 and 3 can be performed using the following Terraform automation toolkit, which creates an EC2 instance named ora_01 and an FSx file system named fsx_01. Review the instruction carefully and change the variables to suit your environment before execution. The template can be easily revised for your own deployment requirements.

   ```
   git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
   ```

   Ensure that you have allocated at least 50G in EC2 instance root volume in order to have sufficient space to stage Oracle installation files.

**Provision and export NFS volume to be mounted to EC2 DB instance host**
In this demonstration, we will show how to provision an NFS volume from the command line by login to an FSx cluster via ssh as fsxadmin user through FSx cluster management IP. Alternatively, the volume can be allocated using the AWS FSx console as well. Repeat the procedures on other FSx file systems if more than one FSx file system are set up to accommodate the size of the database.

1. First, provision NFS volume via CLI by logging to the FSx cluster through SSH as the fsxadmin user. Change to your FSx cluster management IP address, which can be retrieved from AWS FSx ONTAP UI console.

   ```
   ssh fsxadmin@172.30.15.53
   ```

2. Create NFS volume the same size as your primary storage for storing primary Oracle VLDB database data files image copy.

   ```
   vol create -volume ora_01_copy -aggregate aggr1 -size 100G -state online -type RW -junction-path /ora_01_copy -snapshot-policy none -tiering-policy snapshot-only
   ```

3. Alternatively, the volume can be provisioned from AWS FSx console UI with options: storage efficiency Enabled, security style Unix, Snapshot policy None, and Storage tiering Snapshot Only as show below.
4. Create a customized snapshot policy for oracle database with a daily schedule and 30 days retention. You should adjust the policy to fit your specific needs in terms of snapshot frequency and retention window.

```
snapshot policy create -policy oracle -enabled true -schedule1 daily -count1 30
```

Apply policy to provisioned NFS volume for RMAN incremental backup and merge.

```
vol modify -volume ora_01_copy -snapshot-policy oracle
```

5. Login to EC2 instance as ec2-user and create a directory /nfsfsxn. Create additional mount point directories for additional FSx file systems.

```
sudo mkdir /nfsfsxn
```

6. Mount the FSx ONTAP NFS volume to EC2 DB instance host. Change to your FSx virtual server NFS lif address. The NFS lif address can be retrieved from FSx ONTAP UI console.
sudo mount 172.30.15.19:/ora_01_copy /nfsfsxn -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,noin tr

7. Change mount point ownership to oracle:oinstall, change to your oracle user name and primary group as necessary.

sudo chown oracle:oinstall /nfsfsxn

Setup Oracle RMAN incremental merge to image copy on FSx
RMAN incremental merge update the staging database data files image copy continuously at every incremental backup/merge interval. The image copy of database backup will be as up to date as the frequency you execute the incremental backup/merge. So, take into consideration of database performance, your RTO and RPO objectives when deciding the frequency of RMAN incremental backup and merge.

1. Login to primary DB server EC2 instance as oracle user

2. Create an oracopy directory under mount point /nfsfsxn to store oracle data files image copies and archlog directory for Oracle flash recovery area.

   ```bash
   mkdir /nfsfsxn/oracopy
   mkdir /nfsfsxn/archlog
   ```

3. Login to Oracle database via sqlplus, enable block change tracking for faster incremental backup and change Oracle flash recovery area to FSxN mount if it is currently on primary storage. This allows the RMAN default control file/spfile autobackup and archived logs to be backed up to FSxN NFS mount for recovery.

   ```sql
   sqlplus / as sysdba
   ```

   From sqlplus prompt, execute following command.

   ```sql
   alter database enable block change tracking using file '/nfsfsxn/oracopy/bct_db1.ctf'
   ```

   ```sql
   alter system set db_recovery_file_dest='/nfsfsxn/archlog/' scope=both;
   ```

4. Create a RMAN backup and incremental merge script. The script allocates multiple channels for parallel RMAN backup and merge. First execution would generate the initial full baseline image copy. In a complete run, it first purges obsolete backups that are outside of retention window to keep staging area clean. It then switches current log file before merge and backup. The incremental backup follows the merge so that the database image copy is trailing current database state by one backup/merge cycle. The merge and backup order can be reversed for quicker recovery at user’s preference. The RMAN script can be integrated into a simple shell script to be executed from crontab on the primary DB server. Ensure control file autobackup is on in RMAN setting.
vi /home/oracle/rman_bkup_merge.cmd

Add following lines:

RUN
{
  allocate channel c1 device type disk format '/nfsfsxn/oracopy/%U';
  allocate channel c2 device type disk format '/nfsfsxn/oracopy/%U';
  allocate channel c3 device type disk format '/nfsfsxn/oracopy/%U';
  allocate channel c4 device type disk format '/nfsfsxn/oracopy/%U';
  delete obsolete;
  sql 'alter system archive log current';
  recover copy of database with tag 'OraCopyBKUPonFSxN_level_0';
  backup incremental level 1 copies=1 for recover of copy with tag 'OraCopyBKUPonFSxN_level_0' database;
}

5. At EC2 DB server, login to RMAN locally as oracle user with or without RMAN catalog. In this demonstration, we are not connecting to a RMAN catalog.

```bash
rman target / nocatalog;
```

output:

```
[oracle@ip-172-30-15-99 ~]$ rman target / nocatalog;

Recovery Manager: Release 19.0.0.0.0 - Production on Wed May 24 17:44:49 2023
Version 19.18.0.0.0

Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights reserved.

connected to target database: DB1 (DBID=1730530050)
using target database control file instead of recovery catalog

RMAN>
```

6. From RMAN prompt, execute the script. First execution creates a baseline database image copy and subsequent executions merge and update the baseline image copy incrementally. The following is how to execute the script and the typical output. Set the number of channels to match the CPU cores on the host.

```bash
RMAN> @/home/oracle/rman_bkup_merge.cmd
```
RMAN> RUN
2> {
3> allocate channel c1 device type disk format
'/nfsfsxn/oracopy/%U';
4> allocate channel c2 device type disk format
'/nfsfsxn/oracopy/%U';
5> allocate channel c3 device type disk format
'/nfsfsxn/oracopy/%U';
6> allocate channel c4 device type disk format
'/nfsfsxn/oracopy/%U';
7> delete obsolete;
8> sql 'alter system archive log current';
9> recover copy of database with tag 'OraCopyBKUPonFSxN_level_0';
10> backup incremental level 1 copies=1 for recover of copy with
tag 'OraCopyBKUPonFSxN_level_0' database;
11> }

allocated channel: c1
channel c1: SID=411 device type=DISK

allocated channel: c2
channel c2: SID=146 device type=DISK

```
This completes the setup of Oracle database standby image copy backup and merge.

**Switch Oracle DB to image copy for quick recovery**
In the event of a failure due to primary storage issue such as data loss or corruption, database can be quickly switched over to image copy on FSx ONTAP NFS mount and recovered to current state without database restore. Eliminating media restoration speeds up the database recovery tremendously for a VLDB. This use case assumes that the database host instance is intact and database control file, archived and current logs are all available for recovery.

1. Login to EC2 DB server host as oracle user and create a test table before switch over.

```
[ec2-user@ip-172-30-15-99 ~]$ sudo su
[root@ip-172-30-15-99 ec2-user]# su - oracle
Last login: Thu May 18 14:22:34 UTC 2023
[oracle@ip-172-30-15-99 ~]$ sqlplus / as sysdba

test oracle incremental merge switch to copy

7. You could run the Oracle database in FSx NFS mount for an extended period without a performance penalty because FSx ONTAP is redundant production-grade storage that delivers high performance. When the primary storage issue is fixed, you can swing back to it by reversing the incremental backup merge processes with minimal downtime.

**Oracle DB recovery from image copy to different EC2 DB instance host**
In a failure when both primary storage and EC2 DB instance host are lost, the recovery can not be conducted from the original server. Fortunately, you still have an Oracle database backup image copy on the redundant FSxN NFS file system. You could quickly provision another identical EC2 DB instance and easily mount the image copy of your VLDB to the new EC2 DB host via NFS to run recovery. In this section, we will demonstrate the step-by-step procedures for doing so.

1. Insert a row to test table we have created previously for Oracle database restoring to alternative host validation.

```
[oracle@ip-172-30-15-99 ~]$ sqlplus / as sysdba

using target database control file instead of recovery catalog

RMAN> @rman_bkup_merge.cmd

3. Shutdown primary EC2 DB instance host to simulate a total failure of storage and DB server host.

4. Provision a new EC2 DB instance host ora_02 with same OS and version via AWS EC2 console. Configure OS kernel with same patches as primary EC2 DB server host, Oracle preinstall RPM, and add swap space to the host as well. Install same version and patches of Oracle as in primary EC2 DB server host with software only option. These tasks can be automated with NetApp automation toolkit as available from below links.

   Toolkit: na_oracle19c_deploy
   Documentation: Automated Deployment of Oracle19c for ONTAP on NFS
5. Configure oracle environment similarly to primary EC2 DB instance host ora_01, such as oratab, orainst.loc, and oracle user .bash_profile. It is a good practice to backup those files to FSxN NFS mount point.

6. The Oracle database backup image copy on FSxN NFS mount is stored on a FSx cluster that spans AWS availability zones for redundancy, high availability, and high performance. The NFS file system can be easily mounted to a new server as far as the networking is reachable. The following procedures mount the image copy of an Oracle VLDB backup to newly provisioned EC2 DB instance host for recovery.

As ec2-user, create the mount point.

```
sudo mkdir /nfsfsxn
```

As ec2-user, mount the NFS volume that stored Oracle VLDB backup image copy.

```
sudo mount 172.30.15.19:/ora_01_copy /nfsfsxn -o rw, bg, hard, vers=3, proto=tcp, timeo=600, rsize=262144, wsize=262144, noin tr
```

7. Validate the Oracle database backup image copy on FSxN NFS mount point.

```
[ec2-user@ip-172-30-15-124 ~]$ ls -ltr /nfsfsxn/oracop
```

```

```

---

```
8. Verify the available Oracle archived logs on the FSxN NFS mount for recovery and note the last log file log sequency number. In this case, it is 175. Our recovery point is up to log sequency number 176.

```
9. As oracle user, set ORACLE_HOME variable to current Oracle installation on new EC2 instance DB host ora_02, ORACLE_SID to primary Oracle instance SID. In this case, it is db1.

10. As oracle user, create a generic Oracle init file in $ORACLE_HOME/dbs directory with proper admin directories configured. Most importantly, have Oracle flash recovery area point to FSxN NFS mount path as defined in primary Oracle VLDB instance. flash recovery area configuration is demonstrated in section Setup Oracle RMAN incremental merge to image copy on FSx. Set the Oracle control file to FSx ONTAP NFS file system.

```bash
vi $ORACLE_HOME/dbs/initdb1.ora
```

With following example entries:
*audit_file_dest='/u01/app/oracle/admin/db1/adump'
*audit_trail='db'
*compatible='19.0.0'
*control_files=('/nfsfsxn/oracopy/db1.ctl')
*db_block_size=8192
*db_create_file_dest='/nfsfsxn/oracopy/
*db_domain='demo.netapp.com'
*db_name='db1'
*db_recovery_file_dest_size=85899345920
*db_recovery_file_dest='/nfsfsxn/archlog/
*diagnostic_dest='/u01/app/oracle'
*dispatchers='(PROTOCOL=TCP) (SERVICE=db1XDB)'
*enable_pluggable_database=true
*local_listener='LISTENER'
*nls_language='AMERICAN'
*nls_territory='AMERICA'
*open_cursors=300
*pga_aggregate_target=1024m
*processes=320
*remote_login_passwordfile='EXCLUSIVE'
*sga_target=10240m
*undo_tablespace='UNDOTBS1'

The above init file should be replaced by restored backup init file from primary Oracle DB server in the case of discrepancy.

11. As oracle user, launch RMAN to run Oracle recovery on a new EC2 DB instance host.
[oracle@ip-172-30-15-124 dbs]$ rman target / nocatalog;

Recovery Manager: Release 19.0.0.0.0 - Production on Wed May 31 00:56:07 2023
Version 19.18.0.0.0

Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights reserved.

connected to target database (not started)

RMAN> startup nomount;

Oracle instance started

Total System Global Area 12884900632 bytes

Fixed Size 9177880 bytes
Variable Size 1778384896 bytes
Database Buffers 11072962560 bytes
Redo Buffers 24375296 bytes

12. Set database ID. The database ID can be retrieved from Oracle file name of image copy on FSx NFS mount point.

RMAN> set dbid = 1730530050;

executing command: SET DBID

13. Restore controlfile from autobackup. If Oracle controlfile and spfile autobackup is enabled, they are backed up in every incremental backup and merge cycle. The latest backup will be restored if multiple copies are available.
RMAN> restore controlfile from autobackup;

Starting restore at 31-MAY-23
allocated channel: ORA_DISK_1
channel ORA_DISK_1: SID=2 device type=DISK

recovery area destination: /nfsfsxn/archlog
database name (or database unique name) used for search: DB1
channel ORA_DISK_1: AUTOBACKUP
/nfsfsxn/archlog/DB1/autobackup/2023_05_30/o1_mf_s_1138210401__08qlxrrr_.bkp found in the recovery area
channel ORA_DISK_1: looking for AUTOBACKUP on day: 20230531
channel ORA_DISK_1: looking for AUTOBACKUP on day: 20230530
channel ORA_DISK_1: restoring control file from AUTOBACKUP

channel ORA_DISK_1: control file restore from AUTOBACKUP complete
output file name=/nfsfsxn/oracopy/db1.ctl
Finished restore at 31-MAY-23

14. Restore init file from spfile to a /tmp folder for updating parameter file later to match with primary DB instance.

RMAN> restore spfile to pfile '/tmp/archive/initdb1.ora' from autobackup;

Starting restore at 31-MAY-23
using channel ORA_DISK_1

recovery area destination: /nfsfsxn/archlog
database name (or database unique name) used for search: DB1
channel ORA_DISK_1: AUTOBACKUP
/nfsfsxn/archlog/DB1/autobackup/2023_05_30/o1_mf_s_1138210401__08qlxrrr_.bkp found in the recovery area
channel ORA_DISK_1: looking for AUTOBACKUP on day: 20230531
channel ORA_DISK_1: looking for AUTOBACKUP on day: 20230530
channel ORA_DISK_1: restoring spfile from AUTOBACKUP
/nfsfsxn/archlog/DB1/autobackup/2023_05_30/o1_mf_s_1138210401__08qlxrrr_.bkp
channel ORA_DISK_1: SPFILE restore from AUTOBACKUP complete
Finished restore at 31-MAY-23

15. Mount control file and validate the database backup image copy.
RMAN> alter database mount;

released channel: ORA_DISK_1
Statement processed

RMAN> list copy of database tag 'OraCopyBKUPonFSxN_level_0';

List of Datafile Copies

media recovery complete, elapsed time: 00:48:34
Finished recover at 31-MAY-23

For faster recovery, enable parallel sessions with recovery_parallelism parameter or specify degree of parallel in recovery command for database recovery: RECOVER DATABASE PARALLEL (DEGREE d INSTANCES DEFAULT); In general, degrees of parallelism should be equal to number of CPU cores on the host.

18. Exit RMAN, login to Oracle as oracle user via sqlplus to open database and reset log after an incomplete recovery.
SQL> select name, open_mode from v$database;

NAME      OPEN_MODE
--------- ----------------------
DB1       MOUNTED

SQL> select member from v$log;

MEMBER
-----------------------------------------------
-------------
+DATA/DB1/ONLINELOG/group_3.264.1136666437
+DATA/DB1/ONLINELOG/group_2.263.1136666437
+DATA/DB1/ONLINELOG/group_1.262.1136666437

SQL> alter database rename file '/nfsfsxn/oracopy/redo01.log';

Database altered.

SQL> alter database rename file '/nfsfsxn/oracopy/redo02.log';

Database altered.

SQL> alter database rename file '/nfsfsxn/oracopy/redo03.log';

Database altered.

SQL> alter database open resetlogs;

Database altered.

19. Validate the database restored to new host that has the row we have inserted before primary database failure.
SQL> show pdbs

<table>
<thead>
<tr>
<th>CON_ID</th>
<th>CON_NAME</th>
<th>OPEN MODE</th>
<th>RESTRICTED</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>

<td>DB1_PDB2</td>
<td>READ WRITE</td>
<td>NO</td>
</tr>
<tr>
<td>5</td>
<td>DB1_PDB3</td>
<td>READ WRITE</td>
<td>NO</td>
</tr>
</tbody>
</table>

SQL> alter session set container=db1_pdb1;
Session altered.

SQL> select * from test;

<table>
<thead>
<tr>
<th>ID</th>
<th>DT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>18-MAY-23 02.35.37.000000 PM test oracle incremental merge switch to copy</td>
</tr>
<tr>
<td>2</td>
<td>30-MAY-23 05.23.11.000000 PM test recovery on a new EC2 instance host with image copy on FSxN</td>
</tr>
</tbody>
</table>

20. Other post recovery tasks

Add FSxN NFS mount to fstab so that the NFS file system will be mounted when EC2 instance host rebooted.

As EC2 user, vi /etc/fstab and add following entry:

```
172.30.15.19:/ora_01_copy /nfsfsxn nfs rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,nointr 0 0
```

Update the Oracle init file from primary database init file backup that is restored to /tmp/archive and create spfile as needed.

This completes the Oracle VLDB database recovery from backup image copy on FSxN NFS file system to a new EC2 DB instance host.
Clone Oracle standby image copy for other use cases
Another benefit of using AWS FSx ONTAP for staging Oracle VLDB image copy is that it can be FlexCloned to serve many other purposes with minimal additional storage investment. In the following use case, we demonstrate how to snapshot and clone the staging NFS volume on FSx ONTAP for other Oracle use cases such as DEV, UAT, etc.

1. We begin with inserting a row into the same test table we have created before.

```sql
SQL> insert into test values (3, sysdate, 'test clone on a new EC2 instance host with image copy on FSxN');
1 row created.

SQL> select * from test;
ID   DT                EVENT
---  -------------  ------------------------------------------------------
 1   18-MAY-23 02.35.37.000000 PM  test oracle incremental merge switch to copy
 2   30-MAY-23 05.23.11.000000 PM  test recovery on a new EC2 instance host with image copy on FSxN
 3   05-JUN-23 03.19.46.000000 PM  test clone on a new EC2 instance host with image copy on FSxN

SQL>
```
2. Take a RMAN backup and merge to FSx ONTAP database image copy so that the transaction will be captured in the backup set on FSx NFS mount but not merged into copy until cloned database is recovered.

```
RMAN> @/home/oracle/rman_bkup_merge.cmd
```

3. Login to FSx cluster via ssh as fsxadmin user to observe the snapshots created by scheduled backup policy - oracle and take an one-off snapshot so that it will include the transaction we committed in step 1.
FsxId06c3c8b2a7bd56458::> vol snapshot create -vserver svm_ora -volume ora_01_copy -snapshot one-off.2023-06-05-1137 -foreground true

FsxId06c3c8b2a7bd56458::> snapshot show

</tbody>
</table>

15 entries were displayed.
4. Clone from the one-off snapshot to be used for standing up a new DB1 clone instance on an alternative EC2 Oracle host. You have the option to clone from any available daily snapshots for volume ora_01_copy.

```
FsxId06c3c8b2a7bd56458::> vol clone create -flexclone db1_20230605of -type RW -parent-vserver svm_ora -parent-volume ora_01_copy -junction-path /db1_20230605of -junction-active true -parent-snapshot one-off.2023-06-05-1137
[Job 464] Job succeeded: Successful

FsxId06c3c8b2a7bd56458::>
```

```
FsxId06c3c8b2a7bd56458::> vol show db1*
Vserver Volume Aggregate State Type Size
Available Used%
---------- ------------ ------------ ---------- ---- ----------
---------- ----- 
svm_ora db1_20230605of aggr1 online RW 200GB
116.6GB 38%

FsxId06c3c8b2a7bd56458::>
```

5. Turn off snapshot policy for the cloned volume as it inherits parent volume snapshot policy unless you want to protect the cloned volume, then leave it alone.

```
FsxId06c3c8b2a7bd56458::> vol modify -volume db1_20230605of -snapshot-policy none

Warning: You are changing the Snapshot policy on volume "db1_20230605of" to "none". Snapshot copies on this volume that do not match any of the prefixes of the new Snapshot policy will not be deleted. However, when the new Snapshot policy takes effect, depending on the new retention count, any existing Snapshot copies that continue to use the same prefixes might be deleted. See the 'volume modify' man page for more information.
Do you want to continue? {y|n}: y
Volume modify successful on volume db1_20230605of of Vserver svm_ora.

FsxId06c3c8b2a7bd56458::>
```

6. Login to a new EC2 Linux instance with Oracle software pre-installed with same version and patch level as your primary Oracle EC2 instance and mount the cloned volume.

276
[ec2-user@ip-172-30-15-124 ~]$ sudo mkdir /nfsfsxn
[ec2-user@ip-172-30-15-124 ~]$ sudo mount -t nfs 172.30.15.19:/db1_20230605of /nfsfsxn -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=262144,wsize=262144,nointr

7. Validate the database incremental backup sets, image copy, and available archived logs on FSx NFS mount.

[ec2-user@ip-172-30-15-124 ~]$ ls -ltr /nfsfsxn/oracopy

```bash

```

277
8. The recovery processes now are similar to previous use case of recovery to a new EC2 DB instance after a failure - set oracle environment (oratab, $ORACLE_HOME, $ORACLE_SID) to match with primary production instance, create an init file including db_recovery_file_dest_size and db_recovery_file_dest that point to flash recovery directory on FSx NFS mount. Then, launch RMAN to run recovery. Following are command steps and output.

```
[oracle@ip-172-30-15-124 dbs]$ rman target / nocatalog

 Recovery Manager: Release 19.0.0.0.0 - Production on Wed Jun 7 14:44:33 2023
 Version 19.18.0.0.0

 Copyright (c) 1982, 2019, Oracle and/or its affiliates. All rights reserved.

 connected to target database (not started)

RMAN> startup nomount;

Oracle instance started

Total System Global Area  10737418000 bytes

Fixed Size 9174800 bytes
Variable Size 1577058304 bytes
Database Buffers 9126805504 bytes
Redo Buffers 24379392 bytes

RMAN> set dbid = 1730530050;

executing command: SET DBID

RMAN> restore controlfile from autobackup;

Starting restore at 07-JUN-23
allocated channel: ORA_DISK_1
```
channel ORA_DISK_1: SID=2 device type=DISK

recovery area destination: /nfsfsxn/archlog/

-------

-------
9. Rename the cloned database instance and change database ID with Oracle nid utility. The database instance state needs to be in mount to execute the command.

```sql
SQL> select name, open_mode, log_mode from v$database;

NAME      OPEN_MODE            LOG_MODE
--------- -------------------- ------------
DB1       READ WRITE           NOARCHIVELOG

SQL> shutdown immediate;
Database closed.
Database dismounted.
ORACLE instance shut down.

SQL> startup mount;
ORACLE instance started.

Total System Global Area 1.0737E+10 bytes
Fixed Size                  9174800 bytes
Variable Size            1577058304 bytes

    Datafile /nfsfsxn/oracopy/data_D-DB1_I-1730530050_TS-
Database name changed to DB1TST.
Modify parameter file and generate a new password file before restarting.
Database ID for database DB1TST changed to 3054879890.
All previous backups and archived redo logs for this database are unusable.
Database is not aware of previous backups and archived logs in Recovery Area.
Database has been shutdown, open database with RESETLOGS option.
Successfully changed database name and ID.

10. Change Oracle database environment configuration to new database name or instance ID in oratab, init file, and create necessary admin directories that match with new instance ID. Then, start the instance with resetlogs option.
SQL> startup mount;
ORACLE instance started.

Total System Global Area 1.0737E+10 bytes
Fixed Size 9174800 bytes
Variable Size 1577058304 bytes
Database Buffers 9126805504 bytes
Redo Buffers 24379392 bytes
Database mounted.
SQL> alter database open resetlogs;
Database altered.

SQL> select name, open_mode, log_mode from v$database;
NAME      OPEN_MODE            LOG_MODE
--------- -------------------- ------------
DB1TST    READ WRITE           NOARCHIVELOG

SQL> show pdbs

  5 DB1_PDB3         READ WRITE  NO

This completes the clone of a new Oracle instance from staging database copy on FSx NFS mount for DEV, UAT, or any other use cases. Multiple Oracle instances can be cloned off the same staging image copy.
If you run into error RMAN-06571: datafile 1 does not have recoverable copy when switching the database to copy, check database incarnation that matches with primary production DB. If needed, reset the incarnation to match with primary with RMAN command reset database to incarnation n;.

TR-4974: Oracle 19c in Standalone Restart on AWS FSx/EC2 with NFS/ASM

Allen Cao, Niyaz Mohamed, NetApp

Purpose

ASM (Automatic Storage Management) is a popular Oracle storage volume manager that is employed in many Oracle installations. It is also Oracle’s recommended storage management solution. It provides an alternative to conventional volume managers and file systems. Since Oracle version 11g, ASM has been packaged with grid infrastructure rather than a database. As a result, in order to utilize Oracle ASM for storage management without RAC, you must install Oracle grid infrastructure in a standalone server, also known as Oracle Restart. Doing so certainly adds more complexity in an otherwise simpler Oracle database deployment. However, as the name implies, when Oracle is deployed in Restart mode, any failed Oracle services are restarted after a host reboot without user intervention, which provides a certain degree of high availability or HA functionality.

Oracle ASM is generally deployed in FC, iSCSI storage protocols and luns as raw storage devices. However, ASM on NFS protocol and NFS file system is also supported configuration by Oracle. In this documentation, we demonstrate how to deploy an Oracle 19c database with the NFS protocol and Oracle ASM in an Amazon FSx for ONTAP storage environment with EC2 compute instances. We also demonstrate how to use the NetApp SnapCenter service through the NetApp BlueXP console to backup, restore, and clone your Oracle database for dev/test or other use cases for storage-efficient database operation in the AWS public cloud.
This solution addresses the following use cases:

- Oracle database deployment in Amazon FSx for ONTAP storage and EC2 compute instances with NFS/ASM
- Testing and validating an Oracle workload in the public AWS cloud with NFS/ASM
- Testing and validating Oracle database Restart functionalities deployed in AWS

**Audience**

This solution is intended for the following people:

- A DBA who would like to deploy Oracle in an AWS public cloud with NFS/ASM.
- A database solution architect who would like to test Oracle workloads in the AWS public cloud.
- The storage administrator who would like to deploy and manage an Oracle database deployed to AWS FSx storage.
- The application owner who would like to stand up an Oracle database in AWS FSx/EC2.

**Solution test and validation environment**

The testing and validation of this solution was performed in an AWS FSx and EC2 environment that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].

**Architecture**

### Key factors for deployment consideration

- **EC2 compute instances.** In these tests and validations, we used an AWS EC2 t2.xlarge instance type for the Oracle database compute instance. NetApp recommends using an M5 type EC2 instance as the compute instance for Oracle in production deployment because it is optimized for database workloads. You need to size the EC2 instance appropriately for the number of vCPUs and the amount of RAM based on actual workload requirements.

- **FSx storage HA clusters single- or multi-zone deployment.** In these tests and validations, we deployed an FSx HA cluster in a single AWS availability zone. For production deployment, NetApp recommends deploying an FSx HA pair in two different availability zones. An FSx HA cluster is always provisioned in a HA pair that is sync mirrored in a pair of active-passive file systems to provide storage-level redundancy. Multi-zone deployment further enhances high availability in the event of failure in a single AWS zone.

- **FSx storage cluster sizing.** An Amazon FSx for ONTAP storage file system provides up to 160,000 raw SSD IOPS, up to 4GBps throughput, and a maximum of 192TiB capacity. However, you can size the cluster in terms of provisioned IOPS, throughput, and the storage limit (minimum 1,024 GiB) based on your actual requirements at the time of deployment. The capacity can be adjusted dynamically on the fly without affecting application availability.

- **Oracle data and logs layout.** In our tests and validations, we deployed two ASM disk groups for data and logs respectively. Within the +DATA asm disk group, we provisioned four disks in a data NFS file system mount point. Within the +LOGS asm disk group, we provisioned two disks in a logs NFS file system mount point. For large database deployment, ASM disk groups can be built to span multiple FSx file systems with ASM NFS disks distributed through multiple NFS mount points anchored on FSx file systems. This particular setup is designed to meet database throughput over 4GBps throughput and 160,000 raw SSD IOPS requirement.

- **dNFS configuration.** dNFS is built into Oracle kernel and is known to dramatically increase Oracle database performance when Oracle is deployed to NFS storage. dNFS is packaged into Oracle binary but is not turned on by default. It should be turned on for any Oracle database deployment on NFS. For multiple FSx file systems deployment for large database, dNFS multi-path should be properly configured.
• **Oracle ASM redundancy level to use for each Oracle ASM disk group that you create.** Because FSx already mirrors the storage on the FSx cluster level, you should **ONLY** use External Redundancy, which means that the option does not allow Oracle ASM to mirror the contents of the disk group. This is particularly important as NFS for Oracle database data storage requires HARD NFS mount option which is **NOT** desirable for mirroring ASM contents on the Oracle level.

• **Database backup.** NetApp provides a SaaS version of SnapCenter software service for database backup, restore, and clone in the cloud that is available through the NetApp BlueXP console UI. NetApp recommends implementing such a service to achieve fast (under a minute) SnapShot backup, quick (few minutes) database restore, and database cloning.

### Solution deployment

The following section provides step-by-step deployment procedures.

### Prerequisites for deployment

Deployment requires the following prerequisites.

1. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account.

2. From the AWS EC2 console, you must deploy two EC2 Linux instances, one as the primary Oracle DB server and an optional alternative clone target DB server. See the architecture diagram in the previous section for more details about the environment setup. Also review the [User Guide for Linux instances](#) for more information.

3. From the AWS EC2 console, deploy Amazon FSx for ONTAP storage HA clusters to host the Oracle database volumes. If you are not familiar with the deployment of FSx storage, see the documentation [Creating FSx for ONTAP file systems](#) for step-by-step instructions.

4. Steps 2 and 3 can be performed using the following Terraform automation toolkit, which creates an EC2 instance named `ora_01` and an FSx file system named `fsx_01`. Review the instruction carefully and change the variables to suit your environment before execution.

   ```bash
   git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
   ```

   Ensure that you have allocated at least 50G in EC2 instance root volume in order to have sufficient space to stage Oracle installation files.

### EC2 instance kernel configuration
With the prerequisites provisioned, log into the EC2 instance as ec2-user and sudo to root user to configure the Linux kernel for Oracle installation.

1. Create a staging directory \texttt{/tmp/archive} folder and set the 777 permission.

   ```
   mkdir /tmp/archive
   chmod 777 /tmp/archive
   ```

2. Download and stage the Oracle binary installation files and other required rpm files to the \texttt{/tmp/archive} directory.

   See the following list of installation files to be stated in \texttt{/tmp/archive} on the EC2 instance.

   ```
   [ec2-user@ip-172-30-15-58 ~]$ ls -l /tmp/archive
   total 10537316
   -rw-rw-r--. 1 ec2-user ec2-user 19112 Mar 21 15:57 compat-libcap1-1.10-7.el7.x86_64.rpm
   -rw-rw-r--  1 ec2-user ec2-user 3059705302 Mar 21 22:01 LINUX.X64_193000_db_home.zip
   -rw-rw-r--  1 ec2-user ec2-user 2889184573 Mar 21 21:09 LINUX.X64_193000_grid_home.zip
   -rw-rw-r--. 1 ec2-user ec2-user 589145 Mar 21 15:56 netapp_linux_unified_host_utilities-7-1.x86_64.rpm
   -rw-rw-r--. 1 ec2-user ec2-user 31828 Mar 21 15:55 oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
   -rw-rw-r--  1 ec2-user ec2-user 2872741741 Mar 21 22:31 p34762026_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 1843577895 Mar 21 22:32 p34765931_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 124347218 Mar 21 22:33 p6880880_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 257136 Mar 22 16:25 policycoreutils-python-utils-2.9-9.el8.noarch.rpm
   ```

3. Install Oracle 19c preinstall RPM, which satisfies most kernel configuration requirements.

   ```
   yum install /tmp/archive/oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
   ```

4. Download and install the missing \texttt{compat-libcap1} in Linux 8.
yum install /tmp/archive/compat-libcap1-1.10-7.el7.x86_64.rpm

5. From NetApp, download and install NetApp host utilities.

yum install /tmp/archive/netapp_linux_unified_host_utilities-7-1.x86_64.rpm

6. Install policycoreutils-python-utils, which is not available in the EC2 instance.

yum install /tmp/archive/policycoreutils-python-utils-2.9-9.el8.noarch.rpm

7. Install open JDK version 1.8.

yum install java-1.8.0-openjdk.x86_64

8. Install nfs-utils.

yum install nfs-utils

9. Disable transparent hugepages in the current system.

```bash
echo never > /sys/kernel/mm/transparent_hugepage/enabled
echo never > /sys/kernel/mm/transparent_hugepage/defrag
```

Add the following lines in `/etc/rc.local` to disable transparent hugepage after reboot:

```bash
# Disable transparent hugepages
if test -f /sys/kernel/mm/transparent_hugepage/enabled;
then
    echo never > /sys/kernel/mm/transparent_hugepage/enabled
fi
if test -f /sys/kernel/mm/transparent_hugepage/defrag;
then
    echo never > /sys/kernel/mm/transparent_hugepage/defrag
fi
```

10. Disable selinux by changing SELINUX=enforcing to SELINUX=disabled. You must reboot the host to make the change effective.
11. Add the following lines to `limit.conf` to set the file descriptor limit and stack size without quotes " ".

```bash
vi /etc/security/limits.conf

"*    hard    nofile     65536"
"*    soft    stack     10240"
```

12. Add swap space to EC2 instance by following this instruction: How do I allocate memory to work as swap space in an Amazon EC2 instance by using a swap file? The exact amount of space to add depends on the size of RAM up to 16G.

13. Add the ASM group to be used for the asm sysasm group

```bash
groupadd asm
```

14. Modify the oracle user to add ASM as a secondary group (the oracle user should have been created after Oracle preinstall RPM installation).

```bash
usermod -a -G asm oracle
```

15. Reboot the EC2 instance.

Provision and export NFS volumes to be mounted to EC2 instance host
Provision three volumes from the command line by login to FSx cluster via ssh as fsxadmin user with FSx cluster management IP to host the Oracle database binary, data, and logs files.

1. Log into the FSx cluster through SSH as the fsxadmin user.

   ```
   ssh fsxadmin@172.30.15.53
   ```

2. Execute the following command to create a volume for the Oracle binary.

   ```
   vol create -volume ora_01_biny -aggregate aggr1 -size 50G -state online -type RW -junction-path /ora_01_biny -snapshot-policy none -tiering-policy snapshot-only
   ```

3. Execute the following command to create a volume for Oracle data.

   ```
   vol create -volume ora_01_data -aggregate aggr1 -size 100G -state online -type RW -junction-path /ora_01_data -snapshot-policy none -tiering-policy snapshot-only
   ```

4. Execute the following command to create a volume for Oracle logs.

   ```
   vol create -volume ora_01_logs -aggregate aggr1 -size 100G -state online -type RW -junction-path /ora_01_logs -snapshot-policy none -tiering-policy snapshot-only
   ```

5. Validate the DB volumes created.

   ```
   vol show
   ```

   This is expected to return:
Database storage configuration

4 entries were displayed.
Now, import and set up the FSx storage for the Oracle grid infrastructure and database installation on the EC2 instance host.

1. Log into the EC2 instance via SSH as the ec2-user with your SSH key and EC2 instance IP address.

```
ssh -i ora_01.pem ec2-user@172.30.15.58
```

2. Create /u01 directory to mount Oracle binary file system

```
sudo mkdir /u01
```

3. Mount the binary volume to /u01, changed to your FSx NFS lif IP address. If you deployed FSx cluster via NetApp automation toolkit, FSx virtual storage server NFS lif IP address will be listed in the output at the end of resources provision execution. Otherwise, it can be retrieved from AWS FSx console UI.

```
sudo mount -t nfs 172.30.15.19:/ora_01_biny /u01 -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536
```

4. Change /u01 mount point ownership to the Oracle user and it’s associated primary group.

```
sudo chown oracle:oinstall /u01
```

5. Create /oradata directory to mount Oracle data file system

```
sudo mkdir /oradata
```

6. Mount the data volume to /oradata, changed to your FSx NFS lif IP address

```
sudo mount -t nfs 172.30.15.19:/ora_01_data /oradata -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536
```

7. Change /oradata mount point ownership to the Oracle user and it’s associated primary group.

```
sudo chown oracle:oinstall /oradata
```

8. Create /oralogs directory to mount Oracle logs file system

```
sudo mkdir /oralogs
```
9. Mount the log volume to `/oralogs`, changed to your FSx NFS lif IP address

```
sudo mount -t nfs 172.30.15.19:/ora_01_logs /oralogs -o rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536
```

10. Change `/oralogs` mount point ownership to the Oracle user and it’s associated primary group.

```
sudo chown oracle:oinstall /oralogs
```

11. Add a mount point to `/etc/fstab`.

```
sudo vi /etc/fstab
```

Add the following line.

```
172.30.15.19:/ora_01_biny       /u01            nfs
rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536   0 
0
172.30.15.19:/ora_01_data       /oradata        nfs
rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536   0 
0
172.30.15.19:/ora_01_logs       /oralogs        nfs
rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536   0 
0
```

12. `sudo` to oracle user, create asm folders to store asm disk files

```
sudo su
su - oracle
mkdir /oradata/asm
mkdir /oralogs/asm
```

13. As the oracle user, create asm data disk files, change the count to match to the disk size with block size.
dd if=/dev/zero of=/oradata/asm/nfs_data_disk01 bs=1M count=20480 oflag=direct
dd if=/dev/zero of=/oradata/asm/nfs_data_disk02 bs=1M count=20480 oflag=direct
dd if=/dev/zero of=/oradata/asm/nfs_data_disk03 bs=1M count=20480 oflag=direct
dd if=/dev/zero of=/oradata/asm/nfs_data_disk04 bs=1M count=20480 oflag=direct

14. As the root user, change data disk file permission to 640

    chmod 640 /oradata/asm/*

15. As the oracle user, create asm logs disk files, change to count to match to the disk size with block size.

    dd if=/dev/zero of=/oralogs/asm/nfs_logs_disk01 bs=1M count=40960 oflag=direct
    dd if=/dev/zero of=/oralogs/asm/nfs_logs_disk02 bs=1M count=40960 oflag=direct

16. As the root user, change logs disk file permission to 640

    chmod 640 /oralogs/asm/*

17. Reboot the EC2 instance host.

Oracle grid infrastructure installation
1. Log into the EC2 instance as the ec2-user via SSH and enable password authentication by uncommenting `PasswordAuthentication yes` and then commenting out `PasswordAuthentication no`.

```
sudo vi /etc/ssh/sshd_config
```

2. Restart the sshd service.

```
sudo systemctl restart sshd
```

3. Reset the Oracle user password.

```
sudo passwd oracle
```

4. Log in as the Oracle Restart software owner user (oracle). Create an Oracle directory as follows:

```
mkdir -p /u01/app/oracle
mkdir -p /u01/app/oraInventory
```

5. Change the directory permission setting.

```
chmod -R 775 /u01/app
```

6. Create a grid home directory and change to it.

```
mkdir -p /u01/app/oracle/product/19.0.0/grid
cd /u01/app/oracle/product/19.0.0/grid
```

7. Unzip the grid installation files.

```
unzip -q /tmp/archive/LINUX.X64_193000_grid_home.zip
```

8. From grid home, delete the OPatch directory.

```
rm -rf OPatch
```

9. From grid home, copy `p6880880_190000_Linux-x86-64.zip` to the grid_home, and then unzip it.
10. From grid home, revise `cv/admin/cvu_config`, uncomment and replace `CV_ASSUME_DISTID=OEL5` with `CV_ASSUME_DISTID=OL7`.

```
vi cv/admin/cvu_config
```

11. Prepare a `gridsetup.rsp` file for silent installation and place the rsp file in the `/tmp/archive` directory. The rsp file should cover sections A, B, and G with the following information:

```
INVENTORY_LOCATION=/u01/app/oraInventory
oracle.install.option=HA_CONFIG
ORACLE_BASE=/u01/app/oracle
oracle.install.asm.OSDBA=dba
oracle.install.asm.OSOPER=oper
oracle.install.asm.OSASM=asm
oracle.install.asm.SYSASMPassword="SetPWD"
oracle.install.asm.diskGroup.name=DATA
oracle.install.asm.diskGroup.redundancy=EXTERNAL
oracle.install.asm.diskGroup.AUSize=4
oracle.install.asm.diskGroup.disks=/oradata/asm/*,/oralogs/asm/*
oracle.install.asm.diskGroup.diskDiscoveryString=/oradata/asm/nfs_data_disk01,/oradata/asm/nfs_data_disk02,/oradata/asm/nfs_data_disk03,/oradata/asm/nfs_data_disk04
oracle.install.asm.monitorPassword="SetPWD"
oracle.install.asm.configureAFD=false
```

12. Log into the EC2 instance as the root user.

13. Install `cvuqdisk-1.0.10-1.rpm`.

```
rpm -ivh /u01/app/oracle/product/19.0.0/grid/cv/rpm/cvuqdisk-1.0.10-1.rpm
```

14. Log into the EC2 instance as the Oracle user and extract the patch in the `/tmp/archive` folder.

```
unzip p34762026_190000_Linux-x86-64.zip
```

15. From grid home `/u01/app/oracle/product/19.0.0/grid` and as the oracle user, launch `gridSetup.sh` for grid infrastructure installation.
Ignore the warnings about wrong groups for grid infrastructure. We are using a single Oracle user to manage Oracle Restart, so this is expected.

16. As root user, execute the following script(s):

```
/u01/app/oraInventory/orainstRoot.sh
/u01/app/oracle/product/19.0.0/grid/root.sh
```

17. As the Oracle user, execute the following command to complete the configuration:

```
/u01/app/oracle/product/19.0.0/grid/gridSetup.sh -executeConfigTools -responseFile /tmp/archive/gridsetup.rsp -silent
```

18. As the Oracle user, create the LOGS disk group.

```
bin/asmca -silent -sysAsmPassword 'yourPWD' -asmsnmpPassword 'yourPWD' -createDiskGroup -diskGroupName LOGS -disk '/oralogs/asm/nfs_logs_disk*' -redundancy EXTERNAL -au_size 4
```

19. As the Oracle user, validate grid services after installation configuration.

**Oracle database installation**
1. Log in as the Oracle user and unset $ORACLE_HOME and $ORACLE_SID if it is set.

   ```bash
   unset ORACLE_HOME
   unset ORACLE_SID
   ```

2. Create the Oracle DB home directory and change to it.

   ```bash
   mkdir /u01/app/oracle/product/19.0.0/db1
   cd /u01/app/oracle/product/19.0.0/db1
   ```

3. Unzip the Oracle DB installation files.

   ```bash
   unzip -q /tmp/archive/LINUX.X64_193000_db_home.zip
   ```

4. From the DB home, delete the OPatch directory.

   ```bash
   rm -rf OPatch
   ```

5. From DB home, copy p6880880_190000_Linux-x86-64.zip to grid_home, and then unzip it.

   ```bash
   cp /tmp/archive/p6880880_190000_Linux-x86-64.zip .
   unzip p6880880_190000_Linux-x86-64.zip
   ```

6. From DB home, revise cv/admin/cvu_config, and uncomment and replace
   CV_ASSUME_DISTID=OEL5 with CV_ASSUME_DISTID=OL7.

   ```bash
   vi cv/admin/cvu_config
   ```

7. From the /tmp/archive directory, unpack the DB 19.18 RU patch.

   ```bash
   unzip p34765931_190000_Linux-x86-64.zip
   ```

8. Prepare the DB silent install rsp file in /tmp/archive/dbinstall.rsp directory with the following values:
oracle.install.option=INSTALL_DB_SWONLY
UNIX_GROUP_NAME=oinstall
INVENTORY_LOCATION=/u01/app/oraInventory
ORACLE_HOME=/u01/app/oracle/product/19.0.0/db1
ORACLE_BASE=/u01/app/oracle
oracle.install.db.InstallEdition=EE
oracle.install.db.OSDBA_GROUP=dba
oracle.install.db.OSOPER_GROUP=oper
oracle.install.db.OSBACKUPDBA_GROUP=oper
oracle.install.db.OSDGDBA_GROUP=dba
oracle.install.db.OSKMDBA_GROUP=dba
oracle.install.db.OSRACDBA_GROUP=dba
oracle.install.db.rootconfig.executeRootScript=false

9. From db1 home /u01/app/oracle/product/19.0.0/db1, execute silent software-only DB installation.

   .runInstaller -applyRU /tmp/archive/34765931/ -silent
   -ignorePrereqFailure -responseFile /tmp/archive/dbinstall.rsp

10. As root user, run the root.sh script after software-only installation.

    /u01/app/oracle/product/19.0.0/db1/root.sh

11. As Oracle user, create the dbca.rsp file with the following entries:
gdbName=db1.demo.netapp.com
sid=db1
createAsContainerDatabase=true
numberOfPDBs=3
pdbName=db1_pdb
useLocalUndoForPDBs=true
pdbAdminPassword="yourPWD"
templateName=General_Purpose.dbc
sysPassword="yourPWD"
systemPassword="yourPWD"
dbsnmpPassword="yourPWD"
storageType=ASM
diskGroupName=DATA
characterSet=AL32UTF8
nationalCharacterSet=AL16UTF16
listeners=LISTENER
databaseType=MULTIPURPOSE
automaticMemoryManagement=false
totalMemory=8192

Set the total memory based on available memory in EC2 instance host. Oracle allocates 75% of totalMemory to DB instance SGA or buffer cache.

12. As Oracle user, launch DB creation with dbca.
bin/dbca -silent -createDatabase -responseFile /tmp/archive/dbca.rsp

output:
Prepare for db operation
7% complete

[oracle@ip-172-30-15-58 db1]$.

14. Set the Oracle user .bash_profile.
vi ~/.bash_profile

15. Add following entries:

```bash
export ORACLE_HOME=/u01/app/oracle/product/19.0.0/db1
export ORACLE_SID=db1
export PATH=$PATH:$ORACLE_HOME/bin
alias asm='export ORACLE_HOME=/u01/app/oracle/product/19.0.0/grid;export ORACLE_SID=+ASM;export PATH=$PATH:$ORACLE_HOME/bin'
```

16. Validate the CDB/PDB created.

```sql
. ~/.bash_profile
sqlplus / as sysdba
SQL> select name, open_mode from v$database;
NAME     OPEN_MODE
DB1       READ WRITE
SQL> select name from v$datafile;
NAME
+DATA/DB1/DATAFILE/system.256.1132176177
+DATA/DB1/DATAFILE/sysaux.257.1132176221
+DATA/DB1/DATAFILE/undotbs1.258.1132176247
+DATA/DB1/86B637B62FE07A65E053F706E80A27CA/DATAFILE/system.265.1132177009
+DATA/DB1/86B637B62FE07A65E053F706E80A27CA/DATAFILE/sysaux.266.1132177009
+DATA/DB1/86B637B62FE07A65E053F706E80A27CA/DATAFILE/undotbs1.267.1132177853
+DATA/DB1/F7852758DCD6B800E0533A0F1EAC1DC6/DATAFILE/system.271.1132177853
+DATA/DB1/F7852758DCD6B800E0533A0F1EAC1DC6/DATAFILE/sysaux.272.1132177853
+DATA/DB1/F7852758DCD6B800E0533A0F1EAC1DC6/DATAFILE/undotbs1.270.1132177853
+DATA/DB1/F7852758DCD6B800E0533A0F1EAC1DC6/DATAFILE/users.274.1132177853
```
17. As oracle user, change to Oracle database home directory /u01/app/oracle/product/19.0.0/db1 and Enable dNFS

```
cd /u01/app/oracle/product/19.0.0/db1
mkdir rdbms/lib/odm
cp lib/libnfsodm.so rdbms/lib/odm/
```

18. Configure oranfstab file in ORACLE_HOME
vi $ORACLE_HOME/dbs/oranfstab

add following entries:

server: fsx_01
local: 172.30.15.58 path: 172.30.15.19
nfs_version: nfsv3
export: /ora_01_biny mount: /u01
export: /ora_01_data mount: /oradata
export: /ora_01_logs mount: /oralogs

19. As oracle user, login to database from sqlplus and set the DB recovery size and location to the +LOGS disk group.

. ~/.bash_profile

sqlplus / as sysdba

alter system set db_recovery_file_dest_size = 80G scope=both;
alter system set db_recovery_file_dest = '+LOGS' scope=both;

20. Enable archive log mode and reboot Oracle DB instance

shutdown immediate;

startup mount;

alter database archivelog;

alter database open;

alter system switch logfile;

21. Validate DB log mode and dNFS after instance reboot
SQL> select name, log_mode from v$database;

NAME LOG_MODE
--------- ------------
DB1 ARCHIVELOG

SQL> select svrname, dirname from v$dnfs_servers;

SVRNAME
---------
fsx_01

DIRNAME
---------
/ora_01_data
/ora_01_biny
/ora_01_logs

22. Validate Oracle ASM

[oracle@ip-172-30-15-58 db1]$ asm
[oracle@ip-172-30-15-58 db1]$ sqlplus / as sysasm

SQL*Plus: Release 19.0.0.0.0 - Production on Tue May 9 20:39:39 2023

**Automated deployment option**

NetApp will release a fully automated solution deployment toolkit with Ansible to facilitate the implementation of this solution. Please check back for the availability of the toolkit. After it is released, a link will be posted here.

**Oracle Database backup, restore, and clone with SnapCenter Service**

At this moment, Oracle database with NFS and ASM storage option is only supported by traditional SnapCenter Server UI tool. See [Hybrid Cloud Database Solutions with SnapCenter](#) for details on Oracle database backup, restore, and clone with NetApp SnapCenter UI tool.
Where to find additional information

TR-4965: Oracle Database Deployment and Protection in AWS FSx/EC2 with iSCSI/ASM

Allen Cao, Niyaz Mohamed, NetApp

Purpose

ASM (Automatic Storage Management) is a popular Oracle storage volume manager employed in many Oracle installations. It is also Oracle’s recommended storage management solution. It provides an alternative to conventional volume managers and file systems. Since Oracle version 11g, ASM packaged with grid infrastructure rather than a database. As a result, in order to utilize Oracle ASM for storage management without RAC, you must install Oracle grid infrastructure in a standalone server, also known as Oracle Restart. Doing so certainly adds more complexity in Oracle database deployment. However, as the name implies, when Oracle deployed in Restart mode, failed Oracle services restarted automatically by grid infrastructure or after a host reboot without user intervention, which provides a certain degree of high availability or HA functionality.

In this documentation, we demonstrate how to deploy an Oracle database with the iSCSI protocol and Oracle ASM in an Amazon FSx for ONTAP storage environment with EC2 compute instances. We also demonstrate how to use the NetApp SnapCenter service through the NetApp BlueXP console to backup, restore, and clone your Oracle database for dev/test or other use cases for storage-efficient database operation in the AWS public cloud.

This solution addresses the following use cases:

- Oracle database deployment in Amazon FSx for ONTAP storage and EC2 compute instances with iSCSI/ASM
• Testing and validating an Oracle workload in the public AWS cloud with iSCSI/ASM
• Testing and validating Oracle database Restart functionalities deployed in AWS

Audience

This solution is intended for the following people:

• A DBA who would like to deploy Oracle in an AWS public cloud with iSCSI/ASM.
• A database solution architect who would like to test Oracle workloads in the AWS public cloud.
• The storage administrator who would like to deploy and manage an Oracle database deployed to AWS FSx storage.
• The application owner who would like to stand up an Oracle database in AWS FSx/EC2.

Solution test and validation environment

The testing and validation of this solution was performed in an AWS FSx and EC2 environment that might not match the final deployment environment. For more information, see the section [Key Factors for Deployment Consideration].

Architecture

Hardware and software components

<table>
<thead>
<tr>
<th>Hardware</th>
<th>FSx ONTAP storage</th>
<th>Current version offered by AWS</th>
<th>One FSx HA cluster in the same VPC and availability zone</th>
</tr>

| SnapCenter Service | Version | v2.3.1.2324 |

**Key factors for deployment consideration**

- **EC2 compute instances.** In these tests and validations, we used an AWS EC2 t2.xlarge instance type for the Oracle database compute instance. NetApp recommends using an M5 type EC2 instance as the compute instance for Oracle in production deployment because it is optimized for database workloads. You need to size the EC2 instance appropriately for the number of vCPUs and the amount of RAM based on actual workload requirements.

- **FSx storage HA clusters single- or multi-zone deployment.** In these tests and validations, we deployed an FSx HA cluster in a single AWS availability zone. For production deployment, NetApp recommends deploying an FSx HA pair in two different availability zones. An FSx HA cluster is always provisioned in a HA pair that is sync mirrored in a pair of active-passive file systems to provide storage-level redundancy. Multi-zone deployment further enhances high availability in the event of failure in a single AWS zone.

- **FSx storage cluster sizing.** An Amazon FSx for ONTAP storage file system provides up to 160,000 raw SSD IOPS, up to 4GBps throughput, and a maximum of 192TiB capacity. However, you can size the cluster in terms of provisioned IOPS, throughput, and the storage limit (minimum 1,024 GiB) based on your actual requirements at the time of deployment. The capacity can be adjusted dynamically on the fly without affecting application availability.

- **Oracle data and logs layout.** In our tests and validations, we deployed two ASM disk groups for data and logs respectively. Within the +DATA asm disk group, we provisioned four LUNs in a data volume. Within the +LOGS asm disk group, we provisioned two LUNs in a logs volume. In general, multiple LUNs laid out within an Amazon FSx for ONTAP volume provides better performance.

- **iSCSI configuration.** The EC2 instance database server connects to FSx storage with the iSCSI protocol. EC2 instances generally deploy with a single network interface or ENI. The single NIC interface carries both iSCSI and application traffic. It is important to gauge the Oracle database peak I/O throughput requirement by carefully analyzing the Oracle AWR report in order to choose a right EC2 compute instance that meets both application and iSCSI traffic-throughput requirements. NetApp also recommends allocating four iSCSI connections to both FSx iSCSI endpoints with multipath properly configured.

- **Oracle ASM redundancy level to use for each Oracle ASM disk group that you create.** Because FSx already mirrors the storage on the FSx cluster level, you should use External Redundancy, which means that the option does not allow Oracle ASM to mirror the contents of the disk group.
• Database backup. NetApp provides a SaaS version of SnapCenter software service for database backup, restore, and clone in the cloud that is available through the NetApp BlueXP console UI. NetApp recommends implementing such a service to achieve fast (under a minute) SnapShot backup, quick (few minutes) database restore, and database cloning.

Solution deployment

The following section provides step-by-step deployment procedures.

Prerequisites for deployment

Deployment requires the following prerequisites.

1. An AWS account has been set up, and the necessary VPC and network segments have been created within your AWS account.

2. From the AWS EC2 console, you must deploy two EC2 Linux instances, one as the primary Oracle DB server and an optional alternative clone target DB server. See the architecture diagram in the previous section for more details about the environment setup. Also review the User Guide for Linux instances for more information.

3. From the AWS EC2 console, deploy Amazon FSx for ONTAP storage HA clusters to host the Oracle database volumes. If you are not familiar with the deployment of FSx storage, see the documentation Creating FSx for ONTAP file systems for step-by-step instructions.

4. Steps 2 and 3 can be performed using the following Terraform automation toolkit, which creates an EC2 instance named ora_01 and an FSx file system named fsx_01. Review the instruction carefully and change the variables to suit your environment before execution.

```bash
git clone https://github.com/NetApp-Automation/na_aws_fsx_ec2_deploy.git
```

Ensure that you have allocated at least 50G in EC2 instance root volume in order to have sufficient space to stage Oracle installation files.

EC2 instance kernel configuration
With the prerequisites provisioned, log into the EC2 instance as ec2-user and sudo to root user to configure the Linux kernel for Oracle installation.

1. Create a staging directory `/tmp/archive` folder and set the 777 permission.

   ```bash
   mkdir /tmp/archive
   chmod 777 /tmp/archive
   ```

2. Download and stage the Oracle binary installation files and other required rpm files to the `/tmp/archive` directory.

   See the following list of installation files to be stated in `/tmp/archive` on the EC2 instance.

   ```bash
   [ec2-user@ip-172-30-15-58 ~]$ ls -l /tmp/archive
   total 10537316
   -rw-rw-r--. 1 ec2-user ec2-user 19112 Mar 21 15:57 compat-libcap1-1.10-7.el7.x86_64.rpm
   -rw-rw-r--  1 ec2-user ec2-user 3059705302 Mar 21 22:01 LINUX.X64_193000_db_home.zip
   -rw-rw-r--  1 ec2-user ec2-user 2889184573 Mar 21 21:09 LINUX.X64_193000_grid_home.zip
   -rw-rw-r--. 1 ec2-user ec2-user 589145 Mar 21 15:56 netapp_linux_unified_host_utilities-7-1.x86_64.rpm
   -rw-rw-r--. 1 ec2-user ec2-user 31828 Mar 21 15:55 oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
   -rw-rw-r--  1 ec2-user ec2-user 2872741741 Mar 21 22:31 p34762026_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 1843577895 Mar 21 22:32 p34765931_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 124347218 Mar 21 22:33 p6880880_190000_Linux-x86-64.zip
   -rw-rw-r--  1 ec2-user ec2-user 257136 Mar 22 16:25 policycoreutils-python-utils-2.9-9.el8.noarch.rpm
   ```

3. Install Oracle 19c preinstall RPM, which satisfies most kernel configuration requirements.

   ```bash
   yum install /tmp/archive/oracle-database-preinstall-19c-1.0-2.el8.x86_64.rpm
   ```

4. Download and install the missing `compat-libcap1` in Linux 8.
yum install /tmp/archive/compat-libcap1-1.10-7.el7.x86_64.rpm

5. From NetApp, download and install NetApp host utilities.

yum install /tmp/archive/netapp_linux_unified_host_utilities-7-1.x86_64.rpm

6. Install policycoreutils-python-utils, which is not available in the EC2 instance.

yum install /tmp/archive/policycoreutils-python-utils-2.9-9.el8.noarch.rpm

7. Install open JDK version 1.8.

yum install java-1.8.0-openjdk.x86_64

8. Install iSCSI initiator utils.

yum install iscsi-initiator-utils

9. Install sg3_utils.

yum install sg3_utils

10. Install device-mapper-multipath.

yum install device-mapper-multipath

11. Disable transparent hugepages in the current system.

echo never > /sys/kernel/mm/transparent_hugepage/enabled
echo never > /sys/kernel/mm/transparent_hugepage/defrag

Add the following lines in /etc/rc.local to disable transparent_hugepage after reboot:
# Disable transparent hugepages
if test -f /sys/kernel/mm/transparent_hugepage/enabled;
then
echo never > /sys/kernel/mm/transparent_hugepage/enabled
fi
if test -f /sys/kernel/mm/transparent_hugepage/defrag;
then
   echo never > /sys/kernel/mm/transparent_hugepage/defrag
fi

12. Disable selinux by changing SELINUX=enforcing to SELINUX=disabled. You must reboot the host to make the change effective.

   vi /etc/sysconfig/selinux

13. Add the following lines to limit.conf to set the file descriptor limit and stack size without quotes " ".

   vi /etc/security/limits.conf

   
   "* hard nofile 65536"
   "* soft stack 10240"

14. Add swap space to EC2 instance by following this instruction: How do I allocate memory to work as swap space in an Amazon EC2 instance by using a swap file? The exact amount of space to add depends on the size of RAM up to 16G.

15. Change node.session.timeo.replacement_timeout in the iscsi.conf configuration file from 120 to 5 seconds.

   vi /etc/iscsi/iscsid.conf

16. Enable and start the iSCSI service on the EC2 instance.

   systemctl enable iscsid
   systemctl start iscsid

17. Retrieve the iSCSI initiator address to be used for database LUN mapping.

   cat /etc/iscsi/initiatorname.iscsi

18. Add the ASM group to be used for the asm sysasm group.
19. Modify the oracle user to add ASM as a secondary group (the oracle user should have been created after Oracle preinstall RPM installation).

```
usermod -a -G asm oracle
```

20. Stop and disable Linux firewall if it is active.

```
systemctl stop firewalld
systemctl disable firewalld
```

21. Reboot the EC2 instance.

Provision and map database volumes and LUNs to the EC2 instance host
Provision three volumes from the command line by login to FSx cluster via ssh as fsxadmin user with FSx cluster management IP to host the Oracle database binary, data, and logs files.

1. Log into the FSx cluster through SSH as the fsxadmin user.

```bash
ssh fsxadmin@172.30.15.53
```

2. Execute the following command to create a volume for the Oracle binary.

```bash
vol create -volume ora_01_biny -aggregate aggr1 -size 50G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

3. Execute the following command to create a volume for Oracle data.

```bash
vol create -volume ora_01_data -aggregate aggr1 -size 100G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

4. Execute the following command to create a volume for Oracle logs.

```bash
vol create -volume ora_01_logs -aggregate aggr1 -size 100G -state online -type RW -snapshot-policy none -tiering-policy snapshot-only
```

5. Create a binary LUN within the database binary volume.

```bash
lun create -path /vol/ora_01_biny/ora_01_biny_01 -size 40G -ostype linux
```

6. Create data LUNs within the database data volume.

```bash
lun create -path /vol/ora_01_data/ora_01_data_01 -size 20G -ostype linux
lun create -path /vol/ora_01_data/ora_01_data_02 -size 20G -ostype linux
lun create -path /vol/ora_01_data/ora_01_data_03 -size 20G -ostype linux
lun create -path /vol/ora_01_data/ora_01_data_04 -size 20G -ostype linux
```
7. Create log LUNs within the database logs volume.

```bash
lun create -path /vol/ora_01_logs/ora_01_logs_01 -size 40G -ostype linux
lun create -path /vol/ora_01_logs/ora_01_logs_02 -size 40G -ostype linux
```

8. Create an igroup for the EC2 instance with the initiator retrieved from step 14 of the EC2 kernel configuration above.

```bash
```

9. Map the LUNs to the igroup created above. Increment the LUN ID sequentially for each additional LUN within a volume.

```bash
lun map -path /vol/ora_01_biny/ora_01_biny_01 -igroup ora_01 -vserver svm_ora -lun-id 0
lun map -path /vol/ora_01_data/ora_01_data_01 -igroup ora_01 -vserver svm_ora -lun-id 1
lun map -path /vol/ora_01_data/ora_01_data_02 -igroup ora_01 -vserver svm_ora -lun-id 2
lun map -path /vol/ora_01_data/ora_01_data_03 -igroup ora_01 -vserver svm_ora -lun-id 3
lun map -path /vol/ora_01_data/ora_01_data_04 -igroup ora_01 -vserver svm_ora -lun-id 4
lun map -path /vol/ora_01_logs/ora_01_logs_01 -igroup ora_01 -vserver svm_ora -lun-id 5
lun map -path /vol/ora_01_logs/ora_01_logs_02 -igroup ora_01 -vserver svm_ora -lun-id 6
```

10. Validate the LUN mapping.

```bash
mapping show
```

This is expected to return:
FsxId02ad7bf3476b741df::> mapping show
(lun mapping show)

<table>

Database storage configuration
Now, import and set up the FSx storage for the Oracle grid infrastructure and database installation on the EC2 instance host.

1. Log into the EC2 instance via SSH as the ec2-user with your SSH key and EC2 instance IP address.

   ssh -i ora_01.pem ec2-user@172.30.15.58

2. Discover the FSx iSCSI endpoints using either SVM iSCSI IP address. Then change to your environment-specific portal address.

   sudo iscsiadm iscsiadm --mode discovery --op update --type sendtargets --portal 172.30.15.51

3. Establish iSCSI sessions by logging into each target.

   sudo iscsiadm --mode node -l all

The expected output from the command is:

   [ec2-user@ip-172-30-15-58 ~]$ sudo iscsiadm --mode node -l all

4. View and validate a list of active iSCSI sessions.

   sudo iscsiadm --mode session

Return the iSCSI sessions.
5. Verify that the LUNs were imported into the host.

```bash
sudo sanlun lun show
```

This will return a list of Oracle LUNs from FSx.
<table>

</tbody>
</table>

6. Configure the `multipath.conf` file with following default and blacklist entries.
sudo vi /etc/multipath.conf

defaults {
    find_multipaths yes
    user_friendly_names yes
}

blacklist {
    devnode "^(ram|raw|loop|fd|md|dm-|sr|scd|st)[0-9]*"
    devnode "^hd[a-z]"
    devnode "^cciss.*"
}

7. Start the multipath service.

    sudo systemctl start multipathd

Now multipath devices appear in the /dev/mapper directory.

[ec2-user@ip-172-30-15-58 ~]$ ls -l /dev/mapper
total 0
lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c57435472455534e68512d -> ../dm-0
lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c57435472455534e685141 -> ../dm-1
lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c57435472455534e685142 -> ../dm-2
lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c57435472455534e685143 -> ../dm-3

lrwxrwxrwx 1 root root 7 Mar 21 20:13 3600a09806c57435472455534e685146 -> ../dm-6
lrwx------ 1 root root 7 Mar 21 20:13 control

8. Log into the FSx cluster as the fsxadmin user via SSH to retrieve the serial-hex number for each LUN start with 6c574xxx..., the HEX number start with 3600a0980, which is AWS vendor ID.

    lun show -fields serial-hex
FsxId02ad7bf3476b741df::> lun show -fields serial-hex

<table>
<thead>
<tr>
<th>vserver</th>
<th>path</th>
<th>serial-hex</th>
</tr>
</thead>
<tbody>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_biny/ora_01_biny_01</td>
<td>6c574235472455534e68512d</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_data/ora_01_data_01</td>
<td>6c574235472455534e685141</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_data/ora_01_data_02</td>
<td>6c574235472455534e685142</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_data/ora_01_data_03</td>
<td>6c574235472455534e685143</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_data/ora_01_data_04</td>
<td>6c574235472455534e685144</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_logs/ora_01_logs_01</td>
<td>6c574235472455534e685145</td>
</tr>
<tr>
<td>svm_ora</td>
<td>/vol/ora_01_logs/ora_01_logs_02</td>
<td>6c574235472455534e685146</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7 entries were displayed.</td>
</tr>
</tbody>
</table>

9. Update the `/dev/multipath.conf` file to add a user-friendly name for the multipath device.

```bash
sudo vi /etc/multipath.conf
```

with following entries:
multipaths {
  multipath {
    wwid            3600a09806c574235472455534e68512d
    alias           ora_01_biny_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685141
    alias           ora_01_data_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685142
    alias           ora_01_data_02
  }
  multipath {
    wwid            3600a09806c574235472455534e685143
    alias           ora_01_data_03
  }
  multipath {
    wwid            3600a09806c574235472455534e685144
    alias           ora_01_data_04
  }
  multipath {
    wwid            3600a09806c574235472455534e685145
    alias           ora_01_logs_01
  }
  multipath {
    wwid            3600a09806c574235472455534e685146
    alias           ora_01_logs_02
  }
}

10. Reboot the multipath service to verify that the devices under `/dev/mapper` have changed to LUN names versus serial-hex IDs.

    sudo systemctl restart multipathd

Check `/dev/mapper` to return as following:
11. Partition the binary LUN with a single primary partition.

```bash
sudo fdisk /dev/mapper/ora_01_biny_01
```

12. Format the partitioned binary LUN with an XFS file system.

```bash
sudo mkfs.xfs /dev/mapper/ora_01_biny_01p1
```

13. Mount the binary LUN to /u01.

```bash
sudo mount -t xfs /dev/mapper/ora_01_biny_01p1 /u01
```

14. Change /u01 mount point ownership to the Oracle user and it's associated primary group.

```bash
sudo chown oracle:oinstall /u01
```

15. Find the UUI of the binary LUN.

```bash
sudo blkid /dev/mapper/ora_01_biny_01p1
```

16. Add a mount point to /etc/fstab.
Add the following line.

```
UUID=d89fb1c9-4f89-4de4-b4d9-17754036d11d /u01 xfs
defaults,nofail 0 2
```

It is important to mount the binary with only the UUID and with the nofail option to avoid possible root-lock issues during EC2-instance reboot.

17. As the root user, add the udev rule for Oracle devices.

```
vi /etc/udev/rules.d/99-oracle-asmdevices.rules
```

Include following entries:

```
ENV{DM_NAME}=="ora*", GROUP=="oinstall", OWNER=="oracle",
MODE="660"
```

18. As the root user, reload the udev rules.

```
udevadm control --reload-rules
```

19. As the root user, trigger the udev rules.

```
udevadm trigger
```

20. As the root user, reload multipathd.

```
systemctl restart multipathd
```

21. Reboot the EC2 instance host.

**Oracle grid infrastructure installation**
1. Log into the EC2 instance as the ec2-user via SSH and enable password authentication by uncommenting `PasswordAuthentication yes` and then commenting out `PasswordAuthentication no`.

   ```bash
   sudo vi /etc/ssh/sshd_config
   ```

2. Restart the sshd service.

   ```bash
   sudo systemctl restart sshd
   ```

3. Reset the Oracle user password.

   ```bash
   sudo passwd oracle
   ```

4. Log in as the Oracle Restart software owner user (oracle). Create an Oracle directory as follows:

   ```bash
   mkdir -p /u01/app/oracle
   mkdir -p /u01/app/oraInventory
   ```

5. Change the directory permission setting.

   ```bash
   chmod -R 775 /u01/app
   ```

6. Create a grid home directory and change to it.

   ```bash
   mkdir -p /u01/app/oracle/product/19.0.0/grid
   cd /u01/app/oracle/product/19.0.0/grid
   ```

7. Unzip the grid installation files.

   ```bash
   unzip -q /tmp/archive/LINUX_X64_193000_grid_home.zip
   ```

8. From grid home, delete the OPatch directory.

   ```bash
   rm -rf OPatch
   ```

9. From grid home, unzip `p6880880_190000_Linux-x86-64.zip`. 
10. From grid home, revise `cv/admin/cvu_config`, uncomment and replace `CV_ASSUME_DISTID=OEL5` with `CV_ASSUME_DISTID=OL7`.

```bash
vi cv/admin/cvu_config
```

11. Prepare a `gridsetup.rsp` file for silent installation and place the `rsp` file in the `/tmp/archive` directory. The `rsp` file should cover sections A, B, and G with the following information:

```plaintext
INVENTORY_LOCATION=/u01/app/oraInventory
oracle.install.option=HA_CONFIG
ORACLE_BASE=/u01/app/oracle
oracle.install.asm.OSDBA=dba
oracle.install.asm.OSOPER=oper
oracle.install.asm.OSASM=asm
oracle.install.asm.SYSASMPassword="SetPWD"
oracle.install.asm.diskGroup.name=DATA
oracle.install.asm.diskGroup.redundancy=EXTERNAL
oracle.install.asm.diskGroup.AUSize=4
oracle.install.asm.diskGroup.disks=/dev/mapper/ora_01_data_01,/dev/mapper/ora_01_data_02,/dev/mapper/ora_01_data_03,/dev/mapper/ora_01_data_04
oracle.install.asm.diskGroup.diskDiscoveryString=/dev/mapper/*
oracle.install.asm.monitorPassword="SetPWD"
oracle.install.asm.configureAFD=true
```

12. Log into the EC2 instance as the root user and set `ORACLE_HOME` and `ORACLE_BASE`.

```bash
export ORACLE_HOME=/u01/app/oracle/product/19.0.0/grid
export ORACLE_BASE=/tmp
cd /u01/app/oracle/product/19.0.0/grid/bin
```

13. Provision disk devices for use with the Oracle ASM filter driver.
14. Install cvuqdisk-1.0.10-1.rpm.

```bash
rpm -ivh /u01/app/oracle/product/19.0.0/grid/cv/rpm/cvuqdisk-1.0.10-1.rpm
```

15. Unset $ORACLE_BASE.

```bash
unset ORACLE_BASE
```

16. Log into the EC2 instance as the Oracle user and extract the patch in the /tmp/archive folder.

```bash
unzip /tmp/archive/p34762026_190000_Linux-x86-64.zip -d /tmp/archive
```

17. From grid home /u01/app/oracle/product/19.0.0/grid and as the oracle user, launch gridSetup.sh for grid infrastructure installation.

```bash
./gridSetup.sh -applyRU /tmp/archive/34762026/ -silent -responseFile /tmp/archive/gridsetup.rsp
```

Ignore the warnings about wrong groups for grid infrastructure. We are using a single Oracle user to manage Oracle Restart, so this is expected.

18. As root user, execute the following script(s):

```bash
/u01/app/oraInventory/orainstRoot.sh
```

```bash
/u01/app/oracle/product/19.0.0/grid/root.sh
```

19. As root user, reload the multipathd.
systemctl restart multipathd

20. As the Oracle user, execute the following command to complete the configuration:

```
/u01/app/oracle/product/19.0.0/grid/gridSetup.sh -executeConfigTools -responseFile /tmp/archive/gridsetup.rsp -silent
```

21. As the Oracle user, create the LOGS disk group.

```
bin/asmca -silent -sysAsmPassword 'yourPWD' -asmsnmpPassword 'yourPWD' -createDiskGroup -diskGroupName LOGS -disk 'AFD:LOGS*' -redundancy EXTERNAL -au_size 4
```

22. As the Oracle user, validate grid services after installation configuration.

```
bin/crsctl stat res -t
+

Oracle database installation
1. Log in as the Oracle user and unset $ORACLE_HOME and $ORACLE_SID if it is set.

```bash
unset ORACLE_HOME
unset ORACLE_SID
```

2. Create the Oracle DB home directory and change to it.

```bash
mkdir /u01/app/oracle/product/19.0.0/db1
cd /u01/app/oracle/product/19.0.0/db1
```

3. Unzip the Oracle DB installation files.

```bash
unzip -q /tmp/archive/LINUX.X64_193000_db_home.zip
```

4. From the DB home, delete the OPatch directory.

```bash
rm -rf OPatch
```

5. From DB home, unzip p6880880_190000_Linux-x86-64.zip.

```bash
unzip -q /tmp/archive/p6880880_190000_Linux-x86-64.zip
```

6. From DB home, revise cv/admin/cvu_config, and uncomment and replace
   CV_ASSUME_DISTID=OEL5 with CV_ASSUME_DISTID=OL7.

```bash
vi cv/admin/cvu_config
```

7. From the /tmp/archive directory, unpack the DB 19.18 RU patch.

```bash
unzip p34765931_190000_Linux-x86-64.zip
```

8. Prepare the DB silent install rsp file in /tmp/archive/dbinstall.rsp directory with the following values:
oracle.install.option=INSTALL_DB_SWONLY
UNIX_GROUP_NAME=oinstall
INVENTORY_LOCATION=/u01/app/oraInventory
ORACLE_HOME=/u01/app/oracle/product/19.0.0/db1
ORACLE_BASE=/u01/app/oracle
oracle.install.db.InstallEdition=EE
oracle.install.db.OSDBA_GROUP=dba
oracle.install.db.OSOPER_GROUP=oper
oracle.install.db.OSBACKUPDBA_GROUP=oper
oracle.install.db.OSDGDBA_GROUP=dba
oracle.install.db.OSKMDBA_GROUP=dba
oracle.install.db.OSRACDBA_GROUP=dba
oracle.install.db.rootconfig.executeRootScript=false

9. From db1 home /u01/app/oracle/product/19.0.0/db1, execute silent software-only DB installation.

    ./runInstaller -applyRU /tmp/archive/34765931/ -silent
    -ignorePrereqFailure -responseFile /tmp/archive/dbinstall.rsp

10. As root user, run the root.sh script after software-only installation.

    /u01/app/oracle/product/19.0.0/db1/root.sh

11. As Oracle user, create the dbca.rsp file with the following entries:
12. As Oracle user, launch DB creation with dbca.
bin/dbca -silent -createDatabase -responseFile /tmp/archive/dbca.rsp

output:

17. Set the DB recovery destination size to the +LOGS disk group size.

```
alter system set db_recovery_file_dest_size = 80G scope=both;
```

18. Log into the database with sqlplus and enable archive log mode.

```
sqlplus /as sysdba.
shutdown immediate;
startup mount;
alter database archivelog;
alter database open;
```

This completes Oracle 19c version 19.18 Restart deployment on an Amazon FSx for ONTAP and EC2 compute instance. If desired, NetApp recommends relocating the Oracle control file and online log files to the +LOGS disk group.

**Automated deployment option**

NetApp will release a fully automated solution deployment toolkit with Ansible to facilitate the implementation of this solution. Please check back for the availability of the toolkit. After it is released, a link will be posted here.

**Oracle Database backup, restore, and clone with SnapCenter Service**

See SnapCenter Services for Oracle for details on Oracle database backup, restore, and clone with NetApp BlueXP console.

Oracle Database Deployment on AWS EC2 and FSx Best Practices

WP-7357: Oracle Database Deployment on EC2 and FSx Best Practices

Introduction

Allen Cao, Niyaz Mohamed, Jeffrey Steiner, NetApp

Many mission-critical enterprise Oracle databases are still hosted on-premises, and many enterprises are looking to migrate these Oracle databases to a public cloud. Often, these Oracle databases are application centric and thus require user-specific configurations, a capability that is missing from many database-as-a-service public-cloud offerings. Therefore, the current database landscape calls for a public-cloud-based Oracle database solution built from a high-performance, scalable compute and storage service that can accommodate unique requirements. AWS EC2 compute instances and the AWS FSx storage service might be the missing pieces of this puzzle that you can leverage to build and migrate your mission critical Oracle database workloads to a public cloud.

Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for enterprises. The simple Amazon EC2 web-service interface allows you to obtain and configure capacity with minimal friction. It provides you with complete control of your computing resources and lets you run on Amazon’s proven computing environment.
Amazon FSx for ONTAP is an AWS storage service that uses industry-leading NetApp ONTAP block and file storage, which exposes NFS, SMB, and iSCSI. With such a powerful storage engine, it has never been easier to relocate mission-critical Oracle database apps to AWS with sub-millisecond response times, multiple GBps of throughput, and 100,000+ IOPS per database instance. Better yet, the FSx storage service comes with native replication capability that allows you to easily migrate your on-premises Oracle database to AWS or to replicate your mission critical Oracle database to a secondary AWS availability zone for HA or DR.

The goal of this documentation is to provide step-by-step processes, procedures, and best-practice guidance on how to deploy and configure an Oracle database with FSx storage and an EC2 instance that delivers performance similar to an on-premises system. NetApp also provides an automation toolkit that automates most of the tasks that are required for the deployment, configuration, and management of your Oracle database workload in the AWS public cloud.

To learn more about the solution and use case, take a look at following overview video:

Modernize your Oracle database with hybrid cloud in AWS and FSx ONTAP, Part1 - Use case and solution architecture

**Solution architecture**

The following architecture diagram illustrates a highly available Oracle database deployment on an AWS EC2 instance with the FSx storage service. A similar deployment scheme but with the standby in a different region can be set up for disaster recovery.

Within the environment, the Oracle compute instance is deployed via an AWS EC2 instance console. There are multiple EC2 instance types available from the console. NetApp recommends deploying a database-oriented EC2 instance type such as an m5 Ami image with RedHat enterprise Linux 8 and up to 10Gbps of network bandwidth.

Oracle database storage on FSx volumes on the other hand is deployed with the AWS FSx console or CLI. The Oracle binary, data, or log volumes are subsequently presented and mounted on an EC2 instance Linux host. Each data or log volume can have multiple LUNs allocated depending on the underlying storage protocol employed.
An FSx storage cluster is designed with double redundancy, so that both the primary and standby storage clusters are deployed in two different availability zones. Database volumes are replicated from a primary FSx cluster to a standby FSx cluster at a user-configurable interval for all Oracle binary, data, and log volumes.

This high availability Oracle environment is managed with an Ansible controller node and a SnapCenter backup server and UI tool. Oracle installation, configuration, and replication are automated using Ansible playbook-based tool kits. Any update to the Oracle EC2 instance kernel operating system or Oracle patching can be executed in parallel to keep the primary and standby in sync. In fact, the initial automation setup can be easily expanded to perform some repeating daily Oracle tasks if needed.

SnapCenter provides workflows for Oracle database point-in-time recovery or for database cloning at either the primary or standby zones if needed. Through the SnapCenter UI, you can configure Oracle database backup and replication to standby FSx storage for high availability or disaster recovery based on your RTO or RPO objectives.

The solution provides an alternative process that delivers capabilities similar to those available from Oracle RAC and Data Guard deployment.

**Factors to consider for Oracle database deployment**

A public cloud provides many choices for compute and storage, and using the correct type of compute instance and storage engine is a good place to start for database deployment. You should also select compute and storage configurations that are optimized for Oracle databases.

The following sections describe the key considerations when deploying Oracle database in an AWS public cloud on an EC2 instance with FSx storage.
VM performance

Selecting the right VM size is important for optimal performance of a relational database in a public cloud. For better performance, NetApp recommends using an EC2 M5 Series instance for Oracle deployment, which is optimized for database workloads. The same instance type is also used to power a RDS instance for Oracle by AWS.

- Choose the correct vCPU and RAM combination based on workload characteristics.
- Add swap space to a VM. The default EC2 instance deployment does not create a swap space, which is not optimal for a database.

Storage layout and settings

NetApp recommends the following storage layout:

- For NFS storage, the recommended volume layout is three volumes: one for the Oracle binary; one for Oracle data and a duplicate control file; and one for the Oracle active log, archived log, and control file.

- For iSCSI storage, the recommended volume layout is three volumes: one for the Oracle binary; one for Oracle data and a duplicate control file; and one for the Oracle active log, archived log, and control file. However, each data and log volume ideally should contain four LUNs. The LUNs are ideally balanced on the HA cluster nodes.

- For storage IOPS and throughput, you can choose the threshold for provisioned IOPS and throughput for the FSx storage cluster, and these parameters can be adjusted on the fly anytime the workload changes.
  - The auto IOPS setting is three IOPS per GiB of allocated storage capacity or user defined storage up to 80,000.
The throughput level is incremented as follow: 128, 256, 512, 1024, 2048 MBps.

Review the Amazon FSx for NetApp ONTAP performance documentation when sizing throughput and IOPS.

NFS configuration

Linux, the most common operating system, includes native NFS capabilities. Oracle offers the direct NFS (dNFS) client natively integrated into Oracle. Oracle has supported NFSv3 for over 20 years. dNFS is supported with NFSv3 with all versions of Oracle. NFSv4 is supported with all OS's that follow the NFSv4 standard. dNFS support for NFSv4 requires Oracle 12.1.0.2 or higher. NFSv4.1 requires specific OS support. Consult the NetApp Interoperability Matrix Tool (IMT) for supported OS’s. dNFS support for NFSv4.1 requires Oracle version 19.3.0.0 or higher.

Automated Oracle deployment using the NetApp automation toolkit automatically configures dNFS on NFSv3.

Other factors to consider:

- TCP slot tables are the NFS equivalent of host-bus-adapter (HBA) queue depth. These tables control the number of NFS operations that can be outstanding at any one time. The default value is usually 16, which is far too low for optimum performance. The opposite problem occurs on newer Linux kernels, which can automatically increase the TCP slot table limit to a level that saturates the NFS server with requests.

For optimum performance and to prevent performance problems, adjust the kernel parameters that control the TCP slot tables to 128.

```
sysctl -a | grep tcp.*.slot_table
```

- The following table provides recommended NFS mount options for Linux NFSv3 - single instance.

<table>
<thead>
<tr>
<th>File Type</th>
<th>Mount Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control files</td>
<td>rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536</td>
</tr>
<tr>
<td>Data files</td>
<td></td>
</tr>
<tr>
<td>Redo logs</td>
<td></td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536</td>
</tr>
<tr>
<td>ORACLE_BASE</td>
<td></td>
</tr>
</tbody>
</table>

Before using dNFS, verify that the patches described in Oracle Doc 1495104.1 are installed. The NetApp Support matrix for NFSv3 and NFSv4 do not include specific operating systems. All OSs that obey the RFC are supported. When searching the online IMT for NFSv3 or NFSv4 support, do not select a specific OS because no matches will be displayed. All OSs are implicitly supported by the general policy.

High availability

As indicated in the solution architecture, HA is built on storage-level replication. Therefore, the startup and availability of Oracle is contingent on how quickly the compute and storage can be brought up and recovered. See the following key factors:

- Have a standby compute instance ready and synced up with the primary through Ansible parallel update to
both hosts.

- Replicate the binary volume from the primary for standby purposes so that you do not need to install Oracle at the last minute and figure out what needs to be installed and patched.

- Replication frequency dictates how fast the Oracle database can be recovered to make service available. There is a trade off between the replication frequency and storage consumption.

- Leverage automation to make recovery and switch over to standby quick and free of human error. NetApp provides an automation toolkit for this purpose.

### Step-by-Step Oracle Deployment Procedures on AWS EC2 and FSx

This section describes the deployment procedures of deploying Oracle RDS custom database with FSx storage.

**Deploy an EC2 Linux instance for Oracle via EC2 console**

If you are new to AWS, you first need to set up an AWS environment. The documentation tab at the AWS website landing page provides EC2 instruction links on how to deploy a Linux EC2 instance that can be used to host your Oracle database via the AWS EC2 console. The following section is a summary of these steps. For details, see the linked AWS EC2-specific documentation.

**Setting up your AWS EC2 environment**

You must create an AWS account to provision the necessary resources to run your Oracle environment on the EC2 and FSx service. The following AWS documentation provides the necessary details:

- [Set up to use Amazon EC2](#)

Key topics:

- Sign up for AWS.
- Create a key pair.
- Create a security group.

**Enabling multiple availability zones in AWS account attributes**

For an Oracle high availability configuration as demonstrated in the architecture diagram, you must enable at least four availability zones in a region. The multiple availability zones can also be situated in different regions to meet the required distances for disaster recovery.
Creating and connecting to an EC2 instance for hosting Oracle database

See the tutorial Get started with Amazon EC2 Linux instances for step-by-step deployment procedures and best practices.

Key topics:

- Overview.
- Prerequisites.
- Step 1: Launch an instance.
- Step 2: Connect to your instance.
- Step 3: Clean up your instance.

The following screen shots demonstrate the deployment of an m5-type Linux instance with the EC2 console for running Oracle.

1. From the EC2 dashboard, click the yellow Launch Instance button to start the EC2 instance deployment workflow.
2. In Step 1, select "Red Hat Enterprise Linux 8 (HVM), SSD Volume Type - ami-0b0af3577fe5e3532 (64-bit x86) / ami-01fc429821bf1f4b4 (64-bit Arm)."

3. In Step 2, select an m5 instance type with the appropriate CPU and memory allocation based on your Oracle database workload. Click "Next: Configure Instance Details."

4. In Step 3, choose the VPC and subnet where the instance should be placed and enable public IP assignment. Click "Next: Add Storage."
5. In Step 4, allocate enough space for the root disk. You may need the space to add a swap. By default, EC2 instance assign zero swap space, which is not optimal for running Oracle.

6. In Step 5, add a tag for instance identification if needed.
7. In Step 6, select an existing security group or create a new one with the desired inbound and outbound policy for the instance.

8. In Step 7, review the instance configuration summary, and click Launch to start instance deployment. You are prompted to create a key pair or select a key pair for access to the instance.
9. Log into EC2 instance using an SSH key pair. Make changes to your key name and instance IP address as appropriate.

```
ssh -i ora-db1v2.pem ec2-user@54.80.114.77
```

You need to create two EC2 instances as primary and standby Oracle servers in their designated availability.
zone as demonstrated in the architecture diagram.

**Provision FSx for ONTAP file systems for Oracle database storage**

EC2 instance deployment allocates an EBS root volume for the OS. FSx for ONTAP file systems provides Oracle database storage volumes, including the Oracle binary, data, and log volumes. The FSx storage NFS volumes can be either provisioned from the AWS FSx console or from Oracle installation, and configuration automation that allocates the volumes as the user configures in a automation parameter file.

**Creating FSx for ONTAP file systems**

Referred to this documentation Managing FSx for ONTAP file systems for creating FSx for ONTAP file systems.

Key considerations:

- SSD storage capacity. Minimum 1024 GiB, maximum 192 TiB.
- Provisioned SSD IOPS. Based on workload requirements, a maximum of 80,000 SSD IOPS per file system.
- Throughput capacity.
- Set administrator fsxadmin/vsadmin password. Required for FSx configuration automation.
- Backup and maintenance. Disable automatic daily backups; database storage backup is executed through SnapCenter scheduling.
- Retrieve the SVM management IP address as well as protocol-specific access addresses from SVM details page. Required for FSx configuration automation.

See the following step-by-step procedures for setting up either a primary or standby HA FSx cluster.

1. From the FSx console, click Create File System to start the FSx provision workflow.
2. Select Amazon FSx for NetApp ONTAP. Then click Next.

3. Select Standard Create and, in File System Details, name your file system, Multi-AZ HA. Based on your database workload, choose either Automatic or User-Provisioned IOPS up to 80,000 SSD IOPS. FSx storage comes with up to 2TiB NVMe caching at the backend that can deliver even higher measured IOPS.
4. In the Network & Security section, select the VPC, security group, and subnets. These should be created before FSx deployment. Based on the role of the FSx cluster (primary or standby), place the FSx storage nodes in the appropriate zones.
5. In the Security & Encryption section, accept the default, and enter the fsxadmin password.

### Security & encryption

<table>
<thead>
<tr>
<th>Description</th>
<th>Account</th>
<th>KMS key ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default master key that protects my FSx resources when no other key is defined</td>
<td>759995470648</td>
<td>5b31f2f3-6759-4306-a852-9c99a743982a</td>
</tr>
</tbody>
</table>

**File system administrative password**

Password for this file system's "fsxadmin" user, which you can use to access the ONTAP CLI or REST API.

- [ ] Don't specify a password
- [x] Specify a password

**Password**

**Confirm password**
6. Enter the SVM name and the vsadmin password.

7. Leave the volume configuration blank; you do not need to create a volume at this point.
8. Review the Summary page, and click Create File System to complete FSx file system provision.
Provisioning of database volumes for Oracle database

See Managing FSx for ONTAP volumes - creating a volume for details.

Key considerations:

• Sizing the database volumes appropriately.
• Disabling capacity pool tiering policy for performance configuration.
• Enabling Oracle dNFS for NFS storage volumes.
• Setting up multipath for iSCSI storage volumes.

Create database volume from FSx console

From the AWS FSx console, you can create three volumes for Oracle database file storage: one for the Oracle binary, one for the Oracle data, and one for the Oracle log. Make sure that volume naming matches the Oracle host name (defined in the hosts file in the automation toolkit) for proper identification. In this example, we use db1 as the EC2 Oracle host name instead of a typical IP-address-based host name for an EC2 instance.
Create volume

File system
ONTAP | fs-0a51a3f08922224d5 | rdscustomfs007

Storage virtual machine
svm-005c6edf027866ca4 | fsx

Volume name
db1_bin

Maximum of 203 alphanumeric characters, plus _.

Junction path
/db1_bin

The location within your file system where your volume will be mounted.

Volume size
51200

Minimum 20 MiB; Maximum 104857600 MiB

Storage efficiency
Select whether you would like to enable ONTAP storage efficiencies on your volume: deduplication, compression, and compaction.

- Enabled (recommended)
- Disabled

Capacity pool tiering policy
You can optionally enable automatic tiering of your data to lower-cost capacity pool storage.

- None

Cancel Confirm
Create volume

Storage efficiency
Select whether you would like to enable ONTAP storage efficiencies on your volume: deduplication, compression, and compaction.

- Enabled (recommended)
- Disabled

Capacity pool tiering policy
You can optionally enable automatic tiering of your data to lower-cost capacity pool storage.

None

Cancel  Confirm
Creating iSCSI LUNs is not currently supported by the FSx console. For iSCSI LUNs deployment for Oracle, the volumes and LUNs can be created by using automation for ONTAP with the NetApp Automation Toolkit.

Install and configure Oracle on an EC2 instance with FSx database volumes

The NetApp automation team provide an automation kit to run Oracle installation and configuration on EC2 instances according to best practices. The current version of the automation kit supports Oracle 19c on NFS with the default RU patch 19.8. The automation kit can be easily adapted for other RU patches if needed.
Prepare an Ansible controller to run automation

Follow the instruction in the section "Creating and connecting to an EC2 instance for hosting Oracle database" to provision a small EC2 Linux instance to run the Ansible controller. Rather than using RedHat, Amazon Linux t2.large with 2vCPU and 8G RAM should be sufficient.

Retrieve NetApp Oracle deployment automation toolkit

Log into the EC2 Ansible controller instance provisioned from step 1 as ec2-user and from the ec2-user home directory, execute the `git clone` command to clone a copy of the automation code.

```
git clone https://github.com/NetApp-Automation/na_oracle19c_deploy.git
```

```
git clone https://github.com/NetApp-Automation/na_rds_fsx_oranfs_config.git
```

Execute automated Oracle 19c deployment using automation toolkit

See these detailed instruction [CLI deployment Oracle 19c Database](#) to deploy Oracle 19c with CLI automation. There is a small change in command syntax for playbook execution because you are using an SSH key pair instead of a password for host access authentication. The following list is a high level summary:

1. By default, an EC2 instance uses an SSH key pair for access authentication. From Ansible controller automation root directories `/home/ec2-user/na_oracle19c_deploy`, and `/home/ec2-user/na_rds_fsx_oranfs_config`, make a copy of the SSH key `accessststkey.pem` for the Oracle host deployed in the step "Creating and connecting to an EC2 instance for hosting Oracle database."

2. Log into the EC2 instance DB host as ec2-user, and install the python3 library.

```
sudo yum install python3
```

3. Create a 16G swap space from the root disk drive. By default, an EC2 instance creates zero swap space. Follow this AWS documentation: [How do I allocate memory to work as swap space in an Amazon EC2 instance by using a swap file?](#).

4. Return to the Ansible controller (cd `/home/ec2-user/na_rds_fsx_oranfs_config`), and execute the preclone playbook with the appropriate requirements and `linux_config` tags.

```
ansible-playbook -i hosts rds_preclone_config.yml -u ec2-user --private -key accessststkey.pem -e @vars/fsx_vars.yml -t requirements_config
```

```
ansible-playbook -i hosts rds_preclone_config.yml -u ec2-user --private -key accessststkey.pem -e @vars/fsx_vars.yml -t linux_config
```

5. Switch to the `/home/ec2-user/na_oracle19c_deploy-master` directory, read the README file, and populate the global `vars.yml` file with the relevant global parameters.
6. Populate the `host_name.yml` file with the relevant parameters in the `host_vars` directory.

7. Execute the playbook for Linux, and press Enter when prompted for the vsadmin password.

   ```bash
   ansible-playbook -i hosts all_playbook.yml -u ec2-user --private-key accesststkey.pem -t linux_config -e @vars/vars.yml
   ```

8. Execute the playbook for Oracle, and press enter when prompted for the vsadmin password.

   ```bash
   ansible-playbook -i hosts all_playbook.yml -u ec2-user --private-key accesststkey.pem -t oracle_config -e @vars/vars.yml
   ```

Change the permission bit on the SSH key file to 400 if needed. Change the Oracle host (ansible_host in the host_vars file) IP address to your EC2 instance public address.

**Setting up SnapMirror between primary and standby FSx HA cluster**

For high availability and disaster recovery, you can set up SnapMirror replication between the primary and standby FSx storage cluster. Unlike other cloud storage services, FSx enables a user to control and manage storage replication at a desired frequency and replication throughput. It also enables users to test HA/DR without any effect on availability.

The following steps show how to set up replication between a primary and standby FSx storage cluster.

1. Setup primary and standby cluster peering. Log into the primary cluster as the fsxadmin user and execute the following command. This reciprocal create process executes the create command on both the primary cluster and the standby cluster. Replace `standby_cluster_name` with the appropriate name for your environment.

   ```bash
   cluster peer create -peer-addrs standby_cluster_name,inter_cluster_ip_address -username fsxadmin -initial-allowed-vserver-peers *
   ```

2. Set up vServer peering between the primary and standby cluster. Log into the primary cluster as the vsadmin user and execute the following command. Replace `primary_vserver_name`, `standby_vserver_name`, `standby_cluster_name` with the appropriate names for your environment.

   ```bash
   vserver peer create -vserver primary_vserver_name -peer-vserver standby_vserver_name -peer-cluster standby_cluster_name -applications snapmirror
   ```

3. Verify that the cluster and vserver peerings are set up correctly.
4. Create target NFS volumes at the standby FSx cluster for each source volume at the primary FSx cluster. Replace the volume name as appropriate for your environment.

```bash
vol create -volume dr_db1_bin -aggregate aggr1 -size 50G -state online -policy default -type DP
vol create -volume dr_db1_data -aggregate aggr1 -size 500G -state online -policy default -type DP
vol create -volume dr_db1_log -aggregate aggr1 -size 250G -state online -policy default -type DP
```

5. You can also create iSCSI volumes and LUNs for the Oracle binary, Oracle data, and the Oracle log if the iSCSI protocol is employed for data access. Leave approximately 10% free space in the volumes for snapshots.

```bash
vol create -volume dr_db1_bin -aggregate aggr1 -size 50G -state online -policy default -unix-permissions ---rwxr-xr-x -type RW
lun create -path /vol/dr_db1_bin/dr_db1_bin_01 -size 45G -ostype linux
vol create -volume dr_db1_data -aggregate aggr1 -size 500G -state online -policy default -unix-permissions ---rwxr-xr-x -type RW
lun create -path /vol/dr_db1_data/dr_db1_data_01 -size 100G -ostype linux
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lun create -path /vol/dr_db1_data/dr_db1_data_02 -size 100G -ostype linux</td>
<td>Create LUN with path /vol/dr_db1_data/dr_db1_data_02, size 100G, and Linux operating type.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_data/dr_db1_data_03 -size 100G -ostype linux</td>
<td>Repeat for LUNs 03 and 04.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_data/dr_db1_data_04 -size 100G -ostype linux</td>
<td></td>
</tr>
<tr>
<td>vol create -volume dr_db1_log -aggregate aggr1 -size 250G -state online -policy default -unix-permissions ---rwxr-xr-x -type RW</td>
<td>Create volume with path /vol/dr_db1_log, size 250G, online state, default policy, and Unix permissions.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_log/dr_db1_log_01 -size 45G -ostype linux</td>
<td>Create LUN with path /vol/dr_db1_log/dr_db1_log_01, size 45G, and Linux operating type.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_log/dr_db1_log_02 -size 45G -ostype linux</td>
<td>Repeat for LUNs 02 and 03.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_log/dr_db1_log_03 -size 45G -ostype linux</td>
<td>Repeat for LUN 04.</td>
</tr>
<tr>
<td>lun create -path /vol/dr_db1_log/dr_db1_log_04 -size 45G -ostype linux</td>
<td>Repeat for LUN 04.</td>
</tr>
</tbody>
</table>

6. For iSCSI LUNs, create mapping for the Oracle host initiator for each LUN, using the binary LUN as an example. Replace the igroup with an appropriate name for your environment, and increment the lun-id for each additional LUN.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lun mapping create -path /vol/dr_db1_bin/dr_db1_bin_01 -igroup ip-10-0-1-136 -lun-id 0</td>
<td>Map LUN /vol/dr_db1_bin/dr_db1_bin_01 to IP 10.0.1.136 with lun-id 0.</td>
</tr>
<tr>
<td>lun mapping create -path /vol/dr_db1_data/dr_db1_data_01 -igroup ip-10-0-1-136 -lun-id 1</td>
<td>Map LUN /vol/dr_db1_data/dr_db1_data_01 to IP 10.0.1.136 with lun-id 1.</td>
</tr>
</tbody>
</table>

7. Create a SnapMirror relationship between the primary and standby database volumes. Replace the appropriate SVM name for your environment.
snapmirror create -source-path svm_FSxOraSource:db1_bin -destination -path svm_FSxOraTarget:dr_db1_bin -vserver svm_FSxOraTarget -throttle unlimited -identity-preserve false -policy MirrorAllSnapshots -type DP

snapmirror create -source-path svm_FSxOraSource:db1_data -destination -path svm_FSxOraTarget:dr_db1_data -vserver svm_FSxOraTarget -throttle unlimited -identity-preserve false -policy MirrorAllSnapshots -type DP

snapmirror create -source-path svm_FSxOraSource:db1_log -destination -path svm_FSxOraTarget:dr_db1_log -vserver svm_FSxOraTarget -throttle unlimited -identity-preserve false -policy MirrorAllSnapshots -type DP

This SnapMirror setup can be automated with a NetApp Automation Toolkit for NFS database volumes. The toolkit is available for download from the NetApp public GitHub site.

git clone https://github.com/NetApp-Automation/na_ora_hadr_failover_resync.git

Read the README instructions carefully before attempting setup and failover testing.

Replicating the Oracle binary from the primary to a standby cluster might have Oracle license implications. Contact your Oracle license representative for clarification. The alternative is to have Oracle installed and configured at the time of recovery and failover.

SnapCenter Deployment

SnapCenter installation

Follow Installing the SnapCenter Server to install SnapCenter server. This documentation covers how to install a standalone SnapCenter server. A SaaS version of SnapCenter is in beta review and could be available shortly. Check with your NetApp representative for availability if needed.

Configure SnapCenter plugin for EC2 Oracle host

1. After automated SnapCenter installation, log into SnapCenter as an administrative user for the Window host on which the SnapCenter server is installed.
2. From the left-side menu, click Settings, and then Credential and New to add ec2-user credentials for SnapCenter plugin installation.

3. Reset the ec2-user password and enable password SSH authentication by editing the `/etc/ssh/sshd_config` file on the EC2 instance host.

4. Verify that the "Use sudo privileges" checkbox is selected. You just reset the ec2-user password in the previous step.
5. Add the SnapCenter server name and the IP address to the EC2 instance host file for name resolution.

```bash
[ec2-user@ip-10-0-0-151 ~]$ sudo vi /etc/hosts
[ec2-user@ip-10-0-0-151 ~]$ cat /etc/hosts
127.0.0.1   localhost localhost.localdomain localhost4
localhost4.localdomain4
::1         localhost localhost.localdomain localhost6
localhost6.localdomain6
10.0.1.233  rdscustomvalsc.rdscustomval.com rdscustomvalsc
```

6. On the SnapCenter server Windows host, add the EC2 instance host IP address to the Windows host file C:\Windows\System32\drivers\etc\hosts.

```
10.0.0.151      ip-10-0-0-151.ec2.internal
```

7. In the left-side menu, select Hosts > Managed Hosts, and then click Add to add the EC2 instance host to SnapCenter.
Check Oracle Database, and, before you submit, click More Options.

Select Plug-ins to Install SnapCenter Plug-ins Package 4.5 P2 for Linux

Oracle Database
SAP HANA
More Options: Port, Install Path, Custom Plug-Ins...

Submit Cancel

Check Skip Preinstall Checks. Confirm Skipping Preinstall Checks, and then click Submit After Save.
You are prompted with Confirm Fingerprint, and then click Confirm and Submit.

After successful plugin configuration, the managed host’s overall status show as Running.

Configure backup policy for Oracle database

Refer to this section Setup database backup policy in SnapCenter for details on configuring the Oracle database backup policy.

Generally you need create a policy for the full snapshot Oracle database backup and a policy for the Oracle archive-log-only snapshot backup.
Configure Oracle database backup and scheduling

Database backup in SnapCenter is user configurable and can be set up either individually or as a group in a resource group. The backup interval depends on the RTO and RPO objectives. NetApp recommends that you run a full database backup every few hours and archive the log backup at a higher frequency such as 10-15 mins for quick recovery.

Refer to the Oracle section of Implement backup policy to protect database for a detailed step-by-step processes for implementing the backup policy created in the section Configure backup policy for Oracle database and for backup job scheduling.

The following image provides an example of the resources groups that are set up to back up an Oracle database.

EC2 and FSx Oracle database management

In addition to the AWS EC2 and FSx management console, the Ansible control node and the SnapCenter UI tool are deployed for database management in this Oracle environment.

An Ansible control node can be used to manage Oracle environment configuration, with parallel updates that keep primary and standby instances in sync for kernel or patch updates. Failover, resync, and failback can be automated with the NetApp Automation Toolkit to archive fast application recovery and availability with Ansible. Some repeatable database management tasks can be executed using a playbook to reduce human errors.

The SnapCenter UI tool can perform database snapshot backup, point-in-time recovery, database cloning, and so on with the SnapCenter plugin for Oracle databases. For more information about Oracle plugin features, see the SnapCenter Plug-in for Oracle Database overview.

The following sections provide details on how key functions of Oracle database management are fulfilled with the SnapCenter UI:

- Database snapshot backups
- Database point-in-time restore
- Database clone creation

Database cloning creates a replica of a primary database on a separate EC2 host for data recovery in the event of logical data error or corruption, and clones can also be used for application testing, debugging, patch
validation, and so on.

**Taking a snapshot**

An EC2/FSx Oracle database is regularly backed up at intervals configured by the user. A user can also take a one-off snapshot backup at any time. This applies to both full-database snapshot backups as well as archive-log-only snapshot backups.

**Taking a full database snapshot**

A full database snapshot includes all Oracle files, including data files, control files, and archive log files.

1. Log into the SnapCenter UI and click Resources in the left-side menu. From the View dropdown, change to the Resource Group view.

![SnapCenter UI](image)

2. Click the full backup resource name, and then click the Backup Now icon to initiate an add-hoc backup.

![Backup Now icon](image)

3. Click Backup and then confirm the backup to start a full database backup.
From the Resource view for the database, open the database Managed Backup Copies page to verify that the one-off backup completed successfully. A full database backup creates two snapshots: one for the data volume and one for the log volume.

**Taking an archive log snapshot**

An archive log snapshot is only taken for the Oracle archive log volume.

1. Log into the SnapCenter UI and click the Resources tab in the left-side menu bar. From the View dropdown, change to the Resource Group view.
2. Click the log backup resource name, and then click the Backup Now icon to initiate an add-hoc backup for archive logs.

3. Click Backup and then confirm the backup to start an archive log backup.
From the Resource view for the database, open the database Managed Backup Copies page to verify that the one-off archive log backup completed successfully. An archive log backup creates one snapshot for the log volume.

Restoring to a point in time

SnapCenter-based restore to a point in time is executed on the same EC2 instance host. Complete the following steps to perform the restore:

1. From the SnapCenter Resources tab > Database view, click the database name to open the database backup.

2. Select the database backup copy and the desired point in time to be restored. Also mark down the corresponding SCN number for the point in time. The point-in-time restore can be performed using either the time or the SCN.
3. Highlight the log volume snapshot and click the Mount button to mount the volume.

4. Choose the primary EC2 instance to mount the log volume.
5. Verify that the mount job completes successfully. Also check on the EC2 instance host to see the log volume mounted and also the mount point path.

6. Copy the archive logs from the mounted log volume to the current archive log directory.

```
[ec2-user@ip-10-0-0-151 ~]$ cp /var/opt/snapcenter/sco/backup_mount/ip-10-0-0-151_03-25-2022_11.15.01.1503_1/ORCL/1/db/ORCL_A/arch/.*.arc /ora_nfs_log/db/ORCL_A/arch/
```

7. Return to the SnapCenter Resource tab > database backup page, highlight the data snapshot copy, and click the Restore button to start the database restore workflow.
8. Check "All Datafiles" and "Change database state if needed for restore and recovery", and click Next.

9. Choose a desired recovery scope using either SCN or time. Rather than copying the mounted archive logs

---

392
to the current log directory as demonstrated in step 6, the mounted archive log path can be listed in "Specify external archive log files locations" for recovery.

10. Specify an optional prescript to run if necessary.
11. Specify an optional afterscript to run if necessary. Check the open database after recovery.
12. Provide an SMTP server and email address if a job notification is needed.
13. Restore the job summary. Click finish to launch the restore job.
14. Validate the restore from SnapCenter.
15. Validate the restore from the EC2 instance host.
16. To unmount the restore log volume, reverse the steps in step 4.

Creating a database clone

The following section demonstrates how to use the SnapCenter clone workflow to create a database clone from a primary database to a standby EC2 instance.

1. Take a full snapshot backup of the primary database from SnapCenter using the full backup resource group.

2. From the SnapCenter Resource tab > Database view, open the Database Backup Management page for the primary database that the replica is to be created from.

3. Mount the log volume snapshot taken in step 4 to the standby EC2 instance host.
4. Highlight the snapshot copy to be cloned for the replica, and click the Clone button to start the clone procedure.
5. Change the replica copy name so that it is different from the primary database name. Click Next.

6. Change the clone host to the standby EC2 host, accept the default naming, and click Next.
7. Change your Oracle home settings to match those configured for the target Oracle server host, and click Next.
8. Specify a recovery point using either time or the SCN and mounted archive log path.
9. Send the SMTP email settings if needed.
10. Clone the job summary, and click Finish to launch the clone job.
11. Validate the replica clone by reviewing the clone job log.
The cloned database is registered in SnapCenter immediately.
12. Turn off Oracle archive log mode. Log into the EC2 instance as oracle user and execute following command:

```sql
sqlplus / as sysdba
shutdown immediate;
startup mount;
alter database noarchivelog;
alter database open;
```

Instead primary Oracle backup copies, a clone can also be created from replicated secondary backup copies on target FSx cluster with same procedures.

**HA failover to standby and resync**

The standby Oracle HA cluster provides high availability in the event of failure in the primary site, either in the compute layer or in the storage layer. One significant benefit of the solution is that a user can test and validate the infrastructure at any time or with any frequency. Failover can be user simulated or triggered by real failure. The failover processes are identical and can be automated for fast application recovery.

See the following list of failover procedures:

1. For a simulated failover, run a log snapshot backup to flush the latest transactions to the standby site, as demonstrated in the section *Taking an archive log snapshot*. For a failover triggered by an actual failure, the last recoverable data is replicated to the standby site with the last successful scheduled log volume backup.

2. Break the SnapMirror between primary and standby FSx cluster.

3. Mount the replicated standby database volumes at the standby EC2 instance host.

4. Relink the Oracle binary if the replicated Oracle binary is used for Oracle recovery.

5. Recover the standby Oracle database to the last available archive log.

6. Open the standby Oracle database for application and user access.

7. For an actual primary site failure, the standby Oracle database now takes the role of the new primary site and database volumes can be used to rebuild the failed primary site as a new standby site with the reverse SnapMirror method.

8. For a simulated primary site failure for testing or validation, shut down the standby Oracle database after the completion of testing exercises. Then unmount the standby database volumes from the standby EC2 instance host and resync replication from the primary site to the standby site.
These procedures can be performed with the NetApp Automation Toolkit available for download at the public NetApp GitHub site.

```bash
git clone https://github.com/NetApp-Automation/na_ora_hadr_failover_resync.git
```

Read the README instruction carefully before attempting setup and failover testing.

**Database migration from on-prem to public cloud**

Database migration is a challenging endeavor by any means. Migrating an Oracle database from on-premises to the cloud is no exception.

The following sections provide key factors to consider when migrating Oracle databases to the AWS public cloud with the AWS EC2 compute and FSx storage platform.

**ONTAP storage is available on-premises**

If the on-premises Oracle database is sitting on an ONTAP storage array, then it is easier to set up replication for database migration using the NetApp SnapMirror technology that is built into AWS FSx ONTAP storage. The migration process can be orchestrated using NetApp BlueXP console.

1. Build a target compute EC2 instance that matches the on-premises instance.
2. Provision matching, equally sized database volumes from FSx console.
3. Mount the FSx database volumes to the EC2 instance.
4. Set up SnapMirror replication between the on-premises database volumes to the target FSx database volumes. The initial sync might take some time to move the primary source data, but any following incremental updates are much quicker.
5. At the time of switchover, shut down the primary application to stop all transactions. From the Oracle sqlplus CLI interface, execute an Oracle online log switch and allow SnapMirror sync to push the last archived log to the target volume.
6. Break up the mirrored volumes, run Oracle recovery at the target, and bring up the database for service.
7. Point applications to the Oracle database in the cloud.

The following video demonstrates how to migrate an Oracle database from on-premises to AWS FSx/EC2 using the NetApp BlueXP console and SnapMirror replication.

[Migrate on-prem Oracle DB to AWS](#)

**ONTAP storage is not available on premises**

If the on-premises Oracle database is hosted on third-party storage other than ONTAP, database migration is based on the restore of a Oracle database backup copy. You must play the archive log to make it current before switching over.

AWS S3 can be used as a staging storage area for database move and migration. See the following high level steps for this method:

1. Provision a new, matching EC2 instance that is comparable with the on-premises instance.
2. Provision equal database volumes from FSx storage and mount the volumes to the EC2 instance.
3. Create a disk-level Oracle backup copy.
4. Move the backup copy to AWS S3 storage.
5. Recreate the Oracle control file and restore and recover the database by pulling data and the archive log from S3 storage.
6. Sync the target Oracle database with the on-premises source database.
7. At switchover, shut down the application and source Oracle database. Copy the last few archive logs and apply them to the target Oracle database to bring it up to date.
8. Start up the target database for user access.
9. Redirect application to the target database to complete the switchover.

**Migrate on-premises Oracle databases to AWS FSx/EC2 using PDB relocation with maximum availability**

This migration approach is best suited to Oracle databases that are already deployed in PDB/CDB multitenant model, and ONTAP storage is not available on-premises. The PDB relocation method utilizes Oracle PDB hot clone technology to move PDBs between a source CDB and a target CDB while minimizing service interruption.

First, create CDB in the AWS FSx/EC2 with sufficient storage to host PDBs to be migrated from on-premises. Multiple on-premises PDBs can be relocated one at a time.

1. If the on-premises database is deployed in a single instance rather than in the multitenant PDB/CDB model, follow the instructions in Converting a single instance non-CDB to a PDB in a multitenant CDB to convert the single instance to multitenant PDB/CDB. Then follow the next step to migrate the converted PDB to CDB in AWS FSx/EC2.

2. If the on-premises database is already deployed in the multitenant PDB/CDB model, follow the instructions in Migrate on-premises Oracle databases to cloud with PDB relocation to perform the migration.

The following video demonstrates how an Oracle database (PDB) can be migrated to FSx/EC2 using PDB relocation with maximum availability.

**Migrate on-prem Oracle PDB to AWS CDB with max availability**

<i>Although the instructions in step 1 and 2 are illustrated in the context of Azure public cloud, the procedures are applicable to AWS cloud without any changes.</i>

The NetApp Solutions Automation team provides a migration toolkit that can facilitate Oracle database migration from on-premises to the AWS cloud. Use following command to download the Oracle database migration toolkit for PDB relocation.

```
git clone https://github.com/NetApp-Automation/na_ora_aws_migration.git
```

**Oracle Database Deployment and Protection on Azure**

**NetApp Files**
Overview

Many mission-critical Oracle enterprise databases are still hosted on-premises, and many enterprises are looking to migrate these Oracle databases to a public cloud. Often, these Oracle databases are application centric and thus require user-specific configurations, a capability that is missing from many database-as-a-service public-cloud offerings. Therefore, the current database landscape calls for a public-cloud-based Oracle database solution built from a high-performance, scalable compute and storage service that can accommodate unique requirements. Azure virtual machine compute instances and the Azure NetApp Files storage service might be the missing pieces of this puzzle that you can leverage to build and migrate your mission-critical Oracle database workloads to a public cloud.

Azure Virtual Machine

Azure virtual machines are one of several types of on-demand, scalable computing resources that Azure offers. Typically, you choose a virtual machine when you need more control over the computing environment than the other choices offer. Azure virtual machines offer a quick and easy way to create a computer with specific configurations required to run your Oracle database, whether it is for compute- or memory-intensive workloads. Virtual machines in an Azure virtual network can easily be connected to your organization’s network, for example through a secured VPN tunnel.

Azure NetApp Files (ANF)

Azure NetApp Files is a fully managed Microsoft service that will take your database workload to the cloud faster and more securely than ever before. It was designed to meet the core requirements of running high-performance workloads such as Oracle databases in the cloud, and it provides performance tiers that reflect the real-world range of IOPS demands, low latency, high availability, high durability, manageability at scale, and fast and efficient backup, recovery, and cloning. These capabilities are possible because Azure NetApp Files is based on physical all-flash NetApp ONTAP systems running within the Azure data center environment. Azure NetApp Files is completely integrated into the Azure DCs and portal, and customers can use the same comfortable graphical interface and APIs for creating and managing shared files as with any other Azure object. With Azure NetApp file, you can unlock the full capabilities of Azure without extra risk, cost, or time and trust the only enterprise file service native to Azure.

Conclusion

This documentation describes in detail how to deploy, configure, and protect an Oracle database with an Azure virtual machine and Azure NetApp Files storage service that delivers performance and durability similar to an on-premises system. For best-practices guidance, see TR-4780 Oracle Databases on Microsoft Azure. More importantly, NetApp also provides automation toolkits that automate most of the tasks that are required for the deployment, configuration, data protection, migration, and management of your Oracle database workload in the Azure public cloud. The automation toolkits are available for download at NetApp public GitHub site: NetApp-Automation.

Solution Architecture

The following architecture diagram illustrates a highly available Oracle database deployment on Azure VM instances and the Azure NetApp Files storage.

Within the environment, the Oracle compute instance is deployed via an Azure services VM console. There are
multiple Azure instance types available from the console. NetApp recommends deploying a database-oriented Azure VM instance that meets your expected workload.

Oracle database storage on the other hand is deployed with the Azure NetApp Files service available from Azure console. The Oracle binary, data, or log volumes are subsequently presented and mounted on an Azure VM instance Linux host.

In many respects, the implementation of Azure NetApp Files in Azure cloud is very similar to an on-premises ONTAP data storage architecture with many built-in redundancies, such as RAID and dual controllers. For disaster recovery, a standby site can be setup in different regions and database can be synced up with the primary site using application-level replication (for example, Oracle Data Guard).

In our test validation for Oracle database deployment and data protection, the Oracle database is deployed on a single Azure VM as illustrated in the following diagram:
The Azure Oracle environment can be managed with an Ansible controller node for automation using tool kits provided by NetApp for database deployment, backup, recovery, and database migration. Any updates to the
Oracle Azure VM instance operating-system kernel or Oracle patching can be performed in parallel to keep the primary and standby in sync. In fact, the initial toolkits can be easily expanded to perform daily Oracle tasks if needed. If you need help to set up a CLI Ansible controller, see NetApp Solution Automation to get started.

Factors to consider for Oracle database deployment

A public cloud provides many choices for compute and storage, and using the correct type of compute instance and storage engine is a good place to start for database deployment. You should also select compute and storage configurations that are optimized for Oracle databases.

The following sections describe the key considerations when deploying an Oracle database in the Azure public cloud on an Azure virtual machine instance with Azure NetApp Files storage.

VM type and sizing

Selecting the right VM type and size is important for optimal performance of a relational database in a public cloud. An Azure virtual machine provides a variety of compute instances that can be used to host Oracle database workloads. See the Microsoft documentation Sizes for virtual machines in Azure for different types of Azure virtual machines and their sizing. In general, NetApp recommends using a general-purpose Azure virtual machine for the deployment of small- and medium-sized Oracle databases. For the deployment of larger Oracle databases, a memory-optimized Azure VM is appropriate. With more available RAM, a larger Oracle SGA or smart flash cache can be configured to reduce the physical I/O, which in turn improves database performance.

Azure NetApp Files works as an NFS mount attached to an Azure virtual machine, which offers higher throughput and overcomes the storage-optimized VM throughput limit with local storage. Therefore, running Oracle on Azure NetApp Files could reduce the licensable Oracle CPU core count and licensing costs. See TR-4780: Oracle Databases on Microsoft Azure, Section 7 - How Does Oracle Licensing Work?

Other factors to consider include the following:

- Choose the correct vCPU and RAM combination based on workload characteristics. As the RAM size increases on the VM, so does the number of vCPU cores. There should be a balance at some point as the Oracle license fees are charged on the number of vCPU cores.
- Add swap space to a VM. The default Azure VM deployment does not create a swap space, which is not optimal for a database.

Azure NetApp Files performance

Azure NetApp Files volumes are allocated from a capacity pool the customer must provision in their Azure NetApp Files storage account. Each capacity pool is assigned as follows:

- To a service level that defines the overall performance capability.
- The initially provisioned storage capacity or tiering for that capacity pool. A quality of service (QoS) level that defines the overall maximum throughput per provisioned space.

The service level and initially provisioned storage capacity determines the performance level for a particular Oracle database volume.
1. Service Levels for Azure NetApp Files

- **Ultra storage.** This tier provides up to 128MiBps of throughput per 1TiB of volume quota assigned.
- **Premium storage.** This tier provides up to 64MiBps of throughput per 1TiB of volume quota assigned.
- **Standard storage.** This tier provides up to 16MiBps of throughput per 1TiB of volume quota assigned.

2. Capacity pool and quality of service

Each of the desired service levels has an associated cost for provisioned capacity and includes a quality-of-service (QoS) level that defines the overall maximum throughput for provisioned space.

For example, a 10TiB-provisioned single-capacity pool with the premium service level provides an overall available throughput for all volumes in this capacity pool of 10x 64MBps, so 640MBps with 40,000 (16K) IOPs or 80,000 (8K) IOPs.

The minimum capacity pool size is 4TiB. You can change the size of a capacity pool in 1TiB increments in response to changes in your workload requirements to manage storage needs and costs.

3. Calculate the service level at a database volume

The throughput limit for an Oracle database volume is determined by a combination of the following factors: The service level of the capacity pool to which the volume belongs and The quota assigned to the volume.

The following diagram shows how the throughput limit for an Oracle database volume is calculated.

![Diagram showing throughput calculation](image)

In example 1, a volume from a capacity pool with the Premium storage tier that is assigned 2TiB of quota is assigned a throughput limit of 128MiBps (2TiB * 64MiBps). This scenario applies regardless of the capacity pool size or the actual volume consumption.

In example 2, a volume from a capacity pool with the Premium storage tier that is assigned 100GiB of quota is assigned a throughput limit of 6.25MiBps (0.09765625TiB * 64MiBps). This scenario applies regardless of the capacity pool size or the actual volume consumption.

Please note that the minimum volume size is 100GiB.
Storage layout and settings

NetApp recommends the following storage layout:

- For small databases, using single volume layout for all Oracle files.

- For large databases, the recommended volume layout is multiple volumes: one for Oracle data and a duplicate control file and one for the Oracle active log, archived log, and control file. NetApp highly recommends allocating a volume for the Oracle binary instead of the local drive so that the database can be relocated to a new host and quickly restored.
**NFS configuration**

Linux, the most common operating system, includes native NFS capabilities. Oracle offers a direct NFS (dNFS) client natively integrated into Oracle. Oracle dNFS bypasses the OS cache and enables parallel processing to improve database performance. Oracle has supported NFSv3 for over 20 years, and NFSv4 is supported with Oracle 12.1.0.2 and later.

By using dNFS (available since Oracle 11g), an Oracle database running on an Azure Virtual Machine can drive significantly more I/O than the native NFS client. Automated Oracle deployment using the NetApp automation toolkit automatically configures dNFS on NFSv3.

The following diagram demonstrates the SLOB benchmark on Azure NetApp Files with Oracle dNFS.

![Oracle and Azure NetApp Files: Comparing dNFS and Native NFS (Kernel NFS) 75% Read, 25% Update SLOB2 Workload](image)

Other factors to consider:

- TCP slot tables are the NFS equivalent of host-bus-adapter (HBA) queue depth. These tables control the number of NFS operations that can be outstanding at any one time. The default value is usually 16, which is far too low for optimum performance. The opposite problem occurs on newer Linux kernels, which can automatically increase the TCP slot table limit to a level that saturates the NFS server with requests.

  For optimum performance and to prevent performance problems, adjust the kernel parameters that control TCP slot tables to 128.

```
  sysctl -a | grep tcp.*.slot_table
```

- The following table provides recommended NFS mount options for a single instance of Linux NFSv3.
Before using dNFS, verify that the patches described in Oracle Doc 1495104.1 are installed. The NetApp Support matrix for NFSv3 and NFSv4 do not include specific operating systems. All OSs that obey the RFC are supported. When searching the online IMT for NFSv3 or NFSv4 support, do not select a specific OS because no matches will be displayed. All OSs are implicitly supported by the general policy.

### Step-by-Step Oracle deployment procedures on Azure VM and Azure NetApp Files

**Deploy an Azure VM with ANF for Oracle via Azure portal console**

If you are new to Azure, you first need to set up an Azure account environment. This includes signing up your organization to use Azure Active Directory. The following section is a summary of these steps. For details, see the linked Azure-specific documentation.

**Create and consume Azure resources**

After your Azure environment is set up and an account is created and associated with a subscription, you can log into Azure portal with the account to create the necessary resources to run Oracle.

1. **Create a virtual network or VNet**

Azure Virtual Network (VNet) is the fundamental building block for your private network in Azure. VNet enables many types of Azure resources, such as Azure Virtual Machines (VMs), to securely communicate with each other, the internet, and on-premises networks. Before provisioning an Azure VM, a VNet (where a VM is deployed) must first be configured.

See [Create a virtual network using the Azure portal](#) to create a VNet.

2. **Create a NetApp storage account and capacity pool for ANF**

In this deployment scenario, an Azure VM OS is provisioned using regular Azure storage, but ANF volumes are provisioned to run Oracle database via NFS. First, you need to create a NetApp storage account and a capacity pool to host the storage volumes.

See [Set up Azure NetApp Files and create an NFS volume](#) to set up an ANF capacity pool.

3. **Provision Azure VM for Oracle**

Based on your workload, determine what type of Azure VM you need and the size of the VM vCPU and RAM to deploy for Oracle. Then, from the Azure console, click the VM icon to launch the VM deployment workflow.

1. From the Azure VM page, click **Create** and then choose **Azure virtual machine**.

<table>
<thead>
<tr>
<th>File Type</th>
<th>Mount Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control files</td>
<td><code>rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536</code></td>
</tr>
<tr>
<td>Data files</td>
<td></td>
</tr>
<tr>
<td>Redo logs</td>
<td></td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td><code>rw,bg,hard,vers=3,proto=tcp,timeo=600,rsize=65536,wsize=65536</code></td>
</tr>
<tr>
<td>ORACLE_BASE</td>
<td></td>
</tr>
</tbody>
</table>
2. Choose the subscription ID for the deployment, and then choose the resource group, region, host name, VM image, size, and authentication method. Go to the Disk page.
Create a virtual machine

Create a virtual machine that runs Linux or Windows. Select an image from Azure marketplace or use your own customized image. Complete the Basics tab then Review + create to provision a virtual machine with default parameters or review each tab for full customization. Learn more

Project details

Select the subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Administrator account

Authentication type

SSH public key

Password

Review + create
3. Choose **premium SSD** for OS local redundancy and leave the data disk blank because the data disks are mounted from ANF storage. Go to the Networking page.
4. Choose the VNet and subnet. Allocate a public IP for external VM access. Then go to the Management page.
5. Keep all defaults for Management and move to the Advanced page.
6. Keep all defaults for the Advanced page unless you need to customize a VM after deployment with custom scripts. Then go to Tags page.
Add a tag for the VM if desired. Then, go to the Review + create page.
8. The deployment workflow runs a validation on the configuration, and, if the validation passes, click **Create** to create the VM.

4. **Provision ANF database volumes for Oracle**

You must create three NFS volumes for an ANF capacity pool for the Oracle binary, data, and log volumes respectively.
1. From the Azure console, under the list of Azure services, click Azure NetApp Files to open a volume creation workflow. If you have more than one ANF storage account, click the account that you would like to provision volumes from.

2. Under your NetApp storage account, click Volumes, and then Add volume to create new Oracle volumes.
3. As a good practice, identify Oracle volumes with the VM hostname as a prefix and then followed by the mount point on the host, such as u01 for Oracle binary, u02 for Oracle data, and u03 for Oracle log. Choose the same VNet for the volume as for the VM. Click **Next: Protocol**.

4. Choose the NFS protocol, add the Oracle host IP address to the allowed client, and remove the default policy that allows all IP addresses 0.0.0.0/0. Then click **Next: Tags**.
5. Add a volume tag if desired. Then click Review + Create.
6. If the validation passes, click **Create** to create the volume.
Install and configure Oracle on Azure VM with ANF

The NetApp solutions team has created many Ansible-based automation toolkits to help you deploy Oracle in Azure smoothly. Follow these steps to deploy Oracle on an Azure VM.

Set up an Ansible controller

If you have not set up an Ansible controller, see NetApp Solution Automation, which has detailed instructions on how to setup an Ansible controller.

Obtain Oracle deployment automation toolkit

Clone a copy of the Oracle deployment toolkit in your home directory under the user ID that you use to log into the Ansible controller.

```bash
git clone https://github.com/NetApp-Automation/na_oracle19c_deploy.git
```

Execute the toolkit with your configuration

See the CLI deployment Oracle 19c Database to execute the playbook with the CLI. You can ignore the ONTAP portion of the variables configuration in the global VARS file when you create database volumes from...
the Azure console rather than the CLI.

The toolkit default deploys Oracle 19c with RU 19.8. It can be easily adapted for any other patch level with minor default configuration changes. Also default seed-database active log files are deployed into the data volume. If you need active log files on the log volume, it should be relocated after initial deployment. Reach out to the NetApp Solution team for help if needed.

Set up AzAcSnap backup tool for app-consistent snapshots for Oracle

The Azure Application-Consistent Snapshot tool (AzAcSnap) is a command-line tool that enables data protection for third-party databases by handling all the orchestration required to put them into an application-consistent state before taking a storage snapshot. It then returns these databases to an operational state. NetApp recommends installing the tool on the database server host. See the following installation and configuration procedures.

Install AzAcSnap tool

1. Get the most recent version of the [AzArcSnap Installer](#).
2. Copy the downloaded self-installer to the target system.
3. Execute the self-installer as the root user with the default installation option. If necessary, make the file executable using the `chmod +x *.run` command.

   ```
   ./azacsnap_installer_v5.0.run -I
   ```

Configure Oracle connectivity

The snapshot tools communicate with the Oracle database and need a database user with appropriate permissions to enable or disable backup mode.

1. Set up AzAcSnap database user

The following examples show the setup of the Oracle database user and the use of sqlplus for communication to the Oracle database. The example commands set up a user (AZACSNAP) in the Oracle database and change the IP address, usernames, and passwords as appropriate.

1. From the Oracle database installation, launch sqlplus to log into the database.

   ```
   su – oracle
   sqlplus / AS SYSDBA
   ```

2. Create the user.

   ```
   CREATE USER azacsnap IDENTIFIED BY password;
   ```

3. Grant the user permissions. This example sets the permission for the AZACSNAP user to enable putting the database into backup mode.
GRANT CREATE SESSION TO azacsnap;
GRANT SYSBACKUP TO azacsnap;

4. Change the default user’s password expiration to unlimited.
ALTER PROFILE default LIMIT PASSWORD_LIFE_TIME unlimited;

5. Validate azacsnap connectivity for the database.
connect azacsnap/password
quit;

2. Configure Linux-user azacsnap for DB access with Oracle wallet

The AzAcSnap default installation creates an azacsnap OS user. Its Bash shell environment must be configured for Oracle database access with the password stored in an Oracle wallet.

1. As root user, run the `cat /etc/oratab` command to identify the ORACLE_HOME and ORACLE_SID variables on the host.
cat /etc/oratab

2. Add ORACLE_HOME, ORACLE_SID, TNS_ADMIN, and PATH variables to the azacsnap user bash profile. Change the variables as needed.

```bash
echo "export ORACLE_SID=ORATEST" >> /home/azacsnap/.bash_profile
echo "export ORACLE_HOME=/u01/app/oracle/product/19800/ORATST" >> /home/azacsnap/.bash_profile
echo "export TNS_ADMIN=/home/azacsnap" >> /home/azacsnap/.bash_profile
echo "export PATH=\$PATH:\$ORACLE_HOME/bin" >> /home/azacsnap/.bash_profile
```

3. As the Linux user azacsnap, create the wallet. You are prompted for the wallet password.

```bash
sudo su - azacsnap
mkstore -wrl $TNS_ADMIN/.oracle_wallet/ -create
```

4. Add the connect string credentials to the Oracle Wallet. In the following example command, AZACSNAP is the ConnectString to be used by AzAcSnap, azacsnap is the Oracle Database User, and AzPasswd1 is the Oracle User’s database password. You are again prompted for the wallet password.
5. Create the `tnsnames.ora` file. In the following example command, HOST should be set to the IP address of the Oracle Database and the Server SID should be set to the Oracle Database SID.

```bash
echo "# Connection string
AZACSNAP="(DESCRIPTION=(ADDRESS=(PROTOCOL=TCP)(HOST=172.30.137.142)(PORT=1521))(CONNECT_DATA=(SID=ORATST)))"
" > $TNS_ADMIN/tnsnames.ora
```

6. Create the `sqlnet.ora` file.

```bash
echo "SQLNET.WALLET_OVERRIDE = TRUE
WALLET_LOCATION=
    SOURCE=(METHOD=FILE)
    (METHOD_DATA=(DIRECTORY="$TNS_ADMIN/.oracle_wallet"))"
" > $TNS_ADMIN/sqlnet.ora
```

7. Test Oracle access using the wallet.

```bash
sqlplus /@AZACSNAP as SYSBACKUP
```

The expected output from the command:

```
[azacsnap@acao-ora01 ~]$ sqlplus /@AZACSNAP as SYSBACKUP
SQL*Plus: Release 19.0.0.0.0 - Production on Thu Sep 8 18:02:07 2022

```

**Configure ANF connectivity**

This section explains how to enable communication with Azure NetApp Files (with a VM).
1. Within an Azure Cloud Shell session, make sure that you are logged into the subscription that you want to be associated with the service principal by default.

   ```
   az account show
   ```

2. If the subscription isn’t correct, use the following command:

   ```
   az account set -s <subscription name or id>
   ```

3. Create a service principal using the Azure CLI as in the following example:

   ```
   az ad sp create-for-rbac --name "AzAcSnap" --role Contributor --scopes /subscriptions/{subscription-id} --sdk-auth
   ```

   The expected output:

   ```
   {
     "clientId": "00aa000a-aaaa-0000-00a0-00aa000aaa0a",
     "clientSecret": "00aa000a-aaaa-0000-00a0-00aa000aaa0a",
     "subscriptionId": "00aa000a-aaaa-0000-00a0-00aa000aaa0a",
     "tenantId": "00aa000a-aaaa-0000-00a0-00aa000aaa0a",
     "activeDirectoryEndpointUrl": "https://login.microsoftonline.com",
     "resourceManagerEndpointUrl": "https://management.azure.com/",
     "activeDirectoryGraphResourceId": "https://graph.windows.net/",
     "sqlManagementEndpointUrl": "https://management.core.windows.net:8443/",
     "galleryEndpointUrl": "https://gallery.azure.com/",
     "managementEndpointUrl": "https://management.core.windows.net/"
   }
   ```

4. Cut and paste the output content into a file called `oracle.json` stored in the Linux user azacsnap user bin directory and secure the file with the appropriate system permissions.

   ![Make sure the format of the JSON file is exactly as described above, especially with the URLs enclosed in double quotes (".

### Complete the setup of AzAcSnap tool

Follow these steps to configure and test the snapshot tools. After successful testing, you can perform the first database-consistent storage snapshot.

1. Change into the snapshot user account.
su - azacsnap

2. Change the location of commands.

    cd /home/azacsnap/bin/

3. Configure a storage backup detail file. This creates an azacsnap.json configuration file.

    azacsnap -c configure --configuration new

The expected output with three Oracle volumes:

```
[azacsnap@acao-ora01 bin]$ azacsnap -c configure --configuration new
Building new config file
Add comment to config file (blank entry to exit adding comments): Oracle snapshot bkup
Add comment to config file (blank entry to exit adding comments):
Enter the database type to add, 'hana', 'oracle', or 'exit' (for no database): oracle

=== Add Oracle Database details ===
Oracle Database SID (e.g. CDB1): ORATST
Database Server's Address (hostname or IP address): 172.30.137.142
Oracle connect string (e.g. /@AZACSNAP): /@AZACSNAP

=== Azure NetApp Files Storage details ===
Are you using Azure NetApp Files for the database? (y/n) [n]: y
--- DATA Volumes have the Application put into a consistent state before they are snapshot ---
Add Azure NetApp Files resource to DATA Volume section of Database configuration? (y/n) [n]: y
Full Azure NetApp Files Storage Volume Resource ID (e.g. /subscriptions/.../resourceGroups/.../providers/Microsoft.NetApp/netAppAccounts/.../capacityPools/Premium/volumes/...): /subscriptions/0efa2dfb-917c-4497-b56a-b3f4eadb8111/resourceGroups/ANFAVSRG/providers/Microsoft.NetApp/netAppAccounts/ANFAVSAcct/capacityPools/CapPool/volumes/acao-ora01-u01
Service Principal Authentication filename or Azure Key Vault Resource ID (e.g. auth-file.json or https://.../): oracle.json
Add Azure NetApp Files resource to DATA Volume section of Database configuration? (y/n) [n]: y
Full Azure NetApp Files Storage Volume Resource ID (e.g. /subscriptions/.../resourceGroups/.../providers/Microsoft.NetApp/netAppAccounts/.../capacityPools/Premium/volumes/...): /subscriptions/0efa2dfb-917c-4497-b56a-b3f4eadb8111/resourceGroups/ANFAVSRG/providers/Microsoft.NetApp/netAppAccounts/ANFAVSAcct/capacityPools/CapPool/volumes/acao-ora01-u01
```
As the azacsnap Linux user, run the azacsnap test command for an Oracle backup.

```bash
cd ~/bin
azacsnap -c test --test oracle --configfile azacsnap.json
```

The expected output:
5. Run your first snapshot backup.

azacsnap -c backup --volume data --prefix ora_test --retention=1

**Protect your Oracle database in Azure cloud**

Allen Cao, NetApp Solutions Engineering

This section describes how to protect your Oracle database with azacsnap tool and snapshot backup, restore and snapshots tiering to Azure blob.

**Backup Oracle database with snapshot using AzAcSnap tool**

The Azure Application-Consistent Snapshot tool (AzAcSnap) is a command-line tool that enables data protection for third-party databases by handling all the orchestration required to put them into an application-consistent state before taking a storage snapshot, after which it returns the databases to an operational state.

In the case of Oracle, you put the database in backup mode to take a snapshot and then take the database out of backup mode.

**Backup data and log volumes**

The backup can be set up on the database server host with simple shell script that executes the snapshot command. Then, the script can be scheduled to run from crontab.

Generally, the frequency of backup depends on the desired RTO and RPO. Frequent snapshot creation consumes more storage space. There is a trade off between the frequency of backup and space consumption.

Data volumes typically consume more storage space than log volumes. Therefore, you can take snapshots on data volumes every few hours and more frequent snapshots on log volumes every 15 to 30 minutes.

See the following examples of backup scripts and scheduling.

For data volume snapshots:
# /bin/sh
cd /home/azacsnap/bin
. ~/.bash_profile
azacsnap -c backup --volume data --prefix acao-ora01-data --retention 36
azacsnap -c backup --volume other --prefix acao-ora01-log --retention 250

For log volume snapshots:

# /bin/sh
cd /home/azacsnap/bin
. ~/.bash_profile
azacsnap -c backup --volume other --prefix acao-ora01-log --retention 250

Crontab schedule:

```
15,30,45 * * * * /home/azacsnap/snap_log.sh
0 */2 * * * /home/azacsnap/snap_data.sh
```

When setting up the backup azacsnap.json configuration file, add all data volumes, including the binary volume, to dataVolume and all log volumes to otherVolume. The maximum retention of snapshots is 250 copies.

Validate the snapshots

Go to the Azure portal > Azure NetApp Files/volumes to check if the snapshots have been successfully created.
Oracle restore and recovery from local backup

One of key benefits of snapshot backup is that it coexists with source database volumes, and the primary database volumes can be rolled back almost instantly.

Restore and recovery of Oracle on the primary server

The following example demonstrates how to restore and recover an Oracle database from the Azure dashboard and CLI on the same Oracle host.

1. Create a test table in the database to be restored.
SQL> create table testsnapshot(
   id integer,
   event varchar(100),
   dt timestamp);

Table created.

SQL> insert into testsnapshot values(1,'insert a data marker to validate snapshot restore',sysdate);

1 row created.

SQL> commit;

Commit complete.

SQL> select * from testsnapshot;

ID
---
EVENT
----------------------------------------
------
DT
----------------------------------------
---
1
insert a data marker to validate snapshot restore
12-SEP-22 07.07.35.000000 PM

2. Drop the table after the snapshot backups.
[oracle@acao-ora01 ~]$ sqlplus / as sysdba

SQL*Plus: Release 19.0.0.0.0 - Production on Tue Sep 13 14:20:22 2022

SQL> exit
Disconnected from Oracle Database 19c Enterprise Edition Release 19.0.0.0.0 - Production
Version 19.8.0.0.0

3. From the Azure NetApp Files dashboard, restore the log volume to the last available snapshot. Choose Revert volume.
4. Confirm revert volume and click **Revert** to complete the volume reversion to the latest available backup.

5. Repeat the same steps for the data volume, and make sure that the backup contains the table to be recovered.

6. Again confirm the volume reversion, and click "Revert."
7. Resync the control files if you have multiple copies of them, and replace the old control file with the latest copy available.

```
[oracle@acao-ora01 ~]$ mv /u02/oradata/ORATST/control01.ctl /u02/oradata/ORATST/control01.ctl.bk
[oracle@acao-ora01 ~]$ cp /u03/orareco/ORATST/control02.ctl /u02/oradata/ORATST/control01.ctl
```

8. Log into the Oracle server VM and run database recovery with sqlplus.

```
[oracle@acao-ora01 ~]$ sqlplus / as sysdba

This screen demonstrates that the dropped table has been recovered using local snapshot backups.

**Database migration from on-premises to Azure cloud**

As a result of the Oracle decision to phase out single-instance databases, many organizations have converted single-instance Oracle databases to multitenant container databases. This enables the easy relocation of a subset of container databases called PDB to cloud with the maximum availability option, which minimize downtime during migration.

However, if you still have a single instance of a Oracle database, it can first be converted into a multitenant container database in place before attempting PDB relocation.

The following sections provide details for the migration of on-premises Oracle databases to Azure cloud in either scenarios.

**Converting a single instance non-CDB to a PDB in a multitenant CDB**

If you still have a single-instance Oracle database, it must be converted into a multitenant container database whether you wish to migrate it to the cloud or not, because Oracle will stop supporting single-instance databases some time soon.

The following procedures plug a single instance database into a container database as a pluggable database.
1. Build a shell container database on the same host as the single-instance database in a separate ORACLE_HOME.

2. Shut down the single instance database and restart it in read-only mode.

3. Run the DBMS_PDB.DESCRIBE procedure to generate the database metadata.

   ```sql
   BEGIN
   DBMS_PDB.DESCRIBE(
   pdb_descr_file => '/home/oracle/ncdb.xml');
   END;
   /
   ```

4. Shut down the single-instance database.

5. Start up the container database.

6. Run the DBMS_PDB.CHECK_PLUG_COMPATIBILITY function to determine whether the non-CDB is compatible with the CDB.

   ```sql
   SET SERVEROUTPUT ON
   DECLARE
   compatible CONSTANT VARCHAR2(3) :=
   CASE DBMS_PDB.CHECK_PLUG_COMPATIBILITY(
   pdb_descr_file => '/disk1/oracle/ncdb.xml',
   pdb_name => 'NCDB')
   WHEN TRUE THEN 'YES'
   ELSE 'NO'
   END;
   BEGIN
   DBMS_OUTPUT.PUT_LINE(compatible);
   END;
   /
   ```

   If the output is YES, then the non-CDB is compatible, and you can continue with the next step.

   If the output is NO, then the non-CDB is not compatible, and you can check the PDB_PLUG_IN_VIOLATIONS view to see why it is not compatible. All violations must be corrected before you continue. For example, any version or patch mismatches should be resolved by running an upgrade or the opatch utility. After correcting the violations, run DBMS_PDB.CHECK_PLUG_COMPATIBILITY again to ensure that the non-CDB is compatible with the CDB.

7. Plug in the single instance non-CDB.
CREATE PLUGGABLE DATABASE ncbd USING '/home/oracle/ncdb.xml'
    COPY
    FILE_NAME_CONVERT = ('/disk1/oracle/dbs/', '/disk2/oracle/ncdb/')
;

If there is not sufficient space on the host, the NOCOPY option can be used to create the PDB. In that case, a single-instance non-CDB is not useable after plug in as a PDB because the original data files has been used for the PDB. Make sure to create a backup before the conversion so that there is something to fall back on if anything goes wrong.

8. Start with PDB upgrade after conversion if the version between the source single-instance non-CDB and the target CDB are different. For the same-version conversion, this step can be skipped.

```sql
sqlplus / as sysdba;
 alter session set container=ncdb
 alter pluggable database open upgrade;
 exit;
 dbupgrade -c ncbd -l /home/oracle
```

Review the upgrade log file in the `/home/oracle` directory.

9. Open the pluggable database, check for pdb plug-in violations, and recompile the invalid objects.

```sql
alter pluggable database ncbd open;
 alter session set container=ncdb;
 select message from pdb_plug_in_violations where type like '%ERR%' and status <> 'RESOLVED';
 $ORACLE_HOME/perl/bin/perl $ORACLE_HOME/rdbms/admin/catcon.pl -n 1 -c 'ncdb' -e -b utlrp -d $ORACLE_HOME/rdbms/admin utlrp.sql
```

10. Execute `noncdb_to_pdb.sql` to update the data dictionary.

```sql
sqlplus / as sysdba
 alter session set container=ncdb;
 @$ORACLE_HOME/rdbms/admin/noncdb_to_pdb.sql;
```

Shut down and restart the container DB. The ncbd is taken out of restricted mode.

**Migrate on-premises Oracle databases to Azure with PDB relocation**

Oracle PDB relocation with the maximum-availability option employs PDB hot-clone technology, which allows source PDB availability while the PDB is copying over to the target. At switchover, user connections are redirected to the target PDB automatically. Thus, downtime is minimized independent of the size of the PDB.
NetApp provides an Ansible-based toolkit that automates the migration procedure.

1. Create a CDB in the Azure public cloud on an Azure VM with the same version and patch level.
2. From the Ansible controller, clone a copy of the automation toolkit.

   ```bash
   git clone https://github.com/NetApp-Automation/na_ora_aws_migration.git
   ```

3. Read the instruction in the README file.
4. Configure the Ansible host variable files for both the source and target Oracle servers and the DB server host’s configuration file for name resolution.
5. Install the Ansible controller prerequisites on Ansible controller.

   ```bash
   ansible-playbook -i hosts requirements.yml
   ansible-galaxy collection install -r collections/requirements.yml
   --force
   ```

6. Execute any pre-migration tasks against the on-premises server.

   ```bash
   ansible-playbook -i hosts ora_pdb_relocate.yml -u admin -k -K -t ora_pdb_relo_onprem
   ```

   The admin user is the management user on the on-premises Oracle server host with sudo privileges. The admin user is authenticated with a password.

7. Execute Oracle PDB relocation from on-premises to the target Azure Oracle host.

   ```bash
   ansible-playbook -i hosts ora_pdb_relocate.yml -u azureuser --private
   -key db1.pem -t ora_pdb_relo_primary
   ```

   The Ansible controller can be located either on-premises or in the Azure cloud. The controller needs connectivity to the on-premises Oracle server host and the Azure Oracle VM host. The Oracle database port (such as 1521) is open between the on-premises Oracle server host and the Azure Oracle VM host.

**Additional Oracle database migration options**

Please see the Microsoft documentation for additional migration options: Oracle database migration decision process.
Deploying Oracle Database

Solution Overview

Automated Deployment of Oracle19c for ONTAP on NFS

Organizations are automating their environments to gain efficiencies, accelerate deployments, and reduce manual effort. Configuration management tools like Ansible are being used to streamline enterprise database operations. In this solution, we demonstrate how you can use Ansible to automate the provisioning and configuration of Oracle 19c with NetApp ONTAP. By enabling storage administrators, systems administrators, and DBAs to consistently and rapidly deploy new storage, configure database servers, and install Oracle 19c software, you achieve the following benefits:

- Eliminate design complexities and human errors, and implement a repeatable consistent deployment and best practices
- Decrease time for provisioning of storage, configuration of DB hosts, and Oracle installation
- Increase database administrators, systems and storage administrators productivity
- Enable scaling of storage and databases with ease

NetApp provides customers with validated Ansible modules and roles to accelerate deployment, configuration, and lifecycle management of your Oracle database environment. This solution provides instruction and Ansible
playbook code, to help you:

- Create and configure ONTAP NFS storage for Oracle Database
- Install Oracle 19c on RedHat Enterprise Linux 7/8 or Oracle Linux 7/8
- Configure Oracle 19c on ONTAP NFS storage

For more details or to begin, please see the overview videos below.

**AWX/Tower Deployments**

**Part 1: Getting Started, Requirements, Automation Details and Initial AWX/Tower Configuration**

**AWX Deployment**

**Part 2: Variables and Running the Playbook**

**AWX Playbook Run**

**CLI Deployment**

**Part 1: Getting Started, Requirements, Automation Details and Ansible Control Host Setup**

**CLI Deployment**

**Part 2: Variables and Running the Playbook**

**CLI Playbook Run**

**Getting started**

This solution has been designed to be run in an AWX/Tower environment or by CLI on an Ansible control host.

**AWX/Tower**

For AWX/Tower environments, you are guided through creating an inventory of your ONTAP cluster management and Oracle server (IPs and hostnames), creating credentials, configuring a project that pulls the Ansible code from NetApp Automation Github, and the Job Template that launches the automation.

1. Fill out the variables specific to your environment, and copy and paste them into the Extra Vars fields in your job template.
2. After the extra vars have been added to your job template, you can launch the automation.
3. The job template is run in three phases by specifying tags for ontap_config, linux_config, and oracle_config.

**CLI via the Ansible control host**

1. To configure the Linux host so that is can be used as an Ansible control host
   [click here for detailed instructions]
2. After the Ansible control host is configured, you can git clone the Ansible Automation repository.
3. Edit the hosts file with the IPs and/or hostnames of your ONTAP cluster management and Oracle server’s management IPs.
4. Fill out the variables specific to your environment, and copy and paste them into the `vars.yml` file.
5. Each Oracle host has a variable file identified by its hostname that contains host-specific variables.
6. After all variable files have been completed, you can run the playbook in three phases by specifying tags for `ontap_config`, `linux_config`, and `oracle_config`.

Requirements

<table>
<thead>
<tr>
<th>Environment</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible environment</td>
<td>AWX/Tower or Linux host to be the Ansible control host</td>

</tr>
<tr>
<td></td>
<td>Enable DNFS client</td>
</tr>
<tr>
<td></td>
<td>Enable database auto startup and shutdown between OS reboots</td>
</tr>
</tbody>
</table>

**Default parameters**

To simplify automation, we have preset many required Oracle deployment parameters with default values. It is generally not necessary to change the default parameters for most deployments. A more advanced user can make changes to the default parameters with caution. The default parameters are located in each role folder under Defaults directory.

**Deployment instructions**

Before starting, download the following Oracle installation and patch files and place them in the /tmp/archive directory with read, write, and execute access for all users on each DB server to be deployed. The automation tasks look for the named installation files in that particular directory for Oracle installation and configuration.

```
LINUX.X64_193000_db_home.zip -- 19.3 base installer
p31281355_190000_Linux-x86-64.zip -- 19.8 RU patch
p6880880_190000_Linux-x86-64.zip -- opatch version 12.2.0.1.23
```

**License**

You should read license information as stated in the Github repository. By accessing, downloading, installing, or using the content in this repository, you agree the terms of the license laid out [here](#).
Note that there are certain restrictions around producing and/or sharing any derivative works with the content in this repository. Please make sure you read the terms of the License before using the content. If you do not agree to all of the terms, do not access, download, or use the content in this repository.

After you are ready, click here for detailed AWX/Tower deployment procedures or here for CLI deployment.

**Step-by-step deployment procedure**

**AWX/Tower deployment Oracle 19c Database**

1. **Create the inventory, group, hosts, and credentials for your environment**

This section describes the setup of inventory, groups, hosts, and access credentials in AWX/Ansible Tower that prepare the environment for consuming NetApp automated solutions.

1. Configure the inventory.
   a. Navigate to Resources → Inventories → Add, and click Add Inventory.
   b. Provide the name and organization details, and click Save.
   c. On the Inventories page, click the inventory created.
   d. If there are any inventory variables, paste them in the variables field.
   e. Navigate to the Groups sub-menu and click Add.
   f. Provide the name of the group for ONTAP, paste the group variables (if any) and click Save.
   g. Repeat the process for another group for Oracle.
   h. Select the ONTAP group created, go to the Hosts sub-menu and click Add New Host.
   i. Provide the IP address of the ONTAP cluster management IP, paste the host variables (if any), and click Save.
   j. This process must be repeated for the Oracle group and Oracle host(s) management IP/hostname.

2. Create credential types. For solutions involving ONTAP, you must configure the credential type to match username and password entries.
   a. Navigate to Administration → Credential Types, and click Add.
   b. Provide the name and description.
   c. Paste the following content in Input Configuration:
fields:
- id: username
  type: string
  label: Username
- id: password
  type: string
  label: Password
  secret: true
- id: vsadmin_password
  type: string
  label: vsadmin_password
  secret: true

a. Paste the following content into Injector Configuration:

extra_vars:
  password: '{{ password }}'
  username: '{{ username }}'
  vsadmin_password: '{{ vsadmin_password }}'

1. Configure the credentials.
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for ONTAP.
   c. Select the custom Credential Type you created for ONTAP.
   d. Under Type Details, enter the username, password, and vsadmin_password.
   e. Click Back to Credential and click Add.
   f. Enter the name and organization details for Oracle.
   g. Select the Machine credential type.
   h. Under Type Details, enter the Username and Password for the Oracle hosts.
   i. Select the correct Privilege Escalation Method, and enter the username and password.

2. Create a project

1. Go to Resources → Projects, and click Add.
   a. Enter the name and organization details.
   b. Select Git in the Source Control Credential Type field.
   c. enter https://github.com/NetApp-Automation/na_oracle19c_deploy.git as the source control URL.
   d. Click Save.
   e. The project might need to sync occasionally when the source code changes.
3. Configure Oracle host_vars

The variables defined in this section are applied to each individual Oracle server and database.

1. Input your environment-specific parameters in the following embedded Oracle hosts variables or host_vars form.

   The items in blue must be changed to match your environment.

Host VARS Config

```yaml
# Add your Oracle Host
ansible_host: "10.61.180.15"

# Oracle db log archive mode: true - ARCHIVELOG or false - NOARCHIVELOG
log_archive_mode: "true"

# Number of pluggable databases per container instance identified by sid.
# Pdb_name specifies the prefix for container database naming in this case cdb2_pdb1, cdb2_pdb2, cdb2_pdb3
oracle_sid: "cdb2"
pdb_num: "3"
pdb_name: "{{ oracle_sid }}_pdb"

# CDB listener port, use different listener port for additional CDB on same host
listener_port: "1523"

# CDB is created with SGA at 75% of memory_limit, MB. Consider how many databases to be hosted on the node and how much ram to be allocated to each DB. The grand total SGA should not exceed 75% available RAM on node.
memory_limit: "5464"

# Set "em_configuration: DBEXPRESS" to install enterprise manager express and choose a unique port from 5500 to 5599 for each sid on the host.
# Leave them black if em express is not installed.
em_configuration: "DBEXPRESS"
em EXPRESS_port: "5501"

# {{groups.oracle[0]}} represents first Oracle DB server as defined in Oracle hosts group [oracle]. For concurrent multiple Oracle DB servers deployment, [0] will be incremented for each additional DB server. For example,  {{groups.oracle[1]}}" represents DB server 2,
"{{groups.oracle[2]}}" represents DB server 3 ... As a good practice and the default, minimum three volumes is allocated to a DB server with corresponding /u01, /u02, /u03 mount points, which store oracle binary, oracle data, and oracle recovery files respectively. Additional volumes can be added by click on "More NFS volumes" but the number of volumes allocated to a DB server must match with what is defined in global vars file by volumes_nfs parameter, which dictates how many volumes are to be created for each DB server.

```yaml
host_datastores_nfs:
  - {vol_name: "{{groups.oracle[0]}}_u01", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u02", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u03", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
```

a. Fill in all variables in the blue fields.
b. After completing variables input, click the Copy button on the form to copy all variables to be transferred to AWX or Tower.
c. Navigate back to AWX or Tower and go to Resources → Hosts, and select and open the Oracle server configuration page.
d. Under the Details tab, click edit and paste the copied variables from step 1 to the Variables field under the YAML tab.
e. Click Save.
f. Repeat this process for any additional Oracle servers in the system.

4. Configure global variables

Variables defined in this section apply to all Oracle hosts, databases, and the ONTAP cluster.

1. Input your environment-specific parameters in following embedded global variables or vars form.

```yaml
#Inventory group name
#Default inventory group name - 'ontap'
```

The items in blue must be changed to match your environment.
hosts_group: "ontap"

ca_signed_certs: "false"

nodes:
  - "AFF-01"
  - "AFF-02"

storage_vlans:
  - {vlan_id: "203", name: "infra_NFS", protocol: "NFS"}

data_aggregates:
  - {aggr_name: "aggr01_node01"}
  - {aggr_name: "aggr01_node02"}

svm_name: "ora_svm"

svm_mgmt_details:
  - {address: "172.21.91.100", netmask: "255.255.255.0", home_port: "e0M"}

# NFS storage parameters when data_protocol set to NFS. Volume named after Oracle hosts name identified by mount point as follow for oracle DB server 1. Each mount point dedicates to a particular Oracle files: u01 - Oracle binary, u02 - Oracle data, u03 - Oracle redo. Add additional volumes by click on "More NFS volumes" and also add the volumes list to corresponding host_vars as host_datastores_nfs variable. For multiple DB server deployment, additional volumes sets needs to be added for additional DB server. Input variable "{{groups.oracle[1]}}_u01", "{{groups.oracle[1]}}_u02", and "{{groups.oracle[1]}}_u03" as vol_name for second DB server. Place volumes for multiple DB servers alternatingly between controllers for balanced IO performance, e.g. DB server 1 on
controller node1, DB server 2 on controller node2 etc. Make sure match lif address with controller node.

volumes_nfs:
   - {vol_name: "{{groups.oracle[0]}}_u01", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
   - {vol_name: "{{groups.oracle[0]}}_u02", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
   - {vol_name: "{{groups.oracle[0]}}_u03", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}

#NFS LIFS IP address and netmask

nfs_lifs_details:
   - address: "172.21.94.200" #for node-1
     netmask: "255.255.255.0"
   - address: "172.21.94.201" #for node-2
     netmask: "255.255.255.0"

#NFS client match

client_match: "172.21.94.0/24"

#NFS Mount points for Oracle DB volumes

mount_points:
   - "/u01"
   - "/u02"
   - "/u03"

# Up to 75% of node memory size divided by 2mb. Consider how many databases to be hosted on the node and how much ram to be allocated to each DB.
# Leave it blank if hugepage is not configured on the host.

hugepages_nr: "1234"

# RedHat subscription username and password

redhat_sub_username: "xxx"
redhat_sub_password: "xxx"
1. Fill in all variables in blue fields.

2. After completing variables input, click the Copy button on the form to copy all variables to be transferred to AWX or Tower into the following job template.

5. Configure and launch the job template.

1. Create the job template.
   a. Navigate to Resources → Templates → Add and click Add Job Template.
   b. Enter the name and description
   c. Select the Job type; Run configures the system based on a playbook, and Check performs a dry run of a playbook without actually configuring the system.
   d. Select the corresponding inventory, project, playbook, and credentials for the playbook.
   e. Select the all_playbook.yml as the default playbook to be executed.
   f. Paste global variables copied from step 4 into the Template Variables field under the YAML tab.
   g. Check the box Prompt on Launch in the Job Tags field.
   h. Click Save.

2. Launch the job template.
   a. Navigate to Resources → Templates.
   b. Click the desired template and then click Launch.
   c. When prompted on launch for Job Tags, type in requirements_config. You might need to click the Create Job Tag line below requirements_config to enter the job tag.
   d. Click Next and then Launch to start the job.
   e. Click View → Jobs to monitor the job output and progress.
   f. When prompted on launch for Job Tags, type in ontap_config. You might need to click the Create "Job Tag" line right below ontap_config to enter the job tag.
   g. Click Next and then Launch to start the job.

   requirements_config ensures that you have the correct libraries to run the other roles.

   a. Click Next and then Launch to start the job.
   b. Click View → Jobs to monitor the job output and progress.
   c. When prompted on launch for Job Tags, type in ontap_config. You might need to click the Create "Job Tag" line right below ontap_config to enter the job tag.
   d. Click Next and then Launch to start the job.
   e. Click View → Jobs to monitor the job output and progress
   f. After the ontap_config role has completed, run the process again for linux_config.
   g. Navigate to Resources → Templates.
h. Select the desired template and then click Launch.

i. When prompted on launch for the Job Tags type in linux_config, you might need to select the Create "job tag" line right below linux_config to enter the job tag.

j. Click Next and then Launch to start the job.

k. Select View → Jobs to monitor the job output and progress.

l. After the linux_config role has completed, run the process again for oracle_config.

m. Go to Resources → Templates.

n. Select the desired template and then click Launch.

o. When prompted on launch for Job Tags, type oracle_config. You might need to select the Create "Job Tag" line right below oracle_config to enter the job tag.

p. Click Next and then Launch to start the job.

q. Select View → Jobs to monitor the job output and progress.

6. Deploy additional database on same Oracle host

The Oracle portion of the playbook creates a single Oracle container database on an Oracle server per execution. To create additional container databases on the same server, complete the following steps.

1. Revise host_vars variables.
   a. Go back to step 2 - Configure Oracle host_vars.
   b. Change the Oracle SID to a different naming string.
   c. Change the listener port to different number.
   d. Change the EM Express port to a different number if you are installing EM Express.
   e. Copy and paste the revised host variables to the Oracle Host Variables field in the Host Configuration Detail tab.

2. Launch the deployment job template with only the oracle_config tag.

3. Log in to Oracle server as oracle user and execute the following commands:

   ```bash
   ps -ef | grep ora
   ```

   This will list oracle processes if installation completed as expected and oracle DB started

4. Log in to the database to check the db configuration settings and the PDBs created with the following command sets.

   ```bash
   ```

461
[oracle@localhost ~]$ sqlplus / as sysdba

SQL*Plus: Release 19.0.0.0.0 - Production on Thu May 6 12:52:51 2021

NAME      LOG_MODE
--------- ------------
CDB2      ARCHIVELOG

SQL> show pdbs

CON_ID CON_NAME                       OPEN MODE  RESTRICTED
---------- ------------------------------ ---------- ----------
2 PDB$SEED                       READ ONLY  NO
3 CDB2_PDB1                      READ WRITE NO
4 CDB2_PDB2                      READ WRITE NO
5 CDB2_PDB3                      READ WRITE NO

col svrname form a30
col dirname form a30
select svrname, dirname, nfsversion from v$dnfs_servers;

SVRNAME                        DIRNAME                        NFSVERSION
------------------------------ ------------------------------ ----------------
172.21.126.200                 /rhelora03_u02                 NFSv3.0
172.21.126.200                 /rhelora03_u03                 NFSv3.0
172.21.126.200                 /rhelora03_u01                 NFSv3.0

This confirms that dNFS is working properly.

5. Connect to database via listener to check the Oracle listener configuration with the following command.
Change to the appropriate listener port and database service name.
This confirms that Oracle listener is working properly.

Where to go for help?

If you need help with the toolkit, please join the NetApp Solution Automation community support slack channel and look for the solution-automation channel to post your questions or inquires.

Step-by-step deployment procedure

This document details the deployment of Oracle 19c using the automation command line interface (cli).

CLI deployment Oracle 19c Database

This section covers the steps required to prepare and deploy Oracle19c Database with the CLI. Make sure that you have reviewed the Getting Started and Requirements section and prepared your environment accordingly.

Download Oracle19c repo

1. From your ansible controller, run the following command:

   ```
   git clone https://github.com/NetApp-Automation/na_oracle19c_deploy.git
   ```

2. After downloading the repository, change directories to na_oracle19c_deploy <cd na_oracle19c_deploy>.
Edit the hosts file

Complete the following before deployment:

1. Edit your hosts file na_oracle19c_deploy directory.
2. Under [ontap], change the IP address to your cluster management IP.
3. Under the [oracle] group, add the oracle hosts names. The host name must be resolved to its IP address either through DNS or the hosts file, or it must be specified in the host.
4. After you have completed these steps, save any changes.

The following example depicts a host file:

```bash
#ONTAP Host
[ontap]
"10.61.184.183"

#Oracle hosts
[oracle]
"rtpora01"
"rtpora02"
```

This example executes the playbook and deploys oracle 19c on two oracle DB servers concurrently. You can also test with just one DB server. In that case, you only need to configure one host variable file.

The playbook executes the same way regardless of how many Oracle hosts and databases you deploy.

Edit the host_name.yml file under host_vars

Each Oracle host has its host variable file identified by its host name that contains host-specific variables. You can specify any name for your host. Edit and copy the host_vars from the Host VARS Config section and paste it into your desired host_name.yml file.

The items in blue must be changed to match your environment.

Host VARS Config

```bash
# Add your Oracle Host
```
ansible_host: "10.61.180.15"

# Oracle db log archive mode: true - ARCHIVELOG or false - NOARCHIVELOG
log_archive_mode: "true"

# Number of pluggable databases per container instance identified by sid. Pdb_name specifies the prefix for container database naming in this case cdb2_pdb1, cdb2_pdb2, cdb2_pdb3
oracle_sid: "cdb2"
pdb_num: "3"
pdb_name: "{{ oracle_sid }}_pdb"

# CDB listener port, use different listener port for additional CDB on same host
listener_port: "1523"

# CDB is created with SGA at 75% of memory_limit, MB. Consider how many databases to be hosted on the node and how much ram to be allocated to each DB. The grand total SGA should not exceed 75% available RAM on node.
memory_limit: "5464"

# Set "em_configuration: DBEXPRESS" to install enterprise manager express and choose a unique port from 5500 to 5599 for each sid on the host. Leave them black if em express is not installed.
em_configuration: "DBEXPRESS"
em_express_port: "5501"

# {{groups.oracle[0]}} represents first Oracle DB server as defined in Oracle hosts group [oracle]. For concurrent multiple Oracle DB servers deployment, [0] will be incremented for each additional DB server. For example, {{groups.oracle[1]}} represents DB server 2, "{{groups.oracle[2]}}" represents DB server 3 ... As a good practice and the default, minimum three volumes is allocated to a DB server with corresponding /u01, /u02, /u03 mount points, which store oracle binary, oracle data, and oracle recovery files respectively. Additional volumes can be added by click on "More NFS volumes" but the number of volumes allocated to a DB server must match with what is defined in global vars file by volumes_nfs parameter, which dictates how many volumes are to be created for each DB server.
host_datastores_nfs:
  - {vol_name: "{{groups.oracle[0]}}_u01", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u02", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u03", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
Edit the vars.yml file

The vars.yml file consolidates all environment-specific variables (ONTAP, Linux, or Oracle) for Oracle deployment.

1. Edit and copy the variables from the VARS section and paste these variables into your vars.yml file.

```yaml
# Inventory group name
# Default inventory group name - 'ontap'
# Change only if you are changing the group name either in inventory/hosts file or in inventory groups in case of AWX/Tower
hosts_group: "ontap"

# CA_signed_certificates (ONLY CHANGE to 'true' IF YOU ARE USING CA SIGNED CERTIFICATES)
ca_signed_cert: "false"

# Names of the Nodes in the ONTAP Cluster
nodes:
  - "AFF-01"
  - "AFF-02"

# Storage VLANs
# Add additional rows for vlans as necessary
storage_vlans:
  - {vlan_id: "203", name: "infra_NFS", protocol: "NFS"}

# Details of the Data Aggregates that need to be created
# If Aggregate creation takes longer, subsequent tasks of creating volumes may fail.
# There should be enough disks already zeroed in the cluster, otherwise aggregate create will zero the disks and will take long time
data_aggregates:
  - {aggr_name: "aggr01_node01"}

# NFS storage parameters when data_protocol set to NFS. Volume named after Oracle hosts name identified by mount point as follow for oracle DB server 1. Each mount point dedicates to a particular Oracle files: u01 - Oracle binary, u02 - Oracle data, u03 - Oracle redo. Add additional volumes by click on "More NFS volumes" and also add the volumes list to corresponding host_vars as host_datastores_nfs variable. For multiple DB server deployment, additional volumes sets needs to be added for additional DB server. Input variable "{{groups.oracle[1]}}_u01", "{{groups.oracle[1]}}_u02", and "{{groups.oracle[1]}}_u03" as vol_name for second DB server. Place volumes for multiple DB servers alternatingly between controllers for balanced IO performance, e.g. DB server 1 on controller node1, DB server 2 on controller node2 etc. Make sure match lif address with controller node.

volumes_nfs:
  - {vol_name: "{{groups.oracle[0]}}_u01", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u02", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}
  - {vol_name: "{{groups.oracle[0]}}_u03", aggr_name: "aggr01_node01", lif: "172.21.94.200", size: "25"}

#NFS LIFs IP address and netmask

nfs_lifs_details:
  - address: "172.21.94.200" #for node-1
    netmask: "255.255.255.0"
  - address: "172.21.94.201" #for node-2
    netmask: "255.255.255.0"

#NFS client match

client_match: "172.21.94.0/24"

#NFS Mount points for Oracle DB volumes

mount_points:
# Up to 75% of node memory size divided by 2mb. Consider how many databases to be hosted on the node and how much ram to be allocated to each DB.
# Leave it blank if hugepage is not configured on the host.

hugepages_nr: "1234"

# RedHat subscription username and password

redhat_sub_username: "xxx"
redhat_sub_password: "xxx"

### DB env specific install and config variables ###

db_domain: "your.domain.com"

# Set initial password for all required Oracle passwords. Change them after installation.

initial_pwd_all: "netapp123"

Run the playbook

After completing the required environment prerequisites and copying the variables into vars.yml and your_host.yml, you are now ready to deploy the playbooks.

<i>Must be changed to match your environment.</i>

1. Run the ONTAP playbook by passing the correct tags and ONTAP cluster username. Fill the password for ONTAP cluster, and vsadmin when prompted.

   ansible-playbook -i hosts all_playbook.yml -u username -k -K -t ontap_config -e @vars/vars.yml

2. Run the Linux playbook to execute Linux portion of deployment. Input for admin ssh password as well as sudo password.

   ansible-playbook -i hosts all_playbook.yml -u username -k -K -t linux_config -e @vars/vars.yml
3. Run the Oracle playbook to execute Oracle portion of deployment. Input for admin ssh password as well as sudo password.

```
ansible-playbook -i hosts all_playbook.yml -u username -k -K -t oracle_config -e @vars/vars.yml
```

**Deploy Additional Database on Same Oracle Host**

The Oracle portion of the playbook creates a single Oracle container database on an Oracle server per execution. To create additional container database on the same server, complete the following steps:

1. Revise the host_vars variables.
   a. Go back to step 3 - Edit the `host_name.yml` file under `host_vars`.
   b. Change the Oracle SID to a different naming string.
   c. Change the listener port to different number.
   d. Change the EM Express port to a different number if you have installed EM Express.
   e. Copy and paste the revised host variables to the Oracle host variable file under `host_vars`.
2. Execute the playbook with the `oracle_config` tag as shown above in Run the playbook.

**Validate Oracle installation**

1. Log in to Oracle server as oracle user and execute the following commands:

```
ps -ef | grep ora
```

   This will list oracle processes if installation completed as expected and oracle DB started

2. Log in to the database to check the db configuration settings and the PDBs created with the following command sets.
[oracle@localhost ~]$ sqlplus / as sysdba

SQL*Plus: Release 19.0.0.0.0 - Production on Thu May 6 12:52:51 2021

------------------------------ ------------------------------ -----------
----------------
172.21.126.200                 /rhelora03_u02                 NFSv3.0
172.21.126.200                 /rhelora03_u03                 NFSv3.0
172.21.126.200                 /rhelora03_u01                 NFSv3.0

This confirms that dNFS is working properly.

3. Connect to database via listener to check the Oracle listener configuration with the following command. Change to the appropriate listener port and database service name.
This confirms that Oracle listener is working properly.

Where to go for help?

If you need help with the toolkit, please join the NetApp Solution Automation community support slack channel and look for the solution-automation channel to post your questions or inquiries.

Solution Overview

Automated Data Protection for Oracle Databases

Organizations are automating their environments to gain efficiencies, accelerate deployments, and reduce manual effort. Configuration management tools like Ansible are being used to streamline enterprise database operations. In this solution, we demonstrate how you can use Ansible to automate the data protection of Oracle with NetApp ONTAP. By enabling storage administrators, systems administrators, and DBAs to consistently and rapidly setup data replication to an onsite data center or to public cloud, you achieve the following benefits:

- Eliminate design complexities and human errors, and implement a repeatable consistent deployment and best practices
- Decrease time for configuration of Intercluster replication, CVO instantiation, and recovery of Oracle databases
- Increase database administrators, systems and storage administrators productivity
- Provides database recovery workflow for ease of testing a DR scenario.

NetApp provides customers with validated Ansible modules and roles to accelerate deployment, configuration, and lifecycle management of your Oracle database environment. This solution provides instruction and Ansible
playbook code, to help you:

**On Prem to on prem replication**

- Create intercluster lifs on source and destination
- Establish cluster and vserver peering
- Create and initialize SnapMirror of Oracle volumes
- Create a replication schedule through AWX/Tower for Oracle binaries, databases, and logs
- Restore Oracle DB on the destination, and bring database online

**On Prem to CVO in AWS**

- Create AWS connector
- Create CVO instance in AWS
- Add On-Prem cluster to Cloud Manager
- Create intercluster lifs on source
- Establish cluster and vserver peering
- Create and initialize SnapMirror of Oracle volumes
- Create a replication schedule through AWX/Tower for Oracle binaries, databases, and logs
- Restore Oracle DB on the destination, and bring database online

After you are ready, click [here for getting started with the solution](#).

**Getting started**

This solution has been designed to be run in an AWX/Tower environment.

**AWX/Tower**

For AWX/Tower environments, you are guided through creating an inventory of your ONTAP cluster management and Oracle server (IPs and hostnames), creating credentials, configuring a project that pulls the Ansible code from NetApp Automation Github, and the Job Template that launches the automation.

1. The solution has been designed to run in a private cloud scenario (on-premise to on-premise), and hybrid cloud (on-premise to public cloud Cloud Volumes ONTAP [CVO])
2. Fill out the variables specific to your environment, and copy and paste them into the Extra Vars fields in your job template.
3. After the extra vars have been added to your job template, you can launch the automation.
4. The automation is set to be ran three phases (Setup, Replication Schedule for Oracle Binaries, Database, Logs, and Replication Schedule just for Logs), and a forth phase to recovering the database at a DR site.
5. For detailed instructions for obtaining the keys and tokens necessary for the CVO Data Protection visit [Gather Pre-requisites For CVO and Connector Deployments](#)

</tbody>
</table>

**CVO**

This automated deployment is designed with a single Ansible playbook that consists of three separate roles. The roles are for ONTAP, Linux, and Oracle configurations. The following table describes which tasks are being automated.
### Playbook | Tasks
---|---
**cvo_setup** | Pre-check of the environment
| AWS Configure/AWS Access Key ID/Secret Key/Default Region
| Creation of AWS Role
| Creation of NetApp Cloud Manager Connector instance in AWS
| Creation of Cloud Volumes ONTAP (CVO) instance in AWS
| Add On-Prem Source ONTAP Cluster to NetApp Cloud Manager
| Creation of destination SnapMirror and Initialization of designated Oracle volumes

**ora_replication_cg** | Enable backup mode for each database in /etc/oratab
| Snapshot taken of Oracle Binary and Database volumes
| Snapmirror Updated
| Turn off backup mode for each database in /etc/oratab

**ora_replication_log** | Switch current log for each database in /etc/oratab
| Snapshot taken of Oracle Log volume
| Snapmirror Updated

**ora_recovery** | Break SnapMirror
| Enable NFS and create junction path for Oracle volumes on the destination CVO
| Configure DR Oracle Host
| Mount and verify Oracle volumes
| Recover and start Oracle database

### Default parameters

To simplify automation, we have preset many required Oracle parameters with default values. It is generally not necessary to change the default parameters for most deployments. A more advanced user can make changes to the default parameters with caution. The default parameters are located in each role folder under defaults directory.

### License

You should read license information as stated in the Github repository. By accessing, downloading, installing, or using the content in this repository, you agree the terms of the license laid out [here](#).  

Note that there are certain restrictions around producing and/or sharing any derivative works with the content in this repository. Please make sure you read the terms of the License before using the content. If you do not agree to all of the terms, do not access, download, or use the content in this repository.

After you are ready, click [here for detailed AWX/Tower procedures](#).
Step-by-step deployment procedure

AWX/Tower Oracle Data Protection

Create the inventory, group, hosts, and credentials for your environment

This section describes the setup of inventory, groups, hosts, and access credentials in AWX/Ansible Tower that prepare the environment for consuming NetApp automated solutions.

1. Configure the inventory.
   a. Navigate to Resources → Inventories → Add, and click Add Inventory.
   b. Provide the name and organization details, and click Save.
   c. On the Inventories page, click the inventory created.
   d. Navigate to the Groups sub-menu and click Add.
   e. Provide the name oracle for your first group and click Save.
   f. Repeat the process for a second group called dr_oracle.
   g. Select the oracle group created, go to the Hosts sub-menu and click Add New Host.
   h. Provide the IP address of the Source Oracle host's management IP, and click Save.
   i. This process must be repeated for the dr_oracle group and add the DR/Destination Oracle host's management IP/hostname.

Below are instructions for creating the credential types and credentials for either On-Prem with ONTAP, or CVO on AWS.
On-Prem

1. Configure the credentials.

2. Create Credential Types. For solutions involving ONTAP, you must configure the credential type to match username and password entries.
   a. Navigate to Administration → Credential Types, and click Add.
   b. Provide the name and description.
   c. Paste the following content in Input Configuration:

   ```
   fields:
   - id: dst_cluster_username
     type: string
     label: Destination Cluster Username
   - id: dst_cluster_password
     type: string
     label: Destination Cluster Password
     secret: true
   - id: src_cluster_username
     type: string
     label: Source Cluster Username
   - id: src_cluster_password
     type: string
     label: Source Cluster Password
     secret: true
   ```
   d. Paste the following content into Injector Configuration and then click Save:

   ```
   extra_vars:
   dst_cluster_username: '{{ dst_cluster_username }}'
   dst_cluster_password: '{{ dst_cluster_password }}'
   src_cluster_username: '{{ src_cluster_username }}'
   src_cluster_password: '{{ src_cluster_password }}'
   ```

3. Create Credential for ONTAP
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for the ONTAP Credentials
   c. Select the credential type that was created in the previous step.
   d. Under Type Details, enter the Username and Password for your Source and Destination Clusters.
   e. Click Save

4. Create Credential for Oracle
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for Oracle
c. Select the Machine credential type.
d. Under Type Details, enter the Username and Password for the Oracle hosts.
e. Select the correct Privilege Escalation Method, and enter the username and password.
f. Click Save
g. Repeat process if needed for a different credential for the dr_oracle host.

CVO
1. Configure the credentials.
2. Create credential types. For solutions involving ONTAP, you must configure the credential type to match username and password entries, we will also add entries for Cloud Central and AWS.
   a. Navigate to Administration → Credential Types, and click Add.
   b. Provide the name and description.
   c. Paste the following content in Input Configuration:
fields:
- id: dst_cluster_username
  type: string
  label: CVO Username
- id: dst_cluster_password
  type: string
  label: CVO Password
  secret: true
- id: cvo_svm_password
  type: string
  label: CVO SVM Password
  secret: true
- id: src_cluster_username
  type: string
  label: Source Cluster Username
- id: src_cluster_password
  type: string
  label: Source Cluster Password
  secret: true
- id: regular_id
  type: string
  label: Cloud Central ID
  secret: true
- id: email_id
  type: string
  label: Cloud Manager Email
  secret: true
- id: cm_password
  type: string
  label: Cloud Manager Password
  secret: true
- id: access_key
  type: string
  label: AWS Access Key
  secret: true
- id: secret_key
  type: string
  label: AWS Secret Key
  secret: true
- id: token
  type: string
  label: Cloud Central Refresh Token
  secret: true

d. Paste the following content into Injector Configuration and click Save:
3. Create Credential for ONTAP/CVO/AWS
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for the ONTAP Credentials
   c. Select the credential type that was created in the previous step.
   d. Under Type Details, enter the Username and Password for your Source and CVO Clusters, Cloud Central/Manager, AWS Access/Secret Key and Cloud Central Refresh Token.
   e. Click Save

4. Create Credential for Oracle (Source)
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for Oracle host
   c. Select the Machine credential type.
   d. Under Type Details, enter the Username and Password for the Oracle hosts.
   e. Select the correct Privilege Escalation Method, and enter the username and password.
   f. Click Save

5. Create Credential for Oracle Destination
   a. Navigate to Resources → Credentials, and click Add.
   b. Enter the name and organization details for the DR Oracle host
   c. Select the Machine credential type.
   d. Under Type Details, enter the Username (ec2-user or if you have changed it from default enter that), and the SSH Private Key
   e. Select the correct Privilege Escalation Method (sudo), and enter the username and password if needed.
   f. Click Save

Create a project
1. Go to Resources → Projects, and click Add.
a. Enter the name and organization details.

b. Select Git in the Source Control Credential Type field.

c. Enter https://github.com/NetApp-Automation/na_oracle19c_data_protection.git as the source control URL.

d. Click Save.

e. The project might need to sync occasionally when the source code changes.

**Configure global variables**

Variables defined in this section apply to all Oracle hosts, databases, and the ONTAP cluster.

1. Input your environment-specific parameters in following embedded global variables or vars form.

   ![Info](https://example.com/info) The items in blue must be changed to match your environment.
On-Prem

Automation Playbooks

There are four separate playbooks that need to be ran.

1. Playbook for Setting up your environment, On-Prem or CVO.
2. Playbook for replicating Oracle Binaries and Databases on a schedule
3. Playbook for replicating Oracle Logs on a schedule
4. Playbook for Recovering your database on a destination host
ONTAP/CVO Setup
ONTAP and CVO Setup

**Configure and launch the job template.**

1. Create the job template.
   
   a. Navigate to Resources → Templates → Add and click Add Job Template.
   
   b. Enter the name ONTAP/CVO Setup
   
   c. Select the Job type; Run configures the system based on a playbook.
   
   d. Select the corresponding inventory, project, playbook, and credentials for the playbook.
   
   e. Select the ontap_setup.yml playbook for an On-Prem environment or select the cvo_setup.yml for replicating to a CVO instance.
   
   f. Paste global variables copied from step 4 into the Template Variables field under the YAML tab.
   
   g. Click Save.

2. Launch the job template.
   
   a. Navigate to Resources → Templates.
   
   b. Click the desired template and then click Launch.

   ![Info](image)

   We will use this template and copy it out for the other playbooks.

---

**Replication For Binary and Database Volumes**

Scheduling the Binary and Database Replication Playbook

**Configure and launch the job template.**

1. Copy the previously created job template.
   
   a. Navigate to Resources → Templates.
   
   b. Find the ONTAP/CVO Setup Template, and on the far right click on Copy Template
   
   c. Click Edit Template on the copied template, and change the name to Binary and Database Replication Playbook.
   
   d. Keep the same inventory, project, credentials for the template.
   
   e. Select the ora_replication_cg.yml as the playbook to be executed.
   
   f. The variables will remain the same, but the CVO cluster IP will need to be set in the variable dst_cluster_ip.
   
   g. Click Save.

2. Schedule the job template.
   
   a. Navigate to Resources → Templates.
   
   b. Click the Binary and Database Replication Playbook template and then click Schedules at the top set of options.
   
   c. Click Add, add Name Schedule for Binary and Database Replication, choose the Start date/time at the beginning of the hour, choose your Local time zone, and Run frequency. Run frequency will be often the SnapMirror replication will be updated.
Replication for Log Volumes
Scheduling the Log Replication Playbook

Configure and launch the job template.

1. Copy the previously created job template.
   a. Navigate to Resources → Templates.
   b. Find the ONTAP/CVO Setup Template, and on the far right click on Copy Template
   c. Click Edit Template on the copied template, and change the name to Log Replication Playbook.
   d. Keep the same inventory, project, credentials for the template.
   e. Select the ora_replication_logs.yml as the playbook to be executed.
   f. The variables will remain the same, but the CVO cluster IP will need to be set in the variable dst_cluster_ip.
   g. Click Save.

2. Schedule the job template.
   a. Navigate to Resources → Templates.
   b. Click the Log Replication Playbook template and then click Schedules at the top set of options.
   c. Click Add, add Name Schedule for Log Replication, choose the Start date/time at the beginning of the hour, choose your Local time zone, and Run frequency. Run frequency will be often the SnapMirror replication will be updated.

   It is recommended to set the log schedule to update every hour to ensure the recovery to the last hourly update.

Restore and Recover Database
Scheduling the Log Replication Playbook

Configure and launch the job template.

1. Copy the previously created job template.
   a. Navigate to Resources → Templates.
   b. Find the ONTAP/CVO Setup Template, and on the far right click on Copy Template
   c. Click Edit Template on the copied template, and change the name to Restore and Recovery Playbook.
   d. Keep the same inventory, project, credentials for the template.
   e. Select the ora_recovery.yml as the playbook to be executed.
   f. The variables will remain the same, but the CVO cluster IP will need to be set in the variable dst_cluster_ip.
   g. Click Save.
This playbook will not be ran until you are ready to restore your database at the remote site.

Recovering Oracle Database

1. On-premises production Oracle databases data volumes are protected via NetApp SnapMirror replication to either a redundant ONTAP cluster in secondary data center or Cloud Volume ONTAP in public cloud. In a fully configured disaster recovery environment, recovery compute instances in secondary data center or public cloud are standby and ready to recover the production database in the case of a disaster. The standby compute instances are kept in sync with on-prem instances by running parallel updates on OS kernel patch or upgrade in a lockstep.

2. In this solution demonstrated, Oracle binary volume is replicated to target and mounted at target instance to bring up Oracle software stack. This approach to recover Oracle has advantage over a fresh installation of Oracle at last minute when a disaster occurred. It guarantees Oracle installation is fully in sync with current on-prem production software installation and patch levels etc. However, this may or may not have additional software licensing implication for the replicated Oracle binary volume at recovery site depending on how the software licensing is structured with Oracle. User is recommended to check with its software licensing personnel to assess the potential Oracle licensing requirement before deciding to use the same approach.

3. The standby Oracle host at the destination is configured with the Oracle prerequisite configurations.

4. The SnapMirrors are broken and the volumes are made writable and mounted to the standby Oracle host.

5. The Oracle recovery module performs following tasks to recovery and startup Oracle at recovery site after all DB volumes are mounted at standby compute instance.
   a. Sync the control file: We deployed duplicate Oracle control files on different database volume to protect critical database control file. One is on the data volume and another is on log volume. Since data and log volumes are replicated at different frequency, they will be out of sync at the time of recovery.
   b. Relink Oracle binary: Since the Oracle binary is relocated to a new host, it needs a relink.
   c. Recover Oracle database: The recovery mechanism retrieves last System Change Number in last available archived log in Oracle log volume from control file and recovers Oracle database to recoup all business transactions that was able to be replicated to DR site at the time of failure. The database is then started up in a new incarnation to carry on user connections and business transaction at recovery site.

Before running the Recovering playbook make sure you have the following:
Make sure it copy over the /etc/oratab and /etc/oraInst.loc from the source Oracle host to the destination host

TR-4794: Oracle databases on NetApp EF-Series

Mitch Blackburn, Ebin Kadavy, NetApp

TR-4794 is intended to help storage administrators and database administrators successfully deploy Oracle on NetApp EF-Series storage.
