Performing on-demand SnapMirror updates 1

Performing on-demand SnapMirror updates

You can perform SnapMirror incremental updates for all the volumes before the cutover operation to reduce the cutover time.

- You cannot perform on-demand SnapMirror updates when incremental data transfers are scheduled after baseline data copy and after precutover operation.
- This is an optional task.
 1. Click **Update Now** to perform a manual SnapMirror update.

The Transition Update dialog box is displayed, where you can choose to customize the number of SnapMirror transfers and throttle limit for this operation.

2. Select the **Customize the number of concurrent SnapMirror transfers and Throttle limit for this operation** check box to specify the number of SnapMirror data copy operations and throttle limit.
 - a. Enter the maximum number of concurrent SnapMirror transfers to run during transition.
 - b. Enter the percentage of available streams that the tool can use for SnapMirror transfers.

By default, the tool uses 50% of the available volume SnapMirror transfers.

- c. Enter the throttle limit to use the maximum bandwidth.

By default, the tool uses maximum throttle for configuration transition.

3. Click **Continue**.
