Administering Cloud Manager

Updating Cloud Manager

You can update Cloud Manager to the latest version or with a patch that NetApp personnel shared with you.

Enabling automatic updates

Cloud Manager can automatically update itself when a new version is available. This ensures that you are running the latest version.

About this task

Cloud Manager automatically updates at 12:00 midnight if no operations are running.

Steps

1. In the upper right of the Cloud Manager console, click the task drop-down list, and then select **Settings**.
2. Select the checkbox under Automatic Cloud Manager Updates and then click **Save**.

Updating Cloud Manager to the latest version

You should enable automatic updates to Cloud Manager, but you can always do a manual update directly from the web console. Cloud Manager obtains the software update from a NetApp-owned S3 bucket in AWS.

Before you begin

You should have reviewed [what is new in the release](#) to identify new requirements and changes in support.

About this task

The software update takes a few minutes. Cloud Manager will not be available during the update.

Steps

1. Check whether a new version is available by looking at the lower-right corner of the console:

2. If a new version is available, click **Timeline** to determine whether any tasks are in progress.

If any tasks are in progress, wait for them to finish before you proceed to the next step.

3. In the lower-right of the console, click **New version available**.
4. On the Cloud Manager Software Update page, click **Update** next to the version that you want.
5. Complete the confirmation dialog box, and then click **OK**:
 - a. Keep the option to download a backup because you can use it to restore your Cloud Manager configuration, if necessary.
 - b. Read the terms and conditions, and then select the **I read and approve the terms and conditions (EULA)** check box.

6. When prompted, save the Cloud Manager backup.

Result

Cloud Manager starts the update process. You can log in to the console after a few minutes.

Updating Cloud Manager with a patch

If NetApp shared a patch with you, you can update Cloud Manager with the supplied patch directly from the Cloud Manager web console.

About this task

The patch update typically takes a few minutes. Cloud Manager will not be available during the update.

Steps

1. In the upper-right hand corner of the Cloud Manager console, click the task drop-down list, and then select **Update**.
2. Click the link to update Cloud Manager with the supplied patch.

If NetApp shared a patch with you, click [here](#) to update Cloud Manager with the supplied patch.

3. Complete the confirmation dialog box and then click **OK**:
 - a. Keep the option to download a backup enabled because you can use it to restore your Cloud Manager configuration, if necessary.
 - b. Read the terms and conditions and then select the **I read and approve the terms and conditions (EULA)** check box.
4. Select the patch that you were provided.
5. When prompted, save the Cloud Manager backup.

Result

Cloud Manager applies the patch. You can log in to the console after a few minutes.

Backing up and restoring Cloud Manager

Cloud Manager enables you to back up and restore its database to protect your configuration and troubleshoot issues.

Backing up Cloud Manager

It is a good practice to back up the Cloud Manager database on a periodic basis. If you experience problems, you can restore Cloud Manager from a previous backup.

Steps

1. In the upper right of the Cloud Manager console, click the task drop-down list, and then select **Tools**.
2. Click **Backup**.

Tools

Backup

Back up Cloud Manager to a .7z file, which you can use later to restore your configuration.

3. When prompted, save the backup file to a secure location so that you can retrieve it when needed.

Restoring Cloud Manager from a backup

Restoring Cloud Manager from a backup replaces existing data with the data from the backup.

Steps

1. In the upper-right hand corner of the Cloud Manager console, click the task drop-down list, and then select **Tools**.
2. Click **Restore**.
3. Click **OK** to confirm.
4. Select the backup.

Result

Cloud Manager restores the database from the backup file.

Removing Cloud Volumes ONTAP working environments

The Cloud Manager Admin can remove a Cloud Volumes ONTAP working environment to move it to another system or to troubleshoot discovery issues.

About this task

Removing a Cloud Volumes ONTAP working environment removes it from Cloud Manager. It does not delete the Cloud Volumes ONTAP system. You can later rediscover the working environment.

Removing a working environment from Cloud Manager enables you to do the following:

- Rediscover it in another tenant
- Rediscover it from another Cloud Manager system
- Rediscover it if you had problems during the initial discovery

Steps

1. In the upper-right corner of the Cloud Manager console, click the task drop-down list, and then select **Tools**.
2. From the Tools page, click **Launch**.
3. Select the Cloud Volumes ONTAP working environment that you want to remove.

4. On the Review and Approve page, click **Go**.

Result

Cloud Manager removes the working environment. Users can rediscover this working environment from the Working Environments page at any time.

Editing user accounts

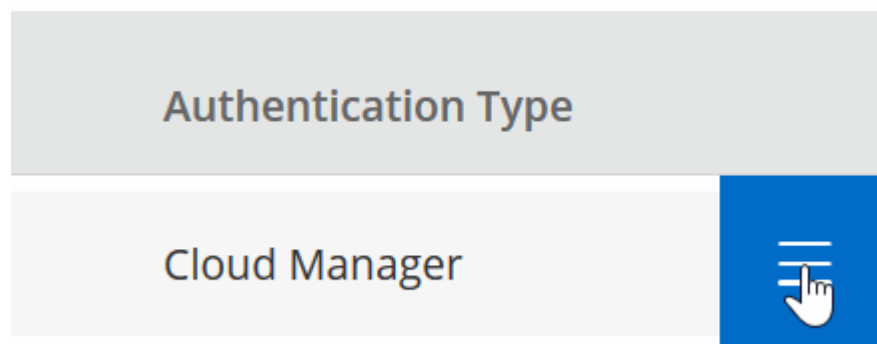

You can modify user accounts in Cloud Manager by enabling and disabling the notification report.

About this task

Password and user information must be changed in [NetApp Cloud Central](#).

Steps

1. In the upper-right corner of the Cloud Manager console, click the user icon, and then select **View Users**.
2. Select the menu icon at the end of the row and click **Edit User**.

3. In the User Settings page, modify the user account.

Configuring Cloud Manager to use a proxy server

When you first deploy Cloud Manager, it prompts you to enter a proxy server if the system does not have internet access. You can also manually enter and modify the proxy from Cloud Manager's settings.

About this task

If your corporate policies dictate that you use a proxy server for all HTTP communication to the internet, then you must configure Cloud Manager to use that proxy server. The proxy server can be in the cloud or in your network.

When you configure Cloud Manager to use a proxy server, Cloud Manager, Cloud Volumes ONTAP, and the HA mediator all use the proxy server.

Steps

1. In the upper-right corner of the Cloud Manager console, click the task drop-down list, and then select **Settings**.

2. Under HTTP Proxy, enter the server using the syntax `http://address:port`, specify a user name and password if basic authentication is required for the server, and then click **Save**.

Cloud Manager does not support passwords that include the @ character.

Result

After you specify the proxy server, new Cloud Volumes ONTAP systems are automatically configured to use the proxy server when sending AutoSupport messages. If you do not specify the proxy server before users create Cloud Volumes ONTAP systems, then they must use System Manager to manually set the proxy server in the AutoSupport options for each system.

Renewing the Cloud Manager HTTPS certificate

You should renew the Cloud Manager HTTPS certificate before it expires to ensure secure access to the Cloud Manager web console. If you do not renew the certificate before it expires, a warning appears when users access the web console using HTTPS.

Steps

1. In the upper right of the Cloud Manager console, click the task drop-down list, and then select **HTTPS Setup**.

Details about the Cloud Manager certificate displays, including the expiration date.

2. Click **Renew HTTPS Certificate** and follow the steps to generate a CSR or install your own CA-signed certificate.

Result

Cloud Manager uses the new CA-signed certificate to provide secure HTTPS access.

Uninstalling Cloud Manager

Cloud Manager includes an uninstallation script that you can use to uninstall the software to troubleshoot issues or to permanently remove the software from the host.

Steps

1. If you are going to reinstall Cloud Manager, back up the database before you uninstall the software:
 - a. In the upper-right corner of the Cloud Manager console, click the task drop-down list, and then select **Tools**.
 - b. Click **Backup** and save the backup file to your local machine.
2. From the Linux host, run the uninstallation script:

```
/opt/application/netapp/cloudmanager/bin/uninstall.sh [silent]
```

silent runs the script without prompting you for confirmation.
