# Example storage node utilization dashboard with variables

Create a custom dashboard for Storage Analysis which has variables for storage, storage pool, node, tier, utilization and latency.

### Before you begin

Familiarity with dashboards in Insight is recommended but not required.

### About this task

The following procedure will create a custom Storage Analysis Overview dashboard which uses variables for storage, storage pool, node, tier, utilization and latency. Variables in the example below will be used to filter the displayed assets or metrics across one or many widgets available on the dashboard. The widgets that use these variables as filters will be updated with filtered content on-demand according to the values entered in the variable fields on the dashboard, allowing you to quickly filter multiple charts and graphs to drill down to a specific area of interest.

By following the steps in this example, you will create a dashboard like the following. You can change these widgets, or add any number of additional widgets, to highlight any data you choose.

#### Steps

- 1. Create a new dashboard, and name it "Analysis: Storage Overview", or something equally descriptive.
- Click on the Variable drop-down and select Text variable type. By default, the variable is named \$var1. Click on \$var1 to edit the name, and change it to \$storage, then click the check mark to save the variable. Repeat to create text variables for \$node, \$pool, and \$volume.
- 3. Repeat the above process to create **Number-**type variables named \$utilization and \$latency.
- 4. Click on the **Variable** drop-down and search for the *Tier* annotation. Select it to create a variable named *\$tier.*

You can add variables at any time, however it is easier to create them up front and therefore make them available to all widgets as you create them.

- 5. Add a widget by clicking on the Widget drop-down and selecting either a line chartor area chart widget. Name the widget "Node Utilization". Click on the Storage asset type and change it to Storage Node. Select Utilization - Total for the chart data.
- 6. Click on the **Filter by +** button to add a filter. Search for and select **Storage**, then click on **Any** and select the *\$storage* variable.
- 7. Click the+button to add another filter for Name. Set the variable to \$node.

Different variables can be assigned to the annotation name filter. Use the name/variable pair at the lowest level depending on the object in the widget. For example:

- You can assign the \$node variable to the Name filter for a Node-focused widget.
- You can assign the *\$pool* variable to the **Name** filter for a Pool-focused widget.
- 8. Click the+button to add another filter for Utilization Total (%). Set the variable to >= \$utilization.
- 9. Click the X after the Roll up field to collapse the field.
- 10. Select Show Top 5 and click Save to save the widget and return to your Dashboard.

Your widget should look something like this:

or our	ization				1	5	nou legend					O/P	moe cashocard	574 077	0.0
A.	20 500	ige Not	a •	: 08/2	ation -	Total	•								-
	Filter by	580	rage: S	iatorage		-	Name Shock		Unizat	ort - Totali (%)	>+ \$.0120	01 4 -	+		
	Rotup	+													
	Show	Top	•	5	•	Noni	596614								
	Display 5	ine che	••	Yeit	Print	2						0	onert to Expres	eion	
A0E 34 20		_	-	_										_	_
10	-	_					-	-	-	245 (9)					

- 11. Add another line or area chart widget to your dashboard. Select **Storage Node** as the asset type and **Latency Total** as the metric to chart.
- 12. Click on the Filter by + button to add filters for Storage: \$storage and Name: \$node.
- 13. Add a filter for Latency Total and select the \$latency variable.
- 14. Name the widget "Node Latency" and save it.
- 15. You can add supporting tables to show more details for the charts you created, for example, Max or Avg node utilization. Add a **Table widget** to the dashboard and select **Storage Node** as the asset type, and create filters for **Storage: \$storage**, **Name: \$node**, and **Utilization Total: \$utilization**.
- 16. Add columns to the table for Utilization Max, Utilization Total, or any other desired columns.
- 17. Name the widget "Node Peak and Avg Utilization" and save it.

lode Peak and Avg Ullilization		Override dashboard time: OFF
🔀 Storage Node 👻		
Filter by Storage: \$stora	ige x Name: \$node x	Utilization - Total (%): >= \$utilization 🛛 🗙 🗕 🛨
Group by +		
Name	🔶 Utilization - Max (%)	🚽 Utilization - Total (%) 🛛 🔶
3070-a	76.79	21.57
3070-b	76.79	21.57
vifasnane01	54.83	18.55
vifasnane02	32.50	6.06
aurora3	29.27	12.88
53 Items found		

- 18. Repeat the steps to create a table for Node Latency, showing **Latency Max**, **Latency Total**, or other columns as desired.
- 19. To round out your dashboard, you might add additional chart and table widgets for some or all of the following:

Chart	Table
Storage Pool Utilization	Storage Pool Peak and Avg Utilization
Storage Pool Throughput	Storage Pool Peak and Avg Throughput
Volume Latency	Volume Peak and Avg Latency
Volume IOPS	Volume Peak and Avg IOPS

1. You can move and resize the widgets in whatever placement you want on your dashboard. When finished, be sure to **Save** the dashboard.

Your final dashboard will look something like this:

2. You can use the variables to focus on specific assets in your dashboard. As you enter values into the variable fields, your widgets update automatically to reflect those variables. For example, by entering "15" in the \$utilization variable field, the widgets using that variable update to show only assets with total utilization >= 15%.

Node utilization widget showing top 5 of all nodes:

Node utilization widget showing nodes with 15% or greater utilization:

- 3. Keep in mind the following when creating your widgets:
  - The \$tier variable will only impact resources that are annotated with the **Tier** annotation.
  - Not all filters will impact all widgets, depending on whether the widget is designed to accept the variable(s) specified.
  - Number variables are applied as "greater than or equal to" the value specified. Note that any variable can be used as a filter on any widget at any level in a storage hierarchy, as long as the variable is valid for the asset against which the widget is running. As you move down from a Node level to Storage Pool to a Volume widget, more variables are present for assignment as filters. For example, at a Storage Node level widget, the *Storage* and *Name* variables can be assigned as filters. At a Storage Pool level, *Storage*, *Nodes*, *Storage Pools* and *Name* are all available. Assign your variables as appropriate and use the \$name variable at the lowest level in the stack. Doing this will allow your \$name variable to filter on the actual name of the asset against which the widget is running.

#### Node dashboard example widget settings

Widget settings for the node dashboard with variables example.

Following are the settings for each of the widgets in the storage node dashboard example.

Node utilization:
