# Managing and monitoring protection relationships

OnCommand Unified Manager enables you to create protection relationships, to monitor and troubleshoot SnapMirror and SnapVault relationships on managed clusters, and to restore data when it is overwritten or lost.

For SnapMirror operations there are two replication types:

Asynchronous

Replication from the primary to the secondary volume is determined by a schedule.

Synchronous

Replication is performed simultaneously on the primary and secondary volume.

You can perform up to 10 protection jobs simultaneously with no performance impact. You might experience some performance impact when you run between 11 and 30 jobs simultaneously. Running more than 30 jobs simultaneously is not recommended.

## What resource pools are

Resource pools are groups of aggregates that are created by a storage administrator using Unified Manager to provide provisioning to partner applications for backup management.

You might pool your resources based on attributes such as performance, cost, physical location, or availability. By grouping related resources into a pool, you can treat the pool as a single unit for monitoring and provisioning. This simplifies the management of these resources and allows for a more flexible and efficient use of the storage.

During secondary storage provisioning, Unified Manager determines the most suitable aggregate in the resource pool for protection using the following criteria:

- The aggregate is a data aggregate (not a root aggregate) and it is ONLINE.
- The aggregate is on a destination cluster node whose ONTAP version is the same or greater than the source cluster major version.
- The aggregate has the largest available space of all the aggregates in the resource pool.
- After provisioning the destination volume, the aggregate space is within the nearly-full and nearly overcommitted threshold defined for the aggregate (global or local threshold, whichever is applicable).
- The number of FlexVol volumes on the destination node must not exceed the platform limit.

## Types of SnapMirror protection

Depending on the deployment of your data storage topology, Unified Manager enables you to configure multiple types of SnapMirror protection relationships. All variations of SnapMirror protection offer failover disaster recovery protection, but offer differing

capabilities in performance, version flexibility, and multiple backup copy protection.

#### Traditional SnapMirror Asynchronous protection relationships

Traditional SnapMirror Asynchronous protection provides block replication mirror protection between source and destination volumes.

In traditional SnapMirror relationships, mirror operations execute faster than they would in alternative SnapMirror relationships because the mirror operation is based on block replication. However, traditional SnapMirror protection requires that the destination volume run under the same or later minor version of ONTAP software as the source volume within the same major release (for example, version 8.x to 8.x, or 9.x to 9.x).

### **SnapMirror Asynchronous protection with version-flexible replication**

SnapMirror Asynchronous protection with version-flexible replication provides logical replication mirror protection between source and destination volumes, even if those volumes are running under different versions of ONTAP 8.3 or later software (for example, version 8.3 to 8.3, or 8.3 to 9.1, or 9.0 to 8.3).

In SnapMirror relationships with version-flexible replication, mirror operations do not execute as quickly as they would in traditional SnapMirror relationships.

Because of slower execution, SnapMirror with version-flexible replication protection is not suitable to implement in either of the following circumstances:

- The source object contains more than 10 million files to protect.
- The recovery point objective for the protected data is two hours or less. (That is, the destination must always contain mirrored, recoverable data that is no more than two hours older than data at the source.)

In either of the listed circumstances, the faster block-replication based execution of default SnapMirror protection is required.

## SnapMirror Asynchronous protection with version-flexible replication and backup option

SnapMirror Asynchronous protection with version-flexible replication and backup option provides mirror protection between source and destination volumes and the capability to store multiple copies of the mirrored data at the destination.

The storage administrator can specify which Snapshot copies are mirrored from source to destination and can also specify how long to retain those copies at the destination, even if they are deleted at the source.

In SnapMirror relationships with version-flexible replication and backup option, mirror operations do not execute as quickly as they would in traditional SnapMirror relationships.

## **SnapMirror Synchronous protection with strict synchronization**

SnapMirror Synchronous protection with "strict" synchronization ensures that the primary and secondary volumes are always a true copy of each other. If a replication failure occurs when attempting to write data to the secondary volume, then the client I/O to the primary volume is disrupted.

## **SnapMirror Synchronous protection with regular synchronization**

SnapMirror Synchronous protection with "regular" synchronization does not require that the primary and

secondary volume are always a true copy of each other; thereby ensuring availability of the primary volume. If a replication failure occurs when attempting to write data to the secondary volume, the primary and secondary volumes fall out of sync and client I/O will continue to the primary volume.

The Restore button and the Relationship operation buttons are not available when monitoring synchronous protection relationships from the Health/Volumes inventory page or the Health/Volume details page.

## Viewing volume protection relationships

From the Protection/Volume Relationships page, you can view the status of existing volume SnapMirror and SnapVault relationships. You can also examine details about protection relationships, including transfer and lag status, source and destination details, schedule and policy information, and so on.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

You can also initiate relationship commands from this page.

#### **Steps**

1. In the left navigation pane, click **Protection > Volume Relationships**.

The Protection/Volume Relationships page is displayed.

- 2. Choose one of the following ways to view the volume protection details:
  - To view current information about all the volume relationships, remain on the default All Volume Relationships page.
  - To view detailed information about the volume transfer trends over a period of time, in the View menu, select **Volume Transfer Status (Historical)**.
  - To view detailed information about the volume transfer activity on a day to day basis, in the View menu, select Volume Transfer Rate (Historical).

The volume transfer views display information for volumes in asynchronous relationships only - volumes in synchronous relationships are not shown.

# Creating a SnapVault protection relationship from the Health/Volumes inventory page

You can use the Health/Volumes inventory page to create SnapVault relationships for one or more volumes on the same storage virtual machine (SVM) to enable data backups for protection purposes.

#### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

The **Protect** menu does not display in the following instances:

- · If RBAC settings do not allow this action: for example, if you have only operator privileges
- When the volume ID is unknown: for example, when you have a intercluster relationship and the destination cluster has not yet been discovered

#### **Steps**

- 1. In the left navigation pane, click **Health > Volumes**.
- 2. In the Health/Volumes inventory page, right-click a volume you want to protect and select Protect.

Alternatively, to create multiple protection relationships on the same storage virtual machine (SVM), select one or more volumes in the Health/Volumes inventory page, and click **Protect** on the toolbar.

3. Select **SnapVault** from the menu.

The Configure Protection dialog box is launched.

- 4. Click **SnapVault** to view the **SnapVault** tab and to configure the secondary volume information.
- 5. Click **Advanced** to set deduplication, compression, autogrow, and space guarantee as needed, and then click **Apply**.
- 6. Complete the **Destination Information** area and the **Relationship Settings** area in the **SnapVault** tab.
- 7. Click Apply.

You are returned to the Health/Volumes inventory page.

8. Click the protection configuration job link at the top of the **Health/Volumes** inventory page.

If you are creating only one protection relationship, the Protection/Job details page is displayed; however, if you are creating more than one protection relationship, a filtered list of all the jobs associated with the protection operation is displayed.

- 9. Do one of the following:
  - If you have only one job, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
  - If you have more than one job:
    - i. Click a job in the jobs list.
    - ii. Click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
    - iii. Use the **Back** button to return to the filtered list and view another job.

# Creating a SnapVault protection relationship from the Health/Volume details page

You can create a SnapVault relationship using the Health/Volume details page so that data backups are enabled for protection purposes on volumes.

#### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- You must have set up Workflow Automation to perform this task.

#### About this task

The **Protect** menu does not display in the following instances:

- · If RBAC settings do not allow this action: for example, if you have only operator privileges
- When the volume ID is unknown: for example, when you have a intercluster relationship and the destination cluster has not yet been discovered

#### **Steps**

- In the Protection tab of the Health/Volume details page, right-click a volume in the topology view that you
  want to protect.
- 2. Select **Protect** > **SnapVault** from the menu.

The Configure Protection dialog box is launched.

- Click SnapVault to view the SnapVault tab and to configure the secondary resource information.
- Click Advanced to set deduplication, compression, autogrow, and space guarantee as needed, and then click Apply.
- Complete the Destination Information area and the Relationship Settings area in the Configure Protection dialog box.
- Click Apply.

You are returned to the Health/Volume details page.

7. Click the protection configuration job link at the top of the **Health/Volume** details page.

The Protection/Job details page is displayed.

8. Click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.

When the job tasks are complete, the new relationships are displayed in the Health/Volume details page topology view.

# Creating a SnapMirror protection relationship from the Health/Volumes inventory page

Using the Health/Volumes inventory page enables you to create several SnapMirror protection relationships at one time by selecting more than one volume on the same SVM.

#### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- You must have set up Workflow Automation.

#### About this task

The **Protect** menu does not display in the following instances:

- · If RBAC settings do not allow this action: for example, if you have only operator privileges
- When the volume ID is unknown: for example, when you have a intercluster relationship and the destination cluster has not yet been discovered

#### **Steps**

1. In the **Health/Volumes** inventory page, right-click a volume that you want to protect.

Alternatively, to create multiple protection relationships on the same SVM, select one or more volumes in the Health/Volumes inventory page, and click **Protect** > **SnapMirror** on the toolbar.

The Configure Protection dialog box is displayed.

- 2. Click **SnapMirror** to view the **SnapMirror** tab and to configure the destination information.
- Click Advanced to set the space guarantee, as needed, and then click Apply.
- 4. Complete the **Destination Information** area and the **Relationship Settings** area in the **SnapMirror** tab.
- 5. Click Apply.

You are returned to the Health/Volumes inventory page.

6. Click the protection configuration job link at the top of the Health/Volumes inventory page.

If you are creating only one protection relationship, the Protection/Job details page is displayed; however, if you are creating more than one protection relationship, a list of all the jobs associated with the protection operation is displayed.

- 7. Do one of the following:
  - If you have only one job, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
  - If you have more than one job:
    - i. Click a job in the jobs list.
    - ii. Click **Refresh** to update the tasks list and task details associated with the protection configuration

job and to determine when the job is complete.

iii. Use the **Back** button to return to the filtered list and view another job.

#### Results

Depending on the destination SVM you specified during configuration or on the options you enabled in your Advanced settings, the resulting SnapMirror relationship might be one of several possible variations:

- If you specified a destination SVM that runs under the same or a newer version of ONTAP compared to that of the source volume, a block-replication-based SnapMirror relationship is the default result.
- If you specified a destination SVM that runs under the same or a newer version of ONTAP (8.3 or later) compared to that of the source volume, but you enabled version-flexible replication in the Advanced settings, a SnapMirror relationship with version-flexible replication is the result.
- If you specified a destination SVM that runs under an earlier version of ONTAP 8.3 or a later version than that of the source volume, and the earlier version supports version-flexible replication, a SnapMirror relationship with version-flexible replication is the automatic result.

# Creating a SnapMirror protection relationship from the Health/Volume details page

You can use the Health/Volume details page to create a SnapMirror relationship so that data replication is enabled for protection purposes. SnapMirror replication enables you to restore data from the destination volume in the event of data loss on the source.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **About this task**

The **Protect** menu does not display in the following instances:

- · If RBAC settings do not allow this action: for example, if you have only operator privileges
- If the volume is a FlexGroup volume
- When the volume ID is unknown: for example, when you have an intercluster relationship and the destination cluster has not yet been discovered

You can perform up to 10 protection jobs simultaneously with no performance impact. You might experience some performance impact when you run between 11 and 30 jobs simultaneously. Running more than 30 jobs simultaneously is not recommended.

#### **Steps**

- 1. In the **Protection** tab of the **Health/Volume** details page, right-click in the topology view the name of a volume that you want to protect.
- 2. Select **Protect > SnapMirror** from the menu.

The Configure Protection dialog box is displayed.

- 3. Click **SnapMirror** to view the **SnapMirror** tab and to configure the destination information.
- 4. Click **Advanced** to set the space guarantee, as needed, and then click **Apply**.
- 5. Complete the **Destination Information** area and the **Relationship Settings** area in the **Configure Protection** dialog box.
- 6. Click Apply.

You are returned to the Health/Volume details page.

7. Click the protection configuration job link at the top of the **Health/Volume** details page.

The job's tasks and details are displayed in the Protection/Job details page.

- 8. In the **Protection/Job** details page, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
- 9. When the job tasks are complete, click **Back** on your browser to return to the **Health/Volume** details page.

The new relationship is displayed in the Health/Volume details page topology view.

#### Results

Depending on the destination SVM you specified during configuration or on the options you enabled in your Advanced settings, the resulting SnapMirror relationship might be one of several possible variations:

- If you specified a destination SVM that runs under the same or a newer version of ONTAP compared to that of the source volume, a block-replication-based SnapMirror relationship is the default result.
- If you specified a destination SVM that runs under the same or a newer version of ONTAP (version 8.3 or higher) compared to that of the source volume, but you enabled version-flexible replication in the Advanced settings, a SnapMirror relationship with version-flexible replication is the result.
- If you specified a destination SVM that runs under an earlier version of ONTAP 8.3, or a version that is higher than that of the source volume and the earlier version supports version-flexible replication, a SnapMirror relationship with version-flexible replication is the automatic result.

# Creating a SnapMirror relationship with version-flexible replication

You can create a SnapMirror relationship with version-flexible replication. Version-flexible replication enables you to implement SnapMirror protection even if source and destination volumes run under different versions of ONTAP.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- The source and destination SVMs must each have a SnapMirror license enabled.
- The source and destination SVMs must each run under a version of ONTAP software that supports version-flexible replication.

#### About this task

SnapMirror with version-flexible replication enables you to implement SnapMirror protection even in heterogeneous storage environments in which not all storage is running under one version of ONTAP; however, mirror operations performed under SnapMirror with version-flexible replication do not execute as quickly as they would under traditional block replication SnapMirror.

#### **Steps**

- 1. Display the Configure Protection dialog box for the volume that you want to protect.
  - If you are viewing the Protection tab of the Health/Volume details page, right-click in the topology view that has the name of a volume that you want to protect and select **Protect > SnapMirror** from the menu.
  - If you are viewing the Health/Volumes inventory page, locate a volume that you want to protect and right-click it; then select **Protect** > **SnapMirror** from the menu. The Configure Protection dialog box is displayed.
- 2. Click **SnapMirror** to view the **SnapMirror** tab.
- 3. Complete the **Destination Information** area and the **Relationship Settings** area in the **Configure Protection** dialog box.

If you specify a destination SVM that runs under an earlier version of ONTAP than the source volume you are protecting, and if that earlier version supports version-flexible replication, this task automatically configures SnapMirror with version-flexible replication.

- 4. If you specify a destination SVM that runs under the same version of ONTAP as that of the source volume, but you still want to configure SnapMirror with version-flexible replication, click **Advanced** to enable version-flexible replication and then click **Apply**.
- 5. Click Apply.

You are returned to the Health/Volume details page.

Click the protection configuration job link at the top of the Health/Volume details page.

The jobs tasks and details are displayed in the Protection/Job details page.

- 7. In the **Protection/Job** details page, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
- 8. When the job tasks are complete, click **Back** on your browser to return to the **Health/Volume** details page.

The new relationship is displayed in the Health/Volume details page topology view.

# Creating SnapMirror relationships with version-flexible replication with backup option

You can create a SnapMirror relationship with version-flexible replication and backup option capability. Backup option capability enables you to implement SnapMirror protection and also retain multiple versions of backup copies at the destination location.

#### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- The source and destination SVMs must each have a SnapMirror license enabled.
- The source and destination SVMs must each have a SnapVault license enabled.
- The source and destination SVMs must each run under a version of ONTAP software (8.3 or higher) that supports version-flexible replication.

#### About this task

Configuring SnapMirror with backup option capability enables you to protect your data with SnapMirror disaster recovery capabilities, such as volume failover ability, and at the same time provide SnapVault capabilities, such as multiple backup copy protection.

#### **Steps**

- 1. Display the Configure Protection dialog box for the volume that you want to protect.
  - If you are viewing the Protection tab of the Health/Volume details page, right-click in the topology view the name of a volume that you want to protect and select **Protect > SnapMirror** from the menu.
  - If you are viewing the Health/Volumes inventory page, locate a volume you want to protect and rightclick it; then select **Protect** > **SnapMirror** from the menu. The Configure Protection dialog box is displayed.
- 2. Click SnapMirror to view the SnapMirror tab.
- 3. Complete the **Destination Information** area and the **Relationship Settings** area in the **Configure Protection** dialog box.
- 4. Click Advanced to display the Advanced Destination Settings dialog box.
- 5. If the Version-Flexible Replication check box is not already selected, select it now.
- 6. Select the With backup option check box to enable backup option capability; then click Apply.
- 7. Click Apply.

You are returned to the Health/Volume details page.

8. Click the protection configuration job link at the top of the Health/Volume details page.

The jobs tasks and details are displayed in the Protection/Job details page.

- 9. In the **Protection/Job** details page, click **Refresh** to update the task list and task details associated with the protection configuration job and to determine when the job is complete.
- 10. When the job tasks are complete, click **Back** on your browser to return to the **Health/Volume** details page.

The new relationship is displayed in the Health/Volume details page topology view.

## **Configuring destination efficiency settings**

You can configure destination efficiency settings such as deduplication, compression, autogrow, and space guarantee on a protection destination using the Advanced

Destination Settings dialog box. You use these settings when you want to maximize space utilization on a destination or secondary volume.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### **About this task**

By default, efficiency settings match those of the source volume, except for compression settings in a SnapVault relationship, which are disabled by default.

### **Steps**

- 1. Click either the **SnapMirror** tab or the **SnapVault** tab in the **Configure Protection** dialog box, depending on the type of relationship you are configuring.
- 2. Click **Advanced** in the **Destination Information** area.

The Advanced Destination Settings dialog box is opened.

- Enable or disable the efficiency settings for deduplication, compression, autogrow, and space guarantee, as required.
- 4. Click **Apply** to save your selections and return to the **Configure Protection** dialog box.

## Creating SnapMirror and SnapVault schedules

You can create basic or advanced SnapMirror and SnapVault schedules to enable automatic data protection transfers on a source or primary volume so that transfers take place more frequently or less frequently, depending on how often the data changes on your volumes.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role...
- · You must have already completed the Destination Information area in the Configure Protection dialog box.
- · You must have set up Workflow Automation to perform this task.

### **Steps**

 From the SnapMirror tab or SnapVault tab of the Configure Protection dialog box, click the Create Schedule link in the Relationship Settings area.

The Create Schedule dialog box is displayed.

- 2. In the **Schedule Name** field, type the name you want to give to the schedule.
- 3. Select one of the following:
  - Basic

Select if you want to create a basic interval-style schedule.

#### Advanced

Select if you want to create a cron-style schedule.

#### 4. Click Create.

The new schedule is displayed in the SnapMirror Schedule or SnapVault Schedule drop-down list.

# Creating cascade or fanout relationships to extend protection from an existing protection relationship

You can extend protection from an existing relationship by creating either a fanout from the source volume or a cascade from the destination volume of an existing relationship. You might do this when you need to copy data from one site to many sites or to provide additional protection by creating more backups.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### **Steps**

- 1. Click Protection > Volume Relationships.
- 2. From the **Protection/Volume Relationships** page, select the SnapMirror relationship from which you want to extend protection.
- 3. On the action bar, click **Extend Protection**.
- 4. In the menu, select either **From Source** or **From Destination**, depending on whether you are creating a fanout relationship from the source or a cascade relationship from the destination.
- 5. Select either **With SnapMirror** or **With SnapVault**, depending on the type of protection relationship you are creating.

The Configure Protection dialog box is displayed.

6. Complete the information as indicated in the **Configure Protection** dialog box.

# Editing protection relationships from the Protection/Volume Relationships page

You can edit existing protection relationships to change the maximum transfer rate, the protection policy, or the protection schedule. You might edit a relationship to decrease the bandwidth used for transfers, or to increase the frequency of scheduled transfers because data is changing often.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

The selected volumes must be protection relationship destinations. You cannot edit relationships when source volumes, load-sharing volumes, or volumes that are not the destination of a SnapMirror or SnapVault relationship are selected.

#### **Steps**

1. From the **Protection/Volume Relationships** page, select in the volumes list one or more volumes in the same SVM for which you want to edit relationship settings, and then select **Edit** from the toolbar.

The Edit Relationship dialog box is displayed.

- 2. In the **Edit Relationship** dialog box, edit the maximum transfer rate, protection policy, or protection schedule, as needed.
- Click Apply.

The changes are applied to the selected relationships.

# Editing protection relationships from the Health/Volume details page

You can edit existing protection relationships to change the current maximum transfer rate, protection policy, or protection schedule. You might edit a relationship to decrease the bandwidth used for transfers, or to increase the frequency of scheduled transfers because data is changing often.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have installed and configured Workflow Automation.

#### About this task

The selected volumes must be protection relationship destinations. You cannot edit relationships when source volumes, load-sharing volumes, or volumes that are not the destination of a SnapMirror or SnapVault relationship are selected.

#### **Steps**

- 1. From the **Protection** tab of the **Health/Volume** details page, locate in the topology the protection relationship you want to edit and right-click it.
- 2. Select **Edit** from the menu.

Alternatively, from the **Actions** menu, select **Relationship** > **Edit** to edit the relationship for which you are currently viewing the details.

The Edit Relationship dialog box is displayed.

3. In the **Edit Relationship** dialog box, edit the maximum transfer rate, protection policy, or protection

schedule, as needed.

4. Click Apply.

The changes are applied to the selected relationships.

## Creating a SnapMirror policy to maximize transfer efficiency

You can create a SnapMirror policy to specify the SnapMirror transfer priority for protection relationships. SnapMirror policies enable you to maximize transfer efficiency from the source to the destination by assigning priorities so that lower-priority transfers are scheduled to run after normal-priority transfers.

#### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- This task assumes that you have already completed the Destination Information area in the Configure Protection dialog box.

#### **Steps**

1. From the **SnapMirror** tab of the **Configure Protection** dialog box, click the **Create Policy** link in the **Relationship Settings** area.

The Create SnapMirror Policy dialog box is displayed.

- In the Policy Name field, type a name you want to give the policy.
- In the Transfer Priority field, select the transfer priority you want to assign to the policy.
- 4. In the **Comment** field, enter an optional comment for the policy.
- Click Create.

The new policy is displayed in the SnapMirror Policy drop-down list.

## Creating a SnapVault policy to maximize transfer efficiency

You can create a new SnapVault policy to set the priority for a SnapVault transfer. You use policies to maximize the efficiency of transfers from the primary to the secondary in a protection relationship.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- You must have already completed Destination Information area in the Configure Protection dialog box.

#### **Steps**

1. From the **SnapVault** tab of the **Configure Protection** dialog box, click the **Create Policy** link in the **Relationship Settings** area.

The SnapVault tab is displayed.

- 2. In the **Policy Name** field, type the name that you want to give the policy.
- 3. In the Transfer Priority field, select the transfer priority that you want to assign to the policy.
- 4. In the **Comment** field, enter a comment for the policy.
- 5. In the **Replication Label** area, add or edit a replication label, as necessary.
- Click Create.

The new policy is displayed in the Create Policy drop-down list.

# Aborting an active data protection transfer from the Protection/Volume Relationships page

You can abort an active data protection transfer when you want to stop a SnapMirror replication that is in progress. You can also clear the restart checkpoint for transfers subsequent to the baseline transfer. You might abort a transfer when it conflicts with another operation, such as a volume move.

## Before you begin

- · You must have the OnCommand Administrator or Storage Administrator role..
- · You must have set up Workflow Automation.

#### About this task

The abort action does not display in the following instances:

- If RBAC settings do not allow this action: for example, if you have only operator privileges
- When the volume ID is unknown: for example, when you have an intercluster relationship and the destination cluster has not yet been discovered

You cannot clear the restart checkpoint for a baseline transfer.

### Steps

1. To abort transfers for one or more protection relationships, from the **Protection/Volume Relationships** page, select one or more volumes and, on the toolbar, click **Abort**.

The Abort Transfer dialog box is displayed.

- If you want to clear the restart checkpoint for a transfer that is not a baseline transfer, select Clear Checkpoints.
- 3. Click Continue.

The Abort Transfer dialog box is closed, and the status of the abort job displays at the top of the Protection/Volume Relationships page, along with a link to the job details.

 Click the View details link to go to the Protection/Job details page for additional details and to view job progress.

## Aborting an active data protection transfer from the Health/Volume details page

You can abort an active data protection transfer when you want to stop a SnapMirror replication that is in progress. You can also clear the restart checkpoint for a transfer if it is not a baseline transfer. You might abort a transfer when it conflicts with another operation, such as a volume move.

### Before you begin

- · You must have the OnCommand Administrator or Storage Administrator role..
- · You must have set up Workflow Automation.

#### About this task

The abort action does not display in the following instances:

- If RBAC settings do not allow this action: for example, if you have only operator privileges
- When the volume ID is unknown: for example, when you have an intercluster relationship and the destination cluster has not yet been discovered

You cannot clear the restart checkpoint for a baseline transfer.

### **Steps**

1. In the **Protection** tab of the **Health/Volume** details page, right-click the relationship in the topology view for the data transfer you want to abort and select **Abort**.

The Abort Transfer dialog box is displayed.

- If you want to clear the restart checkpoint for a transfer that is not a baseline transfer, select Clear Checkpoints.
- 3. Click Continue.

The Abort Transfer dialog box is closed, and the status of the abort operation displays at the top of the Health/Volume details page along with a link to the job details.

- 4. Click the **View details** link to go to the **Protection/Job** details page for additional details and to view job progress.
- 5. Click each job task to view its details.
- 6. Click the Back arrow on your browser to return to the **Health/Volume** details page.

The abort operation is finished when all job tasks successfully complete.

# Quiescing a protection relationship from the Protection/Volume Relationships page

From the Protection/Volume Relationships page, you can quiesce a protection relationship to temporarily prevent data transfers from occurring. You might quiesce a relationship when you want to create a Snapshot copy of a SnapMirror destination volume that contains a database, and you want to ensure that its contents are stable during the Snapshot copy operation.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### About this task

The quiesce action does not display in the following instances:

- · If RBAC settings do not allow this action; for example, if you have only operator privileges
- When the volume ID is unknown; for example, when you have a intercluster relationship and the destination cluster has not yet been discovered
- · When you have not paired Workflow Automation and Unified Manager

### **Steps**

1. To quiesce transfers for one or more protection relationships, from the **Protection/Volume Relationships** page, select one or more volumes and, on the toolbar, click **Quiesce**.

The Quiesce dialog box is displayed.

2. Click Continue.

The status of the quiesce job is displayed at the top of the Health/Volume details page, along with a link to the job details.

- 3. Click the View details link to go to the Protection/Job details page for additional details and job progress.
- 4. Click the **Back** arrow on your browser to return to the **Protection/Volume Relationships** page.

The quiesce job is finished when all job tasks are successfully completed.

# Quiescing a protection relationship from the Health/Volume details page

You can quiesce a protection relationship to temporarily prevent data transfers from occurring. You might quiesce a relationship when you want to create a Snapshot copy of a SnapMirror destination volume that contains a database, and you want to ensure that its contents are stable during the Snapshot copy.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### About this task

The quiesce action does not display in the following instances:

- If RBAC settings do not allow this action, for example, if you have only operator privileges
- When the volume ID is unknown, for example, when you have a intercluster relationship and the destination cluster has not yet been discovered
- When you have not paired Workflow Automation and Unified Manager

### **Steps**

- 1. In the **Protection** tab of the **Health/Volume** details page, right-click the relationship in the topology view for the protection relationship that you want to guiesce.
- 2. Select Quiesce from the menu.
- 3. Click Yes to continue.

The status of the quiesce job is displayed at the top of the Health/Volume details page, along with a link to the job details.

- 4. Click the View details link to go to the Protection/Job details page for additional details and job progress.
- 5. Click the Back arrow on your browser to return to the **Health/Volume** details page.

The quiesce job is finished when all job tasks are successfully completed.

# Breaking a SnapMirror relationship from the Protection/Volume Relationships page

You can break a protection relationship to stop data transfers between a source volume and a destination volume in a SnapMirror relationship. You might break a relationship when you want to migrate data, for disaster recovery, or for application testing. The destination volume is changed to a read/write volume. You cannot break a SnapVault relationship.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **Steps**

1. From the **Protection/Volume Relationships** page, select one or more volumes with protection relationships for which you want to stop data transfers and, on the toolbar, click **Break**.

The Break Relationship dialog box is displayed.

- 2. Click **Continue** to break the relationship.
- In the Protection/Volume Relationships page, verify in the Relationship State column that the relationship is broken.

The Relationship State column is hidden by default, so you might need to select it in the show/hide column list [1].

# Breaking a SnapMirror relationship from the Health/Volume details page

You can break a protection relationship from the Health/Volume details page and stop data transfers between a source and destination volume in a SnapMirror relationship. You might break a relationship when you want to migrate data, for disaster recovery, or for application testing. The destination volume is changed to a read-write volume. You cannot break a SnapVault relationship.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **Steps**

- 1. In the **Protection** tab of the **Health/Volume** details page, select from the topology the SnapMirror relationship you want to break.
- 2. Right-click the destination and select **Break** from the menu.

The Break Relationship dialog box is displayed.

- 3. Click **Continue** to break the relationship.
- 4. In the topology, verify that the relationship is broken.

## Removing a protection relationship from the Protection/Volume Relationships page

From the Protection/Volume Relationships page, you can remove a protection relationship to permanently delete an existing relationship between the selected source and destination: for example, when you want to create a relationship using a different destination. This operation removes all metadata and cannot be undone.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **Steps**

1. From the **Protection/Volume Relationships** page, select one or more volumes with protection relationships you want to remove and, on the toolbar, click **Remove**.

The Remove Relationship dialog box is displayed.

2. Click **Continue** to remove the relationship.

The relationship is removed from the Protection/Volume Relationships page.

# Removing a protection relationship from the Health/Volume details page

You can remove a protection relationship to permanently delete an existing relationship between the selected source and destination: for example, when you want to create a relationship using a different destination. This operation removes all metadata and cannot be undone.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **Steps**

- 1. In the **Protection** tab of the **Health/Volume** details page, select from the topology the SnapMirror relationship you want to remove.
- 2. Right-click the name of the destination and select **Remove** from the menu.

The Remove Relationship dialog box is displayed.

3. Click **Continue** to remove the relationship.

The relationship is removed from the Health/Volume details page.

# Resuming scheduled transfers on a quiesced relationship from the Protection/Volume Relationships page

After you have quiesced a relationship to stop scheduled transfers from occurring, you can use **Resume** to reenable scheduled transfers so that data on the source or primary volume is protected. Transfers resume from a checkpoint, if one exists, at the next scheduled transfer interval.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

· You must have set up Workflow Automation.

#### About this task

You can select no more than 10 guiesced relationships on which to resume transfers.

#### **Steps**

- 1. From the **Protection/Volume Relationships** page, select one or more volumes with quiesced relationships, and, on the toolbar, click **Resume**.
- 2. In the **Resume** dialog box, click **Continue**.

You are returned to the Protection/Volume Relationships page.

- 3. To view the related job tasks and to track their progress, click the job link that is displayed at the top of the **Protection/Volume Relationships** page.
- 4. Do one of the following:
  - If only one job is displayed, in the Protection/Job details page click Refresh to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.
  - If more than one job is displayed,
    - i. In the Protection/Jobs page, click the job for which you want to view the details.
    - ii. In the Protection/Job details page, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete. After the jobs finish, data transfers are resumed at the next scheduled transfer interval.

# Resuming scheduled transfers on a quiesced relationship from the Health/Volume details page

After you have quiesced a relationship to stop scheduled transfers from occurring, you can use **Resume** on the Health/Volume details page to reenable scheduled transfers so that data on the source or primary volume is protected. Transfers resume from a checkpoint, if one exists, at the next scheduled transfer interval.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

## Steps

1. In the **Protection** tab of the **Health/Volume** details page, right-click in the topology view a quiesced relationship that you want to resume.

Alternatively, select **Resume** from the **Actions > Relationship** menu.

2. In the **Resume** dialog box, click **Continue**.

You are returned to the Health/Volume details page.

- 3. To view the related job tasks and to track their progress, click the job link that is displayed at the top of the **Health/Volume** details page.
- 4. In the **Protection/Job** details page, click **Refresh** to update the tasks list and task details associated with the protection configuration job and to determine when the job is complete.

After the jobs are complete, data transfers are resumed at the next scheduled transfer interval.

# Initializing or updating protection relationships from the Protection/Volume Relationships page

From the Protection/Volume Relationships page, you can perform a first-time baseline transfer on a new protection relationship, or update a relationship if it is already initialized and you want to perform a manual, unscheduled incremental update to transfer immediately.

## Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- You must have set up OnCommand Workflow Automation.

#### **Steps**

1. From the **Protection/Volume Relationships** page, right-click a volume and select one or more volumes with relationships that you want to update or initialize, and then, on the toolbar, click **Initialize/Update**.

The Initialize/Update dialog box is displayed.

- 2. In the **Transfer Options** tab, select a transfer priority and the maximum transfer rate.
- 3. Click Source Snapshot Copies; then, in the Snapshot Copy column, click Default.

The Select Source Snapshot Copy dialog box is displayed.

- 4. If you want to specify an existing Snapshot copy rather than transferring the default Snapshot copy, click **Existing Snapshot Copy** and select a Snapshot copy from the list.
- 5. Click Submit.

You are returned to the Initialize/Update dialog box.

- 6. If you selected more than one source to initialize or update, click **Default** for the next source for which you want to specify an existing Snapshot copy.
- 7. Click **Submit** to begin the initialization or update job.

The initialization or update job is started, you are returned to the Protection/Volume Relationships page, and a jobs link is displayed at the top of the page.

Click View Jobs on the Health/Volumes inventory page to track the status of each initialization or update job.

A filtered list of jobs is displayed.

- 9. Click each job to see its details.
- 10. Click the **Back** arrow on your browser to return to the **Protection/Volume Relationships** page.

The initialization or update operation is finished when all tasks successfully finish.

## Initializing or updating protection relationships from the Health/Volume details page

You can perform a first-time baseline transfer on a new protection relationship, or update a relationship if it is already initialized and you want to perform a manual, unscheduled incremental update to transfer data immediately.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- You must have set up OnCommand Workflow Automation.

#### **Steps**

- 1. From the **Protection** tab of the **Health/Volume** details page, locate in the topology the protection relationship that you want to initialize or update, and then right-click it.
- Select Initialize/Update from the menu.

Alternatively, from the **Actions** menu, select **Relationship > Initialize/Update** to initialize or update the relationship for which you are currently viewing the details.

The Initialize/Update dialog box is displayed.

- 3. In the **Transfer Options** tab, select a transfer priority and the maximum transfer rate.
- 4. Click Source Snapshot Copies; then, in the Snapshot Copy column, click Default.

The Select Source Snapshot Copy dialog box is displayed.

- 5. If you want to specify an existing Snapshot copy rather than transferring the default Snapshot copy, click **Existing Snapshot Copy** and select a Snapshot copy from the list.
- 6. Click Submit.

You are returned to the Initialize/Update dialog box.

7. If you selected more than one source to initialize or update, click **Default** for the next read/write source for which you want to specify an existing Snapshot copy.

You cannot select a different Snapshot copy for data protection volumes.

8. Click **Submit** to begin the initialization or update job.

The initialization or update job is started, you are returned to the Health/Volume details page, and a jobs link is displayed at the top of the page.

9. Click **View Jobs** on the **Health/Volume** details page to track the status of each initialization or update job.

A filtered list of jobs is displayed.

- 10. Click each job to see its details.
- 11. Click the Back arrow on your browser to return to the **Health/Volume** details page.

The initialization or update operation is finished when all job tasks successfully complete.

# Resynchronizing protection relationships from the Protection/Volume Relationships page

From the Protection/Volume Relationships page, you can resynchronize a relationship either to recover from an event that disabled your source volume or when you want to change the current source to a different volume.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.

#### **Steps**

1. From the **Protection/Volume Relationships** page, select one or more volumes with quiesced relationships and, from the toolbar, click **Resynchronize**.

The Resynchronize dialog box is displayed.

- 2. In the **Resynchronization Options** tab, select a transfer priority and the maximum transfer rate.
- 3. Click Source Snapshot Copies; then, in the Snapshot Copy column, click Default.

The Select Source Snapshot Copy dialog box is displayed.

- 4. If you want to specify an existing Snapshot copy rather than transferring the default Snapshot copy, click **Existing Snapshot Copy** and select a Snapshot copy from the list.
- Click Submit.

You are returned to the Resynchronize dialog box.

- 6. If you selected more than one source to resynchronize, click **Default** for the next source for which you want to specify an existing Snapshot copy.
- 7. Click **Submit** to begin the resynchronization job.

The resynchronization job is started, you are returned to the Protection/Volume Relationships page, and a jobs link is displayed at the top of the page.

8. Click **View Jobs** on the **Protection/Volume Relationships** page to track the status of each resynchronization job.

A filtered list of jobs is displayed.

9. Click the **Back** arrow on your browser to return to the **Protection/Volume Relationships** page.

# Resynchronizing protection relationships from the Health/Volume details page

You can resynchronize data on a SnapMirror or SnapVault relationship that was broken and then the destination was made read/write so that data on the source matches the data on the destination. You might also resynchronize when a required common Snapshot copy on the source volume is deleted causing SnapMirror or SnapVault updates to fail.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- You must have set up OnCommand Workflow Automation.

#### **Steps**

- 1. From the **Protection** tab of the **Health/Volume** details page, locate in the topology the protection relationship that you want to resynchronize and right-click it.
- 2. Select **Resynchronize** from the menu.

Alternatively, from the **Actions** menu, select **Relationship** > **Resynchronize** to resynchronize the relationship for which you are currently viewing the details.

The Resynchronize dialog box is displayed.

- 3. In the **Resynchronization Options** tab, select a transfer priority and the maximum transfer rate.
- 4. Click Source Snapshot Copies; then, in the Snapshot Copy column, click Default.

The Select Source Snapshot Copy dialog box is displayed.

- 5. If you want to specify an existing Snapshot copy rather than transferring the default Snapshot copy, click **Existing Snapshot Copy** and select a Snapshot copy from the list.
- 6. Click Submit.

You are returned to the Resynchronize dialog box.

- 7. If you selected more than one source to resynchronize, click **Default** for the next source for which you want to specify an existing Snapshot copy.
- 8. Click **Submit** to begin the resynchronization job.

The resynchronization job is started, you are returned to the Health/Volume details page and a jobs link is displayed at the top of the page.

9. Click View Jobs on the Health/Volume details page to track the status of each resynchronization job.

A filtered list of jobs is displayed.

10. Click the Back arrow on your browser to return to the **Health/Volume** details page.

The resynchronization job is finished when all job tasks successfully complete.

## Reversing protection relationships from the Protection/Volume Relationships page

When a disaster disables the source volume in your protection relationship, you can use the destination volume to serve data by converting it to a read/write volume while you repair or replace the source. When the source is again available to receive data, you can use the reverse resynchronization operation to establish the relationship in the reverse direction, synchronizing the data on the source with the data on the read/write destination.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- The relationship must not be a SnapVault relationship.
- · A protection relationship must already exist.
- The protection relationship must be broken.
- · Both the source and destination must be online.
- The source must not be the destination of another data protection volume.

#### About this task

- When you perform this task, data on the source that is newer than the data on the common Snapshot copy is deleted.
- Policies and schedules created on reverse resynchronization relationships are the same as those on the original protection relationship.

If policies and schedules do not exist, they are created.

### Steps

1. From the **Protection/Volume Relationships** page, select one or more volumes with relationships that you want to reverse, and, on the toolbar, click **Reverse Resync**.

The Reverse Resync dialog box is displayed.

2. Verify that the relationships displayed in the **Reverse Resync** dialog box are the ones for which you want to perform the reverse resynchronization operation, and then click **Submit**.

The reverse resynchronization operation is started, you are returned to the Protection/Volume Relationships page, and a jobs link is displayed at the top of the page.

3. Click View Jobs on the Protection/Volume Relationships page to track the status of each reverse

resynchronization job.

A filtered list of jobs related to this operation is displayed.

4. Click the **Back** arrow on your browser to return to the **Protection/Volume Relationships** page.

The reverse resynchronization operation is finished when all job tasks successfully complete.

# Reversing protection relationships from the Health/Volume details page

When a disaster disables the source volume in your protection relationship, you can use the destination volume to serve data by converting it to read/write while you repair or replace the source. When the source is again available to receive data, you can use the reverse resynchronization operation to establish the relationship in the reverse direction, synchronizing the data on the source with the data on the read/write destination.

### Before you begin

- You must have the OnCommand Administrator or Storage Administrator role.
- · You must have set up Workflow Automation.
- The relationship must not be a SnapVault relationship.
- · A protection relationship must already exist.
- The protection relationship must be broken.
- · Both the source and destination must be online.
- The source must not be the destination of another data protection volume.

#### About this task

- When you perform this task, data on the source that is newer than the data on the common Snapshot copy is deleted.
- Policies and schedules created on the reverse resynchronization relationship are the same as those on the original protection relationship.

If policies and schedules do not exist, they are created.

### **Steps**

- 1. From the **Protection** tab of the **Health/Volume** details page, locate in the topology the SnapMirror relationship on which you want to reverse the source and destination, and right-click it.
- 2. Select Reverse Resync from the menu.

The Reverse Resync dialog box is displayed.

3. Verify that the relationship displayed in the **Reverse Resync** dialog box is the one for which you want to perform the reverse resynchronization operation, and then click **Submit**.

The Reverse Resync dialog box is closed and a job link is displayed at the top of the Health/Volume details page.

 Click View Jobs on the Health/Volume details page to track the status of each reverse resynchronization job.

A filtered list of jobs is displayed.

5. Click the Back arrow on your browser to return to the **Health/Volume** details page.

The reverse resynchronization operation is finished when all job tasks are completed successfully.

## Restoring data using the Health/Volumes inventory page

You can restore overwritten or deleted files, directories, or an entire volume from a Snapshot copy by using the restore feature on the Health/Volumes inventory page.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

You cannot restore NTFS file streams.

The restore option is not available when:

- The volume ID is unknown: for example, when you have a intercluster relationship and the destination cluster has not yet been discovered.
- The volume is a FlexGroup volume.
- The volume is configured for SnapMirror Synchronous replication.

#### **Steps**

- 1. In the **Health/Volumes** inventory page, select a volume from which you want to restore data.
- 2. From the toolbar, click Restore.

The Restore dialog box is displayed.

- 3. Select the volume and Snapshot copy from which you want to restore data, if different from the default.
- 4. Select the items you want to restore.

You can restore the entire volume, or you can specify folders and files you want to restore.

- 5. Select the location to which you want the selected items restored; either **Original Location** or **Alternate Location**.
- Click Restore.

The restore process begins.

## Restoring data using the Health/Volume details page

You can restore overwritten or deleted files, directories, or an entire volume from a Snapshot copy by using the restore feature on the Health/Volume details page.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

You cannot restore NTFS file streams.

The restore option is not available when:

- The volume ID is unknown: for example, when you have a intercluster relationship and the destination cluster has not yet been discovered.
- The volume is a FlexGroup volume.
- The volume is configured for SnapMirror Synchronous replication.

#### **Steps**

- 1. In the **Protection** tab of the **Health/Volume** details page, right-click in the topology view the name of the volume that you want to restore.
- 2. Select **Restore** from the menu.

Alternatively, select **Restore** from the **Actions** menu to protect the current volume for which you are viewing the details.

The Restore dialog box is displayed.

- 3. Select the volume and Snapshot copy from which you want to restore data, if different from the default.
- 4. Select the items you want to restore.

You can restore the entire volume, or you can specify folders and files you want to restore.

- 5. Select the location to which you want the selected items restored: either **Original Location** or **Alternate Existing Location**.
- 6. If you select an alternate existing location, do one of the following:
  - In the Restore Path text field, type the path of the location to which you want to restore the data and then click **Select Directory**.
  - Click **Browse** to launch the Browse Directories dialog box and complete the following steps:
    - i. Select the cluster, SVM, and volume to which you want to restore.
    - ii. In the Name table, select a directory name.
    - iii. Click Select Directory.
- 7. Click **Restore**.

The restore process begins.

If a restore operation fails between Cloud Volumes ONTAP HA clusters with an NDMP error, you may need to add an explicit AWS route in the destination cluster so that the destination can communicate with the source system's cluster management LIF. You perform this configuration step using OnCommand Cloud Manager.

## **Creating resource pools**

You can use the Create Resource Pool dialog box to group aggregates for provisioning purposes.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

Resource pools can contain aggregates from different clusters, but the same aggregate cannot belong to different resource pools.

#### **Steps**

- 1. In the left navigation pane, click **Protection > Resource Pools**.
- In the Protection/Resource Pools page, click Create.
- 3. Follow the instructions in the **Create Resource Pool** dialog box to provide a name and description and to add aggregates as members to the resource pool you want to create.

## **Editing resource pools**

You can edit an existing resource pool when you want to change the resource pool name and the description.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

The **Edit** button is enabled only when one resource pool is selected. If more than one resource pool is selected, the **Edit** button is disabled.

### **Steps**

- 1. In the left navigation pane, click **Protection > Resource Pools**.
- 2. Select one resource pool from the list.
- 3. Click Edit.

The Edit Resource Pool window is displayed.

- 4. Edit the resource pool name and description as needed.
- 5. Click Save.

The new name and description are displayed in the resource pool list.

## Viewing resource pools inventory

You can use the Protection/Resource Pools page to view the resource pool inventory and to monitor the remaining capacity for each resource pool.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

### **Steps**

1. In the left navigation pane, click **Protection > Resource Pools**.

The resource pool inventory is displayed.

## Adding resource pool members

A resource pool consists of a number of member aggregates. You can add aggregates to existing resource pools to increase the amount of space available for secondary volume provisioning.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

You can add no more than 200 aggregates to a resource pool at one time. Aggregates shown in the Aggregates dialog box do not belong to any other resource pool.

### **Steps**

- 1. In the left navigation pane, click **Protection > Resource Pools**.
- 2. Select a resource pool from the Resource Pools list.

The resource pool members are displayed in the area below the resource pool list.

3. In the resource pool member area, click **Add**.

The Aggregates dialog box is displayed.

- Select one or more aggregates.
- 5. Click Add.

The dialog box is closed and the aggregates are displayed in the member list for the selected resource pool.

## Removing aggregates from resource pools

You can remove aggregates from an existing resource pool: for example, when you want to use an aggregate for some other purpose.

#### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

Resource pool members are displayed only when a resource pool is selected.

### **Steps**

- 1. In the left navigation pane, click **Protection > Resource Pools**.
- 2. Select the resource pool from which you want to remove member aggregates.

The list of member aggregates is displayed in the Members pane.

3. Select one or more aggregates.

The **Remove** button is enabled.

4. Click Remove.

A warning dialog box is displayed.

5. Click Yes to continue.

The selected aggregates are removed from the Members pane.

## **Deleting resource pools**

You can delete resource pools when they are no longer needed. For example, you might want to redistribute the member aggregates from one resource pool to several other resource pools, making the original resource pool obsolete.

## Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

The **Delete** button is enabled only when at least one resource pool is selected.

#### **Steps**

- 1. In the left navigation pane, click **Protection > Resource Pools**.
- Select the resource pool you want to delete.
- 3. Click Delete.

The resource pool is removed from the resource pool list and its aggregates are removed from the members list.

## **Understanding SVM associations**

storage virtual machine (SVM) associations are mappings from a source SVM to a destination SVM that are used by partner applications for resource selection and secondary volume provisioning.

Associations are always created between a source SVM and a destination SVM, regardless of whether the destination SVM is a secondary destination or a tertiary destination. You cannot use a secondary destination SVM as a source to create an association with a tertiary destination SVM.

You can associate SVMs in three ways:

· Associate any SVM

You can create an association between any primary source SVM and one or more destination SVMs. This means that all existing SVMs that currently require protection, as well as any SVMs that are created in the future, are associated with the specified destination SVMs. For example, you might want applications from several different sources at different locations to be backed up to one or more destination SVMs in one location.

· Associate a particular SVM

You can create an association between a specific source SVM and one or more specific destination SVMs. For example, if you are providing storage services to many clients whose data must be separate from one another, you can choose this option to associate a specific source SVM to a specific destination SVM that is assigned to only that client.

· Associate with an external SVM

You can create an association between a source SVM and an external flexible volume of a destination SVM.

## **SVM** and resource pool requirements to support storage services

You can better ensure conformance in partner applications if you observe some SVM association and resource pool requirements that are specific to storage services: for example, when you associate SVM and create resource pools in Unified Manager to support a protection topology in a storage service provided by a partner application.

Some applications partner with the Unified Manager server to provide services that automatically configure and

execute SnapMirror or SnapVault backup protection between source volumes and protection volumes in secondary or tertiary locations. To support these protection storage services, you must use Unified Manager to configure the necessary SVM associations and resource pools.

To support storage service single-hop or cascaded protection, including replication from a SnapMirror source or SnapVault primary volume to either destination SnapMirror or to SnapVault backup volumes that reside in secondary or tertiary locations, observe the following requirements:

- SVM associations must be configured between the SVM containing the SnapMirror source or SnapVault
  primary volume and any SVM on which either a secondary volume or a tertiary volume resides.
  - For example, to support a protection topology in which source volume Vol\_A resides on SVM\_1, and SnapMirror secondary destination volume Vol\_B resides on SVM\_2, and tertiary SnapVault backup volume Vol\_ C resides on SVM\_3, you must use the Unified Manager web UI to configure a SnapMirror association between SVM\_1 and SVM\_2 and a SnapVault backup association between SVM\_1 and SVM\_3.

In this example, any SnapMirror association or SnapVault backup association between SVM\_2 and SVM\_3 is not necessary and is not used.

- To support a protection topology in which both source volume Vol\_A and SnapMirror destination volume Vol\_B reside on SVM\_1, you must configure a SnapMirror association between SVM\_1 and SVM\_1.
- The resource pools must include cluster aggregate resources available to the associated SVMs.

You configure resource pools through the Unified Manager web UI and then assign through the partner application the storage service secondary target and tertiary target nodes.

# **Creating SVM associations**

The Create Storage Virtual Machine Associations wizard enables partner protection applications to associate a source storage virtual machine (SVM) with a destination SVM for use with SnapMirror and SnapVault relationships. Partner applications use these associations at the time of initial provisioning of destination volumes to determine which resources to select.

# Before you begin

- The SVM you are associating must already exist.
- You must have the OnCommand Administrator or Storage Administrator role.

#### About this task

For any source SVM and relationship type, you can choose only one destination SVM on each destination cluster.

Changing associations using the delete and create functions affects only future provisioning operations. It does not move existing destination volumes.

### **Steps**

- 1. In the left navigation pane, click **Protection > SVM Associations**.
- 2. In the Protection/Storage Virtual Machine Associations page, click Create.

The Create Storage Virtual Machine Associations wizard is launched.

3. Select one of the following sources:

#### Any

Choose this option when you want to create an association between any primary SVM source to one or more destination SVM. This means that all existing SVMs that currently require protection, as well as any SVMs that are created in the future, are associated with the specified destination SVM. For example, you might want applications from several different sources at different locations backed up to one or more destination SVM in one location.

### · Single

Choose this option when you want to select a specific source SVM associated with one or more destination SVMs. For example, if you are providing storage services to many clients whose data must be separate from one another, choose this option to associate a specific SVM source to a specific SVM destination that is assigned only to that client.

#### None (External)

Choose this option when you want to create an association between a source SVM and an external flexible volume of a destination SVM.

- 4. Select one or both of the protection relationship types you want to create:
  - SnapMirror
  - SnapVault
- Click Next.
- 6. Select one or more SVM protection destination.
- 7. Click Finish.

# **Viewing SVM associations**

You can use the Protection/Storage Virtual Machine Associations page to view existing SVM associations and their properties and to determine if additional SVM associations are required.

# Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

# **Steps**

1. In the left navigation pane, click **Protection > SVM Associations**.

The list of SVM associations and their properties is displayed.

# **Deleting SVM associations**

You can delete SVM associations for partner applications to remove the secondary provisioning relationship between source and destination SVMs; for example, you might do this when the destination SVM is full and you want to create a new SVM protection association.

# Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

### **About this task**

The **Delete** button is disabled until at least one SVM association is selected. Changing associations using the delete and create functions affects only future provisioning operations; it does not move existing destination volumes.

# **Steps**

- 1. In the left navigation pane, click **Protection > SVM Associations**.
- 2. Select at least one SVM association.

The **Delete** button is enabled.

3. Click Delete.

A warning dialog box is displayed.

4. Click Yes to continue.

The selected SVM association is removed from the list.

# What jobs are

A job is a series of tasks that you can monitor using Unified Manager. Viewing jobs and their associated tasks enables you to determine if a they have completed successfully.

Jobs are initiated when you create SnapMirror and SnapVault relationships, when you perform any relationship operation (break, edit, quiesce, remove, resume, resynchronize, and reverse resync), when you perform data restoration tasks, when you log in to a cluster, and so on.

When you initiate a job, you can use the Protection/Jobs page and the Protection/Job details page to monitor the job and the progress of the associated job tasks.

# **Monitoring jobs**

You can use the Protection/Jobs page to monitor job status and to view job properties such as storage service type, state, submitted time, and completed time to determine whether or not a job has successfully completed.

### Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

### **Steps**

1. In the left navigation pane, click **Protection > Jobs**.

The Protection/Jobs page is displayed.

- 2. View the **State** column to determine the status of those jobs currently running.
- 3. Click on a job name to view details about that particular job.

The Protection/Job details page is displayed.

# Viewing job details

After you start a job, you can track its progress from the Protection/Job details page and monitor the associated tasks for possible errors.

# Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

### **Steps**

- 1. In the left navigation pane, click **Protection > Jobs**.
- 2. In the **Protection/Jobs** page, click a job name in the **Name** column to display the list of tasks associated with the job.
- 3. Click on a task to display additional information in the **Task Details** pane and the **Task Messages** pane to the right of the task list.

# **Aborting jobs**

You can use the Protection/Jobs page to abort a job if it is taking too long to finish, is encountering too many errors, or is no longer needed. You can abort a job only if its status and type allow it. You can abort any running job.

# Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

# **Steps**

- 1. In the left navigation pane, click **Protection > Jobs**.
- 2. From the list of jobs, select one job, and then click **Abort**.
- 3. At the confirmation prompt, click **Yes** to abort the selected job.

# Retrying a failed protection job

After you have taken measures to fix a failed protection job, you can use **Retry** to run the job again. Retrying a job creates a new job using the original job ID.

# Before you begin

You must have the OnCommand Administrator or Storage Administrator role.

### About this task

You can retry only one failed job at a time. Selecting more than one job disables the **Retry** button. Only jobs of the type Protection Configuration and Protection Relationship Operation can be retried.

### **Steps**

- 1. In the left navigation pane, click **Protection > Jobs**.
- 2. From the list of jobs, select a single failed Protection Configuration or Protection Relationship Operation type job.

The **Retry** button is enabled.

3. Click Retry.

The job is restarted.

# Description of Protection relationships windows and dialog boxes

You can view and manage protection-related details such as resource pools, SVM associations, and protection jobs. You can use the appropriate Configuration/Health Thresholds page to configure global health threshold values for aggregates, volumes, and relationships.

# Protection/Resource Pools page

The Protection/Resource Pools page displays existing resource pools and their members, and enables you to create, monitor, and manage resource pools for provisioning purposes.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

Create

Launches the Create Resource Pool dialog box, which you can use to create resource pools.

• Edit

Enables you to edit the name and description of the resource pools that you create.

#### Delete

Enables you to delete one or more resource pools.

### **Resource Pools list**

The Resource Pools list displays (in tabular format) the properties of existing resource pools.

#### Resource Pool

Displays the name of the resource pool.

### Description

Describes the resource pool.

### SnapLock Type

Displays the SnapLock type that is being used by the aggregates in the resource pool. Valid values for SnapLock type are Compliance, Enterprise, and Non-SnapLock. A resource pool can contain aggregates of only one SnapLock type.

### Total Capacity

Displays the total capacity (in MB, GB, and so on) of the resource pool.

### Used Capacity

Displays the amount of space (in MB, GB, and so on) that is used in the resource pool.

### Available Capacity

Displays the amount of space (in MB, GB, and so on) that is available in the resource pool.

#### Used %

Displays the percentage of space that is used in the resource pool.

### **Members list command buttons**

The Members list command buttons enable you to perform the following tasks:

#### Add

Enables you to add members to the resource pool.

#### Delete

Enables you to delete one or more members from the resource pool.

#### **Members list**

The Members list displays (in tabular format) the resource pool members and their properties when a resource pool is selected.

#### Status

Displays the current status of the member aggregate. The status can be Critical ( $\bigotimes$ ), Error ( $\bigoplus$ ), Warning ( $\bigwedge$ ), or Normal ( $\bigotimes$ ).

### · Aggregate Name

Displays the name of the member aggregate.

### State

Displays the current state of the aggregate, which can be one of the following:

· Offline

Read or write access is not allowed.

· Online

Read and write access to the volumes that are hosted on this aggregate is allowed.

Restricted

Limited operations (such as parity reconstruction) are allowed, but data access is not allowed.

Creating

The aggregate is being created.

Destroying

The aggregate is being destroyed.

Failed

The aggregate cannot be brought online.

• Frozen

The aggregate is (temporarily) not serving requests.

Inconsistent

The aggregate has been marked corrupted; you should contact technical support.

Iron Restricted

Diagnostic tools cannot be run on the aggregate.

Mounting

The aggregate is in the process of mounting.

#### Partial

At least one disk was found for the aggregate, but two or more disks are missing.

### · Quiescing

The aggregate is being quiesced.

### Quiesced

The aggregate is quiesced.

### Reverted

The revert of an aggregate is completed.

### Unmounted

The aggregate has been unmounted.

### Unmounting

The aggregate is being taken offline.

### • Unknown

The aggregate is discovered, but the aggregate information is not yet retrieved by the Unified Manager server.

By default, this column is hidden.

#### Cluster

Displays the name of the cluster to which the aggregate belongs.

#### Node

Displays the name of the node on which the aggregate resides.

### Total Capacity

Displays the total capacity (in MB, GB, and so on) of the aggregate.

### Used Capacity

Displays the amount of space (in MB, GB, and so on) that is used in the aggregate.

### Available Capacity

Displays the amount of space (in MB, GB, and so on) that is available in the aggregate.

### • Used %

Displays the percentage of space that is used in the aggregate.

### Disk Type

Displays the RAID configuration type, which can be one of the following:

- RAID0: All the RAID groups are of type RAID0.
- RAID4: All the RAID groups are of type RAID4.
- RAID-DP: All the RAID groups are of type RAID-DP.
- RAID-TEC: All the RAID groups are of type RAID-TEC.
- Mixed RAID: The aggregate contains RAID groups of different RAID types (RAID0, RAID4, RAID-DP, and RAID-TEC). By default, this column is hidden.

### **Create Resource Pool dialog box**

You can use the Create Resource Pool dialog box to name and describe a new resource pool and to add aggregates to and delete aggregates from that resource pool.

#### **Resource Pool Name**

The text boxes enable you to add the following information to create a resource pool:

Enables you to specify a resource pool name.

### **Description**

Enables you to describe a resource pool.

#### **Members**

Displays the members of the resource pool. You can also add and delete members.

### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Add

Opens the Aggregates dialog box so that you can add aggregates from a specific cluster to the resource pool. You can add aggregates from different clusters, but the same aggregates cannot be added to more than one resource pool.

### Remove

Enables you to remove selected aggregates from the resource pool.

#### Create

Creates the resource pool. This button is not enabled until information has been entered in the Resource Pool Name or Description fields.

#### Cancel

Discards the changes and closes the Create Resource Pool dialog box.

# **Edit Resource Pool dialog box**

You can use the Edit Resource Pool dialog box to change the name and description of an existing resource pool. For example, if the original name and description is inaccurate or incorrect, you can change them so they are more precise.

#### **Text boxes**

The text boxes enable you to change the following information for the selected resource pool:

#### Resource Pool Name

Enables you to enter a new name.

### Description

Enables you to enter a new description.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Save

Saves the changes to the resource pool name and description.

### Cancel

Discards the changes and closes the Edit Resource Pool dialog box.

# Aggregates dialog box

You can use the Aggregates dialog box to select the aggregates that you want to add to your resource pool.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Add

Adds the selected aggregates to the resource pool. The Add button is not enabled until at least one aggregate is selected.

#### Cancel

Discards the changes, and closes the Aggregates dialog box.

### **Aggregates list**

The Aggregates list displays (in tabular format) the names and properties of monitored aggregates.

#### Status

Displays the current status of a volume. The status can be Critical ( $\bigotimes$ ), Error ((!)), Warning ( $\bigwedge$ ), or Normal ( $\bigotimes$ ).

You can move the pointer over the status to view more information about the event or events generated for the volume.

### Aggregate Name

Displays the name of the aggregate.

#### State

Displays the current state of the aggregate, which can be one of the following:

Offline

Read or write access is not allowed.

Restricted

Limited operations (such as parity reconstruction) are allowed, but data access is not allowed.

Online

Read and write access to the volumes that are hosted on this aggregate is allowed.

· Creating

The aggregate is being created.

Destroying

The aggregate is being destroyed.

Failed

The aggregate cannot be brought online.

Frozen

The aggregate is (temporarily) not serving requests.

Inconsistent

The aggregate has been marked corrupted; you should contact technical support.

Iron Restricted

Diagnostic tools cannot be run on the aggregate.

Mounting

The aggregate is in the process of mounting.

#### Partial

At least one disk was found for the aggregate, but two or more disks are missing.

### · Quiescing

The aggregate is being quiesced.

### Quiesced

The aggregate is quiesced.

#### Reverted

The revert of an aggregate is completed.

### Unmounted

The aggregate is offline.

### Unmounting

The aggregate is being taken offline.

### • Unknown

The aggregate is discovered, but the aggregate information is not yet retrieved by the Unified Manager server.

#### Cluster

Displays the name of the cluster on which the aggregate resides.

#### Node

Displays the name of the storage controller that contains the aggregate.

#### Total Capacity

Displays the total data size (in MB, GB, and so on) of the aggregate. By default, this column is hidden.

### Committed Capacity

Displays the total space (in MB, GB, and so on) that is committed for all the volumes in the aggregate. By default, this column is hidden.

### Used Capacity

Displays the amount of space (in MB, GB, and so on) that is used in the aggregate.

### Available Capacity

Displays the amount of space (in MB, GB, and so on) that is available for data in the aggregate. By default, this column is hidden.

#### Available %

Displays the percentage of space that is available for data in the aggregate. By default, this column is hidden.

#### Used %

Displays the percentage of space that is used by data in the aggregate.

### RAID Type

Displays the RAID type of the selected volume. The RAID type can be RAID0, RAID4, RAID-DP, RAID-TEC, or Mixed RAID.

### **Protection/Storage Virtual Machine Associations page**

The Protection/Storage Virtual Machine Associations page enables you to view existing SVM associations between source and destination SVMs and to create new SVM associations for use by partner applications to create SnapMirror and SnapVault relationships.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Create

Opens the Create Storage Virtual Machine Associations wizard.

#### Delete

Enables you to delete the selected SVM associations.

### storage virtual machine (SVM) Associations list

The Storage Virtual Machine Associations list displays in a table the source and destination SVM associations that have been created and the type of protection relationship allowed for each association.

### Source Storage Virtual Machine

Displays the name of the source SVM.

#### Source Cluster

Displays the name of the source cluster.

### Destination Storage Virtual Machine

Displays the name of the destination SVM.

#### Destination Cluster

Displays the name of the destination cluster.

### Type

Displays the type of protection relationship. Relationship types are either SnapMirror or SnapVault.

### **Create Storage Virtual Machine Associations wizard**

The Create Storage Virtual Machine Associations wizard enables you to associate source and destination storage virtual machines (SVMs) for use in SnapMirror and SnapVault protection relationships.

#### Select Source SVM

The Select Source Storage Virtual Machine panel enables you to select the source, or primary, SVM in the SVM association.

### • Any

Enables you to create an association between any SVM source to one or more destination, or secondary, SVM. This means that all existing SVMs that currently require protection, as well as any SVMs that are created in the future, are associated with the specified destination SVM. For example, you might want applications from several different sources at different locations backed up to one or more destination SVM in one location.

### Single

Enables you to associate a specific source SVM with one or more destination SVMs. For example, if you are providing storage services to many clients whose data must be separate from one another, choose this option to associate a specific SVM source to a specific SVM destination that is assigned only to that client.

### None (External)

Enables you to create an association between a source SVM and an external flexible volume of a destination SVM.

Storage Virtual Machine

Lists the names of the available source SVMs

Cluster

Lists the clusters on which each SVM resides

### Allow these kinds of relationships

Enables you to select the relationship type for the association:

SnapMirror

Specifies a SnapMirror relationship as the association type. Selecting this option enables data replication from the selected sources to the selected destinations.

SnapVault

Specifies a SnapVault relationship as the association type. Selecting this option enables backups from the selected primary locations to the selected secondary locations.

#### **Select Protection Destinations**

The Select Protection Destinations panel of the Create Storage Virtual Machine Associations wizard enables you to select where to copy or replicate the data. You can create an association on only one destination SVM per cluster.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Next

Advances you to the next page in the wizard.

#### Back

Returns you to the previous page in the wizard.

#### Finish

Applies your selections and creates the association.

#### Cancel

Discards the selections and closes the Create Storage Virtual Machine Associations wizard.

# Protection/Jobs page

The Protection/Jobs page enables you to view the current status and other information about all partner application protection jobs that are currently running, as well as jobs that have completed. You can use this information to see which jobs are still running and whether a job has succeeded or failed.

### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Abort

Aborts the selected job. This option is available only if the selected job is running.

### Retry

Restarts a failed job of type Protection Configuration or Protection Relationship Operation. You can retry only one failed job at a time. If more than one failed job is selected, the **Retry** button is disabled. You cannot retry failed storage service jobs.

#### Refresh

Refreshes the list of jobs and the information associated with them.

#### Jobs list

The Jobs list displays, in tabular format, a list of the jobs that are in progress. By default, the list displays only the jobs generated within the past week. You can use column sorting and filtering to customize which jobs are displayed.

#### Status

Displays the current status of a job. The status can be Error ([1]) or Normal ([7]).

#### Job Id

Displays the identification number of the job. By default, this column is hidden.

The job identification number is unique and is assigned by the server when it starts the job. You can search for a particular job by entering the job identification number in the text box provided by the column filter.

#### Name

Displays the name of the job.

### Type

Displays the job type. The job types are as follows:

### Cluster Acquisition

A Workflow Automation job is rediscovering a cluster.

### Protection Configuration

A protection job is initiating Workflow Automation workflows, such as cron schedules, SnapMirror policy creation, and so on.

### Protection Relationship Operation

A protection job is running SnapMirror operations.

#### Protection Workflow Chain

A Workflow Automation job is executing multiple workflows.

#### Restore

A restore job is running.

#### Cleanup

The job is cleaning up storage service member artifacts that are no longer needed for restore purposes.

### Conform

The job is checking the configuration of storage service members to ensure that they conform.

#### Destroy

The job is destroying a storage service.

### • Import

The job is importing unmanaged storage objects into an existing storage service.

### Modify

The job is modifying attributes of an existing storage service.

#### Subscribe

The job is subscribing members to a storage service.

#### Unsubscribe

The job is unsubscribing members from a storage service.

### Update

A protection update job is running.

### WFA Configuration

A Workflow Automation job is pushing cluster credentials and synchronizing database caches.

### State

Displays the running state of the job. State options are as follows:

#### Aborted

The job has been aborted.

### Aborting

The job is in the process of aborting.

### Completed

The job has finished.

### Running

The job is running.

#### Submitted Time

Displays the time the job was submitted.

### Duration

Displays the amount of time the job took to complete. This column is displayed by default.

# Completed Time

Displays the time the job finished. By default, this column is hidden.

### Protection/Job details page

The Protection/Job details page enables you to view status and other information about specific protection job tasks that are running, that are queued, or that have completed. You can use this information to monitor protection job progress and to troubleshoot job failures.

### Job summary

The job summary displays the following information:

- Job ID
- Type
- State
- Submitted Time
- · Completed Time
- Duration

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Refresh

Refreshes the task list and the properties associated with each task.

#### View Jobs

Returns you to the Protection/Jobs page.

#### Job tasks list

The Job tasks list displays in a table all the tasks associated with a specific job and the properties related to each task.

#### Started Time

Displays the day and time the task started. By default, the most recent tasks are displayed at the top of the column and older tasks are displayed at the bottom.

### Type

Displays the type of task.

### State

The state of a particular task:

#### Completed

The task has finished.

### Queued

The task is about to run.

### Running

The task is running.

### Waiting

A job has been submitted and some associated tasks are waiting to be queued and executed.

#### Status

Displays the task status:

• Error ([[])

The task failed.

∘ Normal (**∭**)

The task succeeded.

Skipped (

A task failed, resulting in subsequent tasks being skipped.

#### Duration

Displays the elapsed time since the task began.

### Completed Time

Displays the time the task completed. By default, this column is hidden.

### Task ID

Displays the GUID that identifies an individual task for a job. The column can be sorted and filtered. By default, this column is hidden.

### Dependency order

Displays an integer representing the sequence of tasks in a graph, with zero being assigned to the first task. By default, this column is hidden.

### · Task Details pane

Displays additional information about each job task, including the task name, task description, and, if the task failed, a reason for the failure.

### Task Messages pane

Displays messages specific to the selected task. Messages might include a reason for the error and

# **Advanced Secondary Settings dialog box**

You can use the Advanced Secondary Settings dialog box to enable version-flexible replication, multiple copy backup, and space-related settings on a secondary volume. You might use the Advanced Secondary Settings dialog box when you want to change enable or disable the current settings.

Space-related settings maximize the amount of data being stored, including the following: deduplication, data compression, autogrow, and space guarantee.

The dialog box includes the following fields:

### Enable Version-Flexible Replication

Enables SnapMirror with version-flexible replication. Version-flexible replication enables SnapMirror protection of a source volume even if the destination volume is running under an earlier version of ONTAP than that of the source volume, as long as both source and destination are running ONTAP 8.3 or later.

### Enable Backup

If version-flexible replication is enabled, also enables multiple Snapshot copies of the SnapMirror source data to be transferred to and retained at the SnapMirror destination.

### Enable Deduplication

Enables deduplication on the secondary volume in a SnapVault relationship so that duplicate data blocks are eliminated to achieve space savings. You might use deduplication when space savings are at least 10 percent and when data overwrite rate is not rapid. Deduplication is often used for virtualized environments, file shares, and backup data. This setting is disabled by default. When enabled, this operation is initiated after each transfer.

### Enable Compression

Enables transparent data compression. You might use compression when space savings are at least 10 percent, when the potential overhead is acceptable, and when there are sufficient system resources for compression to complete during nonpeak hours. In a SnapVault relationship, this setting is disabled by default. Compression is available only when deduplication is selected.

### Compress Inline

Enables immediate space savings by compressing data before writing data to disk. You might use inline compression when your system has no more than 50 percent utilization during peak hours, and when the system can accommodate new writes and additional CPU during peak hours. This setting is available only when "Enable Compression" is selected.

#### Enable Autogrow

Enables you to automatically grow the destination volume when the free space percentage is below the specified threshold, as long as space is available on the associated aggregate.

#### Maximum Size

Sets the maximum percentage to which a volume can grow. The default is 20 percent greater than the source volume size. A volume does not grow automatically if the current size is greater than or equal to the maximum autogrow percentage. This field is enabled only when the autogrow setting is enabled.

#### Increment Size

Specifies the percentage increment by which the volume automatically grows before reaching the maximum percentage of the source volume.

### Space Guarantee

Ensures that enough space is allocated on the secondary volume so that data transfers always succeed. The space guarantee setting can be one of the following:

- File
- Volume
- None For example, you might have a 200 GB volume that contains files totaling 50 GB; however, those files hold only 10 GB of data. Volume guarantee allocates 200 GB to the destination volume, regardless of contents on the source. File guarantee allocates 50 GB to ensure that enough space is reserved for files on the source; selecting None in this scenario means that only 10 GB is allocated on the destination for the actual space used by file data on the source.

The space guarantee is set to Volume by default.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

### Apply

Saves the selected efficiency settings and applies them when you click **Apply** in the Configure Protection dialog box.

#### Cancel

Discards your selections and closes the Advanced Destination Settings dialog box.

#### **Related information**

NetApp Technical Report 3966: NetApp Data Compression and Deduplication Deployment and Implementation Guide (Clustered Data ONTAP)

# Advanced Destination Settings dialog box

You can use the Advanced Destination Settings dialog box to enable space guarantee settings on a destination volume. You might select advanced settings when space guarantee is disabled on the source, but you want it enabled on the destination. The settings for deduplication, compression, and autogrow in a SnapMirror relationship are inherited from the source volume and cannot be changed.

#### **Space Guarantee**

Ensures that enough space is allocated on the destination volume so that data transfers always succeed. The space guarantee setting can be one of the following:

• File

Space guarantee for files is not available in ONTAP 8.3.

- Volume
- None

For example, you might have a 200-GB volume that contains files totaling 50 GB; however, those files hold only 10 GB of data. Volume guarantee allocates 200 GB to the destination volume, regardless of contents on the source. File guarantee allocates 50 GB to ensure that enough space is reserved for source files on the destination; selecting **None** in this scenario means that only 10 GB is allocated on the destination for the actual space used by file data on the source.

The space guarantee is set to Volume by default.

### Restore dialog box

You can use the Restore dialog box to restore data to a volume from a specific Snapshot copy.

#### **Restore from**

The Restore from area enables you to specify from where you want to restore data.

### Volume

Specifies the volume from which you want to restore data. By default, the volume on which you initiated the restore action is selected. You can select a different volume from the drop-down list that contains all the volumes with protection relationships to the volume on which you initiated the restore action.

#### Snapshot copy

Specifies which Snapshot copy you want to use to restore data. By default, the most recent Snapshot copy is selected. You can also select a different Snapshot copy from the drop-down list. The Snapshot copy list changes according to which volume is selected.

#### · List maximum of 995 files and directories

By default a maximum of 995 objects are shown in the list. You can deselect this checkbox if you want to view all objects within the selected volume. This operation may take some time if the number of items is very large.

#### Select items to restore

The Select items to restore area enables you to select either the entire volume or specific files and folders you want to restore. You can select a maximum of 10 files, folders, or a combination of both. When the maximum number of items is selected, the item selection check boxes are disabled.

#### Path field

Displays the path to the data you want to restore. You can either navigate to the folder and files you want to restore, or you can type the path. This field is empty until you select or type a path. Clicking after you have chosen a path moves you up one level in the directory structure.

### · Folders and files list

Displays the contents of the path you entered. By default, the root folder is initially displayed. Clicking a folder name displays the contents of the folder.

You can select items to restore as follows:

- When you enter the path with a particular file name specified in the path field, the specified file is displayed
  in the Folders and Files.
- When you enter a path without specifying a particular file, the contents of the folder are displayed in the Folders and Files list, and you can select up to 10 files, folders, or a combination of both to restore.

If a folder contains more than 995 items, a message displays to indicate there are too many items to display, and if you proceed with the operation all items in the specified folder are restored. You can deselect the "List maximum of 995 files and directories" checkbox if you want to view all objects within the selected volume.

You cannot restore NTFS file streams.

#### Restore to

The Restore to area enables you to specify where you want to restore the data.

### Original Location in Volume\_Name

Restores the selected data to the directory on the source from which the data was originally backed up.

#### Alternate Location

Restores the selected data to a new location:

· Restore Path

Specifies an alternate path for restoring the selected data. The path must already exist. You can use the **Browse** button to navigate to the location where you want the data restored, or you can enter the path manually using the format cluster://svm/volume/path.

Preserve directory hierarchy

When checked, preserves the structure of the original file or directory. For example, if the source is /A/B/C/myFile.txt and the destination is /X/Y/Z, Unified Manager restores the data using the following directory structure on the destination: /X/Y/Z/A/B/C/myFile.txt.

### **Command buttons**

The command buttons enable you to perform the following tasks:

### Cancel

Discards your selections and closes the Restore dialog box.

#### Restore

Applies your selections and begins the restore process.

### **Browse Directories dialog box**

You can use the Browse Directories dialog box when you want to restore data to a directory on a cluster and SVM that is different from the original source. The original source cluster and volume are selected by default.

The Browse Directories dialog box enables you to select the cluster, SVM, volume, and directory path to which you want data restored.

#### Cluster

Lists the available cluster destinations to which you can restore. By default, the cluster of the original source volume is selected.

### SVM drop-down list

Lists the available SVM available for the selected cluster. By default, the SVM of the original source volume is selected.

#### Volume

Lists all of the read/write volumes in a selected SVM. You can filter the volumes by name and by space available. The volume with the most space is listed first, and so on, in descending order. By default, the original source volume is selected.

#### File path text box

Enables you to type the file path to which you want data restored. The path you enter must already exist.

#### Name

Displays the names of the available folders for the selected volume. Clicking a folder in the Name list displays the subfolders, if any exist. Files contained in the folders are not displayed. Clicking after you have selected a folder moves you up one level in the directory structure.

### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Select Directory

Applies your selections and closes the Browse Directories dialog box. If no directory is selected, this button is disabled.

#### Cancel

Discards your selections and closes the Browse Directories dialog box.

### **Configure Protection dialog box**

You can use the Configure Protection dialog box to create SnapMirror and SnapVault relationships for all read, write, and data protection volumes on clusters to ensure that the data on a source volume or primary volume is replicated.

### Source tab

### · Topology view

Displays a visual representation of the relationship that you are creating. The source in the topology is highlighted by default.

#### Source Information

Displays details about the selected source volumes, including the following information:

- Source cluster name
- Source SVM name
- Cumulative volume total size

Displays the total size of all the source volumes that are selected.

Cumulative volume used size

Displays the cumulative volume used size for all the selected source volumes.

Source volume

Displays the following information in a table :

Source Volume

Displays the names of the selected source volumes.

Type

Displays the volume type.

SnapLock Type

Displays the SnapLock type of the volume. The options are Compliance, Enterprise, and Non-SnapLock.

Snapshot Copy

Displays the Snapshot copy that is used for the baseline transfer. If the source volume is read/write, the value of Default in the Snapshot copy column indicates that a new Snapshot copy is created by default, and is used for the baseline transfer. If the source volume is a data protection volume, the value of Default in the Snapshot copy column indicates that no new Snapshot copy is created, and all existing Snapshot copies are transferred to the destination. Clicking the Snapshot copy value displays a list of Snapshot copies from which you can select an existing Snapshot copy to use for the baseline transfer. You cannot select a different default Snapshot copy if the source type is data protection.

#### SnapMirror tab

Enables you to specify a destination cluster, storage virtual machine (SVM), and aggregate for a protection relationship, as well as a naming convention for destinations while creating a SnapMirror relationship. You can also specify a SnapMirror policy and schedule.

### Topology view

Displays a visual representation of the relationship that you are creating. The SnapMirror destination resource in the topology is highlighted by default.

#### Destination Information

Enables you to select the destination resources for a protection relationship:

#### Advanced link

Launches the Advanced Destination Settings dialog box when you are creating a SnapMirror relationship.

#### Cluster

Lists the clusters that are available as protection destination hosts. This field is required.

storage virtual machine (SVM)

Lists the SVMs that are available on the selected cluster. A cluster must be selected before the SVM list is populated. This field is required.

### Aggregate

Lists the aggregates that are available on the selected SVM. A cluster must be selected before the Aggregate list is populated. This field is required. The Aggregate list displays the following information:

#### Rank

When multiple aggregates satisfy all the requirements for a destination, the rank indicates the priority in which the aggregate is listed, according to the following conditions:

- A. An aggregate that is located on a different node than the source volume node is preferred to enable fault domain separation.
- B. An aggregate on a node with fewer volumes is preferred to enable load balancing across nodes in a cluster.
- C. An aggregate that has more free space than other aggregates is preferred to enable capacity balancing. A rank of 1 means that the aggregate is the most preferred according to the three criteria.

### Aggregate Name

Name of the aggregate

- Available Capacity
- Amount of space that is available on the aggregate for data
- Resource Pool

Name of the resource pool to which the aggregate belongs

### Naming Convention

Specifies the default naming convention that is applied to the destination volume. You can accept the naming convention that is provided, or you can create a custom one. The naming convention can have the following attributes: %C, %M, %V, and %N, where %C is the cluster name, %M is the SVM name, %V is the source volume, and %N is the topology destination node name.

The naming convention field is highlighted in red if your entry is invalid. Clicking the "Preview Name" link displays a preview of the naming convention that you entered, and the preview text updates dynamically as you type a naming convention in the text field. A suffix between 001 and 999 is appended to the destination name when the relationship is created, replacing the nnn that displays in the preview text, with 001 being assigned first, 002 assigned second, and so on.

### Relationship Settings

Enables you to specify the maximum transfer rate, SnapMirror policy, and schedule that the protection relationship uses:

#### Max Transfer Rate

Specifies the maximum rate at which data is transferred between clusters over the network. If you choose not to use a maximum transfer rate, the baseline transfer between relationships is unlimited. However, if you are running ONTAP 8.2, and the primary cluster and the secondary cluster are the same, this setting is ignored.

### SnapMirror Policy

Specifies the ONTAP SnapMirror policy for the relationship. The default is DPDefault.

### Create Policy

Launches the Create SnapMirror Policy dialog box, which enables you to create and use a new SnapMirror policy.

### SnapMirror Schedule

Specifies the ONTAP SnapMirror policy for the relationship. Available schedules include None, 5min, 8hour, daily, hourly, and weekly. The default is None, indicating that no schedule is associated with the relationship. Relationships without schedules have no lag status values unless they belong to a storage service.

#### · Create Schedule

Launches the Create Schedule dialog box, which enables you to create a new SnapMirror schedule.

### SnapVault tab

Enables you to specify a secondary cluster, SVM, and aggregate for a protection relationship, as well as a naming convention for secondary volumes while creating a SnapVault relationship. You can also specify a SnapVault policy and schedule.

### Topology view

Displays a visual representation of the relationship that you are creating. The SnapVault secondary resource in the topology is highlighted by default.

### Secondary Information

Enables you to select the secondary resources for a protection relationship:

Advanced link

Launches the Advanced Secondary Settings dialog box.

Cluster

Lists the clusters that are available as secondary protection hosts. This field is required.

storage virtual machine (SVM)

Lists the SVMs that are available on the selected cluster. A cluster must be selected before the SVM list is populated. This field is required.

Aggregate

Lists the aggregates that are available on the selected SVM. A cluster must be selected before the Aggregate list is populated. This field is required. The Aggregate list displays the following information:

Rank

When multiple aggregates satisfy all the requirements for a destination, the rank indicates the priority in which the aggregate is listed, according to the following conditions:

- A. An aggregate that is located on a different node than the primary volume node is preferred to enable fault domain separation.
- B. An aggregate on a node with fewer volumes is preferred to enable load balancing across nodes in a cluster.
- C. An aggregate that has more free space than other aggregates is preferred to enable capacity balancing. A rank of 1 means that the aggregate is the most preferred according to the three criteria.
- Aggregate Name

Name of the aggregate

- Available Capacity
- Amount of space that is available on the aggregate for data
- Resource Pool

Name of the resource pool to which the aggregate belongs

### Naming Convention

Specifies the default naming convention that is applied to the secondary volume. You can accept the naming convention that is provided, or you can create a custom one. The naming convention can have the following attributes: %C, %M, %V, and %N, where %C is the cluster name, %M is the SVM name, %V is the source volume, and %N is the topology secondary node name.

The naming convention field is highlighted in red if your entry is invalid. Clicking the "Preview Name" link displays a preview of the naming convention that you entered, and the preview text updates dynamically as you type a naming convention in the text field. If you type an invalid value, the invalid information displays as red question marks in the preview area. A suffix between 001 and 999 is appended to the secondary name when the relationship is created, replacing the nnn that displays in the preview text, with 001 being assigned first, 002 assigned second, and so on.

### Relationship Settings

Enables you to specify the maximum transfer rate, SnapVault policy, and SnapVault schedule that the protection relationship uses:

Max Transfer Rate

Specifies the maximum rate at which data is transferred between clusters over the network. If you choose not to use a maximum transfer rate, the baseline transfer between relationships is unlimited. However, if you are running ONTAP 8.2, and the primary cluster and the secondary cluster are the same, this setting is ignored.

SnapVault Policy

Specifies the ONTAP SnapVault policy for the relationship. The default is XDPDefault.

Create Policy

Launches the Create SnapVault Policy dialog box, which enables you to create and use a new SnapVault policy.

SnapVault Schedule

Specifies the ONTAP SnapVault schedule for the relationship. Available schedules include None, 5min, 8hour, daily, hourly, and weekly. The default is None, indicating that no schedule is associated with the relationship. Relationships without schedules have no lag status values unless they belong to a storage service.

· Create Schedule

Launches the Create Schedule dialog box, which enables you to create a SnapVault schedule.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

Cancel

Discards your selections, and closes the Configure Protection dialog box.

Apply

Applies your selections, and begins the protection process.

# Create Schedule dialog box

The Create Schedule dialog box enables you to create a basic or advanced protection

schedule for SnapMirror and SnapVault relationship transfers. You might create a new schedule to increase the frequency of data transfers due to frequent data updates, or you might create a less frequent schedule when data changes infrequently.

Schedules cannot be configured for SnapMirror Synchronous relationships.

#### Destination Cluster

The name of the cluster you selected in the SnapVault tab or SnapMirror tab of the Configure Protection dialog box.

#### Schedule Name

The name you provide for the schedule. Schedule names can consist of the characters A through Z, a through z, 0 through 9, as well as any of the following special characters:  $! @ # $ % ^ & * ( ) _ -.$  Schedule names may not include the following characters: < >.

#### · Basic or Advanced

The schedule mode you want to use.

Basic mode includes the following elements:

Repeat

How often a scheduled transfer occurs. Choices include hourly, daily, and weekly.

Day

When a repeat of weekly is selected, the day of the week a transfer occurs.

Time

When Daily or Weekly is selected, the time of day a transfer occurs.

Advanced mode includes the following elements:

#### Months

A comma-separated numerical list representing the months of the year. Valid values are 0 through 11, with zero representing January, and so on. This element is optional. Leaving the field blank implies that transfers occur every month.

Days

A comma-separated numerical list representing the day of the month. Valid values are 1 through 31. This element is optional. Leaving the field blank implies that a transfer occurs every day of the month.

### Weekdays

A comma-separated numerical list representing the days of the week. Valid values are 0 through 6, with 0 representing Sunday, and so on. This element is optional. Leaving the field blank implies that a transfer occurs every day of the week. If a day of the week is specified but a day of the month is not specified, a transfer occurs only on the specified day of the week and not every day.

#### Hours

A comma-separated numerical list representing the number of hours in a day. Valid values are 0 through 23, with 0 representing midnight. This element is optional.

#### Minutes

A comma-separated numerical list representing the minutes in an hour. Valid values are 0 through 59. This element is required.

# Create SnapMirror Policy dialog box

The Create SnapMirror Policy dialog box enables you to create a policy to set the priority for SnapMirror transfers. You use policies to maximize the efficiency of transfers from the source to the destination.

#### Destination Cluster

The name of the cluster you selected in the SnapMirror tab of the Configure Protection dialog box.

#### Destination SVM

The name of the SVM you selected in the SnapMirror tab of the Configure Protection dialog box.

### Policy Name

The name you provide for the new policy. Policy names can consist of the characters A through Z, a through Z, 0 through 9, period (.), hyphen (-), and underscore ( ).

### Transfer Priority

The priority at which a transfer runs for asynchronous operations. You can select either Normal or Low. Transfer relationships with policies that specify a normal transfer priority run before those with policies that specify a low transfer priority.

#### Comment

An optional field in which you can add comments about the policy.

#### Transfer Restart

Indicates what restart action to take when a transfer is interrupted by an abort operation or any type of failure, such as a network outage. You can select one of the following:

### Always

Specifies that a new Snapshot copy is created before restarting a transfer, then, if one exists, the transfer is restarted from a checkpoint, followed by an incremental transfer from the newly created Snapshot copy..

#### Never

Specifies that interrupted transfers are never restarted.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Cancel

Discards the selections and closes the Configure Protection dialog box.

### Apply

Applies your selections and begins the protection process.

# Create SnapVault Policy dialog box

The Create SnapVault Policy dialog box enables you to create a policy to set the priority for SnapVault transfers. You use policies to maximize the efficiency of transfers from the primary to the secondary volume.

#### Destination Cluster

The name of the cluster that you selected in the SnapVault tab of the Configure Protection dialog box.

#### Destination SVM

The name of the SVM that you selected in the SnapVault tab of the Configure Protection dialog box.

### Policy Name

The name you provide for the new policy. Policy names can consist of the characters A through Z, a through z, 0 through 9, period (.), hyphen (-), and underscore (\_).

### Transfer Priority

The priority at which the transfer is run. You can select either Normal or Low. Transfer relationships with policies that specify a normal transfer priority run before those with policies that specify a low transfer priority. The default setting is Normal.

### Comment

An optional field in which you can a add comment of up to 255 characters about the SnapVault policy.

### Ignore Access Time

Specifies whether incremental transfers are ignored for files that have only their access time changed.

#### Replication Label

Lists in a table the rules associated with Snapshot copies selected by ONTAP that have a specific replication label in a policy. The following information and actions are also available:

#### Command buttons

The command buttons enable you to perform the following actions:

Add

Enables you to create a Snapshot copy label and retention count.

#### Edit Retention Count

Enables you to change the retention count for an existing Snapshot copy label. The retention count must be a number between 1 and 251. The sum of all retention counts for all rules cannot exceed 251.

#### Delete

Enables you to delete an existing Snapshot copy label.

### Snapshot Copy Label

Displays the Snapshot copy label. If you select one or more volumes with the same local Snapshot copy policy, an entry for each label in the policy is displayed. If you select multiple volumes that have two or more local Snapshot copy policies, the table displays all labels from all policies

#### Schedule

Displays the schedule associated with each Snapshot copy label. If a label has more than one schedule associated with it, the schedules for that label are displayed in a comma-separated list. If you select multiple volumes with the same label but with different schedules, the schedule displays "Various" to indicate that more than one schedule is associated with the selected volumes.

#### Destination Retention Count

Displays the number of Snapshot copies with the specified label that are retained on the SnapVault secondary. Retention counts for labels with multiple schedules displays the sum of retention counts of each label and schedule pair. If you select multiple volumes with two or more local Snapshot copy policies, the retention count is empty.

# **Edit Relationship dialog box**

You can edit an existing protection relationship to change the maximum transfer rate, the protection policy, or the protection schedule.

#### **Destination Information**

#### Destination Cluster

The name of the selected destination cluster.

#### Destination SVM

The name of the selected SVM

### Relationship Settings

Enables you to specify the maximum transfer rate, SnapMirror policy, and schedule that the protection relationship uses:

#### Max Transfer Rate

Specifies the maximum rate at which baseline data is transferred between clusters over the network. When selected, network bandwidth is limited to the value you specify. You can enter a numerical value and then select either kilobytes per second (KBps), megabytes per second (MBps), gigabytes per second (GBps), or terabytes per second (TBps). The maximum transfer rate that you specify must be greater than 1 KBps and less than 4 TBps. If you choose not to use a maximum transfer rate, the baseline transfer between relationships is unlimited. If the primary cluster and the secondary cluster are the same, this setting is disabled.

### SnapMirror Policy

Specifies the ONTAP SnapMirror policy for the relationship. The default is DPDefault.

### · Create Policy

Launches the Create SnapMirror Policy dialog box, which enables you to create and use a new SnapMirror policy.

#### SnapMirror Schedule

Specifies the ONTAP SnapMirror policy for the relationship. Available schedules include None, 5min, 8hour, daily, hourly, and weekly. The default is None, indicating that no schedule is associated with the relationship. Relationships without schedules have no lag status values unless they belong to a storage service.

#### · Create Schedule

Launches the Create Schedule dialog box, which enables you to create a new SnapMirror schedule.

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Cancel

Discards the selections and closes the Configure Protection dialog box.

### Submit

Applies your selections and closes the Edit Relationship dialog box.

# Initialize/Update dialog box

The Initialize/Update dialog box enables you to perform a first-time baseline transfer on a new protection relationship, or to update a relationship if it is already initialized and you want to perform a manual, unscheduled, incremental update.

#### **Transfer Options tab**

The Transfer Options tab enables you to change the initialization priority of a transfer and to change the bandwidth used during transfers.

### Transfer Priority

The priority at which the transfer is run. You can select either Normal or Low. Relationships with policies that specify a normal transfer priority run before those that specify a low transfer priority. Normal is selected by default.

#### Max Transfer Rate

Specifies the maximum rate at which data is transferred between clusters over the network. If you choose not to use a maximum transfer rate, the baseline transfer between relationships is unlimited. However, if you are running ONTAP 8.2, and the primary cluster and the secondary cluster are the same, this setting is ignored. If you select more than one relationship with different maximum transfer rates, you can specify one of the following maximum transfer rate settings:

· Use values specified during individual relationship setup or edit

When selected, initialization and update operations use the maximum transfer rate specified at the time of each relationship's creation or edit. This field is available only when multiple relationships with different transfer rates are being initialized or updated.

#### Unlimited

Indicates that there is no bandwidth limitation on transfers between relationships. This field is available only when multiple relationships with different transfer rates are being initialized or updated.

#### Limit bandwidth to

When selected, network bandwidth is limited to the value you specify. You can enter a numerical value and then select either kilobytes per second (KBps), Megabytes per second (MBps), Gigabytes per second (GBps), or Terabytes per second (TBps). The maximum transfer rate that you specify must be greater than 1 KBps and less than 4 TBps.

### **Source Snapshot Copies tab**

The Source Snapshot Copies tab displays the following information about the source Snapshot copy that is used for the baseline transfer:

#### Source Volume

Displays the names of the corresponding source volumes.

#### Destination Volume

Displays the names of the selected destination volumes.

#### Source Type

Displays the volume type. The type can be either Read/write or Data Protection.

### Snapshot Copy

Displays the Snapshot copy that is used for the data transfer. Clicking the Snapshot copy value displays the Select Source Snapshot Copy dialog box, in which you can select a specific Snapshot copy for your transfer, depending on the type of protection relationship that you have and the operation that you are performing. The option to specify a different Snapshot copy is not available for data protection type

#### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Cancel

Discards your selections and closes the Initialize/Update dialog box.

#### Submit

Saves your selections and starts the initialize or update job.

### Resynchronize dialog box

The Resynchronize dialog box enables you to resynchronize data on a SnapMirror or SnapVault relationship that was previously broken and then the destination was made a read/write volume. You might also resynchronize when a required common Snapshot copy on the source volume is deleted causing SnapMirror or SnapVault updates to fail.

### **Resynchronization Options tab**

The Resynchronization Options tab enables you to set the transfer priority and the maximum transfer rate for the protection relationship that you are resynchronizing.

#### Transfer Priority

The priority at which the transfer is run. You can select either Normal or Low. Relationships with policies that specify a normal transfer priority run before those with policies that specify a low transfer priority.

#### Max Transfer Rate

Specifies the maximum rate at which data is transferred between clusters over the network. When selected, network bandwidth is limited to the value that you specify. You can enter a numerical value and then select either kilobytes per second (KBps), megabytes per second (MBps), gigabytes per second (GBps), or TBps. If you choose not to use a maximum transfer rate, the baseline transfer between relationships is unlimited. However, if you are running ONTAP 8.2, and the primary cluster and the secondary cluster are the same, this setting is disabled.

### **Source Snapshot Copies tab**

The Source Snapshot Copies tab displays the following information about the source Snapshot copy that is used for the baseline transfer:

#### Source Volume

Displays the names of the corresponding source volumes.

#### Destination Volume

Displays the names of the selected destination volumes.

### Source Type

Displays the volume type: either Read/write or Data Protection.

### Snapshot Copy

Displays the Snapshot copy that is used for the data transfer. Clicking the Snapshot copy value displays the Select Source Snapshot Copy dialog box, in which can select a specific Snapshot copy for your transfer, depending on the type of protection relationship you have and the operation you are performing.

#### **Command buttons**

#### Submit

Begins the resynchronization process and closes the Resynchronize dialog box.

#### Cancel

Cancels your selections and closes the Resynchronize dialog box.

## Select Source Snapshot Copy dialog box

You use the Select Source Snapshot Copy dialog box to select a specific Snapshot copy to transfer data between protection relationships, or you select the default behavior, which varies depending on whether you are initializing, updating, or resynchronizing a relationship, and whether the relationship is a SnapMirror or SnapVault.

#### **Default**

Enables you to select the default behavior for determining which Snapshot copy is used for initialize, update, and resynchronize transfers for SnapVault and SnapMirror relationships.

If you are performing a SnapVault transfer, the default behavior for each operation is as follows:

Operation	Default SnapVault behavior when source is read/write	Default SnapVault behavior when source is Data Protection (DP)
Initialize	Creates a new Snapshot copy and transfers it.	Transfers the last exported Snapshot copy.
Update	Transfers only labeled Snapshot copies, as specified in the policy.	Transfers the last exported Snapshot copy.
Resynchronize	Transfers all labeled Snapshot copies created after the newest common Snapshot copy.	Transfers the newest labeled Snapshot copy.

If you are performing a SnapMirror transfer, the default behavior for each operation is as follows:

Operation	Default SnapMirror behavior	Default SnapMirror behavior when relationship is second hop in a SnapMirror to SnapMirror cascade
Initialize	Creates a new Snapshot copy and transfers it and all Snapshot copies created prior to the new Snapshot copy.	Transfers all Snapshot copies from the source.
Update	Creates a new Snapshot copy and transfers it and all Snapshot copies created prior to the new Snapshot copy.	Transfers all Snapshot copies.
Resynchronize	Creates a new Snapshot copy and then transfers all Snapshot copies from the source.	Transfers all Snapshot copies from the secondary volume to the tertiary volume, and deletes any data added after creation of the newest common Snapshot copy.

## **Existing Snapshot Copy**

Enables you to select an existing Snapshot copy from the list if Snapshot copy selection is allowed for that operation.

## Snapshot Copy

Displays the existing Snapshot copies from which you can select for a transfer.

### Date Created

Displays the date and time the Snapshot copy was created. Snapshot copies are listed from most recent to least recent, with the most recent at the top of the list.

If you are performing a SnapVault transfer and you want to select an existing Snapshot copy to transfer from a source to a destination, the behavior for each operation is as follows:

Operation	SnapVault behavior when specifying a Snapshot copy	SnapVault behavior when specifying a Snapshot copy in a cascade
Initialize	Transfers the specified Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.
Update	Transfers the specified Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.

Operation	SnapVault behavior when specifying a Snapshot copy	SnapVault behavior when specifying a Snapshot copy in a cascade
Resynchronize	Transfers the selected Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.

If you are performing a SnapMirror transfer and you want to select an existing Snapshot copy to transfer from a source to a destination, the behavior for each operation is as follows:

Operation	SnapMirror behavior when specifying a Snapshot copy	SnapMirror behavior when specifying a Snapshot copy in a cascade
Initialize	Transfers all Snapshot copies on the source, up to the specified Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.
Update	Transfers all Snapshot copies on the source, up to the specified Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.
Resynchronize	Transfers all Snapshot copies from the source, up to the selected Snapshot copy, and then deletes any data added after creation of the newest common Snapshot copy.	Source Snapshot copy selection is not supported for data protection volumes.

### **Command buttons**

The command buttons enable you to perform the following tasks:

#### Submit

Submits your selections and closes the Select Source Snapshot Copy dialog box.

#### Cancel

Discards your selections and closes the Select Source Snapshot Copy dialog box.

# Reverse Resync dialog box

When you have a protection relationship that is broken because the source volume is disabled and the destination is made a read/write volume, reverse resynchronization enables you to reverse the direction of the relationship so that the destination becomes the new source and the source becomes the new destination.

When a disaster disables the source volume in your protection relationship, you can use the destination volume to serve data by converting it to read/write, while you repair or replace the source, update the source,

and reestablish the relationship. When you perform a reverse resync operation, data on the source that is newer than the data on the common Snapshot copy is deleted.

## Before reverse resync

Displays the source and destination of a relationship before a reverse resync operation.

#### Source Volume

The name and location of the source volume before a reverse resync operation.

#### Destination Volume

The name and location of the destination volume before a reverse resync operation.

## After reverse resync

Displays what the source and destination of a relationship is after a reserve resync operation.

#### Source Volume

The name and location of the source volume after a reverse resync operation.

#### Destination Volume

The name and location of the destination volume after a reverse resync operation.

#### **Command buttons**

The command buttons enable you to perform the following actions:

#### Submit

Begins the reverse resynchronization process.

## Cancel

Closes the Reverse Resync dialog box without initiating a reverse resync operation.

# Protection/Volume Relationships page

The Protection/Volume Relationships page displays information about protection relationships on the storage system.

Use the Export button to export the details of all the relationships to a comma-separated values (.csv) file.

#### Relationship Status

Displays the current status of the protection relationship.

The status can be one of Error ( $\bigcirc$ ), Warning ( $\triangle$ ), or Normal ( $\bigcirc$ ).

### Lag Status

Displays the lag status for managed relationships, and for unmanaged relationships that have a schedule associated with that relationship. Lag status can be:

• Error (

The lag duration is greater than or equal to the lag error threshold.

Warning (

The lag duration is greater than or equal to the lag warning threshold.

∘ Normal (**⊘**)

The lag duration is within normal limits.

Not Applicable

The lag status is not applicable for synchronous relationships because a schedule cannot be configured.

### Transfer Status

Displays the transfer status for the protection relationship. The transfer status can be one of the following:

Aborting

SnapMirror transfers are enabled; however, a transfer abort operation that might include removal of the checkpoint is in progress.

Checking

The destination volume is undergoing a diagnostic check and no transfer is in progress.

Finalizing

SnapMirror transfers are enabled. The volume is currently in the post-transfer phase for incremental SnapVault transfers.

Idle

Transfers are enabled and no transfer is in progress.

∘ In-Sync

The data in the two volumes in the synchronous relationship are synchronized.

· Out-of-Sync

The data in the destination volume is not synchronized with the source volume.

· Preparing

SnapMirror transfers are enabled. The volume is currently in the pre-transfer phase for incremental SnapVault transfers.

Queued

SnapMirror transfers are enabled. No transfers are in progress.

#### Quiesced

SnapMirror transfers are disabled. No transfer is in progress.

## · Quiescing

A SnapMirror transfer is in progress. Additional transfers are disabled.

## Transferring

SnapMirror transfers are enabled and a transfer is in progress.

#### Transitioning

The asynchronous transfer of data from the source to the destination volume is complete, and the transition to synchronous operation has started.

## Waiting

A SnapMirror transfer has been initiated, but some associated tasks are waiting to be queued.

## Relationship Type

Displays the relationship type used to replicate a volume. Relationship types include:

- · Asynchronous Mirror
- Asynchronous Vault
- StrictSync
- Sync

## Source SVM

Displays the name of the source SVM.

If the message Resource-key not discovered is displayed, this might indicate that the SVM exists on the cluster but has not yet been added to the Unified Manager inventory, or that the SVM was created after the cluster's last refresh. You must ensure that the SVM exists, or perform a rediscovery on the cluster to refresh the list of resources.

You can move your pointer over the source SVM to view information such as the cluster, volume type, protocols allowed, and spaced used. You can view more details about the SVM by clicking on the SVM name.

#### Source Volume

Displays the source volume being protected. You can view more details about the source volume by clicking the source volume name.

If the message Resource-key not discovered is displayed, this might indicate that the volume exists on the cluster but has not yet been added to the Unified Manager inventory, or that the volume was created after the cluster's last refresh. You must ensure that the volume exists, or perform a rediscovery on the cluster to refresh the list of resources.

#### Destination SVM

Displays the name of the destination SVM.

You can move your pointer over the destination SVM to view information such as the cluster, volume type, protocols allowed, and space used. You can view more details about the SVM by clicking on the SVM name.

#### Destination Volume

Displays the name of the destination volume.

You can move the pointer over a volume to view information such as the aggregate containing the volume, qtree quota overcommitted space, status of the last volume move operation, and space allocated in the volume. You can also view the details of related objects such as the SVM to which the volume belongs, the aggregate to which the volume belongs, and all the volumes that belong to this aggregate.

## Lag Duration

Displays the amount of time that the data on the mirror lags behind the source.

The lag duration should be close to, or equal to, 0 seconds for StrictSync relationships.

### Last Successful Update

Displays the time of the last successful SnapMirror or SnapVault operation.

The last successful update is not applicable for synchronous relationships.

#### Last Transfer Duration

Displays the time taken for the last data transfer to complete.

The transfer duration is not applicable for StrictSync relationships because the transfer should be simultaneous.

#### Last Transfer Size

Displays the size, in bytes, of the last data transfer.

The transfer size is not applicable for StrictSync relationships.

## Relationship Health

Displays the relationship heath of the cluster.

#### Relationship State

Displays the the mirror state of the SnapMirror relationship.

#### Unhealthy Reason

The reason the relationship is in an unhealthy state.

#### Source Cluster

Displays the name of the source cluster for the SnapMirror relationship.

#### Source Node

Displays the name of the source node for the SnapMirror relationship.

#### Destination Cluster

Displays the name of the destination cluster for the SnapMirror relationship.

#### Destination Node

Displays the name of the destination node for the SnapMirror relationship.

## Transfer Priority

Displays the priority at which a transfer runs. The transfer priority is Normal or Low. Normal priority transfers are scheduled before low priority transfers.

The transfer priority is not applicable for synchronous relationships because all transfers are treated with the same priority.

## Policy

Displays the protection policy for the volume. You can click the policy name to view details associated with that policy, including the following information:

#### Transfer priority

Specifies the priority at which a transfer runs for asynchronous operations. The transfer priority is Normal or Low. Normal priority transfers are scheduled before low priority transfers. The default is Normal.

#### Ignore access time

Applies only to SnapVault relationships. This specifies whether incremental transfers ignore files which have only their access time changed. The values are either True or False. The default is False.

### When Relationship is Out of Sync

Specifies the action ONTAP performs when a synchronous relationship is not able to be synchronized. StrictSync relationships will restrict access to the primary volume if there is a failure to synchronize with the secondary volume. Sync relationships do not restrict access to the primary if there is a failure to synchronize with the secondary.

#### · Tries limit

Specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is 8.

#### Comments

Provides a text field for comments for specific to the selected policy.

#### SnapMirror label

Specifies the SnapMirror label for the first schedule associated with the Snapshot copy policy. The SnapMirror label is used by the SnapVault subsystem when you back up Snapshot copies to a SnapVault destination.

#### Retention settings

Specifies how long backups are kept, based on the time or the number of backups.

## Actual Snapshot copies

Specifies the number of Snapshot copies on this volume that match the specified label.

## Preserve Snapshot copies

Specifies the number of SnapVault Snapshot copies that are not deleted automatically even if the maximum limit for the policy is reached. The values are either True or False. The default is False.

## Retention warning threshold

Specifies the Snapshot copy limit at which a warning is sent to indicate that the maximum retention limit is nearly reached.

#### Schedule

Displays the name of the protection schedule assigned to the relationship. You can click the schedule name to view details about the schedule.

The schedule is not applicable for synchronous relationships.

## Version Flexible Replication

Displays either Yes, Yes with backup option, or None.

# Protection/Volume Transfer Status (Historical) page

The Protection/Volume Transfer Status (Historical) page enables you to analyze the volume transfer trends over a period of time. This page also displays whether the volume transfer was a success or a failure.

Use the **Export** button to export the details of all the monitored volumes to a comma-separated values (.csv) file.

This page displays information for volumes in asynchronous relationships only - volumes in synchronous relationships are not shown.

### Source Cluster

Displays the source cluster name.

#### Source SVM

Displays the storage virtual machine (SVM) name.

#### Source Volume

Displays the source volume name.

### Destination Cluster

Displays the destination cluster name.

#### Destination SVM

Displays the destination SVM name.

#### Destination Volume

Displays the destination volume name.

## Operation Result

Displays whether volume transfer was successful.

#### Transfer Start Time

Displays the volume transfer start time.

#### Transfer End Time

Displays the volume transfer end time.

#### Transfer Duration

Displays the time taken (in hours) to complete the volume transfer.

#### Transfer Size

Displays the size (in MB) of the transferred volume.

## Operation Type

Displays the type of volume transfer.

# Protection/Volume Transfer Rate (Historical) page

The Protection/Volume Transfer Rate (Historical) page enables you to analyze the amount of data volume that is transferred on a day-to-day basis. This page also provides details about daily volume transfers and the time required to complete the transfer operation.

Use the **Export** button to export the details of all the monitored volumes to a comma-separated values (.csv) file.

This page displays information for volumes in asynchronous relationships only - volumes in synchronous relationships are not shown.

#### Total Transfer Size

Displays the total size of the volume transfer in gigabytes.

# • Day

Displays the day on which the volume transfer was initiated.

# • End Time

Displays the volume transfer end time with date.
