Get started with Cloud Manager

Learn about Cloud Manager

Cloud Manager enables IT experts and cloud architects to centrally manage their hybrid multi-cloud infrastructure using NetApp's cloud solutions.

Features

Cloud Manager is an enterprise-class, SaaS-based management platform that keeps you in control of your data no matter where it is.

- Set up and use Cloud Volumes ONTAP for efficient, multi-protocol data management across clouds.
- Set up and use file-storage services: Azure NetApp Files, Cloud Volumes Service for AWS, and Cloud Volumes Service for Google Cloud.
- Discover and manage your on-prem ONTAP clusters by creating volumes, backing up to the cloud, replicating data across your hybrid cloud, and tiering cold data to the cloud.
- Enable integrated cloud services and software like Cloud Compliance, Cloud Insights, Cloud Backup Service, Trident, and more.

Learn more about Cloud Manager.

Supported object storage providers

Cloud Manager enables you to manage cloud storage and use cloud services in Amazon Web Services, Microsoft Azure, and Google Cloud.

Cost

Cloud Manager software is free of charge from NetApp.

For most tasks, Cloud Manager prompts you to deploy a Connector in your cloud network, which results in charges from your cloud provider for the compute instance and associated storage. You do have the option to run the Connector software on your premises.

How Cloud Manager works

Cloud Manager includes a SaaS-based interface that is integrated with NetApp Cloud Central, and Connectors that manage Cloud Volumes ONTAP and other cloud services.

Software-as-a-service

Cloud Manager is accessible through a SaaS-based user interface and APIs. This SaaS experience enables you to automatically access the latest features as they’re released and to easily switch between
your Cloud Central accounts and Connectors.

**NetApp Cloud Central**

NetApp Cloud Central provides a centralized location to access and manage NetApp cloud services. With centralized user authentication, you can use the same set of credentials to access Cloud Manager and other cloud services like Cloud Insights.

When you log in to Cloud Manager for the first time, you're prompted to create a *Cloud Central account*. This account provides multi-tenancy and enables you to organize users and resources in isolated *workspaces*.

**Connectors**

In most cases, an Account Admin will need to deploy a *Connector* in your cloud or on-premises network. The Connector enables Cloud Manager to manage resources and processes within your public cloud environment.

A Connector should remain running at all times. It's important for the continued health and operation of the services that you enable.

For example, a Connector is a key component in the health and operation of Cloud Volumes ONTAP PAYGO systems. If a Connector is powered down, Cloud Volumes ONTAP PAYGO systems will shut down after losing communication with a Connector for longer than 14 days.

Learn more about when Connectors are required and how they work.

**Networking overview**

Before users log in to Cloud Manager, you’ll need to ensure that their web browsers can access specific endpoints. After that, you need to verify networking requirements for the specific type of working environment and services that will be used.

**Endpoints accessed from your web browser**

Users must access Cloud Manager from a web browser. The machine running the web browser must have connections to the following endpoints:

<table>
<thead>
<tr>
<th>Endpoints</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="https://cloudmanager.cloud.netapp.com">https://cloudmanager.cloud.netapp.com</a></td>
<td>To connect you to the Cloud Manager SaaS interface.</td>
</tr>
<tr>
<td><a href="https://api.services.cloud.netapp.com">https://api.services.cloud.netapp.com</a></td>
<td>To contact Cloud Central APIs.</td>
</tr>
</tbody>
</table>
Endpoints | Purpose
---|---
https://auth0.com | Your web browser connects to these endpoints for centralized user authentication through NetApp Cloud Central.
https://cdn.auth0.com | 
https://netapp-cloud-account.auth0.com | 
https://services.cloud.netapp.com | 
https://widget.intercom.io | For in-product chat that enables you to talk to NetApp cloud experts.

Index of networking requirements

- Connectors
- Cloud Volumes ONTAP for AWS
- Cloud Volumes ONTAP for Azure
- Cloud Volumes ONTAP for GCP
- Data replication between ONTAP systems
- Cloud Compliance for Cloud Volumes ONTAP or Azure NetApp Files
- Cloud Compliance for Amazon S3
- On-prem ONTAP clusters
  - Data tiering from ONTAP clusters to Amazon S3
  - Data tiering from ONTAP clusters to Azure Blob storage
  - Data tiering from ONTAP clusters to Google Cloud Storage
  - Data tiering from ONTAP clusters to StorageGRID

Signing up to NetApp Cloud Central

Sign up to NetApp Cloud Central so you can access NetApp’s cloud services.

Steps

1. Open a web browser and go to NetApp Cloud Central.
2. Click Sign Up.
3. Fill out the form and click Sign Up.
5. Click the link in the email to verify your email address.

Result
You now have an active Cloud Central user login.

Logging in to Cloud Manager

The Cloud Manager interface is accessible through a SaaS-based user interface by going to [https://cloudmanager.netapp.com](https://cloudmanager.netapp.com).

Steps
1. Open a web browser and go to [https://cloudmanager.netapp.com](https://cloudmanager.netapp.com).
2. Log in using your NetApp Cloud Central credentials.
Set up a Cloud Central account

Account settings: users, workspaces, Connectors, and subscriptions

A Cloud Central account provides multi-tenancy and enables you to organize users and resources in isolated workspaces from within Cloud Manager.

For example, multiple users can deploy and manage Cloud Volumes ONTAP systems in isolated environments called workspaces. These workspaces are invisible to other users, unless they are shared.

When you first access Cloud Manager, you're prompted to select or create a Cloud Central account:
Hi Ben,

Welcome to Cloud Manager

SET UP CLOUD MANAGER

Cloud Manager will be created in account: MyAccount

Cloud Manager Name

LET'S START

Account Admins can then modify the settings for this account by managing users, workspaces, Connectors, and subscriptions:

Account Settings

Users          Workspaces          Service Connector          Subscriptions

MyAccount

Manage the Account’s Workspaces

+ Add New Workspace

Workspace-2

Workspace-1

For step-by-step instructions, see Setting up the Cloud Central account.
Account Settings

The Account Settings widget in Cloud Manager enables Account Admins to manage a Cloud Central account. If you just created your account, then you'll start from scratch. But if you've already set up an account, then you'll see all the users, workspaces, Connectors, and subscriptions that are associated with the account.

Users

The users that display in the Account Settings are NetApp Cloud Central users that you associate with your Cloud Central account. Associating a user with an account and one or more workspaces in that account enables those users to create and manage working environments in Cloud Manager.

When you associate a user, you assign them a role:

- **Account Admin**: Can perform any action in Cloud Manager.
- **Workspace Admin**: Can create and manage resources in the assigned workspace.
- **Cloud Compliance Viewer**: Can only view compliance information and generate reports for systems that they have permission to access.

Workspaces

In Cloud Manager, a workspace isolates any number of working environments from other working environments. Workspace Admins can’t access the working environments in a workspace unless the Account Admin associates the admin with that workspace.

A working environment represents a storage system:

- A single-node Cloud Volumes ONTAP system or an HA pair
- An on-premises ONTAP cluster in your network
- An ONTAP cluster in a NetApp Private Storage configuration

Connectors

A Connector enables Cloud Manager to manage resources and processes within your public cloud environment. The Connector runs on a virtual machine instance that you deploy in your cloud provider, or on an on-prem host that you configured.

You can use a Connector with more than one NetApp cloud data service. For example, if you already have a Connector for Cloud Manager, you can select it when you set up the Cloud Tiering service.

Subscriptions

The Account Settings widget shows the NetApp subscriptions associated with the selected account.

When you subscribe to Cloud Manager from a cloud provider’s marketplace, you’re redirected to Cloud
Central where you need to save your subscription and associate it with specific accounts.

After you've subscribed, each subscription is available from the Account Settings widget. You'll only see the subscriptions that are associated with the account that you're currently viewing.

You have the option to rename a subscription and to disassociate the subscription from one or more accounts.

For example, let's say that you have two accounts and each is billed through separate subscriptions. You might disassociate a subscription from one of the accounts so the users in that account don't accidentally choose the wrong subscription when creating a Cloud Volume ONTAP working environment.

Examples

The following examples depict how you might set up your accounts.

In both example images that follow, the Connector and the Cloud Volumes ONTAP systems don’t actually reside in the NetApp Cloud Central account—they're running in a cloud provider. This is a conceptual representation of the relationship between each component.

Example 1

The following example shows an account that uses two workspaces to create isolated environments. The first workspace is for a production environment and the second is for a dev environment.
Example 2

Here’s another example that shows the highest level of multi-tenancy by using two separate Cloud Central accounts. For example, a service provider might use Cloud Manager in one account to provide services for their customers, while using another account to provide disaster recovery for one of their business units.

Note that account 2 includes two separate Connectors. This might happen if you have systems in separate regions or in separate cloud providers.
Setting up workspaces and users in the Cloud Central account

When you log in to Cloud Manager for the first time, you’re prompted to create a **NetApp Cloud Central account**. This account provides multi-tenancy and enables you to organize users and resources in isolated workspaces.

Learn more about how Cloud Central accounts work.

Set up your Cloud Central account so users can access Cloud Manager and access the working environments in a workspace. Just add a single user or add multiple users and workspaces.

Adding workspaces

In Cloud Manager, workspaces enable you to isolate a set of working environments from other working environments and from other users. For example, you can create two workspaces and associate separate users with each workspace.

Steps

1. From the top of Cloud Manager, click the **Account** drop-down.
2. Click **Manage Account** next to the currently selected account.

3. Click **Workspaces**.

4. Click **Add New Workspace**.

5. Enter a name for the workspace and click **Add**.

*After you finish*

If a Workspace Admin needs access to this workspace, then you'll need to associate the user. You'll also need to associate Connectors with the workspace so Workspace Admins can use those Connectors.

**Adding users**

Associate Cloud Central users with the Cloud Central account so those users can create and manage working environments in Cloud Manager.

**Steps**

1. If the user hasn't already done so, ask the user to go to NetApp Cloud Central and sign up.

2. From the top of Cloud Manager, click the **Account** drop-down and click **Manage Account**.
3. From the Users tab, click **Associate User**.

4. Enter the user’s email address and select a role for the user:
   - *Account Admin*: Can perform any action in Cloud Manager.
   - *Workspace Admin*: Can create and manage resources in assigned workspaces.
   - *Compliance Viewer*: Can only view compliance information and generate reports for workspaces that they have permission to access.

5. If you selected Workspace Admin or Compliance Viewer, select one or more workspaces to associate with that user.
6. Click **Associate User**.

**Result**
The user should receive an email from NetApp Cloud Central titled "Account Association." The email includes the information needed to access Cloud Manager.

**Associating Workspace Admins with workspaces**
You can associate Workspace Admins with additional workspaces at any time. Associating the user enables them to create and view the working environments in that workspace.

**Steps**
1. From the top of Cloud Manager, click the **Account** drop-down and click **Manage Account**.
2. From the Users tab, click the action menu in the row that corresponds to the user.

3. Click **Manage Workspaces**.

4. Select one or more workspaces and click **Apply**.

**Result**

The user can now access those workspaces from Cloud Manager, as long as the Connector was also associated with the workspaces.

**Associating Connectors with workspaces**

You need to associate a Connector with workspaces so Workspace Admins can use those Connectors to create Cloud Volumes ONTAP systems.

If you only have Account Admins, then associating the Connector with workspaces isn’t required. Account Admins have the ability to access all workspaces in Cloud Manager by default.

Learn more about users, workspaces, and Connectors.

**Steps**

1. From the top of Cloud Manager, click the **Account** drop-down and click **Manage Account**.
2. Click Connector.

3. Click Manage Workspaces for the Connector that you want to associate.

4. Select one or more workspaces and click Apply.

Result

Workspace Admins can now use those Connectors to create Cloud Volumes ONTAP systems.

What's next?

Now that you've set up your account, you can manage it any time by removing users, managing workspaces, Connectors, and subscriptions. Learn more.

Set up a Connector

Learn about Connectors

In most cases, an Account Admin will need to deploy a Connector in your cloud or on-premises network. The Connector enables Cloud Manager to manage resources and processes within your public cloud environment.

When a Connector is required

A Connector is required to use any of the following features within Cloud Manager:

• Cloud Volumes ONTAP
• On-premises ONTAP clusters
• Cloud Compliance
A Connector is **not** required for Azure NetApp Files, Cloud Volumes Service, or Cloud Sync.

While a Connector isn’t required to set up and manage Azure NetApp Files, a Connector is required if you want to use Cloud Compliance to scan Azure NetApp Files data.

### Supported locations

A Connector is supported in the following locations:

- Amazon Web Services
- Microsoft Azure
- Google Cloud
- On your premises

If you want to create a Cloud Volumes ONTAP system in Google Cloud, then you must have a Connector running in Google Cloud, as well. You can't use a Connector that’s running in another location.

### Connectors should remain running

A Connector should remain running at all times. It's important for the continued health and operation of the services that you enable.

For example, a Connector is a key component in the health and operation of Cloud Volumes ONTAP PAYGO systems. If a Connector is powered down, Cloud Volumes ONTAP PAYGO systems will shut down after losing communication with a Connector for longer than 14 days.

### How to create a Connector

An Account Admin needs to create a Connector before a Workspace Admin can create a Cloud Volumes ONTAP working environment and use any of the other features listed above.

An Account Admin can create a Connector in a number of ways:

- Directly from Cloud Manager (recommended)
When you create your first Cloud Volumes ONTAP working environment, Cloud Manager will prompt you to create a Connector if you don't have one yet.

**Permissions**

Specific permissions are needed to create the Connector and another set of permissions are needed for the Connector instance itself.

**Permissions to create a Connector**

The user who creates a Connector from Cloud Manager needs specific permissions to deploy the instance in your cloud provider of choice. Cloud Manager will remind you of the permissions requirements when you create a Connector.

View policies for each cloud provider.

**Permissions for the Connector instance**

The Connector needs specific cloud provider permissions to perform operations on your behalf. For example, to deploy and manage Cloud Volumes ONTAP.

When you create a Connector directly from Cloud Manager, Cloud Manager creates the Connector with the permissions that it needs. There's nothing that you need to do.

If you create the Connector yourself from the AWS Marketplace, the Azure Marketplace, or by manually installing the software, then you'll need to make sure that the right permissions are in place.

View policies for each cloud provider.

**When to use multiple Connectors**

In some cases, you might only need one Connector, but you might find yourself needing two or more Connectors.

Here are a few examples:

- You're using a multi-cloud environment (AWS and Azure), so you have one Connector in AWS and another in Azure. Each manages the Cloud Volumes ONTAP systems running in those environments.
• A service provider might use one Cloud Central account to provide services for their customers, while using another account to provide disaster recovery for one of their business units. Each account would have separate Connectors.

**When to switch between Connectors**

When you create your first Connector, Cloud Manager automatically uses that Connector for each additional working environment that you create. Once you create an additional Connector, you'll need to switch between them to see the working environments that are specific to each Connector.

Learn how to switch between Connectors.

**The local user interface**

While you should perform almost all tasks from the SaaS user interface, a local user interface is still available on the Connector. This interface is needed for a few tasks that need to be performed from the Connector itself:

• Setting a proxy server
• Installing a patch (you’ll typically work with NetApp personnel to install a patch)
• Downloading AutoSupport messages (usually directed by NetApp personnel when you have issues)

Learn how to access the local UI.

**Connector upgrades**

The Connector automatically updates its software to the latest version, as long as it has outbound internet access to obtain the software update.

**Networking requirements for the Connector**

Set up your networking so the Connector can manage resources and processes within your public cloud environment. The most important step is ensuring outbound internet access to various endpoints.

If your network uses a proxy server for all communication to the internet, you can specify the proxy server from the Settings page. Refer to Configuring the Connector to use a proxy server.

**Connection to target networks**

A Connector requires a network connection to the type of working environment that you're creating and the services that you're planning to enable.

For example, if you install a Connector in your corporate network, then you must set up a VPN
connection to the VPC or VNet in which you launch Cloud Volumes ONTAP.

**Outbound internet access**

The Connector requires outbound internet access to manage resources and processes within your public cloud environment. Outbound internet access is also required if you want to manually install the Connector on a Linux host or access the local UI running on the Connector.

The following sections identify the specific endpoints.

**Endpoints to manage resources in AWS**

A Connector contacts the following endpoints when managing resources in AWS:

<table>
<thead>
<tr>
<th>Endpoints</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS services (amazonaws.com):</td>
<td>Enables the Connector to deploy and manage Cloud Volumes ONTAP in AWS.</td>

Endpoints | Purpose
--- | ---
https://packages.cloud.google.com/yum | Required to connect Cloud Volumes ONTAP systems with a Kubernetes cluster. The endpoints enable installation of NetApp Trident.
https://github.com/NetApp/trident/releases/download/ | 
Various third-party locations, for example:  
- https://repo1.maven.org/maven2  
- https://oss.sonatype.org/content/repositories  
- https://repo.typesafe.com | During upgrades, Cloud Manager downloads the latest packages for third-party dependencies.

Endpoints to install the Connector on a Linux host

You have the option to manually install the Connector software on your own Linux host. If you do, the installer for the Connector must access the following URLs during the installation process:

- http://dev.mysql.com/get/mysql-community-release-el7-5.noarch.rpm

The host might try to update operating system packages during installation. The host can contact different mirroring sites for these OS packages.

Endpoints accessed from your web browser when using the local UI

While you should perform almost all tasks from the SaaS user interface, a local user interface is still available on the Connector. The machine running the web browser must have connections to the following endpoints:
Endpoints

<table>
<thead>
<tr>
<th>The Connector host</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>You must enter the host's IP address from a web browser to load the Cloud Manager console.</td>
<td>Depending on your connectivity to your cloud provider, you can use the private IP or a public IP assigned to the host:</td>
</tr>
<tr>
<td>• A private IP works if you have a VPN and direct connect access to your virtual network</td>
<td></td>
</tr>
<tr>
<td>• A public IP works in any networking scenario</td>
<td></td>
</tr>
<tr>
<td>In any case, you should secure network access by ensuring that security group rules allow access from only authorized IPs or subnets.</td>
<td></td>
</tr>
</tbody>
</table>

https://auth0.com  
https://cdn.auth0.com  
https://netapp-cloud-account.auth0.com  
https://services.cloud.netapp.com  

Your web browser connects to these endpoints for centralized user authentication through NetApp Cloud Central.

https://widget.intercom.io  
For in-product chat that enables you to talk to NetApp cloud experts.

Ports and security groups

There's no incoming traffic to the Connector, unless you initiate it. HTTP and HTTPS provide access to the local UI, which you'll use in rare circumstances. SSH is only needed if you need to connect to the host for troubleshooting.

Rules for the Connector in AWS

The security group for the Connector requires both inbound and outbound rules.

Inbound rules

The source for inbound rules in the predefined security group is 0.0.0.0/0.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSH</td>
<td>22</td>
<td>Provides SSH access to the Connector host</td>
</tr>
<tr>
<td>HTTP</td>
<td>80</td>
<td>Provides HTTP access from client web browsers to the local user interface and connections from Cloud Compliance</td>
</tr>
<tr>
<td>HTTPS</td>
<td>443</td>
<td>Provides HTTPS access from client web browsers to the local user interface</td>
</tr>
</tbody>
</table>
## Outbound rules

The predefined security group for the Connector opens all outbound traffic. If that is acceptable, follow the basic outbound rules. If you need more rigid rules, use the advanced outbound rules.

### Basic outbound rules

The predefined security group for the Connector includes the following outbound rules.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>All TCP</td>
<td>All</td>
<td>All outbound traffic</td>
</tr>
<tr>
<td>All UDP</td>
<td>All</td>
<td>All outbound traffic</td>
</tr>
</tbody>
</table>

### Advanced outbound rules

If you need rigid rules for outbound traffic, you can use the following information to open only those ports that are required for outbound communication by the Connector.

The source IP address is the Connector host.

<table>

Creating a Connector in AWS from Cloud Manager

An Account Admin needs to deploy a Connector before you can use most Cloud Manager features. Learn when a Connector is required. The Connector enables
Cloud Manager to manage resources and processes within your public cloud environment.

This page describes how to create a Connector in AWS directly from Cloud Manager. You also have the option to create the Connector from the AWS Marketplace, or to download the software and install it on your own host.

These steps must be completed by a user who has the Account Admin role. A Workspace Admin can't create a Connector.

When you create your first CloudVolumes ONTAP working environment, Cloud Manager will prompt you to create a Connector if you don’t have one yet.

Setting up AWS permissions to create a Connector

Before you can deploy a Connector from Cloud Manager, you need to ensure that your AWS account has the correct permissions.

Steps
1. Download the Connector IAM policy from the following location:

   NetApp Cloud Manager: AWS, Azure, and GCP Policies

2. From the AWS IAM console, create your own policy by copying and pasting the text from the Connector IAM policy.

3. Attach the policy that you created in the previous step to the IAM user who will create the Connector from Cloud Manager.

Result

The AWS user now has the permissions required to create the Connector from Cloud Manager. You’ll need to specify AWS access keys for this user when you’re prompted by Cloud Manager.

Creating a Connector in AWS

Cloud Manager enables you to create a Connector in AWS directly from its user interface.

What you’ll need

- An AWS access key and secret key for an IAM user who has the required permissions.
- A VPC, subnet, and keypair in your AWS region of choice.

Steps
1. If you’re creating your first Working Environment, click Add Working Environment and follow the prompts. Otherwise, click the Connector drop-down and select Add Connector.
2. Click **Let's Start**.

3. Choose **Amazon Web Services** as your cloud provider.

   Remember that the Connector must have a network connection to the type of working environment that you're creating and the services that you're planning to enable.

   Learn more about networking requirements for the Connector.

4. Review what you'll need and click **Continue**.

5. Provide the required information:
   - **AWS Credentials**: Enter a name for the instance and specify the AWS access key and secret key that meet permissions requirements.
   - **Location**: Specify an AWS region, VPC, and subnet for the instance.
   - **Network**: Select the key pair to use with the instance, whether to enable a public IP address, and optionally specify a proxy configuration.
   - **Security Group**: Choose whether to create a new security group or whether to select an existing security group that allows inbound HTTP, HTTPS, and SSH access.

   There's no incoming traffic to the Connector, unless you initiate it. HTTP and HTTPS provide access to the local UI, which you'll use in rare circumstances. SSH is only needed if you need to connect to the host for troubleshooting.

6. Click **Create**.

   The instance should be ready in about 7 minutes. You should stay on the page until the process is complete.

**After you finish**

You need to associate a Connector with workspaces so Workspace Admins can use those Connectors to create Cloud Volumes ONTAP systems. If you only have Account Admins, then associating the Connector with workspaces isn’t required. Account Admins have the ability to access all workspaces in
Creating a Connector in Azure from Cloud Manager

An Account Admin needs to deploy a Connector before you can use most Cloud Manager features. Learn when a Connector is required. The Connector enables Cloud Manager to manage resources and processes within your public cloud environment.

This page describes how to create a Connector in Azure directly from Cloud Manager. You also have the option to create the Connector from the Azure Marketplace, or to download the software and install it on your own host.

These steps must be completed by a user who has the Account Admin role. A Workspace Admin can’t create a Connector.

When you create your first Cloud Volumes ONTAP working environment, Cloud Manager will prompt you to create a Connector if you don’t have one yet.

Setting up Azure permissions to create a Connector

Before you can deploy a Connector from Cloud Manager, you need to ensure that your Azure account has the correct permissions.

Steps

1. Create a custom role using the Azure policy for the Connector:
   a. Download the Azure policy for the Connector.

      Right-click the link and click Save link as... to download the file.

   b. Modify the JSON file by adding your Azure subscription ID to the assignable scope.

      Example

      ```json
      "AssignableScopes": [
      "/subscriptions/d333af45-0d07-4154-943d-c25fbzzzzzzz",
      
      ]
      ```

   c. Use the JSON file to create a custom role in Azure.

      The following example shows how to create a custom role using the Azure CLI 2.0:

      ```bash
      az role definition create --role-definition C:\Policy_for_Setup_As_Service_Azure.json
      ```
You should now have a custom role called *Azure SetupAsService*.

2. Assign the role to the user who will deploy the Connector from Cloud Manager:
   a. Open the **Subscriptions** service and select the user’s subscription.
   b. Click **Access control (IAM)**.
   c. Click **Add** > **Add role assignment** and then add the permissions:
      - Select the **Azure SetupAsService** role.
      - Assign access to an **Azure AD user, group, or application**.
      - Select the user account.
      - Click **Save**.

*Result*

The Azure user now has the permissions required to deploy the Connector from Cloud Manager.

**Creating a Connector in Azure**

Cloud Manager enables you to create a Connector in Azure directly from its user interface.

*What you’ll need*

- The **required permissions** for your Azure account.
- An Azure subscription.
- A VNet and subnet in your Azure region of choice.

*Steps*

1. If you’re creating your first Working Environment, click **Add Working Environment** and follow the prompts. Otherwise, click the **Connector** drop-down and select **Add Connector**.
2. Click **Let's Start**.

3. Choose **Microsoft Azure** as your cloud provider.

   Remember that the Connector must have a network connection to the type of working environment that you're creating and the services that you're planning to enable.

   Learn more about networking requirements for the Connector.

4. Review what you'll need and click **Continue**.

5. If you're prompted, log in to your Microsoft account, which should have the required permissions to create the virtual machine.

   The form is owned and hosted by Microsoft. Your credentials are not provided to NetApp.

   If you're already logged in to an Azure account, then Cloud Manager will automatically use that account. If you have multiple accounts, then you might need to log out first to ensure that you're using the right account.

6. Provide the required information:

   ◦ **VM Authentication**: Enter a name for the virtual machine and a user name and password or public key.

   ◦ **Basic Settings**: Choose an Azure subscription, an Azure region, and whether to create a new resource group or to use an existing resource group.

   ◦ **Network**: Choose a VNet and subnet, whether to enable a public IP address, and optionally specify a proxy configuration.

   ◦ **Security Group**: Choose whether to create a new security group or whether to select an existing security group that allows inbound HTTP, HTTPS, and SSH access.

   There's no incoming traffic to the Connector, unless you initiate it. HTTP and HTTPS provide access to the local UI, which you'll use in rare circumstances. SSH is only needed if you need to connect to the host for troubleshooting.
7. Click **Create**.

The virtual machine should be ready in about 7 minutes. You should stay on the page until the process is complete.

**After you finish**

You need to associate a Connector with workspaces so Workspace Admins can use those Connectors to create Cloud Volumes ONTAP systems. If you only have Account Admins, then associating the Connector with workspaces isn’t required. Account Admins have the ability to access all workspaces in Cloud Manager by default. [Learn more.]

**Creating a Connector in GCP from Cloud Manager**

An Account Admin needs to deploy a *Connector* before you can use most Cloud Manager features. [Learn when a Connector is required.](#) The Connector enables Cloud Manager to manage resources and processes within your public cloud environment.

This page describes how to create a Connector in GCP directly from Cloud Manager. You also have the option to [download the software and install it on your own host.](#)

These steps must be completed by a user who has the Account Admin role. A Workspace Admin can’t create a Connector.

💡 When you create your first Cloud Volumes ONTAP working environment, Cloud Manager will prompt you to create a Connector if you don’t have one yet.

**Setting up GCP permissions to create a Connector**

Before you can deploy a Connector from Cloud Manager, you need to ensure that your GCP account has the correct permissions and that a service account is set up for the Connector VM.

**Steps**

1. Ensure that the GCP user who deploys Cloud Manager from NetApp Cloud Central has the permissions in the [Connector deployment policy for GCP.](#)

   You can create a custom role using the YAML file and then attach it to the user. You’ll need to use the gcloud command line to create the role.

2. Set up a service account that has the permissions that Cloud Manager needs to create and manage Cloud Volumes ONTAP systems in projects.

   You’ll associate this service account with the Connector VM when you create it from Cloud Manager.
a. Create a role in GCP that includes the permissions defined in the Cloud Manager policy for GCP. Again, you’ll need to use the gcloud command line.

The permissions contained in this YAML file are different than the permissions in step 2a.

b. Create a GCP service account and apply the custom role that you just created.

c. If you want to deploy Cloud Volumes ONTAP in other projects, grant access by adding the service account with the Cloud Manager role to that project. You’ll need to repeat this step for each project.

Result
The GCP user now has the permissions required to create the Connector from Cloud Manager and the service account for the Connector VM is set up.

Enabling Google Cloud APIs
Several APIs are required to deploy the Connector and Cloud Volumes ONTAP.

Step
1. Enable the following Google Cloud APIs in your project.
   ◦ Cloud Deployment Manager V2 API
   ◦ Cloud Logging API
   ◦ Cloud Resource Manager API
   ◦ Compute Engine API
   ◦ Identity and Access Management (IAM) API

Creating a Connector in GCP
Cloud Manager enables you to create a Connector in GCP directly from its user interface.

What you’ll need
• The required permissions for your Google Cloud account.
• A Google Cloud project.
• A service account that has the required permissions to create and manage Cloud Volumes ONTAP.
• A VPC and subnet in your Google Cloud region of choice.

Steps
1. If you’re creating your first Working Environment, click Add Working Environment and follow the prompts. Otherwise, click the Connector drop-down and select Add Connector.
2. Click **Let's Start**.

3. Choose **Google Cloud Platform** as your cloud provider.

   Remember that the Connector must have a network connection to the type of working environment that you're creating and the services that you're planning to enable.

   Learn more about networking requirements for the Connector.

4. Review what you'll need and click **Continue**.

5. If you're prompted, log in to your Google account, which should have the required permissions to create the virtual machine instance.

   The form is owned and hosted by Google. Your credentials are not provided to NetApp.

6. Provide the required information:

   ◦ **Basic Settings**: Enter a name for the virtual machine instance and specify a project and service account that has the required permissions.

   ◦ **Location**: Specify a region, zone, VPC, and subnet for the instance.

   ◦ **Network**: Choose whether to enable a public IP address and optionally specify a proxy configuration.

   ◦ **Firewall Policy**: Choose whether to create a new firewall policy or whether to select an existing firewall policy that allows inbound HTTP, HTTPS, and SSH access.

   There's no incoming traffic to the Connector, unless you initiate it. HTTP and HTTPS provide access to the local UI, which you'll use in rare circumstances. SSH is only needed if you need to connect to the host for troubleshooting.

7. Click **Create**.

   The instance should be ready in about 7 minutes. You should stay on the page until the process is complete.
After you finish
You need to associate a Connector with workspaces so Workspace Admins can use those Connectors to create Cloud Volumes ONTAP systems. If you only have Account Admins, then associating the Connector with workspaces isn’t required. Account Admins have the ability to access all workspaces in Cloud Manager by default. Learn more.

Where to go next
Now that you’ve logged in and set up Cloud Manager, users can start creating and discovering working environments.

- Get started with Cloud Volumes ONTAP for AWS
- Get started with Cloud Volumes ONTAP for Azure
- Get started with Cloud Volumes ONTAP for Google Cloud
- Set up Azure NetApp Files
- Set up Cloud Volumes Service for AWS
- Discover an on-premises ONTAP cluster
- Discover your Amazon S3 buckets

If you’re an administrator, you can manage Cloud Manager settings after you create your first Connector.

- Learn about Connectors
- Manage an HTTPS certificate for secure access
- Configure proxy settings
