- *any* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

If the security type of the incoming request is AUTH\_NONE, read access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.
- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

#### **[*-rwrule* <authentication method>,...] - RW Access Rule**

This parameter modifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH\_SYS.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow write access to the

volume if the effective security type (determined from *rorule*) of that incoming request is CIFS NTLM.

- *any* - For an incoming request from a client matching the *clientmatch* criteria, allow write access to the volume regardless of the effective security type (determined from *rorule*) of that incoming request.

If the effective security type (determined from *rorule*) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the *clientmatch* criteria, allow write access to the volume as an anonymous user if the effective security type (determined from *rorule*) of that incoming request is none.
- *never* - For an incoming request from a client matching the *clientmatch* criteria, do not allow write access to the volume regardless of the effective security type (determined from *rorule*) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the *clientmatch* criteria, if the effective security type (determined by *rorule*) doesn't match any of the values listed in *rwrule* (as explained above), write access will be denied to that incoming request.

#### **[*-anon <text>*] - User ID To Which Anonymous Users Are Mapped**

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of *rorule* or *superuser* parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534, which is normally associated with the user name "nobody" or "nfsnobody" in Linux environments. NetApp appliances use 65534 as the user "pcuser", which is generally used for multiprotocol operations. Because of this difference, if using local files and NFSv4, the name string for users mapped to 65534 might not match. This discrepancy might cause files to be written as the user specified in the */etc/ldapd.conf* file on the client (Linux) or */etc/default/nfs* file (Solaris), particularly when using multiprotocol (CIFS and NFS) on the same datasets. The following notes apply to the use of this parameter:

- To disable access by any client with a user ID of 0, specify a value of 65535 which is associated with the user nobody.

#### **[*-superuser <authentication method>,...*] - Superuser Security Types**

This parameter specifies a security type for superuser access to files. The default setting of this parameter is *none*. Possible values include the following:

- *sys* - For an incoming request from a client matching the *clientmatch* criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from *rorule*) of that incoming request is AUTH\_SYS.
- *krb5* - For an incoming request from a client matching the *clientmatch* criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from *rorule*) of that incoming request is Kerberos v5.
- *krb5i* - For an incoming request from a client matching the *clientmatch* criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from *rorule*) of that incoming request is Kerberos v5 with integrity service.
- *krb5p* - For an incoming request from a client matching the *clientmatch* criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from *rorule*) of that

incoming request is Kerberos v5 with privacy service.

- *ntlm* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.
- *any* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

#### **[*-allow-suid* {*true*|*false*}] - Honor SetUID Bits in SETATTR**

This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is *true*.

#### **[*-allow-dev* {*true*|*false*}] - Allow Creation of Devices**

This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is *true*.

#### **[*-ntfs-unix-security-ops* {*ignore*|*fail*}] - NTFS Unix Security Options (privilege: advanced)**

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (with value *fail*) or allowed (with value *ignore*) when the request originates from an NFS client. The default setting is *fail*. This parameter is only used if you set the NTFS UNIX security option for the Vserver to *use\_export\_policy*; otherwise, it has no effect.

#### **[*-chown-mode* {*restricted*|*unrestricted*}] - Change Ownership Mode (privilege: advanced)**

This parameter specifies who is authorized to change the ownership mode of a file. The default setting is *restricted*. This parameter is only used if you set the change ownership mode option for the Vserver to *use\_export\_policy*; otherwise, it has no effect. The allowed values are :

- *restricted* - Only root user can change the ownership of the file.
- *unrestricted* - Non-root users may change file ownership provided the on-disk permissions allow the operation.

## **Examples**

The following example modifies the export rule with index number 3 in an export policy named *default\_expolicy* on a Vserver named *vs0*. The rule is modified to match any clients in the netgroups named *group1* or *group2* to enable NFSv2 and CIFS support, to enable read-only access by any matching client, to require authentication

by NTLM or Kerberos 5 for read-write access, and to enable suid and sgid access.

```
cluster1::> vsserver export-policy rule modify -vsserver vs0 -policyname
default_expolicy -ruleindex 3 -protocol "nfs2,cifs"
-clientmatch "@group1, @group2" -rorule any -rwrule "ntlm,krb5" -allow
-suid true
```

## vsserver export-policy rule remove-clientmatches

Remove list of clientmatch strings from an existing rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsserver export-policy rule remove-clientmatches` command removes a list of strings from the `clientmatch` field of a specified export rule in a policy. This command only operates on the `clientmatch` field; to modify other fields in a rule use the `vsserver export-policy modify` command.

## Parameters

### **-vsserver <vsserver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

### **-policyname <export policy name> - Policy Name**

This parameter specifies the name of the export policy containing the export rule from which you want to remove `clientmatch` strings.

### **-ruleindex <integer> - Rule Index**

This parameter specifies the index number of the export rule from which you want to remove `clientmatch` strings. To view a list of rules with their index numbers, use the [vsserver export-policy rule show](#) command.

### **-clientmatches <text> - List of Clientmatch Strings to Remove**

This parameter specifies list of the match strings specifying the client or clients to remove from the export rule. Match strings are removed from the `clientmatch` field if the match string is identical to one of the elements in the `clientmatches` list. If all match strings are removed from the `clientmatch` field the entire export rule is deleted. You can specify the match string in any of the following formats:

- As a hostname; for instance, `host1`
- As an IPv4 address; for instance, `10.1.12.24`
- As an IPv6 address; for instance, `fd20:8b1e:b255:4071::100:1`
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, `10.1.12.0/24`
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance,

fd20:8b1e:b255:4071::/64

- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

## Examples

The following example removes match strings "2.2.2.2" and "3.3.3.3" from the clientmatch field of the export rule with index number 3 in an export policy named default\_expolicy on a Vserver named vs0.

```
cluster1::> vserver export-policy rule remove-clientmatches -vserver vs0  
-policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

## Related Links

- [vserver export-policy rule show](#)

## vserver export-policy rule setindex

Move a rule to a specified index

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy rule setindex` command modifies the index number of the specified export rule. If the new index number is already in use, the command reorders the list to accommodate it. If the existing index is given a higher index number (that is, later in the list), the command decrements the index numbers of rules between the moved rule and moved-to rule; otherwise, the command increments the index numbers between the moved-to rule and the existing rule.

You can use the [vserver export-policy rule show](#) command to view a list of rules with their index numbers.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

**-policyname <export policy name> - Policy Name**

This parameter specifies the export policy that contains the rule whose index number you want to modify.

**-ruleindex <integer> - Rule Index**

This parameter specifies the index number of the rule that you want to move.

**-newruleindex <integer> - Index**

This parameter specifies the new index number for the rule.

## Examples

The following example changes the index number of a rule at index number 5 to index number 3 in an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule setindex -vserver vs0  
-policyname read_only_policy -ruleindex 5 -newruleindex 3
```

## Related Links

- [vserver export-policy rule show](#)

## vserver export-policy rule show

Display a list of rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy rule show` command displays information about export rules. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Vserver name
- Export policy name
- Export rule index number
- Access protocol
- Client match
- Read-only access rule
- Read-write access rule

To display detailed information about a specific export rule, run the command with the `-vserver` , `-policyname` , and `-ruleindex` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Anonymous ID
- Superuser security type
- Whether set user ID (suid) and set group ID (sgid) access is enabled
- Whether creation of devices is enabled
- NTFS security settings
- Change ownership mode

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about export rules that have a read-write rule value of never, run the command with the `-rwrule never` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the `-policyname` parameter, and the `-ruleindex` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified Vserver.

**[-policyname <export policy name>] - Policy Name**

If you specify this parameter, the `-vserver` parameter, and the `-ruleindex` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules on the specified policy.

**[-ruleindex <integer>] - Rule Index**

If you specify this parameter, the `-vserver` parameter, and the `-policyname` parameter, the command displays detailed information about the specified export rule. If you specify this parameter by itself, the command displays information only about the export rules that have the specified index number.

**[-protocol <Client Access Protocol>,...] - Access Protocol**

If you specify this parameter, the command displays information only about the export rules that have the specified access protocol or protocols. Possible values include the following:

- *any* - Any current or future access protocol
- *nfs* - Any current or future version of NFS
- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as *any*, you cannot specify any other protocols in the list.

**[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains**

If you specify this parameter, the command displays information only about the export rules that have a `clientmatch` list containing all of the strings in the specified client match. You can specify the match as a list of strings in any of the following formats:

- As a hostname; for instance, `host1`
- As an IPv4 address; for instance, `10.1.12.24`
- As an IPv6 address; for instance, `fd20:8b1e:b255:4071::100:1`
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, `10.1.12.0/24`
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, `fd20:8b1e:b255:4071::/64`

- As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0
- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

### **[-rorule <authentication method>,...] - RO Access Rule**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-only rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH\_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.
- *any* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

If the security type of the incoming request is AUTH\_NONE, read access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.
- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

### **[*-rwrule* <authentication method>,...] - RW Access Rule**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified read-write rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH\_SYS.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos 5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.
- *any* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.
- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

### **[*-anon* <text>] - User ID To Which Anonymous Users Are Mapped**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified anonymous ID.

### **[*-superuser* <authentication method>,...] - Superuser Security Types**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified superuser security type. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH\_SYS.

- *krb5* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.
- *any* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.
- *never* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user regardless of the effective security type (determined from rorule) of that incoming request.

Only export rules that were created in an earlier release can have the superuser parameter set to the security type *never*

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

#### **`[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR`**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for set user ID (suid) and set group ID (sgid) access.

#### **`[-allow-dev {true|false}] - Allow Creation of Devices`**

If you specify this parameter, the command displays information only about the export rule or rules that have the specified setting for the creation of devices.

#### **`[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)`**

If you have specified this parameter for a particular export policy rule, then the command displays

information about the UNIX security options that apply to that export policy rule. The setting can either prohibit (with value *fail*) or allow (with value *ignore*) UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS client. If the Vserver NTFS UNIX security option is set to fail or allow for the Vserver, then this parameter is overridden.

**`[-ntfs-unix-security-ops-vs {fail|ignore|use_export_policy}]` - Vserver NTFS Unix Security Options (privilege: advanced)**

If you specify this parameter, the command displays information about the UNIX security options that apply to all volumes in this Vserver. The setting can prohibit (with value *fail*) or allow (with value *ignore*) UNIX-type permissions changes on NTFS (Windows) volumes when the request originates from an NFS client, or you can set it to *use\_export\_policy*. If you set this parameter to *fail* or *allow*, this parameter overrides the individual UNIX security options set for the export policy rules. If you set this parameter to *use\_export\_policy*, the UNIX security options associated with the respective export policy rule is used.

**`[-chown-mode {restricted|unrestricted}]` - Change Ownership Mode (privilege: advanced)**

If you have specified this parameter for a particular export policy rule, then the command displays information about the change ownership mode that applies to that export-policy rule. The setting can either allow only the root (with value *restricted*) or all users (with value *unrestricted*) to change file ownership provided the on-disk permissions allow the operation. If the Vserver change ownership mode is set to *restricted* or *unrestricted* for the Vserver, then this parameter is overridden.

**`[-chown-mode-vs {restricted|unrestricted|use_export_policy}]` - Vserver Change Ownership Mode (privilege: advanced)**

If you specify this parameter, the command displays information about the change ownership mode that applies to all volumes in this Vserver. The setting can allow only the root (with value *restricted*) or all users (with value *unrestricted*) to change ownership of the files that they own, or you can set it to *use\_export\_policy*. If you set this parameter to *restricted* or *unrestricted*, this parameter overrides the individual change ownership mode set for the export policy rules. If you set this parameter to *use\_export\_policy*, the change ownership mode associated with the respective export policy rule is used.

## Examples

The following example displays information about all export rules:

```
cluster1::> vsriver export-policy rule show
```

| Policy       | Rule                 | Access   | Client                  | RO |
|--------------|----------------------|----------|-------------------------|----|
| Vserver Name | Index                | Protocol | Match                   |    |
| vs0          | default_expolicy 1   | any      | 0.0.0.0/0,::0/0         |    |
| vs0          | read_only_expolicy 2 | any      | 0.0.0.0/0               |    |
| vs1          | default_expolicy 1   | any      | 10.10.10.10,11.11.11.11 |    |
| vs1          | test_expolicy 1      | any      | 0.0.0.0/0               |    |

4 entries were displayed.

## vsriver fcp commands

### vsriver fcp create

Create FCP service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command creates an FCP service for a Vserver. An FCP service must be licensed before you can manage FCP services. If the FCP service is not licensed, the FCP command returns an error.

When you create an FCP service on a Vserver, the Vserver has the following configuration defaults:

- The administrative status of the FCP service is *up*.
- The FCP command automatically generates a unique World Wide Node Name (WWNN).

#### Parameters

**-vsriver <Vserver Name> - Vserver Name**

Specifies the Vserver for the FCP service.

**[-target-name <text>] - Target Name (privilege: advanced)**

The FCP World Wide Node Name (WWNN) for the service. All FCP LIFs in the Vserver will share the specified WWNN. The format for a WWNN is "XX:XX:XX:XX:XX:XX:XX:XX" where X is a hexadecimal digit.

Unless the *force* option is also provided, the specified WWNN must be within one of the following vendor registered namespaces:

- 2X:XX:00:a0:98:XX:XX:XX

- 2X:XX:00:a0:b8:XX:XX:XX
- 2X:XX:d0:39:ea:XX:XX:XX

The user must ensure that the target name is not in use elsewhere outside the cluster. ONTAP cannot verify that the target name is unique outside the cluster if ONTAP did not generate the target name.

#### **[`-status-admin {down|up}`] - Administrative Status**

Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to *up*, the FCP service will accept login requests from FCP initiators. If you set this parameter to *down*, FCP initiators will not be allowed to log in.

#### **[`-f, -force <true>`] - Force (privilege: advanced)**

Allows you to specify a World Wide Node Name outside one of the known vendor registered namespaces. If you use this parameter without a value, it is set to *true*, and the command does not error when the specified WWNN is outside one of the vendor registered namespaces.

### **Examples**

```
cluster1::> vservers fcp create -vserver vs_1
```

Creates an FCP service on Vserver *vs\_1*.

### **vservers fcp delete**

Delete FCP service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

Deletes an FCP service of a Vserver. Before you can delete an FCP service, the administration status must be *down*. Use the [vservers fcp modify](#) command to change the administration status.

### **Parameters**

#### **`-vserver <Vserver Name>` - Vserver Name**

Specifies the Vserver for the FCP service.

### **Examples**

```
cluster1::> vservers fcp delete -vserver vs_1
```

Deletes the FCP service on Vserver *vs\_1*.

### **Related Links**

- [vservers fcp modify](#)

## vserver fcp modify

### Modify FCP service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command modifies an FCP service configuration on a Vserver.

#### Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the FCP service.

**[-target-name <text>] - Target Name (privilege: advanced)**

The FCP World Wide Node Name (WWNN) for the service. All FCP LIFs in the Vserver will share the specified WWNN. The format for a WWNN is "XX:XX:XX:XX:XX:XX:XX:XX" where X is a hexadecimal digit.

Unless the *force* option is also provided, the specified WWNN must be within one of the following vendor registered namespaces:

- 2X:XX:00:a0:98:XX:XX:XX
- 2X:XX:00:a0:b8:XX:XX:XX
- 2X:XX:d0:39:ea:XX:XX:XX

The user must ensure that the target name is not in use elsewhere outside the cluster. ONTAP cannot verify that the target name is unique outside the cluster if ONTAP did not generate the target name.

**[-status-admin {down|up}] - Administrative Status**

Specifies the administrative status of the FCP service of a Vserver. If you set this parameter to *up*, the FCP service accepts login requests from FCP initiators. If you set this parameter to *down*, FCP initiators cannot log in.

**[-f, -force <true>] - Force (privilege: advanced)**

Allows you to specify a World Wide Node Name outside one of the known vendor registered namespaces. If you use this parameter without a value, it is set to *true*, and the command does not error when the specified WWNN is outside one of the vendor registered namespaces.

#### Examples

```
cluster1::> vserver fcp modify -vserver vs_1 -status-admin down
```

Changes the administration status of the FCP service on Vserver *vs\_1* to *down*.

## vserver fcp show

### Display FCP service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Displays the current status of the FCP service in a cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the FCP services that match the Vserver that you specify.

**[-target-name <text>] - Target Name**

Use this parameter to display the FCP service that matches the target name that you specify.

**[-status-admin {down|up}] - Administrative Status**

Use this parameter to display the FCP services that match the administrative status that you specify.

## Examples

```
cluster1::> vsriver fcp show
```

| server | Target Name             | Status<br>Admin |
|--------|-------------------------|-----------------|
| s0     | 20:00:00:a0:98:0c:b0:eb | up              |
| s2     | 20:01:00:a0:98:0c:b0:eb | up              |

entries were displayed.

Displays the FCP configuration for all the Vservers in the cluster.

## vsvrrvr fcp start

Starts the FCP service

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *admin* privilege level.

## Description

This command starts the FCP service of a Vsvrrvr. When you start the FCP service, the logical interfaces are brought online.

You must have a license before you can start the FCP service. Use [system license add](#) to enable the FCP license.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the FCP service.

## Examples

```
cluster1::> vsriver fcp start -vserver vs_1
(vserver fcp start)
```

Starts FCP service for Vserver *vs\_1* .

## Related Links

- [system license add](#)

## vserver fcp stop

Stops the FCP service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command stops the FCP service of a Vserver. When you stop the FCP service, the operation status of all FCP logical interfaces in the Vserver will be *down* .

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the FCP service.

## Examples

```
cluster1::> vsriver fcp stop -vserver vs_1
(vserver fcp stop)
```

Stops FCP service on Vserver *vs\_1* .

## vserver fcp initiator show

Display FCP initiators currently connected

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays information about FCP initiators that are currently logged in.

If you do not specify a Vserver, the command displays all initiators logged into all FCP Vservers within a cluster. If you specify a Vserver but not a logical interface, the command displays information about all initiators connected to all logical interfaces within the specified Vserver.

If an initiator belongs to an initiator group or has a World Wide Port Name (WWPN) alias, the command displays this information.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the FCP initiators logged into the Vserver that you specify.

**[-lif <lif-name>] - Logical Interface**

Use this parameter to display the FCP initiators that match the logical interfaces that you specify.

**[-wwpn <FC WWN>] - WWPN**

Use this parameter to display the FCP initiators that matches the World Wide Port Name (WWPN) that you specify.

**[-wwnn <FC WWN>] - WWNN**

Use this parameter to display the FCP initiator that matches the World Wide Node Name (WWNN) that you specify.

**[-port-address <Hex Integer>] - Port Address**

Use this parameter to display FCP initiators that match the port address that you specify.

**[-alias <text>,...] - Initiator WWPN Alias**

Use this parameter to display the FCP initiator that matches the alias name that you specify.

**[-igroup <text>,...] - Igroup Name**

Use this parameter to display the FCP initiator that matches the initiator group that you specify.

**[-data-protocol {fcp|fc-nvme}] - Data Protocol**

Use this parameter to display the FCP initiator that matches the data protocol that you specify.

## Examples

```
cluster1::> vsriver fcp initiator show
```

| Logical<br>Vserver | Initiator<br>Interface | Initiator<br>WWNN       | Initiator<br>WWPN       | Igroup  |
|--------------------|------------------------|-------------------------|-------------------------|---------|
| vs1                | vs1.fcp                | 2f:a2:00:a0:98:0b:56:13 | 2f:a2:00:a0:98:0b:56:15 | igroup1 |

Displays information regarding all logged in FCP initiators.

**vsriver fcp interface show**

Display configuration information for an FCP interface

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command displays FCP logical interface information. If you do not specify a *Vserver*, the command displays all of the FCP data interfaces of a cluster.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter with other options to display information about FCP logical interfaces scoped to the specified *Vserver*.

**[-lif <lif-name>] - Logical Interface**

Use this parameter to display FCP logical interfaces that match the names of logical interfaces that you specify. You can provide a partial logical interface name, and press tab to complete the name or the closest match.

**[-wwpn <text>] - WWPN**

Use this parameter to display FCP logical interfaces that match the World Wide Port Name (WWPN) that you specify.

**[-wwnn <text>] - WWNN**

Use this parameter to display FCP logical interfaces that match the World Wide Node Name (WWNN) that you specify.

### **[-status-admin {up|down}] - Administrative Status**

Specifies the configured status of the FCP logical interface. If you set this parameter to *up* the command displays all FCP logical interfaces with the administrative status of *up*. If you set this parameter to *down* the command displays all the FCP logical interfaces with the administrative status of *down*.

### **[-status-oper {up|down}] - Operational Status**

Specifies the current status of the FCP logical interface. If you set this parameter to *up* the command displays all the FCP logical interfaces with the operational status of *up*. If you set this parameter to *down* the command displays all the FCP logical interfaces with the operational status of *down*.

### **[-status-extended <text>] - Extended Status**

Use this parameter to display more detailed information on the status of the FCP logical interface that you specify.

### **[-port-address <Hex Integer>] - Host Port Address**

Use this parameter to display FCP logical interfaces that match the host port address that you specify.

### **[-curr-node <nodename>] - Current Node**

Use this parameter to display FCP logical interfaces that are on the node that you specify.

### **[-curr-port {<netport>|<ifgrp>}] - Current Port**

Use this parameter to display FCP logical interfaces that are on the port that you specify.

### **[-is-home {true|false}] - Is Home**

Specifies whether the node hosting the FCP interface is the initially configured node. If you use this command without using this parameter, it is set to *true*, and the command displays all FCP interfaces that are on the initially configured node.

### **[-relative-port-id <integer>] - Relative Port ID**

Use this parameter to display FCP logical interfaces that match the relative target port ID that you specify. The system assigns each LIF and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

## **Examples**

```
cluster1::> vserver fcp interface show
```

| Logical | Status    |            |                         | Current | Current Is |
|---------|-----------|------------|-------------------------|---------|------------|
| Vserver | Interface | Admin/Oper | WWPN                    | Node    | Port       |
| Home    |           |            |                         |         |            |
| -----   | -----     | -----      | -----                   | -----   | -----      |
| vs1     | vs1.fcp   | up/down    | 2f:a2:00:a0:98:0b:56:13 | node1   | 0c         |
| true    |           |            |                         |         |            |

Displays all FCP interface information.

## vserver fcp nameserver show

Display FCP fabric name server entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command show entries in the fabric name server database.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to select the Vservers that contain FCP LIFs.

**[-lif <text>] - LIF Name**

Use this parameter to select the FCP LIFs.

**[-port-id <Hex Integer>] - Port Identifier**

Use this parameter to select the assigned port identifier of the LIF.

**[-unzoned <true>] - Show unzoned name server entries**

Use this parameter to show unzoned name server information.

**[-port-type <text>] - Port Type**

Use this parameter to select the port type of the LIF.

**[-port-wwn <text>] - Port WWN**

Use this parameter to select World Wide Port Name (WWPN) of the LIF.

**[-fabric-port-wwn <text>] - Fabric Port WWN**

Use this parameter to select the fabric World Wide Port Name (WWPN) of the lif.

**[-node-wwn <text>] - Node WWN**

Use this parameter to select the World Wide Node Name (WWNN) of the LIF.

**[-service-class <text>] - Service Class**

Use this parameter to select the registered class of services as defined in the FC-FS standard.

**[-fc4-type <text>] - FC4 Type**

Use this parameter to select the registered FC4 type.

## **[*-switch-port* <text>] - Switch Port**

Use this parameter to select the name of switch port connected to target array.

## **Examples**

```
cluster1::> vsriver fcp nameserver show
```

|      |                           |                         | Port    | Port   |
|------|---------------------------|-------------------------|---------|--------|
| FC4  | Vserver:Lif               | Node WWN, Port WWN      | Id      | Type   |
| Type |                           |                         |         |        |
|      | -----                     | -----                   | -----   | -----  |
|      | vs1 :lif1                 | 20:00:00:a0:98:55:73:38 |         |        |
|      |                           | 20:01:00:a0:98:55:73:38 | 8130561 | N-Port |
| FCP  |                           | 20:00:00:90:fa:73:12:dd |         |        |
|      |                           | 10:00:00:90:fa:73:12:dd | 8194560 | N-Port |
|      | vs1 :lif2                 | 20:00:00:90:fa:94:29:ee |         |        |
|      |                           | 10:00:00:90:fa:94:29:ee | 8201984 | N-Port |
| FCP  |                           |                         |         |        |
|      | 3 entries were displayed. |                         |         |        |

## **vsriver fcp ping-igroup show**

### **Ping FCP by Igroup**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command performs a connectivity check (ping) between the FCP initiators of an igroup and the FCP LIFs for which they are configured.

### **Parameters**

**{ [*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**| [*-instance* ] }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-vserver* <Vserver Name>] - Vserver**

Use this parameter to select the Vservers that contain initiators and FCP LIFs.

### **[-igroup <text>] - Igroup Name**

Use this parameter to select the FCP initiators that belong to the specified igroup and FCP LIFs that belong to the portset that is bound to the igroup. If the igroup is not bound to a portset, then the default portset (all FCP LIFs in the Vserver), is used.

### **[-wwpn <text>] - FCP initiator WWPN**

Use this parameter to select the FCP initiator WWPN.

### **[-lif <text>] - LIF Name**

Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

### **[-portset <text>] - Portset**

Use this parameter to select igroups bound to the specified portset.

### **[-node <nodename>] - Node**

Use this parameter to select the nodes that contain the specified FCP LIFs.

### **[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status**

Use this parameter to select the status of FCP ping command.

### **[-ext-status {logged-in|not-logged\_in|not-in-fabric|not-in-same-zone|fabric-info-not-available}] - Extended Status**

Use this parameter to select the extended status of FCP ping command.

### **[-check-fabric <true>] - Query Fabric Records (privilege: advanced)**

Use this parameter to query the unzoned name server for the FCP initiator WWPN.

## **Examples**

```
cluster1::> vservers fcp ping-igroup show
      Igroup          Node          Logical   Ping
Extended
Vserver  Name          WWPN          Name          Interface Status
Status
-----
vserver_1
      igroup_1      c0:03:ff:e4:70:06:00:e4
                        node_1
                        lif_1      reachable  wwpn-
logged-in
      igroup_1      c0:03:ff:e4:70:06:00:e6
                        node_2
                        lif_2      not-zoned  -
2 entries were displayed.
```

## vserver fcp ping-initiator show

### Ping FCP initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command performs a connectivity check (ping) between FCP initiators and FCP LIFs.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to select the Vservers that contain FCP initiators and FCP LIFs.

**-wwpn <text> - Remote WWPN**

Use this parameter to select the remote WWPN (most likely, FCP initiator).

**[-lif <text>] - LIF Name**

Use this parameter to limit the test to a subset of the FCP LIFs available for the igroup.

**[-check-fabric <true>] - Query Fabric Records (privilege: advanced)**

Use this parameter to query the unzoned name server for the FCP initiator WWPN.

**[-node <nodename>] - Node**

Use this parameter to select the nodes that contain the specified FCP LIFs.

**[-status {unknown|reachable|not-reachable|not-zoned|cannot-ping-same-wwpn|fcp-service-busy|lif-is-down|zone-info-not-available}] - Ping Status**

Use this parameter to select the result of FCP ping command.

**[-ext-status {logged-in|not-logged\_in|not-in-fabric|not-in-same-zone|fabric-info-not-available}] - Extended Status**

Use this parameter to select the extended result of FCP ping command.

### Examples

```
cluster1::> vservers fcp ping-initiator show
```

| Vserver   | WWPN                    | Node Name | Logical Interface | Ping Status | Extended Status |
|-----------|-------------------------|-----------|-------------------|-------------|-----------------|
| vserver_1 | c0:03:ff:e4:70:06:00:e4 | node_1    | lif_1             | reachable   | wwpn-logged-in  |
|           | c0:03:ff:e4:70:06:00:e6 | node_2    | lif_2             | not-zoned   | -               |

2 entries were displayed.

## vservers fcp portname set

Assigns a new WWPN to a FCP adapter

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command assigns a new World Wide Port Name (WWPN) to a logical interface. The administration status of logical interface must be down before you can change the WWPN.

Use the [network interface modify](#) to change the administration status of the logical interface.

### Parameters

**-vserver <Vserver Name> - Vserver (privilege: advanced)**

Specifies the Vserver.

**-lif <lif-name> - Logical Interface (privilege: advanced)**

Specifies the logical interface to which you want to assign a new WWPN.

**-wwpn <text> - FCP Adapter WWPN (privilege: advanced)**

Specifies the WWPN that you want to change.

**[-f, -force <true>] - Force (privilege: advanced)**

Allows you to use a WWPN that is not in the format 2X:XX:0a:09:80:XX:XX:XX when set to true. If you use this parameter without a value, it is set to true, and the command does not prompt you when the WWNN does not follow this format.

### Examples

```
cluster1::*> vservers fcp portname set -vserver vs_1 -lif vs_1.fcp -wwpn
2f:a2:00:a0:98:0b:56:13
```

Sets a new WWPN for LIF vs\_1.fcp on Vserver vs\_1.

## Related Links

- [network interface modify](#)

## vserver fcp portname show

Display WWPN for FCP logical interfaces

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays a list of World Wide Port Names (WWPN) that are used by the FCP logical interfaces.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the Vserver name you specify.

**[-lif <lif-name>] - Logical Interface**

Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the logical interface that you specify. You can use wildcards in the logical interface to display a specific group of logical interfaces.

**[-wwpn <text>] - WWPN**

Use this parameter to display a list of FCP logical interfaces and their WWPNs that match the WWPN that you specify. You can use wildcards in the WWPN to display a specific group of WWPNs.

## Examples

```
cluster1::> vservers fcp portname show
```

| Vserver | Logical Interface | WWPN                    |
|---------|-------------------|-------------------------|
| vs_a    | vs_a.fcp          | 2f:a2:00:a0:98:0b:56:13 |
| vs_io1  | vs_io1.fcp        | 2f:9e:00:a0:98:0b:56:13 |
| vs_2    | lif2              | 2f:a3:00:a0:98:0b:56:13 |
| vs_2    | lif3              | 2f:a4:00:a0:98:0b:56:13 |
| vs_2    | lif4              | 2f:a5:00:a0:98:0b:56:13 |
| vs_2    | lif5              | 2f:a6:00:a0:98:0b:56:13 |
| vs_2    | vs_2.fcp          | 2f:9a:00:a0:98:0b:56:13 |
| vs1     | vs1.fcp           | 2f:9d:00:a0:98:0b:56:13 |
| vs1     | vs1.fcp2          | 2f:97:00:a0:98:0b:56:13 |

Displays the WWPNs for each FCP logical interface for all the Vservers in a cluster.

## vservers fcp topology show

Show FCP topology interconnect elements

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Show FCP topology interconnect elements

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to select the interconnect elements for the specified Vservers.

**[-lif <text>] - LIF Name**

Use this parameter to select the interconnect elements for the specified FCP LIFs.

**[-domain-id <integer>] - Domain Identifier**

Use this parameter to select the interconnect elements with the specified domain identifier

**[-logical-name <text>] - Logical Name**

Use this parameter to select the interconnect elements with the specified logical name

**[-vendor <text>] - Vendor**

Use this parameter to select the interconnect elements with the specified vendor

**[-release <text>] - Release**

Use this parameter to select the interconnect elements with the specified release

**[-wwn <text>] - World Wide Name**

Use this parameter to select the interconnect elements with the specified World Wide Name

**[-port-count <integer>] - Port Count**

Use this parameter to select the interconnect elements with the specified port count

**Examples**

```
cluster1::> vservers fcp topology show
Domain Logical
Port
Vserver Lif Name      Id      Name      WWN
Count

```

The example above show FCP topology interconnect information for the cluster.

## **vserver fcp wwn blacklist show**

Displays the blacklisted WWNs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

This command displays WWNs that have been blacklisted from re-use.

A blacklisted WWN is a WWN that is prohibited for use as either a fiber channel protocol service WWNN or a fiber channel data LIF WWPN.

### **Parameters**

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-wwn* <text>] - World Wide Name (privilege: advanced)**

Selects the blacklisted WWNs that match the parameter value.

**[*-vserver* <Vserver Name>] - Vserver Name (privilege: advanced)**

Selects the blacklisted WWNs that were previously assigned to the Vserver(s) that match the parameter value.

### **Examples**

```
cluster1::> vserver fcp wwn blacklist show
      WWN                               Vserver
-----
01:02:03:04:05:06:07:08 vs1
01:02:03:04:05:06:07:09 vs1
2 entries were displayed.
```

Displays the blacklisted WWNs.

## **vserver fcp wwpn-alias remove**

Removes an alias for a World Wide Port Name of an initiator.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command removes an alias from a World Wide Port Name (WWPN).

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

**{ -a, -alias <text>, ... - Initiator WWPN Alias**

Specifies the alias of the WWPN that you want to remove.

**| -w, -wwpn <FC WWN> - Initiator WWPN }**

Specifies the WWPN.

## Examples

```
cluster1::> vsriver fcp wwpn-alias remove -vserver vs_1 -wwpn  
2f:a0:00:a0:98:0b:56:13
```

On Vserver *vs\_1* , removes all the aliases on WWPN *2f:a0:00:a0:98:0b:56:13* .

```
cluster1::> vsriver fcp wwpn-alias remove -vserver vs_1 -alias my_alias
```

On Vserver *vs\_1* , removes the alias *my\_alias* .

## vserver fcp wwpn-alias set

Set an alias for a World Wide Port Name of an initiator that might login to the target.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command creates a new alias for a World Wide Port Name (WWPN). You can create multiple aliases for a WWPN, but you cannot use the same alias for multiple WWPNs.

An alias name is a case-sensitive name that must contain one to 32 characters. Spaces are not allowed.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

**-a, -alias <text> - Initiator WWPN Alias**

Specifies the alias of the WWPN.

### **-w, -wwpn <FC WWN> - Initiator WWPN**

Specifies the WWPN.

### **[-f, -force <true>] - Force**

Allows you to override a WWPN associated with an existing alias with a newly specified WWPN. If you use this parameter without a value, it is set to true, and the command does not prompt you when you override an existing alias.

## **Examples**

```
cluster1::> vservers fcp wwpn-alias set -vservers vs_1 -alias my_alias -wwpn
2f:a0:00:a0:98:0b:56:13
```

Sets the alias *my\_alias* for the WWPN *2f:a0:00:a0:98:0b:56:13*.

## **vservers fcp wwpn-alias show**

Displays a list of the WWPN aliases configured for initiators

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command displays aliases associated with World Wide Port Names (WWPN).

You can also use these commands to display WWPN aliases:

- [lun igroup show](#)
- [lun igroup create](#)
- [lun igroup add](#)
- [lun igroup remove](#)
- [vservers fcp show](#)

## **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vservers <Vserver Name>] - Vserver Name**

Use this parameter to display a list of WWPNs and the associated aliases that match the Vserver name that you specify.

### **[-a, -alias <text>] - Initiator WWPN Alias**

Use this parameter to display the WWPN that matches the alias that you specify.

### **[-w, -wwpn <FC WWN>] - Initiator WWPN**

Use this parameter to display a list of aliases that match the WWPN that you specify.

## **Examples**

```
cluster1::> vsserver fcp wwpn-alias show
      Initiator      Initiator
Vserver  WWPN              Alias
-----
vs1      2f:a0:00:a0:98:0b:56:13 my_alias
```

Displays the alias `my_alias` for the WWPN `2f:a0:00:a0:98:0b:56:13` on Vserver `vs1`.

# **vsserver fpolicy commands**

## **vsserver fpolicy disable**

Disable a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vsserver fpolicy disable` command disables an FPolicy policy for the specified Vserver.

## **Parameters**

### **-vsserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to disable an FPolicy policy.

### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy you want to disable.

## **Examples**

The following command disables an FPolicy policy.

```
cluster1::> vserver fpolicy show
```

| Vserver         | Policy Name | Sequence | Status |
|-----------------|-------------|----------|--------|
| Engine          |             |          |        |
| -----           | -----       | -----    | -----  |
| vs1.example.com | vs1_pol     | -        | off    |
| native          |             |          |        |
| vs2.example.com | vs2_pol     | 5        | on     |
| external        |             |          |        |

2 entries were displayed.

```
cluster1::> vserver fpolicy disable -vserver vs2.example.com -policy-name vs2_pol
```

```
cluster1::> vserver fpolicy show
```

| Vserver         | Policy Name | Sequence | Status |
|-----------------|-------------|----------|--------|
| Engine          |             |          |        |
| -----           | -----       | -----    | -----  |
| vs1.example.com | vs1_pol     | -        | off    |
| native          |             |          |        |
| vs2.example.com | vs2_pol     | -        | off    |
| external        |             |          |        |

2 entries were displayed.

## vserver fpolicy enable

### Enable a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy enable` command enables FPolicy policies for the specified Vserver and sets their sequence (priority). The sequence is used when multiple policies have subscribed to the same file access event. To modify the sequence number of a policy, the administrator must disable the policy (if it is enabled) and then use this command to enable it with the new sequence number. Policies that use the *native* engine configuration have a higher priority than policies for any other engine, regardless of the sequence number assigned to them.

Events on FlexGroup volumes do not notify the FPolicy server.

### Parameters

#### **-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to enable an FPolicy policy. The Vserver administrator can enable FPolicy policies created within the scope of the Vserver and can also

enable an FPolicy policy created by the cluster administrator. The cluster administrator can enable FPolicy policies for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

**-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy you want to enable.

**-sequence-number <integer> - Policy Sequence Number**

This parameter specifies the sequence number that is assigned to the policy.

**Examples**

The following command enables an FPolicy policy:

```
cluster1::> vservers fpolicy show
Vserver          Policy Name          Sequence  Status
Engine
-----
vs1.example.com  vs1_pol              -         off
native
vs2.example.com  vs2_pol              -         off
external
2 entries were displayed.
cluster1::> vservers fpolicy enable -vserver vs2.example.com -policy-name
vs2_pol -sequence-number 5

cluster1::> vservers fpolicy show
Vserver          Policy Name          Sequence  Status
Engine
-----
vs1.example.com  vs1_pol              -         off
native
vs2.example.com  vs2_pol              5         on
external
2 entries were displayed.
```

**vservers fpolicy engine-connect**

Establish a connection to FPolicy server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vservers fpolicy engine-connect` command connects an FPolicy server to a specified node. Connecting the FPolicy server to a node enables FPolicy processing, providing the FPolicy configuration is

complete. Before connecting an FPolicy server to a node, you must configure FPolicy by completing the following tasks:

- Create an FPolicy event
- Create an FPolicy external engine
- Create an FPolicy policy
- Create a scope for the FPolicy policy

-  The FPolicy event and external engine must be attached to the FPolicy policy.
-  The FPolicy policy should be enabled.

Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node that you want to connect to the FPolicy server. The value local specifies the current node.

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver that you want to connect to the specified FPolicy server using the specified FPolicy policy.

**-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that is attached to an external engine.

**-server <IP Address> - Server**

This parameter specifies the FPolicy server to which you want to connect the node. The specified server must be present in the external engine configuration of the above specified policy.

Examples

The following example connects an FPolicy server.

```
cluster1::> vserver fpolicy engine-connect -node FPolicy-01 -vserver
vs1.example.com -policy-name p -server 1.1.1.1
cluster1::> vserver fpolicy show
  FPolicy
Server-
  Vserver      Policy      Node      Server      status
type
-----
vs1.example.com p          FPolicy-01  1.1.1.1      connected
primary
```

# vserver fpolicy engine-disconnect

Terminate connection to FPolicy server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver fpolicy engine-disconnect` command disconnects an FPolicy server from a specified node.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node that you want to disconnect from the FPolicy server. The value `local` specifies the current node.

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver that you want to disconnect from the specified FPolicy server with the specified attached FPolicy policy.

**-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that is attached with an external engine.

**-server <IP Address> - Server**

This parameter specifies the FPolicy server you want to disconnect. The specified server must be present in the external engine configuration of the above specified FPolicy policy.

## Examples

The following example disconnects an FPolicy server.

```
cluster1::> vserver fpolicy engine-disconnect -node FPolicy-01 -vserver
vs1.example.com -policy-name p -server 1.1.1.1
cluster1::> vserver fpolicy show
  FPolicy
Server-
  Vserver      Policy      Node      Server      status
type
-----
-----
vs1.example.com p          FPolicy-01  1.1.1.1      disconnected
primary
```

# vserver fpolicy show-enabled

Display all enabled policies

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `vserver fpolicy show-enabled` command displays information about all enabled policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Priority

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies.

You can specify the `-instance` parameter to display information for all FPolicy policies in a list format.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver>] - Vserver`

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

`[-policy-name <Policy name>] - Policy Name`

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

`[-priority <text>] - Policy Priority`

If you specify this parameter, the command displays information only about the FPolicy policies with the policy priority that you specify.

Examples

The following example displays the information about enabled FPolicy policies on the cluster.

```
cluster1::> vserver fpolicy show-enabled
Vserver                Policy Name                Priority
-----
vs1.example.com        pol_native                native
vs1.example.com        pol_native2              native
vs1.example.com        pol1                     2
vs1.example.com        pol2                     4
```

## vserver fpolicy show-engine

### Display FPolicy server status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver fpolicy show-engine` command displays status information for all FPolicy external engines or displays status information only for FPolicy servers for a specified Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information for all FPolicy servers:

- Vserver name
- Node name
- FPolicy policy name
- FPolicy server IP Address
- FPolicy server status
- FPolicy server type

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy servers. You can specify specific parameters to display only information that matches those parameters. For instance, to display information only about all FPolicy servers (external engines) that are connected, run the command with the `-fields` parameter set to `server` and `-server-status`` parameter set to `connected`.

You can specify the `-instance` parameter to display all information for all policies in the list form.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about the FPolicy external engine attached to the specified node.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy server for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the FPolicy servers that are attached with the specified policy.

**[-server <IP Address>] - Server**

If you specify this parameter, the command displays information only about the FPolicy servers that you specify.

### **[-server-status <Status>] - Server Status**

If you specify this parameter, the command displays information only about the FPolicy servers that have the specified status.

### **[-server-type <Server Type>] - Server Type**

If you specify this parameter, the command displays information only about the FPolicy servers that have the specified server type.

### **[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Connected**

If you specify this parameter, the command displays information only about the FPolicy servers that have been connected since the specified time.

### **[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time FPolicy Server was Disconnected**

If you specify this parameter, the command displays information only about the FPolicy servers that have been disconnected since the specified time.

### **[-disconnect-reason <text>] - Reason for FPolicy Server Disconnection**

If you specify this parameter, the command displays information only about the FPolicy servers that are disconnected because of the specified reason.

### **[-disconnect-reason-id <integer>] - ID for FPolicy Server Disconnection**

If you specify this parameter, the command displays information about the FPolicy servers that are disconnected because of the specified disconnect reason ID. There is a unique ID associated with each disconnect reason, which can be used to identify the reason for FPolicy server disconnection.

### **[-session-id <text>] - Session ID**

If you specify this parameter, the command displays information about the FPolicy server that is connected with the specified session ID. There is a unique session ID associated with each connection to FPolicy server, which can be used to identify the established connection.

## **Examples**

This example displays information about all FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine
FPolicy
Server-
Vserver      Policy      Node      Server      status
type
-----
vs2.example.com vs2_pol      FPolicy-01  9.9.9.9      connected
primary
vs1.example.com vs1_pol      FPolicy-01  1.1.1.1      connected
primary
2 entries were displayed.
```

This example displays information only about all connected FPolicy servers (external engines).

```
cluster1::> vserver fpolicy show-engine -fields server -server-status
connected
node          vserver          policy-name server
-----
FPolicy-01 vs1.example.com vs1_pol      1.1.1.1
```

This example displays information about an FPolicy server.

```
cluster1::> vserver fpolicy show-engine -server 10.72.204.118 -instance
Node: fpol-01
Vserver: vserver_1.example.com
Policy: pol_cifs
Server: 10.72.204.118
Server Status: disconnected
Server Type: primary
Time FPolicy Server was Connected: -
Time FPolicy Server was Disconnected: 2/5/2013 05:06:22
Reason for FPolicy Server Disconnection: TCP Connection to FPolicy server
failed.
ID for FPolicy Server Disconnection: 9307
Session ID:
```

## vserver fpolicy show-passthrough-read-connection

Display connection status for FPolicy passthrough-read

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy show-passthrough-read-connection` command displays the status of the passthrough-read connection from all FPolicy servers. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. If you do not specify any parameters, the command displays following information about the passthrough-read connection from FPolicy servers:

- Vserver name
- FPolicy policy name
- Node name
- FPolicy server IP address
- Passthrough-read connection status

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields.

- Session ID of the control channel

- Time passthrough-read channel was connected
- Time passthrough-read channel was disconnected
- Reason for passthrough-read channel disconnection

You can specify the `-instance` parameter to display information for all passthrough-read connections in the list form.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about the passthrough-read connections on the specified node.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the passthrough-read connections for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the passthrough-read connections that are attached with the specified FPolicy policy.

**[-server <IP Address>] - Server**

If you specify this parameter, the command displays information only about the passthrough-read connections from the specified FPolicy server.

**[-control-session-id <text>] - Session ID of the Control Channel**

If you specify this parameter, the command displays information only about the passthrough-read connections that are connected with the specified control session ID. The passthrough-read connection is attached to a control connection that has a unique control session ID.

**[-server-status <Status of fpolicy passthrough-read connection>] - Server Status**

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified status.

**[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Connected**

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified connection time.

**[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time Channel Was Disconnected**

If you specify this parameter, the command displays information only about the passthrough-read connections that have the specified disconnection time.

**[-disconnect-reason <Reason for fpolicy passthrough-read disconnection>] - Reason for Disconnection**

If you specify this parameter, the command displays information only about the passthrough-read connections that are disconnected because of the specified disconnect reason.

**Examples**

This example displays information about passthrough-read connections from all FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection
```

| Vserver         | Policy Name | Node       | FPolicy Server | Server Status |
|-----------------|-------------|------------|----------------|---------------|
| vs2.example.com | pol_cifs_2  | FPolicy-01 | 2.2.2.2        | disconnected  |
| vs1.example.com | pol_cifs_1  | FPolicy-01 | 1.1.1.1        | connected     |

2 entries were displayed.

This example displays information about passthrough-read connections from all connected FPolicy servers.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -server -status connected
```

| Vserver         | Policy Name | Node       | FPolicy Server | Server Status |
|-----------------|-------------|------------|----------------|---------------|
| vs1.example.com | pol_cifs_1  | FPolicy-01 | 1.1.1.1        | connected     |

This example displays information about passthrough-read connections from FPolicy servers configured in an FPolicy policy.

```
cluster1::> vserver fpolicy show-passthrough-read-connection -policy-name pol_cifs_1 -instance
```

Node: FPolicy-01

Vserver: vs1.example.com  
Policy: pol\_cifs\_1  
Server: 2.2.2.2

## vserver fpolicy show

Display all policies with status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy show` command displays status information about all FPolicy policies in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Sequence number
- Status

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies.

You can specify the `-instance` parameter to display information for all FPolicy policies in a list format.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

**[-sequence-number <integer>] - Sequence Number**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified sequence-number.

**[-status {on|off}] - Status**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified status.

**[-engine <Engine name>] - FPolicy Engine**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

## Examples

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy show` command.

```
cluster1::> vserver fpolicy show
```

| Status | Vserver Engine                  | Policy Name            | Sequence Number |
|--------|---------------------------------|------------------------|-----------------|
| off    | FPolicy eng1<br>vs1.example.com | cserver_policy<br>vlp1 | -               |
| off    | eng2<br>vs1.example.com         | vlp2                   | -               |
| off    | native<br>vs1.example.com       | vlp3                   | -               |
| off    | native<br>vs1.example.com       | cserver_policy         | -               |
| on     | eng1<br>vs2.example.com         | vlp1                   | 3               |
| on     | eng3<br>vs2.example.com         | vlp2                   | 1               |
| on     | eng1<br>vs2.example.com         | cserver_policy         | 2               |

8 entries were displayed.

## vserver fpolicy persistent-store create

### Create a Persist Store

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy persistent-store create` command create an FPolicy Persistent Store entry for the Vserver. This can then be used for enabling the persistent mode for Fpolicy events by specifying the Fpolicy Persistent Store name for the parameter "persistent-store" when creating/modifying the Fpolicy policy. In persistent mode, when the Persistent Store is full, event notifications are dropped.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create FPolicy Persistent Store.

**-persistent-store <text> - Persistent Store Name**

This parameter specifies the name of the FPolicy Persistent Store that you want to create.

**-volume <text> - Volume name of the Persistent Store**

This parameter specifies volume name for the FPolicy Persistent Store.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of the Persistent Store**

This parameter specifies size of the FPolicy Persistent Store.

**[-autosize-mode {off|grow|grow\_shrink}] - Autosize Mode for the Volume**

This parameter specifies autosize mode of the volume. The valid values are: *off*, *grow*, *grow\_shrink*.  
The default value is *off*.

**Examples**

The following example creates an FPolicy persistent-store.

```
cluster1::> vserver fpolicy persistent-store create -vserver
vs1.example.com -persistent-store ps1 -volume psvol -size 1GB -autosize
-mode grow

cluster1::> vserver fpolicy persistent-store show -vserver vs1 -persistent
-store ps1
Vserver: vs1.example.com
                                Persistent Store Name: ps1
Volume name of the Persistent store: psvol
Size of the Persistent Store: 1GB
Autosize Mode for the Volume: grow
```

**vserver fpolicy persistent-store delete****Delete a Persist Store**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver fpolicy persistent-store delete` command deletes an FPolicy Persistent Store.

**Parameters****-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver from which you want to delete the FPolicy Persistent Store.

### **-persistent-store <text> - Persistent Store Name**

This parameter specifies the name of the FPolicy Persistent Store that you want to delete.

### **[-delete-volume {true|false}] - Delete the Persistent Store Volume**

This parameter specifies if the associated volume for the FPolicy Persistent Store has to be deleted. By default, it will be false.

## **Examples**

The following example deletes an FPolicy Persistent Store.

```
cluster1::> vserver fpolicy persistent-store delete -vserver  
vs1.example.com -persistent-store ps1 -delete-volume true
```

## **vserver fpolicy persistent-store modify**

### **Modify a Persist Store**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver fpolicy persistent-store modify` command modifies an FPolicy Persistent Store.

### **Parameters**

#### **-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an FPolicy Persistent Store.

#### **-persistent-store <text> - Persistent Store Name**

This parameter specifies name of the FPolicy Persistent Store that you want to modify.

#### **[-volume <text>] - Volume name of the Persistent Store**

This parameter specifies volume name for the FPolicy Persistent Store.

#### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of the Persistent Store**

This parameter specifies size of the FPolicy Persistent Store.

#### **[-delete-volume {true|false}] - Delete the previous Volume**

This parameter specifies if the previously associated volume for the FPolicy Persistent Store has to be deleted. By default, it will be false.

## **Examples**

The following example modifies an FPolicy Persistent Store.

```
cluster1::> vserver fpolicy persistent-store modify -vserver  
vs1.example.com -persistent-store ps1 -volume psvol -size 1GB -delete  
-volume true
```

```
cluster1::> vserver fpolicy persistent-store show -vserver vs1.example.com  
-persistent-store ps1 -size 1GB  
Vserver: vs1.example.com  
Persistent Store Name: ps1  
Volume name of the Persistent Store: psvol  
Size of the Persistent Store: 1GB
```

## vserver fpolicy persistent-store show

### Display Persist Store details

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy persistent-store show` command displays information about all FPolicy Persistent Store belonging to the Vserver. Any Vserver administrator can see FPolicy persistent store associated with their Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays information about all FPolicy persistent store:

- Vserver Name
- Persistent Store Name
- Persistent Store Volume name

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy persistent-store. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about FPolicy Persistent Store where the FPolicy persistent store belong to particular Vserver vs1, run the command with the `-vserver` parameter set to vs1.

You can specify the `-instance` parameter to display all information for all policies in the list form.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-vserver <Vserver Name>`] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy Persistent Store for the specified Vserver.

### **[`-persistent-store <text>`] - Persistent Store Name**

If you specify this parameter, the command displays information only about the FPolicy Persistent Store that you specify.

### **[`-volume <text>`] - Volume name of the Persistent Store**

If you specify this parameter, the command displays information only about the FPolicy Persistent Store that use the specified volume name.

### **[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Size of the Persistent Store**

If you specify this parameter, the command displays information only about the FPolicy Persistent Store that has the specified size.

### **[`-autosize-mode {off|grow|grow_shrink}`] - Autosize Mode for the Volume**

If you specify this parameter, the command displays information only about the FPolicy Persistent Store that has the specified autosize mode.

## **Examples**

The following example displays the information about FPolicy Persistent Store on the cluster using the `vserver fpolicy persistent-store show` command.

```
cluster1::> vserver fpolicy persistent-store show
```

| Vserver         | Persistent Store | Volume | Size  |
|-----------------|------------------|--------|-------|
| vs1.example.com | ps1              | psvol  | 1GB   |
| vs2.example.com | ps2              | psvol1 | 100MB |

## **vserver fpolicy policy create**

### **Create a policy**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver fpolicy policy create` command creates an FPolicy policy. You must create an FPolicy event name before creating an FPolicy policy. If you are using an external FPolicy server, you must also create an FPolicy engine before creating a policy.

### **Parameters**

#### **`-vserver <Vserver Name>` - Vserver**

This parameter specifies the name of the Vserver on which you want to create an FPolicy policy.

**-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that you want to create. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_" and ".".

**-events <Event name>, ... - Events to Monitor**

This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the `fpolicy policy event create` command.

**-engine <Engine name> - FPolicy Engine**

This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to creating the FPolicy policy. If this parameter is not specified, the default *native* external engine is used. The *native* external engine is internal to ONTAP and is used if you want to configure native file blocking and you do not want to use an external FPolicy server.

**[-is-mandatory {true|false}] - Is Mandatory Screening Required**

This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to *true*, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to *false*. By default, it is *true*.

**[-allow-privileged-access {yes|no}] - Allow Privileged Access**

This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to *yes*, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is *no*.

**[-privileged-user-name <text>] - User Name for Privileged Access**

This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "*domain\user name*" format. If `-allow-privileged-access` is set to *no*, any value set for this field is ignored.

**[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled**

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is *false*.

**[-persistent-store <text>] - Persistent Store Name**

This parameter specifies persistent storage name. This can then be used for enabling the Persistent mode for Fpolicy events.

**Examples**

The following example creates an FPolicy policy.

```

cluster1::> vsrver fpolicy policy create -vsrver vs1.example.com -policy
-name vs1_pol -events cserver_evt,vle1
-engine native -is-mandatory true -allow-privileged-access no
-is-passthrough-read-enabled false

cluster1::> vsrver fpolicy policy show -vsrver vs1.example.com -policy
-name vs1_pol
Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, vle1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
persistent-store: -

```

## vsrver fpolicy policy delete

### Delete a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsrver fpolicy policy delete` command deletes an FPolicy policy.

### Parameters

#### **-vsrver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver from which you want to delete the FPolicy policy.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that you want to delete.

### Examples

The following example deletes an FPolicy policy.

```

cluster1::> vsrver fpolicy policy delete -vsrver vs1.example.com -policy
-name vs1_pol

```

## vsrver fpolicy policy modify

### Modify a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver fpolicy policy modify` command modifies an FPolicy policy.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy.

### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy that you want to modify. An FPolicy policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_" and ".".

### **[-events <Event name>,...] - Events to Monitor**

This parameter specifies a list of events to monitor for the FPolicy policy. All the events in the event list should be created by the administrator of the specified Vserver or the cluster administrator. The events must already exist. Create events using the `fpolicy policy event create` command.

### **[-engine <Engine name>] - FPolicy Engine**

This parameter specifies an external engine for this FPolicy policy. An external engine contains information required by the node to send notifications to an FPolicy server. The Vserver administrator of the specified Vserver or the cluster administrator creates the external engine prior to modifying the FPolicy policy. If this parameter is not specified, the default *native* external engine is used. The *native \_ external* engine is internal to ONTAP and is used if you want to configure *\_native* file blocking and you do not want to use an external FPolicy server.

### **[-is-mandatory {true|false}] - Is Mandatory Screening Required**

This parameter specifies what action to take on a file access event in a case when all primary and secondary servers are down or no response is received from the FPolicy servers within a given timeout period. When this parameter is set to *true*, file access events will be denied under these circumstances. To allow file access events under these circumstances, set this parameter to *false*. By default, it is *true*.

### **[-allow-privileged-access {yes|no}] - Allow Privileged Access**

This parameter specifies privileged access for FPolicy servers. It is used to specify whether privileged access is required for FPolicy servers. Privileged access is used when the FPolicy server requires direct access to the cluster nodes. With this option set to *yes*, FPolicy servers can access files on the cluster using a separate data channel with privileged access. By default, it is *no*.

### **[-privileged-user-name <text>] - User Name for Privileged Access**

This parameter specifies the privileged user name. It is used to specify the privileged user name for accessing files on the cluster using a separate data channel with privileged access. The input for this field should be in "*domain\user name*" format. If `-allow-privileged-access` is set to *no*, any value set for this field is ignored.

### **[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled**

This parameter specifies whether passthrough-read should be allowed for FPolicy servers registered for the policy. Passthrough-read is a way to read data for offline files without restoring the files to primary storage. Offline files are the files which have been moved to secondary storage. If passthrough-read is enabled, the

FPolicy server provides the data for the file over a separate channel instead of restoring the file to primary storage. By default, this parameter is *false*.

### **[*-persistent-store* <text>] - Persistent Store Name**

This parameter specifies persistent storage name. This can then be used for enabling the Persistent mode for Fpolicy events.

## **Examples**

The following example modifies an FPolicy policy.

```
cluster1::> vserver fpolicy policy modify -vserver vs1.example.com -policy
-name vs1_pol -events cserver_evt,vle1
-engine native -is-mandatory true -allow-privileged-access no
-is-passthrough-read-enabled false

cluster1::> vserver fpolicy policy show -vserver vs1.example.com -policy
-name vs1_pol
Vserver: vs1.example.com
Policy Name: vs1_pol
Events to Monitor: cserver_evt, vle1
FPolicy Engine: native
Is Mandatory Screening Required: true
Allow Privileged Access: no
User Name for Privileged Access: -
Is Passthrough Read Enabled: false
persistent-store: -
```

## **vserver fpolicy policy show**

### **Display policy configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver fpolicy policy show` command displays information about all FPolicy policies belonging to the Vserver. Any Vserver administrator can see FPolicy policies associated with their Vserver as well as policies created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy policies:

- Vserver name
- Policy name
- Events to monitor
- FPolicy engine
- Is mandatory screening required

- Allow privileged access
- User name for privileged access

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy policies. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about FPolicy policies where the FPolicy server requires privileged access, run the command with the `-fields` parameter set to `policy-name` (no "-") and `-allow-privileged-access` parameter set to `yes`.

You can specify the `-instance` parameter to display all information for all policies in the list form.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy policies for the specified Vserver. FPolicy policies created by the cluster administrator are visible for all Vservers.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the FPolicy policy that you specify.

**[-events <Event name>,...] - Events to Monitor**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified event or events.

**[-engine <Engine name>] - FPolicy Engine**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified engine.

**[-is-mandatory {true|false}] - Is Mandatory Screening Required**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified mandatory attribute.

**[-allow-privileged-access {yes|no}] - Allow Privileged Access**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged access.

**[-privileged-user-name <text>] - User Name for Privileged Access**

If you specify this parameter, the command displays information only about the FPolicy policy or policies that use the specified privileged user name.

**[-is-passthrough-read-enabled {true|false}] - Is Passthrough Read Enabled**

If you specify this parameter, the command displays information only about the FPolicy policies that use the specified passthrough-read setting.

## **[`-persistent-store <text>`] - Persistent Store Name**

This parameter specifies persistent storage name. This can then be used for enabling the Persistent mode for FPolicy events.

### **Examples**

The following example displays the information about FPolicy policies on the cluster using the `vserver fpolicy policy show` command.

```
cluster1::> vserver fpolicy policy show
Vserver          Policy          Events          Engine          Is Mandatory
PrivAccess
-----
Cluster          cserver_pol     cserver_
                  evt
vs1.example.com  p               r              n              true          no
vs1.example.com  cserver_pol     cserver_
                  evt              cserver_eng    true          yes
vs2.example.com  cserver_pol     cserver_
                  evt              cserver_eng    true          yes
4 entries were displayed.
```

The following example displays FPolicy policy name information about all Vserver FPolicy policies with the `-allow-privileged-access` parameter set to "yes".

```
cluster1::> vserver fpolicy policy show -fields policy-name -allow
-privileged-access yes
vserver          policy-name
-----
Cluster          cserver_pol
vs1.example.com  cserver_pol
vs2.example.com  cserver_pol
3 entries were displayed.
```

## **vserver fpolicy policy event create**

### **Create an event**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver fpolicy policy event create` command creates an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more

policies.

Three parameters have dependency rules: `-protocol`, `-file-operations` and `-filters`. The following combinations are supported:

- Both `-protocol` and `-file-operations`
- All of `-protocol`, `-file-operations` and `-filters`
- Specify none of three

## Parameters

### **`-vserver <Vserver Name> - Vserver`**

This parameter specifies the name of the Vserver on which you want to create an FPolicy event.

### **`-event-name <Event name> - Event`**

This parameter specifies the name of the FPolicy event that you want to create. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_" and ".".

### **`[-protocol <Protocol>] - Protocol`**

This parameter specifies the protocol name for which the event will be created. By default, no protocol is selected. The value of this parameter must be one of the following:

- `_ cifs _` - This specifies that the event is for the CIFS protocol.
- `_ nfsv3 _` - This specifies that the event is for the NFSv3 protocol.
- `_ nfsv4 _` - This specifies that the event is for the NFSv4 protocol.

If you specify `-protocol`, then you must also specify a valid value for the `-file-operations` parameter.

### **`[-file-operations <File Operation>,...] - File Operations`**

This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the `-protocol` parameter. The list can include one or more of the following operations:

- `_ close _` - File close operations.
- `_ create _` - File create operations.
- `_ create_dir _` - Directory create operations.
- `_ delete _` - File delete operations.
- `_ delete_dir _` - Directory delete operations.
- `_ getattr _` - Get attribute operations.
- `_ link _` - Link operations.
- `_ lookup _` - Lookup operations.
- `_ open _` - File open operations.

- `_read _` - File read operations.
- `_write _` - File write operations.
- `_rename _` - File rename operations.
- `_rename_dir _` - Directory rename operations.
- `_setattr _` - Set attribute operations.
- `_symlink _` - Symbolic link operations.

If you specify `-file-operations` then you must specify a valid protocol in the `-protocol` parameter.

### **`[-filters <Filter>, ...]` - Filters**

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the `-protocol` parameter. The values in the `-filters` parameter are used to filter client requests. The list can include one or more of the following:

- `_monitor-ads _` - Filter the client request for alternate data stream.
- `_close-with-modification _` - Filter the client request for close with modification.
- `_close-without-modification _` - Filter the client request for close without modification.
- `_close-with-read _` - Filter the client request for close with read.
- `_first-read _` - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first read-request for which FPolicy processing is done.
- `_first-write _` - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first-write request for which FPolicy processing is done.
- `_offline-bit _` - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.
- `_open-with-delete-intent _` - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the `FILE_DELETE_ON_CLOSE` flag is specified.
- `_open-with-write-intent _` - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.
- `_write-with-size-change _` - Filter the client request for write with size change.
- `_setattr-with-owner-change _` - Filter the client setattr requests for changing owner of a file or directory.
- `_setattr-with-group-change _` - Filter the client setattr requests for changing group of a file or directory.
- `_setattr-with-sacl-change _` - Filter the client setattr requests for changing sacl on a file or

directory.

- `_ setattr-with-dacl-change _` - Filter the client setattr requests for changing dacl on a file or directory.
- `_ setattr-with-modify-time-change _` - Filter the client setattr requests for changing the modification time of a file or directory.
- `_ setattr-with-access-time-change _` - Filter the client setattr requests for changing the access time of a file or directory.
- `_ setattr-with-creation-time-change _` - Filter the client setattr requests for changing the creation time of a file or directory.
- `_ setattr-with-mode-change _` - Filter the client setattr requests for changing the mode bits on a file or directory.
- `_ setattr-with-size-change _` - Filter the client setattr requests for changing the size of a file.
- `_ setattr-with-allocation-size-change _` - Filter the client setattr requests for changing the allocation size of a file.
- `_ exclude-directory _` - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

If you specify a value for the `-filters` parameter, then you must also specify valid values for the `-file-operations` and `-protocol` parameters.

If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

#### **`[-volume-operation {true|false}] - Send Volume Operation Notifications`**

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to *true* then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is *false*.

#### **`[-monitor-fileop-failure {true|false}] - Send Failed File Operation Notifications`**

This parameter specifies whether failed file operations generate notifications for the FPolicy event. If field is set to *true* then FPolicy sends notifications when the file operations fail due to lack of permissions. By default, it is *false*.

### **Examples**

The following example creates an FPolicy event.

```

cluster1::> vserver fpolicy policy event create -vserver vs1.example.com
-event-name cifs_event -protocol cifs
                                -file
-operations open,close,read,write -filters first-read,offline-bit
                                -volume
-operation true -monitor-fileop-failure false
cluster1::> vserver fpolicy policy event show -vserver vs1.example.com
-event-name cifs_event
Vserver: vs1.example.com
                                Event Name: cifs_event
                                Protocol: cifs
                                File Operations: open, close, read, write
                                Filters: first-read, offline-bit
                                Send Volume Operation Notifications: true
                                Send Failed File Operation Notifications: false

```

The following is a list of supported `-file-operations` and `-filters` for the *CIFS* protocol.

## vserver fpolicy policy event delete

Delete an event

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy policy event delete` command deletes an FPolicy event.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you want to delete an FPolicy event.

**-event-name <Event name> - Event**

This parameter specifies the name of the FPolicy event you want to delete.

### Examples

The following example deletes an FPolicy event.

```
cluster1::> vserver fpolicy policy event delete -vserver vs1.example.com
-event-name cifs_event
```

## vserver fpolicy policy event modify

Modify an event

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy policy event modify` command modifies an FPolicy event. An event describes what to monitor. An event can contain protocol, file operations, filters, and volume operation event types. In the FPolicy configuration, an event is attached to an FPolicy policy. You can attach the same event to one or more policies. You can modify an event while it is attached to an FPolicy policy. Any changes to the event take effect immediately.

Three parameters have dependency rules: `-protocol`, `-files-operations` and `-filters`. The following combinations are supported:

- Both `-protocol` and `-file-operations`
- All of `-protocol`, `-file-operations` and `-filters`
- Specify none of three

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an FPolicy event.

**-event-name <Event name> - Event**

This parameter specifies the name of the FPolicy event that you want to modify. An event name can be up to 256 characters long. An event name value is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_" and ".".

**[-protocol <Protocol>] - Protocol**

This parameter specifies the protocol name for which the event will be modified. By default, no protocol is selected. The value of this parameter must be one of the following:

- `_ cifs _` - This specifies that the event is for the CIFS protocol.
- `_ nfsv3 _` - This specifies that the event is for the NFSv3 protocol.
- `_ nfsv4 _` - This specifies that the event is for the NFSv4 protocol.

If you specify `-protocol`, then you must also specify a valid value for the `-file -operations` parameter.

**[-file-operations <File Operation>,...] - File Operations**

This parameter specifies a list of file operations for the FPolicy event. The event will check the operations specified in this list from all client requests using the protocol specified in the `-protocol` parameter. The list can include one or more of the following operations:

- `_ close _` - File close operations.
- `_ create _` - File create operations.
- `_ create_dir _` - Directory create operations.
- `_ delete _` - File delete operations.
- `_ delete_dir _` - Directory delete operations.
- `_ getattr _` - Get attribute operations.
- `_ link _` - Link operations.
- `_ lookup _` - Lookup operations.
- `_ open _` - File open operations.
- `_ read _` - File read operations.
- `_ write _` - File write operations.
- `_ rename _` - File rename operations.
- `_ rename_dir _` - Directory rename operations.
- `_ setattr _` - Set attribute operations.
- `_ symlink _` - Symbolic link operations.

If you specify `-file-operations` then you must specify a valid protocol in the `-protocol` parameter.

### **`[-filters <Filter>,...] - Filters`**

This parameter specifies a list of filters of given file operation or operations for the protocol specified in the `-protocol` parameter. The values in the `-filters` parameter are used to filter client requests. The list can include one or more of the following:

- `_ monitor-ads _` - Filter the client request for alternate data stream.
- `_ close-with-modification _` - Filter the client request for close with modification.
- `_ close-without-modification _` - Filter the client request for close without modification.
- `_ close-with-read _` - Filter the client request for close with read.
- `_ first-read _` - Filter the client requests for the first-read. When this filter is used for CIFS events, the first-read request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first read-request for which FPolicy processing is done.
- `_ first-write _` - Filter the client requests for the first-write. When this filter is used for CIFS events, the first-write request within a CIFS session results in FPolicy processing. When this filter is used for NFS events, the `-file-session-io-grouping-count` and `-file-session-io-grouping-duration` configurations determine the first-write request for which FPolicy processing is done.
- `_ offline-bit _` - Filter the client request for offline bit set. Setting this filter, FPolicy server receives notification only when offline files are accessed.
- `_ open-with-delete-intent _` - Filter the client request for open with delete intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to delete it. This is used by file systems when the `FILE_DELETE_ON_CLOSE` flag is specified.
- `_ open-with-write-intent _` - Filter the client request for open with write intent. Setting this filter, FPolicy server receives notification only when an attempt is made to open a file with the intent to write something in it.
- `_ write-with-size-change _` - Filter the client request for write with size change.
- `_ setattr-with-owner-change _` - Filter the client setattr requests for changing owner of a file or directory.
- `_ setattr-with-group-change _` - Filter the client setattr requests for changing group of a file or directory.
- `_ setattr-with-sacl-change _` - Filter the client setattr requests for changing sacl on a file or directory.
- `_ setattr-with-dacl-change _` - Filter the client setattr requests for changing dacl on a file or directory.
- `_ setattr-with-modify-time-change _` - Filter the client setattr requests for changing the modification time of a file or directory.
- `_ setattr-with-access-time-change _` - Filter the client setattr requests for changing the access time of a file or directory.
- `_ setattr-with-creation-time-change _` - Filter the client setattr requests for changing the

creation time of a file or directory.

- `_ setattr-with-mode-change _` - Filter the client setattr requests for changing the mode bits on a file or directory.
- `_ setattr-with-size-change _` - Filter the client setattr requests for changing the size of a file.
- `_ setattr-with-allocation-size-change _` - Filter the client setattr requests for changing the allocation size of a file.
- `_ exclude-directory _` - Filter the client requests for directory operations. When this filter is specified directory operations are not monitored.

If you specify a value for the `-filters` parameter, then you must also specify valid values for the `-file-operations` and `-protocol` parameters.

If the client sends multiple read/write requests simultaneously for the same file, then the first-read and first-write filters can result in more than one FPolicy notification.

### **[`-volume-operation {true|false}`] - Send Volume Operation Notifications**

This parameter specifies whether volume operations generate notifications for the FPolicy event. If this field is set to *true* then FPolicy sends notifications when volumes are mounted or unmounted. By default, it is *false*.

### **[`-monitor-fileop-failure {true|false}`] - Send Failed File Operation Notifications**

This parameter specifies whether failed file operation generate notifications for the FPolicy event. If field is set to *true* then FPolicy sends notifications when the file operations fail due to lack of permissions. By default, it is *false*.

## **Examples**

The following example modifies an FPolicy event.

```
cluster1:> vserver fpolicy policy event modify -vserver vs1.example.com
-event-name cifs_event -protocol cifs
                                -file
-operations open,close,read,write -filters first-read,offline-bit
                                -volume
-operation true -monitor-fileop-failure false
cluster1:> vserver fpolicy policy event show -vserver vs1.example.com
-event-name cifs_event
Vserver: vs1.example.com
                                Event Name: cifs_event
                                Protocol: cifs
                                File Operations: open, close, read, write
                                Filters: first-read, offline-bit
                                Send Volume Operation Notifications: true
                                Send Failed File Operation Notifications: false
```

The following is a list of supported `-file-operations` and `-filters` for the *CIFS* protocol.

| Supported<br>File<br>Operations | Supported Filters                                                            |

## vserver fpolicy policy event show

### Display events

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy policy event show` command displays information about all FPolicy events belonging to the Vserver. Any Vserver administrator can see FPolicy events associated with their Vserver as well as FPolicy events created by the cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy events:

- Vserver name
- FPolicy event name
- Protocol name
- List of file operations
- List of filters
- Volume operation
- Monitor failed file operation

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy events. You can specify additional parameters to display only information that matches those parameters. For example, to display information only about all CIFS events configured with the `-volume-operation` field set, run the command with the `-fields` parameter set to `-event-name event-name -protocol cifs-volume-operation yes`.

You can specify the `-instance` parameter to display all information for all policies in a list format.

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy events for the specified Vserver. Events created on the admin Vserver by the cluster administrator are visible in all Vservers.

**[-event-name <Event name>] - Event**

If you specify this parameter, the command displays information only about the FPolicy event that matches the specified event name.

**[-protocol <Protocol>] - Protocol**

If you specify this parameter, the command displays information only about the FPolicy event or events that

use the specified protocol.

**`[-file-operations <File Operation>,...]` - File Operations**

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified file operation or operations.

**`[-filters <Filter>,...]` - Filters**

If you specify this parameter, the command displays information only about the FPolicy event or events that use the specified filter or filters.

**`[-volume-operation {true|false}]` - Send Volume Operation Notifications**

If this field is set to *true*, then FPolicy displays information about those events for which it sends notifications when volumes are mounted or unmounted. If you set this parameter to *true*, the command displays information about events where the `-volume-operation` parameter is set *true* and volume operations such as mount and unmount are monitored. If you set this parameter to *false*, the command displays information about events where volume operations are not monitored.

**`[-monitor-fileop-failure {true|false}]` - Send Failed File Operation Notifications**

If you specify this parameter, the command displays information only about the FPolicy event or events that has `-monitor-fileop-failure` parameter set to the specified value.

## Examples

The following example displays the information about all Vserver FPolicy policy events.

```

cluster1::> vservers fpolicy policy event show

```

| Volume            | Vserver         | Event Name      | Protocols   | Operations               |                          |
|-------------------|-----------------|-----------------|-------------|--------------------------|--------------------------|
| Filters           | Operation       |                 |             |                          |                          |
| first-write, true | Cluster         | cserver_evt     | cifs        | open, close, read, write |                          |
| first-read        | vs1.example.com | cserver_evt     | cifs        | open, close, read, write |                          |
| first-read        | vs1.example.com | v1e1            | cifs        | open, read               |                          |
| first-read        | -               | vs1.example.com | v1e2        | cifs                     | open                     |
| -                 | false           | vs1.example.com | v1e3        | nfsv4                    | open                     |
| -                 | true            | vs2.example.com | cserver_evt | cifs                     | open, close, read, write |
| first-read        |                 |                 |             |                          |                          |

6 entries were displayed.

The following example displays event name information about all Vserver FPolicy policy events with CIFS as a protocol and with false as volume operation.

```

cluster1::> vservers fpolicy policy event show -fields event-name -protocol
cifs -volume-operation false

```

| vserver         | event-name |
|-----------------|------------|
| vs1.example.com | v1e2       |

vservers fpolicy policy external-engine create

Create an external engine

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vservers fpolicy policy external-engine create` command creates an FPolicy external

engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create an FPolicy external engine.

### **-engine-name <Engine name> - Engine**

This parameter specifies the name of the FPolicy external engine that you want to create. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_", and ".".

### **-primary-servers <IP Address>,... - Primary FPolicy Servers**

This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you create to apply. The `-primary-servers` parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

### **-port <integer> - Port Number of FPolicy Service**

This parameter specifies the port number for the FPolicy service.

### **[-secondary-servers <IP Address>,...] - Secondary FPolicy Servers**

This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you create to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

### **[-extern-engine-type <External Engine Type>] - External Engine Type**

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is *synchronous* in nature. When set to *synchronous*, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to *asynchronous*, after sending a notification to the external FPolicy server, file request processing continues.

### **-ssl-option {no-auth|server-auth|mutual-auth} - SSL Option for External Communication**

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- **no-auth** : When set to no-auth, no authentication takes place. The communication link is established over the TCP protocol.
- **server-auth** : When set to server-auth, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- **mutual-auth** : When set to mutual-auth, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy

server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the [security certificate install](#) command with `-type` set to `client_ca`. The private key and public certificate required for authentication of the Vserver is installed using the [security certificate install](#) command with `-type` set to `server`.

**`[-reqs-cancel-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Canceling a Request (privilege: advanced)**

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

**`[-reqs-abort-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Aborting a Request (privilege: advanced)**

This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

**`[-status-req-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Interval for Sending Status Requests (privilege: advanced)**

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be send to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

**`[-max-connection-retries <integer>]` - Max Reconnect Attempt (privilege: advanced)**

This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.

**`[-max-server-reqs <integer>]` - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)**

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. The default values are 500, 1000 or 2000 for Low-end(< 64 GB memory), Mid-end(>=64 GB memory) and High-end(>=128 GB memory) Platforms respectively.

**`[-server-progress-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Disconnecting Non-responsive Server (privilege: advanced)**

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the `-max-server-reqs` parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

**`[-keep-alive-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Interval for Sending Keep-Alive Messages (privilege: advanced)**

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections.

The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

**`[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name`**

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-certificate-serial <text>] - Serial Number of Certificate`**

This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-certificate-ca <text>] - Certificate Authority`**

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)`**

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

**`[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)`**

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 1 Mb. When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

**`[-session-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)`**

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the `-session-timeout` interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

**`[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled`**

This parameter specifies whether the resiliency feature is enabled. When this parameter is set to *true* and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified `-resiliency-directory-path`. To deny the file access events from being stored under these circumstances, set this parameter to *false*. By default, it is *false*.

**`[-resiliency-max-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Maximum Notification Retention Duration`**

This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set

to 180s.

### **[`-resiliency-directory-path <text>`] - Directory for Notification Storage**

This parameter specifies the directory path under the `-vserver` namespace, where notifications are stored in the files whenever network outage happens.

### **[`-extern-engine-format {xml|protobuf}`] - External Engine Format**

This parameter specifies the format of the FPolicy notification messages sent to the external engine. Valid values: `xml` or `protobuf`. Default value for this parameter is `xml`. When set to `protobuf`, the notification messages are encoded in binary form using Google Protobuf. Before setting this to `protobuf`, ensure that the FPolicy server also supports Protobuf deserialization.

## **Examples**

The following example creates an FPolicy external engine.

```
cluster1::> vsriver fpolicy policy external-engine create -vserver
vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10
-secondary-servers 2.2.2.2 -ssl-option mutual-auth -extern-engine-type
synchronous -extern-engine-format xml -certificate-serial 8DDE112A114D1FBC
-certificate-common-name Sample1-FPolicy-Client -certificate-ca TASample1

cluster1::> vsriver fpolicy policy external-engine show -vserver
vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
                                Engine: new_engine
      Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
      Secondary FPolicy Servers: 2.2.2.2
      External Engine Type: synchronous
      External Engine Format: xml
SSL Option for External Communication: mutual-auth
      FQDN or Custom Common Name: Sample1-FPolicy-Client
                                Serial Number: 8DDE112A114D1FBC
                                Certificate Authority: TASample1
```

- [security certificate install](#)

## **vsriver fpolicy policy external-engine delete**

Delete an external engine

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver fpolicy policy external-engine delete` command deletes an FPolicy external engine.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you want to delete an FPolicy external engine.

### **-engine-name <Engine name> - Engine**

This parameter specifies the name of the FPolicy external engine you want to delete.

## Examples

The following example deletes an FPolicy external engine.

```
cluster1::> vserver fpolicy policy external-engine show -vserver
vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
                        Engine: new_engine
      Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
      Secondary FPolicy Servers: 2.2.2.2
      External Engine Type: synchronous
SSL Option for External Communication: mutual-auth
      FQDN or Custom Common Name: Sample1-FPolicy-Client
                        Serial Number: 8DDE112A114D1FBC
      Certificate Authority: TASample1

cluster1::> vserver fpolicy policy external-engine delete -vserver
vs1.example.com -engine-name new_engine
```

## vserver fpolicy policy external-engine modify

### Modify an external engine

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver fpolicy policy external-engine modify` command modifies an FPolicy external engine. The cluster uses the external engine to hold configuration information that it needs in order to send notification information to the FPolicy servers. It specifies the primary servers and secondary servers to which the cluster will send notifications. It also specifies FPolicy server related configuration information.

## Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an FPolicy external engine.

**-engine-name <Engine name> - Engine**

This parameter specifies the name of the FPolicy external engine that you want to modify. An external engine name can be up to 256 characters long. An external engine name is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_", and ".".

**[-primary-servers <IP Address>,...] - Primary FPolicy Servers**

This parameter specifies a list of IP addresses for the primary FPolicy servers to which you want the external engine you modify to apply. The `-primary-servers` parameter is used to specify a list of servers to which to send file access events for a given FPolicy policy. When an administrator configures multiple servers as primary servers, notifications are sent to the FPolicy servers in a round-robin fashion.

**[-port <integer>] - Port Number of FPolicy Service**

This parameter specifies the port number for the FPolicy service.

**[-secondary-servers <IP Address>,...] - Secondary FPolicy Servers**

This parameter specifies a list of IP addresses for the secondary FPolicy servers to which you want the external engine you modify to apply. Secondary servers will be used only when all the primary servers are not reachable. When an administrator configures multiple servers as secondary servers, notifications are sent to FPolicy server in a round-robin fashion. By default, no secondary server is selected.

**[-extern-engine-type <External Engine Type>] - External Engine Type**

This parameter specifies the type of the external engine. This specifies how the FPolicy server should behave, synchronously or asynchronously. By default, it is synchronous in nature. When set to synchronous, after sending a notification to the external FPolicy server, request processing does not continue until after receiving a response from the FPolicy server. At that point request flow either continues or processing results in denial, depending on whether the response from the FPolicy server permits the requested action. When set to asynchronous, after sending a notification to the external FPolicy server, file request processing continues.

**[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication**

This parameter specifies the SSL option for external communication with the FPolicy server. Possible values include the following:

- `no-auth` : When set to `no-auth`, no authentication takes place. The communication link is established over the TCP protocol.
- `server-auth` : When set to `server-auth`, only the FPolicy server is authenticated by the Vserver. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate.
- `mutual-auth` : When set to `mutual-auth`, mutual authentication takes place between the Vserver and the FPolicy server, i.e. authentication of the FPolicy server by the Vserver along with authentication of the Vserver by the FPolicy server. With this option, before creating the FPolicy external engine, the administrator must install the public certificate of the certificate authority (CA) that signed the FPolicy server certificate along with the public certificate and key file for authentication of the Vserver.

The public certificate of certificate authority (CA) that is used to sign the FPolicy server certificate is installed using the [security certificate install](#) command with `-type` set to `client_ca`. The private key and public certificate required for authentication of the Vserver is installed using the [security certificate install](#) command with `-type` set to `server`.

**`[-reqs-cancel-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Canceling a Request (privilege: advanced)**

This parameter specifies the timeout for canceling a request. It is used to specify the time interval in which the node waits for a response from the FPolicy server. Beyond this timeout, a cancel request is sent to the FPolicy server to cancel the pending request. The request is then sent to an alternate FPolicy server that is registered for the policy. This timeout helps in handling a FPolicy server that is not responding, which can improve CIFS/NFS client response. Also, this feature can help in releasing of system resources since the request is moved from a down/bad FPolicy server to an alternate FPolicy server. The value for this field must be between 0s and 100s. By default, it is 20s.

**`[-reqs-abort-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Aborting a Request (privilege: advanced)**

This parameter specifies the timeout for aborting a request. The value for this field must be between 0s and 200s. By default, it is 40s.

**`[-status-req-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Interval for Sending Status Requests (privilege: advanced)**

This parameter specifies the interval for sending status requests. It is used to specify the interval after which a status request will be send to the FPolicy server. The value for this field must be between 0s and 50s. By default, it is 10s.

**`[-max-connection-retries <integer>]` - Max Reconnect Attempt (privilege: advanced)**

This parameter specifies the maximum number of attempts to reconnect to the FPolicy server from a Vserver. It is used to specify the number of times a broken connection will be retried. The value for this field must be between 0 and 20. By default, it is 5.

**`[-max-server-reqs <integer>]` - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)**

This parameter specifies the maximum number of outstanding requests for the FPolicy server. It is used to specify the maximum outstanding requests that will be queued up for the FPolicy server. The value for this field must be between 1 and 10000. The default values are 500, 1000 or 2000 for Low-end(< 64 GB memory), Mid-end(>=64 GB memory) and High-end(>=128 GB memory) Platforms respectively.

**`[-server-progress-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for Disconnecting Non-responsive Server (privilege: advanced)**

This parameter specifies the timeout for disconnecting non-responsive FPolicy servers. It is used to specify the time interval after which the connection to the FPolicy server is terminated. This happens only when the FPolicy server's queue contains the maximum allowed number of requests that it can hold in its queue and no response is received within this timeout. The maximum allowed number of requests is either 50 (the default) or the number specified by the `-max-server-reqs` parameter. The value for this field must be between 1s and 100s. By default, it is 60s.

**`[-keep-alive-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Interval for Sending Keep-Alive Messages (privilege: advanced)**

This parameter specifies the interval in hours (h), minutes (m), or seconds (s) at which keep-alive messages are sent to the FPolicy server. Keep-alive messages are used to detect half-open connections. The range of supported values for this field is 10 through 600 (h, m, or s). Alternatively, the value can be set to 0, which disables keep-alive messages and prevents them from being sent to the FPolicy servers. The default value for this field is 120s.

**`[-certificate-common-name <FQDN or Custom Common Name>]` - FQDN or Custom Common Name**

This parameter specifies the certificate name as a fully qualified domain name (FQDN) or custom common name. The certificate is used if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-certificate-serial <text>] - Serial Number of Certificate`**

This parameter specifies the serial number of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-certificate-ca <text>] - Certificate Authority`**

This parameter specifies the certificate authority (CA) name of the certificate used for authentication if SSL authentication between the Vserver and the FPolicy server is configured.

**`[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)`**

This parameter specifies the receive buffer size of the connected socket for the FPolicy server. The default value is set to 256 kilobytes (Kb). When the value is set to 0, the size of the receive buffer is set to a value defined by the system. For example, if the default receive buffer size of the socket is 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the receive buffer.

**`[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)`**

This parameter specifies the send buffer size of the connected socket for the FPolicy server. The default value is set to 1 Mb. When the value is set to 0, the size of the send buffer is set to a value defined by the system. For example, if the default send buffer size of the socket is set to 65536 bytes, by setting the tunable value to 0, the socket buffer size is set to 65536 bytes. You can use any non-default value to set the size (in bytes) of the send buffer.

**`[-session-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)`**

This parameter specifies the interval after which a new session ID is sent to the FPolicy server during reconnection attempts. The value for this field must be between 0s and 200s. The default value is set to 10 seconds. If the connection between the storage controller and the FPolicy server is terminated and reconnection is made within the `-session-timeout` interval, the old session ID is sent to FPolicy server so that it can send responses for old notifications.

**`[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled`**

This parameter specifies whether the resiliency feature is enabled. When this parameter is set to *true* and all the primary and secondary servers are down, or no response is received from the FPolicy servers, file access events are stored inside the storage controller under the specified `-resiliency-directory-path`. To deny the file access events from being stored under these circumstances, set this parameter to *false*. By default, it is *false*.

**`[-resiliency-max-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Maximum Notification Retention Duration`**

This parameter specifies the duration for which the notifications are written to files inside the storage controller during network outage. The value for this field must be between 0s and 600s. By default, it is set to 180s.

**`[-resiliency-directory-path <text>] - Directory for Notification Storage`**

This parameter specifies the directory path under the `-vserver` namespace, where notifications are stored in the files whenever network outage happens.

## **[`-extern-engine-format {xml|protobuf}`]] - External Engine Format**

This parameter specifies the format of the FPolicy notification messages sent to the external engine. Valid values: *xml* or *protobuf*. Default value for this parameter is *xml*. When set to *protobuf*, the notification messages are encoded in binary form using Google Protobuf. Before setting this to *protobuf*, ensure that the FPolicy server also supports Protobuf deserialization.

### **Examples**

The following example modifies an FPolicy external engine.

```
cluster1:> vserver fpolicy policy external-engine modify -vserver
vs1.example.com -engine-name new_engine -primary-servers 1.1.1.1 -port 10
-secondary-servers 2.2.2.2

cluster1:> vserver fpolicy policy external-engine show -vserver
vs1.example.com -engine-name new_engine
Vserver: vs1.example.com
                                Engine: new_engine
        Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 10
        Secondary FPolicy Servers: 2.2.2.2
        External Engine Type: synchronous
        External Engine Format: xml
SSL Option for External Communication: mutual-auth
        FQDN or Custom Common Name: Sample1-FPolicy-Client
                                Serial Number: 8DDE112A114D1FBC
                                Certificate Authority: TASample1
```

The following example shows how to modify `-recv-buffer-size` and `-send-buffer-size` to a non-default value of 0.

```
cluster1::*> vserver fpolicy policy external-engine modify -vserver
vs1.example.com -engine-name new_engine -recv-buffer-size 0 -send-buffer
-size 0
```

## **vserver fpolicy policy external-engine show**

Display external engines

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver fpolicy policy external-engine show` command displays information about all FPolicy external engines belonging to the Vserver. Any Vserver administrator can see FPolicy external engines associated to their Vserver as well as external engines created by cluster administrator. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy external engines:

- Vserver name
- FPolicy external engine name
- List of primary FPolicy servers
- List of secondary FPolicy servers
- Port number for FPolicy service
- FPolicy external engine type
- FPolicy external engine format

You can specify the `-fields` parameter to specify which fields of information to display about FPolicy external engines. You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about all external engines where the `-port` parameter is set to `9`, run the command with the `-field` parameter set to `engine-name` and `-port` parameter set to `9`.

You can specify the `-instance` parameter to display all information for all policies in a list format.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information only about the FPolicy external engines for the specified Vserver. FPolicy external engines that the cluster administrator creates are visible in all Vservers.

**[-engine-name <Engine name>] - Engine**

If you specify this parameter, the command displays information only about the FPolicy external engine that you specify.

**[-primary-servers <IP Address>,... ] - Primary FPolicy Servers**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as primary FPolicy servers.

**[-port <integer>] - Port Number of FPolicy Service**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified port for the FPolicy service.

**[-secondary-servers <IP Address>,...] - Secondary FPolicy Servers**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified IP addresses as secondary FPolicy servers.

**[-extern-engine-type <External Engine Type>] - External Engine Type**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified external engine type.

**[-ssl-option {no-auth|server-auth|mutual-auth}] - SSL Option for External Communication**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified SSL option.

**[-reqs-cancel-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Timeout for Canceling a Request (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for canceling a request.

**[-reqs-abort-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Timeout for Aborting a Request (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for aborting a request.

**[-status-req-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Interval for Sending Status Requests (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified interval for sending status requests.

**[-max-connection-retries <integer>] - Max Reconnect Attempt (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified maximum reconnect attempts.

**[-max-server-reqs <integer>] - Maximum Outstanding Requests for FPolicy Server (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified FPolicy server maximum outstanding requests.

**[-server-progress-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Timeout for Disconnecting Non-responsive Server (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified timeout for disconnecting non-responsive server.

**[-keep-alive-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Interval for Sending Keep-Alive Messages (privilege: advanced)**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified keep-alive interval.

**[-certificate-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate common name.

**`[-certificate-serial <text>] - Serial Number of Certificate`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate serial number.

**`[-certificate-ca <text>] - Certificate Authority`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified certificate authority name.

**`[-recv-buffer-size <integer>] - Receive Buffer Size (privilege: advanced)`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified receive buffer size.

**`[-send-buffer-size <integer>] - Send Buffer Size (privilege: advanced)`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified send buffer size.

**`[-session-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session ID Purge Timeout During Reconnection (privilege: advanced)`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified session timeout.

**`[-is-resiliency-enabled {true|false}] - Is Resiliency Feature Enabled`**

If you specify this parameter set to *true*, the command displays information only about the FPolicy external engine or engines that has the resiliency feature enabled.

**`[-resiliency-max-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Maximum Notification Retention Duration`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified network outage duration.

**`[-resiliency-directory-path <text>] - Directory for Notification Storage`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified directory path.

**`[-extern-engine-format {xml|protobuf}] - External Engine Format`**

If you specify this parameter, the command displays information only about the FPolicy external engine or engines that use the specified engine format.

## Examples

The following example displays the information about the configured external engines using the `vserver fpolicy policy external-engine show` command.

```
cluster1::> vserver fpolicy policy external-engine show
```

|                      |             | Primary | Secondary | External |
|----------------------|-------------|---------|-----------|----------|
| External             |             |         |           |          |
| Vserver              | Engine      | Servers | Servers   | Port     |
| Type Engine Format   |             |         |           | Engine   |
| -----                | -----       | -----   | -----     | -----    |
| Cluster              | cserver_eng | 9.9.9.9 | -         | 9        |
| synchronous xml      |             |         |           |          |
| vs1.example.com      | cserver_eng | 9.9.9.9 | -         | 9        |
| synchronous protobuf |             |         |           |          |
| vs1.example.com      | v1n1        | 1.1.1.1 | 2.2.2.2   | 1        |
| synchronous protobuf |             |         |           |          |
| vs2.example.com      | cserver_eng | 9.9.9.9 | -         | 9        |
| synchronous xml      |             |         |           |          |
| vs2.example.com      | v2n1        | 3.3.3.3 | 5.5.5.5   | 2        |
| synchronous xml      |             |         |           |          |

5 entries were displayed.

The following example displays the information about all Vserver FPolicy external engines with the -port parameter set to 9.

```
cluster1::> vserver fpolicy policy external-engine show -fields engine-
name -port 9
```

| vserver         | engine-name |
|-----------------|-------------|
| -----           | -----       |
| Cluster         | cserver_eng |
| vs1.example.com | cserver_eng |
| vs2.example.com | cserver_eng |

3 entries were displayed.

The following example displays the values of all the advanced-level parameters for the external engine v1n1 in Vserver vs1.example.com.

```

cluster1::*> vserver fpolicy policy external-engine show -vserver
vs1.example.com -engine-name v1n1 -instance
(vserver fpolicy policy external-engine show)
Vserver: vs1.example.com

Engine: v1n1
Primary FPolicy Servers: 1.1.1.1
Port Number of FPolicy Service: 1
Secondary FPolicy Servers: 2.2.2.2
External Engine Type: synchronous
External Engine Format: protobuf
SSL Option for External Communication: no-auth
Timeout for Canceling a Request: 20s
Timeout for Aborting a Request: 40s
Interval for Sending Status Requests: 10s
Max Reconnect Attempt: 5
Maximum Outstanding Requests for FPolicy Server: 50
Timeout for Disconnecting Non-responsive Server: 1m
Interval for Sending Keep-Alive Messages: 2m
FQDN or Custom Common Name: -
Serial Number of Certificate: -
Certificate Authority: -
Receive Buffer Size: 0
Send Buffer Size: 0
Session ID Purge Timeout During Reconnection: 10s
Is Resiliency Feature Enabled: true
Maximum Notification Retention Duration: 3m
Directory for Notification Storage: /fpolicy

```

## vserver fpolicy policy scope create

### Create scope

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy policy scope create` command creates an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you create a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the `-volumes-to-include` parameter or which volumes to exclude using the `-volumes-to-exclude` parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

There are special considerations for the scope for a cluster FPolicy policy. The cluster FPolicy policy is a policy that the cluster administrator creates for the admin Vserver. If the cluster administrator also creates the scope for that cluster FPolicy policy, a Vserver administrator cannot create a scope for that same policy. However, if the cluster administrator does not create a scope for the cluster FPolicy policy, then any Vserver administrator can create the scope for that cluster policy. In the event that the Vserver administrator creates a scope for that cluster FPolicy policy, the cluster administrator cannot subsequently create a cluster scope for that same cluster policy. This is because the cluster administrator cannot override the scope for the same cluster policy.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create an FPolicy policy scope.

### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy for which you want to create the scope.

### **[-shares-to-include <Share name>,...] - Shares to Include**

This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The `-shares-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

When a share is included in the `-shares-to-include` parameter and the parent volume of the share is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-shares-to-include`.

### **[-shares-to-exclude <Share name>,...] - Shares to Exclude**

This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the `-shares-to-exclude` parameter, no notification is sent for files accessed relative to that share. The `-shares-to-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

### **[-volumes-to-include <volume name>,...] - Volumes to Include**

This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The `-volumes-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

### **[-volumes-to-exclude <volume name>,...] - Volumes to Exclude**

This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The `-volumes-to-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

When a share is included in the `-shares-to-include` parameter and the parent volume of the share is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-shares-to-include`. Similarly, when an export policy is included in the `-export-policies-to-include` parameter and the parent volume of the export-policy is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-export-policies-to-include`.

### **`[-export-policies-to-include <FPolicy export policy>,...]` - Export Policies to Include**

This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The `-export-policies-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

When an export policy is included in the `-export-policies-to-include` parameter and the parent volume of the export policy is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-export-policies-to-include`.

### **`[-export-policies-to-exclude <FPolicy export policy>,...]` - Export Policies to Exclude**

This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The `-export-policies-exclude` parameter can contain regular expressions and can include metacharacters such as "?" and \*.

### **`[-file-extensions-to-include <File extension>,...]` - File Extensions to Include**

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the `-file-extensions-to-include` parameter generates a notification. The `-file-extensions-to-include` parameter can contain regular expressions and can include metacharacters such as "?".

### **`[-file-extensions-to-exclude <File extension>,...]` - File Extensions to Exclude**

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the `-file-extensions-to-exclude` parameter does not generate a notification. The `-file-extensions-to-exclude` parameter can contain regular expressions and can include metacharacters such as "?".

An administrator can specify both `-file-extensions-to-include` and `-file-extensions-to-exclude` lists. The `-file-extensions-to-exclude` parameter is checked first before the `-file-extensions-to-include` parameter is checked.

### **`[-is-file-extension-check-on-directories-enabled {true|false}]` - Is File Extension Check on Directories Enabled (privilege: advanced)**

This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is *true*.

**[*-is-monitoring-of-objects-with-no-extension-enabled* {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)**

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is *false*.

This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

**Examples**

The following example creates an FPolicy policy scope.

```
cluster1::> vservers fpolicy policy scope create -vservers vs1.example.com
                                                    -policy-name
vs1_pol
                                                    -file
-extensions-to-include flv,wmv,mp3,mp4
                                                    -file
-extensions-to-exclude cpp,c,h,txt
cluster1::> vservers fpolicy policy scope show
      Vservers      Policy      Extensions
Extensions
      Name      Name      Included
Excluded
-----
-----
      Cluster      cserver_pol      txt
mp3, wmv
      vs1.example.com      vs1_pol      flv, wmv, mp3, mp4
cpp, c, h, txt
      2 entries were displayed.
```

**vservers fpolicy policy scope delete**

**Delete scope**

**Availability:** This command is available to *cluster* and *Vservers* administrators at the *admin* privilege level.

**Description**

The `vservers fpolicy policy scope delete` command deletes an FPolicy policy scope.

**Parameters**

**-vservers <Vservers Name> - Vservers**

This parameter specifies the name of the Vservers from which you want to delete the FPolicy policy scope.

### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy for which you want to delete the scope.

## **Examples**

The following example deletes a scope of an FPolicy policy.

```
cluster1::> vsserver fpolicy policy scope delete -vsserver vs1.example.com
-policy-name vs1_pol
```

## **vsserver fpolicy policy scope modify**

### **Modify scope**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver fpolicy policy scope modify` command modifies an FPolicy scope for an FPolicy policy. A scope defines the boundaries on which the FPolicy policy will apply. The Vserver is the basic scope boundary. When you modify a scope for an FPolicy policy, you must define the FPolicy policy to which it will apply and you must designate to which Vserver you want to apply the scope. There are a number of parameters that further restrict the scope within the specified Vserver. You can restrict the scope by specifying what to include in the scope. Or you can restrict the scope by specifying what to exclude from the scope. For example, you can restrict the scope by specifying which volumes to include using the `-volumes-to-include` parameter or which volumes to exclude using the `-volumes-to-exclude` parameter. Once you apply a scope to an enabled policy, policy event checks get applied to the scope defined by this command.

### **Parameters**

#### **-vsserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an FPolicy policy scope.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the FPolicy policy for which you want to modify the scope.

#### **[-shares-to-include <Share name>,...] - Shares to Include**

This parameter specifies a list of shares for file access monitoring. With this option, the administrator provides a list of shares, separated by commas. For file access events relative to the specified shares and file operations monitored by the FPolicy policy, a notification is generated. The `-shares-to-include` parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

When a share is included in the `-shares-to-include` parameter and the parent volume of the share is included in the `-volumes-to-exclude` parameter, `-volumes-to-exclude` has precedence over `-shares-to-include`.

#### **[-shares-to-exclude <Share name>,...] - Shares to Exclude**

This parameter specifies a list of shares to exclude from file access monitoring. With this option, the administrator provides a list of shares, separated by commas. When a share is specified in the `-shares`

-to-exclude parameter, no notification is sent for files accessed relative to that share. The -shares-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "\*\*".

#### **[-volumes-to-include <volume name>,...] - Volumes to Include**

This parameter specifies a list of volumes for file access monitoring. With this option, the administrator provides a list of volumes, separated by commas. For file access events within the volume and file operations monitored by the FPolicy policy, a notification is generated. The -volumes-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "\*\*".

#### **[-volumes-to-exclude <volume name>,...] - Volumes to Exclude**

This parameter specifies a list of volumes to exclude from file access monitoring. With this option, the administrator provides a list of volumes, separated by commas, for which no file access notifications are generated. The -volumes-to-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "\*\*".

When a share is included in the -shares-to-include parameter and the parent volume of the share is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -shares-to-include. Similarly, when an export policy is included in the -export-policies-to-include parameter and the parent volume of the export-policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

#### **[-export-policies-to-include <FPolicy export policy>,...] - Export Policies to Include**

This parameter specifies a list of export policies for file access monitoring. With this option, the administrator provides a list of export policies, separated by commas. For file access events within an export policy and file operations monitored by the FPolicy policy, a notification is generated. The -export-policies-to-include parameter can contain regular expressions and can include metacharacters such as "?" and "\*\*".

When an export policy is included in the -export-policies-to-include parameter and the parent volume of the export policy is included in the -volumes-to-exclude parameter, -volumes-to-exclude has precedence over -export-policies-to-include.

#### **[-export-policies-to-exclude <FPolicy export policy>,...] - Export Policies to Exclude**

This parameter specifies a list of export policies to exclude from file access monitoring. With this option, the administrator provides a list of export policies, separated by commas, for which no file access notification is sent. The -export-policies-exclude parameter can contain regular expressions and can include metacharacters such as "?" and "\*".

#### **[-file-extensions-to-include <File extension>,...] - File Extensions to Include**

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing is required. Any file access to files with the same extensions included in the -file-extensions-to-include parameter generates a notification. The -file-extensions-to-include parameter can contain regular expressions and can include metacharacters such as "?".

#### **[-file-extensions-to-exclude <File extension>,...] - File Extensions to Exclude**

This parameter specifies a list of file extensions, separated by commas, for a given FPolicy policy for which FPolicy processing will be excluded. Using the exclude list, the administrator can request notification for all extensions except those in the excluded list. Any file access to files with the same extensions included in the -file-extensions-to-exclude parameter does not generate a notification. The -file

-extensions-to-exclude parameter can contain regular expressions and can include metacharacters such as "?".

An administrator can specify both -file-extensions-to-include and -file-extensions-to-exclude lists. The -file-extensions-to-exclude parameter is checked first before the -file-extensions-to-include parameter is checked.

**[`-is-file-extension-check-on-directories-enabled {true|false}`] - Is File Extension Check on Directories Enabled (privilege: advanced)**

This parameter specifies whether the file name extension checks apply to directory objects as well. If this parameter is set to true, the directory objects are subjected to same extension checks as regular files. If this parameter is set to false, the directory names are not matched for extensions and notifications would be sent for directories even if their name extensions do not match. By default, it is *true*.

**[`-is-monitoring-of-objects-with-no-extension-enabled {true|false}`] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)**

This parameter specifies whether the extension checks apply to objects with no extension as well. If this parameter is set to true, the objects with no extension are also monitored along with the objects with extension. By default, it is *false*.

This parameter is ignored when file-extensions-to-include and file-extensions-to-exclude lists are empty.

**Examples**

The following example modifies an FPolicy policy scope.

```
cluster1::> vserver fpolicy policy scope modify      -vserver vs1.example.com
                                                    -policy-name
vs1_pol
                                                    -file
-extensions-to-include flv,wmv,mp3,mp4
                                                    -file
-extensions-to-exclude cpp,c,h,txt
cluster1::> vserver fpolicy policy scope show
      Vserver      Policy      Extensions
Extensions
      Name      Name      Included
Excluded
-----
Cluster      cserver_pol      txt
mp3, wmv
vs1.example.com  vs1_pol      flv, wmv, mp3, mp4
cpp, c, h, txt
      2 entries were displayed.
```

## vserver fpolicy policy scope show

### Display scope

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver fpolicy policy scope show` command displays scope information about all FPolicy policies belonging to the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all FPolicy scopes:

- Vserver name
- Policy name
- The file extensions to include
- The file extensions to exclude

You can use the `-fields` parameter to specify which fields of information to display about FPolicy scopes. In addition to the fields above, you can display the following fields:

- The shares to include
- The shares to exclude
- The volumes to include
- The volumes to exclude
- The export policies to include
- The export policies to exclude
- Whether file extension check on directories is enabled
- Whether monitoring of objects with no extension is enabled

You can specify specific parameters to display only information that matches those parameters. For example, to display scope information only about all FPolicy policies where the `-file-extensions-to-include` parameter is set to `txt`, run the command with the `-fields` parameter set to `policy-name` and `-file-extensions-to-include` parameter set to `txt`.

You can specify the `-instance` parameter to display scope information for all FPolicy policies in a list format.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays scope information only about the FPolicy policies for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the specified FPolicy policy.

**[-shares-to-include <Share name>,...] - Shares to Include**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the include list.

**[-shares-to-exclude <Share name>,...] - Shares to Exclude**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified share or shares in the exclude list.

**[-volumes-to-include <volume name>,...] - Volumes to Include**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the include list.

**[-volumes-to-exclude <volume name>,...] - Volumes to Exclude**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified volume or volumes in the exclude list.

**[-export-policies-to-include <FPolicy export policy>,...] - Export Policies to Include**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the include list.

**[-export-policies-to-exclude <FPolicy export policy>,...] - Export Policies to Exclude**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified export policy or policies in the exclude list.

**[-file-extensions-to-include <File extension>,...] - File Extensions to Include**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in the include list.

**[-file-extensions-to-exclude <File extension>,...] - File Extensions to Exclude**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension or extensions in exclude list.

**[-is-file-extension-check-on-directories-enabled {true|false}] - Is File Extension Check on Directories Enabled (privilege: advanced)**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified file extension check on directories. If set to true, the command displays information about scopes where file extension checks on directories is enabled. If set to false, the command displays information about scopes where file extension checks on directories is disabled.

**[-is-monitoring-of-objects-with-no-extension-enabled {true|false}] - Is Monitoring of Objects with No Extension Enabled (privilege: advanced)**

If you specify this parameter, the command displays scope information only about the FPolicy policy or policies that use the specified monitoring of objects with no extension setting. If set to true, the command displays information about scope of policy or policies for which monitoring of objects with no extension is enabled.

Examples

The following example displays scope information about FPolicy policies.

```
cluster1::> vsriver fpolicy policy scope show
      Vserver      Policy      Extensions
Extensions
      Name      Name      Included
Excluded
-----
Cluster      cserver_pol      -      -
vs1.example.com      p      -      -
vs1.example.com      vs1_pol      mp3      -
3 entries were displayed.
```

vsriver http-proxy commands

vsriver http-proxy create

Create a HTTP Proxy configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `vsriver http-proxy create` command creates an HTTP proxy configuration for a *Vserver*.

Parameters

**{ -vsriver <vsriver> - Vserver**

Use this parameter to specify the *Vserver* on which the HTTP proxy configuration is to be created.

Note that `-vsriver` and `-ipspace` are mutually exclusive options.

**| [-ipspace <text>] - Ipspace }**

Use this parameter to specify the *IPspace* on which the HTTP proxy configuration is to be created. The proxy is created on the system *Vserver* of that *IPspace*.

Note that `-vsriver` and `-ipspace` are mutually exclusive options.

**-server <text> - Proxy Server**

Use this parameter to specify the Fully Qualified Domain Name or IP address of the proxy server.

**-port <integer> - Port**

Use this parameter to specify the port number on which the HTTP proxy service is configured on the proxy server.

### **-is-auth-enabled {true|false} - Authentication Enabled**

Use this parameter to specify if authentication is enabled to connect to the HTTP proxy server. By default it is set to false. When set to true, username and password will be prompted.

### **[-skip-config-validation <true>] - Skip the config validation**

Use this parameter to skip the HTTP proxy configuration validation.

The proxy configuration is validated to verify that the specified server is reachable and is providing an HTTP proxy service on the specified port.

The validation fails in the following cases:

- The server is not reachable.
- The specified port is invalid.
- HTTP proxy service is not configured on the specified server and port.
- Route or LIF does not exist.

## **Examples**

The following example creates an HTTP proxy configuration for the Vserver vs0 with Fully Qualified Domain Name as input for the `-server` parameter:

```
cluster1::*> vserver http-proxy create -vserver vs0 -server example.com
-port 222
```

The following example creates an HTTP proxy configuration with the IP address as input for the `-server` parameter:

```
cluster1::*> vserver http-proxy create -vserver vs0 -server 192.168.0.0
-port 222
```

The following example creates an HTTP proxy configuration with `-skip-config-validation` set to true:

```
cluster1::*> vserver http-proxy create -vserver vs0 -server 192.168.0.0
-port 222 -skip-config-validation
```

The following example creates an HTTP proxy configuration with the IPspace specified and not the Vserver name:

```
cluster1::*> vserver http-proxy create -ipspace default -server
192.168.0.0 -port 222
```

The following example creates an HTTP proxy configuration with authentication enabled:

```
cluster1::*> vserver http-proxy create -ipspace default -server  
192.168.0.0 -port 222 -is-auth-enabled true
```

Enter the user name: test

Enter the password:

## vserver http-proxy delete

### Remove a HTTP Proxy configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver http-proxy delete` command deletes an HTTP proxy configuration.

#### Parameters

**-vserver <vserver> -Vserver**

Use this parameter to specify the Vserver for which the HTTP proxy configuration is to be deleted.

#### Examples

The following example deletes the HTTP proxy configuration for the Vserver vs0:

```
cluster1::*> vserver http-proxy delete -vserver vs0
```

## vserver http-proxy modify

### Change a HTTP Proxy configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver http-proxy modify` command modifies an HTTP proxy configuration of a Vserver.

#### Parameters

**{ -vserver <vserver> -Vserver**

Use this parameter to specify the Vserver for which the HTTP proxy server configuration is to be modified.

Note that `-vserver` and `-ipspace` are mutually exclusive options.

**| [-ipspace <text>] -lpspace }**

Use this parameter to specify the IPspace for which the HTTP proxy server configuration is to be modified.

Note that `-vserver` and `-ipSpace` are mutually exclusive options.

### **[`-server <text>`] - Proxy Server**

Use this parameter to specify the Fully Qualified Domain Name or IP address of the proxy server.

### **[`-port <integer>`] - Port**

Use this parameter to specify the port number on which the HTTP proxy service is configured on the proxy server.

### **[`-is-auth-enabled {true|false}`] - Authentication Enabled**

Use this parameter to specify if authentication is enabled to connect to the HTTP proxy server. By default it is set to false. When set to true, username and password will be prompted.

### **[`-skip-config-validation <true>`] - Skip the config validation**

Use this parameter to skip the HTTP proxy configuration validation.

The proxy configuration is validated to verify that the specified server is reachable and is providing HTTP proxy service on the specified port.

The validation fails in the following cases:

- The server is not reachable.
- The specified port is invalid.
- HTTP proxy service is not configured on the specified server and port.
- Route or LIF does not exist.

## **Examples**

The following example modifies the HTTP proxy server of the Vserver `vs0` with Fully Qualified Domain Name as input for `-server` parameter:

```
cluster1::*> vsserver http-proxy modify -vserver vs0 -server example.com
```

## **vsserver http-proxy show**

### **Display HTTP Proxy configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver http-proxy show` command displays information about HTTP proxy configurations. The `IPspace` field is populated only if a Vserver is the system vsserver of that IPspace. For all other Vservers, the `IPspace` field is empty.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**{ [-vserver <vserver>] - Vserver**

Use this parameter to display information only about the HTTP proxy configuration of the Vservers you specify.

**[-ipspace <text>] - Ipspace**

Use this parameter to display information only about the HTTP proxy configuration of the IPspace you specify.

**[-server <text>] - Proxy Server**

Use this parameter to display information only about the HTTP proxy configurations that match the Fully Qualified Domain Name or IP address you specify.

**[-port <integer>] - Port**

Use this parameter to display information only about the HTTP proxy configurations that match the port you specify.

**[-is-auth-enabled {true|false}] - Authentication Enabled**

Use this parameter to display information only about the HTTP proxy configurations that match the specified authentication enabled setting.

## Examples

The following example displays information about all HTTP proxy configurations:

```
cluster1::*> vserver http-proxy show
Vserver      IPspace      Server      Port
-----
test         test         10.0.0.0    3128
vs2          -           192.168.0.0 3128
2 entries were displayed.
```

The following example displays information about all HTTP proxy configurations with server 10.0.0.0:

```
cluster1::*> vserver http-proxy show -server 10.0.0.0
Vserver      IPspace      Server      Port
-----
test         test         10.0.0.0    3128
```

# vserver iscsi commands

## vserver iscsi create

Create a Vserver's iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command creates an iSCSI target for a specified Vserver. By default the system creates a default iSCSI target name with the status-admin set to enabled. Until you create an iSCSI service, iSCSI initiators cannot log into the Vserver.

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver for the iSCSI service.

**[-target-name <text>] - Target Name (privilege: advanced)**

Specifies a iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format `iqn.1995-08.com.example:string` and the following rules:

- Contains up to 128 bytes.
- Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
- Does not contain the underscore character "\_".

**[-target-alias <text>] - Target Alias**

Specifies an iSCSI target alias name of a Vserver. The maximum number of characters for an alias name is 128. The alias default name is the Vserver name.

**[-status-admin {down|up}] - Administrative Status**

Specifies the administrative status of the iSCSI service of a Vserver. If you set this parameter to up, the command creates an iSCSI service with the administrative status of up. If you set this parameter to down, the command creates an iSCSI service with the administrative status of down.

**[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)**

Specifies the wait time before an active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target. The default is 20 seconds.

**[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)**

Specifies the login phase duration. The default is 15 seconds.

**[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)**

Specifies the maximum number of connections per session that a target can accept. The default is 4 connections.

**[`-max-ios-per-session <integer>`] - Max Commands per Session (privilege: advanced)**

Specifies the maximum number of commands per session that a target can accept. The default is 128 commands per session.

**[`-tcp-window-size <integer>`] - TCP Receive Window Size (in bytes) (privilege: advanced)**

Specifies the TCP receive window size (in bytes). The default is 131,400 bytes.

**[`-f, -force <true>`] - Allow Non-Vendor Target Name (privilege: advanced)**

Force the command to accept a target name that would normally be rejected as invalid.

## Examples

```
cluster1::> vserver iscsi create -vserver vs_1
```

Creates the iSCSI service for Vserver vs\_1.

## vserver iscsi delete

Delete a Vserver's iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command deletes the iSCSI service from a Vserver.

You must first disable the service with the command `vserver iscsi modify` with `"-status-admin down"` before you can delete the service.

## Parameters

**`-vserver <Vserver Name>` - Vserver**

Specifies the Vserver for the iSCSI service.

## Examples

```
cluster1::> vserver iscsi delete -vserver vs_1
```

Deletes the iSCSI service for Vserver vs\_1.

## Related Links

- [vserver iscsi modify](#)

## vserver iscsi modify

Modify a Vserver's iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command modifies the configuration for an iSCSI service.

Modifications take effect immediately after you execute the command. Making modifications to your service can result in traffic loss on a live system. Call technical support if you are unsure of the possible consequences.

## Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver for the iSCSI service.

**[-target-name <text>] - Target Name (privilege: advanced)**

Specifies an iSCSI target name of a Vserver. This name is unique and is not case sensitive. The target name must conform to this format `iqn.1995-08.com.example:string` and the following rules:

- Contains up to 128 bytes.
- Contains alphanumeric characters. The period ".", hyphen "-", and colon ":" are acceptable.
- Does not contain the underscore character "\_".

The iSCSI service must be down in order to change the target name.

**{ [-target-alias <text>] - Target Alias**

Specifies the new target alias of the iSCSI service.

**| [-c, -clear <true>] - Clear the Target Alias }**

Clears the current target alias from the iSCSI service configuration.

**[-status-admin {down|up}] - Administrative Status**

Specifies the configured administrative status of a service. If you set this parameter to up, the iSCSI service begins to accept login requests from iSCSI initiators. If you set this parameter to down, iSCSI initiators cannot log in.

**[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)**

Specifies the wait time before active task reassignment is possible after an unexpected connection termination. For example, a value of 0 means that the connection or task state is immediately discarded by the target.

**[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)**

Specifies maximum time the login phase remains active until the iSCSI target terminates the connection.

**[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)**

Specifies the maximum number of connections per session that the iSCSI target can accept.

**[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)**

Specifies the maximum number of commands per session that the iSCSI target can accept.

**[`-tcp-window-size <integer>`] - TCP Receive Window Size (in bytes) (privilege: advanced)**

Specifies the TCP receive window size (in bytes).

A change to the TCP receive window size value takes effect for all network interfaces when you restart the iSCSI service for the Vserver as follows:

```
vserver iscsi stop -vserver <vserver name>
vserver iscsi start -vserver <vserver name>
```

If you change an individual network interface from up to down back to up, as follows, the new value for TCP receive window size takes effect for that network interface:

```
network interface modify -vserver <vserver name> -lif <LIF name> -status
-admin down
network interface modify -vserver <vserver name> -lif <LIF name> -status
-admin up
```

**[`-f, -force <true>`] - Allow Non-Vendor Target Name (privilege: advanced)**

Force the command to accept a target name that would normally be rejected as invalid.

## Examples

```
cluster1::> vserver iscsi modify -vserver vs_1 -status-admin down
```

Modifies the status-admin of the iSCSI service for Vserver vs\_1 to down.

## vserver iscsi show

Display a Vserver's iSCSI configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays the current configuration of the iSCSI service.

### Parameters

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Selects the iSCSI services for the Vserver that matches the parameter value.

**[-target-name <text>] - Target Name**

Selects the iSCSI services with a target name that matches the parameter value.

**[-target-alias <text>] - Target Alias**

Selects the iSCSI services with a target alias that matches the parameter value.

**[-status-admin {down|up}] - Administrative Status**

Selects the iSCSI services with a configured status that matches the parameter value.

**[-retain-timeout <integer>] - RFC3720 DefaultTime2Retain Value (in sec) (privilege: advanced)**

Selects the iSCSI services with a wait time that matches the parameter value. The wait time is the amount of time before active task reassignment is possible after an unexpected connection termination.

**[-login-timeout <integer>] - Login Phase Duration (in sec) (privilege: advanced)**

Selects the iSCSI services with a login phase duration that matches the parameter value.

**[-max-conn-per-session <integer>] - Max Connections per Session (privilege: advanced)**

Selects the iSCSI services with a maximum connection per session that matches the parameter value.

**[-max-ios-per-session <integer>] - Max Commands per Session (privilege: advanced)**

Selects the iSCSI services with a maximum number of commands per session that matches the parameter value.

**[-tcp-window-size <integer>] - TCP Receive Window Size (in bytes) (privilege: advanced)**

Selects the iSCSI services with a TCP receive window size (in bytes) that matches the parameter value.

## Examples

```

cluster1::> vserver iscsi show
              Target                               Target
Status
Vserver      Name                               Alias
Admin
-----
vs_1         iqn.1992-
08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
vs_1_alias
up
1 entries were displayed.

```

```

cluster1::> vserver iscsi show -instance
Vserver: vs_1
              Target Name: iqn.1992-
08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2

```

The following is the output of the show command at the advanced privilege level:

```

Target Alias: vs_1_alias
Administrative Status: up
1 entries were displayed.

```

Displays the output of the show command at the admin privilege level.

```

cluster1::*> vserver iscsi show
              Target                               Target
Status
Vserver      Name                               Alias
Admin
-----
vs_1         iqn.1992-
08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
vs_1_alias
up
1 entries were displayed.

```

Displays the output of the show command at the advanced privilege level.

```
cluster1::*> vserver iscsi show -instance
Vserver: vs_1
                                Target Name: iqn.1992-
08.com.example:sn.c7c82a22bf9f11df83e5123478563412:vs.2
                                Target Alias: vs_1_alias
                                Administrative Status: up
RFC3720 DefaultTime2Retain Value (in sec): 20
                                Login Phase Duration (in sec): 15
                                Max Connections per Session: 4
                                Max I/O per Session: 128
                                TCP Window Size all Sessions (in bytes): 131400
```

Displays the detailed entries for all entries.

## vserver iscsi start

Starts the iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command starts the iSCSI service of a Vserver. You can also use [vserver iscsi modify](#) with "-status-admin up".

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver for the iSCSI service.

### Examples

```
cluster1::> vserver iscsi start -vserver vs_1
```

Starts the iSCSI service for Vserver vs\_1.

### Related Links

- [vserver iscsi modify](#)

## vserver iscsi stop

Stops the iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Stops the iSCSI service of a Vserver. This command shuts down all active iSCSI sessions and stops any new iSCSI sessions. You can also use [vserver iscsi modify](#) with "-status-admin down".

## Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver for the iSCSI service.

## Examples

```
cluster1::> vserver iscsi stop -vserver vs_1
```

Stops the iSCSI service for Vserver vs\_1.

## Related Links

- [vserver iscsi modify](#)

## vserver iscsi command show

Display active iSCSI commands

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays the status of active iSCSI commands in an iSCSI session. If you specify an iSCSI command ID, the command shows what commands are active in a session and is useful for initiator debugging.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display a list of active iSCSI commands that match the Vserver name that you specify.

**[-tpgroup <text>] - Target Portal Group**

Use this parameter to display a list of active iSCSI commands that are within the target portal group.

**[-tsih <integer>] - Target Session ID**

Use this parameter to display a list of active iSCSI commands that match the target session ID handle that you specify.

**[-command-id <integer>] - Command ID**

Use this parameter to display a list of active iSCSI commands that match the command ID that you specify.

**[-initiator-name <text>] - Initiator Name**

Use this parameter to display a list of active iSCSI commands that match the initiator name that you specify.

**[-initiator-alias <text>] - Initiator Alias**

Use this parameter to display a list of active iSCSI commands that match the initiator alias that you specify.

**[-isid <text>] - Initiator Session ID**

Use this parameter to display a list of active iSCSI commands that match the initiator session ID that you specify.

**[-command-sub-id <integer>] - Command Sub ID**

Use this parameter to display a list of active iSCSI commands that match the command sub ID that you specify.

**[-command-state <iSCSI Command States>] - Command State**

Use this parameter to display a list of active iSCSI commands that match the command state that you specify.

**[-command-type {Sequenced|Imm\_Taskmgmt|Imm\_Other}] - Command Type**

If you use this parameter, the command displays a list of active iSCSI commands that contains the specified command type. The command types indicate:

- "Sequenced" — the system processes the commands in sequence
- "Imm\_Taskmgmt" — the system processes the commands immediately
- "Imm\_Other" — the system processes the commands as queued

**Examples**

```
cluster1::> vserver iscsi command show -instance -vserver vs_1
server: vs_1
    Target Portal Group Name: tpgroup_1
    Target Session ID: 2
    Command ID: 20797
    Initiator Name: iqn.1993-08.org.debian:01:fa752b8a5a3a
    Initiator Alias: alias_1
    Initiator Session ID: 00:02:3d:01:00:00
    Command Sub ID: 20797
    Command State: Scsicdb_Waiting_STLayer
    Command Type: Sequenced
```

Displays detailed information for active iSCSI commands in Vserver vs\_1.

## **vserver iscsi connection show**

Display active iSCSI connections

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command displays iSCSI connection information within a session. If you do not specify a connection, the command displays all information for all connections.

An active iSCSI session can contain one or multiple iSCSI connections. If an iSCSI connection has not completed the iSCSI login sequence, the iSCSI session might not contain iSCSI connections.

This command gives real-time status of connection activity. You can use the parameters header-digest-enabled and data-digest-enabled to troubleshoot performance problems.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display iSCSI connections that match the Vserver that you specify.

**[-tpgroup <text>] - Target Portal Group**

Use this parameter to display iSCSI connections that match the target portal group that you specify.

**[-tsih <integer>] - Target Session ID**

Use this parameter to display iSCSI connections that match the target session ID that you specify.

**[-connection-id <integer>] - Connection ID**

Use this parameter to display iSCSI connections that match the connection ID that you specify.

**[-connection-state <iSCSI Connection State>] - Connection State**

Use this parameter to display iSCSI connections that match the connection state you specify.

**[-has-session {true|false}] - Connection Has session**

Specifies if a session is established for a connection. If you enter this command using the parameter without a value, it is set to true, and the command displays all connections that have an established session. If you set this parameter to false, the command displays all connections that do not have established sessions.

**[-lif <text>] - Logical interface**

Use this parameter to display iSCSI connections that match the logical interface that you specify.

**[-tpgroup-tag <integer>] - Target Portal Group Tag**

Use this parameter to display iSCSI connections that use the target portal group tag that you specify.

**[-local-address <text>] - Local IP Address**

Use this parameter to display iSCSI connections that use the local IP address that you specify.

**[-local-ip-port <integer>] - Local TCP Port**

Use this parameter to display iSCSI connections that use the local TCP port that you specify.

**[-authentication-method {CHAP|deny|none}] - Authentication Type**

Use this parameter to display iSCSI connections that match the authentication type that you specify. CHAP requires password validation. Deny does not allow connections. None allows all connections.

**[-data-digest-enabled {true|false}] - Data Digest Enabled**

Specifies if data digest is enabled for a connection. If you enter this command using the parameter without a value, it is set to true, and the command displays all connections that support data digest. If you set this parameter to false, the command displays all connections that do not support data digest.

**[-header-digest-enabled {true|false}] - Header Digest Enabled**

Specifies if header digest is supported. If you enter this command using the parameter without a value, it is set to true, and the command shows all connections that support header digest. If you set this parameter to false, the command displays all connections that do not support header digest.

**[-rcv-window-size <integer>] - TCP/IP Recv Size**

Use this parameter to display iSCSI connections that match the specified negotiated size of the TCP/IP receive window in bytes.

**[-initiator-mrds1 <integer>] - Initiator Max Recv Data Length**

Use this parameter to display iSCSI connections that match the maximum length of message that the initiator can receive.

**[-remote-address <text>] - Remote IP address**

Use the parameter to display iSCSI connections that match the IP address of the initiator that you specify.

**[-remote-ip-port <integer>] - Remote TCP Port**

Use this parameter to display iSCSI connections that match the specified TCP port of initiator that you specify.

**[-target-mrds1 <integer>] - Target Max Recv Data Length**

Use this parameter to display iSCSI connections that match the maximum message size that a target can receive.

## Examples

```
cluster1::> vsriver iscsi connection show -vsriver vs1
```

| Recv<br>Vserver<br>Size | Tpgroup<br>Name | TSIH  | Conn<br>ID | Local<br>Address | Remote<br>Address | TCP |
|-------------------------|-----------------|-------|------------|------------------|-------------------|-----|
| -----                   | -----           | ----- | -----      | -----            | -----             |     |
| vs1<br>131400           | vs1.iscsi       | 6     | 0          | 10.63.8.163      | 10.60.141.65      |     |
| vs1<br>131400           | vs1.iscsi       | 7     | 0          | 10.63.8.163      | 10.62.8.75        |     |

2 entries were displayed.

Displays connection information on Vserver vs1.

## vsvrr iscsi connection shutdown

Shut down a connection on a node

**Availability:** This command is available to *cluster* and *Vsvrr* administrators at the *advanced* privilege level.

### Description

This command shuts down a specified iSCSI connection within a session. If you want to shut down all iSCSI connections in a session, use the [vsriver iscsi session shutdown](#) command.

### Parameters

**-vsriver <Vsvrr Name> - Vsvrr (privilege: advanced)**

Specifies the Vsvrr.

**-tpgroup <text> - Target Portal Group (privilege: advanced)**

Specifies the target portal group that contains the connection you want to shut down.

**-tsih <integer> - Target Session ID (privilege: advanced)**

Specifies the target session ID that you want to shut down.

**-connection-id <integer> - Connection ID (privilege: advanced)**

Specifies the connection ID that you want to shut down.

### Examples

```
cluster1::*> vsriver iscsi connection shutdown -vsriver vs_1 -tpgroup  
tpgroup_1 -tsih 4 -connection-id 0
```

Forces the shutdown of an iSCSI connection with the connection ID of 0 on Vsvrr vs\_1 in tpgroup tpgroup\_1, target session ID 4.

## Related Links

- [vserver iscsi session shutdown](#)

## vserver iscsi initiator show

Display iSCSI initiators currently connected

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays a list of active initiators currently connected to a specified Vserver.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display the active initiators that match the Vserver that you specify.

**[-tpgroup <text>] - Target Portal Group**

Use this parameter to display the active initiators that match the name of the target portal group that you specify.

**[-tsih <integer>] - Target Session ID**

Use this parameter to display the active initiators that match the target session ID you that specify.

**[-initiator-name <text>] - Initiator Name**

Use this parameter to display the active initiators that match the initiator name that you specify.

**[-initiator-alias <text>] - Initiator Alias**

Use this parameter to display the active initiators that match the alias name that you specify.

**[-tpgroup-tag <integer>] - TPGroup Tag**

Use this parameter to display the active initiators that match the target portal group tag that you specify.

**[-isid <text>] - Initiator Session ID**

Use this parameter to display the active initiators that match the initiator session ID that you specify.

**[-igroup <text>,...] - Igroup Name**

Use this parameter to display the active initiators that match the initiator group that you specify.

## Examples

```
cluster1::> vsriver iscsi initiator show -vsriver vs_1

      Tpgroup      Initiator
Vserver Name      TSIH Name      ISID      IGroup
-----
vs_1      vs_1.iscsi  6 iqn.1994-05.com.redhat:6ed6dfb0489e
                                00:02:3d:03:00:00 -
vs_1      vs_1.iscsi  7 iqn.1993-08.org.debian:01:fa752b8a5a3a
                                00:02:3d:01:00:00 igroup_1
2 entries were displayed.
```

Displays the active initiator information on Vserver vs\_1.

## vsriver iscsi interface disable

Disable the specified interfaces for iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command disables the specified logical interfaces for an iSCSI service. Once disabled, all subsequent attempts to establish new iSCSI connections over the logical interface will fail.

### Parameters

**-vsriver <Vserver Name> - Vserver**

Specifies the Vserver.

**{ -lif <lif-name>, ... - Logical Interface**

Specifies the logical interfaces on a Vserver you want to disable.

**| -a, -all <true> - All }**

Specifies that all logical interfaces on the Vserver are disabled.

**[-f, -force <true>] - Force**

When set to true, forces the termination of any active iSCSI sessions without prompting you for a confirmation.

## Examples

```
cluster1::> vsriver iscsi interface disable -vsriver vs_1 -lif vs_1.iscsi
```

Disables the iscsi logical interface vs\_1.iscsi on Vserver vs\_1.

## vserver iscsi interface enable

Enable the specified interfaces for iSCSI service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command enables specified logical interfaces for iSCSI Vserver service. Once enabled, your system accepts new iSCSI connections and services iSCSI requests over the newly enabled logical interfaces.

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver.

**{ -lif <lif-name>, ... - Logical Interface**

Specifies the logical interfaces on a Vserver that you want to enable.

**| -a, -all <true> - All }**

When set to true, all logical interfaces are enabled. If you use this parameter without a value, it is set to true, and the command enables all logical interfaces.

### Examples

```
cluster1::> vserver iscsi interface enable -vserver vs_1 -lif vs_1.iscsi
```

Enables the iscsi logical interface vs\_1.iscsi on Vserver vs\_1.

## vserver iscsi interface modify

Modify network interfaces used for iSCSI connectivity

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver iscsi interface modify` command modifies the iSCSI specific configuration for an iSCSI LIF.

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver.

**-lif <lif-name> - Logical Interface**

Use this parameter to specify the logical interface on a Vserver that you want to modify.

### **[`-sendtargets-fqdn <text>`] - iSCSI Discovery SendTargets FQDN (privilege: advanced)**

Use this parameter to specify the Fully Qualified Domain Name (FQDN) to return during an iSCSI Discovery SendTargets operation. To clear the FQDN, set this parameter to "". If unset, the IP address of the LIF is used in iSCSI SendTargets discovery. + This is not part of iSNS and will not affect the iSNS configuration.

### **Examples**

The following example modifies the `sendtargets-fqdn` of the iSCSI LIF `vs1_iscsi1` for Vserver `vs1` to `myhost.example.com`.

```
cluster1:> vserver iscsi interface modify -vserver vs1 -lif vs1_iscsi1
-sendtargets_fqdn myhost.example.com
```

## **vserver iscsi interface show**

Show network interfaces used for iSCSI connectivity

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command shows the iSCSI logical interfaces for a specified Vserver. If you do not specify any of the parameters, the command displays all of the interfaces on a Vserver.

### **Parameters**

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <Vserver Name>`] - Vserver**

Use this parameter to display iSCSI logical interfaces that match the Vserver that you specify.

**[`-lif <lif-name>`] - Logical Interface**

Use this parameter to display iSCSI logical interfaces that that you specify.

**[`-status-admin {up|down}`] - Administrative Status**

Specifies the configured status of the logical interface. If you set this parameter to `up`, the command displays all iSCSI logical interfaces with the administrative status of `up`. If you set this parameter to `down`, the command displays all the iSCSI logical interfaces with the administrative status of `down`.

**[`-status-oper {up|down}`] - Operational Status**

Specifies the current status of the logical interface. If you set this parameter to `up`, the command displays all the iSCSI logical interfaces with the operational status of `up`. If you set this parameter to `down`, the command displays all the iSCSI logical interfaces with the operational status of `down`.

**[`-enabled {true|false}`] - Enabled**

Specifies if this logical unit is enabled for iSCSI service. If you enter this command without a parameter, its effective value is true, and the command displays all the enabled iSCSI logical interfaces.

**[`-address <IP Address>`] - IP Address**

Use this parameter to display iSCSI logical interfaces that match the IP address that you specify.

**[`-ip-port <integer>`] - IP Port Number**

Use this parameter to display iSCSI logical interfaces that match IP port number for the logical interface that you specify.

**[`-curr-node <nodename>`] - Current Node**

Use this parameter to display iSCSI logical interfaces that match current node that you specify.

**[`-curr-port {<netport>|<ifgrp>}`] - Current Port**

Use this parameter to display iSCSI logical interfaces that match specified current physical port that you specify.

**[`-is-home {true|false}`] - Is Home**

Specifies if the node hosting the logical interface is the initially configured node. If you use this command without using this parameter, it is set to true, and the command displays all iSCSI interfaces that are on the initially configured node.

**[`-tpgroup <text>`] - TPGGroup Name**

Use this parameter to display iSCSI logical interfaces that match the target portal group name that you specify.

**[`-t, -tpgroup-tag <integer>`] - TPGGroup Tag**

Use this parameter to display iSCSI logical interfaces that match the target portal group tag that you specify.

**[`-relative-port-id <integer>`] - Relative Port ID**

Use this parameter to display the iSCSI logical interface that matches the relative target port ID that you specify. The system assigns each logical interfaces and target portal group a relative target port ID that is Vserver unique. You cannot change this ID.

**[`-sendtargets-fqdn <text>`] - iSCSI Discovery SendTargets FQDN (privilege: advanced)**

Use this parameter to display the iSCSI logical interfaces that match the iSCSI Discovery SendTargets Fully Qualified Domain Name (FQDN) that you specify.

**[`-home-node <nodename>`] - Home Node**

Use this parameter to display iSCSI logical interfaces that match home node that you specify.

**[`-home-port {<netport>|<ifgrp>}`] - Home Port**

Use this parameter to display iSCSI logical interfaces that match specified home physical port that you specify.

## Examples

The following example displays information for logical interfaces on Vserver vs\_1.

```
cluster1::> vserver iscsi interface show -vserver vs_1
```

| Vserver | Logical Interface | TPGT | Status Admin/Oper | IP Address  | Curr Node | Curr Port |
|---------|-------------------|------|-------------------|-------------|-----------|-----------|
| vs_1    | vs_1.iscsi        | 1027 | up/up             | 10.63.8.165 | node1     | e0c       |
| vs_1    | vs_1.iscsi2       | 1028 | up/up             | 10.63.8.166 | node1     | e0c       |

2 entries were displayed.

The following example displays the logical interface vs\_1.iscsi with the relative target port ID of 1.

```
cluster1::> vserver iscsi interface show -vserver vs_1 -relative-port-id 1
```

| Vserver | Logical Interface | TPGT | Status Admin/Oper | IP Address  | Curr Node | Curr Port |
|---------|-------------------|------|-------------------|-------------|-----------|-----------|
| vs_1    | vs_1.iscsi        | 1027 | up/up             | 10.63.8.165 | node1     | e0c       |

## vserver iscsi interface accesslist add

Add the iSCSI LIFs to the accesslist of the specified initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command adds network interfaces to an access list for a specified initiator. An access list ensures that an initiator only logs in with IP addresses associated with the interfaces defined in the access list.

You can restrict an initiator to certain network interfaces to improve performance and security. Access lists are useful where a particular initiator cannot access all of the network interfaces on a node.

Access list policies are based on the interface name. The accesslist rules are:

- If you disable the network interface for iSCSI through the [vserver iscsi interface disable](#) command, for example, the network interface is not accessible to any initiator regardless of any access lists in effect.
- If an initiator does not have an access list, that initiator can access any iSCSI-enabled network interface.
- If an initiator has an access list, that initiator can only login to network interfaces in its access list. Additionally, the initiator cannot discover any IP addresses that are not on this access list. If an initiator sends an iSCSI sendtargets request, the node responds with a list of IP addresses for iSCSI data logical

interfaces that are in its access list.

- If an initiator does not have an access list, you automatically create an access list when you issue the `vserver iscsi interface accesslist add` command.
- If you remove all the interfaces from the access list of an initiator with the [vserver iscsi interface accesslist remove](#) command, the accesslist is also deleted.
- Creating or modifying access list requires that initiator log out and log back in before changes take effect.

When you use the add or remove commands, the system warns you if an iSCSI session could be affected.

You will not affect any iSCSI sessions if you use the `-a` parameter when adding or removing all interfaces.

## Parameters

### **-vserver <Vserver Name> - Vserver**

Specifies the Vserver name.

### **-initiator-name <text> - Initiator Name**

Specifies the initiator you want to add to the access list.

### **{ -lif <lif-name>, ... - Logical Interface**

Specifies the lif you want to add to an access list.

### **| -a, -all <true> - All }**

If you use this parameter without a value, it is set to true, and the command adds all iSCSI data logical interfaces for a vserver to an initiator's accesslist. If the initiator does not have an accesslist, the system creates a new accesslist.

### **[-f, -force <true>] - Force**

If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

## Examples

```
cluster1::> vserver iscsi interface accesslist add -vserver vs_1
-initiator-name iqn.1992-08.com.example:abcdefg -a
```

Adds the initiator `iqn.1992-08.com.example:abcdefg` on Vserver `vs_1` for all iSCSI data logical interfaces in `vs_1`.

## Related Links

- [vserver iscsi interface disable](#)
- [vserver iscsi interface accesslist remove](#)

## vserver iscsi interface accesslist remove

Remove the iSCSI LIFs from the accesslist of the specified initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command removes network interfaces from an access list for a specified initiator. The system removes the access list when the list is empty. When you remove a network interface from an initiator, this action could result in the shutdown of active sessions.

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver name.

**-initiator-name <text> - Initiator Name**

Specifies the initiator that you want to remove logical interfaces from.

**{ -lif <lif-name>, ... - Logical Interface**

Specifies the logical interface you want to remove.

**| -a, -all <true> - All }**

If you use this parameter without a value, it is set to true, and the command removes all of the iSCSI data logical interfaces from an initiator's accesslist. If you remove all the network interfaces from an access list, the system removes the access list.

**[-f, -force <true>] - Force**

If you use this parameter without a value, it is set to true, and the command does not prompt you when an active iSCSI service or any active iSCSI data logical interfaces could be affected. If you do not use this parameter, the command prompts for confirmation if the iSCSI service is active or if any active data logical interfaces would be affected.

### Examples

```
cluster1::> vserver iscsi interface accesslist remove -vserver vs_1  
-initiator-name iqn.1992-08.com.example:abcdefg -a
```

Removes all the network interfaces from the access list for initiator iqn.1992-08.com.example:abcdefg on Vserver vs\_1.

## vserver iscsi interface accesslist show

Show accesslist of the initiators for iSCSI connectivity

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command displays an access list for an initiator. An access list is a list of logical interfaces that an initiator can use for iSCSI logins. The system records the access lists as part of the node configuration and preserves the access lists during reboots.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display the access lists that match the Vserver name that you specify.

**[-initiator-name <text>] - Initiator Name**

Use this parameter to display the access lists that match the initiator that you specify.

**[-lif <lif-name>] - Logical Interface**

Use this parameter to display the access lists that match the logical interface that you specify.

**Examples**

```
cluster1::> vservice iscsi interface accesslist show -vserver vs1
Vserver           Initiator Name           Logical Interface
-----
vs1               iqn.2010-01.com.example:aaaaa isw1
                                     isw2
                                     iqn.2010-01.com.example:aaabb isw1
                                     isw2
4 entries were displayed.
```

Displays the access lists for vservice vs1.

**vservice iscsi isns create**

Configure the iSNS service for the Vservice

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

**Description**

This command creates and starts an iSNS service with the IP address of the iSNS server.

A Vserver management LIF must exist before you can create an iSNS service. This LIF is used to communicate with the iSNS server. To create a Vserver management LIF, use the [network interface create](#) command, with `-role data` and `-data-protocol none`.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to create.

### **-address <IP Address> - iSNS Server IP Address**

Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vservers management LIF.

A default route must exist for the specified vservers. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

### **[-status-admin {down|up}] - Administrative Status**

Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

### **[-force <true>] - Force**

`vserver iscsi isns create` fails if vservers management LIF is not configured. When you set this option to "true," you create an iSNS service on a Vserver even if the vservers does not have a vservers management LIF.

## Examples

```
cluster1::> vserver iscsi isns create -vserver vs_1 -address 10.60.1.1
-status-admin up
```

Creates the iSNS service for Vserver vs\_1 using the IPv4 address.

```
cluster1::> vserver iscsi isns create -vserver vs_1 -address
fd20:8b1e:b255:840b:a0df:565b:19b5:4d06 -status-admin up
```

Creates the iSNS service for Vserver vs\_1 using the IPv6 address.

## Related Links

- [network interface create](#)

## vserver iscsi isns delete

Remove the iSNS service for the Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command deletes the iSNS service for the Vserver.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to delete.

## Examples

```
cluster1::> vserver iscsi isns delete -vserver vs_1
```

Deletes the iSNS service for Vserver vs\_1.

## vserver iscsi isns modify

Modify the iSNS service for the Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command modifies the configuration of an iSNS service.

Modifications take effect immediately after you execute the command.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to modify.

**[-address <IP Address>] - iSNS Server IP Address**

Specifies the IP address of the iSNS server. Both IPv4 and IPv6 address families are supported. The address family must be the same as that of the vserver management LIF.

A default route must exist for the specified vserver. To create a route, use the `network routing-groups route create` command. To view existing routes, use the `network routing-groups route show` command.

**[-status-admin {down|up}] - Administrative Status**

Specifies the administrative status of the iSNS service of a Vserver. If you set this parameter to up, the iSNS service starts for the Vserver, and registers with the configured iSNS server. If you set this parameter to down, the Vserver loses its ability to register with the iSNS server and to be discovered by iSNS clients.

**[-force <true>] - Force**

`vserver iscsi isns modify` fails to modify the iSNS server address if vserver management LIF is not configured. When you set this option to "true," you can modify the iSNS service on a Vserver even if the

vserver does not have a vserver management LIF.

## Examples

```
cluster1::> iscsi isns modify -vserver vs_1 -status-admin up
```

Modifies the status-admin of the iSNS service for Vserver vs\_1 to up.

## vserver iscsi isns show

Show iSNS service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Shows the iSNS service configuration.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the iSNS services that match the Vserver name that you specify.

**[-address <IP Address>] - iSNS Server IP Address**

Use this parameter to display the iSNS services that match the IP address of the iSNS server that you specify.

**[-status-admin {down|up}] - Administrative Status**

Use this parameter to display the iSNS services that match the configured status of the service that you specify.

**[-entity-id <text>] - iSNS Server Entity Id**

Use this parameter to display the iSNS services that match the configured iSNS server entity-id that you specify.

**[-last-successful-update <MM/DD/YYYY HH:MM:SS>] - Last Successful Update**

Use this parameter to display the iSNS services that match the time of the last successful attempt.

**[-last-update-attempt <MM/DD/YYYY HH:MM:SS>] - Last Update Attempt**

Use this parameter to display the iSNS services that match the time of the last update attempt.

## **[*-last-update-result* <isnsErrors>] - Last Update Result**

Use this parameter to display the iSNS services that match the result of the last update attempt.

### **Examples**

```
cluster1::> vsserver iscsi isns show
Vserver      iSNS Server Entity Identifier    iSNS Server IP Address iSNS
Status
-----
iscsi_vs     isns:00000044                    10.229.136.188         up
```

Displays the output of the show command for all Vservers in a cluster.

```
cluster1::> vsserver iscsi isns show -instance
      Vserver Name: vs1
iSNS Server IP Address: 10.72.19.11
Administrative Status: up
iSNS Server Entity Id: isns.0000001c
Last Successful Update: 11/12/2011 10:18:45
  Last Update Attempt: 11/12/2011 10:18:45
    Last Update Result: iSNS_Ok

Vserver Name: vs2
iSNS Server IP Address: 10.72.16.13
Administrative Status: up
iSNS Server Entity Id: isns.0000001b
Last Successful Update: 11/12/2011 13:38:05
  Last Update Attempt: 11/12/2011 13:38:05
    Last Update Result: iSNS_Ok

2 entries were displayed.
```

Displays the details for all Vservers in a cluster.

## **vsserver iscsi isns start**

Starts the iSNS service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

Starts the iSNS service. Once you start the iSNS service, the Vserver automatically register with the iSNS server.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to start.

## Examples

```
cluster1::> vserver iscsi isns start -vserver vs_1
```

Starts the iSNS service for Vserver vs\_1.

## **vserver iscsi isns stop**

Stops the iSNS service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Stops the iSNS service. Once you stop the iSNS service, the Vserver loses the ability to register with the iSNS server and to be discovered by iSNS clients.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to stop.

## Examples

```
cluster1::> vserver iscsi isns stop -vserver vs_1
```

Stops the iSNS service for Vserver vs\_1.

## **vserver iscsi isns update**

Force update of registered iSNS information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Forces an update of the registration information with the iSNS server. Normally, the system checks for iSNS configuration changes on the Vserver every few minutes and automatically sends updates to the iSNS server.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the iSNS service that you want to update.

## Examples

```
cluster1::> vserver iscsi isns update -vserver vs_1
```

Updates the iSNS server registration for Vserver vs\_1.

## vserver iscsi security add-initiator-address-ranges

### Add IP Address Ranges

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Add IP address ranges to an existing iSCSI security entry

### Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver.

**-i, -initiator-name <text> - Initiator Name**

Specifies the initiator.

**-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>} - Initiator IP Address Ranges**

Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

## Examples

```
cluster1::> vserver iscsi security add-initiator-address-range  
-vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4  
-initiator-address-range 192.168.2.1-192.168.2.255
```

Adds the IP address range 192.168.2.1-192.168.2.255 to initiator iqn.1993-08.com.example:01:e3f87c7cf2e4 for vserver vs1.

## vserver iscsi security create

### Create an iSCSI authentication configuration for an initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command configures the security method for an iSCSI initiator on a Vserver. The outbound CHAP password and user name are optional. If you want mutual authentication, you need to configure both inbound and outbound CHAP passwords and user names.

You cannot use the same password for inbound and outbound settings.

## Parameters

**-vserver <Vserver Name> - Vserver**

Specifies the Vserver.

**-i, -initiator-name <text> - Initiator Name**

Specifies the initiator that you want to create a security method for. You can use either an iqn such as iqn.1995-08.com.example:string or eui such as eui.0123456789abcdef for the initiator.

**-s, -auth-type {CHAP|deny|none} - Authentication Type**

Specifies the authentication type:

- CHAP - Authenticates using a CHAP user name and password.
- none - The initiator can access the Vserver without authentication.
- deny - The initiator cannot access the Vserver.

**[-n, -user-name <text>] - Inbound CHAP User Name**

Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

**[-m, -outbound-user-name <text>] - Outbound CHAP User Name**

Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

**[-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>}] - Initiator IP Address Ranges**

Specifies one or more initiator source IP address ranges. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

## Examples

```
cluster1::> vservers iscsi security create -vservers vs_1
-initiator-name eui.0123456789abcdef -auth-type CHAP -user-name bob
-outbound-user-name bob2
```

Password: {enter password}

Outbound Password: {enter password}

Creates authentication method chap for initiator eui.0123456789abcdef with inbound and outbound usernames and passwords.

```
cluster1::> vservers iscsi security create -vservers vs_1
-initiator-name iqn.1995-08.com.example:e3f87c7cf2e4 -auth-type none
-initiator-address-ranges 192.168.1.1-192.168.1.255
```

Creates authentication method for initiator iqn.1993-08.com.example:01:e3f87c7cf2e4 with IP address validation only.

## vservers iscsi security default

### Configure the default authentication settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command defines a default iSCSI authentication method for your Vserver. If you do not configure the initiator to use a user-defined authentication method, the system assigns the default authentication method automatically to the initiator. Use the [vservers iscsi security create](#) command if you want to configure a user-defined authentication method.

The outbound CHAP user name and password are optional. If you want a bi-directional handshake, provide the outbound user name and you will be prompted for the corresponding password.

You cannot use the same password for inbound and outbound settings.

#### Parameters

**-vservers <Vserver Name> - Vserver**

Specifies the Vserver.

**-s, -auth-type {CHAP|deny|none} - Authentication Method**

Specifies the authentication type:

- CHAP - Authenticates using a CHAP user name and password.
- none - The initiator can access the Vserver without authentication.
- deny - The initiator cannot access the Vserver.

### **[*-n*, *-user-name* <text>] - Inbound CHAP User Name**

Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

### **{ [*-m*, *-outbound-user-name* <text>] - Outbound CHAP User Name**

Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

### **[*-clear-outbound* <true>] - Clear Outbound CHAP Parameters }**

Removes the outbound user name and the outbound password information from the default authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.

## **Examples**

```
cluster1::> vservers iscsi security default -vservers vs1 -auth-type chap
-user-name bob -outbound-user-name bob_out
```

```
Password:
```

```
Outbound Password:
```

Sets the default authentication method to CHAP with inbound and outbound user names and passwords.

- [vservers iscsi security create](#)

## **vservers iscsi security delete**

Delete the iSCSI authentication configuration for an initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command removes the security settings for this initiator. The default authentication setting now applies to this initiator.

## **Parameters**

### ***-vservers* <Vserver Name> - Vserver**

Specifies the Vserver.

### ***-i*, *-initiator-name* <text> - Initiator Name**

Specifies the initiator that you want to remove the authentication setting from.

## **Examples**

```
cluster1::> vsserver iscsi security delete -vsserver vs1 -initiator-name
iqn.1992-08.com.example:abcdefg
```

Deletes initiator iqn.1992-08.com.example:abcdefg on Vserver vs1 from the authentication setting. The default authentication now applies to this initiator.

## vsserver iscsi security modify

Modify the iSCSI authentication configuration for an initiator

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The command modifies an existing authentication method for an initiator. To delete the authentication setting for an initiator, use the [vsserver iscsi security delete](#) command.

The outbound CHAP password and user name are optional. If you want a bi-directional handshake, you need to configure both inbound and outbound CHAP passwords and user names.

You do not need to know the inbound or outbound passwords to change them.

### Parameters

**-vsserver <Vserver Name> - Vserver**

Specifies the Vserver.

**-i, -initiator-name <text> - Initiator Name**

Specifies the initiator name that you want to modify the existing authentication method.

**[-s, -auth-type {CHAP|deny|none}] - Authentication Type**

Specifies the authentication type:

- CHAP - Authenticates using a CHAP user name and password.
- none - The initiator can access the Vserver without authentication.
- deny - The initiator cannot access the Vserver.

**[-n, -user-name <text>] - Inbound CHAP User Name**

Specifies the inbound CHAP user name. CHAP user names can be one to 128 bytes. A null user name is not allowed. If provided, you will be prompted to provide the corresponding inbound CHAP password.

**{ [-m, -outbound-user-name <text>] - Outbound CHAP User Name**

Specifies the outbound CHAP user name. CHAP user names can be one to 128 bytes. If provided, you will be prompted to enter the corresponding outbound CHAP password.

**[-clear-outbound <true>] - Clear Outbound CHAP Parameters }**

Removes the outbound user name and the outbound password information from the authentication method. After you clear the outbound information, you no longer have a bi-directional handshake.

## Examples

```
cluster1::> vservers iscsi security modify -vservers vs_1 -initiator-name
iqn.1992-08.com.example:abcdefg -auth-type chap -user-name bob -outbound
-user-name bob_out
```

Password:

Outbound Password:

Changes user names and passwords for initiator iqn.1992-08.com.example:abcdefg on Vserver vs\_1.

## Related Links

- [vservers iscsi security delete](#)

## vservers iscsi security prepare-to-downgrade

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command prepares the cluster for a downgrade to an earlier version of ONTAP. Before using this command verify that all security entries do not have any initiator address ranges defined. This may be done by running the command [vservers iscsi security show address-ranges](#)

## Examples

```
cluster1::> vservers iscsi security prepare-to-downgrade
```

The above example will verify that the cluster is able to downgrade to a prior release of ONTAP.

## Related Links

- [vservers iscsi security show](#)

## vservers iscsi security remove-initiator-address-ranges

Remove an IP Address Range

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Remove IP address ranges to an existing iSCSI security entry

## Parameters

### **-vserver <Vserver Name> - Vserver**

Specifies the Vserver.

### **-i, -initiator-name <text> - Initiator Name**

Specifies the initiator.

### **-initiator-address-ranges {<ipaddr>|<ipaddr>-<ipaddr>} - Initiator IP Address Ranges**

Specifies one or more initiator source IP address range. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

## Examples

```
netapp-clus-1::> vsriver iscsi security remove-initiator-address-range
-vserver vs1 -initiator-name iqn.1993-08.com.example:01:e3f87c7cf2e4
-initiator-address-range 192.168.2.1-192.168.2.255
```

Removes the IP address range 192.168.2.1-192.168.2.255 to the initiator iqn.1993-08.com.example:01:e3f87c7cf2e4 for vsriver vs1.

## **vsriver iscsi security show**

Show the current iSCSI authentication configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays the default authentication and all initiator-specific authentication information. ONTAP authentication overrides all other service authentication methods.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-address-masks ]**

Display the list of IP Address ranges in CIDR notation that each initiator is allowed to originate from. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

**| [-address-ranges ]**

Display the list of IP Address ranges that each initiator is allowed to originate from. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address

and an end address. The start and end addresses themselves are included in the range.

**[`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver` <Vserver Name>] - Vserver**

Use this parameter to display authentication information that matches the Vserver name that you specify.

**[`-i`, `-initiator-name` <text>] - Initiator Name**

Use this parameter to display authentication information that matches the initiator that you specify.

**[`-s`, `-auth-type` {CHAP|deny|none}] - Authentication Type**

Use this parameter to display authentication information that matches the authentication type that you specify.

**[`-n`, `-user-name` <text>] - Inbound CHAP User Name**

Use this parameter to display authentication information that matches the inbound CHAP user name that you specify.

**[`-m`, `-outbound-user-name` <text>] - Outbound CHAP User Name**

Use this parameter to display authentication information that matches the outbound CHAP user name that you specify.

**[`-auth-chap-policy` <local>] - Authentication CHAP Policy**

Use this parameter to display authentication information that matches the authentication CHAP policy that you specify.

**[`-initiator-address-ranges` {<ipaddr>|<ipaddr>-<ipaddr>}] - Initiator IP Address Ranges**

Use this parameter to display authentication information that matches the initiator address range that you specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range is: '192.168.1.100-192.168.1.150'.

An example of a valid IPv6 address range is: '2001:db8::1000:1-2001:db8::1000:50'.

**[`-initiator-address-masks` <IP Address/Mask>, ...] - Initiator IP Address Masks**

Use this parameter to display authentication information that matches the initiator address masks that you specify. If this list is empty, the initiator is allowed to log in from any IP address. The IPv4 or IPv6 address range contains a start address and an end address. The start and end addresses themselves are included in the range.

An example of a valid IPv4 address range in CIDR notation is: 192.168.1.3/32.

An example of a valid IPv6 address range in CIDR notation is: 2001:db8::1000:1/128.

## Examples

```
cluster1::> vserver iscsi security show -vserver vs1
```

|         |                                 | Auth  | Auth CHAP | Inbound CHAP | Outbound  |

2 entries were displayed.

Displays the initiator and their valid address ranges for Vserver vs1.

## vserver iscsi session show

### Display iSCSI sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays iSCSI session information. If you do not specify the target session ID (TSIH), the command displays all session information for the specified Vserver. If a Vserver is not specified, the command displays all session information in the cluster. Use the [vserver iscsi connection show](#) command to display connection information. Use the [vserver iscsi session parameter show](#) command to show the parameters used when creating the session.

You can use session information for troubleshooting performance problems.

An iSCSI session can have one or multiple connections. Typically a session has at least one connection.

Most of the parameters are read-only. However, some parameters can be modified with the [vserver iscsi modify](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display iSCSI session information that matches the Vserver name that you specify.

**[-tpgroup <text>] - Target Portal Group**

Use this parameter to display iSCSI session information that matches the target portal group name that you specify.

**[-tsih <integer>] - Target Session ID**

Use this parameter to display iSCSI session information that matches the target session ID that you specify.

**[-max-ios-per-session <integer>] - Max Commands per Session**

Use this parameter to display iSCSI session information that matches the maximum commands per session count you specify.

**[-data-pdu-in-order {true|false}] - Data PDU in Order**

Specifies if the data PDUs are in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

**[-data-sequence-in-order {true|false}] - Data Sequence in Order**

Specifies if the data is in sequence order. If you enter this command without using this parameter, it is set to true, and the command displays all session information where data sequence is supported. If you provide a false value, the command displays all session information that does not support data sequence.

**[-default-time-to-retain <integer>] - Default Time to Retain**

Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

**[-default-time-to-wait <integer>] - Default Time to Wait**

Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

**[-error-recovery-level <integer>] - Error Recovery Level**

Use this command to display session information that matches the error recovery level that you specify.

**[-first-burst-length <integer>] - First Burst Length**

Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-

out PDU. The first burst length must not exceed the maximum burst length.

**`[-immediate-data-enabled {true|false}] - Immediate Data`**

Specifies if immediate data is supported. When immediate data is supported, the initiator can send immediate data. If you enter this command using the parameter without a value, it is set to true, and the command displays all session information that supports immediate data. If you provide a false value, the command displays all session information that does not support immediate data.

**`[-initiator-alias <text>] - Initiator Alias`**

Use this parameter to display iSCSI session information that matches the alias name of the initiator that you specify.

**`[-initial-r2t-enabled {true|false}] - Initial R2T Enabled`**

Specifies if the initiator supports Initial Ready to Transfer (R2T). R2T is the mechanism that allows the target to request the initiator for output data. If you enter this command using the parameter without a value, it is set to true, and the command displays all session information that supports initial R2T data. If you provide a false value, the command displays all session information that does not support initial R2T data.

**`[-initiator-name <text>] - Initiator Name`**

Use this parameter to display the iSCSI session information that matches the initiator name that you specify.

**`[-isid <text>] - Initiator Session ID`**

Use this parameter to display iSCSI session information that matches the initiator session ID that you specify.

**`[-max-burst-length <integer>] - Max Burst Length for Session`**

Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

**`[-max-connections <integer>] - Max Connections for Session`**

Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

**`[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session`**

Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

**`[-session-type <iSCSI Session Type>] - Session Type`**

Use this parameter to display iSCSI session information that matches the session type that you specify.

**`[-tpgroup-tag <integer>] - Target Portal Group Tag`**

Use this parameter to display iSCSI session information that matches the target portal group tag that you specify.

**`[-connection-ids <integer>,...] - Active Connection IDs`**

Use this parameter to display iSCSI session information that matches the active connection IDs that you specify.

## Examples

```
cluster1::> vserver iscsi session show -vserver vs_1
```

| Vserver | Tpgroup   | TSIH  | Initiator                              | Initiator       |
|---------|-----------|-------|----------------------------------------|-----------------|
| Name    |           |       | Name                                   | Alias           |
| -----   | -----     | ----- | -----                                  | -----           |
| vs_1    | tpgroup_1 | 2     | iqn.1993-08.org.debian:01:fa752b8a5a3a |                 |
|         |           |       | 00:02:3d:01:00:00                      | initiator-alias |

Displays session information for all sessions on Vserver vs\_1.

## vserver iscsi session shutdown

Shut down a session on a node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command forces a shutdown of all connections in a session. If you want to shut down a single connection in a session, use the [vserver iscsi connection shutdown](#) command.

### Parameters

**-vserver <Vserver Name> - Vserver (privilege: advanced)**

Specifies the Vserver.

**-tpgroup <text> - Target Portal Group (privilege: advanced)**

Specifies the target portal group that contains the session you want to shutdown.

**-tsih <integer> - Target Session ID (privilege: advanced)**

Specifies the target session ID that you want to shut down.

## Examples

```
cluster1::*> vserver iscsi session shutdown -vserver vs_1 -tpgroup  
tpgroup_1 -tsih 2
```

Forces a session shutdown for target session ID 2 in tpgroup\_1 in Vserver vs\_1 .

- [vserver iscsi connection shutdown](#)

## vserver iscsi session parameter show

Display the parameters used to establish an iSCSI session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays session parameter information. This command is intended for troubleshooting performance problems.

Most of the parameters are read-only. However, some parameters can be modified with the [vserver iscsi modify](#) command.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display session information that matches the Vserver name that you specify.

**[-tpgroup <text>] - Target Portal Group**

Use this parameter to display session information that matches the target portal group name that you specify.

**[-tsih <integer>] - Target Session ID**

Use this parameter to display session information that matches the target session ID that you specify.

**[-cmd-window-size <integer>] - Max Commands per Session**

Use this parameter to display session information that matches the command window size that you specify.

**[-data-pdu-in-order {true|false}] - Data PDU in Order**

Use this parameter to display session information with the value of the Protocol Data Units (PDU) in order flag you specify. This parameter indicates if the data within a sequence can be in any order or must be in sequence. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports PDUs in order. If you provide a false value, the command displays all session information that does not support PDUs in order.

**[-data-sequence-in-order {true|false}] - Data Sequence in Order**

Use this parameter to display session information with the value of the data sequence in order flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports data sequence. If you set the values to false, the command displays all

session information that does not support data sequence.

**[`-default-time-to-retain <integer>`] - Default Time to Retain**

Use this parameter to display session information that matches the retain time that you specify. This value specifies the amount of time before active reassignment is possible after an unexpected connection termination or a connection reset. A value of 0 means the connection task state is immediately discarded by the target.

**[`-default-time-to-wait <integer>`] - Default Time to Wait**

Use this parameter to display session information that matches the logout or active task assignment wait time that you specify. Wait time refers to the amount of time before attempting an explicit or implicit logout or active task assignment after an unexpected connection termination or connection reset.

**[`-error-recovery-level <integer>`] - Error Recovery Level**

Use this command to display session information that matches the error recovery level that you specify.

**[`-first-burst-length <integer>`] - First Burst Length**

Use this parameter to display session information that matches the first burst length that you specify. First burst length is the maximum amount of unsolicited data in bytes that can be sent during the execution of a single iSCSI packet. First burst length covers the total amount of immediate data and the unsolicited data-out PDU. The first burst length must not exceed the maximum burst length.

**[`-immediate-data-enabled {true|false}`] - Immediate Data**

Use this parameter to display session information with the value of the immediate data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports immediate data. If you set the value to false, the command displays all session information that does not support immediate data.

**[`-initial-r2t-enabled {true|false}`] - Initial R2T Enabled**

Use this parameter to display session information with the value of the R2T data-enabled flag that you specify. If you enter this command without using this parameter, it is set to true, and the command displays all session information that supports R2T data. If you set the value to false, the command displays all session information that does not support R2T data.

**[`-initiator-alias <text>`] - Initiator Alias**

Use this parameter to display iSCSI session information that matches the initiator alias name you specify.

**[`-initiator-name <text>`] - Initiator Name**

Use this parameter to display iSCSI session information that matches the initiator name you specify.

**[`-isid <text>`] - Initiator Session ID**

Use this parameter to display iSCSI session information that matches the initiator session identifier you specify.

**[`-max-burst-length <integer>`] - Max Burst Length for Session**

Use this parameter to display iSCSI session information that matches the maximum burst length that you specify. Maximum burst length is the maximum iSCSI data payload in bytes for a data-in or solicited data-out sequence.

### **[-max-connections <integer>] - Max Connections for Session**

Use this parameter to display iSCSI session information that matches the maximum number of connections that you specify.

### **[-max-outstanding-r2t <integer>] - Max Outstanding R2T for Session**

Use this parameter to display iSCSI session information that matches the maximum number of outstanding R2T per task that you specify.

### **[-session-type <iSCSI Session Type>] - Session Type**

Use this parameter to display iSCSI session information that matches the session type you specify.

### **[-tpgroup-tag <integer>] - Target Portal Group Tag**

Use this parameter to display iSCSI session information that matches the target portal group tag you specify.

### **[-initiator-mrds1 <integer>,...] - Initiator Max Recv Data Len**

Use this parameter to display iSCSI session information that matches the initiator maximum receivable data segment length you specify. An iSCSI initiator declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

### **[-target-mrds1 <integer>,...] - Target Max Recv Data Len**

Use this parameter to display iSCSI session information that matches the target maximum receivable data segment length you specify. An iSCSI target declares the maximum data segment length in bytes it can receive in an iSCSI PDU during the iSCSI login phase.

## **Examples**

```
cluster1:> iscsi session parameter show -vserver vs_1
      Tpgroup      Max  Data PDU Data Seq Time 2 Time 2 Error  Imm
Initial
Vserver Name      TSIH Conn In Order In Order Retain Wait  Rec Lvl Data
R2T
-----
vs_1      vs_1.iscsi 6      1 true      true      0      2      0 true
false
vs_1      vs_1.iscsi 7      1 true      true      0      2      0 true
false
2 entries were displayed.
```

Lists iSCSI session parameters for Vserver vs\_1.

# vserver locks commands

## vserver locks break

Break file locks based on a set of criteria

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver locks break` command breaks one or more locks.

### Parameters

**{ -vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver containing the lock.

**-volume <volume name> - Volume (privilege: advanced)**

This parameter specifies the name of the volume containing the lock.

**[-lif <lif-name>] - Logical Interface (privilege: advanced)**

This parameter specifies the logical interface through which the lock was established.

**[-lif-id <integer>] - Logical Interface ID (privilege: advanced)**

This parameter specifies the logical interface id through which the lock was established.

**-path <text> - Object Path (privilege: advanced)**

This parameter specifies a path to the lock.

**| -lockid <UUID> - Lock UUID (privilege: advanced) }**

This parameter specifies the universally unique identifier (UUID) for the lock. Queries and wildcard characters are not supported.

**-owner-id <text> - Owner ID (privilege: advanced)**

This parameter specifies an owner ID for a lock. This parameter must be used with the query notation { } exhibited in the second example.

**-protocol <lock protocol> - Lock Protocol (privilege: advanced)**

This parameter specifies the protocol that was used to establish a lock. This parameter must be used with the query notation { } exhibited in the second example.

**-client-address <IP Address> - Client Address (privilege: advanced)**

This parameter specifies a client address associated with a lock. This parameter must be used with the query notation { } exhibited in the second example.

**-client-address-type {ipv4|ipv6|ipv6z} - Client Address Type (privilege: advanced)**

This parameter specifies the type of ip address a client used to create its lock (ipv4, ipv6). This parameter must be used with the query notation { } exhibited in the second example.

**-flexcache-volume <text> - FlexCache Volume Name (privilege: advanced)**

This parameter specifies the name of the FlexCache volume. This parameter must be used with the query notation { } exhibited in the third example.

**-flexcache-vserver <text> - FlexCache Vserver Name (privilege: advanced)**

This parameter specifies the name of the Vserver hosting the FlexCache volume. This parameter must be used with the query notation { } exhibited in the third example.

**-flexcache-cluster <text> - FlexCache Cluster Name (privilege: advanced)**

This parameter specifies the name of the cluster hosting the FlexCache volume. This parameter must be used with the query notation { } exhibited in the third example.

## Examples

The following example breaks the locks on all objects on the Vserver named vs0 in the volume named vol0, regardless of the paths to the locked objects and the logical interface through which the locks were established.

```
cluster1::*> vsver locks break -vserver vs0 -volume vol0 -path * -lif *
WARNING: Breaking file locks can cause applications to become
unsynchronized
          and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

The vsver locks break command can also be issued using a query on the parameters available to the vsver locks show command. The following example breaks all NLM protocol lock objects locked by the client at address 12.34.56.78.

```
cluster1::*> vsver locks break { -protocol nlm -client-address
12.34.56.78 }
Warning: Breaking file locks can cause applications to become
unsynchronized
          and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

The following example breaks all FlexCache lock objects locked for FlexCache volume "fc1" in Vserver "vs12".

```
cluster1::*> vserver locks break { -flexcache-volume fcl -flexcache
-vserver vs12 -flexcache-cluster cluster2 }
Warning: Breaking file locks can cause applications to become
unsynchronized
        and may lead to data corruption.
Do you want to continue? {y|n}: y
1 entry was acted on.
```

## vserver locks show-mirrored-open-count

Display mirrored open count

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver locks show-mirrored-open-count`` command displays number of mirrored opens on node.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-detailed ]**

This option displays detailed count of type of locks persisted on this node.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter displays node name.

**[-mirrored-open-count <integer>] - Mirrored Open Count**

This parameter displays mirrored opens count on node.

**[-persistent-locks <integer>] - Persistent Opens**

This parameter displays count of opens persisted on node.

**[-mirrored-locks <integer>] - Mirrored Opens**

This parameter displays count of opens mirrored on node.

### Examples

The following example displays the mirrored opens count on node1.

```
cluster1::> vserver locks show-mirrored-open-count
```

| Node  | Mirrored Open Count |
|-------|---------------------|
| ----- | -----               |
| node1 | 40                  |

The following example displays the mirrored opencount for HA pair cluster.

```
cluster1::> vserver locks show-mirrored-open-count
```

| Node  | Mirrored Open Count |
|-------|---------------------|
| ----- | -----               |
| node1 | 20                  |
| node2 | 30                  |

## vserver locks show

Display current list of locks

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver locks show` command displays information about locks. A lock is a synchronization mechanism for enforcing limits on concurrent access to files where many clients can be accessing the same file at the same time. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about locks:

- Vserver name
- Volume name
- Object path
- Logical interface name
- Lock protocol
- Lock type
- Client

The `vserver locks show` command is also used to display FlexCache specific locks. FlexCache locks are not stored on the FlexCache volume. Instead all of the locks are stored on the origin of a FlexCache volume. To view the FlexCache locks use the `vserver locks show` command on the origin cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### | [-smb-attrs ]

If you specify the `-smb-attrs` parameter, the command displays information related to SMB2 and higher.

### | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### { [-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about locks on the specified Vserver.

### [-volume <volume name>] - Volume

If you specify this parameter, the command displays information about locks on the specified volume.

For the FlexCache locks, this parameter displays the origin of a FlexCache volume name.

### [-lif <lif-name>] - Logical Interface

If you specify this parameter, the command displays information about locks established through the specified logical interface name.

For the FlexCache locks, this parameter is unset if the FlexCache volume is not local to the cluster.

### [-lif-id <integer>] - Logical Interface ID (privilege: advanced)

If you specify this parameter, the command displays information about locks established through the specified logical interface id.

For the FlexCache locks, this parameter displays the logical interface id of the FlexCache cluster.

### [-path <text>] - Object Path

If you specify this parameter, the command displays information about locks at the specified path name.

### | [-lockid <UUID>] - Lock UUID }

If you specify this parameter, the command displays information about the lock with the specified universally unique identifier (UUID).

### [-is-constituent {true|false}] - Is Constituent Volume

If you specify this parameter, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

### [-protocol <lock protocol>] - Lock Protocol

If you specify this parameter, the command displays information about locks established through the specified protocol. Some of the valid protocols are:

- `cifs`: SMB locks
- `nlm`: NFS3 locks
- `nfsv4`: NFS4.0 locks
- `nfsv4.1`: NFS4.1 locks

- *crposix* : CrPosix locks for CREATE and LINK
- *fcache* : Delegations for 7-mode destination FlexCache volumes

#### **[*-type* {*byte-range*|*share-level*|*op-lock*|*delegation*}] - Lock Type**

If you specify this parameter, the command displays information about locks of the specified lock type. The four types of locks are:

- Byte-range locks: Lock only a portion of a file.
- Share locks: Represent opened files.
- Opportunistic locks: Control client-side caching over SMB.
- Delegations: Control client-side caching over NFSv4.

#### **[*-node* <nodename>] - Node Holding Lock State**

If you specify this parameter, the command displays information about all locks on the specified node.

#### **[*-lock-state* <lock\_state>] - Lock State**

If you specify this parameter, the command displays information about the state of the lock. Some of the valid states are:

- *granted* : The lock is established.
- *revoking* : The server is currently coordinating with the client to change the state of this lock.
- *revoked* : The lock is undergoing revocation to be downgraded or released.
- *adjusted* : The lock is undergoing revocation to be replaced by a lock equal to or weaker than the current lock.
- *subsumed* : The lock is one of a set of locks that will replace a lock that is being revoked.
- *waiting* : The lock is waiting to be granted, because it conflicts with another lock.
- *denied* : The lock has been denied.
- *timeout* : The lock was waiting and has now timed out.
- *gone* : The lock is about to be released.
- *unused* : The lock is allocated but has not been processed into any state.

#### **[*-bytelock-offset* <integer>] - Bytelock Starting Offset**

If you specify this parameter, the command displays information about bytelocks with the specified offset value. This is the index in the file (in bytes) where the lock begins.

#### **[*-bytelock-length* <integer>] - Number of Bytes Locked**

If you specify this parameter, the command displays information about bytelocks with the specified length. This is the number of bytes that are locked by this particular lock.

#### **[*-bytelock-mandatory* {*true*|*false*}] - Bytelock is Mandatory**

If you specify this parameter, the command displays information only about mandatory bytelocks. A mandatory bytelock enforces the requirement of byte range locking on clients before accessing the associated range.

### **`[-bytelock-exclusive {true|false}] - Bytelock is Exclusive`**

If you specify this parameter, the command displays information only about exclusive bytelocks. When an exclusive bytelock is granted, no other bytelock may be granted whose range overlaps it.

### **`[-bytelock-super {true|false}] - Bytelock is Superlock`**

If you specify this parameter, the command displays information only about super-bytelocks. When a super-bytelock is granted, all other locks on that file are released, and no other operations will be allowed on that file.

### **`[-bytelock-soft {true|false}] - Bytelock is Soft`**

If you specify this parameter, the command displays information only about softened bytelocks. An NFSv4 bytelock might become softened if the connection to the client is interrupted. Soft locks might be reclaimed if the client reconnects. However if another client requests a lock that conflicts with a soft lock, then the soft lock will be released.

### **`[-oplock-level {exclusive|level2|batch|null|read-batch}] - Oplock Level`**

If you specify this parameter, the command displays information about locks with the specified oplock level. The oplock level determines which operations the client may cache locally. Those operations include opening, reading, writing, closing, and creating and destroying bytelocks on a file. The five valid oplock levels are:

- *batch* : The client may cache all operations on the file.
- *exclusive* : The client may cache reads and writes on the file.
- *read-batch* : The client may cache reads and opens on the file.
- *level2* : The client may cache reads on the file.
- *null* : The client may not cache any operations on the file.

### **`[-sharelock-mode <share lock mode>] - Shared Lock Access Mode`**

If you specify this parameter, the command displays information about locks with the specified sharelock mode. The parameter has two components separated by a hyphen: the access mode followed by the share mode. The access mode specifies which operations the client is allowed to perform on the file. The share mode specifies which operations other clients are disallowed to perform. The two modes are a combination of one or more of these permissions:

- *read*
- *write*
- *delete*
- *all*
- *none*

For example, the sharelock mode *read\_write-deny\_delete* allows the client to read and write the file, and disallows other clients to delete the file. A special mode is *delete-on-close*, which specifies that the server will delete the file as soon as it is closed.

### **`[-sharelock-soft {true|false}] - Shared Lock is Soft`**

If you specify this parameter, the command displays information only about softened sharelocks. A NFSv4 sharelock can become softened when the connection to the client is interrupted. If the client reconnects, it

might reclaim the sharelock. However, if another client creates a sharelock that conflicts with the softened sharelock, the softened sharelock will be released.

#### **`[-delegation-type {read|write}] - Delegation Type`**

If you specify this parameter, the command displays information only about locks with the specified delegation-type setting. The delegation type determines which operations the client may cache locally. The two valid delegation types are:

- *read*: The client may cache reads on the file.
- *write*: The client may cache reads and writes on the file.

#### **`[-owner-id <text>] - Owner ID`**

If you specify this parameter, the command displays information only about locks with the specified owner ID. The owner ID is an opaque byte string generated by the server for each file lock request.

#### **`[-client-address <IP Address>] - Client Address`**

If you specify this parameter, the command displays information only about locks from the specified client IP address.

#### **`[-client-address-type {ipv4|ipv6|ipv6z}] - Client Address Type`**

If you specify this parameter, the command displays information only about locks corresponding to a certain IP address type. Note that locks created over the NFSv4 or NFSv4.1 protocol cannot have their address types resolved. Valid options are:

- *ipv4*: Clients operating over an IPv4 interface.
- *ipv6*: Clients operating over an IPv6 interface.

#### **`[-smb-open-type {none|durable|persistent}] - SMB Open Type`**

If you specify this parameter, the command displays information only about locks with the specified SMB open type. Valid open types are

- *durable*: Durability is a feature of SMB2. A durable lock might become "disconnected" if the connection between the client and server is disrupted. A disconnected durable lock might be reconnected if the connection is reestablished.
- *persistent*: Persistence is a feature of SMB3. Persistent locks can become disconnected and later reconnected, like durable locks. Persistent locks are used to facilitate continuously available shares.
- *none*: The lock is neither durable nor persistent.

#### **`[-smb-connect-state <Lock Connect State>] - SMB Connect State`**

If you specify this parameter, the command displays information only about locks with the specified SMB connection state. Some of the valid states are:

- *connected*: This is the normal state of a SMB lock when the server and client are connected.
- *disconnected*: If a lock is durable or persistent, it might become disconnected if the connection between the server and its client is interrupted. Disconnected locks may later be reconnected if the connection is reestablished.

**[`-smb-expiration-time <integer>`] - SMB Expiration Time (Secs)**

If you specify this parameter, the command displays information only about locks with the specified SMB lock expiration time. When a lock is disconnected, `-smb-expiration-time` shows the time remaining until the lock expires. The server releases the lock after it expires.

**[`-smb-open-group-id <text>`] - SMB Open Group ID**

If you specify this parameter, the command displays information only about locks with the specified SMB open group identifier. This is an opaque byte string provided by the client as the SMB lease key when the lock is first established.

**[`-is-flexcache-lock {true|false}`] - Is FlexCache Lock**

If you specify this parameter, the command displays information only about locks with the specified value.

**[`-flexcache-volume <text>`] - FlexCache Volume Name**

If you specify this parameter, the command displays information only about locks with the specified FlexCache volume.

**[`-flexcache-vserver <text>`] - FlexCache Vserver Name**

If you specify this parameter, the command displays information only about locks with the specified Vserver hosting a FlexCache volume.

**[`-flexcache-vserver-uuid <UUID>`] - FlexCache Vserver UUID**

If you specify this parameter, the command displays information only about locks with the specified UUID of a Vserver hosting a FlexCache volume.

**[`-flexcache-volume-msid <integer>`] - FlexCache Volume MSID**

If you specify this parameter, the command displays information only about locks with the specified FlexCache volume MSID

**[`-flexcache-cluster <text>`] - FlexCache Cluster Name**

If you specify this parameter, the command displays information only about locks with the specified cluster hosting a FlexCache volume.

**[`-flexcache-lock-authority <text>`] - FlexCache lock authority**

If you specify this parameter, the command displays information only about locks with the specified authority granted to a FlexCache volume.

## Examples

The following example displays default information about all locks:

```
cluster1::> vsriver locks show
```

```
Vserver: vs0
```

| Volume      | Object Path                            | LIF         | Protocol | Lock Type   |

# vserver migrate commands

## vserver migrate abort

Abort a Vserver migrate operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command aborts a Vserver migrate operation. It is normally run on the destination cluster of the migrate operation. If the destination cluster cannot be accessed, the abort command can be run on the source cluster to cleanup the migrate operation on the source cluster. The migrate operation must be in migrate-paused, or in a failed migrate status, to be aborted.

### Parameters

**-vserver <vserver name> - Vserver Name**

Name of the Vserver to be aborted.

### Examples

```
cluster1::> vserver migrate abort -vserver test
```

## vserver migrate cutover

Perform Cutover of the migrate operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command performs a cutover of the Vserver from the source cluster to the destination cluster. It must be run on the destination cluster of the Vserver migrate.

### Parameters

**-vserver <vserver name> - Vserver Name**

Name of the Vserver which is being migrated.

### Examples

```
cluster1::> vserver migrate cutover -vserver test
```

## vserver migrate pause

Pause a Vserver migrate operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command pauses a Vserver migrate operation. Both data transfer and configuration replication are stopped. It must be run on the destination cluster of the Vserver migrate operation.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the Vserver whose migration operation will be paused.

## Examples

```
cluster1::> vsriver migrate pause -vserver test
```

## vsvrr migrate rsumr

Resume a migrate operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command resumes a Vserver migrate operation. It must be run on the destination cluster of the Vserver migrate operation. The migrate operation, which either previously failed or was paused in order to prioritize other cluster operations, can be resumed.

## Parameters

**-vsvrr <vsvrr name> - Vsvrr Name**

Name of the Vserver being migrated.

**[-auto-cutover {true|false}] - Automatically cutover when ready**

This parameter specifies if the Vserver migrate operation should cutover automatically when ready. If this parameter is not specified, migrate resume will use the value from the previous migrate start or resume operation.

**[-auto-source-cleanup {true|false}] - Automatically cleanup the source vsvrr after cutover**

This parameter specifies if the Vserver migrate operation should cleanup the source Vserver automatically. Setting the parameter requires advanced privilege. If this parameter is not specified, migrate resume will use the value from the previous migrate start or resume operation.

**[-throttle <throttleType>] - Throttle for Migrate Transfers(Kbs)**

This parameter specifies the throttle value to limit the network bandwidth used for the migrate transfers. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. The throttle value is applied individually to each volume of the migrating Vserver. To fully use the network bandwidth available, set the throttle value to unlimited or 0. If this parameter is not specified, migrate will use the throttle value from the previous migrate start or resume operation. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4.

## Examples

```
cluster1::> vsriver migrate resume -vsvrr test -auto-cutover false cluster1::> vsriver migrate resume
```

-vserver test -auto-cutover false -throttle 12500

## vserver migrate show-volume-fix-details

List volumes and commands to run post migrate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command displays the list of volumes whose properties failed to get transferred to the destination Vserver of the Vserver migrate post cutover.

For each of these volumes, this command also displays the [volume modify](#) command which you must run to transfer the failed volume properties manually.

### Parameters

**[*-fields* <fieldname>,...]**

This specifies the fields that must be displayed.

**[*-instance* ] (privilege: advanced) }**

If this parameter is specified, the command displays the volume details and properties that failed to get transferred during the migrate.

**[*-vserver-uuid* <UUID>] - Vserver-UUID (privilege: advanced)**

The UUID of the Vserver which is migrating.

**[*-volume* <volume name>] - Volume Name (privilege: advanced)**

If this parameter is specified, the command displays the volume details and properties that match the specified volume.

**[*-command* <text>] - Volume Modify Command (privilege: advanced)**

If this parameter is specified, the command displays the volume details and properties that match the specified `Volume Modify` command.

### Examples

```
clusterB::> vsserver migrate show-volume-fix-details -vsserver-uuid
7a08a236-f6b3-11eb-98a5-005056a78af4
      Vserver  Volume          Command

## vsserver migrate show-volume

Display status of volumes in a migrating Vservers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays status of all the volumes in a migrating Vservers. It must be run on the destination cluster of the Vserver migrate.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays detailed volume status information.

**[-vsserver <vsserver name>] - Vserver Name**

Name of the Vserver which is migrating.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays detailed volume status information that matches the specified volume.

**[`-volume-dsid <integer>`] - Volume DSID**

If this parameter is specified, the command displays the details of volume status that matches the specified DSID.

**[`-volume-msid <integer>`] - Volume MSID**

If this parameter is specified, the command displays the details of volume status that matches the specified MSID.

**[`-vserver-uuid <UUID>`] - Vserver UUID**

If this parameter is specified, the command displays the details of volume status that matches the specified Vserver UUID.

**[`-node <nodename>`] - Node**

If this parameter is specified, the command displays the details of volume status that matches the specified node.

**[`-volume-state {online|restricted|offline|force-online|force-offline|mixed}`] - State of the Volume**

If this parameter is specified, the command displays the details of volume status that matches the specified volume state.

**[`-transfer-status <mirror status>`] - Status of Transfer**

If this parameter is specified, the command displays the details of volume status that matches the specified transfer status.

**[`-healthy {true|false}`] - Healthy**

If this parameter is specified, the command displays the details of volume status that matches the specified health status

**[`-errors <text>,...`] - Errors in Volume Operation**

If this parameter is specified, the command displays the details of volume status that matches the specified errors.

**Examples**

```
cluster1::> vserver migrate show-volume -vserver test
```

**vserver migrate show**

Display status of migrating Vservers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command displays information about the migrating vserver.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-migrate-status-details ]**

If this parameter is specified, the command displays the following information about Vserver migrate operation.

- Vserver
- Migrate status
- Status details

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Name of the Vserver which is migrating.

**[-vserver-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver UUID.

**[-destination-cluster <Cluster name>] - Destination Cluster Name**

If this parameter is specified, the command displays Vserver migrate information that matches the specified destination cluster.

**[-source-cluster <Cluster name>] - Source Cluster Name**

If this parameter is specified, the command displays Vserver migrate information that matches the specified source cluster.

**[-migrate-status {precheck-started|transferring|ready-for-cutover|cutover-triggered|cutover-started|cutover-complete|migrate-paused|migrate-complete|migrate-complete-with-warnings|migrate-failed|cleanup|cleanup-failed|manual-cleanup|destination-cleaned-up|migrate-pausing|cleanup-pausing|post-cutover|post-cutover-failed|ready-for-source-cleanup|setup-configuration|setup-configuration-failed|migrate-pause-failed|migrate-aborting|migrate-abort-failed|migrate-aborted}] - Vserver migrate status**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate status.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Migrate start time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate start time.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - Migrate operation finish time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate end time.

**[-last-pause-time <MM/DD/YYYY HH:MM:SS>] - Last migrate pause time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate last paused time.

**[-last-resume-time <MM/DD/YYYY HH:MM:SS>] - Last migrate resume time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate last resume time.

**[-last-restart-time <MM/DD/YYYY HH:MM:SS>] - Last migrate restart time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate last rollback time.

**[-cutover-precommit-start-time <MM/DD/YYYY HH:MM:SS>] - Cutover precommit start time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate cutover trigger time.

**[-cutover-commit-start-time <MM/DD/YYYY HH:MM:SS>] - Cutover commit start time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate cutover start time.

**[-cutover-complete-time <MM/DD/YYYY HH:MM:SS>] - Cutover complete time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate cutover completion time.

**[-restart-count <integer>] - Restart Count**

If this parameter is specified, the command displays Vserver migrate information that matches the specified rollback count.

**[-status-details <text>,...] - Errors and Warnings During Migrate**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate status details.

**[-ipspace <IPspace>] - Destination cluster IPspace Name for vserver**

If this parameter is specified, the command displays Vserver migrate information that matches the specified ipspace.

**[-aggr-list <aggregate name>,...] - Aggregate list for creating the volumes**

If this parameter is specified, the command displays Vserver migrate information that matches the specified aggregate list that are assigned for Vserver to use.

**[-migrate-vserver-type {migrate-source|migrate-destination}] - Identify if the Vserver is migrate source or destination**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver migrate type.

**[-owning-node <nodename>] - Name of node on which migrate is orchestrated**

If this parameter is specified, the command displays Vserver migrate information that matches the specified node that owns Vserver migrate.

**[-stream-uuid <UUID>] - Stream Uuid**

If this parameter is specified, the command displays Vserver migrate information that matches the specified stream UUID.

**[-is-past-point-of-no-return {true|false}] - Indicate point of no return for migrate**

If this parameter is specified, the command displays Vserver migrate information that matches the specified past point of no return flag.

**[-last-failed-migrate-status {precheck-started|transferring|ready-for-cutover|cutover-triggered|cutover-started|cutover-complete|migrate-paused|migrate-complete|migrate-complete-with-warnings|migrate-failed|cleanup|cleanup-failed>manual-cleanup|destination-cleaned-up|migrate-pausing|cleanup-pausing|post-cutover|post-cutover-failed|ready-for-source-cleanup|setup-configuration|setup-configuration-failed|migrate-pause-failed|migrate-aborting|migrate-abort-failed|migrate-aborted}] - Migrate status when the migrate aborted or failed**

If this parameter is specified, the command displays Vserver migrate information that matches the specified last failed Vserver migrate status.

**[-current-migrate-operation {none|start|resume|pause|cleanup|cutover|abort}] - Current Migrate operation**

If this parameter is specified, the command displays Vserver migrate information that matches the specified current Vserver migrate operation.

**[-last-migrate-operation {none|start|resume|pause|cleanup|cutover|abort}] - Last Migrate operation**

If this parameter is specified, the command displays Vserver migrate information that matches the specified last Vserver migrate operation.

**[-local-vserver-id <integer>] - Vserver ID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified local Vserver ID.

**[-group-id <integer>] - Group ID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified group ID.

**[-partner-vserver-id <integer>] - Partner Vserver ID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified Vserver ID of a partner node.

**[-partner-group-id <integer>] - Partner group ID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified group ID of a partner node.

**[-auto-cutover {true|false}] - Automatic cutover**

If this parameter is specified, the command displays Vserver migrate information that matches the specified auto cutover flag.

**[`-skip-performance-check {true|false}`] - Skip checking iops requirement of volume on destination aggregates**

If this parameter is specified, the command displays Vserver migrate information that matches the specified skip performance flag.

**[`-migration-uuid <UUID>`] - Migration UUID**

If this parameter is specified, the command displays Vserver migrate information that matches the specified migration UUID.

**[`-migration-failures <SmdbError>,...`] - List of migration failures**

If this parameter is specified, the command displays Vserver migrate information that matches the specified migration failures.

**[`-client-outage-window <integer>`] - Window duration during cutover when clients are not served**

If this parameter is specified, the command displays Vserver migrate information that matches the specified client outage window.

**[`-auto-source-cleanup {true|false}`] - Automatic source cleanup (privilege: advanced)**

If this parameter is specified, the command displays Vserver migrate information that matches the specified auto source cleanup flag.

**[`-throttle <throttleType>`] - Throttle for Migrate Transfers(Kbs)**

If this parameter is specified, the command displays Vserver migrate information that matches the specified throttle value.

**[`-post-ponr-retry-count <integer>`] - Number of times migrate retried operations post-PONR**

If this parameter is specified, the command displays Vserver migrate information that matches the specified post point of no return retry count.

**[`-last-post-ponr-retry-time <MM/DD/YYYY HH:MM:SS>`] - Last post-PONR retry time**

If this parameter is specified, the command displays Vserver migrate information that matches the specified last post point of no return retry time.

## Examples

```
cluster1::> vserver migrate show -vserver test
```

## vserver migrate source-cleanup

Perform vserver cleanup on the source cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command cleans up the migrate source Vserver.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Name of the Vserver to be deleted on the source cluster.

**[-force {true|false}] - Force option to override veto checks (privilege: advanced)**

This parameter is used to forcibly delete the Vserver.

## Examples

```
cluster1::> vsver migrate source-cleanup -vserver test
```

## vserver migrate start

Start the Vserver migrate operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command starts the migration of a Vserver from one cluster to another. This has to be run on the destination cluster, i.e. the cluster where the Vserver is intended to migrate. The source cluster from where the Vserver is to be migrated is specified in the command.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the Vserver which needs to be migrated.

**-source-cluster <Cluster name> - Source Cluster Name**

Name of the source cluster.

**[-check-only {true|false}] - Check if migrate can be done**

Runs the prechecks and tells if the Vserver migrate operation can be started or not.

**[-ipspace <IPspace>] - Destination cluster IPspace Name for vsver**

Name of the IPspace in the destination cluster.

**[-aggr-list <aggregate name>,...] - Aggregate list**

Provide the list of aggregates where the volumes will be created in the destination cluster.

**[-auto-cutover {true|false}] - Automatically cutover when ready**

This parameter specifies if the Vserver migrate operation should cutover automatically when ready. The default setting is true.

**[-auto-source-cleanup {true|false}] - Automatically cleanup the source vsver after cutover**

This parameter is to specify if the Vserver migrate operation should cleanup the source Vserver automatically. Setting the parameter requires diagnostic privilege. The default setting is true.

**[-throttle <throttleType>] - Throttle for Migrate Transfers(Kbs)**

This parameter specifies the throttle value to limit the network bandwidth used for the migrate transfers. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. The throttle value is applied individually to each volume of the migrating Vserver. To fully use the network bandwidth

available, set the throttle value to unlimited or 0. The default setting is unlimited. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4.

## Examples

```
cluster1::> vsriver migrate start -vsriver test -source-cluster cluster-22 -ipspace ips1 -check-only true -aggr-list aggr1,aggr2 -auto-cutover false -throttle 12500
```

# vsriver name-mapping commands

## vsriver name-mapping create

Create a name mapping

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

## Description

The `vsriver name-mapping create` command creates a name mapping. Name mappings are applied in the order in which they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, UNIX-to-Windows, S3-to-UNIX and S3-to-Windows) has its own priority list. ONTAP prevents you from creating two name mappings with the same pattern.

Patterns can be expressed as POSIX regular expressions. Any sub pattern enclosed within the parentheses () is considered a group. Back reference "backslash(\) followed by nonzero decimal digit d" matches the "dth" group. For information about regular expressions, see the UNIX reference page for *regex(7)*.

Each Vsriver can have up to 12500 name mappings in each direction.

If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression `(.)_` in the CLI, type `_`"(.)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".`

## Parameters

**-vsriver <vsriver name> - Vsriver**

This parameter specifies the Vsriver on which you want to create the name mapping.

**-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Direction**

This parameter specifies the direction of the name mapping. Possible values are *krb-unix* for a Kerberos-to-UNIX name mapping, *win-unix* for a Windows-to-UNIX name mapping, *unix-win* for a UNIX-to-Windows name mapping, *s3-unix* for a S3-to-UNIX name mapping and *s3-win* for a S3-to-Windows name mapping.

**-position <integer> - Position**

This parameter specifies the name mapping's position in the priority list. Specify the position as a positive integer.

If you want to create a new name mapping at a position that is already occupied in the priority list, use the [vserver name-mapping insert](#) command instead of the `vserver name-mapping create` command.

#### **-pattern <text> - Pattern**

This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

#### **-replacement <text> - Replacement**

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

#### **{ [-address <IP Address/Mask>] - IP Address with Subnet Mask**

This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

#### **| [-hostname <text>] - Hostname }**

This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

### **Examples**

The following example creates a name mapping on a Vserver named `vs1`. The mapping is from UNIX to Windows at position 5 in the priority list. The mapping maps the pattern `cifs` to the replacement `EXAMPLE\Domain Users`.

```
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win
-position 5 -pattern jane_doe -replacement contoso\\jdoe -address
10.238.33.245/24
cluster1::> vserver name-mapping create -vserver vs1 -direction unix-win
-position 6 -pattern john_smith -replacement contoso\\jsmith -hostname
google.com
```

### **Related Links**

- [vserver name-mapping insert](#)

## **vserver name-mapping delete**

### **Delete a name mapping**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver name-mapping delete` command deletes a name mapping.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver from which you want to delete the name mapping.

### **-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Direction**

This parameter specifies the direction of the name mapping that you want to delete.

### **-position <integer> - Position**

This parameter specifies the position of the name mapping that you want to delete. Specify the position as a positive integer.

## Examples

The following example deletes a name mapping on a Vserver named vs1. The name mapping is from UNIX to Windows and is at position 5.

```
cluster1::> vsriver name-mapping delete -vserver vs1 -direction unix-win
-position 5
```

## vsriver name-mapping insert

### Create a name mapping at a specified position

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsriver name-mapping insert` command creates a name mapping at a specified position in the priority list. The command rearranges the list as needed to accommodate the new entry. For instance, if you have a priority list of five mappings and insert a new mapping at position 3, the mapping previously at position 3 is moved to position 4, the mapping previously at position 4 is moved to position 5, and the mapping previously at position 5 is moved to position 6. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, UNIX-to-Windows, S3-to-UNIX and S3-to-Windows) has its own priority list.

You can specify patterns as POSIX regular expressions. Any sub pattern enclosed within the parentheses ( ) is considered a group. Back reference "backslash(\) followed by nonzero decimal digit d" matches the "dth" group. For information about regular expressions, see the UNIX reference page for *regex(7)* .

Each Vserver can have up to 12500 name mappings in each direction.

If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression `(.)_`` in the CLI, type ``"(.)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".`

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to create the name mapping.

**-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Direction**

This parameter specifies the direction of the name mapping. Possible values are *krb-unix* for a Kerberos-to-UNIX name mapping, *win-unix* for a Windows-to-UNIX name mapping, *unix-win* for a UNIX-to-Windows name mapping, *s3-unix* for a S3-to-UNIX name mapping and *s3-win* for a S3-to-Windows name mapping.

**-position <integer> - Position**

This parameter specifies the position in the priority list at which you want to insert the new name mapping. Specify a position as a positive integer.

**-pattern <text> - Pattern**

This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

**-replacement <text> - Replacement**

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

**{ [-address <IP Address/Mask>] - IP Address with Subnet Mask**

This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

**| [-hostname <text>] - Hostname }**

This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

**Examples**

The following example creates a name mapping on a Vserver named vs1. It is a user mapping from Kerberos to UNIX. It is inserted into the priority list at position 2. The name mapping maps any principal in the Kerberos realm SEC.EXAMPLE.COM to the UNIX user name corresponding to the principal's base name with any instance names removed; for example, tom/admin@SEC.EXAMPLE.COM is mapped to tom. Back reference "\1" refers to sequence of characters matched in first group("tom").

```
cluster1::> vsserver name-mapping insert -vserver vs1 -direction krb-unix
-position 2 -pattern "([^\0/]+)(/[^\0]+)?@SEC.EXAMPLE.COM" -replacement "\1"
cluster1::> vsserver name-mapping insert -vserver vs1 -direction krb-
unix -position 3 -pattern
"([^\0/]+)(/[^\0]+)?@SEC.EXAMPLE.COM" -replacement "\1" -address
10.238.33.245/24
```

**vsserver name-mapping modify**

Modify a name mapping's pattern, replacement pattern, or both

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver name-mapping modify` command modifies the pattern, the replacement pattern, or both of a specified name mapping.

You can specify patterns as POSIX regular expressions. Any sub pattern enclosed within the parentheses ( ) is considered a group. Back reference "backslash(\) followed by nonzero decimal digit d" matches the "dth" group. For information about regular expressions, see the UNIX reference page for *regex(7)* .

Each Vserver can have up to 12500 name mappings in each direction.

If you are using the CLI, you must delimit all regular expressions with double quotation marks ("). For instance, to enter the regular expression (.) in the CLI, type "(.)" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to modify the name mapping.

### **-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Direction**

This parameter specifies the direction of the name mapping. Possible values are *krb-unix* for a Kerberos-to-UNIX name mapping, *win-unix* for a Windows-to-UNIX name mapping, *unix-win* for a UNIX-to-Windows name mapping, *s3-unix* for a S3-to-UNIX name mapping and *s3-win* for a S3-to-Windows name mapping.

### **-position <integer> - Position**

This parameter specifies the name mapping's position in the priority list. A position is specified as a positive integer. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, UNIX-to-Windows, S3-to-UNIX and S3-to-Windows) has its own priority list.

### **[-pattern <text>] - Pattern**

This parameter specifies the pattern you want to match. Refer to the command description section for details. The pattern can be up to 256 characters in length.

### **[-replacement <text>] - Replacement**

This parameter specifies the replacement pattern. The replacement pattern can be up to 256 characters in length.

### **{ [-address <IP Address/Mask>] - IP Address with Subnet Mask**

This optional parameter specifies the IP address that can be used to match the client's workstation IP address with the pattern.

### **| [-hostname <text>] - Hostname }**

This optional parameter specifies the hostname that can be used to match the corresponding client's workstation IP address with the list of IP addresses with the pattern.

## Examples

The following example modifies the name mapping on the Vserver named `vs1` and direction `win-unix`, at position 3. The pattern to be matched is changed to `"EXAMPLE\(.+)"`.

```
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix
-position 3 -pattern "EXAMPLE\\(.+)" -address 10.238.2.54/32"
cluster1::> vserver name-mapping modify -vserver vs1 -direction win-unix
-position 3 -pattern "EXAMPLE\\(.+)" -hostname google.com"
```

## vserver name-mapping refresh-hostname-ip

Refresh the IP addresses for configured hostnames

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver name-mapping refresh-hostname-ip` command will refresh the IP Address entries in the name-mapping configuration by resolving the hostname. If you run this command with no parameters, this will refresh the IP address entries for every hostname in the name-mapping configuration.

### Parameters

**-vserver <vserver> - Vserver (privilege: advanced)**

This parameter specifies the Vserver for which the hostname lookup needs to be done.

**[-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win}] - Name Mapping Direction (privilege: advanced)**

This optional parameter specifies the direction of the name-mapping entry for the hostname lookup.

**[-hostname <text>] - Hostname (privilege: advanced)**

This optional parameter specifies the hostname for which the lookup needs to be done.

### Examples

```
cluster1::*> vserver name-mapping refresh-hostname-ip -vserver vs1
-direction win-unix -hostname
```

## vserver name-mapping show

Display name mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver name-mapping show` command displays information about name mappings. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all name mappings:

- Vserver name

- Direction of the mapping (krb-unix for Kerberos-to-UNIX, win-unix for Windows-to-UNIX, or unix-win for UNIX-to-Windows)
- Position of the mapping in the priority list
- Pattern to be matched
- Replacement pattern

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos-to-UNIX name mappings, run the command with the `-direction krb-unix` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the name mapping or mappings that match the specified Vserver.

**[-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win}] - Direction**

If you specify this parameter, the command displays information only about the name mapping or mappings that have the specified mapping direction.

**[-position <integer>] - Position**

If you specify this parameter, the command displays information only about the name mapping that has the specified position in the priority list.

**[-pattern <text>] - Pattern**

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified matching pattern. The pattern can be up to 256 characters in length. Refer to the command description section for details.

**[-replacement <text>] - Replacement**

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified replacement pattern.

**[-address <IP Address/Mask>] - IP Address with Subnet Mask**

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified IP address.

**[-hostname <text>] - Hostname**

If you specify this parameter, the command displays information only about the name mapping or mappings that use the specified hostname.

## Examples

The following example displays information about all name mappings:

```
cluster1::> vsriver name-mapping show
Vserver:    vs1
Direction:  win-unix
Position Hostname          IP Address/Mask
-----
1          google.com      -
EXAMPLE\\administrator
Replacement: nobody

## vsriver name-mapping swap

Exchange the positions of two name mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver name-mapping swap` command exchanges the positions of two name mappings in the priority list.

### Parameters

**-vsriver <vsriver name> - Vserver**

This parameter specifies the Vserver on which the name mappings are located.

**-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Direction**

This parameter specifies the direction of the name mappings that you want to exchange. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list.

**-position <integer> - Position**

This parameter specifies the position in the priority list of the first name mapping that you want to exchange. Specify a position as a positive integer.

**-with-position <integer> - Position of an existing name mapping entry in the list of name mappings for this Vserver. This entry will be swapped with the entry at 'position'.**

This parameter specifies the position in the priority list of the second name mapping that you want to exchange. Specify a position as a positive integer.

## Examples

The following example exchanges the positions of two name mappings on a Vserver named `vs1`. The name mappings have the direction Windows-to-UNIX. The name mappings are exchanged between positions 2 and 4.

```
cluster1::> vserver name-mapping swap -vserver vs1 -direction win-unix
-position 2 -with-position 4
```

## vserver nfs commands

### vserver nfs create

Create an NFS configuration for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver nfs create` command enables and configures a Vserver to serve NFS clients. The Vserver must already exist. An NFS-enabled Vserver is associated with an NIS domain.

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to create the NFS configuration.

##### **[-access {true|false}] - General NFS Access**

This optional parameter specifies whether to enable NFS access on the Vserver. The default setting is `true`.

##### **[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)**

This optional parameter specifies the maximum number of `RPCSEC_GSS` authentication contexts, which are used by Kerberos. The default setting is zero. See RFC 2203 for information about `RPCSEC_GSS` contexts.

##### **[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)**

This optional parameter specifies, in seconds, the amount of time a `RPCSEC_GSS` context is permitted to remain unused before it is deleted. The default setting is zero seconds. See RFC 2203 for information about `RPCSEC_GSS` contexts.

##### **[-v3 {enabled|disabled}] - NFS v3**

This optional parameter specifies whether to enable access for NFSv3 clients. The default setting is `enabled`.

##### **[-v4.0 {enabled|disabled}] - NFS v4.0**

This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is `enabled`.

##### **[-udp {enabled|disabled}] - UDP Protocol**

This optional parameter specifies whether to enable NFS access over UDP. The default setting is `enabled`.

Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS\_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the [vserver export-policy rule create](#) command.

#### **`[-tcp {enabled|disabled}] - TCP Protocol`**

This optional parameter specifies whether to enable NFS access over TCP. The default setting is `enabled`.

#### **`[-default-win-user <text>] - Default Windows User`**

This optional parameter specifies a list of default Windows users for the NFS server.

#### **`[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)`**

This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is `true`.

#### **`[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)`**

This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is `false`.

#### **`[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)`**

This optional parameter specifies whether ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. The default setting is `enabled`.

#### **`[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)`**

This optional parameter specifies whether ONTAP allows to drop the connection when a NFSv3 request is dropped. The default setting is `enabled`.

#### **`[-ntfs-unix-security-ops {fail|ignore|use_export_policy}] - Vserver NTFS Unix Security Options (privilege: advanced)`**

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to `ignore`, ONTAP ignores NFSv3 security changes. If you set this parameter to `fail`, this overrides the unix security options set in the relevant export rules. If you set this parameter to `use_export_policy`, ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is `use_export_policy` at the time of creation.

#### **`[-chown-mode {restricted|unrestricted|use_export_policy}] - Vserver Change Ownership Mode (privilege: advanced)`**

This optional parameter specifies whether file ownership can be changed only by the superuser, or if a non-root user can also change file ownership. If you set this parameter to `restricted`, file ownership can be changed only by the superuser, even though the on-disk permissions allow a non-root user to change file ownership. If you set this parameter to `unrestricted`, file ownership can be changed by the superuser and by the non-root user, depending upon the access granted by on-disk permissions. If you set this parameter to `use_export_policy`, file ownership can be changed in accordance with the relevant export rules.

**[`-trace-enabled {true|false}`] - NFS Response Trace Enabled (privilege: advanced)**

This optional parameter specifies whether ONTAP logs NFS requests when they exceed the NFS response trigger time (see the `trigger` parameter). The default setting is `false`.

**[`-trigger <integer>`] - NFS Response Trigger (in secs) (privilege: advanced)**

This optional parameter specifies the amount of time, in seconds, after which ONTAP must log an NFS request if it has not completed (assuming the `-trace-enabled` option is `true`). The default setting is 60.

**[`-udp-max-xfer-size <integer>`] - UDP Maximum Transfer Size (bytes) (privilege: advanced)**

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol will negotiate with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768.

**[`-tcp-max-xfer-size <integer>`] - TCP Maximum Transfer Size (bytes) (privilege: advanced)**

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3, and NFSv4.x protocols. The range is 8192 to 1048576. The default setting is 65536.

Setting the parameter value greater than 65536 may cause performance degradation for existing connections using smaller values. Contact technical support for guidance.

**[`-v4.0-acl {enabled|disabled}`] - NFSv4.0 ACL Support**

This optional parameter specifies whether ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is `disabled`.

**[`-v4.0-read-delegation {enabled|disabled}`] - NFSv4.0 Read Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4.0 read delegations. The default setting is `disabled`.

**[`-v4.0-write-delegation {enabled|disabled}`] - NFSv4.0 Write Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4.0 write delegations. The default setting is `disabled`.

**[`-v4-fsid-change {enabled|disabled}`] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)**

This optional parameter specifies whether ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is `enabled`.

If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to `disabled`.

**[`-v4.0-referrals {enabled|disabled}`] - NFSv4.0 Referral Support (privilege: advanced)**

This optional parameter specifies whether ONTAP supports NFSv4.0 referrals. The default setting is `disabled`. You can set this parameter to `enabled` only if you also set the `-v4-fsid-change` to `enabled`. If clients accessing the node do not support NFSv4.0 referrals, set this option to `disabled`; otherwise, those clients will not be able to access the file system.

**[`-v4-id-domain <nfs domain>`] - NFSv4 ID Mapping Domain**

This optional parameter specifies the domain portion of the string form of user and group names as defined

by the NFSv4 protocol. By default, the domain name is defaultv4iddomain.com. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

**`[-v4-validate-symlinkdata {enabled|disabled}] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)`**

This optional parameter specifies whether ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is `disabled`.

**`[-v4-lease-seconds <integer>] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)`**

This optional parameter specifies the time period in which ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the `-v4-grace-seconds` parameter.

**`[-v4-grace-seconds <integer>] - NFSv4 Grace Timeout Value (in secs)`**

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more than the value of the `-v4-lease-seconds` parameter. The maximum value is 90.

**`[-v4-acl-preserve {enabled|disabled}] - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)`**

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when `chmod` is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when `chmod`, `chgrp`, or `chown` are performed. The default is `enabled`.

**`[-v4.1 {enabled|disabled}] - NFSv4.1 Minor Version Support`**

This optional parameter specifies whether to enable access for NFSv4.1 or later clients. The default setting is `enabled`.

**`[-rquota {enabled|disabled}] - Rquota Enable`**

This optional parameter specifies whether to enable rquota over NFS. The default setting is `disabled`.

**`[-v4.1-implementation-domain <nfs domain>] - NFSv4.1 Implementation ID Domain (privilege: advanced)`**

This optional parameter specifies the NFSv4.1 or later implementation domain.

**`[-v4.1-implementation-name <text>] - NFSv4.1 Implementation ID Name (privilege: advanced)`**

This optional parameter specifies the NFSv4.1 or later implementation name.

**`[-v4.1-implementation-date <Date>] - NFSv4.1 Implementation ID Date (privilege: advanced)`**

This optional parameter specifies the NFSv4.1 or later implementation date.

**`[-v4.1-pnfs {enabled|disabled}] - NFSv4.1 Parallel NFS Support`**

This optional parameter specifies whether ONTAP supports parallel NFS over NFSv4.1 or later. The default setting is `disabled`.

**`[-v4.1-referrals {enabled|disabled}] - NFSv4.1 Referral Support (privilege: advanced)`**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later referrals. The default setting is `disabled`. You can set this parameter to `enabled` only if you also set the `-v4-fsid-change` to `enabled`.

. If clients accessing the node do not support NFSv4.1 or later referrals, set this option to `disabled`; otherwise, those clients will not be able to access the file system.

**`[-v4.1-acl {enabled|disabled}] - NFSv4.1 ACL Support`**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later access control lists (ACLs). The default setting is `disabled`.

**`[-vstorage {enabled|disabled}] - NFS vStorage Support`**

This optional parameter specifies whether to enable vstorage over NFS. The default setting is `disabled`.

**`[-v4-numeric-ids {enabled|disabled}] - NFSv4 Support for Numeric Owner IDs`**

This optional parameter specifies whether the support for numeric string identifiers in NFSv4 owner attributes is enabled. The default setting is `enabled`.

**`[-default-win-group <text>] - Default Windows Group`**

This optional parameter specifies a list of default Windows groups for the NFS server.

**`[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support`**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later read delegations. The default setting is `disabled`.

**`[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support`**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later write delegations. The default setting is `disabled`.

**`[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)`**

This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

**`[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)`**

This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

**`[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)`**

This optional parameter specifies the maximum number of ACEs in an NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

**`[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only`**

This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is `enabled`.

**`[-nfs-rootonly {enabled|disabled}] - NFS Root Only`**

This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is `disabled`.

**`[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled`  
(privilege: advanced)**

This optional parameter specifies whether ONTAP supports fetching auxiliary groups from a name service rather than from the RPC header. The default setting is *disabled*.

**`[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxillary Groups Limit`  
(privilege: advanced)**

This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH\_SYS and RPCSEC\_GSS in ONTAP. The range is 32 to 1024. The default value is 32.

**`[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations`  
(privilege: advanced)**

This optional parameter specifies whether ONTAP performs an additional validation on qtree IDs. The default setting is *enabled*. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

**`[-mountd-port <integer>] - NFS Mount Daemon Port` (privilege: advanced)**

This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

**`[-nlm-port <integer>] - Network Lock Manager Port` (privilege: advanced)**

This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045.

**`[-nsm-port <integer>] - Network Status Monitor Port` (privilege: advanced)**

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046.

**`[-rquotad-port <integer>] - NFS Quota Daemon Port` (privilege: advanced)**

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049.

**`[-permitted-enc-types <NFS Kerberos Encryption Type>,...] - Permitted Kerberos Encryption Types`**

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is *aes-128,aes-256*.

**`[-showmount {enabled|disabled}] - Showmount Enabled`**

This optional parameter specifies whether to allow or disallow clients to see the Vserver's NFS exports list. The default setting is *enabled*.

Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

**`[-name-service-lookup-protocol {TCP|UDP}] - Set the Protocol Used for Name Services Lookups for Exports`**

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are *TCP* and *UDP*. The default setting is *UDP*.

**[`-map-unknown-uid-to-default-windows-user {enable|disable}`] - Map Unknown UID to Default Windows User (privilege: advanced)**

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

**[`-netgroup-dns-domain-search {enabled|disabled}`] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)**

If you enable this optional parameter, during client access check evaluation in a netgroup, ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is *enabled*.

**[`-netgroup-trust-any-ns-switch-no-match {enabled|disabled}`] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)**

This optional parameter specifies if you can consider a no-match result from any netgroup ns-switch source to be authoritative. If this option is enabled, then a no-match response from any one of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is 'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

**[`-ntacl-display-permissive-perms {enabled|disabled}`] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)**

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is *false*.

**[`-v3-ms-dos-client {enabled|disabled}`] - NFSv3 MS-DOS Client Support**

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is *disabled*.

**[`-ignore-nt-acl-for-root {enabled|disabled}`] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)**

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

**[`-cached-cred-positive-ttl <integer>`] - Time To Live Value (in msec) of a Positive Cached Credential (privilege: advanced)**

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 3600000.

**[`-cached-cred-negative-ttl <integer>`] - Time To Live Value (in msec) of a Negative Cached Credential (privilege: advanced)**

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 3600000.

**`[-skip-root-owner-write-perm-check {enabled|disabled}]` - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)**

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be *enabled*. Warning: When *enabled*, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is *disabled*.

**`[-v3-64bit-identifiers {enabled|disabled}]` - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)**

This optional parameter specifies whether ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. The default setting is *disabled*. When `-v3-fsid-change` is disabled, enable this parameter to avoid file ID collisions.

**`[-v4-inherited-acl-preserve {enabled|disabled}]` - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)**

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is *disabled*.

**`[-v3-search-unconverted-filename {enabled|disabled}]` - Fallback to Unconverted Filename Search (privilege: advanced)**

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.

**`[-file-session-io-grouping-count <integer>]` - I/O Count to Be Grouped as a Session (privilege: advanced)**

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified `-file-session-io-grouping-count`. The default value is *5000*.

**`[-file-session-io-grouping-duration <integer>]` - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)**

This optional parameter specifies the duration for which the read or write operations on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is *120* seconds.

**`[-checksum-for-replay-cache {enabled|disabled}]` - Enable or disable Checksum for Replay-Cache (privilege: advanced)**

This optional parameter specifies whether to enable replay cache checksum for NFS requests. The default value is *enabled*.

**`[-cached-cred-harvest-timeout <integer>]` - Harvest timeout (in msec) for a Cached Credential (privilege: advanced)**

This optional parameter specifies the harvest timeout for cached credentials. The value specified must be between 60000 and 604800000. The default setting is *86400000*.

**`[-idle-connection-timeout <integer>]` - Idle Connection Timeout Value (in seconds)**

This optional parameter specifies the idle connection timeout value for NFS connections in seconds. The value specified must be between 120 and 86400.

**[`-allow-idle-connection-timeout` {`enabled`|`disabled`}] - Are Idle NFS Connections Supported**

This optional parameter specifies whether killing idle NFS connections is allowed or not. The default setting for `-allow-idle-connection-timeout` is *enabled*.

**[`-v3-hide-snapshot` {`enabled`|`disabled`}] - Hide Snapshot Directory under NFSv3 Mount Point**

This optional parameter specifies whether to hide the `.snapshot` directory while listing under NFSv3 mount points. However an explicit access to the `.snapshot` directory will still be allowed even though the option is enabled. The default setting is *disabled*.

**[`-showmount-rootonly` {`enabled`|`disabled`}] - Provide Root Path as Showmount State**

This optional parameter specifies whether to provide root path as showmount state when `-showmount` parameter is disabled. The default value for `showmount-rootonly` is *disabled*.

**[`-v4-64bit-identifiers` {`enabled`|`disabled`}] - Use 64 Bits for NFSv4.x FSIDs and File IDs (privilege: advanced)**

This optional parameter specifies whether ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv4.x clients. The default setting is *enabled*. When `-v4-fsid-change` is disabled, enable this parameter to avoid file ID collisions.

**[`-v4.2-seclabel` {`enabled`|`disabled`}] - NFSV4.2 Security Label Support (privilege: advanced)**

This optional parameter specifies whether to enable security labels for NFSv4.2. The default setting for `-v4.2-seclabel` is *disabled*.

**[`-rdma` {`enabled`|`disabled`}] - RDMA Protocol**

This optional parameter specifies whether to enable NFS access over RDMA. The default setting for parameter `-rdma` is *enabled*.

**[`-v4.1-trunking` {`enabled`|`disabled`}] - NFSV4.1 Trunking Support**

This optional parameter specifies whether to enable trunking for NFSv4.1. The default setting for `-v4.1-trunking` is *disabled*.

**[`-v4.2-sparsefile-ops` {`enabled`|`disabled`}] - NFSV4.2 Sparse Files Ops Support (privilege: advanced)**

This optional parameter specifies whether to enable sparsefile ops for NFSv4.2. The default setting for `-v4.2-sparsefile-ops` is *disabled*.

**[`-v4.2-xattrs` {`enabled`|`disabled`}] - NFSV4.2 Extended Attributes Support**

This optional parameter specifies whether to enable extended attributes for NFSv4.2. The default setting for `-v4.2-xattrs` is *enabled*.

**[`-v4.1-sequence-admin-revoked` {`enabled`|`disabled`}] - NFSV4 Admin Revoked Support (privilege: advanced)**

This optional parameter specifies whether to enable NFSv4.1 admin revoked for NFSv4. Once enabled, when any of the client state is marked as revoked on the server side, the NFS server sends a `SEQ4_STATUS_ADMIN_STATE_REVOKED` flag in the `SEQUENCE` operation reply. The default setting for `-v4.1-sequence-admin-revoked` is *disabled*.

**[`-v4-acl-compliance` {`enabled`|`disabled`}] - NFSV4 ACL Compliance Support (privilege: advanced)**

This optional parameter specifies whether to enable ACL compliance support for NFSv4 newly created

files/directory. Once enabled, the `EVERYONE@` ACE mask will be mapped to UNIX 'owner' and 'group' as well, along with UNIX 'other'. UNIX 'owner' will no longer be considered under `GROUP@` ACE. The default setting for `-v4-acl-compliance` is *disabled*.

## Examples

The following example enables and configures NFS access on a Vserver named `vs0`. NFS access is enabled. The maximum number of `RPCSEC_GSS` authentication contexts is set to 5. The `RPCSEC_GSS` idle time is set to 360 seconds. Access is enabled for NFS v3 clients over both UDP and TCP.

```
cluster1::> vsriver nfs create -vsriver vs0 -access true -rpcsec-ctx-high
5 -rpcsec-ctx-idle 360 -v3 enabled -udp enabled -tcp enabled
```

## Related Links

- [vsriver export-policy rule create](#)

## vsriver nfs delete

Delete the NFS configuration of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsriver nfs delete` command deletes the NFS configuration of a specified Vserver. This command does not delete the Vserver itself, just its ability to serve NFS clients.

If you delete a Vserver, the Vserver's NFS configuration is automatically deleted. Any Windows-to-UNIX or UNIX-to-Windows name mappings defined for the Vserver are also deleted because they require both the CIFS and NFS servers.

## Parameters

**-vsriver <vsriver name> - Vserver**

This specifies the Vserver whose NFS configuration you want to delete.

## Examples

The following example deletes the NFS configuration of a Vserver named `vs2`:

```
cluster1::> vsriver nfs delete -vsriver vs2
```

## vsriver nfs modify

Modify the NFS configuration of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs modify` command modifies the configuration of an NFS-enabled Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This specifies the Vserver whose NFS configuration you want to modify.

### **[-access {true|false}] - General NFS Access**

This optional parameter specifies whether NFS access is enabled on the Vserver.

### **[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)**

This optional parameter specifies the maximum number of RPCSEC\_GSS authentication contexts, which are used by Kerberos. The default setting is zero at the time of creation. See RFC 2203 for information about RPCSEC\_GSS contexts.

### **[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)**

This optional parameter specifies, in seconds, the amount of time a RPCSEC\_GSS context is permitted to remain unused before it is deleted. The default setting is zero seconds at the time of creation. See RFC 2203 for information about RPCSEC\_GSS contexts.

### **[-v3 {enabled|disabled}] - NFS v3**

This optional parameter specifies whether to enable access for NFS v3 clients.

### **[-v4.0 {enabled|disabled}] - NFS v4.0**

This optional parameter specifies whether to enable access for NFSv4.0 clients. The default setting is enabled at the time of creation.

### **[-udp {enabled|disabled}] - UDP Protocol**

This optional parameter specifies whether to enable NFS access over UDP.

Even if UDP is disabled, if TCP is enabled, the Vserver does not block NFSv3 traffic over UDP. By allowing this traffic, the storage system can process NFS\_NULL ops that the Solaris automounter sends to determine if the storage system is alive. (Solaris sends these ops over UDP even if configured to use TCP.) To disallow access for certain clients, including over UDP, you can use export-policy rules. For more information, see the [vserver export-policy rule create](#) command.

### **[-tcp {enabled|disabled}] - TCP Protocol**

This optional parameter specifies whether to enable NFS access over TCP.

### **[-default-win-user <text>] - Default Windows User**

This optional parameter specifies a list of default Windows users for the NFS server.

### **[-enable-ejukebox {true|false}] - Enable NFSv3 EJUKEBOX error (privilege: advanced)**

This optional parameter specifies whether EJUKEBOX errors are enabled for NFSv3. The default setting is `true` at the time of creation.

**`[-v3-require-read-attributes {true|false}] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)`**

This optional parameter specifies whether NFSv3 read operations are required to return read attributes. The default setting is `false` at the time of creation.

**`[-v3-fsid-change {enabled|disabled}] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)`**

This optional parameter specifies whether ONTAP shows changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3.

**`[-v3-connection-drop {enabled|disabled}] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)`**

This optional parameter specifies whether NFS v3 connection drop is enabled. The default setting is `enabled` at the time of creation.

**`[-ntfs-unix-security-ops {fail|ignore|use_export_policy}] - Vserver NTFS Unix Security Options (privilege: advanced)`**

This optional parameter specifies how NFSv3 security changes affect NTFS volumes. If you set this parameter to `ignore`, ONTAP ignores NFSv3 security changes. If you set this parameter to `fail`, this overrides the unix security options set in the relevant export rules. If you set this parameter to `use_export_policy`, ONTAP processes NFSv3 security changes in accordance with the relevant export rules. The default setting is `use_export_policy` at the time of creation.

**`[-chown-mode {restricted|unrestricted|use_export_policy}] - Vserver Change Ownership Mode (privilege: advanced)`**

This optional parameter specifies whether file ownership can be changed only by the superuser, or if a non-root user can also change file ownership. If you set this parameter to `restricted`, file ownership can be changed only by the superuser, even though the on-disk permissions allow a non-root user to change file ownership. If you set this parameter to `unrestricted`, file ownership can be changed by the superuser and by the non-root user, depending upon the access granted by on-disk permissions. If you set this parameter to `use_export_policy`, file ownership can be changed in accordance with the relevant export rules.

**`[-trace-enabled {true|false}] - NFS Response Trace Enabled (privilege: advanced)`**

This optional parameter specifies whether ONTAP logs NFS requests when they exceed the NFS response trigger time (see the `trigger` parameter). The default setting is `false` at the time of creation.

**`[-trigger <integer>] - NFS Response Trigger (in secs) (privilege: advanced)`**

This optional parameter specifies the amount of time, in seconds, after which ONTAP must log an NFS request if it has not completed (assuming the `-trace-enabled` option is set to `true`). The default setting is 60 at the time of creation.

**`[-udp-max-xfer-size <integer>] - UDP Maximum Transfer Size (bytes) (privilege: advanced)`**

This optional parameter specifies the maximum transfer size (in bytes) that the NFS mount protocol negotiates with the client for UDP transport. The range is 8192 to 57344. The default setting is 32768 at the time of creation.

**`[-tcp-max-xfer-size <integer>] - TCP Maximum Transfer Size (bytes) (privilege: advanced)`**

This optional parameter specifies the maximum transfer size (in bytes) that the storage system negotiates with the client for TCP transport of data for NFSv3 and NFSv4.x protocols. The range is 8192 to 1048576.

The default setting is 65536 when created. Warning: Increasing/decreasing the value of this parameter could affect the performance for existing connections.

#### **[`-v4.0-acl {enabled|disabled}`] - NFSv4.0 ACL Support**

This optional parameter specifies whether ONTAP supports NFSv4.0 access control lists (ACLs). The default setting is `disabled` when created.

#### **[`-v4.0-read-delegation {enabled|disabled}`] - NFSv4.0 Read Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4 read delegations. The default setting is `disabled` when created.

#### **[`-v4.0-write-delegation {enabled|disabled}`] - NFSv4.0 Write Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4 write delegations. The default setting is `disabled` when created.

#### **[`-v4-fsid-change {enabled|disabled}`] - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)**

This optional parameter specifies whether ONTAP shows changes in file system identifiers (FSIDs) as NFSv4 clients traverse file systems. The default setting is `enabled` when created. If you change the value of this parameter, clients must remount any paths over which they are using NFSv4.

If users access the storage system using NFSv4 from Solaris 10 clients, you must set this option to `disabled`.

#### **[`-v4.0-referrals {enabled|disabled}`] - NFSv4.0 Referral Support (privilege: advanced)**

This optional parameter specifies whether ONTAP supports NFSv4.0 referrals. The default setting is `disabled` when created. You can set this parameter to `enabled` only if the `-v4-fsid-change` option is also set to `enabled`. If clients accessing the node do not support NFSv4.0 referrals, set this option to `disabled`; otherwise, those clients will not be able to access the file system.

#### **[`-v4-id-domain <nfs domain>`] - NFSv4 ID Mapping Domain**

This optional parameter specifies the domain portion of the string form of user and group names as defined by the NFSv4 protocol. By default, the domain name is `defaultv4iddomain.com`. However, the value of this parameter overrides the default. The domain name must be agreed upon by both the NFS client and the storage controller before NFSv4 operations can be executed. It is recommended that the domain be specified in the fully qualified domain name format.

#### **[`-v4-validate-symlinkdata {enabled|disabled}`] - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)**

This optional parameter specifies whether ONTAP validates the UTF-8 encoding of symbolic link data. The default setting is `disabled` when created.

#### **[`-v4-lease-seconds <integer>`] - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)**

This optional parameters specifies the time period in which ONTAP irrevocably grants a lock to a client. By default, the lease period is 30 seconds. The minimum value is 10. The maximum value is one less than the value of the `-v4-grace-seconds` parameter.

#### **[`-v4-grace-seconds <integer>`] - NFSv4 Grace Timeout Value (in secs)**

This optional parameter specifies the time period in which clients attempt to reclaim their locking state from ONTAP during server recovery. By default, the grace period is 45 seconds. The minimum value is 1 more

than the value of the `-v4-lease-seconds` parameter. The maximum value is 90.

**`[-v4-acl-preserve {enabled|disabled}]` - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)**

This optional parameter specifies if the NFSv4 ACL is preserved or dropped when `chmod` is performed. In unified security style, this parameter also specifies if NTFS file permissions are preserved or dropped when `chmod`, `chgrp`, or `chown` are performed. The default is `enabled`.

**`[-v4.1 {enabled|disabled}]` - NFSv4.1 Minor Version Support**

This optional parameter specifies whether to enable access for NFSv4.1 or later clients. The default setting is `enabled` at the time of creation.

**`[-rquota {enabled|disabled}]` - Rquota Enable**

This optional parameter specifies whether to enable `rquota` over NFS. The default setting is `disabled` at the time of creation.

**`[-v4.1-implementation-domain <nfs domain>]` - NFSv4.1 Implementation ID Domain (privilege: advanced)**

This optional parameter specifies the NFSv4.1 or later implementation domain.

**`[-v4.1-implementation-name <text>]` - NFSv4.1 Implementation ID Name (privilege: advanced)**

This optional parameter specifies the NFSv4.1 or later implementation name.

**`[-v4.1-implementation-date <Date>]` - NFSv4.1 Implementation ID Date (privilege: advanced)**

This optional parameter specifies the NFSv4.1 or later implementation date.

**`[-v4.1-pnfs {enabled|disabled}]` - NFSv4.1 Parallel NFS Support**

This optional parameter specifies whether to enable access for pNFS for NFSv4.1 or later. The default setting is `disabled` at the time of creation.

**`[-v4.1-referrals {enabled|disabled}]` - NFSv4.1 Referral Support (privilege: advanced)**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later referrals. The default setting is `disabled` when created. You can set this parameter to `enabled` only if the `-v4-fsid-change` option is also set to `enabled`. If clients accessing the node do not support NFSv4.1 or later referrals, set this option to `disabled`; otherwise, those clients will not be able to access the file system.

**`[-v4.1-acl {enabled|disabled}]` - NFSv4.1 ACL Support**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later access control lists (ACLs). The default setting is `disabled` when created.

**`[-vstorage {enabled|disabled}]` - NFS vStorage Support**

This optional parameter specifies whether to enable `vstorage` over NFS. The default setting is `disabled` at the time of creation.

**`[-v4-numeric-ids {enabled|disabled}]` - NFSv4 Support for Numeric Owner IDs**

This optional parameter specifies whether to enable the support for numeric string identifiers in NFSv4 owner attributes. The default setting is `enabled` at the time of creation.

**[`-default-win-group <text>`] - Default Windows Group**

This optional parameter specifies a list of default Windows groups for the NFS server.

**[`-v4.1-read-delegation {enabled|disabled}`] - NFSv4.1 Read Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later read delegations. The default setting is `disabled` when created.

**[`-v4.1-write-delegation {enabled|disabled}`] - NFSv4.1 Write Delegation Support**

This optional parameter specifies whether ONTAP supports NFSv4.1 or later write delegations. The default setting is `disabled` when created.

**[`-v4.x-session-num-slots <integer>`] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)**

This optional parameter specifies the number of entries in the NFSv4.x session slot table. By default, the number of slots is 180. The maximum value is 2000.

**[`-v4.x-session-slot-reply-cache-size <integer>`] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)**

This optional parameter specifies the number of bytes of the reply that will be cached in each NFSv4.x session slot. By default, the size of the cached reply is 640 bytes. The maximum value is 4096.

**[`-v4-acl-max-aces <integer>`] - Maximum Number of ACEs per ACL (privilege: advanced)**

This optional parameter specifies the maximum number of ACEs in a NFSv4 ACL. The range is 192 to 1024. The default value is 400. Setting it to a value more than the default could cause performance problems for clients accessing files with NFSv4 ACLs.

**[`-mount-rootoonly {enabled|disabled}`] - NFS Mount Root Only**

This optional parameter specifies whether the Vserver allows MOUNT protocol calls only from privileged ports (port numbers less than 1024). The default setting is `enabled`.

**[`-nfs-rootoonly {enabled|disabled}`] - NFS Root Only**

This optional parameter specifies whether the Vserver allows NFS protocol calls only from privileged ports (port numbers less than 1024). The default setting is `disabled`.

**[`-auth-sys-extended-groups {enabled|disabled}`] - AUTH\_SYS Extended Groups Enabled (privilege: advanced)**

This optional parameter specifies whether ONTAP supports fetching auxiliary groups from a name service rather than from the RPC header. The default setting is `disabled`.

**[`-extended-groups-limit <integer>`] - AUTH\_SYS and RPCSEC\_GSS Auxillary Groups Limit (privilege: advanced)**

This optional parameter specifies the maximum number of auxiliary groups supported over RPC security flavors AUTH\_SYS and RPCSEC\_GSS in ONTAP. The range is 32 to 1024. The default value is 32.

**[`-validate-qtree-export {enabled|disabled}`] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)**

This optional parameter specifies whether ONTAP performs an additional validation on qtree IDs. The default setting is `enabled`. This parameter is ignored unless a non-inherited policy has been or is assigned to a qtree.

**[`-mountd-port <integer>`] - NFS Mount Daemon Port (privilege: advanced)**

This optional parameter specifies which port the NFS mount daemon (mountd) uses. The port numbers allowed are 635 (the default) and 1024 through 9999.

**[`-nlm-port <integer>`] - Network Lock Manager Port (privilege: advanced)**

This optional parameter specifies which port the network lock manager (NLM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4045 .

**[`-nsm-port <integer>`] - Network Status Monitor Port (privilege: advanced)**

This optional parameter specifies which port the network status monitor (NSM) uses. The port numbers allowed are 1024 through 9999. The default setting is 4046 .

**[`-rquotad-port <integer>`] - NFS Quota Daemon Port (privilege: advanced)**

This optional parameter specifies which port the NFS quota daemon (rquotad) uses. The port numbers allowed are 1024 through 9999. The default setting is 4049 .

**[`-permitted-enc-types <NFS Kerberos Encryption Type>,...`] - Permitted Kerberos Encryption Types**

This optional parameter specifies the permitted encryption types for Kerberos over NFS. The default setting is `aes-128,aes-256` .

**[`-showmount {enabled|disabled}`] - Showmount Enabled**

This optional parameter specifies whether to allow or disallow clients to see the Vserver's NFS exports list. The default setting is *enabled* .

Showmount leverages the MOUNT protocol in NFSv3 to issue an EXPORT query to the NFS server. If the mount port is not listening or blocked by a firewall, or if NFSv3 is disabled on the NFS server, showmount queries fail.

**[`-name-service-lookup-protocol {TCP|UDP}`] - Set the Protocol Used for Name Services Lookups for Exports**

This optional parameter specifies the protocol to use for doing name service lookups. The allowed values are TCP and UDP . The default setting is UDP .

**[`-map-unknown-uid-to-default-windows-user {enable|disable}`] - Map Unknown UID to Default Windows User (privilege: advanced)**

If you enable this optional parameter, unknown UNIX users that do not have a name mapping to a Windows user are mapped to the configured default Windows user. This allows all unknown UNIX users access with the credentials of the default Windows user. If you disable it, all unknown UNIX users without name mapping are always denied access. By default, this parameter is enabled.

**[`-netgroup-dns-domain-search {enabled|disabled}`] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)**

If you enable this optional parameter, during client access check evaluation in a netgroup, ONTAP performs an additional verification to ensure that the domain returned from DNS for that client is listed in the DNS configuration of the Vserver. This enables you to validate the domain when clients have the same short name in multiple domains. The default setting is *enabled* .

**[`-netgroup-trust-any-ns-switch-no-match {enabled|disabled}`] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)**

This optional parameter specifies if you can consider a no-match result from any of the netgroup ns-switch sources to be authoritative. If this option is enabled, then a no-match response from any of the netgroup ns-switch sources is deemed conclusive even if other sources could not be searched. The default setting is 'disabled', which causes all netgroup ns-switch sources to be consulted before a no-match result is deemed conclusive.

**[`-ntacl-display-permissive-perms {enabled|disabled}`] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)**

This optional parameter controls the permissions that are displayed to NFSv3 and NFSv4 clients on a file or directory that has an NT ACL set. When true, the displayed permissions are based on the maximum access granted by the NT ACL to any user. When false, the displayed permissions are based on the minimum access granted by the NT ACL to any user. The default setting is *false*.

**[`-v3-ms-dos-client {enabled|disabled}`] - NFSv3 MS-DOS Client Support**

This optional parameter specifies whether to enable access for NFSv3 MS-DOS clients. The default setting is *disabled* at the time of creation.

**[`-ignore-nt-acl-for-root {enabled|disabled}`] - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)**

This optional parameter specifies whether Windows ACLs affect root access from NFS. If this option is enabled, root access from NFS ignores the NT ACL set on the file or directory. If auditing is enabled for the Vserver and there is no name-mapping present, then a default SMB credential (Builtin\administrator) is used for auditing, and an EMS warning is generated. The default setting is 'disabled', which causes NFS 'root' to be mapped to a Windows account, like any other NFS user.

**[`-cached-cred-positive-ttl <integer>`] - Time To Live Value (in msec) of a Positive Cached Credential (privilege: advanced)**

This optional parameter specifies the age of the positive cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 3600000.

**[`-cached-cred-negative-ttl <integer>`] - Time To Live Value (in msec) of a Negative Cached Credential (privilege: advanced)**

This optional parameter specifies the age of the negative cached credentials after which they will be cleared from the cache. The value specified must be between 60000 and 604800000. The default setting is 3600000.

**[`-skip-root-owner-write-perm-check {enabled|disabled}`] - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)**

This optional parameter specifies if permission checks are to be skipped for NFS WRITE calls from root/owner. For copying read-only files to a destination folder which has inheritable ACLs, this option must be *enabled*. Warning: When *enabled*, if an NFS client does not make use of an NFS ACCESS call to check for user-level permissions and then tries to write onto read-only files, the operation will succeed. The default setting is *disabled*.

**[`-v3-64bit-identifiers {enabled|disabled}`] - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)**

This optional parameter specifies whether ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv3 clients. If you change the value of this parameter, clients must remount any paths over which they are using NFSv3. When `-v3-fsid-change` is

disabled, enable this parameter to avoid file ID collisions.

**`[-v4-inherited-acl-preserve {enabled|disabled}]` - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)**

This optional parameter specifies whether the client-specified mode bits should be ignored and the inherited NFSv4 ACL should be preserved when creating new files or directories. The default setting is *disabled*.

**`[-v3-search-unconverted-filename {enabled|disabled}]` - Fallback to Unconverted Filename Search (privilege: advanced)**

This optional parameter specifies whether to continue search without converting the filename to the Unicode character set while doing lookup in a directory.

**`[-file-session-io-grouping-count <integer>]` - I/O Count to Be Grouped as a Session (privilege: advanced)**

This optional parameter specifies the number of read or write operations on a file from a single client that are grouped and considered as one session for event generation applications, such as FPolicy. The event is generated on the first read or write of a file, and subsequently the event is generated only after the specified `-file-session-io-grouping-count`. The default value is *5000*.

**`[-file-session-io-grouping-duration <integer>]` - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)**

This optional parameter specifies the duration for which the read or write operations on a file from a single client are grouped and considered as one session for event generation applications, such as FPolicy. The default value is *120* seconds.

**`[-checksum-for-replay-cache {enabled|disabled}]` - Enable or disable Checksum for Replay-Cache (privilege: advanced)**

This optional parameter specifies whether to enable replay cache checksum for NFS requests. The default value is *enabled*.

**`[-cached-cred-harvest-timeout <integer>]` - Harvest timeout (in msec) for a Cached Credential (privilege: advanced)**

This optional parameter specifies the harvest timeout for cached credentials. The value specified must be between 60000 and 604800000. The default setting is *86400000*.

**`[-idle-connection-timeout <integer>]` - Idle Connection Timeout Value (in seconds)**

This optional parameter specifies the idle connection timeout for NFS connections. The value specified must be between 120 and 86400.

**`[-allow-idle-connection-timeout {enabled|disabled}]` - Are Idle NFS Connections Supported**

This optional parameter specifies whether killing idle NFS connections is allowed or not. The default setting for `-allow-idle-connection-timeout` is *enabled*.

**`[-v3-hide-snapshot {enabled|disabled}]` - Hide Snapshot Directory under NFSv3 Mount Point**

This optional parameter specifies whether to hide the `.snapshot` directory while listing under NFSv3 mount points. However an explicit access to the `.snapshot` directory will still be allowed even though the option is enabled. The default setting is *disabled* at the time of creation.

**`[-showmount-rootonly {enabled|disabled}]` - Provide Root Path as Showmount State**

This optional parameter specifies whether to provide root path as showmount state when `-showmount` parameter is disabled. The default value for `showmount-rootonly` is *disabled*.

**[`-v4-64bit-identifiers {enabled|disabled}`] - Use 64 Bits for NFSv4.x FSIDs and File IDs (privilege: advanced)**

This optional parameter specifies whether ONTAP uses 64 bits (instead of 32 bits) for file system identifiers (FSIDs) and file identifiers (file IDs) that are returned to NFSv4.x clients. If you change the value of this parameter, clients must remount any paths over which they are using NFSv4.x. When `-v4-fsid-change` is disabled, enable this parameter to avoid file ID collisions.

**[`-v4.2-seclabel {enabled|disabled}`] - NFSV4.2 Security Label Support (privilege: advanced)**

This optional parameter specifies whether to enable security labels for NFSv4.2. The default setting for `-v4.2-seclabel` is *disabled*.

**[`-rdma {enabled|disabled}`] - RDMA Protocol**

This optional parameter specifies whether to enable NFS access over RDMA. The default setting for parameter `-rdma` is *enabled*.

**[`-v4.1-trunking {enabled|disabled}`] - NFSV4.1 Trunking Support**

This optional parameter specifies whether to enable trunking for NFSv4.1. The default setting for `-v4.1-trunking` is *disabled*.

If the `-v4.1-trunking` is set to *enabled* and if users access the storage system using NFSv4.1 with NFS clients that don't support session trunking, they may see performance drop, due to use of a single TCP connection for the multiple mounts to the SVM data LIFs.

If the `-v4.1-trunking` is changed from *enabled* to *disabled* and if users access the storage system using NFSv4 with trunking mount then client may see IO hung issue, because on the client side session trunking is still in use and on the Nfs4 server side it is getting disabled. Remount is required on the Nfs client if such issue happens.

**[`-v4.2-sparsefile-ops {enabled|disabled}`] - NFSV4.2 Sparse Files Ops Support (privilege: advanced)**

This optional parameter specifies whether to enable sparsefile ops for NFSv4.2. The default setting for `-v4.2-sparsefile-ops` is *disabled*.

**[`-v4.2-xattrs {enabled|disabled}`] - NFSV4.2 Extended Attributes Support**

This optional parameter specifies whether to enable extended attributes for NFSv4.2. The default setting for `-v4.2-xattrs` is *enabled*.

**[`-v4.1-sequence-admin-revoked {enabled|disabled}`] - NFSV4 Admin Revoked Support (privilege: advanced)**

This optional parameter specifies whether to enable admin revoked sequence flag support for NFSv4. Once enabled, when any of the client state is marked as revoked on the server side, the NFS server sends a SEQ4\_STATUS\_ADMIN\_STATE\_REVOKED flag in the SEQUENCE operation reply. The default setting for `-v4.1-sequence-admin-revoked` is *disabled*.

**[`-v4-acl-compliance {enabled|disabled}`] - NFSV4 ACL Compliance Support (privilege: advanced)**

This optional parameter specifies whether to enable ACL compliance support for NFSv4 newly created files/directory. Once enabled, the EVERYONE@ ACE mask will be mapped to UNIX 'owner' and 'group' as well, along with UNIX 'other'. UNIX 'owner' will no longer be considered under GROUP@ ACE. The default setting for `-v4-acl-compliance` is *disabled*.

## Examples

The following example enables NFS access on a Vserver named `vs0` for NFS clients that use NFS v3 over TCP:

```
cluster1::> vserver nfs modify -vserver vs0 -access true -v3 enabled -udp disabled -tcp enabled
```

## Related Links

- [vserver export-policy rule create](#)

## vserver nfs off

Disable the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nfs off` command disables NFS access on a Vserver. The Vserver must already exist.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to disable NFS access.

## Examples

The following example disables NFS access on a Vserver named `vs0`.

```
cluster1::> vserver nfs off -vserver vs0
```

## vserver nfs on

Enable the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nfs on` command enables NFS access on a Vserver. The Vserver must already exist.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to enable NFS access.

## Examples

The following example enables NFS access on a Vserver named vs0.

```
cluster1::> vserver nfs on -vserver vs0
```

## vserver nfs prepare-to-downgrade

Remove NFS configurations that are not compatible with earlier versions of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver nfs prepare-to-downgrade` command removes NFS configurations incompatible with the earlier release of ONTAP.

### Parameters

#### **-disable-feature-set <downgrade version> - Data ONTAP Version (privilege: advanced)**

This parameter specifies the ONTAP version that introduced the new NFS configurations and needs to be removed before downgrade. The value can be one of the following:

- 9.2.0 - Remove the NFS configurations introduced in ONTAP release 9.2.0. The configurations include the following:
  - `-file-session-io-grouping-count`.
  - `-file-session-io-grouping duration`.

## Examples

```
cluster1::*> vserver nfs prepare-to-downgrade -disable-feature-set 9.2.0
```

## vserver nfs show

Display the NFS configurations of Vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nfs show` command displays information about NFS-enabled Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all NFS-enabled Vservers:

- Vserver name
- Whether general NFS access is enabled
- Whether access to NFSv3 clients is enabled

- Whether access to NFSv4 clients is enabled
- Whether NFS access over UDP is enabled
- Whether NFS access over TCP is enabled
- List of default Windows users (detailed view only)

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Vservers that enable access over TCP, enter the command with the `-tcp -enable true` parameter. ++ All NFSv4.1 options apply to NFSv4.1 or later versions.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-krb-opts ] (privilege: advanced)**

If you specify the parameter for `-instance`, the command shows detailed information about all NFS-enabled Vservers. Otherwise, if the `-krb-opts` parameter is specified, the command shows the following Kerberos-related information:

- Vserver name
- Maximum number of RPCSEC\_GSS authentication contexts
- Time, in seconds, an RPCSEC\_GSS context can remain idle before being deleted

Otherwise, if the `-fields` parameter is specified, the command shows information about all of the NFS-enabled Vservers that you specify as a comma-delimited list.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the specified NFS-enabled Vserver.

**[-access {true|false}] - General NFS Access**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified general-access setting.

**[-rpcsec-ctx-high <integer>] - RPC GSS Context Cache High Water Mark (privilege: advanced)**

If you specify this parameter, the command displays information only about NFS-enabled Vservers that have the specified maximum number of RPCSEC\_GSS authentication contexts.

**[-rpcsec-ctx-idle <integer>] - RPC GSS Context Idle (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified timeout value for idle RPCSEC\_GSS contexts.

**[-v3 {enabled|disabled}] - NFS v3**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v3` option matches the specified input.

**[`-v4.0 {enabled|disabled}`] - NFS v4.0**

If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the `v4.0` option matches the specified input.

**[`-udp {enabled|disabled}`] - UDP Protocol**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-UDP access setting.

**[`-tcp {enabled|disabled}`] - TCP Protocol**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-TCP setting.

**[`-default-win-user <text>`] - Default Windows User**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows users.

**[`-enable-ejukebox {true|false}`] - Enable NFSv3 EJUKEBOX error (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `enable-ejukebox` option matches the specified input.

**[`-v3-require-read-attributes {true|false}`] - Require All NFSv3 Reads to Return Read Attributes (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which NFSv3 read operations are required or not required to return read attributes.

**[`-v3-fsid-change {enabled|disabled}`] - Show Change in FSID as NFSv3 Clients Traverse Filesystems (privilege: advanced)**

If you specify this parameter, the command displays information about changes in file system identifiers (FSIDs) as NFSv3 clients traverse file systems.

**[`-v3-connection-drop {enabled|disabled}`] - Enable the Dropping of a Connection When an NFSv3 Request is Dropped (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v3-connection-drop` option matches the specified input.

**[`-ntfs-unix-security-ops {fail|ignore|use_export_policy}`] - Vserver NTFS Unix Security Options (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the NTFS-UNIX security setting matches the specified input.

**[`-chown-mode {restricted|unrestricted|use_export_policy}`] - Vserver Change Ownership Mode (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `chown-mode` setting matches the specified input.

**[`-trace-enabled {true|false}`] - NFS Response Trace Enabled (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `trace-enabled` option matches the specified input.

**`[-trigger <integer>]` - NFS Response Trigger (in secs) (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified NFS response trigger time.

**`[-udp-max-xfer-size <integer>]` - UDP Maximum Transfer Size (bytes) (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified UDP maximum transfer size. The range is 8192 to 57344.

**`[-tcp-max-xfer-size <integer>]` - TCP Maximum Transfer Size (bytes) (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers with the specified TCP maximum transfer size. The range is 8192 to 1048576.

**`[-v4.0-acl {enabled|disabled}]` - NFSv4.0 ACL Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.0-acl` option matches the specified input.

**`[-v4.0-read-delegation {enabled|disabled}]` - NFSv4.0 Read Delegation Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.0-read-delegation` option matches the specified input.

**`[-v4.0-write-delegation {enabled|disabled}]` - NFSv4.0 Write Delegation Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.0-write-delegation` option matches the specified input.

**`[-v4-fsid-change {enabled|disabled}]` - Show Change in FSID as NFSv4 Clients Traverse Filesystems (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the showing of NFSv4 file system identifier (FSID) changes has been enabled or disabled.

**`[-v4.0-referrals {enabled|disabled}]` - NFSv4.0 Referral Support (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.0-referrals` option matches the specified input.

**`[-v4-id-domain <nfs domain>]` - NFSv4 ID Mapping Domain**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers having the specified domain name.

**`[-v4-validate-symlinkdata {enabled|disabled}]` - NFSv4 Validate UTF-8 Encoding of Symbolic Link Data (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which validation of UTF-8 encoding of symbolic link data has been enabled or disabled.

**`[-v4-lease-seconds <integer>]` - NFSv4 Lease Timeout Value (in secs) (privilege: advanced)**

If you specify this parameter, it displays the locking lease period. It is expressed in seconds. Clients that have been inactive for a period equal or longer to the lease period may lose all their locking state on a node.

**`[-v4-grace-seconds <integer>]` - NFSv4 Grace Timeout Value (in secs)**

If you specify this parameter, it displays the grace period for clients to reclaim file locks after a server failure. The grace period is expressed in seconds.

**`[-v4-acl-preserve {enabled|disabled}]` - Preserves and Modifies NFSv4 ACL (and NTFS File Permissions in Unified Security Style)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4-acl-preserve` option matches the specified input.

**`[-v4.1 {enabled|disabled}]` - NFSv4.1 Minor Version Support**

If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the `v4.1` option matches the specified input.

**`[-rquota {enabled|disabled}]` - Rquota Enable**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `rquota` option matches the specified input.

**`[-v4.1-implementation-domain <nfs domain>]` - NFSv4.1 Implementation ID Domain (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-implementation-domain` option matches the specified input.

**`[-v4.1-implementation-name <text>]` - NFSv4.1 Implementation ID Name (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-implementation-name` option matches the specified input.

**`[-v4.1-implementation-date <Date>]` - NFSv4.1 Implementation ID Date (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-implementation-date` option matches the specified input.

**`[-v4.1-pnfs {enabled|disabled}]` - NFSv4.1 Parallel NFS Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-pnfs` option matches the specified input.

**`[-v4.1-referrals {enabled|disabled}]` - NFSv4.1 Referral Support (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-referrals` option matches the specified input.

**`[-v4.1-acl {enabled|disabled}]` - NFSv4.1 ACL Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-acl` option matches the specified input.

**`[-vstorage {enabled|disabled}]` - NFS vStorage Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `vstorage` option matches the specified input.

**`[-v4-numeric-ids {enabled|disabled}]` - NFSv4 Support for Numeric Owner IDs**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4-numeric-ids` option matches the specified input.

**`[-default-win-group <text>]` - Default Windows Group**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified list of default Windows groups.

**`[-v4.1-read-delegation {enabled|disabled}] - NFSv4.1 Read Delegation Support`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-read-delegation` option matches the specified input.

**`[-v4.1-write-delegation {enabled|disabled}] - NFSv4.1 Write Delegation Support`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-write-delegation` option matches the specified input.

**`[-v4.x-session-num-slots <integer>] - Number of Slots in the NFSv4.x Session slot tables (privilege: advanced)`**

If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the `v4.x-session-num-slots` option matches the specified input. The range is 1 to 2000.

**`[-v4.x-session-slot-reply-cache-size <integer>] - Size of the Reply that will be Cached in Each NFSv4.x Session Slot (in bytes) (privilege: advanced)`**

If you specify this parameter, this command displays information only about the NFS-enabled Vservers for which the `v4.x-session-slot-reply-cache-size` option matches the specified input. The cache size is expressed in bytes. The range is 512 to 4096.

**`[-v4-acl-max-aces <integer>] - Maximum Number of ACEs per ACL (privilege: advanced)`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4-acl-max-aces` option matches the specified input.

**`[-mount-rootonly {enabled|disabled}] - NFS Mount Root Only`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `mount-rootonly` option matches the specified input.

**`[-nfs-rootonly {enabled|disabled}] - NFS Root Only`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `nfs-rootonly` option matches the specified input.

**`[-auth-sys-extended-groups {enabled|disabled}] - AUTH_SYS Extended Groups Enabled (privilege: advanced)`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `auth-sys-extended-groups` option matches the specified input.

**`[-extended-groups-limit <integer>] - AUTH_SYS and RPCSEC_GSS Auxillary Groups Limit (privilege: advanced)`**

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which the `extended-groups-limit` option matches the specified input. The range is 32 to 1024.

**`[-validate-qtree-export {enabled|disabled}] - Validation of Qtree IDs for Qtree File Operations (privilege: advanced)`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `validate-qtree-export` option matches the specified input.

**`[-mountd-port <integer>] - NFS Mount Daemon Port (privilege: advanced)`**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `mountd-port` option matches the specified input.

**[`-nlm-port <integer>`] - Network Lock Manager Port (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `nlm-port` option matches the specified input.

**[`-nsm-port <integer>`] - Network Status Monitor Port (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `nsm-port` option matches the specified input.

**[`-rquotad-port <integer>`] - NFS Quota Daemon Port (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `rquotad-port` option matches the specified input.

**[`-permitted-enc-types <NFS Kerberos Encryption Type>,...`] - Permitted Kerberos Encryption Types**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `permitted-enc-types` option matches any of the following : `aes-128`, `aes-256`.

**[`-showmount {enabled|disabled}`] - Showmount Enabled**

If you specify this parameter, the command displays information only about the NFS-enabled Vserver's for which the `showmount` option matches the specified input.

**[`-name-service-lookup-protocol {TCP|UDP}`] - Set the Protocol Used for Name Services Lookups for Exports**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-name-service-lookup-protocol` matches the parameter.

**[`-map-unknown-uid-to-default-windows-user {enable|disable}`] - Map Unknown UID to Default Windows User (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-map-unknown-uid-to-default-windows-user` is enabled or disabled.

**[`-netgroup-dns-domain-search {enabled|disabled}`] - DNS Domain Search Enabled During Netgroup Lookup (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-netgroup-dns-domain-search` is enabled or disabled.

**[`-netgroup-trust-any-ns-switch-no-match {enabled|disabled}`] - Trust No-Match Result from Any Name Service Switch Source During Netgroup Lookup (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-netgroup-trust-any-ns-switch-no-match` is enabled or disabled.

**[`-ntacl-display-permissive-perms {enabled|disabled}`] - Display maximum NT ACL Permissions to NFS Client (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-ntacl-display-permissive-perms` matches the parameter.

**[`-v3-ms-dos-client {enabled|disabled}`] - NFSv3 MS-DOS Client Support**

If you specify this parameter, the command displays information only about NFS-enabled Vservers for which NFSv3 MS-DOS client support is enabled or disabled.

**`[-ignore-nt-acl-for-root {enabled|disabled}]` - Ignore the NT ACL Check for NFS User 'root' (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-ignore-nt-acl-for-root` is enabled or disabled.

**`[-cached-cred-positive-ttl <integer>]` - Time To Live Value (in msec) of a Positive Cached Credential (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the positive cached credentials.

**`[-cached-cred-negative-ttl <integer>]` - Time To Live Value (in msec) of a Negative Cached Credential (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers time to live value of the negative cached credentials.

**`[-skip-root-owner-write-perm-check {enabled|disabled}]` - Skip Permission Check for NFS Write Calls from Root/Owner (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-skip-root-owner-write-perm-check` is enabled or disabled.

**`[-v3-64bit-identifiers {enabled|disabled}]` - Use 64 Bits for NFSv3 FSIDs and File IDs (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-v3-64bit-identifiers` is enabled or disabled.

**`[-v4-inherited-acl-preserve {enabled|disabled}]` - Ignore Client Specified Mode Bits and Preserve Inherited NFSv4 ACL When Creating New Files or Directories (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which `-v4-inherited-acl-preserve` matches the specified input.

**`[-v3-search-unconverted-filename {enabled|disabled}]` - Fallback to Unconverted Filename Search (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which `-v3-search-unconverted-filename` matches the specified input.

**`[-file-session-io-grouping-count <integer>]` - I/O Count to Be Grouped as a Session (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the `-file-session-io-grouping-count` matches the specified input.

**`[-file-session-io-grouping-duration <integer>]` - Duration for I/O to Be Grouped as a Session (Secs) (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the `-file-session-io-grouping-duration` matches the specified input.

**`[-checksum-for-replay-cache {enabled|disabled}]` - Enable or disable Checksum for Replay-Cache (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled SVMs for which the `-checksum-for-replay-cache` matches the specified input.

**`[-cached-cred-harvest-timeout <integer>]` - Harvest timeout (in msec) for a Cached Credential (privilege: advanced)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers harvest timeout for cached credentials.

**`[-idle-connection-timeout <integer>]` - Idle Connection Timeout Value (in seconds)**

If you specify this parameter, the command displays information about the NFS-enabled Vservers idle connections timeout

**`[-allow-idle-connection-timeout {enabled|disabled}]` - Are Idle NFS Connections Supported**

If you specify this parameter, the command displays information only about NFS-enabled Vservers for which the `-allow-idle-connection-timeout` option matches the specified input.

**`[-v3-hide-snapshot {enabled|disabled}]` - Hide Snapshot Directory under NFSv3 Mount Point**

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which `-v3-hide-snapshot` matches the specified input.

**`[-showmount-rootonly {enabled|disabled}]` - Provide Root Path as Showmount State**

If you specify this parameter, the command displays information about the NFS-enabled Vservers for which `-showmount-rootonly` matches the specified input.

**`[-v4-64bit-identifiers {enabled|disabled}]` - Use 64 Bits for NFSv4.x FSIDs and File IDs (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which `-v4-64bit-identifiers` is enabled or disabled.

**`[-v4.2-seclabel {enabled|disabled}]` - NFSV4.2 Security Label Support (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.2-seclabel` option matches the specified input.

**`[-rdma {enabled|disabled}]` - RDMA Protocol**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers that have the specified NFS-over-RDMA setting.

**`[-v4.1-trunking {enabled|disabled}]` - NFSV4.1 Trunking Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.1-trunking` option matches the specified input.

**`[-v4.2-sparsefile-ops {enabled|disabled}]` - NFSV4.2 Sparse Files Ops Support (privilege: advanced)**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.2-sparsefile-ops` option matches the specified input.

**`[-v4.2-xattrs {enabled|disabled}]` - NFSV4.2 Extended Attributes Support**

If you specify this parameter, the command displays information only about the NFS-enabled Vservers for which the `v4.2-xattrs` option matches the specified input.

**`[-v4.1-sequence-admin-revoked {enabled|disabled}]` - NFSV4 Admin Revoked Support (privilege: advanced)**

If you specify this parameter, the command only displays information about the NFS-enabled Vservers for

which the `v4.1-sequence-admin-revoked` option matches the specified input.

**[`-v4-acl-compliance {enabled|disabled}`] - NFSV4 ACL Compliance Support (privilege: advanced)**

If you specify this parameter, the command only displays information about the NFS-enabled Vservers where NFSv4.1 acl compliance is enabled or disabled.

**Examples**

The following example displays information about all NFS-enabled Vservers:

```
cluster1::> vserver nfs show
      General
Vserver  Access  v3      v4      v4.1    UDP      Default
User
-----
vs0      true     enabled disabled disabled enabled  enabled -
vs1      true     enabled disabled disabled enabled  enabled -
2 entries were displayed.
```

The following example displays Kerberos-related information about all NFS-enabled Vservers:

```
cluster1::*> vserver nfs show -krb-opts
Vserver Context High Context Idle
-----
vs0      30      30
vs1      30      30
2 entries were displayed.
```

**vserver nfs start**

Start the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver nfs start` command starts the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

**Parameters**

**`-vserver <vserver name>` - Vserver**

This parameter specifies the Vserver on which you want to start the NFS service.

## Examples

The following example starts the NFS service on a Vserver named vs0.

```
cluster1::> vserver nfs start -vserver vs0
```

## vserver nfs status

Display the status of the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nfs status` command shows the status of NFS on a Vserver. The Vserver must already exist.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver for which you want to see the NFS status.

**[-is-enabled {true|false}] - NFS Service Enabled**

If you specify this optional parameter, the command displays whether NFS is enabled or not. This parameter is true if the NFS server is running.

## Examples

The following example shows the status of NFS on a Vserver named vs0 for which NFS is enabled.

```
cluster1::> vserver nfs status -vserver vs0.  
The NFS server is running.
```

## vserver nfs stop

Stop the NFS service of a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nfs stop` command stops the NFS service on a Vserver to serve NFS clients. The Vserver must already exist.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to stop the NFS service.

## Examples

The following example stops the NFS service on a Vserver named vs0.

```
cluster1::> vsriver nfs stop -vsriver vs0
```

## vsriver nfs connected-clients show

### Display List of recent NFS clients information

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `nfs connected-clients show` command displays information about currently connected NFS clients, other NFS clients that are currently idle but can be connected, and a list of recently unmounted clients. If a client connected to the NFS server is idle for longer than the maximum cache idle time, then the entry will be removed. By default, the maximum cache idle time is 48 hours.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name**

Use this parameter to display information only about the specified node.

**[-vsriver <vsriver>] - Vsriver**

Use this parameter to display information only about the specified vsriver.

**[-data-lif-ip <IP Address>] - Data LIF IP Address**

Use this parameter to display information only about the specified data LIF IP.

**[-client-ip <IP Address>] - Client IP Address**

Use this parameter to display information only about the specified client IP.

**[-volume <volume name>] - Volume Accessed**

Use this parameter to display information only about the specified volume.

**[-protocol <Client Access Protocol>] - Protocol Version**

Use this parameter to display information only about the specified protocol.

**[-idle-time <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Idle Time (Sec)**

Use this parameter to display the time elapsed since the client sent the last request for this volume.

### **[-local-reqs <integer>] - Number of Local Reqs**

Use this parameter to display a counter tracking requests that are sent to the volume with fast-path.

### **[-remote-reqs <integer>] - Number of Remote Reqs**

Use this parameter to display a counter tracking requests that are sent to the volume with slow-path to remote Dblade using a CSM session.

### **[-policy-name <text>] - Export Policy Name**

Use this parameter to display the Policy Name for this volume.

### **[-trunking-status {true|false}] - Trunking Status**

Use this parameter to display trunking status for the specified client/connection.

## **Examples**

The following example displays the connected clients information.

```
cluster-1::*> nfs connected-clients show
Node: node1
  Vserver: vs1
  Data-IP: xxx.xxx.xxx.xxx

Client-IP      Protocol Volume      Policy      Idle-Time      Local Remote
Trunking                               Reqs  Reqs
-----
-----
xxx.xxx.xxx.xxx nfs4.1   root_vol  poll        6s             9      0
false
xxx.xxx.xxx.xxx nfs3      vol1      poll        56s            7      0
false
xxx.xxx.xxx.xxx nfs4.1   vol1      poll        6s             7      0
false
3 entries were displayed.
```

## **vserver nfs credentials count**

### **Count credentials cached by NFS**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `vserver nfs credentials count` command displays the number of credentials stored in NFS credentials cache on a specific node. This command has no effect if the specified node has no active data.

### **Parameters**

**-node <nodename> - Node (privilege: advanced)**

The name of the node on which the command is executed.

## Examples

Lists the number of credentials stored by NFS on node node1

```
cluster1::*> vserver nfs credentials count -node node1
```

```
Number of credentials cached by NFS on node "node1": "2"
```

## vserver nfs credentials flush

Flush credentials cached by NFS

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver nfs credentials flush` command deletes credentials from the NFS credentials cache on a specific node for a given Vserver or a given UNIX user. This command has no effect if the vserver that is specified has no active data interfaces on the node where the command is run.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to clear the credential cache for the Vserver you specify.

**{ [-unix-user-id <integer>] - UNIX User ID (privilege: advanced)**

Use this parameter to clear the credential cache for the UNIX user id you specify.

**[-client-ip <IP Address>] - Client IP Address (privilege: advanced)**

Use this parameter to clear the credential cache for the client IP address you specify.

**| [-unix-user-name <text>] - UNIX User Name (privilege: advanced)**

Use this parameter to clear the credential cache for the UNIX user name you specify.

**| [-unix-group-id <integer>] - UNIX Group ID (privilege: advanced)**

Use this parameter to clear the credential cache for the UNIX group id you specify.

**| [-unix-group-name <text>] - UNIX Group Name (privilege: advanced) }**

Use this parameter to clear the credential cache for the UNIX group name you specify.

## Examples

Clear the credential cache for user user1 on node node1 in Vserver vs1.

```
cluster1::*> vserver nfs credentials flush -node node1 -vserver vs1 -unix  
-user-name user1
```

```
Number of matching credentials flushed: 1
```

## vserver nfs credentials show

Show credentials cached by NFS

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver nfs credentials show` command displays the user account credentials stored on a specific node for a given UNIX user. This command has no effect if the vserver specified has no active data interfaces on the node where the command is run.

### Parameters

**[`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**| [`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`-node <nodename>` - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver name>` - Vserver (privilege: advanced)**

Use this parameter to search for user credentials in the Vserver you specify.

**{ `-unix-user-id <integer>` - UNIX User ID (privilege: advanced)**

Use this parameter to search for user credentials for the UNIX user id you specify.

**[`-client-ip <IP Address>`] - Client IP Address (privilege: advanced)**

Use this parameter to search for user credentials for the client ip you specify.

**| `-unix-user-name <text>` - UNIX User Name (privilege: advanced)**

Use this parameter to search for user credentials for the UNIX user name you specify.

**| `-unix-group-id <integer>` - UNIX Group ID (privilege: advanced)**

Use this parameter to search for user credentials for the UNIX group id you specify.

**| -unix-group-name <text> - UNIX Group Name (privilege: advanced) }**

Use this parameter to search for user credentials for the UNIX group name you specify.

**[-flags {ip-qualifier-configured|ip-qualifier-not-configured|unix-extended-creds-present|no-unix-extended-creds|unix-extended-creds-requested|unix-creds-transient-failure|cifs-creds-present|no-cifs-creds|cifs-creds-requested|cifs-cifs-transient-failure|place-holder|transient-failure|transient-error-on-last-refresh|id-name-mapping-present|no-id-name-mapping|id-name-mapping-requested|id-name-mapping-transient-failure|unix-cred-is-partial}] - Credential Entry Flags (privilege: advanced)**

The credential entry flags.

**[-last-refresh-time <[<integer>h] [<integer>m] [<integer>s]>] - Time since Last Refresh (privilege: advanced)**

Time since last refreshed.

**[-last-access-time <[<integer>h] [<integer>m] [<integer>s]>] - Time since Last Access (privilege: advanced)**

Time since last access.

**[-hit-count <integer>] - Number of Hits (privilege: advanced)**

Number of times the cached credential is fetched successfully.

**[-unix-cred-flags <integer>] - UNIX Credential Flags (privilege: advanced)**

UNIX credentials flags.

**[-unix-cred-domain-id <integer>] - UNIX Credential Domain ID (privilege: advanced)**

UNIX credentials domain ID.

**[-unix-cred-uid <integer>] - UNIX Credential UID (privilege: advanced)**

User ID of the UNIX user.

**[-unix-cred-primary-gid <integer>] - UNIX Credential Primary GID (privilege: advanced)**

Primary GID of the UNIX user.

**[-unix-cred-additional-gids <integer>, ...] - UNIX Credential Additional GIDs (privilege: advanced)**

Additional GIDs of the UNIX user.

**[-win-cred-flags <integer>] - Windows Credential Flags (privilege: advanced)**

Windows credentials flags.

**[-win-cred-user-sid <text>] - Windows Credential User SID (privilege: advanced)**

SID of the windows user.

**[-win-cred-primary-group-sid <text>] - Windows Credential Primary Group SID (privilege: advanced)**

SID of the windows user's primary group.

## **[-win-cred-domain-sids <text>,...] - Windows Credential Domain SIDs (privilege: advanced)**

Domain SIDs of the windows user.

### **Examples**

Show the credentials cached by NFS Cred Store for the UNIX user node1 on node node1.

```
gnklcluster1::*> vserver nfs credentials show -node gnklcluster1-01
-vserver coke -unix-user-name root

Credentials
-----
                Node: gnklcluster1-01
                Vserver: coke
                Client IP: -
                Flags: ip-qualifier-not-configured, unix-extended-
creds-present, cifs-creds-present, id-name-mapping-present
                Time since Last Refresh: 10s
                Time since Last Access: 5s
                Hit Count: 24
Unix Credentials:
                Flags: 0
                Domain ID: 0
                UID: 0
                Primary GID: 1
                Additional GIDs: 1
Windows Credentials:
                Flags: 8759
                User SID: S-1-5-21-2552784647-1202982559-4146209732-500
                Primary Group SID: S-1-5-21-2552784647-1202982559-4146209732-513
                Domain SIDs: S-1-5-21-2552784647-1202982559-4146209732
                           S-1-1
                           S-1-5

```

### **vserver nfs kerberos interface disable**

Disable NFS Kerberos on a LIF

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs kerberos interface disable` command disables NFS Kerberos on a logical interface.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver in which the logical interface exists.

### **-lif <lif-name> - Logical Interface**

This parameter specifies the name of the logical interface on which you want to disable NFS Kerberos.

### **[-admin-username <text>] - Account Creation Username**

This optional parameter specifies the administrator user name.

### **[-admin-password <text>] - Account Creation Password**

This optional parameter specifies the administrator password.

## Examples

The following example disables NFS Kerberos on a Vserver named `vs0` and a logical interface named `datalif1`.

```
vs1::> vserver nfs kerberos interface disable -vserver vs0 -lif datalif1
```

## vserver nfs kerberos interface enable

Enable NFS Kerberos on a LIF

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs kerberos interface enable` command enables NFS Kerberos on a logical interface.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver in which the logical interface exists.

### **-lif <lif-name> - Logical Interface**

This parameter specifies the name of the logical interface on which you want to enable NFS Kerberos.

### **[-spn <text>] - Service Principal Name**

This optional parameter specifies the service principal name (SPN) for the logical interface you want to enable. This value must be in the form `nfs/host_name@REALM`, where *host\_name* is the fully qualified host name of the Kerberos server, *nfs* is the service, and *REALM* is the name of the Kerberos realm (for instance, `EXAMPLE.COM`). Specify Kerberos realm name in uppercase.

**`[-admin-username <text>]` - Account Creation Username**

This optional parameter specifies the administrator user name.

**`[-admin-password <text>]` - Account Creation Password**

This optional parameter specifies the administrator password.

**`[-keytab-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}]` - Load Keytab from URI**

This optional parameter specifies loading a keytab file from the specified URI.

**`[-ou <text>]` - Organizational Unit**

This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

**`[-machine-account <text>]` - Machine Account Name**

This optional parameter specifies the machine account to create in Active Directory

**Examples**

The following example enables NFS Kerberos on a Vserver named vs0 and a logical interface named datalif1. The SPN is nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM and the keytab file is loaded from <ftp://ftp.example.com/keytab>.

```
vs1::> vsserver nfs kerberos interface enable -vserver vs0 -lif datalif1
-spns nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab-uri
ftp://ftp.example.com/keytab
```

**vserver nfs kerberos interface modify**

Modify the Kerberos configuration of an NFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver nfs kerberos interface modify` command modifies a Kerberos configuration for NFS. An NFS Kerberos configuration is associated with both a Vserver and a logical interface.

**Parameters****`-vserver <vserver name>` - Vserver**

This parameter specifies the Vserver associated with the NFS Kerberos configuration you want to modify.

**`-lif <text>` - Logical Interface**

This parameter specifies the name of the logical interface associated with the NFS Kerberos configuration you want to modify.

### **[`-kerberos {enabled|disabled}`] - Kerberos Enabled**

This optional parameter specifies whether to enable or disable Kerberos for NFS on the specified Vserver and logical interface. If you specify a value of `enable`, you must also specify the `-spn` parameter. The command prompts you for a user name and password for a Kerberos principal in the same realm as the principal specified by the `-spn` parameter; this principal must have permission to create or modify the principal specified by the `-spn` parameter.

### **[`-spn <text>`] - Service Principal Name**

This optional parameter specifies the service principal name (SPN) of the Kerberos configuration you want to modify. If you specify a value of `enable` for the `-kerberos` parameter, you must also specify this parameter. This value must be in the form `nfs/host_name@REALM`, where `host_name` is the fully qualified host name of the Kerberos server, `nfs` is the service, and `REALM` is the name of the Kerberos realm (for instance, `EXAMPLE.COM`). Specify Kerberos realm names in uppercase.

### **[`-admin-username <text>`] - Account Creation Username**

This optional parameter specifies the administrator user name.

### **[`-keytab-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}`] - Load Keytab from URI**

This optional parameter specifies loading a keytab file from the specified URI.

### **[`-ou <text>`] - Organizational Unit**

This optional parameter specifies the organizational unit (OU) under which the Microsoft Active Directory server account will be created when you enable Kerberos using a realm for Microsoft KDC. If this parameter is not specified, the default OU is "CN=Computers".

### **[`-machine-account <text>`] - Machine Account Name**

This optional parameter specifies the machine account to create in Active Directory

## **Examples**

The following example enables an NFS Kerberos configuration on a Vserver named `vs0` and a logical interface named `datalif1`. The SPN is `nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM` and the keytab file is loaded from <ftp://ftp.example.com/keytab>.

```
vs1::> vsriver nfs kerberos interface modify -vsriver vs0 -lif datalif1
-karberos enabled -spn nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM -keytab
-uri
ftp://ftp.example.com/keytab
```

## **vsvriver nfs karberos interface show**

Display the Kerberos configurations of NFS servers

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

## **Description**

The `vsvriver nfs karberos interface show` command displays information about Kerberos

configurations for NFS. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos configurations for NFS:

- Vserver name
- Logical interface name
- Logical interface IP address
- Whether Kerberos is enabled or disabled
- The Kerberos service principal name (SPN)
- The permitted encryption types

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Kerberos configurations for NFS that are enabled, run the command with the `-kerberos enabled` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter and the `-lif` parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified Vserver and logical interface.

**[-lif <text>] - Logical Interface**

If you specify this parameter and the `-vserver` parameter, the command displays information only about the Kerberos configuration or configurations for NFS that are associated with the specified logical interface and Vserver.

**[-address <IP Address>] - IP Address**

If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that are associated with the specified logical-interface IP address.

**[-kerberos {enabled|disabled}] - Kerberos Enabled**

If you specify this parameter, the command displays information only about the Kerberos configurations for NFS that match the specified value.

**[-spn <text>] - Service Principal Name**

If you specify this parameter, the command displays information only about the Kerberos configuration or configurations for NFS that match the specified SPN.

**[-permitted-enc-types <NFS Kerberos Encryption Type>,...] - Permitted Encryption Types**

If you specify this parameter, the command displays information only about the Kerberos configuration for NFS that matches the specified encryption types.

### **[`-machine-account <text>`] - Machine Account Name**

If you specify this parameter, the command displays information only about the Kerberos configuration for NFS that matches the specified machine account.

### **Examples**

The following example displays information about the Kerberos configuration for NFS associated with the Vserver `vs0` and the logical interface `datalif1`:

```
vs1::> vsriver nfs kerberos interface show -vsriver vs0 -lif datalif1
      Vserver: vs1
      Logical Interface: datalif1
      IP Address: 192.0.2.130
      Kerberos Enabled: enabled
      Service Principal Name: nfs/sec.example.com@AUTH.SEC.EXAMPLE.COM
      Permitted Encryption Types: des,des3,aes-128,aes-256
```

## **vsvriver nfs kerberos realm create**

Create a Kerberos realm configuration

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

### **Description**

The `vsvriver nfs kerberos realm create` command creates a Kerberos realm configuration.

### **Parameters**

#### **`-vsriver <vsriver name>` - Vsvriver**

This parameter specifies the Vsvriver associated with the Kerberos realm configuration that you want to create.

#### **`-realm <text>` - Kerberos Realm**

This parameter specifies the name of the Kerberos realm for the configuration.

#### **`-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>` - KDC Vendor**

This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

#### **`-kdc-ip <IP Address>` - KDC IP Address**

This parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

#### **`[-kdc-port <integer>]` - KDC Port**

This optional parameter specifies the port number of the KDC server. The default setting is 88.

#### **`[-clock-skew <integer>]` - Clock Skew**

This optional parameter specifies how many minutes of clock skew between the clients and the server are

permitted. The default setting is 5 minutes.

**[-adserver-name <text>] - Active Directory Server Name**

This parameter specifies the name of an Active Directory server for the configuration. Use this parameter only if you specified the value of `-kdc-vendor` parameter as *Microsoft*.

**[-adserver-ip <IP Address>] - Active Directory Server IP Address**

This parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter only if you specified the value of the `-kdc-vendor` parameter as *Microsoft*.

**[-comment <text>] - Comment**

This optional parameter specifies a comment for the Kerberos realm configuration.

**[-adminserver-ip <IP Address>] - Admin Server IP Address**

This optional parameter specifies the IP address of the administrative server. Use this parameter only if you specified the value of `-kdc-vendor` parameter as *Other*. The default setting for this parameter is the KDC server's IP address as specified by the `-kdc-ip` parameter.

**[-adminserver-port <integer>] - Admin Server Port**

This optional parameter specifies the port number of the administrative server. The default setting is 749. Use this parameter only if you specified the value of `-kdc-vendor` parameter as *Other*.

**[-passwordserver-ip <IP Address>] - Password Server IP Address**

This optional parameter specifies the IP address of the password server. Use this parameter only if you specified the value of `-kdc-vendor` parameter as *Other*. The default setting for this parameter is the KDC server's IP address as specified by the `-kdc-ip` parameter.

**[-passwordserver-port <integer>] - Password Server Port**

This optional parameter specifies the port number of the password server. The default setting is 464. Use this parameter only if you specified the value of `-kdc-vendor` parameter as *Other*.

## Examples

The following example creates a Kerberos realm named SEC.EXAMPLE.COM for the Vserver named AUTH. The permitted clock skew is 15 seconds. The KDC's IP address is 192.0.2.170 and its port is 88. The KDC vendor is *Other* (for a UNIX KDC). The administrative server's IP address is 192.0.2.170 and its port is 749. The password server's IP address is 192.0.2.170 and its port is 464.

```
cluster1::> vsriver nfs kerberos realm create -vsriver AUTH -realm
SEC.EXAMPLE.COM -clock-skew 15 -kdc-ip 192.0.2.170 -kdc-port 88 -kdc
-vendor Other -adminserver-ip 192.0.2.170 -adminserver-port 749
-passwordserver-ip 192.0.2.170 -passwordserver-port 464
```

## vsvriver nfs kerberos realm delete

Delete a Kerberos realm configuration

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

## Description

The `vserver nfs kerberos realm delete` command deletes a Kerberos realm configuration from the system.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to delete.

### **-realm <text> - Kerberos Realm**

This parameter specifies the name of the Kerberos realm for the configuration.

## Examples

The following example deletes the Kerberos realm SEC.EXAMPLE.COM from the Vserver named AUTH:

```
cluster1::> vserver nfs kerberos realm delete -vserver AUTH -realm  
SEC.EXAMPLE.COM
```

## vserver nfs kerberos realm modify

Modify a Kerberos realm configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs kerberos realm modify` command modifies one or more attributes of a Kerberos realm configuration.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for the Kerberos realm configuration that you want to modify.

### **-realm <text> - Kerberos Realm**

This optional parameter specifies the name of a Kerberos realm for the configuration.

### **[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor**

This optional parameter specifies the KDC vendor. Specify Microsoft if you are using a Microsoft Active Directory server; specify Other if you are using a UNIX server.

### **[-kdc-ip <IP Address>] - KDC IP Address**

This parameter specifies the IP address of the Kerberos Distribution Center (KDC) server.

**[`-kdc-port` <integer>] - KDC Port**

This optional parameter specifies the port number of the KDC server. The default setting at the time of creation is 88.

**[`-clock-skew` <integer>] - Clock Skew**

This optional parameter specifies how many minutes of clock-skew between server and the clients are permitted. The default setting at the time of creation is 5 minutes.

**[`-adserver-name` <text>] - Active Directory Server Name**

This parameter specifies the name of an Active Directory server for the configuration. Use this parameter if you specified the value of `-kdc-vendor` parameter as Microsoft.

**[`-adserver-ip` <IP Address>] - Active Directory Server IP Address**

This parameter specifies the IP address of an Active Directory server for the configuration. Use this parameter if you specified the value of the `-kdc-vendor` parameter as Microsoft.

**[`-comment` <text>] - Comment**

This optional parameter specifies a comment for the Kerberos realm configuration.

**[`-adminserver-ip` <IP Address>] - Admin Server IP Address**

This optional parameter specifies the IP address of the administrative server. Use this parameter if you specified the value of `-kdc-vendor` parameter as Other.

**[`-adminserver-port` <integer>] - Admin Server Port**

This optional parameter specifies the port number of the administrative server. The default setting at the time of creation is 749. Use this parameter if you specified the value of the `-kdc-vendor` parameter as Other.

**[`-passwordserver-ip` <IP Address>] - Password Server IP Address**

This optional parameter specifies the IP address of the password server. Use this parameter if you specified the value of `-kdc-vendor` parameter as Other.

**[`-passwordserver-port` <integer>] - Password Server Port**

This optional parameter specifies the port number of the password server. The default setting at the time of creation is 464. Use this parameter only if you specified the value of `-kdc-vendor` parameter as Other.

**Examples**

The following example modifies the Kerberos realm SEC.EXAMPLE.COM for the Vserver named AUTH to use a Microsoft KDC server with the IP address 192.0.2.170 and an Active Directory server named AUTH.SEC.EXAMPLE.COM with the IP address 192.0.2.170:

```
cluster1::> vsriver nfs kerberos realm modify -vsriver AUTH -realm
SEC.EXAMPLE.COM -adserver-name AUTH.SEC.EXAMPLE.COM -adserver-ip
192.0.2.170 -kdc-ip 192.0.2.170 -kdc-vendor Microsoft
```

## vserver nfs kerberos realm show

### Display Kerberos realm configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver nfs kerberos realm show` command displays information about Kerberos realm configurations. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Kerberos realm configurations:

- Vserver
- Kerberos realm name
- Active Directory server name
- Kerberos Distribution Center (KDC) vendor
- KDC IP address
- The permitted encryption types

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the Kerberos realm configurations for the specified Vserver.

**[-realm <text>] - Kerberos Realm**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified Kerberos realm.

**[-kdc-vendor <Kerberos Key Distribution Center (KDC) Vendor>] - KDC Vendor**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC vendor.

**[-kdc-ip <IP Address>] - KDC IP Address**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC IP address.

**[-kdc-port <integer>] - KDC Port**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified KDC port number.

**[-clock-skew <integer>] - Clock Skew**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified clock skew.

**[-adserver-name <text>] - Active Directory Server Name**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified name.

**[-adserver-ip <IP Address>] - Active Directory Server IP Address**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the Active Directory server that has the specified IP address.

**[-comment <text>] - Comment**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that match the specified comment text.

**[-adminserver-ip <IP Address>] - Admin Server IP Address**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server IP address.

**[-adminserver-port <integer>] - Admin Server Port**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified administrative-server port number.

**[-passwordserver-ip <IP Address>] - Password Server IP Address**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server IP address.

**[-passwordserver-port <integer>] - Password Server Port**

If you specify this parameter, the command displays information only about the Kerberos realm configurations that use the specified password-server port number.

**[-permitted-enc-types <NFS Kerberos Encryption Type>,...] - Permitted Encryption Types**

If you specify this parameter, the command displays information only about the Kerberos realm configuration that match the specified encryption types.

## Examples

The following example displays information about all Kerberos realm configurations:

```
cluster1::> vserver nfs kerberos realm show
Kerberos           Active Directory KDC      KDC
Vserver  Realm           Server      Vendor      IP Address
-----
AUTH      SEC.EXAMPLE.COM      AUTH.SEC.EXAMPLE.COM      Microsoft  192.0.2.170
```

## vserver nfs pnfs devices create

Create a new pNFS device and its mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The ``vserver nfs pnfs devices create`` command creates a pNFS device for a given instance of a volume. The actual creation of pNFS devices is automatically done by the pNFS implementation in ONTAP kernel. The usage of this command might interfere with the functionality of the pNFS server. Thus, it is advised that this command not be used without supervision by technical support.

### Parameters

**`[-global-device-table-id <integer>]` - Global Device Mapping Table ID (privilege: advanced)**

This optional parameter specifies the unique identifier that the pNFS devices subsystem assigns to the device that corresponds to the MSID described below. The pNFS devices implementations keeps track of the global unique identifier that needs to be assigned to this device. It is expected that users need not specifically input the device identifier while creation.

**`-vserver <vserver name>` - Vserver Name (privilege: advanced)**

This parameter specifies the Vserver to which the volumes belong.

**`-msid <integer>` - Volume MSID (privilege: advanced)**

This parameter uniquely identifies the volume for which you are creating a pNFS device.

**`-striping-epoch <integer>` - Striping Epoch (privilege: advanced)**

This optional parameter specifies the striping epoch identifier for a volume for which you are creating a pNFS device. For flexible volumes, the value is always 1.

**`-device-access <integer>` - Device Access Flags (privilege: advanced)**

This optional parameter specifies the type of access that is given to the pNFS device that you are creating. If the value is 1, it means write access. If the value is 0, it means read access. By default, the device is created with write access.

**`-version <integer>` - Device Version (privilege: advanced)**

This optional parameter specifies the version associated with the pNFS device identifier. By default, the version is set to 1.

**`[-generation-count <integer>]` - Device Generation (privilege: advanced)**

This optional parameter specifies the generation count associated with the pNFS device identifier. If a device already exists, the existing device is invalidated and the generation number for the device is bumped. If a device does not already exist, a new device is created with generation number 1.

**[`-create-time` <MM/DD/YYYY HH:MM:SS>] - Device Creation Time (privilege: advanced)**

This optional parameter specifies the time at which the device is created. If the parameter is not specified, the time at which the device is created is stored along with the device.

**[`-mapping-status` {`available`|`notavailable`}] - Device Mapping Status (privilege: advanced)**

This optional parameter specifies if the mapping exists for a device. If the value is set to "available", the mappings will be created in the device mappings table. If the value is set to "notavailable", the mappings will not be created in the device mappings table.

## Examples

### **vserver nfs pnfs devices delete**

Delete a pNFS device

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### **Description**

The `vserver nfs pnfs devices delete` command deletes a unique pNFS device. The pNFS device to be deleted is identified by the unique device mapping identifier (`mid`) parameter passed to this operation. When this operation is successful, the device mappings corresponding to the device and the information corresponding to the device itself are removed. You can obtain the global mapping identifier from the list of devices using the command [vserver nfs pnfs devices show](#).

#### **Parameters**

**`-global-device-table-id` <integer> - Global Device Mapping Table ID (privilege: advanced)**

This parameter specifies the pNFS global device mapping identifier that uniquely identifies a pNFS device

## Examples

The following example deletes the device information of a device with global mapping identifier value 2.

```
cluster1::> vserver nfs pnfs delete -mid 2
```

#### **Related Links**

- [vserver nfs pnfs devices show](#)

### **vserver nfs pnfs devices show**

Display pNFS device information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### **Description**

The ``vserver nfs pnfs devices show`` command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The master data set ID (MSID) of the volume that leads to this device
- The mapping status of the device
- The generation number of the device

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the `-access-flags 1` parameter.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**`[-global-device-table-id <integer>] - Global Device Mapping Table ID (privilege: advanced)`**

If you specify this parameter, the command displays information only about the unique identifier that the pNFS devices subsystem assigns to the device that is being output.

**`[-vserver <vserver name>] - Vserver Name (privilege: advanced)`**

If you specify this parameter, the command displays information only about the Vserver that owns the volume represented by MSID.

**`[-msid <integer>] - Volume MSID (privilege: advanced)`**

If you specify this parameter, the command displays information only about the volume or volumes that match the specified MSID.

**`[-striping-epoch <integer>] - Striping Epoch (privilege: advanced)`**

If you specify this parameter, the command displays information only about the striping epoch identifier for a volume that serves as the basis for the pNFS device.

**`[-device-access <integer>] - Device Access Flags (privilege: advanced)`**

If you specify this parameter, the command displays information only about access flags which specify the type of access that is given to the pNFS device. If the value is 1, it means write access. If the value is 0, it means read access.

**[`-version <integer>`] - Device Version (privilege: advanced)**

If you specify this parameter, the command displays information only about pNFS devices that match the specified version number.

**[`-generation-count <integer>`] - Device Generation (privilege: advanced)**

If you specify this parameter, the command displays information only about generation count associated with the pNFS device identifier.

**[`-create-time <MM/DD/YYYY HH:MM:SS>`] - Device Creation Time (privilege: advanced)**

If you specify this parameter, the command displays information only about pNFS devices that were created at the specified time.

**[`-mapping-status {available|notavailable}`] - Device Mapping Status (privilege: advanced)**

If you specify this parameter, the command displays information only about if the mapping exists for a device. If the value is set to "available", the mappings can be seen in the device mappings table. If the value is set to "notavailable", the mappings will not be seen in the device mappings table.

## Examples

The following example displays the information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device mappings corresponding to this device follow in the mappings table.

```
cluster1::*> vsriver nfs pnfs devices show
Vserver Name      Mapping ID      Msid            Mapping Status
Generation
-----
vs1                1              2147484673      available      6

cluster1::*> vsriver nfs pnfs devices mappings show
Vserver Name      Mapping ID      Dsid            LIF IP
-----
vs1                1              1025            10.53.4.14
```

## vsriver nfs pnfs devices cache show

Display the device cache

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``vsriver nfs pnfs devices cache show`` command displays the device cache.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**[`-instance`  ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays information only about the pNFS devices cache present on the node.

**[`-vserver <vserver name>`] - Vserver Name (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vserver that has the pNFS devices cache.

## Examples

### **vserver nfs pnfs devices mappings show**

Display the list of pNFS device mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `xref:{relative_path}vserver-nfs-pnfs-devices-show.html[vserver nfs pnfs devices show]` command displays a pNFS device for a given instance of a volume. The command output depends on the parameter or parameters specified with the command. If you do not specify parameters, the command displays the following information about all pNFS devices:

- Vserver name
- The global device mapping identifier of the device
- The Data Set ID (DSID) of the constituent volume
- The LIF IP address that serves the constituent on the same controller.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about devices that are exported as write-only devices, enter the command with the `-access-flags 1` parameter.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**[ *-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all entries.

**[ *-global-device-table-id* <integer> ] - Global Device Mapping Table ID (privilege: advanced)**

This specifies the unique identifier that the pNFS devices subsystem assigns to the device whose mappings are being output.

**[ *-vserver* <vserver name> ] - Vserver Name (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vserver that the mapping identifier and DSID belong to.

**[ *-dsid* <integer> ] - Constituent Volume DSID (privilege: advanced)**

If you specify this parameter, the command displays information only about the volume or volumes that match the specified DSID.

**[ *-lifip* <IP Address> ] - LIF IP Address (privilege: advanced)**

If you specify this parameter, the command displays information only about the pNFS devices that match the specified LIF IP address.

## Examples

The following example displays the device information of a device with global mapping identifier 6. The device corresponds to a volume with MSID 2147484673 on Vserver vs1. The device has one constituent with DSID 1025 and is served by the LIF with the IP address 10.53.4.14.

```
cluster1::*> vsriver nfs pnfs devices* show
Vserver Name      Mapping ID      Msid              Mapping Status
Generation
-----
vs1                1              2147484673        available        6

cluster1::*> vsriver nfs pnfs devices mappings show
Vserver Name      Mapping ID      Dsid              Lif IP
-----
vs1                1              1025              10.53.4.14
```

## vsriver nfs storepool show

Display storepool information for currently connected NFSv4 clients

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver nfs storepool show` command shows the number of storepool resources consumed. A storepool is a pool of resources used by NFSv4 clients. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following storepool information about all the connected clients:

- Node on which the storepool resource is located
- Vserver name
- Data ip address
- Client ip address
- Protocol (nfs4, nfs4.1, or nfs4.2)
- Session trunking status (true or false)
- Owner count
- Open state count
- Delegation state count
- Lock state count
- Bad State Count
- Stale State Count

To display detailed information about a single instance, run the command with the `-instance` parameter. The detailed view provides all of the information in the previous list and the following additional information:

- Layout state count
- Copy state count
- Client identifier

## Parameters

**`[-fields <fieldname>,...]`**

This specifies the fields that need to be displayed. The fields Vserver, node, data-lif-ip, client-ip and protocol are the default fields (see example).

**`| [-instance ] (privilege: advanced) }`**

If this parameter is specified, the command displays information about all entries.

**`[-node {<nodename>|local}] - Node Name (privilege: advanced)`**

If this parameter is specified, the command displays information only about clients with the specified node.

**`[-vserver <vserver>] - Vserver (privilege: advanced)`**

If this parameter is specified, the command displays information only about clients with the specified Vserver.

**`[-data-lif-ip <IP Address>] - Data LIF IP Address (privilege: advanced)`**

If this parameter is specified, the command displays information only about clients with the specified data LIF.

**[-client-ip <IP Address>] - Client IP Address (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified client IP.

**[-protocol <Nfs4 Storepool Client Access Protocol>] - Protocol Version (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified protocol.

**[-trunking-status {true|false}] - Trunking Status (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified trunking status.

**[-owner-count <integer>] - Allocated Owner Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of owner counts.

**[-open-state-count <integer>] - Allocated OpenState Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of open state counts.

**[-deleg-state-count <integer>] - Allocated DelegState Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of delegation state counts.

**[-lock-state-count <integer>] - Allocated LockState Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of lock state counts.

**[-layout-state-count <integer>] - Allocated LayoutState Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of layout state counts.

**[-copy-state-count <integer>] - Allocated CopyState Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of copy state counts.

**[-client-id <integer>] - Unique Client Identifier (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified client id.

**[-exhausted-object {owner|open|lock|delegation}] - Exhausted Object List (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified exhausted object.

**[-is-exhausted {true|false}] - Is Storepool Exhausted? (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified exhausted status.

**[-bad-seqid-state-count <integer>] - Bad Sequential ID State Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of bad sequential ID state counts.

**[-stale-stateid-count <integer>] - Stale State ID Count (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of stale state ID counts.

**[-slot-inuse-count <integer>] - Slots in Use (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of session slots in use.

**[-max-slot-inuse-count <integer>] - Max Slots in Use (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with a matching number of maximum slots in use.

## Examples

The following example displays the storepool information of NFSv4 clients.

```
cluster1::*> vserver nfs storepool show
    Node: node1
    Vserver: vs1
    Data-Ip: 10.0.1.1
Client-Ip      Protocol  IsTrunked OwnerCount OpenCount  DelegCount
LockCount
-----
-----
10.0.2.1      nfs4.1   true      2          1          0          4
10.0.2.2      nfs4.2   true      2          1          0          4
2 entries were displayed.

cluster1::*> vserver nfs storepool show -instance
    Node Name: node1
    Vserver: vs1
    Data LIF IP Address: 10.0.1.1
    Client IP Address: 10.0.2.1
    Protocol Version: nfs4.1
    Trunking Status: true
    Allocated Owner Count: 2
    Allocated OpenState Count: 1
    Allocated DelegState Count: 0
    Allocated LockState Count: 4
    Allocated LayoutState Count: 0
    Allocated CopyState Count: 0
    Unique Client Identifier: 16962161483653840897
    Exhausted Object List: -
```

```

    Is Storepool Exhausted? : false
Bad Sequential ID State Count: 0
    Stale State ID Count: 0
        Slots in Use: 0
        Max Slots in Use: 64
Node Name: node1
        Vserver: vs1
    Data LIF IP Address: 10.0.1.1
    Client IP Address: 10.0.2.2
    Protocol Version: nfs4.2
    Trunking Status: true
    Allocated Owner Count: 2
    Allocated OpenState Count: 1
    Allocated DelegState Count: 0
    Allocated LockState Count: 4
    Allocated LayoutState Count: 0
    Allocated CopyState Count: 0
    Unique Client Identifier: 16962161483653840897
    Exhausted Object List: -
    Is Storepool Exhausted? : false
Bad Sequential ID State Count: 0
    Stale State ID Count: 0
        Slots in Use: 0
        Max Slots in Use: 64
2 entries were displayed.

```

## vserver nfs storepool blocked-client flush

Flush cached blocked client entries on the specified node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver nfs storepool blocked-client flush` command flushes the storepool blocked client cache which allows the previously blocked specified clients to reconnect.

- Node on which storepool blocked client cache is present
- Client ip address

### Parameters

**-node <nodename> - Node (privilege: advanced)**

If this parameter is specified, the command is used to flush the storepool blocked client cache only in the specified node.

### **[*-client-ip* <IP Address>] - Client IP Address (privilege: advanced)**

If this parameter is specified, the command is used to only flush the storepool blocked client cache associated with specified client IP.

## **Examples**

The following example flushes all NFSv4 storepool blocked client caches present on node1.

```
cluster1::*> vserver nfs storepool blocked-client flush -node node1
                Number of NFSv4.x blocked clients flushed on node "node1":
0.
cluster1::*>
```

## **vserver nfs storepool blocked-client show**

### **Display the Storepool Blocked Clients Information**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `vserver nfs storepool blocked-client show` command shows the NFSv4 storepool blocked clients. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the blocked clients:

- Node on which storepool blocked client cache is present
- Client ip address
- Time to live for blocked client cache entry

### **Parameters**

#### **[*-fields* <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

#### **[*-instance* ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### **[*-node* {<nodename>|local}] - Node Name (privilege: advanced)**

If this parameter is specified, the command displays information only about clients with the specified node.

#### **[*-client-ip* <IP Address>] - Client IP Address (privilege: advanced)**

If this parameter is specified, the command displays information with the specified client IP.

#### **[*-ttl* <[<integer>d][<integer>h][<integer>m][<integer>s]>] - TTL For Entries (Secs) (privilege: advanced)**

If this parameter is specified, the command displays all the blocked client information whose time to live matches the provided value.

## Examples

The following example displays all NFSv4 storepool blocked clients caches which are present on node1.

```
cluster1::*> vserver nfs storepool blocked-client show -node node1
cluster1::*>
Node: node1
Client-IP      TTL (secs)
-----
1.0.1.62       512s
1.0.1.63       512s
1.0.1.126      512s
3 entries were displayed.
cluster1::*>
```

## vserver nfs storepool config modify

Modify the storepool configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver nfs storepool config modify` command modifies NFSv4.x storepool configuration parameters:

### Parameters

**[-limit-enforce {enabled|disabled}] - Storepool Limit Enforce Control (privilege: advanced)**

This parameter is used to enable or disable the limit enforcement. The default value is *disabled*.

**[-blocked-client-ttl <integer>] - Blocked Client TTL in Seconds (privilege: advanced)**

This parameter is used to set the blocked client eviction time-to-live (TTL). The client will be able to reconnect with NFS4.x server after this value expires. Valid values are from 0 to 604800 seconds (7 days). The default value is *86400*.

## Examples

The following is an example of how to modify the storepool limit-enforce parameter.

```
cluster1::*> vserver nfs storepool config modify -limit-enforce disabled
-blocked-client-ttl 90000
```

## vserver nfs storepool config show

Display the storepool configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver nfs storepool config show` command displays the following NFSv4.X storepool configuration information:

- Storepool limit enforce control
- Blocked client TTL in seconds

## Examples

The following example displays the NFSv4.x storepool configuration information.

```
cluster1::*> vserver nfs storepool config show

Storepool Limit Enforce Control: disabled
Blocked client TTL in seconds: 90000

cluster1::*>
```

## vserver nfs tls interface disable

Disable NFS TLS on a LIF

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs tls interface disable` command disables NFS TLS on a logical interface.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver in which the logical interface exists.

**-lif <lif-name> - Logical Interface**

This parameter specifies the name of the logical interface on which you want to disable NFS TLS.

## Examples

The following example disables NFS TLS on a Vserver named `vs0` and a logical interface named `datalif1`.

```
vs1::> vserver nfs tls interface disable -vserver vs0 -lif datalif1
```

## vserver nfs tls interface enable

Enable NFS TLS on a LIF

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs tls interface enable` command enables NFS TLS on a logical interface.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver in which the logical interface exists.

### **-lif <lif-name> - Logical Interface**

This parameter specifies the name of the logical interface on which you want to enable NFS TLS.

### **[-certificate-name <text>] - TLS Certificate Name**

This parameter specifies the name of a certificate to be associated with the instance of a given Vserver and logical interface.

The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the [security certificate install](#) command to configure it before enabling TLS on a Vserver and LIF.

### **[-skip-san-validation {true|false}] - Skip Certificate's Subject Alternate Name Validation**

This parameter specifies whether Subject Alternate Name (SAN) validation is skipped. The default value is *false*.

## Examples

The following example enables NFS TLS on a Vserver named `vs0` and a logical interface named `datlif1`. The certificate name is `lif1.com` which is preinstalled on server.

```
vs1::> vserver nfs tls interface enable -vserver vs0 -lif datlif1
-certificate-name lif1.com
```

## Related Links

- [security certificate install](#)

## vserver nfs tls interface modify

Modify the TLS configuration of an NFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs tls interface modify` command modifies a TLS configuration for NFS. An NFS TLS configuration is associated with both a Vserver and a logical interface.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver associated with the NFS TLS configuration you want to modify.

### **-lif <text> - Logical Interface**

This parameter specifies the name of the logical interface associated with the NFS TLS configuration you want to modify.

### **[-status {enabled|disabled}] - TLS Status**

This optional parameter specifies whether to enable or disable TLS for NFS on the specified Vserver and logical interface. If you specify a value of `enable`, you must also specify the `-certificate-name` parameter.

### **[-certificate-name <text>] - TLS Certificate Name**

This optional parameter specifies the name of a certificate to be associated with the instance of a given Vserver and logical interface. If you specify a value of `enable` for the `-status` parameter, you must also specify this parameter.

The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the [security certificate install](#) command to configure it before enabling TLS on a Vserver and LIF.

### **[-skip-san-validation {true|false}] - Skip Certificate's Subject Alternate Name Validation**

This parameter specifies whether Subject Alternate Name(SAN) validation is skipped. The default value is `false`.

## Examples

The following example enables the NFS TLS configuration on a Vserver named `vs0` and a logical interface named `datalif1`. The certificate-name is `datalif1.example.com`

```
clus1::> vsriver nfs tls interface modify -vserver vs0 -lif datalif1
-status enabled -certificate-name datalif1.example.com
```

## Related Links

- [security certificate install](#)

## vserver nfs tls interface show

Display the TLS configurations of NFS servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nfs tls interface show` command displays information about TLS configurations for NFS. The command output depends on the parameters specified with the command. If you do not specify any parameters, the command displays the following information about all TLS configurations for NFS:

- Vserver name
- Logical interface name
- Logical interface IP address
- Whether TLS is enabled or disabled
- The TLS certificate name
- The TLS certificate UUID

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about TLS configurations for NFS that are enabled, run the command with the `-status enabled` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter and the `-lif` parameter, the command displays information only about the TLS configuration or configurations for NFS that are associated with the specified Vserver and logical interface.

**[-lif <text>] - Logical Interface**

If you specify this parameter and the `-vserver` parameter, the command displays information only about the TLS configuration or configurations for NFS that are associated with the specified logical interface and Vserver.

**[-address <IP Address>] - IP Address**

If you specify this parameter, the command displays information only about the TLS configurations for NFS that are associated with the specified logical-interface IP address.

**[-status {enabled|disabled}] - TLS Status**

If you specify this parameter, the command displays information only about the TLS configurations for NFS that match the specified value.

**[-certificate-name <text>] - TLS Certificate Name**

If you specify this parameter, the command displays information only about the TLS configurations for NFS that match the specified value.

**[-certificate-uuid <UUID>] - TLS Certificate UUID**

If you specify this parameter, the command displays information only about the TLS configuration for NFS that match the specified value.

## Examples

The following example displays information about the TLS configuration for NFS associated with the Vserver `vs0` and the logical interface `datalif1`:

```
vs1::> vsriver nfs tls interface show -vsriver vs0 -lif datalif1
      Vserver: vs0
    Logical Interface: datalif1
      IP Address: 192.0.2.130
      TLS Status: enabled
  TLS Certificate Name: vs0_17A014E1FA994582
  TLS Certificate UUID: d1905777-98e8-11ee-aa96-005056bb844f
```

## vsvrr nvme commands

### vsvrr nvme create

Create NVMe service configuration

**Availability:** This command is available to *cluster* and *Vsvrr* administrators at the *admin* privilege level.

### Description

The `vsvrr nvme create` command creates an NVMe service for a Vsvrr.

When you create the NVMe service on a Vsvrr, the Vsvrr must have only *nvme* in the allowed-protocols list.

When you create the NVMe service on a Vsvrr, the administrative status of the service is *up* by default.

### Parameters

**-vsriver <Vsvrr Name> - Vsvrr Name**

Specifies the Vsvrr for the NVMe service.

**[-status-admin {down|up}] - Administrative Status**

Specifies the configured administrative status of a service.

**[-mdns-service-discovery-enabled {true|false}] - Use Multicast DNS Service Discovery (privilege: advanced)**

Specifies the configured mDNS service discovery status of a service. If you set this parameter to *false*, the Vsvrr will not advertise NVMe-IP LIFs over Multicast DNS. The default value is *true*.

## Examples

```
cluster1::*> vsriver nvme create -vsriver vs_1
```

Creates an NVMe service on Vserver *vs\_1* .

## vserver nvme delete

Delete NVMe service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme delete` command deletes an NVMe service of a Vserver. Before you can delete an NVMe service, the administrative status must be *down* . Use the [vserver nvme modify](#) command to change the administrative status.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the NVMe service.

### Examples

```
cluster1::*> vserver nvme delete -vserver vs_1
```

Deletes the NVMe service on Vserver *vs\_1* .

### Related Links

- [vserver nvme modify](#)

## vserver nvme modify

Modify NVMe service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme modify` command modifies an NVMe service configuration on a Vserver.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver for the NVMe service.

**[-status-admin {down|up}] - Administrative Status**

Specifies the configured administrative status of a service. If you set this parameter to *down* , the Vserver will not serve NVMe traffic.

## **`[-mdns-service-discovery-enabled {true|false}] - Use Multicast DNS Service Discovery`** (privilege: advanced)

Specifies the configured mDNS service discovery status of a service. If you set this parameter to *false*, the Vserver will not advertise NVMe-IP LIFs over Multicast DNS. The default value for create is *true*.

### Examples

```
cluster1::*> vservers nvme modify -vserver vs_1 -status-admin down
```

Sets the administrative status of the NVMe service on Vserver *vs\_1* to *down*.

## **`vserver nvme show-discovery-controller`**

Display active NVMe discovery controllers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme show-discovery-controller` command displays information for established NVMe controllers on the discovery subsystem. An NVMe controller is established upon each host connection to the discovery subsystem.

### Parameters

**`{ [-fields <fieldname>, ...]`**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**`| [-instance ] }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <Vserver Name>] - Vserver Name`**

Use this parameter to display the NVMe controllers that match the Vserver that you specify.

**`[-controller-id <Hex 16bit Integer>] - Controller ID`**

Use this parameter to display the NVMe controllers that match the controller ID that you specify. The controller ID is the identifier assigned by the NVMe subsystem upon host login and controller creation.

**`[-discovery-nqn <text>] - Discovery Subsystem NQN`**

Use this parameter to display the NVMe controllers that match the discovery subsystem NQN that you specify.

**`[-lif <text>] - Logical Interface`**

Use this parameter to display the NVMe controllers that match the LIF that you specify.

**`[-node <nodename>] - Node`**

Use this parameter to display the NVMe controllers that match the cluster node that you specify.

**[-host-nqn <text>] - Host NQN**

Use this parameter to display the NVMe controllers that match the host NQN that you specify. The host NQN is the NVMe identifier assigned to a specific host.

**[-transport-protocol {fc-nvme|nvme-tcp}] - Transport Protocol**

Use this parameter to display the NVMe controllers that match the transport protocol that you specify.

**[-initiator-transport-address <text>] - Initiator Transport Address**

Use this parameter to display the NVMe controllers that match the initiator transport address that you specify. The initiator transport address format depends on the transport protocol in use.

**[-trsvcid <text>] - Transport Service Identifier**

Use this parameter to display the NVMe controllers that match the transport service identifier that you specify.

**[-host-id <Hex String>] - Host Identifier**

Use this parameter to display the NVMe controllers that match the host identifier that you specify. The host identifier is a 128-bit identifier assigned to a specific host.

**[-admin-queue-depth <integer>] - Admin Queue Depth**

Use this parameter to display the NVMe controllers that match the administrative queue depth that you specify.

**[-header-digest-enabled {true|false}] - Header Digest Enabled**

Use this parameter to display the NVMe controllers that have header digest enabled.

**[-data-digest-enabled {true|false}] - Data Digest Enabled**

Use this parameter to display the NVMe controllers that have data digest enabled.

**[-kato <integer>] - Keep-Alive Timeout (msec)**

Use this parameter to display the NVMe controllers that match the keep-alive timeout value (in msec) that you specify.

**Examples**

```
cluster1::*> vserver nvme show-discovery-controller -vserver vs1
Vserver ID    LIF  Host NQN
-----
vs1          0041h node1_e0f
                        nqn.2001-08.example.com:nvme:host1
vs1          0080h node2_e0f
                        nqn.2001-08.example.com:nvme:host2
2 entries were displayed.
```

**vserver nvme show-host-priority**

Display NVMe Host Priority Information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver nvme show-host-priority` command displays NVMe I/O queue count and NVMe I/O queue depth for each host priority level and node in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display the NVMe priority, NVMe I/O queue count, and NVMe I/O queue depth that match the cluster node that you specify.

**[-transport-protocol {fc-nvme|nvme-tcp}] - Transport Protocol**

Use this parameter to display the priority, NVMe I/O queue count, and NVMe I/O queue depth that match the transport protocol that you specify.

**[-priority {regular|high}] - Host Priority**

Use this parameter to display the NVMe I/O queue count, and NVMe I/O queue depth that match the priority that you specify.

**[-io-queue-count <integer>] - I/O Queue count**

Use this parameter to display the priorities, transport-protocol, and NVMe I/O queue depth on each node that match the NVMe I/O queue count that you specify.

**[-io-queue-depth <integer>] - I/O Queue Depths**

Use this parameter to display the priorities, transport-protocol, and NVMe I/O count on each node that match the NVMe I/O queue depth that you specify.

## Examples

```
cluster-1::*> nvme show-host-priority
(vserver nvme show-host-priority)
Node                Protocol  Priority I/O Queue Count I/O Queue
Depth
-----
node1               fc-nvme
                    regular      4
32
                    high         6
32
                    nvme-tcp
                    regular      2
128
                    high         4
128
node2               fc-nvme
                    regular      4
32
                    high         6
32
                    nvme-tcp
                    regular      2
128
                    high         4
128
8 entries were displayed.
```

## vserver nvme show-interface

Display the NVMe over Fabrics LIF configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme show-interface` command displays the currently available interfaces to the NVMe protocol.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <Vserver Name>`] - Vserver Name**

Use this parameter to display the NVMe interfaces that match the Vserver that you specify.

**[`-lif <lif-name>`] - Logical Interface**

Use this parameter to display the NVMe interfaces that match the LIF that you specify.

**[`-vserver-uuid <UUID>`] - Vserver UUID**

Use this parameter to display the NVMe interfaces that match the Vserver UUID that you specify.

**[`-home-node <nodename>`] - Home Node**

Use this parameter to display the NVMe interfaces that match the home node that you specify.

**[`-home-port {<netport>|<ifgrp>}`] - Home Port**

Use this parameter to display the NVMe interfaces that match the home port that you specify.

**[`-status-admin {up|down}`] - Status Admin**

Use this parameter to display the NVMe interfaces that match the administrative status that you specify.

**[`-physical-protocol {fibre-channel|ethernet}`] - Physical Protocol**

Use this parameter to display the NVMe interfaces that match the physical protocol that you specify.

**[`-transport-protocol {fc-nvme|nvme-tcp}`] - Transport Protocol**

Use this parameter to display the NVMe interfaces that match the transport protocol that you specify.

**[`-transport-address <text>`] - Transport Address**

Use this parameter to display the NVMe interfaces that match the transport address that you specify.

**[`-comment <text>`] - Comment**

Use this parameter to display the NVMe interfaces that match the textual comment that you specify.

**[`-fc-wwnn <FC WWN>`] - FC WWNN**

Use this parameter to display the NVMe interfaces that match the FC WWNN that you specify.

**[`-fc-wwpn <FC WWN>`] - FC WWPN**

Use this parameter to display the NVMe interfaces that match the FC WWPN that you specify.

**[`-lif-id <integer>`] - LIF ID**

Use this parameter to display the NVMe interfaces that match the LIF ID that you specify.

**[`-lif-uuid <UUID>`] - LIF UUID**

Use this parameter to display the NVMe interfaces that match the LIF UUID that you specify.

## Examples

```
cluster1::*> vserver nvme show-interface
Vserver Logical Interface      Home Node:Port      Transport Protocols
-----
vs_1
      nvme1                  node1:1a              fc-nvme
      Transport Address: nn-0x2000005056b45113:pn-0x2001005056b45113
```

## vserver nvme show

Show NVMe service configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme show` command displays the current status of the NVMe service in a cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the NVMe services that match the Vserver that you specify.

**[-status-admin {down|up}] - Administrative Status**

Use this parameter to display the NVMe services that match the administrative status that you specify.

**[-discovery-nqn <text>] - Discovery Subsystem NQN**

Use this parameter to display the NVMe services that match the discovery subsystem NQN that you specify.

**[-mdns-service-discovery-enabled {true|false}] - Use Multicast DNS Service Discovery (privilege: advanced)**

Use this parameter to display the NVMe services that match the service discovery state that you specify.

### Examples

```
cluster1::*> vserver nvme show
Vserver      Status Admin
-----
vs1          up
vs2          up
2 entries were displayed.
```

## vserver nvme feature show

Display NVMe target features

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Displays the list of currently enabled NVMe over Fabrics features and limits.

### Examples

```
cluster1::*> vserver nvme feature show
      Enabled Features: nvmf, fc-nvme, multi-path, multi-node
Maximum Namespace Size: 15.97TB
      Maximum NSID: 00000200h
      Maximum ANAGRPID: 00000200h
```

## vserver nvme namespace convert-from-lun

Transition an existing LUN into an NVMe namespace.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command transitions an existing LUN in-place into an NVMe namespace within a volume in a Vserver. When performing an in-place transition, the application data remains unchanged and only the metadata gets modified.

When using this command, it is necessary that any existing maps to an lgroup for this LUN be removed first. If any maps exist for the specified LUN, you will receive an error message.

Only LUNs with a zero prefix and suffix size can be transitioned into an NVMe namespace. You will receive an error message if the LUN has a non-zero prefix and/or suffix size.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

The name of the Vserver containing the LUN. If only one data Vserver exists, you do not need to specify this parameter.

### **-lun-path <path> - Path of the LUN**

Specifies the path of the LUN you want to transition into an NVMe namespace. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

### **Examples**

```
cluster1::> vsserver nvme namespace convert-from-lun -vsserver vs1 -lun-path /vol/vol1/lun1
```

Transitions LUN `lun1` in-place to NVMe namespace within volume `vol1` in Vserver `vs1`.

## **vsserver nvme namespace create**

### **Create an NVMe namespace**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver nvme namespace create` command creates a new NVMe namespace of a specific size. You must create NVMe namespaces at the root of a volume or qtree.

When you create an NVMe namespace, it is non-space reserved.

This command is not supported for FlexGroup volumes or Vservers with Infinite Volumes.

### **Parameters**

#### **-vsserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

#### **-path <path> - Namespace Path**

Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths: `/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`

#### **-size {<integer>[KB|MB|GB|TB|PB]} - Size**

Specifies the size of the NVMe namespace in bytes. You can specify a multiplier suffix:

- KB (1024 bytes)
- MB (KB\*KB bytes)
- GB (KB\*MB bytes)
- TB (MB\*MB bytes)
- PB (KB\*TB bytes)

#### **-ostype {aix|linux|vmware|windows} - OS Type**

Specifies the operating system type of the NVMe namespace. The OS types are:

- `aix` - the NVMe namespace stores AIX file system data.
- `linux` - the NVMe namespace stores Linux file system data.
- `vmware` - the NVMe namespace stores VMware file system data.
- `windows` - the NVMe namespace stores Windows file system data.

**[`-comment <text>`] - Comment**

Contains a textual description of the NVMe namespace.

**[`-block-size {512|4KB}`] - Block Size**

Specifies the block size of the NVMe namespace in bytes. Valid block sizes are

- `512` (in ONTAP 9.6 and later)
- `4096`

## Examples

```
cluster1::*> vservers nvme namespace create -vservers vs_1 -path
/vol/nsvol/namespace1 -size 100g -ostype linux
```

Creates an NVMe namespace at path `/vol/ns/vol/namespace1` on Vserver `vs_1`.

## vservers nvme namespace delete

Delete an NVMe namespace

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservers nvme namespace delete` command deletes an NVMe namespace from a specified Vserver and volume.

### Parameters

**`-vservers <Vserver Name>` - Vserver Name**

Specifies the Vserver.

**`-path <path>` - Namespace Path**

Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths:

`/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`

**[`-skip-mapped-check <true>`] - Skip Mapped Check**

This option is required to delete an NVMe namespace that is attached to a subsystem.

## Examples

```
cluster1::> vsserver nvme namespace delete -vsserver vs1 -path  
/vol/nsvol/ns1
```

Deletes the NVMe namespace at path `/vol/nsvol/ns1` on Vserver `vs1`.

## vsserver nvme namespace modify

Modify an NVMe namespace

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver nvme namespace modify` command modifies NVMe namespace attributes.

### Parameters

**-vsserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

**-path <path> - Namespace Path**

Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths:  
`/vol/voll/ns1` and `/vol/voll/qtree1/ns1`

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

Specifies the size of the NVMe namespace in bytes. You can specify a multiplier suffix:

- KB (1024 bytes)
- MB (KB\*KB bytes)
- GB (KB\*MB bytes)
- TB (MB\*MB bytes)
- PB (KB\*TB bytes)

**[-comment <text>] - Comment**

Contains a textual description of the NVMe namespace.

**[-state {online|offline|nvfail|space-error}] - State (privilege: advanced)**

Use this parameter to modify the state of an NVMe namespace from `nvfail` to `online`. Any other state change is not supported.

**[-skip-shrink-check <true>] - Skip checking for NS shrink (privilege: advanced)**

Use this parameter to shrink NVMe namespace size.

### Examples

```
cluster1::*> vserver nvme namespace modify -path /vol/nsvol/ns1 -vserver  
vs_1 -size 30GB
```

Modifies the size of NVMe namespace at path `/vol/nsvol/ns1` on Vserver `vs_1` to `30GB`.

## vserver nvme namespace show

### Display NVMe namespaces

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme namespace show` command displays information for NVMe namespaces.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Selects the NVMe namespaces that match the Vserver that you specify.

**[-path <path>] - Namespace Path**

Selects the NVMe namespaces that match the path that you specify.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

Selects the NVMe namespaces that match the size that you specify.

**[-size-used {<integer>[KB|MB|GB|TB|PB]}] - Size Used**

Selects the NVMe namespaces that match this parameter value.

**[-ostype {aix|linux|vmware|windows}] - OS Type**

Selects the NVMe namespaces that match this parameter value.

**[-comment <text>] - Comment**

Selects the NVMe namespaces that match this parameter value.

**[-block-size {512|4KB}] - Block Size**

Selects the NVMe namespaces that match this parameter value.

**[-state {online|offline|nvfail|space-error}] - State**

Selects the NVMe namespaces that match this parameter value.

**`[-is-read-only {true|false}] - Is Read Only`**

Selects the NVMe namespaces that match this parameter value.

**`[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Creation Time`**

Selects the NVMe namespaces that match this parameter value.

**`[-uuid <UUID>] - Namespace UUID`**

Selects the NVMe namespaces that match this parameter value.

**`[-restore-inaccessible {true|false}] - Restore Inaccessible`**

Selects the NVMe namespaces that match this parameter value.

**`[-node <nodename>] - Node Hosting the Namespace`**

Selects the NVMe namespaces that match this parameter value.

**`[-volume <volume name>] - Volume Name`**

Selects the NVMe namespaces that match this parameter value.

**`[-qtree <qtree name>] - Qtree Name`**

Selects the NVMe namespaces that match this parameter value.

**`[-nsid <Hex 32bit Integer>] - Namespace ID`**

Selects the NVMe namespaces that match this parameter value.

**`[-anagrpid <Hex 32bit Integer>] - ANA Group ID (privilege: advanced)`**

Selects the NVMe namespaces that match Asymmetric Namespace Access (ANA) group identifier that you specify.

**`[-vserver-id <integer>] - Vserver ID`**

Selects the NVMe namespaces that match this parameter value.

**`[-container-state {online|aggregate-offline|volume-offline|error}] - Namespace Container State (privilege: advanced)`**

Selects the namespaces that match this parameter value. The container states are:

- *online* - The namespace's aggregate and volume are online.
- *aggregate-offline* - The namespace's aggregate is offline.
- *volume-offline* - The namespace's volume is offline.
- *error* - An error occurred accessing the namespace's volume.

**`[-include-offline-containers <true>] - Include Namespaces on Offline Volumes and Aggregates (privilege: advanced)`**

If true, include available information for namespaces in offline aggregates and offline volumes in the output. By default, namespaces in offline aggregates and offline volumes are excluded from the output.

**`[-zrto-vol-consensus {true|false}] - ZRTO Volume Consensus`**

Selects the namespaces that match the specified value. The status indicates whether the volume containing the namespace in a SnapMirror Synchronous relationship can process operations.

### **[-application <text>] - Application**

Selects the namespaces that are part of an application that matches the parameter value.

### **[-consistency-group <text>] - Consistency Group Name**

Selects the namespaces that are associated with the specified consistency group.

## **Examples**

```
cluster::*> vsserver nvme namespace show -vsserver vs1
Vserver    Path                               State      Size Subsystem
NSID
-----
vs1        /vol/test_1_vol/ns1               online     10GB subsys1
00000001h
vs1        /vol/test_1_vol/ns2               online     500MB subsys1
00000002h
vs1        /vol/test_1_vol/ns3               online     1TB  -
-
3 entries were displayed.
```

## **vsserver nvme subsystem create**

### **Create an NVMe target subsystem**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver nvme subsystem create` command creates a new NVMe target subsystem.

When you create an NVMe subsystem on a Vserver, the Vserver must meet the following pre-conditions:

- The Vserver must have an NVMe service created.
- The Vserver must not already have an NVMe subsystem by the same name.

The NVMe subsystem identifiers are assigned by the system. The NQN is derived from the Vserver UUID and subsystem name and may not be specified or modified by the user.

### **Parameters**

#### **-vsserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

#### **-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

### **-ostype {aix|linux|vmware|windows} - OS Type**

Specifies the operating system type of the NVMe subsystem. The OS types are:

- aix - the initiators belong to an AIX host.
- linux - the initiators belong to a Linux host.
- vmware - the initiators belong to a VMware ESX host.
- windows - the initiators belong to a Windows host.

### **[-comment <text>] - Comment**

Contains a textual description of the NVMe subsystem.

### **[-delete-on-unmap {true|false}] - Delete on Unmap (privilege: advanced)**

Specifies whether the subsystem should be deleted automatically when it is no longer mapped to a namespace.

### **[-vendor-uuids <UUID>,...] - Vendor UUIDs (privilege: advanced)**

Specifies vendor-specific identifiers (UUIDs) optionally assigned to an NVMe subsystem when the subsystem is created. The identifiers are used to enable vendor-specific NVMe protocol features. The identifiers are provided by a host application vendor and shared with NetApp prior to a joint product release. Creating an NVMe subsystem with an unknown or non-specific identifier will have no effect on the NVMe subsystem. Refer to the ONTAP SAN Administration Guide for a list of the supported vendor-specific identifiers. After a subsystem is created, the vendor-specific identifiers cannot be changed or removed.

## **Examples**

```
cluster1::*> vservers nvme subsystem create -vservers vs_1 -subsystem sub_1
-ostype linux
```

Creates a subsystem named *sub\_1* on Vserver *vs\_1*.

## **vservers nvme subsystem delete**

Delete the subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vservers nvme subsystem delete` command deletes an NVMe subsystem from a specified Vserver.

### **Parameters**

#### **-vservers <Vserver Name> - Vserver Name**

Specifies the Vserver.

#### **-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

### **`[-skip-mapped-check <true>]` - Skip Mapped Namespace Check**

Required to delete an NVMe subsystem with attached NVMe namespaces.

### **`[-skip-host-check <true>]` - Skip Host Check**

Required to delete an NVMe subsystem with associated hosts.

## **Examples**

```
cluster1::*> vserver nvme subsystem delete -vserver vs_1 -subsystem sub_1
```

Deletes the NVMe subsystem *sub\_1* on Vserver *vs\_1*.

## **vserver nvme subsystem modify**

Modify an NVMe target subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vserver nvme subsystem modify` command modifies an existing NVMe target subsystem.

## **Parameters**

### **`-vserver <Vserver Name>` - Vserver Name**

Specifies the Vserver.

### **`-subsystem <text>` - Subsystem**

Specifies the NVMe target subsystem.

### **`[-comment <text>]` - Comment**

Contains a textual description of the NVMe subsystem.

### **`[-delete-on-unmap {true|false}]` - Delete on Unmap (privilege: advanced)**

Specifies whether the subsystem should be deleted automatically when it is no longer mapped to a namespace.

## **Examples**

```
cluster1::*> vserver nvme subsystem modify -vserver vs_1 -subsystem sub_1  
-comment "Example Comment"
```

Modifies the comment on the subsystem named *sub\_1* on Vserver *vs\_1*.

## **vserver nvme subsystem show**

Display NVMe target subsystems

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nvme subsystem show` command displays information for NVMe subsystems.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the NVMe subsystems that match the Vserver that you specify.

**[-subsystem <text>] - Subsystem**

Use this parameter to display the NVMe subsystem that matches the name that you specify.

**[-ostype {aix|linux|vmware|windows}] - OS Type**

Use this parameter to display the NVMe subsystems that match this parameter value.

**[-comment <text>] - Comment**

Use this parameter to display the NVMe subsystems that match this parameter value.

**[-target-nqn <text>] - Target NQN**

Use this parameter to display the NVMe subsystems that match this parameter value.

**[-serial-number <text>] - Serial Number**

Use this parameter to display the NVMe subsystems that match this parameter value.

**[-default-io-queue-count <integer>] - Default Number of Host I/O Queue Pairs**

Specifies the IO queue count inherited by hosts added to this subsystem. The actual value used when a connection is established may vary depending on the host and transport protocol used.

**[-default-io-queue-depth <integer>] - Default Host I/O Queue Depth**

Specifies the IO queue depth inherited by hosts added to this subsystem. The actual value used when a connection is established may vary depending on the host and transport protocol used.

**[-uuid <UUID>] - UUID**

Use this parameter to display the NVMe subsystems that have UUIDs matching the parameter value.

**[-delete-on-unmap {true|false}] - Delete on Unmap (privilege: advanced)**

Specifies whether the subsystem should be deleted automatically when it is no longer mapped to a namespace.

### **[`-vendor-uuids <UUID>,...`] - Vendor UUIDs (privilege: advanced)**

Use this parameter to display the NVMe subsystems that have vendor-specific UUIDs that match the parameter value.

### **[`-peer-vserver-name <text>`] - Peer Vserver Name**

Selects the subsystems that match this parameter value. The peer-vserver-name is the local name of the peer Vserver, as reported by the `vserver peer show -fields peer-vserver` command. When set, the subsystem and its hosts and maps to namespaces are replicated to the peer cluster.

### **[`-replication-error <text>`] - Replication Error**

Selects the subsystems that match this parameter value. This field provides information about asynchronous errors encountered while replicating this subsystem. Subsystems within a peering relationship are replicated in the same stream, so the error reported here might be related to this subsystem or a prior replicated subsystem that is now blocking the replication of this subsystem. Both the error information and the subsystem encountering the error are reported. If the error is configuration related, it can be corrected on the referenced subsystem. The replication is retried using exponential backoff up to a maximum of one retry every 5 minutes. Every operation on the same stream triggers an immediate retry and restarts the exponential backoff starting with a 1 second delay. If the error is system related, the retries should correct the error when the system enters a healthy state.

### **[`-replication-error-subsystem <text>`] - Replication Error Subsystem**

Selects the subsystems that match this parameter value. The name of the subsystem encountering the error reported by the 'replication-error' field.

## **Examples**

```
cluster1::*> vserver nvme subsystem show -vserver vs_1
Vserver Subsystem      Target NQN
-----
-----
vs_1
      ss1              nqn.1992-
08.netapp.com:sn.ccb5a7d5d9d311e7924e005056b45113:subsystem.ss1
      ss2              nqn.1992-
08.netapp.com:sn.ccb5a7d5d9d311e7924e005056b45113:subsystem.ss2
2 entries were displayed.
```

## **Related Links**

- [vserver peer show](#)

## **vserver nvme subsystem controller show**

Display active NVMe controllers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nvme subsystem controller show` command displays information for established NVMe controllers. An NVMe controller is established upon each host connection to a subsystem.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the NVMe controllers that match the Vserver that you specify.

**[-subsystem <text>] - Subsystem**

Use this parameter to display the NVMe controllers that match the subsystem that you specify.

**[-controller-id <Hex 16bit Integer>] - Controller ID**

Use this parameter to display the NVMe controllers that match the controller ID that you specify. The controller ID is the identifier assigned by the NVMe subsystem upon host login and controller creation.

**[-lif <text>] - Logical Interface**

Use this parameter to display the NVMe controllers that match the LIF that you specify.

**[-node <nodename>] - Node**

Use this parameter to display the NVMe controllers that match the cluster node that you specify.

**[-host-nqn <text>] - Host NQN**

Use this parameter to display the NVMe controllers that match the host NQN that you specify. The host NQN is the NVMe identifier assigned to a specific host.

**[-transport-protocol {fc-nvme|nvme-tcp}] - Transport Protocol**

Use this parameter to display the NVMe controllers that match the transport protocol that you specify.

**[-initiator-transport-address <text>] - Initiator Transport Address**

Use this parameter to display the NVMe controllers that match the initiator transport address that you specify. The initiator transport address format depends on the transport protocol in use.

**[-host-id <Hex String>] - Host Identifier**

Use this parameter to display the NVMe controllers that match the host identifier that you specify. The host identifier is a 128-bit identifier assigned to a specific host.

**[-io-queue-count <integer>] - Number of I/O Queues**

Use this parameter to display the NVMe controllers that match the I/O queue count that you specify.

**[-io-queue-depth <integer>,...] - I/O Queue Depths**

Use this parameter to display the NVMe controllers that match the I/O queue depth that you specify.

**[-admin-queue-depth <integer>] - Admin Queue Depth**

Use this parameter to display the NVMe controllers that match the administrative queue depth that you specify.

**[-max-io-size <integer>] - Max I/O Size in Bytes**

Use this parameter to display the NVMe controllers that match the maximum I/O size (in bytes) that you specify.

**[-kato <integer>] - Keep-Alive Timeout (msec)**

Use this parameter to display the NVMe controllers that match the keep-alive timeout value (in msec) that you specify.

**[-subsystem-uuid <UUID>] - Subsystem UUID**

Use this parameter to display the NVMe controllers that match the Subsystem UUID that you specify.

**[-header-digest-enabled {true|false}] - Header Digest Enabled**

Use this parameter to display the NVMe controllers that have header digest enabled.

**[-data-digest-enabled {true|false}] - Data Digest Enabled**

Use this parameter to display the NVMe controllers that have data digest enabled.

**[-dhchap-hash-function {sha-256|sha-512}] - Authentication Hash Function**

Use this parameter to display the NVMe controllers that connected with the specified hash function using DH-HMAC-CHAP in-band authentication.

**[-dhchap-dh-group {none|2048-bit|3072-bit|4096-bit|6144-bit|8192-bit}] - Authentication Diffie-Hellman Group**

Use this parameter to display the NVMe controllers that connected with the specified Diffie-Hellman group size using DH-HMAC-CHAP in-band authentication.

**[-dhchap-mode {none|unidirectional|bidirectional}] - Authentication Mode**

Use this parameter to display the NVMe controllers that connected with the specified mode for DH-HMAC-CHAP in-band authentication.

**[-trsvcid <text>] - Transport Service Identifier**

Use this parameter to display the NVMe controllers that match the transport service identifier that you specify.

**[-tls-key-type {none|configured}] - TLS Key Type**

Use this parameter to display the NVMe controllers that have the specified NVMe/TLS-TCP encryption key type.

**[-tls-psk-identity <text>] - TLS PSK Identity**

Use this parameter to display the NVMe controllers that have the specified NVMe/TLS-TCP encryption PSK identity.

## **[-tls-cipher {TLS-AES-128-GCM-SHA256|TLS-AES-256-GCM-SHA384}] - TLS Cipher**

Use this parameter to display the NVMe controllers that use the specified NVMe/TLS-TCP encryption cipher.

### **Examples**

```
cluster1::*> vserver nvme subsystem controller show -vserver vs_1
-subsystem ssl
Vserver Subsystem      ID LIF      Host NQN
-----
vs_1      ssl
          0003h lif1    nqn.2001-08.example.com:nvme:host1
          0004h lif1    nqn.2001-08.example.com:nvme:host2
          0009h lif2    nqn.2001-08.example.com:nvme:host1
          000Ah lif2    nqn.2001-08.example.com:nvme:host2
4 entries were displayed.
```

## **vserver nvme subsystem host add-proximal-vserver**

Add a Vserver to the host's proximal list

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command is used to configure which site in a SnapMirror Active Synchronous (SM-AS) relationship is proximal to the subsystem host.

### **Parameters**

**-vserver <Vserver Name> - Vserver Name**

Specifies the name of the Vserver.

**-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

**-host-nqn <text> - Host NQN**

Specifies the NVMe subsystem host NQN.

**-proximal-vservers <text>, ... - Proximal Vserver Names**

Specifies the name of the Vservers to configure as proximal to the host.

## **vserver nvme subsystem host add**

Add a host to a subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver nvme subsystem host add` command adds an FC-NVMe host to an NVMe subsystem on a Vserver.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

**-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

**-host-nqn <text> - Host NQN**

Specifies the NVMe subsystem host NQN.

**[-priority {regular|high}] - Host priority**

Specifies the host priority.

**[-dhchap-host-secret-key <text>] - Authentication Host Secret**

Specifies the NVMe DH-HMAC-CHAP in-band authentication host secret.

**[-dhchap-controller-secret-key <text>] - Authentication Controller Secret**

Specifies the NVMe DH-HMAC-CHAP in-band authentication controller secret.

**[-dhchap-hash-function {sha-256|sha-512}] - Authentication Hash Function**

Specifies the NVMe DH-HMAC-CHAP in-band authentication hash function.

**[-dhchap-dh-group {none|2048-bit|3072-bit|4096-bit|6144-bit|8192-bit}] - Authentication Diffie-Hellman Group**

Specifies the NVMe DH-HMAC-CHAP in-band authentication Diffie-Hellman group size.

**[-tls-configured-psk <text>] - TLS Configured PSK**

Specifies the configured pre-shared key (PSK) for the host.

**[-proximal-vservers <text>,...] - Proximal Vserver Names**

Select Vservers configured as proximal to the specified host.

## Examples

```
cluster::*> vserver nvme subsystem host add -vserver vs1 -subsystem ss1  
-host-nqn nqn.2001-01.com.example:nvme-host1 -proximal-vservers vs1
```

Adds a host with the specified NQN to the NVMe subsystem `ss1` on Vserver `vs1` that is proximal to Vserver `vs1`.

## **vserver nvme subsystem host remove-proximal-vserver**

Remove a Vserver from the host's proximal list

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command is used to remove the proximal Vserver configuration from subsystem host.

### **Parameters**

**-vserver <Vserver Name> - Vserver Name**

Specifies the name of the Vserver.

**-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

**-host-nqn <text> - Host NQN**

Specifies the NVMe subsystem host NQN.

**-proximal-vservers <text>, ... - Proximal Vserver Names**

Specifies the name of the Vservers that need to be removed from the proximity to the host.

## **vserver nvme subsystem host remove**

Remove a host from a subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver nvme subsystem host remove` command removes an FC-NVMe host from an NVMe subsystem on a Vserver.

### **Parameters**

**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

**-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

**-host-nqn <text> - Host NQN**

Specifies the NVMe subsystem host NQN.

### **Examples**

```
cluster::*> vserver nvme subsystem host remove -vserver vs_1 -subsystem
sub_1 -host-nqn nqn.2001-01.com.example:host1
```

Removes the host with the specified NQN from NVMe subsystem *sub\_1* on Vserver *vs\_1*.

## vserver nvme subsystem host show

Display NVMe hosts configured to the subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver nvme subsystem host show` command displays information for the NVMe subsystem hosts.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Use this parameter to display the NVMe subsystem hosts that match the Vserver that you specify.

**[-subsystem <text>] - Subsystem**

Use this parameter to display the NVMe subsystem hosts that match the subsystem that you specify.

**[-host-nqn <text>] - Host NQN**

Use this parameter to display the NVMe subsystem host that matches the subsystem host NQN that you specify.

**[-priority {regular|high}] - Host Priority**

Specifies the host priority.

**[-io-queue-count <integer>] - Number of I/O Queue Pairs**

Use this parameter to display the NVMe subsystem hosts that match the maximum IO queue count that you specify.

**[-io-queue-depth <integer>] - I/O Queue Depth**

Use this parameter to display the NVMe subsystem hosts that match the maximum IO queue depth that you specify.

**[-dhchap-hash-function {sha-256|sha-512}] - Authentication Hash Function**

Specifies the NVMe DH-HMAC-CHAP in-band authentication hash function.

**[*-dhchap-dh-group* {none|2048-bit|3072-bit|4096-bit|6144-bit|8192-bit}] -**

**Authentication Diffie-Hellman Group**

Specifies the NVMe DH-HMAC-CHAP in-band authentication Diffie-Hellman group size.

**[*-dhchap-mode* {none|unidirectional|bidirectional}] - Authentication Mode**

Reports the NVMe DH-HMAC-CHAP in-band authentication mode.

**[*-tls-key-type* {none|configured}] - TLS Key Type**

Specifies the type of TLS pre-shared key (PSK) for the host.

**[*-proximal-vservers* <text>,...] - Proximal Vserver Names**

Select name of Vservers that are configured as proximal to the subsystem host.

## Examples

```
cluster::*> vservice nvme subsystem host show -vserver vs_1 -subsystem
sub_1
Vserver Subsystem Host NQN
-----
vs_1      sub_1      nqn.2001-08.com.example:nvme:host1
              nqn.2001-08.com.example:nvme:host2
              nqn.2001-08.com.example:nvme:host3
3 entries were displayed.
```

## vservice nvme subsystem map add

### Add a namespace map

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The `vservice nvme subsystem map add` command creates an association on an NVMe namespace to an NVMe subsystem.

When you add an NVMe subsystem map, the following pre-conditions must hold:

- The NVMe namespace must not be already mapped to a different subsystem.
- There must be an FC-NVMe LIF on the NVMe namespace owning node.

### Parameters

***-vserver* <Vservice Name> - Vservice Name**

Specifies the Vservice.

***-subsystem* <text> - Subsystem**

Specifies the NVMe target subsystem.

### **-path <path> - Namespace Path**

Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths:

`/vol/vol1/ns1` and `/vol/vol1/mtree1/ns1`

### **Examples**

```
cluster::*> vservice nvme subsystem map add -vservice vs_1 -subsystem sub_1
-path /vol/nsvol/namespace1
```

Adds an association on the NVMe namespace at the specified path to NVMe subsystem `sub_1` on Vservice `vs_1`.

## **vservice nvme subsystem map remove**

Remove a namespace map

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### **Description**

The `vservice nvme subsystem map remove` command deletes an association on an NVMe namespace to an NVMe subsystem.

### **Parameters**

#### **-vservice <Vservice Name> - Vservice Name**

Specifies the Vservice.

#### **-subsystem <text> - Subsystem**

Specifies the NVMe target subsystem.

#### **-path <path> - Namespace Path**

Specifies the path of the NVMe namespace. Examples of correct NVMe namespace paths:

`/vol/vol1/ns1` and `/vol/vol1/mtree1/ns1`

### **Examples**

```
cluster::*> vservice nvme subsystem map remove -vservice vs_1 -subsystem
sub_1 -path /vol/nsvol/namespace1
```

Removes the association on the NVMe namespace at the specified path to NVMe subsystem `sub_1` on Vservice `vs_1`.

## **vservice nvme subsystem map show**

Display namespace maps within the subsystem

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver nvme subsystem map show` command displays information about NVMe subsystem maps.

**Parameters**

- { [-fields <fieldname>,...]**  
If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
- | [-instance ] }**  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
- [-vserver <Vserver Name>] - Vserver Name**  
Use this parameter to display the NVMe subsystem maps that match the Vserver that you specify.
- [-subsystem <text>] - Subsystem**  
Use this parameter to display the NVMe subsystem maps that match the subsystem that you specify.
- [-nsid <Hex 32bit Integer>] - NSID**  
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace NSID that you specify.
- [-path <path>] - Namespace Path**  
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace path that you specify.
- [-anagrp-id <Hex 32bit Integer>] - ANA Group ID (privilege: advanced)**  
Use this parameter to display the NVMe namespaces that match the Asymmetric Namespace Access (ANA) group identifier that you specify.
- [-namespace-uuid <UUID>] - Namespace UUID**  
Use this parameter to display the NVMe subsystem maps that match the NVMe namespace UUID that you specify.

**Examples**

```
cluster-1::*> vserver nvme subsystem map show -vserver vs_1
Vserver      Subsystem      NSID Namespace Path
-----
vs_1         sub_1
              00000001h /vol/nsvol1/ns1
              00000002h /vol/nsvol1/ns2
2 entries were displayed.
```

# vserver object-store-server commands

## vserver object-store-server create

Create an object store server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server create` command creates an object store server.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which to create the object store server. The Vserver must already exist.

#### **-object-store-server <Object store server name> - Object Store Server Name**

This parameter specifies the name of the object store server. Note that the object-store-server name must not begin with a bucket name. For virtual hosted style (VHS) API access, you must use the same hostname as the server name configured here.

#### **[-is-http-enabled {true|false}] - Accept Connections Over HTTP**

This optional parameter specifies if server should accept HTTP connections.

#### **[-is-https-enabled {true|false}] - Accept Connections Over HTTPS**

This optional parameter specifies if server should accept HTTPS connections.

#### **[-certificate-name <text>] - Name of Certificate Used for HTTPS Connections**

Common name of the certificate used for HTTPS connections.

#### **[-listener-port <integer>] - Object Store Server Listener Port**

Use this parameter to specify the listener port for the object store server. The default port is *80* .

#### **[-secure-listener-port <integer>] - Object Store Server Listener Port for HTTPS**

Use this parameter to specify the secure listener port for the object store server. The default port is *443* .

#### **-status-admin {down|up} - Object Store Server Administrative State**

Use this parameter to specify whether the initial administrative status of the object store server is up or down. The default setting is *up* .

#### **[-comment <text>] - Object Store Server Description**

This optional parameter specifies a text comment for the object store server.

#### **[-default-unix-user <text>] - Default UNIX User for NAS Access**

This optional parameter specifies the default UNIX user for name-mapping from an S3 user to UNIX user during NAS access. The default UNIX user name is *pcuser* .

### **[`-default-win-user <text>`] - Default Windows User for NAS Access**

This optional parameter specifies the default Windows user for name-mapping from an S3 user to Windows user during NAS access.

### **[`-is-ldap-fastbind-enabled {true|false}`] - Is LDAP FastBind Authentication Enabled? (privilege: advanced)**

This parameter specifies whether LDAP FastBind authentication is enabled for the object store server.

### **[`-max-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}`] - Maximum Value for Key TTL**

Use this parameter to specify the maximum permissible value for object store user key time-to-live property.

### **[`-max-lock-retention-period {{<integer> days|years} | none}`] - Maximum Object Lock Retention Period**

This parameter specifies the maximum value that can be specified as lock retention period for an object in an object store bucket.

### **[`-min-lock-retention-period {{<integer> days|years} | none}`] - Minimum Object Lock Retention Period**

This parameter specifies the minimum value that can be specified as lock retention period for an object in an object store bucket.

## **Examples**

The following example creates an object store server OSS1 for Vserver vs1.

```
cluster1::> vsserver object-store-server create -vsserver vs1 -object-store
-server OSS1
```

## **vsserver object-store-server delete**

Delete an object store server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver object-store-server delete` command deletes an object store server.

### **Parameters**

#### **`-vsserver <vsserver name>` - Vserver**

This parameter specifies the name of the Vserver for the object store server you want to delete.

## **Examples**

The following example deletes an object store server for Vserver vs1.

```
cluster1::> vsserver object-store-server delete -vsserver vs1
```

## **vsserver object-store-server modify**

Modify an object store server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver object-store-server modify` command modifies an object store server.

### **Parameters**

**-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver for the object store server which you want to modify.

**[-object-store-server <Object store server name>] - Object Store Server Name**

This parameter specifies the name of the object store server. Note that the object-store-server name must not begin with a bucket name.

**[-is-http-enabled {true|false}] - Accept Connections Over HTTP**

This optional parameter specifies if server should accept HTTP connections.

**[-is-https-enabled {true|false}] - Accept Connections Over HTTPS**

This optional parameter specifies if server should accept HTTPS connections.

**[-certificate-name <text>] - Name of Certificate Used for HTTPS Connections**

Common name of the certificate used for HTTPS connections.

**[-listener-port <integer>] - Object Store Server Listener Port**

This parameter specifies the listener port for the object store server.

**[-secure-listener-port <integer>] - Object Store Server Listener Port for HTTPS**

This parameter specifies the secure listener port for the object store server.

**[-status-admin {down|up}] - Object Store Server Administrative State**

This parameter specifies the administrative status of the object store server.

**[-comment <text>] - Object Store Server Description**

This parameter specifies the text comment for the object store server.

**[-default-unix-user <text>] - Default UNIX User for NAS Access**

This optional parameter specifies the default UNIX user used for name-mapping from an S3 user to UNIX user during NAS access.

**[-default-win-user <text>] - Default Windows User for NAS Access**

This optional parameter specifies the default Windows user used for name-mapping from an S3 user to

Windows user during NAS access.

**`[-is-ldap-fastbind-enabled {true|false}] - Is LDAP FastBind Authentication Enabled?`**  
(privilege: advanced)

This parameter specifies whether LDAP FastBind authentication is enabled for the object store server.

**`[-max-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}] - Maximum Value for Key TTL`**

This parameter specifies the maximum permissible value for object store user key time-to-live property.

**`[-max-lock-retention-period {{<integer> days|years} | none}] - Maximum Object Lock Retention Period`**

This parameter specifies the maximum value that can be specified as lock retention period for an object in an object store bucket.

**`[-min-lock-retention-period {{<integer> days|years} | none}] - Minimum Object Lock Retention Period`**

This parameter specifies the minimum value that can be specified as lock retention period for an object in an object store bucket.

## Examples

The following example modifies the name of the object store server for Vserver vs1.

```
cluster1::> vsserver object-store-server modify -vserver vs1 -object-store
-server OSS2
```

## vsserver object-store-server show

Display object store servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server show` command displays information about the object store server.

### Parameters

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver`**

If you specify this parameter, the command displays information only about the object store servers for the specified Vserver

**[-object-store-server <Object store server name>] - Object Store Server Name**

If you specify this parameter, the command displays information only for object store servers that match the specified object store server name.

**[-is-http-enabled {true|false}] - Accept Connections Over HTTP**

If you specify this parameter, the command displays information only for object store servers that accept HTTP connections.

**[-is-https-enabled {true|false}] - Accept Connections Over HTTPS**

If you specify this parameter, the command displays information only for object store servers that accept HTTPS connections.

**[-certificate-name <text>] - Name of Certificate Used for HTTPS Connections**

If you specify this parameter, the command displays information only for object store servers that match specified certificate name.

**[-listener-port <integer>] - Object Store Server Listener Port**

If you specify this parameter, the command displays information only for object store servers that match the specified listener port.

**[-secure-listener-port <integer>] - Object Store Server Listener Port for HTTPS**

If you specify this parameter, the command displays information only for object store servers that match the specified secure listener port.

**[-status-admin {down|up}] - Object Store Server Administrative State**

If you specify this parameter, the command displays information only for object store servers that match the specified administrative status.

**[-comment <text>] - Object Store Server Description**

If you specify this parameter, the command displays information only for object store servers that match the specified comment field.

**[-default-unix-user <text>] - Default UNIX User for NAS Access**

If you specify this parameter, the command displays information only for object store servers that match the specified default UNIX user.

**[-default-win-user <text>] - Default Windows User for NAS Access**

If you specify this parameter, the command displays information only for object store servers that match the specified default Windows user.

**[-is-ldap-fastbind-enabled {true|false}] - Is LDAP FastBind Authentication Enabled?  
(privilege: advanced)**

This parameter specifies whether LDAP FastBind authentication is enabled for the object store server.

**[-max-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P<integer>W}] - Maximum Value for Key TTL**

If you specify this parameter, the command displays information only for object store servers that match the specified time-to-live value.

**`[-max-lock-retention-period {{<integer> days|years} | none}]` - Maximum Object Lock Retention Period**

If you specify this parameter, the command displays information only for object store servers that match the specified maximum lock retention period.

**`[-min-lock-retention-period {{<integer> days|years} | none}]` - Minimum Object Lock Retention Period**

If you specify this parameter, the command displays information only for object store servers that match the specified minimum lock retention period.

## Examples

The following example displays information of all object store servers:

```
cluster1::> vsserver object-store-server show
Vserver: vs3
Object Store Server Name: test.s3.local
      Administrative State: up
      Listener Port For HTTP: 80
      Secure Listener Port For HTTPS: 443
      HTTP Enabled: false
      HTTPS Enabled: true
      Certificate for HTTPS Connections: server_cert
      Default UNIX User: pcuser
      Default Windows User: win_user
      Maximum Object Lock Retention Period: 100 days
      Minimum Object Lock Retention Period: 10 days
      Comment: Server comment
```

The following example displays information about the object store server associated with Vserver vs1:

```
cluster1::> vsserver object-store-server show -vserver vs1
Vserver: vs1
Object Store Server Name: test.s3.local
      Administrative State: up
      Listener Port For HTTP: 80
      Secure Listener Port For HTTPS: 443
      HTTP Enabled: false
      HTTPS Enabled: true
      Certificate for HTTPS Connections: server_cert
      Default UNIX User: pcuser
      Default Windows User: win_user
      Maximum Object Lock Retention Period: 100 days
      Minimum Object Lock Retention Period: 10 days
      Comment: Server comment
```

## vserver object-store-server audit create

### Create an audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server audit create` command creates an audit configuration for a Vserver.

When you create an object store audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (`-rotate-schedule-month`, `-rotate-schedule-dayofweek`, `-rotate-schedule-day`, `-rotate-schedule-hour`, and `-rotate-schedule-minute`). The `-rotate-schedule-minute` parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the `-rotate-schedule-minute` parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say `-rotate-schedule-month` and `-rotate-schedule-minutes`), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both `-rotate-schedule-dayofweek` and `-rotate-schedule-day`, they are considered independently. For example if you specify `-rotate-schedule-dayofweek` as Friday and `-rotate-schedule-day` as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

#### **-destination <text> - Log Destination Path**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

#### **[-events {data|management}] - Categories of Events to Audit**

This parameter specifies the categories of events to be audited. Supported event categories are: data and management events, The corresponding parameter values are: *data*, *management*.

#### **[-format <json>] - Log Format**

This parameter specifies the output format of the audit logs. By default, the output format is JSON.

#### **[-rotate-size {<size>|-}] - Log File Size Limit**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The

default audit log size is 100 MB.

**`[-rotate-schedule-month <cron_month>,...] - Log Rotation Schedule: Month`**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

**`[-rotate-schedule-dayofweek <cron_dayofweek>,...] - Log Rotation Schedule: Day of Week`**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

**`[-rotate-schedule-day <cron_dayofmonth>,...] - Log Rotation Schedule: Day`**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

**`[-rotate-schedule-hour <cron_hour>,...] - Log Rotation Schedule: Hour`**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

**`[-rotate-schedule-minute <cron_minute>,...] - Log Rotation Schedule: Minute`**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

**`{ [-rotate-limit <integer>] - Log Files Rotation Limit`**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

**`[-retention-duration [<integer>d [<integer>h] [<integer>m] [<integer>s]] - Log Retention Duration }`**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. The default value is 0s. For example, if you enter a value of 5d0h0m, logs more than 5 days old are deleted.

## Examples

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vsserver object-store-server audit create -vsserver vs1
-destination /audit_log -rotate-size 10MB -rotate-limit 5
```

+ +

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsserver object-store-server audit create -vsserver vs1
-destination /audit_log -rotate-schedule-month all -rotate-schedule
-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vsserver object-store-server audit create -vsserver vs1
-destination /audit_log -rotate-schedule-month
January, March, May, July, September, November -rotate-schedule-dayofweek
Monday, Wednesday, Friday -rotate-schedule-hour 6,12,18 -rotate-schedule
-minute 15,30,45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing object store data access events in the output log format Json.

```
cluster1::> vsserver object-store-server audit create -vsserver vs1
-destination /audit_log -format json -events data
```

## vserver object-store-server audit delete

### Delete audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server audit delete` command deletes the audit configuration for a Vserver.

### Parameters

**-vsserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

**[-force <true>] - Force Delete (privilege: advanced)**

This parameter is used to forcibly delete the audit configuration. By default the setting is `false`.

### Examples

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vsserver object-store-server audit delete -vsserver vs1
```

## vserver object-store-server audit disable

Disable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server audit disable` command disables auditing for a Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

### Examples

The following example disables auditing for Vserver vs1.

```
cluster1::> vserver object-store-server audit disable -vserver vs1
```

## vserver object-store-server audit enable

Enable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server audit enable` command enables auditing for a Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

**[-force <true>] - Force Enable (privilege: advanced)**

This parameter is used to ignore errors while enabling auditing.

### Examples

The following example enables auditing for Vserver vs1:

```
cluster1::> vserver object-store-server audit enable -vserver vs1
```

## vserver object-store-server audit modify

Modify the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server audit modify` command modifies an audit configuration for a Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the `-rotate-schedule-dayofweek` parameter to Monday,Wednesday,Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".

#### **[-destination <text>] - Log Destination Path**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

#### **[-events {data|management}] - Categories of Events to Audit**

This parameter specifies the categories of events to be audited. Supported event categories are: data and management events. The corresponding parameter values are: *data* , *management* . By default, *data* events are enabled

#### **[-format <json>] - Log Format**

This parameter specifies the output format of the audit logs. By default, the output format is JSON.

#### **[-rotate-size {<size>|-}] - Log File Size Limit**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

#### **[-rotate-schedule-month <cron\_month>,...] - Log Rotation Schedule: Month**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

#### **[-rotate-schedule-dayofweek <cron\_dayofweek>,...] - Log Rotation Schedule: Day of Week**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

### **`[-rotate-schedule-day <cron_dayofmonth>,...]` - Log Rotation Schedule: Day**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

### **`[-rotate-schedule-hour <cron_hour>,...]` - Log Rotation Schedule: Hour**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

### **`[-rotate-schedule-minute <cron_minute>,...]` - Log Rotation Schedule: Minute**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

### **`{ [-rotate-limit <integer>]}` - Log Files Rotation Limit**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

### **`| [-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Log Retention Duration }**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. For example, if you enter a value of 5d0h0m0s, logs more than 5 days old are deleted.

## **Examples**

The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

```
cluster1::> vsserver object-store-server audit modify -vserver vs1 -rotate
-size 10MB -rotate-limit 3
```

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsserver object-store-server audit modify -vserver vs1
-destination /audit_log -rotate-schedule-month all -rotate-schedule
-dayofweek all -rotate-schedule-hour 12 -rotate-schedule-minute 30
```

The following example modifies an audit configuration for Vserver vs1 for auditing object store data events in the output log format Json.

```
cluster1::> vsserver object-store-server audit modify -vserver vs1 -format
json -events data
```

## **vserver object-store-server audit rotate-log**

### **Rotate audit log**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server audit rotate-log` command rotates audit logs for a Vserver.

## Parameters

### **-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

## Examples

The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver object-store-server audit rotate-log -vserver vs1
```

## vserver object-store-server audit show

Display the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server audit show` command displays object store audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields` parameter to specify which audit configuration information to display about Vservers. + You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size 10MB` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

## | [-log-save-details ]

You can specify the `-log-save-details` parameter to display the following information about all the Vservers:

- Vserver name
- Rotation file size
- Rotation schedules
- Rotation limit

## | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all entries.

## [-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information about the specified Vserver.

## [-state {true|false}] - Auditing State

If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

## [-destination <text>] - Log Destination Path

If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

## [-events {data|management}] - Categories of Events to Audit

If you specify this parameter, the command displays information about the Vservers that use the specified category of events that are audited. Valid values are *file-ops* , *cifs-logon-logoff* , *cap-staging* , *file-share* , *audit-policy-change* , *user-account* , *security-group* and *authorization-policy-change* . *audit-policy-change* will appear only in diag mode.

## [-format <json>] - Log Format

If you specify this parameter, the command displays information about the Vservers that use the specified log format.

## [-rotate-size {<size>|-}] - Log File Size Limit

If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

## [-rotate-schedule-month <cron\_month>,...] - Log Rotation Schedule: Month

If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

## [-rotate-schedule-dayofweek <cron\_dayofweek>,...] - Log Rotation Schedule: Day of Week

If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

## [-rotate-schedule-day <cron\_dayofmonth>,...] - Log Rotation Schedule: Day

If you specify this parameter, the command displays information about the Vservers that use the specified

day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

**[-rotate-schedule-hour <cron\_hour>,...] - Log Rotation Schedule: Hour**

If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

**[-rotate-schedule-minute <cron\_minute>,...] - Log Rotation Schedule: Minute**

If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

**[-rotate-schedule-description <text>] - Rotation Schedules**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.

**[-rotate-limit <integer>] - Log Files Rotation Limit**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

**[-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Log Retention Duration**

If you specify this parameter, the command displays information about the Vservers audit logs retention duration.

## Examples

The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver object-store-server audit show
Vserver      State  Event Types Log Format Target Directory
-----
vs1          false  data      json      /audit_log
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver object-store-server audit show -log-save-details
Rotation
Vserver      File Size Rotation Schedule Limit
-----
vs1          100MB      -              0
```

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vsserver object-store-server audit show -instance
Vserver: vs1
        Auditing state: true
        Log Destination Path: /audit_log
Categories of Events to Audit: data
        Log Format: json
        Log File Size Limit: 100MB
        Log Rotation Schedule: Month: -
Log Rotation Schedule: Day of Week: -
        Log Rotation Schedule: Day: -
        Log Rotation Schedule: Hour: -
Log Rotation Schedule: Minute: -
        Rotation Schedules: -
        Log Files Rotation Limit: 0
        Log Retention Time: 0s
```

## vsserver object-store-server audit event-selector create

Create an object store server audit event-selector

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server audit event-selector create` command creates an audit event selector for the object store server bucket. The audit event selector specifies the types of event access and the types of event permission that are to be audited. S3 auditing configurations are enabled at the Vserver level. However, this command must be used to specify the buckets in the Vserver that are enabled for audit. If buckets are added to the Vserver and need to be audited, they must be added with this command.

### Parameters

#### **-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket audit event-selector needs to be created for the object store server bucket.

#### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the audit event-selector needs to be created. The object store bucket must already exist.

#### **-access {read-only|write-only|all} - Access type for audit events**

Use this parameter to specify which type of event access is being audited. Possible values are: read-only, write-only or all.

#### **-permission {allow-only|deny-only|all} - Permission type for audit events**

Use this parameter to specify which type of event permission is being audited. Possible value are: allow-only, deny-only or all.

## Examples

The following example displays information on object store server audit event-selector for vs1 and bucket1:

```
cluster1::> vs1 object-store-server audit event-selector create
               -vs1 -bucket bucket1 -access read-only -permission
allow-only
```

## vs1 object-store-server audit event-selector delete

Delete an object store server audit event-selector

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vs1 object-store-server audit event-selector delete` command delete an audit event-selector for the object store server bucket.

### Parameters

**-vs1 <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket audit event-selector needs to be deleted.

**-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the audit event-selector needs to be deleted.

## Examples

The following example delete an object store server audit event-selector for Vserver vs1 and bucket1:

```
cluster1::> vs1 object-store-server audit event-selector delete
               -vs1 -bucket bucket1
```

## vs1 object-store-server audit event-selector modify

Modify an object store server audit event-selector

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vs1 object-store-server audit event-selector modify` command modifies an audit event-selector for the object store server bucket.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket audit event-selector needs to be modified for the object store server bucket.

### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the audit event-selector needs to be modified.

### **[-access {read-only|write-only|all}] - Access type for audit events**

Use this parameter to specify which type of event access is being audited. Possible values are: read-only, write-only or all.

### **[-permission {allow-only|deny-only|all}] - Permission type for audit events**

Use this parameter to specify which type of event permission is being audited. Possible value are: allow-only, deny-only or all.

## Examples

The following example modified an object store server audit event-selector for Vserver vs1 and bucket1 with read-only access to write-only access:

```
cluster1::> vsserver object-store-server audit event-selector modify
               -vserver vs1 -bucket bucket1 -access write-only
```

## **vsserver object-store-server audit event-selector show**

Display object store server audit event-selector

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsserver object-store-server audit event-selector show` command displays information about object store server audit event-selector.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server audit event-selector for the specified Vserver.

### **[-bucket <TextNoCase>] - Object Store Server Bucket Name**

If you specify this parameter, the command displays information on the object store server audit event-selector for the specified bucket.

### **[-access {read-only|write-only|all}] - Access type for audit events**

If you specify this parameter, the command displays information on the object store server audit event-selector that match the specified access.

### **[-permission {allow-only|deny-only|all}] - Permission type for audit events**

If you specify this parameter, the command displays information on the object store server audit event-selector that match the specified permission.

## **Examples**

The following example displays information on object store server audit event-selector for vserver vs1 and bucket bucket1:

```
cluster1::> vsserver object-store-server audit event-selector show
               -vserver vs1 -bucket bucket1
Vserver      Bucket      Access      Permission
-----
vs1
            bucket1      read-only      allow-only
```

The following example displays detailed information of the object server audit event-selector associated with Vserver vs1.

```
cluster1::> vsserver object-store-server audit event-selector show
               -vserver vs1
Vserver      :vs1
Bucket       :bucket1
Access       :all
Permission   :all
```

## **vsserver object-store-server bucket clear-snapshot-metadata**

Delete all snapshot metadata for the S3 bucket.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## **Description**

The `vsserver object-store-server bucket clear-snapshot-metadata` command removes all snapshot metadata for a specified S3 bucket. This command is available in advanced privilege.

## Parameters

### **-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This specifies the name of the Vserver that contains the S3 bucket for which the snapshot metadata will be removed.

### **-bucket <TextNoCase> - Object Store Server Bucket Name (privilege: advanced)**

This specifies the name of the S3 bucket for which the snapshot metadata will be removed.

## Examples

The following example removes all snapshot metadata for an S3 bucket bucket-1 on Vserver named vs0.

```
cluster1::> vsriver object-store-server bucket clear-snapshot-metadata  
-vserver vs0 -bucket bucket-1
```

## vserver object-store-server bucket create

Create an object store server bucket

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server bucket create` command creates a bucket for the object store server.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server where the bucket needs to be created. The object store server must already exist.

### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket. Note that the bucket name must not be same as the beginning of the object-store-server name present in the vsriver.

### **[-type {s3|nas}] - Type of bucket**

This parameter specifies the type of the bucket. The default value is `s3`.

### **[-versioning-state {disabled|enabled|suspended}] - Object Store Server Versioning State**

Use this parameter to specify the state of versioning on the bucket.

### **[-comment <text>] - Object Store Server Bucket Comment**

This optional parameter specifies a text comment for the object store server bucket.

### **{ [-aggr-list <aggregate name>, ...] - List of Aggregates for FlexGroup Constituents (privilege: advanced)**

Use this parameter to specify the list of aggregates for the FlexGroup constituents on which the bucket

needs to be created. Each entry in the list will create a constituent on the specified aggregate. The root constituent will always be placed on the first aggregate in the list, unless `optimize-aggr-list` is specified as `true`. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroup volumes. This parameter is available only in advanced privilege mode.

**`[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count (privilege: advanced)`**

Use this parameter to specify the number of FlexGroup constituents to be created. This parameter is available only in advanced privilege mode.

**`[-optimize-aggr-list {true|false}] - Have the System Optimize the Order of the Aggregate List (privilege: advanced)`**

Specifies whether to create the constituents of the FlexGroup volume on which the bucket needs to be created, on the aggregates specified in the `aggr-list` in the order they are specified, or whether the system should optimize the ordering of the aggregates. If this value is `true`, the system will optimize the ordering of the aggregates specified in the `aggr-list`. If this value is `false` the order of the `aggr-list` will be unchanged. The default value is `false`. This parameter only applies to FlexGroup volumes. This parameter is available only in advanced privilege mode.

**`{ [-used-as-capacity-tier {true|false}] - Is Used as Capacity Tier`**

Use this parameter to specify if the bucket is going to be used for FabricPool capacity tier. This parameter is used for bucket provisioning to strike a balance between low cost and performance.

**`[-storage-service-level <text>] - Storage Service Level of the Bucket }`**

Use this parameter to specify the storage service level with which the bucket should be created.

**`[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of the Bucket`**

Use this parameter to specify the size of the FlexGroup volume to be created.

**`[-exclude-aggr-list <aggregate name>,...] - List of Aggregates to Exclude During FlexGroup Create`**

Use this parameter to specify the list of aggregates to exclude during FlexGroup creation. This parameter is used only when creating bucket for capacity tier use case within the local cluster.

**`[-qos-policy-group <text>] - QoS policy group`**

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a bucket, the system will not monitor and control the traffic to it.

**`[-nas-path <text>] - NAS Path Specified During Bucket Creation`**

This parameter specifies the path to the NAS directory which the bucket maps to.

**`[-is-nas-path-mutable {true|false}] - Is NAS Path Mutable (privilege: advanced)`**

This parameter determines if the NAS bucket mapping with a NAS volume can change with the changes in NAS volume `junction-path` due to operations like mount and unmount. If mutable, the NAS bucket will access any path in a NAS volume that matches the specified `nas-path`. If immutable, the NAS bucket will always access the `nas-path` specified during creation, regardless of `junction-path` changes. For example, if a NAS volume 'volA' is mounted at '/data' and a NAS bucket is created with `nas-path` '/data', and later 'volA' is unmounted and 'volB' is mounted at '/data': If mutable, '/data' of 'volB' will be accessible over S3. If immutable, '/data' of 'volA' will be accessible over S3. The default value is `true`.

### **`[-retention-mode {no-lock|compliance|governance}] - Bucket Retention Mode`**

Use this parameter to specify the retention-mode in which objects within the bucket can be locked.

### **`[-use-mirrored-aggregates {true|false}] - Use Mirrored Aggregates`**

Use this parameter to specify whether mirrored aggregates are selected for the FlexGroup on which the bucket will be created. Only mirrored aggregates are used if this parameter is set to *true* and only unmirrored aggregates are used if this parameter is set to *false*. The default value is *true* for a MetroCluster configuration and is *false* for a non-MetroCluster configuration.

### **`[-default-retention-period {{<integer> days|years} | none}] - Bucket Default Retention Period`**

Use this parameter to specify the retention-period to be applied on all unlocked objects inserted into the bucket. The retention period can be in years, or days. A period specified for years and days is represented in the ISO-8601 format as "10 years" and "100 days" respectively, for example "10 years" represents a duration of 10 years. The period string must contain only a single time element that is, either years, or days. A duration which combines different periods is not supported, for example "10 years 12 days" is not supported.

### **`[-snapshot-policy <snapshot policy>] - Snapshot Policy`**

This parameter specifies the snapshot policy for the object store server bucket.

### **`[-is-consistent-etag {true|false}] - Return Consistent ETag for NAS Bucket (privilege: advanced)`**

This parameter specifies whether a consistent entity tag is returned across different S3 requests for the NAS bucket. The default value is *false*.

## **Examples**

The following example creates an object store server bucket for Vserver vs1 of size 1TB.

```
cluster1::> vsserver object-store-server bucket create -vsserver vs1 -bucket testbucket -size 1TB.
```

The following example creates an object store server bucket for Vserver vs1 of size 1TB using aggr-list.

```
cluster1::*> vsserver object-store-server bucket create -vsserver vs1 -bucket testbucket -aggr-list aggr1 -size 1TB.
```

The following example creates an object store server NAS bucket for Vserver vs1 with *is-nas-path-mutable* option turned off.

```
cluster1::> vsserver object-store-server bucket create -vsserver vs1 -bucket nasbucket -nas-path /path1 -is-nath-path-mutable false
```

## vserver object-store-server bucket delete

Delete an object store bucket

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket delete` command deletes the bucket belonging to the object store server.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server's bucket you want to delete.

**-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the bucket of the object store server you want to delete.

### Examples

The following example deletes an object store server bucket for Vserver vs1.

```
cluster1::> vserver object-store-server delete -vserver vs1 -bucket  
testbucket
```

## vserver object-store-server bucket evict-remote-cached-objects

Evict remote read-write cached objects

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver object-store-server evict-remote-cached-objects` command will evict read-write dirty cached objects in all constituent volumes of a given object store server bucket. This command will evict only objects that are cached on a different volume than its origin volume. This command requires two parameters - a Vserver name and an object store server bucket name.

### Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This specifies the name of the Vserver for the object store server.

**-bucket <TextNoCase> - Object Store Server Bucket Name (privilege: advanced)**

This specifies the name of the object store server bucket.

### Examples

The following example starts the command:

```
cluster1::>vserver object-store-server bucket evict-remote-cached-objects
-vserver my-vserver -bucket my-bkt
```

## vserver object-store-server bucket modify

### Modify an object store server bucket

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver object-store-server bucket modify` command modifies an object store server bucket.

#### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server which you want to modify.

**-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket which you want to modify.

**[-versioning-state {disabled|enabled|suspended}] - Object Store Server Versioning State**

Use this parameter to specify the state of versioning on the bucket. Note that the versioning state cannot be modified to 'disabled' from any other state.

**[-comment <text>] - Object Store Server Bucket Comment**

This parameter specifies the text comment for the object store server bucket.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of the Bucket**

This parameter specifies the size of the object store server bucket.

**[-qos-policy-group <text>] - QoS policy group**

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a bucket, the system will not monitor and control the traffic to it.

**[-nas-path <text>] - NAS Path Specified During Bucket Creation**

This parameter specifies the path to the NAS directory which the bucket maps to.

**[-default-retention-period {{<integer> days|years} | none}] - Bucket Default Retention Period**

Use this parameter to modify the default-retention-period to be applied on all unlocked objects to be inserted into the bucket.

**[-snapshot-policy <snapshot policy>] - Snapshot Policy**

This parameter specifies the snapshot policy for the object store server bucket.

**`[-is-consistent-etag {true|false}]` - Return Consistent ETag for NAS Bucket (privilege: advanced)**

This parameter specifies whether a consistent entity tag is returned across different S3 requests for the NAS bucket.

## Examples

The following example modifies the comment of the object store server bucket for Vserver vs1.

```
cluster1::> vsriver object-store-server bucket modify -vsriver vs1 -bucket
testbucket -comment test
```

## vsriver object-store-server bucket show

Display object store server buckets

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver object-store-server bucket show` command displays information about the object store server bucket.

### Parameters

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ]`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vsriver <Vsriver Name>] - Vsriver Name`**

If you specify this parameter, the command displays information only about the object store server buckets for the specified Vsriver

**`[-bucket <TextNoCase>] - Object Store Server Bucket Name`**

If you specify this parameter, the command displays information only for object store server buckets that match the specified bucket.

**`[-type {s3|nas}] - Type of bucket`**

This parameter specifies the type of bucket.

**`[-versioning-state {disabled|enabled|suspended}] - Object Store Server Versioning State`**

This parameter specifies the state of the versioning on a bucket.

**`[-uuid <UUID>] - Object Store Server Bucket UUID`**

If you specify this parameter, the command displays information only for object store server buckets that match the specified bucket uuid.

**[`-comment <text>`] - Object Store Server Bucket Comment**

If you specify this parameter, the command displays information only for object store server buckets that match the specified comment.

**[`-volume <volume name>`] - Hosting Volume Name**

If you specify this parameter, the command displays information only for object store server buckets that match the specified volume.

**[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Size of the Bucket**

If you specify this parameter, the command displays information only for object store server buckets that match the specified size.

**[`-logical-used {<integer>[KB|MB|GB|TB|PB]}`] - Object Store Server Bucket Logical Used Size**

If you specify this parameter, the command displays information only for object store server buckets that match the specified logical used size.

**[`-object-count <integer>`] - Object Store Server Object Count**

If you specify this parameter, the command displays information only for object store server buckets that match the specified object-count.

**[`-incomplete-multipart-uploads-count <integer>`] - Count of Incomplete Multipart Uploads**

If you specify this parameter, the command displays information only for object store server buckets that match the specified incomplete-multipart-uploads-count.

**[`-encryption {true|false}`] - Is Encryption Enabled on Bucket**

If you specify this parameter, the command displays information only for object store server buckets that match the specified encryption field.

**[`-qos-policy-group <text>`] - QoS policy group**

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a bucket, the system will not monitor and control the traffic to it.

**[`-is-protected {true|false}`] - Is bucket a FabricLink source and protected**

This parameter specifies whether a bucket is protected using SnapMirror relationship to another bucket.

**[`-is-protected-on-ontap {true|false}`] - Is bucket protected over ONTAP**

This parameter specifies whether a bucket is protected using SnapMirror relationship to another ONTAP bucket.

**[`-is-protected-on-cloud {true|false}`] - Is bucket protected over Cloud**

This parameter specifies whether a bucket is protected using SnapMirror relationship to a Cloud bucket.

**[`-is-protected-on-external-cloud {true|false}`] - Is bucket protected on External Cloud**

This parameter specifies whether a bucket is protected using S3 SnapMirror relationship to a bucket on an external Cloud provider i.e. excluding providers types ONTAP\_S3 and SGWS.

**[`-nas-path <text>`] - NAS Path Specified During Bucket Creation**

This parameter specifies the path to the NAS directory which the bucket maps to.

**[-nas-path-current <text>] - Current NAS Path corresponding to the Bucket (privilege: advanced)**

This parameter specifies the current path to the NAS directory which the bucket maps to.

**[-is-nas-path-mutable {true|false}] - Is NAS Path Mutable (privilege: advanced)**

If you specify this parameter, the command displays information only for object store server buckets that match the specified value. This parameter specifies whether to use nas-path name or nas-path file handle for data access through NAS bucket.

**[-retention-mode {no-lock|compliance|governance}] - Bucket Retention Mode**

If you specify this parameter, the command displays information only for object store server buckets that match the specified retention-mode. This parameter specifies the object locking mode of the bucket.

**[-default-retention-period {{<integer> days|years} | none}] - Bucket Default Retention Period**

If you specify this parameter, the command displays information only for object store server buckets that match the specified default-retention-period field. This parameter specifies the default-retention-period applied on the bucket.

**[-snapshot-policy <snapshot policy>] - Snapshot Policy**

If you specify this parameter, the command displays information only for object store server buckets that match the specified snapshot-policy field. This parameter specifies the snapshot-policy for the bucket.

**[-is-consistent-etag {true|false}] - Return Consistent ETag for NAS Bucket (privilege: advanced)**

If you specify this parameter, the command displays information only for object store server buckets that match the specified consistent entity tag behavior. This parameter specifies whether a consistent entity tag is returned across different S3 requests for the NAS bucket.

## Examples

The following example displays information of all object store servers buckets:

```
cluster1::> vsriver object-store-server bucket show
nsankaracluster-1::*> vsriver object-store-server bucket show
Vserver      Bucket      Type      Volume      Size
Encryption Role      NAS Path
-----
vs1          s3bucket1   nas       s3adapter   -          false
-            /s3adapter
vs1          testbucket1 s3        fg_oss_1654817100 1.56GB    false
standalone -
Comment: test1
vs2          nasbucket1  nas       vol2        -          false
-            /vol2
vs2          nasbucket2  nas       vol2        -          false
-            /vol2
4 entries were displayed.
```

The following example displays information of the object store server bucket associated with Vserver vs1:

```
cluster1::> vserver object-store-server bucket show -vserver vs1
Vserver      Bucket      Type      Volume      Size
Encryption Role      NAS Path
-----
vs1          s3bucket1    nas       s3adapter    -      false
-            /s3adapter
vs1          testbucket1  s3        fg_oss_1654817100 1.56GB  false
standalone -
Comment: test1
```

The following example displays detailed information of the object store server bucket associated with Vserver vs1:

```

cluster1::> vsserver object-store-server bucket show -vsserver vs1 -instance
Vserver Name: vs1
    Object Store Server Bucket Name: s3bucket1
        Type of bucket: nas
    Object Store Server Versioning State: -
    Object Store Server Bucket UUID: c621d53a-ddf0-11ec-958f-
005056bba281
    Object Store Server Bucket Comment:
        Hosting FlexGroup Volume Name: s3adapter
        Size of the Bucket: -
Object Store Server Bucket Logical Used Size: -
    Object Store Server Object Count: -
    Is Encryption Enabled on Bucket: false
        QoS policy group: -
        Role of the Bucket: -
    Is bucket a FabricLink source and protected: -
        Is bucket protected over ONTAP: -
        Is bucket protected over Cloud: -
    Is bucket protected on External Cloud: -
    NAS Path corresponding to the Bucket: /s3adapter
        Current NAS Path: -
        Is Mutable NAS Path: true
Vserver Name: vs1
    Object Store Server Bucket Name: testbucket1
        Type of bucket: s3
    Object Store Server Versioning State: disabled
    Object Store Server Bucket UUID: 6a1fa354-e84b-11ec-adce-
005056bba281
    Object Store Server Bucket Comment:
        Hosting FlexGroup Volume Name: fg_oss_1654817100
        Size of the Bucket: 1.56GB
Object Store Server Bucket Logical Used Size: 0B
    Object Store Server Object Count: 0
    Is Encryption Enabled on Bucket: false
        QoS policy group: -
        Role of the Bucket: standalone
    Is bucket a FabricLink source and protected: false
        Is bucket protected over ONTAP: false
        Is bucket protected over Cloud: false
    Is bucket protected on External Cloud: false
    NAS Path corresponding to the Bucket: -
2 entries were displayed.

```

## vserver object-store-server bucket cors-rule create

### Create a Cross-Origin rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket cors-rule create` command creates a cross-origin resource sharing (CORS) rule for the object store server bucket.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver hosting the object store server bucket for which the CORS rule will to be created.

**-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the CORS rule will to be created.

**[-index <integer>] - Cross-Origin Access Rule Index**

This parameter specifies the index of the object store server bucket CORS rule. This is an optional parameter. Its value is calculated automatically by the system, if not specified.

**[-rule-id <text>] - Cross-Origin Access Rule ID**

This parameter specifies the ID of the object store server bucket CORS rule.

**-allowed-origins <text>,... - List of the Origins Allowed for Cross-Origin Requests**

This parameter specifies a list of origins from where a cross-origin request is allowed to originate from for the object store bucket.

**-allowed-methods <text>,... - List of HTTP Request Methods Allowed in Cross-Origin Requests**

This parameter specifies a list of HTTP methods allowed in the cross-origin requests.

**[-allowed-headers <text>,...] - List of the Headers Allowed in Cross-Origin Requests**

This parameter specifies a list of HTTP headers allowed in the cross-origin requests.

**[-expose-headers <text>,...] - Headers that Servers Allow Clients to Access**

This parameter specifies a list of extra headers sent in the response that customers can access from their applications.

**[-max-age-in-seconds <integer>] - How Long ( in Seconds ) the Results of a Cross-Origin Pre-Flight Request Can Be Cached?**

This optional parameter specifies the time in seconds for your browser to cache the pre-flight response for the specified resource.

### Examples

The following example creates an object store server bucket CORS rule for Vserver vs1 and bucket bb1.

```
cluster1::> vserver object-store-server bucket cors-rule create -vserver
vs1 -bucket bbl -allowed-origins example.com -allowed-methods POST,DELETE
-allowed-headers x-amz-request-id -max-age-in-seconds 2000 -expose-headers
x-purpose -rule-id rule1
```

## vserver object-store-server bucket cors-rule delete

### Delete a Cross-Origin rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver object-store-server bucket cors-rule delete` command deletes a cross-origin resource sharing (CORS) rule belonging to the object store server bucket.

#### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver hosting the object store server bucket for which the CORS rule will be deleted.

**-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the CORS rule will be deleted.

**-index <integer> - Cross-Origin Access Rule Index**

This parameter specifies the index of the object store server bucket CORS rule.

#### Examples

The following example deletes an object store server bucket CORS rule with index 1 of Vserver vs1 and bucket bucket1.

```
cluster1::> vserver object-store-server bucket cors-rule delete -vserver
vs1 -bucket bucket1 -index 1
```

## vserver object-store-server bucket cors-rule show

### Show the Cross-Origin rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver object-store-server bucket cors-rule show` command displays information about the cross-origin resource sharing (CORS) rules for the specified object store server bucket.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server bucket CORS rules for the specified Vserver.

**[-bucket <TextNoCase>] - Object Store Server Bucket Name**

If you specify this parameter, the command displays information on the object store server bucket CORS rules for the specified object store server bucket.

**[-index <integer>] - Cross-Origin Access Rule Index**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified index.

**[-rule-id <text>] - Cross-Origin Access Rule ID**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified rule ID.

**[-allowed-origins <text>,...] - List of the Origins Allowed for Cross-Origin Requests**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified allowed origins.

**[-allowed-methods <text>,...] - List of HTTP Request Methods Allowed in Cross-Origin Requests**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified allowed methods.

**[-allowed-headers <text>,...] - List of the Headers Allowed in Cross-Origin Requests**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified allowed headers.

**[-expose-headers <text>,...] - Headers that Servers Allow Clients to Access**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified exposed headers.

**[-max-age-in-seconds <integer>] - How Long ( in Seconds ) the Results of a Cross-Origin Pre-Flight Request Can Be Cached?**

If you specify this parameter, the command displays information on the object store server bucket CORS rules that match the specified value for this parameter.

## Examples

The following example displays information on object store server bucket CORS rules for vs1 and bucket bucket1:

```
cluster1::> vserver object-store-server bucket cors-rule show -vserver vs1
-bucket bb1
```

| Vserver | Bucket | Rule-Index | Origin      | Methods      |
|---------|--------|------------|-------------|--------------|
| vs1     | bb1    | 1          | hello.com   | POST         |
| vs1     | bb1    | 2          | *           | POST         |
| vs1     | bb1    | 5          | example.com | POST, DELETE |

2 entries were displayed.

The following example displays detailed information of the object store server bucket CORS rule associated with Vserver vs1 and bucket bucket1:

```
cluster1::> vserver object-store-server bucket cors-rule show -vserver vs1
-bucket bb1 -index 5
```

```
-----
                                Vserver: vs1
      Object Store Server Bucket Name: bb1
      Cross-Origin Access Rule Index: 5
      Cross-Origin Access Allowed Origins: example.com
      Cross-Origin Access Allowed Methods: POST, DELETE
      Cross-Origin Access Allowed Headers: x-amz-request-id
      Cross-Origin Access Rule Identifier: rule1
      Cross-Origin Access Exposed Headers: x-purpose
      Time a browser can cache Cross-Origin Response: 2000
```

## vserver object-store-server bucket lifecycle-management-rule create

### Create a lifecycle management rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket lifecycle-management-rule create` command creates a lifecycle management rule for the object store server bucket.

### Parameters

#### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket lifecycle management rule needs to be created for the object store server bucket.

#### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the lifecycle management rule needs to be created. The object store server bucket must already exist.

**-rule-id <text> - Lifecycle Management Rule Identifier**

This parameter specifies the rule identifier of the lifecycle management rule to be applied on the object store server bucket.

**[-index <integer>] - Lifecycle Management Rule Index**

This parameter specifies the index of the lifecycle management rule to be applied on the object store server bucket.

**[-is-enabled {true|false}] - Is This Rule Enabled?**

This parameter specifies whether the configured lifecycle management rule is enabled or disabled on the object store server bucket. If you do not specify this parameter, the default is *true*.

**[-prefix <text>] - Prefix to be Matched with Object Names**

Use this parameter to specify a prefix that is matched against object-names within a bucket.

**[-tags <text>, ...] - Tags in Format <tag> or <tag=value>**

Use this parameter to specify a list of key-value paired tags.

**[-obj-size-greater-than {<integer>[KB|MB|GB|TB|PB]}] - Min Size of the Object**

Use this parameter to specify the minimum size of the object for which the corresponding lifecycle rule is to be applied.

**[-obj-size-less-than {<integer>[KB|MB|GB|TB|PB]}] - Max Size of the Object**

Use this parameter to specify the maximum size of the object for which the corresponding lifecycle rule is to be applied.

**-action**

**{Expiration|NoncurrentVersionExpiration|AbortIncompleteMultipartUpload|ExpirationInternal} - Lifecycle Management Action**

Use this parameter to specify lifecycle management actions. The set of actions that the object store server supports are *Expiration*, *NoncurrentVersionExpiration* and *AbortIncompleteMultipartUpload*.

**{ [-obj-age-days <integer>] - Number of Days since Creation, After Which Current Version of Objects Can be Deleted**

Minimum lifetime in number of days since creation, after which objects can be deleted. This parameter is available for expiration actions only.

**[-obj-exp-date <MM/DD/YYYY HH:MM:SS>] - Specific Date When the Objects Should Expire**

Expiration date of an object. This parameter is available for expiration actions only.

**[-expired-obj-del-marker {true|false}] - Cleanup Object Delete Markers**

When set to *true*, an object with a delete marker will be deleted. This parameter is available for expiration actions only.

**[-new-non-curr-versions <integer>] - Number of Latest Non-current Versions to Be Retained**

This parameter specifies the number of latest non-current versions to be retained. This parameter is available for non-current version expiration actions only.

### **[*-non-curr-days* <integer>] - Number of Days after Which Non-current Versions will Be Deleted**

This parameter specifies the number of days after which non-current versions can be deleted. This parameter is available for non-current version expiration actions only.

### **[*-after-initiation-days* <integer>] - Number of Days of Initiation, After Which Upload Can Be Aborted }**

This parameter specifies the number of days of initiation, after which uploads can be aborted. This parameter is required for abort-incomplete multipart upload actions only.

## **Examples**

The following example creates an object store server bucket lifecycle management rule for Vserver vs1 and bucket1 which specifies an expiration action on a set of objects.

```
cluster1::> vs1 object-store-server bucket lifecycle-management-rule
create -vs1 -bucket bucket1 -rule-id rule1 -prefix obj1/ -action
Expiration -obj-age-days 100"
```

## **vs1 object-store-server bucket lifecycle-management-rule delete**

### **Delete a Lifecycle Management rule**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vs1 object-store-server bucket lifecycle-management-rule delete` command deletes a lifecycle management rule for the object store server bucket.

### **Parameters**

#### ***-vs1* <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket lifecycle management rule needs to be deleted for the object store server bucket.

#### ***-bucket* <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the lifecycle management rule needs to be deleted. The object store server bucket must already exist.

#### ***-rule-id* <text> - Lifecycle Management Rule Identifier**

This parameter specifies the rule identifier of the lifecycle management rule to be deleted from the object store server bucket.

#### ***-index* <integer> - Lifecycle Management Rule Index**

This parameter specifies the index of the lifecycle management rule to be deleted from the object store server bucket.

#### **[*-force* <true>] - Ignore Errors**

If this parameter is specified and set to true, the user is not prompted to confirm each deletion operation. In

addition, several potential errors are ignored. By default, this setting is *true*.

## Examples

The following example deletes an object store server bucket lifecycle management rule for Vserver vs1 and bucket1.

```
cluster1::> vsserver object-store-server bucket lifecycle-management-rule
delete -vsserver vs1 -bucket bucket1 -rule-id rule1 -index 1"
```

## vsserver object-store-server bucket lifecycle-management-rule modify

Modify a lifecycle management rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server bucket lifecycle-management-rule modify` command modifies a lifecycle management rule for the object store server bucket.

### Parameters

#### **-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket lifecycle management rule will be modified for the object store server bucket.

#### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the lifecycle management rule will be modified. The object store server bucket must already exist.

#### **-rule-id <text> - Lifecycle Management Rule Identifier**

This parameter specifies the rule identifier of the lifecycle management rule to be applied on the object store server bucket.

#### **-index <integer> - Lifecycle Management Rule Index**

This parameter specifies the index of the lifecycle management rule to be applied on the object store server bucket.

#### **[-is-enabled {true|false}] - Is This Rule Enabled?**

This parameter specifies whether the configured lifecycle management rule is to be enabled or disabled on the object store server bucket. The default value when a rule is created is *true*.

#### **{ [-obj-age-days <integer>] - Number of Days since Creation, After Which Current Version of Objects Can be Deleted**

This parameter specifies the minimum lifetime, in days since creation, after which objects can be deleted. This parameter is available for expiration actions only.

**[`-obj-exp-date` <MM/DD/YYYY HH:MM:SS>] - Specific Date When the Objects Should Expire**

This parameter specifies the expiration date when an object will expire. This parameter is available for expiration actions only.

**[`-expired-obj-del-marker` {`true`|`false`}] - Cleanup Object Delete Markers**

This parameter specifies whether to delete an object that has a delete marker or not. When set to `true`, an object with a delete marker will be deleted. This parameter is available for expiration actions only.

**[`-new-non-curr-versions` <integer>] - Number of Latest Non-current Versions to Be Retained**

This parameter specifies the number of latest non-current versions to be retained. This parameter is available for non-current version expiration actions only.

**[`-non-curr-days` <integer>] - Number of Days after Which Non-current Versions will Be Deleted**

This parameter specifies the number of days after which non-current versions can be deleted. This parameter is available for non-current version expiration actions only.

**[`-after-initiation-days` <integer>] - Number of Days of Initiation, After Which Upload Can Be Aborted }**

This parameter specifies the number of days of initiation, after which uploads can be aborted. This parameter is available for abort-incomplete multipart upload actions only.

## Examples

The following example modifies an object store server bucket lifecycle management rule for Vserver `vs1` and bucket `bucket1` which specifies expiration action on a set of objects.

```
cluster1::> vsserver object-store-server bucket lifecycle-management-rule
modify -vsserver vs1 -bucket bucket1 -rule-id rule1 -index 1 -obj-age-days
200"
```

## vsserver object-store-server bucket lifecycle-management-rule show

Show the lifecycle management rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server bucket lifecycle-management-rule show` command displays information about lifecycle management rules. If no parameters are specified, the command displays the following information about all lifecycle management rule:

- Vserver name
- Bucket name
- Lifecycle Management rule identifier
- Lifecycle Management rule index
- Action

- Enabled

To display detailed information about a single lifecycle management rule, run the command with the `-vserver` `-bucket-rule-id` and `-index` parameters. The detailed view provides all of the information in the default list and the following additional information:

- Link-id
- Prefix to be matched with object names
- Tags
- Minimum size of the object
- Maximum size of the object
- Lifecycle Management Rule Action
- Number of days since creation after which objects can be deleted
- Specific Date when the objects should expire cleanup object delete markers
- Number of latest non-current versions to be retained
- Number of days after which non-current versions will be deleted
- Number of days of initiation after which upload can be aborted

To display detailed information about all lifecycle management rules, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about lifecycle management rules with a specified rule identifier, run the command with the `-rule-id` specified rule identifier parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command only displays information about all lifecycle management rule entries.

**[-vserver <Vserver Name>] - Vserver Name**

If this parameter is specified, the command only displays information about all lifecycle management rule entries on the specified vservers.

**[-bucket <TextNoCase>] - Object Store Server Bucket Name**

If this parameter is specified, the command only displays information about all lifecycle management rule entries on the specified bucket.

**[-rule-id <text>] - Lifecycle Management Rule Identifier**

If this parameter is specified, the command only displays information about all lifecycle management rule entries with the specified rule identifier.

#### **[`-index <integer>`] - Lifecycle Management Rule Index**

If this parameter is specified, the command only displays information about all lifecycle management rule entries with the specified index.

#### **[`-is-enabled {true|false}`] - Is This Rule Enabled?**

If this parameter is specified, the command only displays information about lifecycle management rules that are enabled (true) or disabled (false).

#### **[`-prefix <text>`] - Prefix to be Matched with Object Names**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified prefix.

#### **[`-tags <text>,...`] - Tags in Format `<tag>` or `<tag=value>`**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified tags.

#### **[`-obj-size-greater-than {<integer>[KB|MB|GB|TB|PB]}`] - Min Size of the Object**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified object greater than size.

#### **[`-obj-size-less-than {<integer>[KB|MB|GB|TB|PB]}`] - Max Size of the Object**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified object lesser than size.

#### **[`-action`**

**{`Expiration|NoncurrentVersionExpiration|AbortIncompleteMultipartUpload|ExpirationInternal`}] - Lifecycle Management Action**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified action.

#### **[`-obj-age-days <integer>`] - Number of Days since Creation, After Which Current Version of Objects Can be Deleted**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified number of days since creation, after which objects can be deleted.

#### **[`-obj-exp-date <MM/DD/YYYY HH:MM:SS>`] - Specific Date When the Objects Should Expire**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified date from when objects can expire.

#### **[`-expired-obj-del-marker {true|false}`] - Cleanup Object Delete Markers**

If this parameter is specified, the command only displays information about lifecycle management rules that have delete markers enabled (true) or disabled (false).

#### **[`-new-non-curr-versions <integer>`] - Number of Latest Non-current Versions to Be Retained**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified non current versions to be allowed.

#### **[`-non-curr-days <integer>`] - Number of Days after Which Non-current Versions will Be Deleted**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified number of days after which non-current versions can be deleted.

**[-after-initiation-days <integer>] - Number of Days of Initiation, After Which Upload Can Be Aborted**

If this parameter is specified, the command only displays information about lifecycle management rules with the specified number of days of initiation, after which uploads can be aborted.

**Examples**

The following example displays object store server bucket lifecycle management rule entries for all Vservers.

```
cluster1::> vserver object-store-server bucket lifecycle-management-rule
show
Vserver  Bucket    Rule-identifier Action-identifier Action
Enabled
-----
vs1      bucket1   rule1          1              Expiration    true
vs1      bucket1   rule2          1
AbortIncompleteMultipartUpload true
vs1      bucket2   rule1          1              Expiration    true
vs1      bucket2   rule2          1
AbortIncompleteMultipartUpload true
vs1      bucket3   rule1          1              Expiration    true
vs1      bucket3   rule2          1
AbortIncompleteMultipartUpload true
vs2      bucket4   rule1          1              Expiration    true
vs2      bucket4   rule2          1
AbortIncompleteMultipartUpload true
vs2      bucket5   rule1          1              Expiration    true
vs2      bucket5   rule2          1
AbortIncompleteMultipartUpload true
10 entries were displayed.
```

The following example displays detailed information about a lifecycle management rule on bucket bucket1 on a Vserver named vs1 with rule identifier rule1 and index 1:

```
cluster1::*> vserver object-store-server bucket lifecycle-management-rule
show -vserver vs1 -bucket bucket1 -rule-id rule1 -index 1
```

```
-----
                                Vserver: vs1
                Object Store Server Bucket Name: bucket1
        Lifecycle Management Rule Identifier: rule1
                Lifecycle Management Rule Index: 1
Link-id from the Fabriclink Links Table: 4
                Is This Rule Enabled?: true
        Prefix to Be Matched with Object Names: obj1/
                                Tags in Format: -
                Minimum Size of the Object: -
                Maximum Size of the Object: -
        Lifecycle Management Rule Action: Expiration
Number of Days Since Creation After Which
                Objects Can Be Deleted: 100
Specific Date When the Objects Should Expire: -
                Cleanup Object Delete Markers: -
Number of Latest Non-current Versions to be
                Retained: -
        Number of Days after Which Non-current
                Versions will Be Deleted: -
Number of Days of Initiation After Which
                Upload Can Be Aborted: -
```

## vserver object-store-server bucket policy-statement-condition create

Create a bucket policy statement condition

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver object-store-server bucket policy-statement-condition create` command creates a single condition for a bucket policy statement in an object store server bucket.

### Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the name of the Vserver on which the bucket policy statement condition needs to be created for the object store server bucket.

**-bucket <TextNoCase> - Object Store Server Bucket Name (privilege: advanced)**

This parameter specifies the name of the object store server bucket for which the policy statement condition needs to be created. The object store bucket must already exist.

**-index <integer> - Statement Index (privilege: advanced)**

This parameter specifies the index of the object store server bucket policy statement in which a condition needs to be created. The index must already exist.

**-operator {ip-address|not-ip-address|string-equals|string-not-equals|string-equals-ignore-case|string-not-equals-ignore-case|string-like|string-not-like|numeric-equals|numeric-not-equals|numeric-greater-than|numeric-greater-than-equals|numeric-less-than|numeric-less-than-equals} - Policy Condition Operator (privilege: advanced)**

This parameter specifies the condition operator to be applied on the condition keys specified.

**[-source-ips <IP Address or Subnet>,...] - List of IP Addresses with Access Allowed or Denied (privilege: advanced)**

Use this parameter to specify a list of IP addresses for which the access is allowed or denied based on the operator specified.

**[-usernames <text>,...] - List of Usernames with Access Allowed or Denied (privilege: advanced)**

Use this parameter to specify a list of object store server users for which the access is allowed or denied based on the operator specified. The user name policy variables '\${aws:username}' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

**[-prefixes <text>,...] - List of Prefixes to be Matched (privilege: advanced)**

Use this parameter to specify a list of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified. The user name policy variables '\${aws:username}' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

**[-max-keys <integer>,...] - List of Maximum Keys Allowed to be Fetched (privilege: advanced)**

Use this parameter to specify a list of max-keys values that are allowed or denied retrieval using an S3 list operation, based on the condition operator specified.

**[-delimiters <text>,...] - List of Delimiters to be Matched (privilege: advanced)**

Use this parameter to specify a list of delimiters that are compared with the input delimiter value specified at the time of execution of an S3-based command, using the condition operator specified. The user name policy variables '\${aws:username}' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

## Examples

The following example creates an object store server bucket policy statement condition for storage virtual machine (SVM) vs1, bucket bucket1, index 1 and ip-address as operator.

```
cluster1::*> vsserver object-store-server bucket policy-statement-condition
create -vsserver vs1 -bucket bucket1 -index 1 -operator ip-address -source
-ips 10.1.1.0/24,10.1.1.1
```

The following example creates an object store server bucket policy statement condition for storage virtual machine (SVM) vs1, bucket bucket1, index 1, string-like as operator and prefix with the user name policy variable.

```
cluster1::*> vserver object-store-server bucket policy-statement-condition
create -vserver vs1 -bucket bucket1 -index 1 -operator string-like
-prefixes ${aws:username}/*
```

The following example creates an object store server bucket policy statement condition for storage virtual machine (SVM) vs1, bucket bucket1, index 1, string-like as operator and prefix with a specific folder name policy variable.

```
cluster1::*> vserver object-store-server bucket policy-statement-condition
create -vserver vs1 -bucket bucket1 -index 1 -operator string-like
-prefixes ${aws:username}/folder/*
```

## vserver object-store-server bucket policy-statement-condition delete

Delete a bucket policy statement condition

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver object-store-server bucket policy-statement-condition delete` command deletes a condition for the specified bucket policy statement belonging to the object store server bucket.

### Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the name of the Vserver for which a condition belonging to a particular bucket policy statement (which belongs to the object store server bucket) you want to delete.

**-bucket <TextNoCase> - Object Store Server Bucket Name (privilege: advanced)**

This parameter specifies the name of the object store server bucket for which a condition belonging to a particular bucket policy statement needs to be deleted.

**-index <integer> - Statement Index (privilege: advanced)**

This parameter specifies the index of the object store server bucket policy for which a condition needs to be deleted.

**-operator {ip-address|not-ip-address|string-equals|string-not-equals|string-equals-ignore-case|string-not-equals-ignore-case|string-like|string-not-like|numeric-equals|numeric-not-equals|numeric-greater-than|numeric-greater-than-equals|numeric-less-than|numeric-less-than-equals} - Policy Condition Operator (privilege: advanced)**

This parameter specifies the condition operator of a condition which needs to be deleted.

### Examples

The following example deletes an object store server bucket policy statement condition for Vserver vs1, bucket bucket1, index 1 and operator as IpAddress.

```
cluster1::*> vsserver object-store-server bucket policy-statement-condition
delete -vsserver vs1 -bucket bucket1 -index 1 -operator IpAddress
```

## vsserver object-store-server bucket policy-statement-condition modify

Modify a bucket policy statement condition

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vsserver object-store-server bucket policy-statement-condition modify` command modifies a single condition for a bucket policy statement in an object store server bucket.

### Parameters

**-vsserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the name of the Vserver on which the bucket policy statement condition needs to be modified for the object store server bucket.

**-bucket <TextNoCase> - Object Store Server Bucket Name (privilege: advanced)**

This parameter specifies the name of the object store server bucket for which the policy statement condition needs to be modified.

**-index <integer> - Statement Index (privilege: advanced)**

This parameter specifies the index of the object store server bucket policy statement in which a condition needs to be modified.

**-operator {ip-address|not-ip-address|string-equals|string-not-equals|string-equals-ignore-case|string-not-equals-ignore-case|string-like|string-not-like|numeric-equals|numeric-not-equals|numeric-greater-than|numeric-greater-than-equals|numeric-less-than|numeric-less-than-equals} - Policy Condition Operator (privilege: advanced)**

This parameter specifies the condition operator to be applied on the condition keys specified.

**[-source-ips <IP Address or Subnet>,...] - List of IP Addresses with Access Allowed or Denied (privilege: advanced)**

Use this parameter to specify a list of IP addresses for which the access is allowed or denied based on the operator specified.

**[-usernames <text>,...] - List of Usernames with Access Allowed or Denied (privilege: advanced)**

Use this parameter to specify a list of object store server users for which the access is allowed or denied based on the operator specified. The user name policy variables '`${aws:username}`' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

**[-prefixes <text>,...] - List of Prefixes to be Matched (privilege: advanced)**

Use this parameter to specify a list of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified. The user name policy variables '`${aws:username}`' can be specified here, serving as placeholders that are dynamically replaced

with the actual user name during run time based on the request context.

**[`-max-keys <integer>,...`] - List of Maximum Keys Allowed to be Fetched (privilege: advanced)**

Use this parameter to specify a list of max-keys values that are allowed or denied retrieval using an S3 list operation, based on the condition operator specified.

**[`-delimiters <text>,...`] - List of Delimiters to be Matched (privilege: advanced)**

Use this parameter to specify a list of delimiters that are compared with the input delimiter value specified at the time of execution of an S3-based command, using the condition operator specified. The user name policy variables '`${aws:username}`' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

## Examples

The following example modifies an object store server bucket policy statement condition for storage virtual machine (SVM) vs1, bucket bucket1, index 1 and ip-address as operator.

```
cluster1::*> vserver object-store-server bucket policy-statement-condition
modify -vserver vs1 -bucket bucket1 -index 1 -operator ip-address -source
-ips 10.1.0.0/16,10.1.1.1
```

The following example modifies an object store server bucket policy statement condition for storage virtual machine (SVM) vs1, bucket bucket1, index 1, string-like as operator and prefix with the user name policy variable.

```
cluster1::*> vserver object-store-server bucket policy-statement-condition
modify -vserver vs1 -bucket bucket1 -index 1 -operator string-like
-prefixes "${aws:username}/*"
```

## vserver object-store-server bucket policy-statement-condition show

Show the bucket policy condition

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver object-store-server bucket policy-statement-condition show` command displays information about object store server bucket policy condition.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**[`-instance`] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <Vserver Name>`] - Vserver Name (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions for the specified Vserver.

**[`-bucket <TextNoCase>`] - Object Store Server Bucket Name (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions for the specified bucket.

**[`-index <integer>`] - Statement Index (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions for the specified bucket policy index.

**[`-operator {ip-address|not-ip-address|string-equals|string-not-equals|string-equals-ignore-case|string-not-equals-ignore-case|string-like|string-not-like|numeric-equals|numeric-not-equals|numeric-greater-than|numeric-greater-than-equals|numeric-less-than|numeric-less-than-equals}`] - Policy Condition Operator (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified condition operator.

**[`-source-ips <IP Address or Subnet>,...`] - List of IP Addresses with Access Allowed or Denied (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified bucket policy condition source IP addresses.

**[`-usernames <text>,...`] - List of Usernames with Access Allowed or Denied (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified usernames.

**[`-prefixes <text>,...`] - List of Prefixes to be Matched (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified prefixes.

**[`-max-keys <integer>,...`] - List of Maximum Keys Allowed to be Fetched (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified max-keys.

**[`-delimiters <text>,...`] - List of Delimiters to be Matched (privilege: advanced)**

If you specify this parameter, the command displays information on the object store server bucket policy statement conditions that match the specified delimiters.

## Examples

The following example displays information on object store server bucket policy statement conditions for vs1, bucket bb1 and index 1:

```
cluster1::*> vserver object-store-server bucket policy-statement-condition
show -vserver vs1 -bucket bb1 -index 1
Vserver: vs1
Bucket: bb1
```

| Index      | Operator    | Source-IPs | Usernames | Prefixes | Max-Keys |
|------------|-------------|------------|-----------|----------|----------|
| Delimiters |             |            |           |          |          |
| 1          | ip-address  | 1.1.1.0/24 | -         | -        | - -      |
| 1          | string-like | -          | user1     | pref     | - delim1 |

2 entries were displayed.

## vserver object-store-server bucket policy statement create

### Create a bucket policy statement

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket policy statement create` command creates a bucket policy statement for the object store server bucket.

### Parameters

#### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the bucket policy statement needs to be created for the object store server bucket.

#### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which the policy statement needs to be created. The object store bucket must already exist.

#### **[-index <integer>] - Statement Index**

This parameter specifies the index of the object store server bucket policy statement. The allowed range is 1-10. This is an optional parameter.

#### **-effect {deny|allow} - Allow or Deny Access**

Use this parameter to specify whether access is allowed or denied when a user requests the specific action.

#### **[-action <Action>, ...] - Bucket Policy Action Allowed or Denied**

Use this parameter to specify resource operations. The set of resource operations that the object store server supports are GetObject, PutObject, DeleteObject, ListBucket, GetBucketAcl, GetObjectAcl, ListBucketMultipartUploads, ListMultipartUploadParts, GetObjectTagging, PutObjectTagging, DeleteObjectTagging, PutBucketPolicy, GetBucketPolicy, DeleteBucketPolicy, GetBucketLocation, GetBucketVersioning, PutBucketVersioning, and ListBucketVersions. Wildcards are accepted for this parameter.

### **[*-principal* <Objectstore Principal>,...] - List of Users to Be Allowed or Denied Access**

Validate the user requesting access against the object store server users or groups or NAS groups specified in this parameter. To gain access, the user in the context should either match one of the users or belong to one of the groups specified in this principle parameter. An object store server group is specified by adding a prefix "group/" to the group name. A NAS group is specified by adding a prefix "nasgroup/" to the group name.

### **[*-resource* <text>,...] - Bucket or Objects to Be Allowed or Denied Access**

Use this parameter to specify the bucket, folder, or object for which allow or deny permissions are set. The user name policy variables '{aws:username}' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

### **[*-sid* <SID>] - Statement Identifier**

This optional parameter specifies a text comment for the object store server bucket policy statement. Alpha numeric characters are allowed as values for this parameter.

## **Examples**

The following example creates an object store server bucket policy statement for storage virtual machine (SVM) vs1 and bucket1 which specifies allowed access to a readme folder for the object store server user user1.

```
cluster1::> vsserver object-store-server bucket policy statement create
-vserver vs1 -bucket bucket1 -effect allow -action
GetObject,PutObject,DeleteObject,ListBucket -principal
user1,group/group1,nasgroup/group2 -resource bucket1/readme/* -sid
"fullAccessToReadmeForUser1"
```

The following example creates an object store server bucket policy statement for storage virtual machine (SVM) vs1 and bucket1 which specifies allowed access to the corresponding user home directory by specifying the user name policy variable in the resource field.

```
cluster1::> vsserver object-store-server bucket policy statement create
-vserver vs1 -bucket bucket1 -effect allow -action * -principal *
-resource bucket1,bucket1/${aws:username}/* -sid
"fullAccessToUsersHomeDirectory"
```

## **vsserver object-store-server bucket policy statement delete**

Delete a bucket policy statement

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver object-store-server bucket policy statement delete` command deletes the bucket policy statement belonging to the object store server bucket.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver whose bucket policy statement (which belongs to the object store server bucket) you want to delete.

### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket whose policy needs to be deleted.

### **-index <integer> - Statement Index**

This parameter specifies the index of the object store server bucket policy.

## Examples

The following example deletes an object store server bucket policy statement with index 1 of Vserver vs1 and bucket bucket1.

```
cluster1::> vsriver object-store-server bucket policy statement delete
-vserver vs1 -bucket bucket1 -index 1
```

## vserver object-store-server bucket policy statement modify

### Modify a bucket policy statement

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server bucket policy statement modify` command modifies a bucket policy statement.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server bucket for which the bucket policy statement needs to be modified.

### **-bucket <TextNoCase> - Object Store Server Bucket Name**

This parameter specifies the name of the object store server bucket for which policy statement needs to be modified.

### **-index <integer> - Statement Index**

This parameter specifies the index of the object store server bucket policy statement.

### **[-effect {deny|allow}] - Allow or Deny Access**

Use this parameter to specify whether access is allowed or denied when a user requests the specific action.

### **[-action <Action>,...] - Bucket Policy Action Allowed or Denied**

Use this parameter to specify resource operations. The set of resource operations that the object store

server supports are GetObject, PutObject, DeleteObject, ListBucket, GetBucketAcl, GetObjectAcl, ListBucketMultipartUploads, ListMultipartUploadParts, GetObjectTagging, PutObjectTagging, DeleteObjectTagging, GetBucketLocation, PutBucketPolicy, GetBucketPolicy, DeleteBucketPolicy, GetBucketVersioning, PutBucketVersioning, and ListBucketVersions.

**[*-principal* <Objectstore Principal>,...] - List of Users to Be Allowed or Denied Access**

Validate the user requesting access against the object store server users or groups or NAS groups specified in this parameter. To gain access, the user in the context should either match one of the users or belong to one of the groups specified in this principle parameter. An object store server group is specified by adding a prefix "group/" to the group name. A NAS group is specified by adding a prefix "nasgroup/" to the group name.

**[*-resource* <text>,...] - Bucket or Objects to Be Allowed or Denied Access**

Use this parameter to specify the bucket, folder, or object for which allow or deny permissions are set. The user name policy variables '{aws:username}' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

**[*-sid* <SID>] - Statement Identifier**

This optional parameter specifies a text comment for the object store server bucket policy statement.

## Examples

The following example modifies an object store server bucket policy statement for storage virtual machine (SVM) vs1 and bucket1 which specifies allowed access to a readme folder for the object store server user user1.

```
cluster1::> vsserver object-store-server bucket policy statement modify
-vserver vs1 -bucket bucket1 -index 1 -effect allow -action
GetObject,PutObject,DeleteObject,ListBucket -principal user1 -resource
bucket1/readme/* -sid "fullAccessToReadmeForUser1"
```

The following example modifies an object store server bucket policy statement for storage virtual machine (SVM) and bucket1 which specifies allowed access to the corresponding user home directory by specifying the user name policy variable in the resource field.

```
cluster1::> vsserver object-store-server bucket policy statement modify
-vserver vs1 -bucket bucket1 -index 1 -effect allow -action * -principal *
-resource bucket1,bucket1/${aws:username}/* -sid
"fullAccessToUsersHomeDirectory"
```

## vsserver object-store-server bucket policy statement show

Show the bucket policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server bucket policy statement show` command displays information about object store server bucket policy.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server bucket policy statements for the specified Vserver.

**[-bucket <TextNoCase>] - Object Store Server Bucket Name**

If you specify this parameter, the command displays information on the object store server bucket policy statements for the specified bucket.

**[-index <integer>] - Statement Index**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified index.

**[-effect {deny|allow}] - Allow or Deny Access**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified effect.

**[-action <Action>,...] - Bucket Policy Action Allowed or Denied**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified action.

**[-principal <Objectstore Principal>,...] - List of Users to Be Allowed or Denied Access**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified bucket principal.

**[-resource <text>,...] - Bucket or Objects to Be Allowed or Denied Access**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified resource.

**[-sid <SID>] - Statement Identifier**

If you specify this parameter, the command displays information on the object store server bucket policy statements that match the specified sid.

## Examples

The following example displays information on object store server bucket policy statements for vserver vs1 and bucket bucket1:

```
cluster1::> vserver object-store-server bucket policy show -vserver vs1
-bucket bucket1
```

| Vserver | Bucket  | Index | Effect | Action                                                   | Principal | Resource             |
|---------|---------|-------|--------|----------------------------------------------------------|-----------|----------------------|
| vs1     | bucket1 | 1     | allow  | GetObject,<br>PutObject,<br>DeleteObject<br>, ListBucket | user1     | bucket1/<br>readme/* |
|         | bucket1 | 2     | allow  | GetObject                                                | user2     | bucket1/*            |

2 entries were displayed.

The following example displays detailed information of the object store server bucket policy statement associated with Vserver vs1 and bucket bucket1:

```
cluster1::> vserver object-store-server bucket policy show -vserver vs1
-bucket bucket1 -index 1
```

|           |                                     |
|-----------|-------------------------------------|
| Vserver   | :vs1                                |
| Bucket    | :bucket1                            |
| Index     | :1                                  |
| Effect    | :allow                              |
| Action    | :GetObject                          |
| Principal | :user-2                             |
| Resource  | :bucket1/readme/*                   |
| Sid       | :AllowAccessToUseruser1ForGetObject |

## vserver object-store-server bucket snapshot create

Create a snapshot for the S3 bucket.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket snapshot create` command creates a snapshot of a specified S3 bucket.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver that contains the S3 bucket for which the snapshot is to be created.

**-bucket <TextNoCase> - S3 Bucket Name**

This specifies the name of the S3 bucket where the snapshot is to be created.

### **-snapshot <TextNoCase> - Snapshot Name**

This specifies the name of the snapshot that is to be created.

### **[-foreground <true>] - Run Operation in the Foreground**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). If `true`, the command will wait until the operation is finished. If `false`, the command will return immediately and the operation will complete in the background.

## **Examples**

The following example creates a snapshot named `bucket-1-snap` on S3 bucket `bucket-1` on Vserver named `vs0`.

```
cluster1::> vs0 object-store-server bucket snapshot create -vserver  
vs0 -bucket bucket-1 -snapshot bucket-1-snap
```

## **vs0 object-store-server bucket snapshot delete**

Delete a snapshot for the S3 bucket.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vs0 object-store-server bucket snapshot delete` command deletes a snapshot from a specified S3 bucket.

## **Parameters**

### **-vserver <vserver name> - Vserver**

This specifies the name of the Vserver that contains the S3 bucket for from which the snapshot will be deleted.

### **-bucket <TextNoCase> - S3 Bucket Name**

This specifies the name of the S3 bucket for from which the snapshot will be deleted.

### **-snapshot <TextNoCase> - Snapshot Name**

This specifies the name of the snapshot that is to be deleted.

### **[-foreground <true>] - Run Operation in the Foreground**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). If `true`, the command will wait until the operation is finished. If `false`, the command will return immediately and the operation will complete in the background.

## **Examples**

The following example deletes a snapshot named `bucket-1-snap` on S3 bucket named `bucket-1` on Vserver named `vs0`.

```
cluster1::> vserver object-store-server bucket snapshot delete -vserver
vs0 -bucket bucket-1 -snapshot bucket-1-snap
```

## vserver object-store-server bucket snapshot show

Display a list of snapshots associated with the S3 bucket.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server bucket snapshot show` command displays information about snapshots created for S3 buckets.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the snapshots located for the specified Vserver.

**[-bucket <TextNoCase>] - S3 Bucket Name**

If you specify this parameter, the command displays information only about the snapshots located for the specified S3 buckets.

**[-snapshot <TextNoCase>] - Snapshot Name**

If you specify this parameter, the command displays information only snapshots matching the specified name.

**[-create-time <Date>] - Snapshot Creation Time**

If this parameter is specified, the command displays information only for the snapshots that match the specified creation time. The create time format is `<day> <month> <day of month> <hour>:<min>:<sec> <year>`.

**[-instance-uuid <UUID>] - Snapshot Instance UUID**

If this parameter is specified, the command displays information only for the snapshots that have the specified instance UUID.

### Examples

The following example displays information for all snapshots associated with Vserver vs0.

```
cluster1::> vsriver object-store-server bucket snapshot show
Vserver   Bucket      Snapshot                                Create Time
-----
vs0       bucket      snap1                                Wed May 15 19:47:04
2024
vs0       bucket      snap2                                Thu May 16 03:21:26
2024
vs0       bucket      snap3                                Thu May 16 17:02:03
2024
3 entries were displayed.
```

The following example displays detailed information of the snapshots associated with Vserver vs0:

```
cluster1::> vsriver object-store-server bucket snapshot show -instance
Vserver Name: vs0
    Bucket Name: bucket
    Snapshot Name: snap1
    Create Time: Wed May 15 19:47:04 2024
    Instance Uuid: 1639d804-5245-4a64-af89-093891b251a1
Vserver Name: vs0
    Bucket Name: bucket
    Snapshot Name: snap2
    Create Time: Thu May 16 03:21:26 2024
    Instance Uuid: dec5daf6-28f8-4eef-89f7-a9256de17d86
Vserver Name: vs0
    Bucket Name: bucket
    Snapshot Name: snap3
    Create Time: Thu May 16 17:02:03 2024
    Instance Uuid: aeed7372-a16f-4aad-8e23-708267a109fb
3 entries were displayed.
```

The following example displays information for all snapshots created at or after "Thu May 16 03:21:26 2024":

```
cluster1::> vsserver object-store-server bucket snapshot show -create-time
>="Thu May 16 03:21:26 2024"
Vserver   Bucket      Snapshot                                Create Time
-----
vs0       bucket      snap2                                Thu May 16 03:21:26
2024
vs0       bucket      snap3                                Thu May 16 17:02:03
2024
2 entries were displayed.
```

## vsserver object-store-server group create

### Create an Object Store Server Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver object-store-server group create` command creates an object store group.

#### Parameters

##### **-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which to create the object store group. The Vserver must already exist.

##### **-gid <integer> - Group ID**

This parameter specifies a unique ID used to identify a particular object store group.

##### **-name <TextNoCase> - Group Name**

This parameter specifies the name of the object store group.

##### **[-users <TextNoCase>, ...] - List of Users Belonging to the Group**

Use this parameter to specify the list of object store users who belong to the object store group.

##### **[-policies <TextNoCase>, ...] - List of Policies Attached to the Group**

Use this parameter to specify the list of object store policies that are attached to the object store group.

##### **[-comment <text>] - Group Description**

This optional parameter specifies a text comment for the object store group.

#### Examples

The following example creates an object store group named `user_group` for Vserver `vs1`:

```
cluster1::> vsserver object-store-server group create -vsserver vs1 -name
user_group -users user1,user2 -policies policy1,policy2 -comment
"UserGroup1"
```

## vsserver object-store-server group delete

### Delete an Object Store Server Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver object-store-server group delete` command deletes an object store group.

#### Parameters

**-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server you want to delete.

**-gid <integer> - Group ID**

This parameter specifies the ID of the object store group you want to delete.

#### Examples

The following example deletes an object store group for Vserver vs1:

```
cluster1::> vsserver object-store-server group delete -vsserver vs1 -gid 1
```

## vsserver object-store-server group modify

### Modify an Object Store Server Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver object-store-server group modify` command modifies an object store group.

#### Parameters

**-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store group which you want to modify.

**-gid <integer> - Group ID**

This parameter specifies the ID of the object store group.

**[`-name` <TextNoCase>] - Group Name**

This parameter specifies the name of the object store group.

**[`-users` <TextNoCase>,...] - List of Users Belonging to the Group**

Use this parameter to specify the list of object store users who belong to the object store group.

**[`-policies` <TextNoCase>,...] - List of Policies Attached to the Group**

Use this parameter to specify the list of object store policies that are attached to the object store group.

**[`-comment` <text>] - Group Description**

This parameter specifies the text comment for the object store group.

**Examples**

The following example modifies the comment of the object store group for Vserver vs1:

```
cluster1::> vsserver object-store-server group modify -vsserver vs1 -gid 3
-comment "UserGroup"
```

**vsserver object-store-server group show****Display Object Store Server Groups**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vsserver object-store-server group show` command displays information about the object store group.

**Parameters**

**{ [`-fields` <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vsserver` <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server groups for the specified Vserver.

**[`-gid` <integer>] - Group ID**

If you specify this parameter, the command displays information on the object store server group that match the specified group ID.

### **[*-name* <TextNoCase>] - Group Name**

If you specify this parameter, the command displays information on the object store server groups that match the specified group name.

### **[*-users* <TextNoCase>, ...] - List of Users Belonging to the Group**

If you specify this parameter, the command displays information on the object store server groups that match the specified user.

### **[*-policies* <TextNoCase>, ...] - List of Policies Attached to the Group**

If you specify this parameter, the command displays information on the object store server groups that match the specified policy.

### **[*-comment* <text>] - Group Description**

If you specify this parameter, the command displays information on the object store server groups that match the specified comment.

## **Examples**

The following example displays information for all object store groups in admin privilege:

```
cluster1::> vserver object-store-server group show
Vserver      Group ID  Group Name      Users              Policies
-----
vs1           3  UserGroup      user1, user2      policy1, policy2
  Comment: User_Privileges
vs1           4  AdminGroup     admin1, admin2    policy1, policy2
  Comment: Admin_Privileges
  2 entries were displayed.
```

The following example displays information for a particular object store group associated with vserver vs1:

```
cluster1::> vserver object-store-server group show -vserver vs1 -gid 5
Vserver Name      :vs1
  Group ID        :5
  Group Name      :User-Group
  Users           :user_1, user_2
  Policies        :Policy1, Policy2, Policy3
  Comment         :User group
```

## **vserver object-store-server policy create**

Create a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server policy create` command creates an object store policy.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which to create the object store policy. The Vserver must already exist.

### **-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store policy.

### **[-comment <text>] - Comment**

This optional parameter specifies a text comment for the object store policy.

## Examples

The following example creates an object store policy named `Policy_1` for Vserver `vs1`:

```
cluster1::> vserver object-store-server policy create -vserver vs1 -policy
Policy_1 -comment "ReadAccessForBucket1"
```

## vserver object-store-server policy delete

### Delete a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server policy delete` command deletes an object store policy.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server you want to delete.

### **-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store policy you want to delete.

## Examples

The following example deletes an object store policy for Vserver `vs1`:

```
cluster1::>vserver object-store-server policy delete -vserver vs1 -policy
Policy_2
```

## vserver object-store-server policy modify

Modify a policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server policy modify` command modifies an object store policy.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store policy you want to modify.

**-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store policy.

**[-comment <text>] - Comment**

This parameter specifies the text comment for the object store policy.

### Examples

The following example modifies the comment of the object store policy for Vserver vs1:

```
cluster1::> vserver object-store-server policy modify -policy Policy_1
-comment "Read_Access_for_Bucket2"
```

## vserver object-store-server policy show

Show the policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server policy show` command displays information about the object store policy.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server policies for the specified Vserver.

### **[-policy <TextNoCase>] - Policy Name**

If you specify this parameter, the command displays information on the object store server policies that match the specified policy name.

### **[-is-read-only {true|false}] - Is Read-Only?**

If you specify this parameter, the command displays information on the object store server policies that match the specified read only field.

### **[-comment <text>] - Comment**

If you specify this parameter, the command displays information on the object store server policies that match the specified comment.

## **Examples**

The following example displays information for all object store policies in admin privilege:

```
cluster1::> vsriver object-store-server policy show
  Vserver      Name                Is Read-Only Comment
  -----
  vs1          FullAccess          true          Read Only Policy: To allow
full access to S3 resources
  vs1          NoS3Access          true          Read Only Policy: To deny
access to all S3 resources
  vs1          Policy_1            false         Read_access_for_bucket1
  vs1          Policy_2            false         Read_access_for_bucket2
  vs1          ReadOnlyAccess      true          Read Only Policy: To allow
read-only access to S3 resources
  5 entries were displayed.
```

The following example displays information for a particular object store policy associated with Vserver vs1:

```
cluster1::> vsriver object-store-server policy show -policy Policy_1
  Vserver      Name                Is Read-Only Comment
  -----
  vs1          Policy_1            false         Read_access_for_bucket1
```

## **vsriver object-store-server policy statement create**

### **Create a Policy Statement**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server policy statement create` command creates a policy statement for the object store server policy.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the policy statement needs to be created for the object store server policy.

### **-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store server policy for which the policy statement needs to be created. The object store policy must already exist.

### **-index <integer> - Statement Index**

This parameter specifies the unique index used to identify the particular object store server policy statement.

### **-effect {deny|allow} - Allow or Deny Access**

Use this parameter to specify whether or not access is allowed or denied when a user requests a specific action.

### **-actions <Action>, ... - Policy Actions**

Use this parameter to specify resource operations. The set of resource operations that the object store server supports are `GetObject`, `PutObject`, `DeleteObject`, `ListBucket`, `GetBucketAcl`, `GetObjectAcl`, `ListAllMyBuckets`, `ListBucketMultipartUploads`, `ListMultipartUploadParts`, `GetObjectTagging`, `PutObjectTagging`, `DeleteObjectTagging`, `CreateBucket`, `DeleteBucket`, `GetBucketLocation`, `GetBucketVersioning`, `PutBucketVersioning`, and `ListBucketVersions`. Wildcards are accepted for this parameter. If all operations must be specified, then use the wildcard character `*` to specify it. The default actions are `GetObject`, `PutObject`, `DeleteObject`, `ListBucket`, `GetBucketAcl`, `GetObjectAcl`, `ListBucketMultipartUploads`, `ListMultipartUploadParts`, `GetObjectTagging`, `PutObjectTagging`, `DeleteObjectTagging`, `GetBucketLocation`, `PutBucketPolicy`, `GetBucketPolicy`, `DeleteBucketPolicy`, `GetBucketVersioning`, `PutBucketVersioning`, and `ListBucketVersions`.

### **-resource <text>, ... - Buckets or Objects**

Use this parameter to specify the bucket, folder, or object for which allow or deny permissions are set. The user name policy variables `'${aws:username}'` can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

### **[-sid <SID>] - Statement Identifier**

This optional parameter specifies a text comment for the object store server policy statement. The parameter name "sid" refers to statement identifier.

## Examples

The following example creates an object store server policy statement for storage virtual machine (SVM) vs1 and Policy\_1 which specifies allowed access to bucket1 resources.

```
cluster1::> vsserver object-store-server policy statement create -vsserver
vs1 -policy Policy_1 -effect allow -actions
GetObject,PutObject,DeleteObject,ListBucket,GetBucketAcl,GetObjectAcl,List
AllMyBuckets,GetBucketLocation -resource bucket1/* -sid
"FullAccessToBucket1"
```

The following example creates an object store server policy statement for storage virtual machine (SVM) vs1 and Policy\_1 which specifies allowed access to the corresponding user home directory by specifying the user name policy variable in the resource field.

```
cluster1::> vsserver object-store-server policy statement create -vsserver
vs1 -policy Policy_1 -effect allow -actions * -resource
bucket1,bucket1/${aws:username}/* -sid "fullAccessToUsersHomeDirectory"
```

## vsserver object-store-server policy statement delete

### Delete a Policy Statement

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server policy statement delete` command deletes the policy statement belonging to the object store server policy.

### Parameters

**-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver whose policy statement you want to delete.

**-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store server policy whose policy statement needs to be deleted.

**-index <integer> - Statement Index**

This parameter specifies the index of the object store server policy statement.

### Examples

The following example deletes an object store server policy statement with index 1 of Vserver vs1 and policy Policy\_1.

```
cluster1::> vsserver object-store-server policy statement delete -vsserver
vs1 -policy Policy_1 -index 1
```

## vserver object-store-server policy statement modify

### Modify a Policy Statement

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver object-store-server policy statement modify` command modifies a policy statement.

#### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server policy for which the policy statement needs to be modified.

**-policy <TextNoCase> - Policy Name**

This parameter specifies the name of the object store server policy for the policy statement that needs to be modified.

**-index <integer> - Statement Index**

This parameter specifies the index of the object store server policy statement.

**[-effect {deny|allow}] - Allow or Deny Access**

Use this parameter to specify whether or not access is allowed or denied when a user requests a specific action.

**[-actions <Action>,...] - Policy Actions**

Use this parameter to specify resource operations. The set of resource operations that the object store server supports are `GetObject`, `PutObject`, `DeleteObject`, `ListBucket`, `GetBucketAcl`, `GetObjectAcl`, `ListAllMyBuckets`, `ListBucketMultipartUploads`, `ListMultipartUploadParts`, `GetObjectTagging`, `PutObjectTagging`, `DeleteObjectTagging`, `CreateBucket`, `DeleteBucket`, `GetBucketLocation`, `PutBucketPolicy`, `GetBucketPolicy`, `DeleteBucketPolicy`, `GetBucketVersioning` and `PutBucketVersioning`.

**[-resource <text>,...] - Buckets or Objects**

Use this parameter to specify the bucket, folder, or object for which allow or deny permissions are set. The user name policy variables '`${aws:username}`' can be specified here, serving as placeholders that are dynamically replaced with the actual user name during run time based on the request context.

**[-sid <SID>] - Statement Identifier**

This optional parameter specifies a text comment for the object store server policy statement.

#### Examples

The following example modifies an object store server policy statement for storage virtual machine (SVM) `vs1` and `Policy_1` which specifies allowed access to `bucket1` resources.

```
cluster1::> vserver object-store-server policy statement modify -vserver
vs1 -policy Policy_1 -index 5 -effect allow -actions
GetObject,PutObject,DeleteObject,ListBucket,GetBucketAcl,GetObjectAcl,List
AllMyBuckets,GetBucketLocation -resource bucket1/* -sid
FullAccesToBucket1Resources
```

The following example modifies an object store server policy statement for storage virtual machine (SVM) vs1 and Policy\_1 which specifies allowed access to the corresponding user home directory by specifying the user name policy variable in the resource field.

```
cluster1::> vserver object-store-server policy statement modify -vserver
vs1 -policy Policy_1 -index 5 -effect allow -actions * -resource
bucket1,bucket1/${aws:username}/* -sid "fullAccessToUsersHomeDirectory"
```

## vserver object-store-server policy statement show

### Show Policy Statements

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server policy statement show` command displays information about object store server policy statements.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information on the object store server policy statements for the specified Vserver.

**[-policy <TextNoCase>] - Policy Name**

If you specify this parameter, the command displays information on the object store server policy statements for the specified policy.

**[-index <integer>] - Statement Index**

If you specify this parameter, the command displays information on the object store server policy statements that match the specified index.

**[*-effect* {deny|allow}] - Allow or Deny Access**

If you specify this parameter, the command displays information on the object store server policy statements that match the specified effect.

**[*-actions* <Action>,...] - Policy Actions**

If you specify this parameter, the command displays information on the object store server policy statements that match the specified action.

**[*-resource* <text>,...] - Buckets or Objects**

If you specify this parameter, the command displays information on the object store server policy statements that match the specified resource.

**[*-sid* <SID>] - Statement Identifier**

If you specify this parameter, the command displays information on the object store server policy statements that match the specified sid.

**Examples**

The following example displays information on object store server policy statements for Vserver vs1 and policy Policy\_1:

```
cluster1::> vsserver object-store-server policy statement show -vserver vs1
-policy Policy_1
Vserver      Policy      Index  Effect  Actions      Resources
-----
vs1
      Policy_1      1  allow  ListBucket      *
      Policy_1      5  allow  GetObject,      bucket1/*
                                PutObject,
                                DeleteObject,
                                ListBucket,
                                GetBucketAcl,
                                GetObjectAcl,
                                ListAllMyBuckets

      Sid: FullAccesToBucket1
2 entries were displayed.
```

The following example displays detailed information of the object store server policy statement associated with Vserver vs1 and policy Policy\_1:

```
cluster1::> vsserver object-store-server policy statement show -vsserver vs1
-policy Policy_1 -index 5
Vserver: vs1
  Policy: Policy_1
  Index: 5
  Effect: allow
  Actions: GetObject, PutObject, DeleteObject, ListBucket,
GetObjectAcl, GetObjectAcl, ListAllMyBuckets
  Resource: bucket1/*
  Sid: FullAccesToBucket1
```

## vsserver object-store-server user create

Create an object store server user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server user create` command creates an object store user. This will generate an access-key and a secret-key to be used for aws v4 authentication. The user keys generated will be shown as part of the response of this command. Note that the secret-key is not retrievable and should be noted down. It will not be shown as part of the [vsserver object-store-server user show](#) command. If the secret-key is lost, the user keys will need to be regenerated.

### Parameters

#### **-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which to create the object store user. The Vserver must already exist.

#### **-user <TextNoCase> - Object Store Server User Name**

This parameter specifies the name of the object store user. If user is a part of Active Directory, user must be specified in User Principal Name (UPN) format.

#### **[-comment <text>] - Object Store Server User Description**

This optional parameter specifies a text comment for the object store user.

#### **[-access-key <text>] - Access Key for the Object Store Server User**

This optional parameter specifies the access key for the object store user.

#### **[-secret-key <text>] - Secret Key for the Object Store Server User**

This optional parameter specifies the secret key for the object store user.

#### **[-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P<integer>W}] - Time Period After Which User Keys Expire**

This optional parameter specifies a time period after which the object store user keys expire and are no longer valid. If the value specified is zero or no value is specified, then the user keys will not expire.

## Examples

The following example creates an object store user user1 for Vserver vs1.

```
cluster1::> vsserver object-store-server user create -vserver vs1 -user
user1

Vserver: vs1
User: user1
Access Key: DUMMY_ACCESS_KEY_123
Secret Key: dummy_secret_key_1234_abcd__lkfj
Warning: The secret key won't be displayed
again. Save this key for future use.
```

The following example creates an object store user user1, with the specified keys, for Vserver vs1.

```
cluster1::> vsserver object-store-server user create -vserver vs1 -user
user1 -access-key DUMMY_ACCESS_KEY_123 -secret-key
dummy_secret_key_1234_abcd__lkfj

Vserver: vs1
User: user1
Access Key: DUMMY_ACCESS_KEY_123
Secret Key: dummy_secret_key_1234_abcd__lkfj
Warning: The secret key won't be displayed
again. Save this key for future use.
```

The following example creates an object store user user1, for Vserver vs1, where user1 is a member of active directory.

```
cluster1::> vsserver object-store-server user create -vserver vs1 -user
user1@domain1.com -access-key DUMMY_ACCESS_KEY_123 -secret-key
dummy_secret_key_1234_abcd__lkfj

Vserver: vs1
User: user1@domain1.com
Access Key: DUMMY_ACCESS_KEY_123
Secret Key: dummy_secret_key_1234_abcd__lkfj
Warning: The secret key won't be displayed
again. Save this key for future use.
```

## vsserver object-store-server user delete-keys

Delete keys for an object store user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server user delete-keys` command deletes the access-key and secret-key for an object store user. To regenerate the keys for the user again, use the [vserver object-store-server user regenerate-keys](#) command.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the SVM on which the keys should be deleted for the object store user. The object store user must already exist.

### **-user <TextNoCase> - Object Store Server User Name**

This parameter specifies the name of the object store user.

## Examples

The following example deletes the keys for object store user for the SVM vs1.

```
cluster1::> vserver object-store-server user delete-keys -vserver vs1
-user user1
```

## Related Links

- [vserver object-store-server user regenerate-keys](#)

## vserver object-store-server user delete

Delete an object store server user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver object-store-server user delete` command deletes an object store user.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver for the object store server you want to delete.

### **-user <TextNoCase> - Object Store Server User Name**

This parameter specifies the name of the object store user you want to delete.

## Examples

The following example deletes an object store user for Vserver vs1.

```
cluster1::> vsserver object-store-server user delete -vsserver vs1 -user
user1
```

## vsserver object-store-server user modify

Modify an object store server user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server user modify` command modifies an object store user.

### Parameters

**-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the SVM for the object store user which you want to modify.

**-user <TextNoCase> - Object Store Server User Name**

This parameter specifies the name of the object store user.

**[-comment <text>] - Object Store Server User Description**

This parameter specifies the text comment for the object store user.

### Examples

The following example modifies the object store user for the SVM vs1:

```
cluster1::> vsserver object-store-server user modify -vsserver vs1 -user
user1 -comment testuser --key-time-to-live 1h20m
```

## vsserver object-store-server user regenerate-keys

Regenerate keys for object store user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver object-store-server user regenerate-keys` command regenerates a new access-key and secret-key for an object store user. The user keys generated will be shown as part of the command response. Note that the secret-key is not retrievable and should be noted down. It will not be shown as part of the [vsserver object-store-server user show](#) command. If the secret-key is lost, the user keys will need to be regenerated.

### Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the name of the Vserver on which the keys should be generated for the object store user. The object store user must already exist.

### **-user <TextNoCase> - Object Store Server User Name**

This parameter specifies the name of the object store user.

### **[-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}] - Time Period after Which User Keys Expire**

This optional parameter specifies a time period after which the object store user keys expire and are no longer valid. If the value specified is zero, then the user keys will not expire.

### **[-access-key <text>] - Access Key for the Object Store User**

This optional parameter specifies the access key for the object store user.

### **[-secret-key <text>] - Secret Key for the Object Store User**

This optional parameter specifies the secret key for the object store user.

## **Examples**

The following example regenerates the keys for object store user for Vserver vs1.

```
cluster1::> vsserver object-store-server user regenerate-keys -vserver vs1
-user user1

Vserver: vs1
User: user1
Access Key: DUMMY_ACCESS_KEY_123
Secret Key: dummy_secret_key_1234_abcd__lkfj
Warning: The secret key won't be displayed
again. Save this key for future use.
```

The following example sets the new keys, that are passed from the input, for object store user for Vserver vs1.

```
cluster1::> vsserver object-store-server user regenerate-keys -vserver vs1
-user user1 -access-key DUMMY_ACCESS_KEY_123 -secret-key
dummy_secret_key_1234_abcd__lkfj

Vserver: vs1
User: user1
Access Key: DUMMY_ACCESS_KEY_123
Secret Key: dummy_secret_key_1234_abcd__lkfj
Warning: The secret key won't be displayed
again. Save this key for future use.
```

- [vsserver object-store-server user show](#)

## vserver object-store-server user show

Display object store server users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver object-store-server user show` command displays information about the object store user. The user secret-key will not be shown as part of the response. It is shown only when user is created or user keys are regenerated.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

If you specify this parameter, the command displays information only about the object store users for the specified SVM.

**[-user <TextNoCase>] - Object Store Server User Name**

If you specify this parameter, the command displays information only for object store users that match the specified object store user name.

**[-id <integer>] - Object Store Server User ID**

If you specify this parameter, the command displays information only for object store users that match the specified user id.

**[-comment <text>] - Object Store Server User Description**

If you specify this parameter, the command displays information only for object store users that match the specified comment field.

**[-access-key <text>] - Access Key for the Object Store Server User**

If you specify this parameter, the command displays information only for object store users that match the specified access key.

**[-key-time-to-live {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P<integer>W}] - Time Period After Which User Keys Expire**

If you specify this parameter, the command displays information only for object store users that match the specified key time to live value.

**[-key-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Date And Time When User Keys Expire**

If you specify this parameter, the command displays information only for object store users that match the specified key expiry date value.

## Examples

The following example displays information of all object store users in admin privilege:

```
cluster1::> vservers object-store-server user show
Vserver      User              ID      Key Time To Live Key Expiry Time
-----
vs1          user1             1       1h                2/6/2023
13:28:50
  Comment: testuser
vs1          user2             2       -                 -
vs1          user@domain1.com  3       -                 -
2 entries were displayed.
```

The following example displays information of a particular object store user associated with the SVM vs1 in admin privilege:

```
cluster1::> vservers object-store-server user show -vservers vs1 -user user1
Vserver Name: vs1
Object Store Server User Name: user1
Object Store Server User ID: 1
Object Store Server User Description: testuser
Access Key for the Object Store Server User: 5HBRV20PWWX7IIHKYRRN
Time Period After Which User Keys Expire: 1h
Date And Time When User Keys Expire: 2/6/2023 13:28:50
```

The following example displays information of all object store users in advanced privilege:

```
cluster1::*> vservers object-store-server user show
Vserver      User              ID      Key Time To Live Key Expiry Time
-----
vs1          root             0       -                 -
Access Key: -
  Comment: Root User
vs1          user2            2       99999h0m0s        7/6/2034 23:40:54
Access Key: 2K4PL22JQV5L2WA564TB
  Comment:
2 entries were displayed.
```

The following example displays information of a particular object store user associated with the SVM vs1 in advanced privilege. Note that user secret key is not shown as part of this command:

```
cluster1::*> vserver object-store-server user show -vserver vs1 -user
user1
```

```
                Vserver Name: vs1
      Object Store Server User Name: user1
      Object Store Server User ID: 1
Object Store Server User Description: testuser
Access Key for the Object Store Server User: 5HBRV20PWWX7IIHKYRRN
Time Period After Which User Keys Expire: 1h
Date And Time When User Keys Expire: 2/6/2023 13:28:50
```

## vserver peer commands

### vserver peer accept

Accept a pending Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `vserver peer accept` command is used to accept the Vserver peer relationship between two Vservers. This command is used only for intercluster Vserver peer relationships.

#### Parameters

**-vserver <vserver> - Vserver Name**

Specifies name of the local Vserver for which you want to accept the Vserver peer relationship.

**-peer-vserver <vserver> - Peer Vserver Name**

Specifies name of the peer Vserver with which the Vserver peer relationship was initiated.

**[-local-name <vserver>] - Peer Vserver Local Name**

Specifies the unique local name to identify the peer Vserver with which the Vserver peer relationship was initiated. The default value is the remote peer Vserver name.

#### Examples

The following example illustrates how to accept the Vserver peer relationship between Vservers `pvs1.example.com` residing on `cluster2`, and `lvs1.example.com` residing on `cluster1`.

```
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver
lvs1.example.com
```

The following example illustrates how to accept the Vserver peer relationship between Vservers `pvs1.example.com` residing on `cluster2`, and `pvs1.example.com` residing on `cluster1`. During execution of [vserver peer create](#) command on peer cluster, peer Vserver name is locally referred by unique system generated name `pvs1.example.com.1`. Using `vserver peer accept` command specify the

unique `-local-name` for peer Vserver.

```
cluster2::> vserver peer accept -vserver pvs1.example.com -peer-vserver  
pvs1.example.com.1 -local-name locallyUniqueName
```

## Related Links

- [vserver peer create](#)

## vserver peer create

Create a new Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer create` command creates a Vserver peer relationship between two Vservers residing on the same cluster or across two clusters. For intercluster Vserver peer relationships, the cluster administrator must accept or reject the relationship on the peer cluster.

## Parameters

### **-vserver <vserver> - Vserver Name**

Specifies the name of the local Vserver.

### **-peer-vserver <vserver> - Peer Vserver Name**

Specifies the name of the peer Vserver with which you want to create the Vserver peer relationship.

### **[-peer-cluster <text>] - Peer Cluster Name**

Specifies the name of the peer cluster. If this is not specified, it is assumed that the peer Vserver resides on the same cluster.

### **-applications {snapmirror|file-copy|lun-copy|flexcache} - Peering Applications**

Specifies the applications for which the Vserver peer relationship is created.

### **[-local-name <vserver>] - Peer Vserver Local Name**

Specifies the unique local name to identify the peer Vserver with which you want to create the Vserver peer relationship. The default value is the remote peer Vserver name.

## Examples

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver `lvs1.example.com`, residing on `cluster1`, and `pvs1.example.com`, residing on `cluster2`. The relationship is created for SnapMirror.

```
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver  
pvs1.example.com -peer-cluster cluster2 -applications snapmirror
```

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver *lvs1.example.com* , residing on *cluster1* , and *lvs1.example.com* , residing on *cluster2* . The relationship is created for SnapMirror. The `-local-name` parameter is specified to create a local name used to identify the peer Vserver in cases where the name of the peer Vserver name is not uniquely referenced from local cluster.

```
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver
lvs1.example.com -peer-cluster cluster2 -applications snapmirror -local
-name cluster2lvs1locallyUniqueName

cluster1::> vserver peer show
Peer Peer Peering
Remote
Vserver Vserver State Peer Cluster Applications
Vserver
-----
lvs1.example.com
cluster2lvs1locallyUniqueName
initiated cluster2 snapmirror
lvs1.example.com
cluster1::> vserver peer show -instance
Local Vserver Name: lvs1.example.com
Peer Vserver Name: cluster2lvs1locallyUniqueName
Peering State: initiated
Peering Applications: snapmirror
Remote Vserver Name: lvs1.example.com
```

The following example illustrates how to create an intercluster Vserver peer relationship between Vserver *lvs1* , residing on *cluster1* , and Vserver *pvs1* , residing on *cluster2* . The relationship is created for SnapMirror. The following Vserver peer permission exists on remote cluster *cluster2* for local Vserver *pvs1* .

```
cluster2::> vserver peer permission show
```

| Peer Cluster | Vserver | Applications |
|--------------|---------|--------------|
| cluster1     | pvs1    | snapmirror   |

1 entries were displayed.

```
cluster1::> vserver peer create -vserver lvs1 -peer-vserver pvs1 -peer
-cluster cluster2 -applications snapmirror
```

```
cluster1::> vserver peer show
```

| Remote Vserver | Peer Vserver | Peer State | Peer Cluster | Peering Applications |
|----------------|--------------|------------|--------------|----------------------|
| lvs1           | pvs1         | peered     | cluster2     | snapmirror pvs1      |

```
cluster2::> vserver peer show
```

| Remote Vserver | Peer Vserver | Peer State | Peer Cluster | Peering Applications |
|----------------|--------------|------------|--------------|----------------------|
| pvs1           | lvs1         | peered     | cluster1     | snapmirror lvs1      |

Here is an another example which creates an intracluster Vserver peer relationship.

```
cluster1::> vserver peer create -vserver lvs1.example.com -peer-vserver
lvs2.example.com -applications snapmirror
```

## vserver peer delete

Delete a Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver peer delete` command deletes the Vserver peer relationship between two Vservers.

### Parameters

**-vserver <vserver> - Vserver Name**

Specifies the local Vserver name for which you want to delete the Vserver peer relationship.

**-peer-vserver <vserver> - Peer Vserver Name**

Specifies the peer Vserver name with which the Vserver peer relationship was established.

**[-force <true>] - Force Delete**

Deletes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

**[-foreground {true|false}] - Foreground**

This parameter optionally specifies whether the Vserver peer delete operation can be executed in the background. If nothing is specified, by default the Vserver peer delete operation is executed in the background.

**Examples**

The following example illustrates how to delete the Vserver peer relationship between two Vservers *lvsl.example.com* residing on *cluster1*, and *pvs1.example.com* residing on *cluster2*.

```
cluster1::> vsriver peer delete -vserver lvsl.example.com -peer-vserver  
pvs1.example.com
```

**vserver peer modify-local-name****Modify the local name for a peer Vserver**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `vserver peer modify-local-name` command modifies the local name for a remote peer Vserver. The new local name must be unique.

**Parameters****-peer-cluster <text> - Peer Cluster**

Use this parameter to specify the peer cluster.

**-peer-vserver <text> - Remote Peer Vserver**

Use this parameter to specify the existing remote peer Vserver name.

**-new-name <vserver> - Remote Peer Vserver Local Name**

Use this parameter to specify the new local name of the peer Vserver. The new local name must conform to the same rules as a Vserver name.

**Examples**

```
cluster2::> vsserver peer modify-local-name -peer-cluster cluster1 -peer
-vserver vs51.example.com -new-name vs51_cluster1.example.com
```

## vsserver peer modify

### Modify a Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `vsserver peer modify` command modifies applications of the Vserver peer relationship.

#### Parameters

**-vserver <vserver> - Vserver Name**

Specifies name of the local Vserver for which you want to modify applications of the Vserver peer relationship.

**-peer-vserver <vserver> - Peer Vserver Name**

Specifies name of the peer Vserver for which you want to modify applications of the Vserver peer relationship.

**-applications {snapmirror|file-copy|lun-copy|flexcache} - Peering Applications**

Specifies the Vserver peer applications.

#### Examples

The following example illustrates how to modify applications that are part of the peer relationship between the Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vsserver peer modify -vserver lvs1.example.com -peer-vserver
pvs1.example.com -applications snapmirror
```

## vsserver peer reject

### Reject a Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `vsserver peer reject` command is used to reject the Vserver peer relationship between the two Vservers. This command is used only for an intercluster Vserver peer relationship.

#### Parameters

**-vserver <vserver> - Vserver Name**

Specifies the name of the local Vserver for which you want to reject the Vserver peer relationship.

**-peer-vserver <vserver> - Peer Vserver Name**

Specifies the name of the peer Vserver with which the Vserver peer relationship was initiated.

**Examples**

The following example illustrates how to reject the Vserver peer relationship between two Vservers *lvs1.example.com* residing on *cluster1*, and *pvs1.example.com* residing on *cluster2*.

```
cluster1::> vserver peer reject -vserver lvs1.example.com -peer-vserver  
pvs1.example.com
```

**vserver peer repair-peer-name**

Repair the peer vserver name that was not updated during the last rename operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

Updates the peer Vserver name in remote peer clusters for the specified Vserver in the local cluster.

**Parameters****-vserver <vserver> - vserver (privilege: advanced)**

Name of the Vserver in the local cluster. This name will be repaired on remote peer clusters.

**Examples**

The following example updates the peer-Vserver name across the peered clusters:

```
cluster1::*> vserver peer repair-peer-name -vserver vs1.example.com  
Info: Command completed successfully
```

**vserver peer resume**

Resume a Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `vserver peer resume` command resumes the Vserver peer relationship between two Vservers.

## Parameters

### **-vserver <vserver> - Vserver Name**

Specifies name of the local Vserver for which you want to resume the Vserver peer relationship.

### **-peer-vserver <vserver> - Peer Vserver Name**

Specifies name of the peer Vserver with which you want to resume the Vserver peer relationship.

### **[-force <true>] - Force Resume**

Resumes the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

## Examples

The following example illustrates resuming a Vserver peer relationship between two Vservers *lvs1.example.com* residing on *cluster1*, and *pvs1.example.com* residing on *cluster2*.

```
cluster1::> vserver peer resume -vserver lvs1.example.com -peer-vserver  
pvs1.example.com
```

## vserver peer show-all

(DEPRECATED)-Display Vserver peer relationships in detail

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer show-all` command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- Applications
- State of the peering relationship
- Remote Vserver name

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ `-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ `-vserver <vserver>` ] - Local Vserver Name**

If this parameter is specified, the command displays relationships that match the specified local Vserver.

**[ `-peer-vserver <text>` ] - Peer Vserver Name**

If this parameter is specified, the command displays relationships that match the specified peer Vserver.

**[ `-vserver-uuid <UUID>` ] - Local Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

**[ `-peer-vserver-uuid <UUID>` ] - Peer Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

**[ `-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}` ] - Peering State**

If this parameter is specified, the command displays relationships that match the specified peer state.

**[ `-applications {snapmirror|file-copy|lun-copy|flexcache}` ] - Peering Applications**

If this parameter is specified, the command displays relationships that have the specified applications.

**[ `-peer-cluster <text>` ] - Peer Cluster Name**

If this parameter is specified, the command displays relationships that have the specified peer cluster name.

**[ `-remote-vserver-name <text>` ] - Remote Vserver Name**

If this parameter is specified, the command displays relationships that match the specified remote Vserver.

## Examples

The following example illustrates how to display Vserver peer relationships. +

```

cluster1::> vsriver peer show-all

```

| Remote Vserver   | Peer Vserver              | Peer State | Peer Cluster | Peering Applications |
|------------------|---------------------------|------------|--------------|----------------------|
| lvs1.example.com | lvs2.example.com          | peered     | cluster1     | snapmirror           |
| lvs2.example.com | lvs1.example.com          |            |              |                      |
|                  | pvs1.example.com          | peered     | cluster2     | snapmirror           |
| pvs1.example.com | lvs2.example.com          |            |              |                      |
|                  | lvs1.example.com          | peered     | cluster1     | snapmirror           |
| lvs1.example.com | lvs3.example.com          |            |              |                      |
|                  | pvs1_cluster3.example.com | peered     | cluster3     | snapmirror           |
| pvs1.example.com | lvs1.example.com          |            |              |                      |
|                  | lvs1_cluster4.example.com | peered     | cluster4     | snapmirror           |
| lvs1.example.com |                           |            |              |                      |

5 entries were displayed.

## vsriver peer show

### Display Vserver peer relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver peer show` command displays the following information about Vserver peer relationships:

- Local Vserver name
- Peer Vserver name
- Local Vserver UUID
- Peer Vserver UUID
- Peer cluster name
- State of the peering relationship

- Applications
- Remote Vserver name

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Local Vserver Name**

If this parameter is specified, the command displays relationships that match the specified local Vserver.

**[-peer-vserver <text>] - Peer Vserver Name**

If this parameter is specified, the command displays relationships that match the specified peer Vserver.

**[-peer-state {peered|pending|initializing|initiated|rejected|suspended|deleted}] - Peering State**

If this parameter is specified, the command displays relationships that match the specified peer state.

**[-applications {snapmirror|file-copy|lun-copy|flexcache}] - Peering Applications**

If this parameter is specified, the command displays relationships that have the specified applications.

**[-peer-cluster <text>] - Peer Cluster Name**

If this parameter is specified, the command displays relationships that have the specified peer cluster name.

**[-peer-vserver-uuid <UUID>] - Peer Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays relationships that match the specified peer Vserver UUID.

**[-vserver-uuid <UUID>] - Local Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays relationships that match the specified local Vserver UUID.

**[-remote-vserver-name <text>] - Remote Vserver Name**

If this parameter is specified, the command displays relationships that match the specified remote Vserver.

## Examples

The following examples illustrate how to display Vserver peer relationships. + Cluster administrator:

```

cluster1::> vsserver peer show

```

| Remote Vserver   | Peer Vserver              | Peer State | Peering Applications |
|------------------|---------------------------|------------|----------------------|
| lvs1.example.com | lvs2.example.com          | peered     | cluster1 snapmirror  |
| lvs2.example.com | lvs1.example.com          |            |                      |
| pvs1.example.com | pvs1.example.com          | peered     | cluster2 snapmirror  |
| lvs2.example.com | lvs1.example.com          | peered     | cluster1 snapmirror  |
| lvs1.example.com | pvs1_cluster3.example.com | peered     | cluster3 snapmirror  |
| lvs1.example.com | lvs1_cluster4.example.com | peered     | cluster4 snapmirror  |

5 entries were displayed.

Vserver administrator:

```

vs11.example.com::> vsserver peer show

```

| Peer Vserver      | Peer State | Peering Applications  | Remote Vserver |
|-------------------|------------|-----------------------|----------------|
| pvs21.example.com | peered     | snapmirror            |                |
| vs12.example.com  | peered     | file-copy, snapmirror |                |

2 entries were displayed.

## vserver peer suspend

Suspend a Vserver peer relationship

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver peer suspend` command suspends the Vserver peer relationship between two Vservers.

### Parameters

**-vserver <vserver> - Vserver Name**

Specifies name of the local Vserver for which you want to suspend the Vserver peer relationship.

**-peer-vserver <vserver> - Peer Vserver Name**

Specifies name of the peer Vserver for which you want to suspend the Vserver peer relationship.

**[-force <true>] - Force Suspend**

Suspends the Vserver peer relationship even if the remote cluster is not accessible due to, for example, network connectivity issues.

### Examples

The following example illustrates how to suspend the Vserver peer relationship between two Vservers `lvs1.example.com` residing on `cluster1`, and `pvs1.example.com` residing on `cluster2`.

```
cluster1::> vserver peer suspend -vserver lvs1.example.com -peer-vserver  
pvs1.example.com
```

## vserver peer permission create

Create a new Vserver peer permission

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver peer permission create` command creates a new Vserver peer permission that can be used during intercluster Vserver peer relationship creation. Once this permission exists for a local Vserver and peer cluster combination on local cluster, no explicit `vserver peer accept` command is required for any incoming Vserver peer relationship creation request from a remote cluster for that local Vserver. Peer relationship directly changes state to *peered* on both clusters.

### Parameters

**-peer-cluster <text> - Peer Cluster Name**

Specifies the name of the peer Cluster.

### **-vserver <text> - Vserver Name**

Specifies the name of the local Vserver. Use "\*" to create permission that applies for all local Vservers.

### **-applications {snapmirror|flexcache} - Peering Applications**

Specifies the applications that can make use of the intercluster Vserver peer relationship.

## **Examples**

The following example illustrates how to create Vserver peer permissions:

```
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver
vs1 -applications snapmirror
```

The following example illustrates how to create a Vserver peer permission that applies for all the local Vservers

```
cluster1::> vserver peer permission create -peer-cluster cluster2 -vserver
"*" -applications snapmirror
```

Warning: This Vserver peer permission applies to all local Vservers. After that no explicit

"vserver peer accept" command required for Vserver peer relationship creation request

from peer cluster "cluster2" with any of the local Vservers. Do you want to continue? {y|n}: y

```
cluster1::> vserver peer permission show
```

| Peer Cluster | Vserver | Applications |
|--------------|---------|--------------|
| cluster2     | "*"     | snapmirror   |
| cluster2     | vs1     | snapmirror   |

2 entries were displayed.

Note that both all Vservers and any local Vserver name permission can exists at same time.

## **Related Links**

- [vserver peer accept](#)

## **vserver peer permission delete**

Delete a Vserver peer permission

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer permission delete` command deletes Vserver peer permissions.

## Parameters

### **-peer-cluster <text> - Peer Cluster Name**

Specifies the name of the peer Cluster.

### **-vserver <text> - Vserver Name**

Specifies the name of the local Vserver.

## Examples

The following example illustrates how to delete Vserver peer permissions:

```
cluster1::> vserver peer permission delete -peer-cluster cluster2 -vserver  
vs1
```

## vserver peer permission modify

### Modify the Existing Vserver peer permission

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer permission modify` command is used to modify attributes of the Vserver peer permission relationship. Changes made using this command will only apply to Vserver peer relationships that are created after the Vserver peer permission have been modified. Vserver peer permission is used to give permission to a local Vserver for intercluster Vserver peer relationship creation so that the command [vserver peer accept](#) is not required for incoming Vserver peer relationship creation from a remote cluster for that local Vserver.

## Parameters

### **-peer-cluster <text> - Peer Cluster Name**

Specifies the name of the peer cluster.

### **-vserver <text> - Vserver Name**

Specifies name of the local Vserver for which you want to modify applications of the Vserver peer permission relationship.

### **-applications {snapmirror|flexcache} - Peering Applications**

Specifies the applications that can make use of the intercluster Vserver peer relationship.

## Examples

The following example illustrates how to modify Vserver peer permissions:

```
cluster1::*> vserver peer permission modify -peer-cluster cluster2
-vserver vs1 -applications snapmirror
```

## Related Links

- [vserver peer accept](#)

## vserver peer permission show

Display Vserver peer permissions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer permission show` command displays the following information about Vserver peer permissions:

- Peer cluster name
- Local Vserver name
- Applications

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-peer-cluster <text>] - Peer Cluster Name**

If this parameter is specified, the command displays permissions that have the specified peer cluster name.

**[-vserver <text>] - Vserver Name**

If this parameter is specified, the command displays permissions that match the specified local Vserver.

**[-applications {snapmirror|flexcache}] - Peering Applications**

If this parameter is specified, the command displays permissions that have the specified applications.

## Examples

The following examples illustrate how to display Vserver peer permissions:

```
cluster1::> vserver peer permission show
Peer Cluster      Vserver           Applications
-----
cluster2          "*"              snapmirror
cluster3          vs1              snapmirror
2 entries were displayed.
```

## vserver peer transition create

Create a new transition peer relationship between a 7-Mode system and a Vserver.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver peer transition create` command creates a transition peer relationship between a 7-Mode system and a Vserver. This command is not supported from 9.12.1

### Parameters

**-local-vserver <vserver name> - Local Vserver name**

Specifies the name of the local Vserver.

**-src-filer-name <text> - Source 7-Mode system**

Specifies the name of the source 7-Mode system (hostname or IP address).

**[-multi-path-address <text>] - Additional address for source 7-Mode system**

Additional address (hostname or IP address) for the source 7-Mode system.

**[-local-lifs <lif-name>,...] - List of Local LIFs**

List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

### Examples

The following example illustrates how to create a transition peer relationship between Vserver `vs1.example.com`, residing on `Cluster1`, and a 7-Mode system `src1.example.com`. We can also specify an additional multipath address `src1-e0d.example.com`, for load balancing and list of local LIFs `lif1`, `lif2` to be used.

```
Cluster1::> vserver peer transition create -local-vserver vs1.example.com
-src-filer-name src1.example.com -multi-path-address src1-e0d.example.com
-local-lifs lif1,lif2
```

## vserver peer transition delete

Delete a transition peer relationship.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer transition delete` command deletes the transition peer relationship.

## Parameters

**-local-vserver <vserver name> - Local Vserver name**

Specifies the name of the local Vserver.

**-src-filer-name <text> - Source 7-Mode system**

Specifies the name of the source 7-Mode system(hostname or IP address).

## Examples

The following example illustrates how to delete the transition peer relationship between a Vserver `lvs1.example.com` residing on `cluster1`, and source 7-Mode system `src1.example.com`.

```
cluster1::> vserver peer transition delete -local-vserver lvs1.example.com
-src-filer-name src1.example.com
```

## vserver peer transition modify

Modify a transition peer relationship.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver peer transition modify` command is used to modify the multipath address or local LIFs of the transition peer relationship.

## Parameters

**-local-vserver <vserver name> - Local Vserver name**

Specifies the name of the local Vserver.

**-src-filer-name <text> - Source 7-Mode system**

Specifies the name of the source 7-Mode system (hostname or IP address).

**[-multi-path-address <text>] - Additional address for source 7-Mode system**

Additional address (hostname or IP address) for the source 7-Mode system.

**[-local-lifs <lif-name>,...] - List of Local LIFs**

List of LIFs to be used for this peering relationship. The LIF role can be data or node-mgmt or intercluster or cluster-mgmt.

## Examples

The following example illustrates how to modify a transition peer relationship's multipath address.

```
cluster1::> vserver peer transition modify -local-vserver vs1.example.com
-src-filer-name src1.example.com -multi-path-address src1-e0b.example.com
```

The following example illustrates how to modify the local LIFs of a transition peer relationship.

```
Cluster1::> vserver peer transition modify -local-vserver vs1.example.com
-src-filer-name src1.example.com
-local-lifs lif1,lif2
```

## vserver peer transition show

Display transition peer relationships.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver peer transition show` command displays the following information about transition peer transition relationships:

- Local Vserver name
- Source 7-Mode system
- Multi-path address
- Local LIFs

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-local-vserver <vserver name>] - Local Vserver name**

If this parameter is specified, the command displays transition peer information about the specified local Vserver.

**[-src-filer-name <text>] - Source 7-Mode system**

If this parameter is specified, the command displays transition peer information about the specified source 7-Mode system.

### **[-multi-path-address <text>] - Additional address for source 7-Mode system**

If this parameter is specified, the command displays information about the specified multipath-address.

### **[-local-lifs <lif-name>,...] - List of Local LIFs**

If this parameter is specified, the command displays information about the specified local LIFs.

#### **Examples**

```
cluster1::> vservers peer transition show
Vserver  Source Filer  Multi Path Address  Local LIFs
-----  -
vs1.example.com
          src1.example.com
          src1-e0b.example.com
          lif1, lif2
```

## **vserver san commands**

### **vserver san prepare-to-downgrade**

Restore the SAN Configurations to Earlier Release of Data ONTAP Version.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

This command initiates the procedure to restore the configuration to Earlier Release of ONTAP Version.

As part of this command, capability for making SAN LIF offline if placed on the DR auxiliary partner as part of LIF placement in MetroCluster environment will be disabled.

#### **Parameters**

### **-feature-set <ClusterVersion> - Disable the capability introduced in the Data ONTAP Version**

Specifies the ONTAP Cluster Version from revert to.

#### **Examples**

```
cluster1::> vserver san prepare-to-downgrade -feature-set 8.3.1
```

Clears the SAN configuration to make it compatible to an earlier ONTAP release.

## **vserver security commands**

### **vserver security file-directory apply**

Apply security descriptors on files and directories defined in a policy to a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory apply` command applies security settings to files and directories defined in a security policy of a Vserver.

Applying a security policy to a Vserver is the last step to creating and applying NTFS ACLs to files or folders. A security policy contains definitions for the security configuration of a file (or folder) or set of files (or, folders). The policy is a container for tasks. A task associates a file/folder path name to the security descriptor that needs to be set on the file/folder. Every task in a policy is uniquely identified by the file/folder path. A policy cannot have duplicate task entries. There can be only one task per path.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLs to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create policy tasks.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

\* Apply a policy to the associated Vserver.

The file-directory apply job will skip those directories/files for which it encounters permission errors.

Modifying the ACLs via ONTAP CLI will replace the current permissions on the directory or path.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver that contains the path to which the security policy is applied.

**-policy-name <Security policy name> - Policy Name**

Specifies the security policy to apply.

**[-ignore-broken-symlinks {true|false}] - Skip Broken Symlinks (privilege: advanced)**

If you specify this parameter as *true*, the file-directory apply job will skip all the symlinks that are broken instead of failing the job.

## Examples

The following example applies a security policy named "p1" to Vserver vs0.

```
cluster1::> vsserver security file-directory apply -vsserver vs0 -policy  
-name p1
```

## **vsserver security file-directory remove-slag**

### **Removes Storage-Level Access Guard**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### **Description**

The `vsserver security file-directory remove-slag` command removes Storage-Level Access Guard (SLAG) security from the specified volume or qtree path.

#### **Parameters**

**-vsserver <vsserver> - Vserver**

Specifies the name of the Vserver that is associated with the volume or qtree path from where you want to remove SLAG.

**-path <text> - Path**

Specifies the volume or qtree mounted junction path from which you want to remove SLAG security.

#### **Examples**

The following example removes SLAG security from the volume path `"/vol1"` on Vserver `vs1`.

```

cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
Vserver: vs1
        File Path: /vol1
        Security Style: mixed
        Effective Style: unix
        DOS Attributes: 10
        DOS Attributes in Text: ----D---
        Expanded Dos Attributes: -
        Unix User Id: 0
        Unix Group Id: 0
        Unix Mode Bits: 755
        Unix Mode Bits in Text: rwxr-xr-x
        ACLs: Storage-Level Access Guard security
DACL (Applies to Directories):
        ALLOW-CIFS1\Administrator-0x1200a9
        DACL (Applies to Files):
        ALLOW-CIFS1\Administrator-0x1200a9
cluster1::>vserver security file-directory remove-slag -path /vol1
-vserver vs1
cluster1::>vserver security file-directory show -vserver vs1 -path /vol1
        Vserver: vs1
        File Path: /vol1
        Security Style: mixed
        Effective Style: unix
        DOS Attributes: 10
        DOS Attributes in Text: ----D---
        Expanded Dos Attributes: -
        Unix User Id: 0
        Unix Group Id: 0
        Unix Mode Bits: 755
        Unix Mode Bits in Text: rwxr-xr-x
        ACLs: -

```

The following example removes SLAG security from the qtree path "/vol1/q1" on Vserver vs1.

```

cluster1::>vserver security file-directory show -vserver vs1 -path
/vol1/q1
Vserver: vs1
        File Path: /vol1/q1
        Security Style: mixed
        Effective Style: unix
        DOS Attributes: 10
        DOS Attributes in Text: ----D---
        Expanded Dos Attributes: -
        Unix User Id: 0
        Unix Group Id: 0
        Unix Mode Bits: 755
        Unix Mode Bits in Text: rwxr-xr-x
        ACLs: Storage-Level Access Guard security
DACL (Applies to Directories):
        ALLOW-CIFS1\Administrator-0x1200a9
        DACL (Applies to Files):
        ALLOW-CIFS1\Administrator-0x1200a9
cluster1::>vserver security file-directory remove-slag -path /vol1/q1
-vserver vs1
cluster1::>vserver security file-directory show -vserver vs1 -path
/vol1/q1
        Vserver: vs1
        File Path: /vol1/q1
        Security Style: mixed
        Effective Style: unix
        DOS Attributes: 10
        DOS Attributes in Text: ----D---
        Expanded Dos Attributes: -
        Unix User Id: 0
        Unix Group Id: 0
        Unix Mode Bits: 755
        Unix Mode Bits in Text: rwxr-xr-x
        ACLs: -

```

## vserver security file-directory show-effective-permissions

Display effective file or folder permissions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory show-effective-permissions` command displays the effective permission granted to a Windows or UNIX user on the specified file or folder path. The command output depends on the parameter or parameters specified with the command.

The `-vserver`, `-win-user-name` or `-unix-user-name` and `-path` parameters are required for this command. If the optional parameter `-share-name` is specified, it will display the effective share permission.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver> - Vserver**

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required `-path` parameter. Query characters, such as `"**"`, are not supported.

**{ -win-user-name <text> - Windows User Name**

Use this parameter to specify the Windows user for which effective permission needs to be displayed on the given file or folder.

**| -unix-user-name <text> - Unix User Name }**

Use this parameter to specify the UNIX user for which effective permission needs to be displayed on the given file or folder.

**-path <text> - File Path**

Use this mandatory parameter to specify the path of the file or the folder for which you want to display effective permissions. The path is relative to the Vserver root volume. If `-share-name` is specified then the path will be relative to the share path. Query characters, such as `"**"`, are not supported.

**[-share-name <Share>] - CIFS Share Name**

If you specify this optional parameter, the command displays the file or directory effective permission for the mentioned user, only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as the default. If this optional parameter is specified, then it will also display the effective share permission of the user. Wildcard query characters are not supported.

**[-client-ip-address <IP Address>] - Client IP Address**

If you specify this optional parameter, the command displays the effective permission for the user with the specified client ip address.

**[-expand-mask {true|false}] - Expand Bit Masks**

If you specify this optional parameter, the command displays effective permission for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to default (false), the command displays effective permission for file or directory in collapsed (textual) form.

**[-share-path <text>] - CIFS Share Path**

If you specify this parameter, the command displays information only about the CIFS share that match the specified path. Query characters, such as `"**"`, are not supported.

## **[`-permission <Security acl>,...`] - Effective Permissions**

If you specify this parameter, the command displays effective permission only if specified permission matches. Wildcard query characters are not supported.

## **vserver security file-directory show**

Display file/folder security information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver security file-directory show` command displays file/folder security information. The command output depends on the parameter or parameters specified with the command.

The `-vserver` and `-path` parameters are required for this command. If you do not specify any of the optional parameters, the command displays all security information in list format for the specified path.

You can specify the `-fields` parameter to specify which fields of information to display about files and folders security.

You can specify the `-instance` parameter to display all the security information in list format.

### **Parameters**

**{ [`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [`-instance ]` }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**`-vserver <vserver> - Vserver`**

Use this required parameter to specify the Vserver that contains the path to the file or folder specified with the required `-path` parameter.

**{ [`-path <text>`] - File Path**

Use this field to specify the path of the file or folder for which you want to display security information. If the volume name is not specified in the path, the path is relative to the Vserver root volume. If the path's last subcomponent has a wildcard ("\*"), the output will display information for all files and directories below the parent path. A path within the FlexCache volume is not supported.

If you want to display information of a file or directory which contains wildcard ("\*") as its last sub-component, then provide the complete path inside "<path>".

For instance, `vserver security file-directory show -vserver vs1 -path "/vol1/"` **will show ACL information for the directory named "", only.**

**| [`-inode <integer>`] - File Inode Number }**

Use this field to specify the inode number of the file or folder for which you want to display security information. If the volume name is not specified, inode is searched in the Vserver root volume.

### **{ [-volume-name <volume name>] - Volume Name**

If you specify this parameter, the command displays information about file and directory security only for files and directories where the specified path is relative to the specified volume. If this parameter is not specified, the Vserver root volume is taken as default.

### **| [-share-name <Share>] - Share Name }**

If you specify this parameter, the command displays information about file and directory security only for files and directories contained where the specified path is relative to the root of the specified share. If this parameter is not specified, the Vserver root volume is taken as default.

### **[-lookup-names {true|false}] - SID to Name Lookups**

If you specify this parameter, the command displays information about file and directory security for files and directories where the information about owner and group are stored as names. If set to false, the command displays information about file and directory security for files and directories where the information for owner and group are stored as SIDs.

### **{ [-expand-mask {true|false}] - Expand Bit Masks**

If you specify this parameter, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in expanded bit form. If set to false, the command displays information about file and directory security for files and directories where the hexadecimal bit mask entries are in collapsed form.

### **| [-textual-mask {true|false}] - Show Textual Mask**

If you specify this parameter as *true*, the command displays information about file and directory security for files and directories where the hexadecimal bit mask is translated to textual format.

### **| [-sddl {true|false}] - Display ACLs in SDDL Format }**

If you specify this parameter, the command displays the ACL information for files and directories in Security Descriptor Definition Language (SDDL) format. If the file has *effective-style* as "unix" then this flag has no effect.

### **[-security-style <security style>] - Security Style**

If you specify this parameter, the command displays information about file and directory security only for files and directories with paths in volumes of the specified security style.

### **[-effective-style <security style>] - Effective Style**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified effective security style on the path.

### **[-dos-attributes <Hex Integer>] - DOS Attributes**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified DOS attributes.

### **[-text-dos-attr <TextNoCase>] - DOS Attributes in Text**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified text DOS attributes.

### **[-expanded-dos-attr <TextNoCase>] - Expanded Dos Attributes**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified extended DOS attributes. This parameter is useful only for files or directories where the *-expand-mask* is set to true.

**[`-user-id <user name>`] - UNIX User Id**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX user ID.

**[`-group-id <group name>`] - UNIX Group Id**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX group ID.

**[`-mode-bits <Octal Permission>`] - UNIX Mode Bits**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in Octal form.

**[`-text-mode-bits <text>`] - UNIX Mode Bits in Text**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified UNIX mode bits in text form.

**[`-acls <Security acl>,...`] - ACLs**

If you specify this parameter, the command displays information about file and directory security only for files and directories with the specified ACLs. If the specified path is a volume or qtree path and Storage-Level Access Guard (SLAG) is configured on the volume or qtree, this parameter displays the SLAG information. It also displays the Dynamic Access Control (DAC) policies if DAC is configured for the given file or directory path. The following ACL information can be entered:

- Type of ACL - NTFS or NFSV4
- Control bits in the security descriptors
- Owner - only in case of NTFS security descriptors
- Group - only in case of NTFS security descriptors
- Access Control Entries - discretionary access control list (DACL) and system access control list (SACL) access control entries (ACEs) in the ACL

**Examples**

The following example displays the security information about the path "/vol4" in Vserver vs1.

```
cluster1::> vserver security file-directory show -vserver vs1 -path /vol4
(vserver security file-directory show)
Vserver: vs1
      File Path: /vol4
    File Inode Number: 64
      Security Style: ntfs
    Effective Style: ntfs
      DOS Attributes: 10
  DOS Attributes in Text: ----D---
Expanded Dos Attributes: -
      Unix User Id: 0
      Unix Group Id: 0

```

## vserver security file-directory job show

Display a list of file security jobs

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory job show` command displays information about security file-directory jobs.

To display detailed information about a specific job, run the command with the `-id` parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about security file-directory jobs running on a specific node, run the command with the `-node` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-inprogress ]**

Displays the job ID, the job name, the owning Vserver, and the progress of the security file-directory job.

**| [-jobstate ]**

Displays information about each job's state, including the queue state, whether the job was restarted and when the job has completely timed out.

**| [-jobuuid ] (privilege: advanced)**

Displays the job ID, the job name, the owning Vserver, and the job UUID.

**| [-sched ]**

Displays the job ID, the job name, the owning Vserver, and the schedule on which the security file-directory job runs.

**| [-times ]**

Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.

**| [-type ]**

Displays the job ID, the job name, the job type, and the job category.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-id <integer>] - Job ID**

Selects the jobs that match the ID or range of IDs that you specify.

**[-vserver <vserver name>] - Owning Vserver**

Selects jobs that are owned by the specified Vserver.

**[-name <text>] - Name**

Selects the jobs that match this parameter value.

**[-description <text>] - Description**

Selects the jobs that match this parameter value.

**[-priority {Low|Medium|High|Exclusive}] - Priority**

Selects the jobs that match this parameter value.

**[-node <nodename>] - Node**

Selects the jobs that match this parameter value.

**[-affinity {Cluster|Node}] - Affinity**

Selects the jobs that match this parameter value.

**[-schedule <job\_schedule>] - Schedule**

Selects the jobs that match this parameter value.

**[-queuetime <MM/DD HH:MM:SS>] - Queue Time**

Selects the jobs that match this parameter value.

**[-starttime <MM/DD HH:MM:SS>] - Start Time**

Selects the jobs that match this parameter value.

**[-endtime <MM/DD HH:MM:SS>] - End Time**

Selects the jobs that match this parameter value.

**[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time**

Selects the jobs that match this parameter value.

**[-restarted {true|false}] - Restarted?**

Selects the jobs that match this parameter value.

**[-state {Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State**

Selects the jobs that match this parameter value.

**[-code <integer>] - Status Code**

Selects the jobs that match this parameter value.

**[-completion <text>] - Completion String**

Selects the jobs that match this parameter value.

**[-jobtype <text>] - Job Type**

Selects the jobs that match this parameter value.

**[-category <text>] - Job Category**

Selects the jobs that match this parameter value.

**[-uuid <UUID>] - UUID**

Selects the jobs that match this parameter value.

### **[-progress <text>] - Execution Progress**

Selects the jobs that match this parameter value.

### **[-username <text>] - User Name**

Selects the jobs that match this parameter value.

### **[-process <text>] - Process**

Selects jobs with the specified process number.

## **Examples**

The following example displays information about the file-directory security job.

```
cluster1::> vserver security file-directory apply -policy-name pol
-vserver vs1
cluster1::> vserver security file-directory job show
```

|                                                |    | Owning          |         |            |         |
|------------------------------------------------|----|-----------------|---------|------------|---------|
| Job                                            | ID | Name            | Vserver | Node       | State   |
| 25                                             |    | Fsecurity Apply | vsim2.3 | vsim2.3-01 | Success |
| Description: File Directory Security Apply Job |    |                 |         |            |         |

## **vserver security file-directory ntfs create**

Create an NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver security file-directory ntfs create` command creates an NTFS security descriptor to which you can add access control entries (ACEs) to the discretionary access control list (DACL) and the system access control list (SACL).

Creating an NTFS security descriptor is the first step in configuring and applying NTFS access control lists (ACLs) to files and folders residing within a namespace. Later, you will associate the security descriptor to a policy task.

You can create NTFS security descriptors for files and folders residing within FlexVol volumes with NTFS security-style or on NTFS security descriptors on mixed security-style volumes.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLs and SACLs to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding a SACL to the security descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create a policy task.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

\* Apply a policy to the associated Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver on which to create the security descriptor.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor you want to create. After you create a security descriptor, you can add SACL and DACL access control entries (ACEs) to it.

Every newly created security descriptor contains the 4 default DACL ACEs as mentioned below:

```
Vserver: vservers1
NTFS Security Descriptor Name: sd1
Account Name      Access      Access      Apply To
                  Type      Rights
-----
BUILTIN\Administrators
                  allow      full-control
this-folder, sub-folders, files
BUILTIN\Users
                  allow      full-control
this-folder, sub-folders, files
CREATOR OWNER
                  allow      full-control
this-folder, sub-folders, files
NT AUTHORITY\SYSTEM
                  allow      full-control
this-folder, sub-folders, files
```

+

### **[-owner <name or sid>] - Owner**

Specifies the owner of the security descriptor. You can specify the owner using either a user name or SID.

The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-owner`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

### **[`-group <name or sid>`] - Primary Group (privilege: advanced)**

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-group`, keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

### **[`-control-flags-raw <Hex Integer>`] - Raw Control Flags (privilege: advanced)**

Specifies the control flags in the security descriptor.

The value for the control flag is ignored for SLAG.

## **Examples**

The following example creates an NTFS security descriptor named “sd1” on Vserver “vs1” and assigns “DOMAIN\Administrator” as the security descriptor owner.

```
cluster1:> vserver security file-directory ntfs create -ntfs-sd sd1
-vserver vs1 -owner DOMAIN\Administrator
cluster1:> vserver security file-directory ntfs show -vserver vs1 -ntfs
-sd sd1

Vserver: vs1
Security Descriptor Name: sd2
Owner of the Security Descriptor: DOMAIN\Administrator
```

## **vserver security file-directory ntfs delete**

Delete an NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory ntfs delete` command deletes an NTFS security descriptor. Deleting a security descriptor also deletes all the contained DACL and SACL access control entries (ACEs).

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver that is associated with the security descriptor that you want to delete.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor to delete.

## Examples

The following example deletes an NTFS security descriptor named "sd1" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs delete -ntfs-sd sd1
-vserver vs1
```

## vserver security file-directory ntfs modify

### Modify an NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory ntfs modify` command modifies an NTFS security descriptor. You can change the `-owner`, `-group` and ``-control-flags-raw`` of the security descriptor with this command.

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor that you want to modify.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor that you want to modify.

### **[-owner <name or sid>] - Owner**

Specifies the owner of the security descriptor. You can specify the owner using either the user name or SID.

The owner of the security descriptor can modify the permissions on the file (or folder) or files (or folders) to which the security descriptor is applied and can give other users the right to take ownership of the object or objects to which the security descriptor is applied. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID

- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-owner` , keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for Storage-Level Access Guard (SLAG).

### **[`-group <name or sid>`] - Primary Group (privilege: advanced)**

Specifies the owner group of the security descriptor. You can specify the owner group using either a group name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-group` , keep in mind that the value for the user name is case insensitive. The value for the user name is ignored for SLAG.

### **[`-control-flags-raw <Hex Integer>`] - Raw Control Flags (privilege: advanced)**

Specifies the control flags in the security descriptor to be modified.

The value for the control flag is ignored for SLAG.

## **Examples**

The following example modifies the owner of an NTFS security descriptor named "sd2" on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs modify -ntfs-sd sd2
-vserver vs1 -owner domain\administrator
cluster1::> vserver security file-directory ntfs show -vserver vs1 -ntfs
-sd sd2
Vserver: vs1
                Security Descriptor Name: sd2
                Owner of the Security Descriptor: DOMAIN\Administrator
```

## **vserver security file-directory ntfs show**

Display an NTFS security descriptors

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vserver security file-directory ntfs show` command displays information about the security descriptor. The command output depends on the parameter or parameters specified with the command. If you

do not specify any parameters, the command displays all information about all security descriptors defined on the cluster.

You can specify the `-fields` parameter to specify which fields of information to display about security descriptors.

You can specify the `-instance` parameter to display all the information about security descriptors in list format.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the security descriptors associated with the Vserver that you specify.

**[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name**

If you specify this parameter, the command displays information only about the security descriptors that you specify.

**[-owner <name or sid>] - Owner**

If you specify this parameter, the command displays information only about the security descriptors owned by the specified user name or SID.

**[-group <name or sid>] - Primary Group (privilege: advanced)**

If you specify this parameter, the command displays information only about the security descriptors associated with the owner group.

**[-control-flags-raw <Hex Integer>] - Raw Control Flags (privilege: advanced)**

If you specify this parameter, the command displays information only about the security descriptors associated with the control flags.

## Examples

The following example displays information about an NTFS security descriptor named "sd2" on Vserver vs1.

```
cluster1::> vsserver security file-directory ntfs show -vserver vs1 -ntfs
-sd sd2
Vserver: vs1
                Security Descriptor Name: sd2
                Owner of the Security Descriptor: DOMAIN\Administrator
```

## vserver security file-directory ntfs dacl add

Add a DACL entry to NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory ntfs dacl add` command adds access control entries (ACEs) into a security descriptor's discretionary access control list (DACL).

If the security descriptor contains a DACL that has existing ACEs, the command adds the new ACE to the DACL. If the security descriptor does not contain a DACL, the command creates the DACL and adds the new ACE to it.

Adding a DACL entry to the security descriptor is the second step in configuring and applying ACLs to a file or folder. Before you can add a DACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLs and SACLs to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create policy tasks.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

\* Apply a policy to the associated Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor to which you want to add a discretionary access control entry (discretionary ACE).

**-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor to which you want to add a discretionary access control entry.

**-access-type {deny|allow} - Allow or Deny**

Specifies whether the discretionary access control entry is an *allow* or *deny* type of access control.

**-account <name or sid> - Account Name or SID**

Specifies the account on which to apply the discretionary access control entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

### **{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] - DACL ACE's Access Rights**

Specifies the right that you want to add for the account specified in the -account parameter. The -rights parameter is mutually exclusive with the -advanced-rights and -rights-raw parameter. If you specify the -rights parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

### **| [-advanced-rights <Advanced access right>,...] - DACL ACE's Advanced Access Rights }**

Specifies the advanced rights that you want to add for the account specified in the -account parameter. The -advanced-rights parameter is mutually exclusive with the -rights and -rights-raw parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

### **[`-rights-raw <Hex Integer>`] - DACL ACE's Raw Access Rights (privilege: advanced) }**

Specifies the raw rights that you want to add for the account specified in the `-account` parameter. The `rights-raw` parameter is mutually exclusive with the `-advanced-rights` and `-rights` parameter. Specify the value as a hexadecimal integer, for example: `0xA10F` or `0xb3ff` etc.

### **[`-apply-to {this-folder|sub-folders|files}`] - Apply DACL Entry**

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- `this-folder`
- `sub-folder`
- `files`

Select one of the following combinations of values for the `-apply-to` parameter for Storage-Level Access Guard (SLAG):

- `this-folder, sub-folder, files`
- `this-folder, sub-folder`
- `files`

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

## **Examples**

The following example adds a DACL entry to the security descriptor named "sd1" on Vserver "vs1" for the "DOMAIN\Administrator" account.

```
cluster1::> vsserver security file-directory ntfs dacl add -ntfs-sd sd1
-access-type deny -account DOMAIN\Administrator -rights full-control
-apply-to this-folder -vserver vs1
cluster1::> vsserver security file-directory ntfs dacl show -vserver vs1
-ntfs-sd sd1 -access-type deny -account domain\administrator
Vserver: vs1
    Security Descriptor Name: sd1
        Allow or Deny: deny
        Account Name or SID: DOMAIN\Administrator
        Access Rights: full-control
    Advanced Access Rights: -
        Apply To: this-folder
        Access Rights: full-control
```

## vserver security file-directory ntfs dacl modify

Modify an NTFS security descriptor DACL entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory ntfs dacl modify` command modifies parameters in an existing discretionary access control (DACL) entry.

You can unambiguously define which DACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

You can modify the following parameters:

- `-right,-advanced-rights ,-rights-raw`
- `-apply-to`

### Parameters

#### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor containing the discretionary access control entry whose parameters you want to modify.

#### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor that contains the discretionary access control entry that you want to modify.

#### **-access-type {deny|allow} - Allow or Deny**

Specifies whether the discretionary access control entry that you want to modify is an *allow* or *deny* type of access control.

#### **-account <name or sid> - Account Name or SID**

Specifies the account associated with the discretionary access control entry you want to modify. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
  - \* SID
  - \* Domain\user-name
  - \* user-name@Domain
  - \* user-name@FQDN

If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

### **{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] -Access Rights**

Specifies the right that you want to add for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

### **| [-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)**

Specifies the raw rights that you want to add for the account specified in the `-account` parameter. The `-rights-raw` parameter is mutually exclusive with the `-advanced-rights` and `-rights` parameter. Specify the value as a hexadecimal integer, for example: `0xA10F` or `0xb3ff` etc.

### **| [-advanced-rights <Advanced access right>,...] - Advanced Access Rights }**

Specifies the advanced rights that you want to add for the account specified in the `-account` parameter. The `-advanced-rights` parameter is mutually exclusive with the `-rights` and `-rights-raw` parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

## **[*-apply-to* {*this-folder*|*sub-folders*|*files*}] - Apply DACL Entry**

Specifies where to apply the discretionary access control entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- *this-folder*
- *sub-folder*
- *files*

Select one of the following combinations of values for the *-apply-to* parameter for Storage-Level Access Guard (SLAG):

- *this-folder, sub-folder, files*
- *this-folder, sub-folder*
- *files*

If you specify an invalid *-apply-to* value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

## **Examples**

The following example modifies the *-right* and *-apply-to* parameters in the DACL entry associated to the security descriptor named “sd2” on Vserver vs1 for the “BUILTIN\Administrators” account.

```
cluster1::> vsserver security file-directory ntfs dacl modify -ntfs-sd sd2
-access-type allow -account BUILTIN\Administrators -vserver vs1 -rights
modify -apply-to this-folder,sub-folders
cluster1::> vsserver security file-directory ntfs dacl show -vserver vs1
-ntfs-sd sd2 -account BUILTIN\Administrators -instance
Vserver: vs1
    Security Descriptor Name: sd2
        Allow or Deny: allow
            Account Name or SID: BUILTIN\Administrators
                Access Rights: modify
                    Advanced Access Rights: -
                        Apply To: this-folder, sub-folders
                            Access Rights: modify
```

## **vsserver security file-directory ntfs dacl remove**

Remove a DACL entry from NTFS security descriptor.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory ntfs dacl remove` command removes a discretionary access control entry from a security descriptor.

You can unambiguously define which DACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the DACL entry
- Name of the security descriptor that contains the DACL entry
- Whether the DACL is an allow or deny type of DACL entry
- The account name or SID to which the DACL is applied

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor from which you want to remove a discretionary access control entry.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor that contains the discretionary access control entry that you want to remove.

### **-access-type {deny|allow} - Allow or Deny**

Specifies whether the discretionary access control entry you want to remove is an *allow* or *deny* of access control.

### **-account <name or sid> - Account Name or SID**

Specifies the account name or SID associated with the discretionary access control entry that you want to remove.

## Examples

The following example removes a DACL entry from the security descriptor named “sd2” with “allow” access type for the “BUILTIN\Administrators” account on Vserver vs1.

```
cluster1::> vserver security file-directory ntfs dacl remove -ntfs-sd sd2  
-access-type allow -account BUILTIN\Administrators -vserver vs1
```

## vserver security file-directory ntfs dacl show

Display NTFS security descriptor DACL entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver security file-directory ntfs dacl show` command displays information about all the discretionary access control entries in the Vserver. The command output depends on the parameter or

parameters specified with the command. If you do not specify any parameters, the command displays the following information about all DACL entries:

- Vserver name
- Security descriptor
- List of DACL entries

You can specify the `-fields` parameter to specify which fields of information to display about DACL entries.

You can specify the `-instance` parameter to display all information about DACL entries in a list format.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about discretionary access control entries associated with the specified Vserver.

**[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name**

If you specify this parameter, the command displays information only about the discretionary access control entries for the security descriptor that you specify.

**[-access-type {deny|allow}] - Allow or Deny**

If you specify this parameter, the command displays information only about the discretionary access control entries with the access type that you specify.

**[-account <name or sid>] - Account Name or SID**

If you specify this parameter, the command displays information only about the discretionary access control entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- +
  - \* SID
  - \* Domain\user-name
  - \* user-name@Domain
  - \* user-name@FQDN

If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

**[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights**

If you specify this parameter, the command displays information only about the discretionary access control entries with the user right that you specify. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

**[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)**

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: *0xA10F* or *0xb3ff* etc.

**[-advanced-rights <Advanced access right>,...] - Advanced Access Rights**

If you specify this parameter, the command displays information only about the discretionary access control entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

**[-apply-to {this-folder|sub-folders|files}] - Apply DACL Entry**

If you specify this parameter, the command displays information only about the discretionary access control entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder

- files

## **[~~-readable-access-rights~~ <TextNoCase>] - Access Rights**

If you specify this parameter, the command displays information only the discretionary access control entries with the readable access rights that you specify.

### **Examples**

The following example shows information about a DACL entry.

```
cluster1::> vserver security file-directory ntfs dacl show
Vserver: vs1
NTFS Security Descriptor Name: sd2
Account Name      Access      Access      Apply To
                  Type      Rights
-----
BUILTIN\Users      allow      full-control      this-folder,
sub-folders, files
CREATOR OWNER      allow      full-control      this-folder,
sub-folders, files
NT AUTHORITY\SYSTEM
                  allow      full-control      this-folder,
sub-folders, files
3 entries were displayed.
```

## **vserver security file-directory ntfs sacl add**

Add a SACL entry to NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver security file-directory ntfs sacl add` command adds system access control list entries (ACEs) into a security descriptor's system access control list (SACL).

If the security descriptor contains a SACL that has existing security ACEs, the command adds the new security ACE to the SACL. If the security descriptor does not contain a SACL, the command creates the SACL and adds the new security ACE to it.

Adding a SACL entry to the security descriptor is the second step in configuring and applying security ACLs to a file or folder. Before you can add a SACL entry to a security descriptor, you must first create the security descriptor.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACL and SACL entries to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding the SACL to the security descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create policy tasks.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

\* Apply a policy to the associated Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor to which you want to add a system access control list entry.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor to which you want to add a system access control list entry.

### **-access-type {failure|success} - Success or Failure**

Specifies whether the system access control list entry that you want to add is a *failure* or *success* access audit type.

### **-account <name or sid> - Account Name or SID**

Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

### **{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights**

Specifies the rights that you want to get audited for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify

- read-and-execute
- read
- write

#### **[`-advanced-rights` <Advanced access right>,...] - Advanced Access Rights }**

Specifies the advanced rights that you want to get audited for the account specified in the `-account` parameter. The `-advanced-rights` parameter is mutually exclusive with the `-rights` and `-rights -raw` parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

#### **[`-rights-raw` <Hex Integer>] - Raw Access Rights (privilege: advanced) }**

Specifies the raw rights that you want to get audited for the account specified in the `-account` parameter. The `-rights-raw` parameter is mutually exclusive with the `-advanced-rights` and `-rights` parameter. Specify the value as a hexadecimal integer, for example: `0xA10F` or `0xb3ff` etc.

#### **[`-apply-to` {`this-folder`|`sub-folders`|`files`}] - Apply SACL To**

Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

Select one of the following combinations of values for the `-apply-to` parameter for Storage-Level Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

## Examples

The following example adds a SACL entry to the security descriptor named “sd1” on Vserver vs1.

```
cluster1::> vsserver security file-directory ntfs sac1 add -ntfs-sd sd1
-access-type failure -account DOMAIN\Administrator -rights full-control
-apply-to this-folder -vserver vs1
cluster1::> vsserver security file-directory ntfs sac1 show -vserver vs1
-ntfs-sd sd1 -access-type deny -account DOMAIN\Administrator
Vserver: vs1
Security Descriptor Name: sd1
Access type for Specified Access Rights: failure
Account Name or SID:
DOMAIN\Administrator
Access Rights: full-control
Advanced Access Rights: -
Apply To: this-folder
Access Rights: full-control
```

## vserver security file-directory ntfs sac1 modify

### Modify an NTFS security descriptor SACL entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory ntfs sac1 modify` command modifies parameters in an existing system access control list entry.

You can unambiguously define which SACL entry to modify by specifying the following four parameters in the modify command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the SACL entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

You can modify the following parameters:

- -rights,-advanced-rights,-rights-raw
- -apply-to

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor containing the system access control list entry whose fields you want to modify.

### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor that contains the system access control list entry that you want to modify.

### **-access-type {failure|success} - Success or Failure**

Specifies whether the system access control list entry that you want to modify is a *failure* or *success* access audit type.

### **-account <name or sid> - Account Name or SID**

Specifies the account on which to apply the system access control list entry. You can specify the account by using a user name or SID. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of `-account`, keep in mind that the value for the user name is case insensitive.

### **{ [-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights**

Specifies the rights that you want to get audited for the account specified in the `-account` parameter. The `-rights` parameter is mutually exclusive with the `-advanced-rights` and `-rights-raw` parameter. If you specify the `-rights` parameter, you can only specify one value.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

### **| [-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)**

Specifies the raw rights that you want to get audited for the account specified in the `-account` parameter. The `-rights-raw` parameter is mutually exclusive with the `-advanced-rights` and `-rights`

parameter. Specify the value as a hexadecimal integer, for example: *0xA10F* or *0xb3ff* etc.

### **[`-advanced-rights` <Advanced access right>,...] - Advanced Access Rights }**

Specifies the advanced rights that you want to get audited for the account specified in the `-account` parameter. The `-advanced-rights` parameter is mutually exclusive with the `-rights` and `-rights -raw` parameter. You can specify more than one advanced-rights value by using a comma-delimited list.

You can specify one or more of the following advanced rights:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

### **[`-apply-to` {`this-folder`|`sub-folders`|`files`}] - Apply SACL To**

Specifies where to apply the system access control list entry. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

Select one of the following combinations of values for the `-apply-to` parameter for Storage-Level Access Guard (SLAG):

- this-folder, sub-folder, files
- this-folder, sub-folder
- files

If you specify an invalid `-apply-to` value, this security descriptor is removed from the associated Storage-Level Access Guard (SLAG) security file-directory policy task.

## Examples

The following example modifies the rights and -apply-to fields in the SACL entry.

```
cluster1::> vserver security file-directory ntfs sacl modify -ntfs-sd sd2
-access-type success -account BUILTIN\Administrators -vserver vs1 -rights
modify -apply-to this-folder,sub-folders
cluster1::> vserver security file-directory ntfs sacl show -vserver vs1
-ntfs-sd sd2 -account BUILTIN\Administrators -instance
Vserver: vs1
                        Security Descriptor Name: sd2
        Access type for Specified Access Rights: success
                        Account Name or SID:
BUILTIN\Administrators
                        Access Rights: modify
        Advanced Access Rights: -
                        Apply To: this-folder, sub-
folders
                        Access Rights: modify
```

## vserver security file-directory ntfs sacl remove

Remove a SACL entry from NTFS security descriptor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory ntfs sacl remove` command removes a system access control list entry from a security descriptor.

You can unambiguously define which SACL entry to remove by specifying the following four parameters in the command:

- Vserver associated with the security descriptor that contains the SACL entry
- Name of the security descriptor that contains the SACL entry
- Whether the SACL is a success or failure type of SACL entry
- The account name or SID to which the SACL is applied

### Parameters

#### **-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security descriptor from which you want to remove the system access control list entry.

#### **-ntfs-sd <ntfs sd name> - NTFS Security Descriptor Name**

Specifies the name of the security descriptor that contains the system access control list entry that you want to remove.

**-access-type {failure|success} - Success or Failure**

Specifies whether the system access control list entry that you want to remove is a *failure* or *success* access audit type.

**-account <name or sid> - Account Name or SID**

Specifies the account name or SID associated with the system access control list entry that you want to remove.

**Examples**

The following example removes a SACL entry named “sd2” on Vserver vs1 with an access type of “success” associated with the "BUILTIN\Administrators" account.

```
cluster1::> vsserver security file-directory ntfs sacl remove -ntfs-sd sd2  
-access-type success -account BUILTIN\Administrators -vsserver vs1
```

**vsserver security file-directory ntfs sacl show****Display NTFS security descriptor SACL entries**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vsserver security file-directory ntfs sacl show` command displays information about all the system access control list entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all SACL entries:

- Vserver name
- Security descriptor
- List of SACL entries

You can specify the `-fields` parameter to specify which fields of information to display about SACL entries.

You can specify the `-instance` parameter to display all information about SACL entries in a list format.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vsserver <vsserver name>] - Vserver**

If you specify this parameter, the command displays information only about system access control list entries associated with the specified Vserver.

### **[-ntfs-sd <ntfs sd name>] - NTFS Security Descriptor Name**

If you specify this parameter, the command displays information only about the system access control list entries for the security descriptor that you specify.

### **[-access-type {failure|success}] - Success or Failure**

If you specify this parameter, the command displays information only about the system access control list entries with the access type that you specify.

### **[-account <name or sid>] - Account Name or SID**

If you specify this parameter, the command displays information only about the system access control list entries associated with the account name or SID that you specify. You can use any of the following formats when specifying the value for this parameter:

- +
- \* SID
- \* Domain\user-name
- \* user-name@Domain
- \* user-name@FQDN

If you specify any of the three user name formats for the value of -account, keep in mind that the value for the user name is case insensitive.

### **[-rights {no-access|full-control|modify|read-and-execute|read|write}] - Access Rights**

If you specify this parameter, the command displays information only about the system access control list entries with the user right that you specify. The value for this parameter is mutually exclusive with any other rights values. Only one value can be specified.

You can specify one of the following rights values:

- no-access
- full-control
- modify
- read-and-execute
- read
- write

### **[-rights-raw <Hex Integer>] - Raw Access Rights (privilege: advanced)**

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. This value for this parameter is mutually exclusive with any other rights values. Specify the value as a hexadecimal integer, for example: *0xA10F* or *0xb3ff* etc.

### **[-advanced-rights <Advanced access right>,...] - Advanced Access Rights**

If you specify this parameter, the command displays information only about the system access control list entries with the advanced user rights that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following advanced rights values:

- read-data
- write-data
- append-data
- read-ea
- write-ea
- execute-file
- delete-child
- read-attr
- write-attr
- delete
- read-perm
- write-perm
- write-owner
- full-control

#### **[-apply-to {this-folder|sub-folders|files}] - Apply SACL To**

If you specify this parameter, the command displays information only about the system access control list entries with the -applied-to value or values that you specify. You can specify more than one value by using a comma-delimited list.

You can specify one or more of the following values:

- this-folder
- sub-folder
- files

#### **[-readable-access-rights <TextNoCase>] - Access Rights**

If you specify this parameter, the command displays information only about the system access control list entries with the readable access rights that you specify.

### **Examples**

The following example shows a SACL entry.

```
cluster1::> vserver security file-directory sacl show
              (vserver security file-directory ntfs sacl show)
Vserver: vs1
              NTFS Security Descriptor Name: sd1
Account Name  Access  Access  Apply To
              Type    Rights
-----
              domain\user  success  full-control  this-folder,
sub-folders, files
```

## vserver security file-directory policy create

### Create a file security policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver security file-directory policy create` command creates a security policy for a Vserver. A policy acts as a container for various tasks where each task is a single entry that can be applied to a file/folder.

Creating a security policy is the third step in configuring and applying security ACLs to a file or folder. You will later add tasks to the security policy.

You cannot modify a security policy. If you want to apply a policy with the same settings to a different Vserver, you must create a new policy with the same configuration and apply it to the desired Vserver.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLs to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLs to the security descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create policy tasks.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

\* Apply a policy to the associated Vserver.

#### Parameters

**-vserver <vserver name> - Vserver**

Specifies the name of the Vserver on which to create the security policy.

**-policy-name <Security policy name> - Policy Name**

Specifies the name of the security policy.

#### Examples

The following example creates a security policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy create -policy-name
policy1 -vserver vs1
cluster1::> vserver security file-directory policy show
Vserver      Policy Name
-----
vs1          policy1
```

## vserver security file-directory policy delete

Delete a file security policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The ``vserver security file-directory policy delete`` command deletes a security policy from a Vserver.

Deleting a policy fails if a job is currently running for the specified policy.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the name of the Vserver associated with the security policy that you want to delete.

**-policy-name <Security policy name> - Policy Name**

Specifies the name of the security policy you want to delete.

### Examples

The following example deletes a security policy named “policy1” from Vserver vs1.

```
cluster1::> vserver security file-directory policy delete -policy-name
policy1 -vserver vs1
```

## vserver security file-directory policy show

Display file security policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory policy show` command displays information about all security policies in the Vserver. The command output depends on the parameter or parameters specified with

the command.

You can specify the `-fields` parameter to specify which fields of information to display about security policies.

You can specify the `-instance` parameter to display information for all security policies in a list format.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about security policies associated with the specified Vserver.

**[-policy-name <Security policy name>] - Policy Name**

If you specify this parameter, the command displays information only about the security policy you specify.

**Examples**

The following example displays information about the security policies on the cluster.

```
cluster1::> vsriver security file-directory policy show
      Vserver      Policy Name
      -----      -
      vs1           policy1
      vs1           policy2
      2 entries were displayed.
```

**vsriver security file-directory policy task add**

**Add a policy task**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vsriver security file-directory policy task add` command adds a single task entry to a security policy. A task refers to a single operation that can be done by a security policy to a file/folder.

Before you create a security policy task, you must first create a security policy and a security descriptor. You should also add DACL entries and SACL entries (if desired) to the security descriptor before you create the security policy task.

You can add DACL and SACL entries to the security descriptor after you have associated it to a security policy task.

Creating a policy task is the fourth step in configuring and applying ACLs to a file or folder. When you create the policy task, you associate a security descriptor to it. You also associate the task to a security policy.

The steps to creating and applying NTFS ACLs are the following:

- Create an NTFS security descriptor.
- Add DACLS and SACLs to the NTFS security descriptor.

If you want to audit file and directory events, you must configure auditing on the Vserver in addition to adding SACLs to the Security Descriptor.

- Create a file/directory security policy.

This step associates the policy with a Vserver.

\* Create policy tasks.

A policy task refers to a single operation to apply to a file (or folder) or to a set of files (or folders). among other things, the task defines which security descriptor to apply to a path.

Adding a policy task fails if a job is currently running for the specified policy to which a task is being added.

- Apply a policy to the associated Vserver.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver associated with the security policy to which you want to add a task.

**-policy-name <Security policy name> - Policy Name**

Specifies the name of the security policy into which you want to add the task.

**-path <text> - Path**

Specifies the path of the file/folder on which to apply the security descriptor associated with this task. A path within the FlexCache volume is not supported.

**[-index-num <integer>] - Position**

Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

If you specify an index number that is already assigned to an existing task, index number will be auto arranged to highest index number in the table.

### **[`-security-type {ntfs|nfsv4}`] - Security Type of the File**

Specifies whether the security descriptor associated with this task is an NTFS or a NFSv4 security descriptor type. If you do not specify a value for this optional parameter, the default is “ntfs”.

The nfsv4 security descriptor type is not supported in this release. If you specify this optional parameter, you must enter ntfs for the `-security-type` value.

### **[`-ntfs-mode {propagate|ignore|replace}`] - Propagation Mode**

Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

You can specify one of the three parameter values that correspond to three types of propagation modes:

- `propagate` - propagate inheritable permissions to all subfolders and files
- `replace` - replace existing permissions on all subfolders and files with inheritable permissions
- `ignore` - do not allow permissions on this file or folder to be replaced

The `ntfs-mode` value is ignored for Storage-Level Access Guard (SLAG).

### **[`-ntfs-sd <ntfs sd name>,...`] - NTFS Security Descriptor Name**

Specifies the list of security descriptor names to apply to the path specified in the `-path` parameter.

### **[`-access-control {file-directory|slag}`] - Access Control Level**

Specifies the access control of the task to be applied. Valid values are *file-directory* or *slag*. Use the value *slag* to apply the specified security descriptors with the task for the volume or *qtree*. Otherwise, the security descriptors are applied on files and directories at the specified path. The value *slag* is not supported on FlexGroup volumes. The default value is *file-directory*.

## **Examples**

The following example adds a security policy task entry to the policy named “policy1” on Vserver vs1.

```
cluster1::> vserver security file-directory policy task add -vserver vs1
-policy-name policy1 -path / -access-control slag -security-type ntfs
-ntfs-mode propagate -ntfs-sd sd -index-num 1
cluster1::> vserver security file-directory policy task add -vserver vs1
-policy-name policy2 -path /1 -security-type ntfs -ntfs-mode propagate
-ntfs-sd sd1,sd2
cluster1::> vserver security file-directory policy task show
Vserver: vs1
Policy: policy1
Index  File/Folder  Access      Security  NTFS      NTFS Security
      Path        Control      Type      Mode
Descriptor Name
-----
1      /          slag      ntfs
propagate sd
Vserver: vs1
Policy: policy2
Index  File/Folder  Access      Security  NTFS      NTFS Security
      Path        Control      Type      Mode
Descriptor Name
-----
1      /1        file-directory ntfs
propagate sd1, sd2
```

## vserver security file-directory policy task modify

### Modify policy tasks

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security file-directory policy task modify` command modifies a task entry in a security policy.

Modifying a policy task fails if a job is currently running for the specified policy in which a task is being modified.

You can unambiguously define which task to modify by specifying the following three parameters in the modify command:

- Vserver associated with the task
- Name of the security policy that contains the task
- Name of the path to which the task is applied

You can modify the following parameters:

- `-ntfs-mode`
- `-ntfs-sd`
- `-index-num`

The only security type supported in this ONTAP release is `"ntfs"`; therefore, you cannot modify the `-security-type` parameter.

## Parameters

### `-vserver <vserver name> - Vserver`

Specifies the Vserver associated with the security policy that contains the task you want to modify.

### `-policy-name <Security policy name> - Policy Name`

Specifies the name of the security policy that contains the task you want to modify.

### `-path <text> - Path`

Specifies the path of the file/folder associated with the task that you want to modify. A path within the FlexCache volume is not supported.

### `[-index-num <integer>] - Position`

Specifies the index number of a task. Tasks are applied in order. A task with a larger index value is applied after a task with a lower index number. If you do not specify this optional parameter, new tasks are applied to the end of the index list.

The range of supported values is 1 through 9999. If there is a gap between the highest existing index number and the value entered for this parameter, the task with this number is considered to be the last task in the policy and is treated as having an index number of the previous highest index plus one.

If you specify an index number that is already assigned to an existing task, the command fails when you attempt to create a duplicate entry.

### `[-security-type {ntfs|nfsv4}] - Security Type`

Specifies whether the security descriptor in the task that you want to modify should be an NTFS security descriptor type or an NFSv4 security descriptor type. Default value is `ntfs`.

The `nfsv4` security descriptor type is not supported in this release. If you specify this optional parameter, you must enter `ntfs` for the `-security-type` value.

### `[-ntfs-mode {propagate|ignore|replace}] - NTFS Propagation Mode`

Specifies how to propagate security settings to child subfolders and files. This setting determines how child files and/or folders contained within a parent folder inherit access control and audit information from the parent folder.

You can specify one of the three parameter values that correspond to three types of propagation modes:

- `propagate` - propagate inheritable permissions to all subfolders and files
- `replace` - replace existing permissions on all subfolders and files with inheritable permissions

- ignore - do not allow permissions on this file or folder to be replaced

### **[-ntfs-sd <ntfs sd name>,...] - NTFS Security Descriptor Name**

Specifies the list of security descriptor names to apply to the path specified in the `-path` parameter.

### **Examples**

The following example modifies the ntfs mode, index, and ntfs-sd parameters in the security policy task entry.

```
cluster1::> vserver security file-directory policy task modify -vserver
vs1 -policy-name policy1 -path / -security-type ntfs -ntfs-mode propagate
-ntfs-sd sd -index-num 1
cluster1::> vserver security file-directory policy task modify -vserver
vs1 -policy-name policy1 -path /1 -security-type ntfs -ntfs-mode propagate
-ntfs-sd sd1, sd2 -index-num 2
cluster1::> vserver security file-directory policy task show -vserver vs1
-policy-name policy1
Vserver: vs1
```

|                    | Policy: policy1 |             |                |          |       |
|--------------------|-----------------|-------------|----------------|----------|-------|
|                    | Index           | File/Folder | Access         | Security | NTFS  |
| NTFS Security      |                 |             |                |          |       |
|                    |                 | Path        | Control        | Type     | Mode  |
| Descriptor Name    |                 |             |                |          |       |
|                    | -----           | -----       | -----          | -----    | ----- |
|                    | -----           |             |                |          |       |
|                    | 1               | /           | file-directory | ntfs     |       |
| propagate sd       |                 |             |                |          |       |
|                    | 2               | /1          | file-directory | ntfs     |       |
| propagate sd1, sd2 |                 |             |                |          |       |

## **vserver security file-directory policy task remove**

### **Remove a policy task**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver security file-directory policy task remove` command removes a task entry from a security policy.

Removing a policy task fails if a job is currently running for the specified policy from which a task is being removed.

### **Parameters**

**-vserver <vserver name> - Vserver**

Specifies the Vserver associated with the security policy that contains the task you want to remove.

**-policy-name <Security policy name> - Policy Name**

Specifies the name of the security policy that contains the task you want to remove.

**-path <text> - Path**

Specifies the path of the file/folder associated with the task that you want to remove. A path within the FlexCache volume is not supported.

**Examples**

The following example removes a security policy task entry.

```
cluster1::> vserver security file-directory policy task remove -vserver
vs1 -policy-name policy1 -path /
```

**vserver security file-directory policy task show****Display policy tasks**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver security file-directory policy task show` command displays information about all the task entries in the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all task entries:

- Vserver name
- Policy name
- Task entries

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only tasks associated with the specified Vserver.

**[-policy-name <Security policy name>] - Policy Name**

If you specify this parameter, the command displays information only about tasks associated with the specified security policy.

### **[-index-num <integer>] - Position**

If you specify this parameter, the command displays information only about tasks assigned the index number that you specify.

### **[-path <text>] - Path**

If you specify this parameter, the command displays information only about tasks applied to the specified path. A path within the FlexCache volume is not supported.

### **[-security-type {ntfs|nfsv4}] - Security Type**

If you specify this parameter, the command displays information only about tasks associated with the specified security type.

The nfsv4 security descriptor type is not supported in this release.

### **[-ntfs-mode {propagate|ignore|replace}] - NTFS Propagation Mode**

If you specify this parameter, the command displays information only about tasks configured with the NTFS propagation mode that you specify.

### **[-ntfs-sd <ntfs sd name>,...] - NTFS Security Descriptor Name**

If you specify this parameter, the command displays information only about the policy tasks associated with the NTFS security descriptor that you specify.

### **[-access-control {file-directory|slag}] - Access Control Level**

If you specify this parameter, the command displays information only about tasks associated to the access control.

## **Examples**

The following example displays policy task entries for a policy named “policy1” on Vserver vs1.

```
cluster1::> vsserver security file-directory policy task show -vsserver vs1
-policy-name policy1
Vserver: vs1

Policy: policy1
Index  File/Folder  Access      Security  NTFS      NTFS Security
      Path      Control      Type      Mode
Descriptor Name
-----
1      /1      file-directory  ntfs      propagate
sd1, sd2
2      /2      file-directory  ntfs      ignore
-
2 entries were displayed.
```

## vserver security trace filter create

### Create a security trace entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security trace filter create` command creates a security trace filter entry. Prior to ONTAP 9.3, this feature was only supported for CIFS. In ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which the permission trace is applied.

#### **-index <integer> - Filter Index**

This parameter specifies the index number you want to assign to the trace filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

#### **[-protocols {cifs|nfs}] - Protocols**

This parameter specifies the protocols for which the permission trace is created. If the `-protocols` parameter is not specified, the filter will only apply to the CIFS protocol.

#### **[-client-ip <IP Address>] - Client IP Address to Match**

This parameter specifies the IP Address from which the user is accessing the Vserver.

#### **[-path <TextNoCase>] - Path**

This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

#### **{ [-windows-name <TextNoCase>] - Windows User Name**

This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:

- user\_name
- domain\user\_name

#### **| [-unix-name <TextNoCase>] - UNIX User Name or User ID }**

This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

#### **[-trace-allow {yes|no}] - Trace Allow Events**

Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

### **[-enabled {enabled|disabled}] - Filter Enabled**

This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

### **[-time-enabled <integer>] - Minutes Filter is Enabled**

This parameter specifies a timeout for this filter, after which it is deleted.

## **Examples**

The following example creates a security trace filter.

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-time-enabled 120 -client-ip 10.72.205.207
```

The following examples create filters that include the -path option, these filters are deleted when the time specified in the time enabled field elapses. The default value for the time-enabled option is 60 min. If the client is accessing a file with the path \\server\sharename\dir1\dir2\dir3\file.txt, for a filter applicable to CIFS, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-path /dir1/dir2/dir3/file.txt
```

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-path dir3/file.txt
```

Similarly, while creating a filter for NFS, if -path option is specified and the client is accessing a file with path /junction\_path1/junction\_path2/dir1/file.txt, a complete path starting from the last junction path or a partial path can be given as shown:

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-protocols nfs -path dir1/file.txt
```

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-protocols nfs -path file.txt
```

The following example creates a filter that is applicable to both CIFS and NFS.

```
cluster1::> vservers security trace filter create -vservers vs0 -index 1
-protocols cifs,nfs -unix-user root
```

## vserver security trace filter delete

Delete a security trace entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security trace filter delete` command deletes a security trace filter entry. Prior to ONTAP 9.3, this feature was only supported for CIFS. In ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which the tracing filter entry that you want to delete is applied.

#### **-index <integer> - Filter Index**

This parameter specifies the index number for the filter that you want to delete. You can display a list of the filter index numbers by using the [vserver security trace filter show](#) command.

### Examples

The following example deletes a security trace filter.

```
cluster1::> vserver security trace filter delete -vserver vs0 -index 1
```

## vserver security trace filter modify

Modify a security trace entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security trace filter modify` command modifies a security trace filter entry. Prior to ONTAP 9.3, this feature was only supported for CIFS. In ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which the permission trace is applied.

### **-index <integer> - Filter Index**

This parameter specifies the index number for the filter. A maximum of 10 entries can be created. The allowed values for this parameter are 1 through 10.

### **[-protocols {cifs|nfs}] - Protocols**

This parameter specifies the protocols for which the permission trace is created.

### **[-client-ip <IP Address>] - Client IP Address to Match**

This parameter specifies the IP Address from which the user is accessing the Vserver.

### **[-path <TextNoCase>] - Path**

This parameter specifies the path to which permission tracing is applied. The value can be the complete path, starting from the root of the share (for a CIFS filter) or the root of the junction path (for an NFS filter) that the client is accessing, or the value can be a part of the path that the client is accessing. Use NFS style directory separators in the path value.

### **{ [-windows-name <TextNoCase>] - Windows User Name**

This parameter specifies the Windows user name to trace. You can use any of the following formats when specifying the value for this parameter:

- user\_name
- domain\user\_name

### **| [-unix-name <TextNoCase>] - UNIX User Name or User ID }**

This parameter specifies the UNIX user name to trace. It accepts UNIX user ID only for NFS filters.

### **[-trace-allow {yes|no}] - Trace Allow Events**

Security tracing can trace deny events and allow events. Deny event tracing is always ON by default. Allow events can optionally be traced. If set to yes, this option allows tracing of allow events. If set to no, allow events are not traced.

### **[-enabled {enabled|disabled}] - Filter Enabled**

This parameter specifies whether to enable or disable the filter. Filters are enabled by default.

### **[-time-enabled <integer>] - Minutes Filter is Enabled**

This parameter specifies a timeout for this filter, after which it is deleted.

## Examples

The following example modifies a security trace filter.

```
cluster1::> vsriver security trace filter modify -vserver vs0 -index 1
-time-enabled 120 -client-ip 10.72.205.207
```

The following examples modify filters that include the `-path` option. If the client is accessing a file with the path `\\server\sharename\dir1\dir2\dir3\file.txt`, for a filter applicable to CIFS, a complete path starting from the root of the share or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1  
-path /dir1/dir2/dir3/file.txt
```

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1  
-path dir3/file.txt
```

Similarly, for filters applicable to NFS, if `-path` option is specified and the client is accessing a file with path `/junction_path1/junction_path2/dir1/file.txt`, a complete path starting from the last junction path or a partial path can be given as shown:

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1  
-protocols nfs -path dir1/file.txt
```

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1  
-protocols nfs -path file.txt
```

The following example modifies a filter that is applicable to both CIFS and NFS.

```
cluster1::> vserver security trace filter modify -vserver vs0 -index 1  
-protocols cifs,nfs -unix-user root -path file.txt
```

## vserver security trace filter show

Display a security trace entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver security trace filter show` command displays information about security trace filter entries. Prior to ONTAP 9.3, this feature was only supported for CIFS. In ONTAP 9.3 and later, this feature is supported for both NFS and CIFS.

NFS security trace filters are not supported for FlexGroup volumes, and will only be applied to the FlexVol volumes within the specified Vserver.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Vserver.

**[-index <integer>] - Filter Index**

If you specify this parameter, the command displays permission tracing information only for filters with the specified filter index number.

**[-protocols {cifs|nfs}] - Protocols**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified protocols.

**[-client-ip <IP Address>] - Client IP Address to Match**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified client IP address.

**[-path <TextNoCase>] - Path**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified path.

**[-windows-name <TextNoCase>] - Windows User Name**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified Windows user name.

**[-unix-name <TextNoCase>] - UNIX User Name or User ID**

If you specify this parameter, the command displays permission tracing information only for filters applied to the specified UNIX user name or user ID (for NFS specific filters).

**[-trace-allow {yes|no}] - Trace Allow Events**

If you specify this parameter, the command displays information only about events that either trace or do not trace allow events, depending on the value provided.

**[-enabled {enabled|disabled}] - Filter Enabled**

If you specify this parameter, the command displays information only about filters that either are enabled or disabled, depending on the value provided.

**[-time-enabled <integer>] - Minutes Filter is Enabled**

If you specify this parameter, the command displays information about the time durations configured for filters during creation.

## Examples

The following example displays security trace filters for Vserver `vserver1`.

```
cluster1::> vservers security trace filter show
Vserver Index Client-IP Path Trace-Allow Windows-Name
Protocol
-----
vserver1 1 - - no domain\user
cifs
vserver1 2 192.168.2.3 - yes -
cifs
vserver1 3 - /dir1/dir2/file no domain\
cifs administrator
vserver1 4 - file yes - nfs
4 entries were displayed.
```

## vservers security trace trace-result delete

### Delete security trace results

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Delete the specified security tracing event record.

### Parameters

#### **-node {<nodename>|local} - Node**

This parameter specifies the cluster node on which the permission tracing event that you want to delete occurred.

#### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the permission tracing event that you want to delete occurred.

#### **-seqnum <integer> - Sequence Number**

This parameter specifies the sequence number of the log entry to be deleted.

### Examples

The following example deletes the security trace result record for the Vserver ``\_vserver\_1\_`` on node ``\_Node\_1\_`` whose sequence number is ``\_999\_``.

```
cluster1::> vsserver security trace trace-result delete -vsserver vsserver_1
-node Node_1 -seqnum 999
```

## vsserver security trace trace-result show

### Display security trace results

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver security trace trace-result show` command displays the list of security trace event records stored on the cluster. These records are generated in response to security trace filters that are created using the [vsserver security trace filter create](#) command. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the security trace events generated since the filter was enabled:

- Vserver name
- Cluster node name
- Security trace filter index number
- User name
- Security style
- Path
- Reason

You can specify additional parameters to display only information that match those parameters. For example, to display information about events that occurred for the user "guest", run the command with `-user-name` parameter set to ```_guest_```.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify this parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify this parameter, the command displays detailed information about all security trace events.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about security trace events on the specified node.

**[-vsserver <vsserver name>] - Vserver**

If you specify this parameter, the command displays information only about security trace events on the specified Vserver.

**[`-seqnum` <integer>] - Sequence Number**

If you specify this parameter, the command displays information only about the security trace events with this sequence number.

**[`-keytime` <Date>] - Time**

If you specify this parameter, the command displays information only about security trace events that occurred at the specified time.

**[`-index` <integer>] - Index of the Filter**

If you specify this parameter, the command displays information only about security trace events that occurred as a result of the filter corresponding to the specified filter index number.

**[`-client-ip` <IP Address>] - Client IP Address**

If you specify this parameter, the command displays information only about security trace events that occurred as a result of file access from the specified client IP address.

**[`-path` <TextNoCase>] - Path of the File Being Accessed**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file accesses to the specified path.

**[`-win-user` <TextNoCase>] - Windows User Name**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified Windows user.

**[`-security-style` <security style>] - Effective Security Style On File**

If you specify this parameter, the command displays information only about the security trace events that occurred on file systems with the specified security style. The allowed values for security style are the following:

- SECURITY\_NONE - Security not Set
- SECURITY\_UNIX\_MODEBITS - UNIX and UNIX permissions
- SECURITY\_UNIX\_ACL - UNIX and NFSv4 ACL
- SECURITY\_UNIX\_SD - UNIX and NT ACL
- SECURITY\_MIXED\_MODEBITS - MIXED and UNIX permissions
- SECURITY\_MIXED\_ACL - MIXED and NFSv4 ACL
- SECURITY\_MIXED\_SD - MIXED and NT ACL
- SECURITY\_NTFS\_MODEBITS - NTFS and UNIX permissions
- SECURITY\_NTFS\_ACL - NTFS and NT ACL
- SECURITY\_NTFS\_SD - NTFS and NT ACL
- SECURITY\_UNIX - UNIX
- SECURITY\_MIXED - MIXED
- SECURITY\_NTFS - NTFS
- SECURITY\_MODEBITS - UNIX permissions
- SECURITY\_ACL - ACL
- SECURITY\_SD - SD

## **[-result <TextNoCase>] - Result of Security Checks**

If you specify this parameter, the command displays information about the security trace events that have the specified result. Access to a file or a directory can be 'allowed' or 'denied'. Output from this command displays the result as a combination of the reason for allowing or denying access, the location where access is either allowed or denied, and the access right for which the file operation is allowed or denied.

The following are the reasons why an access can be allowed:

- +
- \* Access is allowed because the operation is trusted and no security is configured
- \* Access is allowed because the user has UNIX root privileges
- \* Access is allowed because the user has UNIX owner privileges
- \* Access is allowed because UNIX implicit permission grants requested access
- \* Access is allowed because the CIFS user is owner
- \* Access is allowed because the user has take ownership privilege
- \* Access is allowed because there is no CIFS ACL
- \* Access is allowed because CIFS implicit permission grants requested access
- \* Access is allowed because the security descriptor is corrupted and the user is a member of the Administrators group
- \* Access is allowed because the ACL is corrupted and the user is a member of the Administrators group
- \* Access is allowed because the user has UNIX permissions
- \* Access is allowed because explicit ACE grants requested access
- \* Access is allowed because the user has audit privileges
- \* Access is allowed because the user has superuser credentials
- \* Access is allowed because inherited ACE grants requested access
- \* Access is allowed because storage-level access guard (SLAG) grants requested access
- \* Access is allowed because no central access policies applied
- \* Access is allowed because no central access policies could be applied from the corrupt SACL
- \* Access is allowed because matching central access policy could not be located
- \* Access is allowed because no central access rules apply to the object
- \* Access is allowed because skipped one or more corrupt central access rules
- \* Access is allowed because all evaluated central access rules grant access

+

The following are the reasons why an access can be denied:

- +
- Access is denied by UNIX permissions
- Access is denied by an explicit ACE
- Access is denied. The requested permissions are not granted by the ACE
- Access is denied. The security descriptor is corrupted
- Access is denied. The ACL is corrupted
- Access is denied. The sticky bit is set on the parent directory and the user is not the owner of file or parent directory
- Access is denied. The owner can be changed only by root
- Access is denied. The UNIX permissions/uid/gid/NFSv4 ACL can be changed only by owner or root
- Access is denied. The GID can be set by owner to a member of its legal group list only if 'Owner can chown' is not set
- Access is denied. The file or the directory has readonly bit set

- Access is denied. There is no audit privilege
- Access is denied. Enforce DOS bits blocks the access
- Access is denied. Hidden attribute is set
- Access is denied by an inherited ACE
- Access is denied as the volume is readonly or directory is a snapshot
- Access is denied. System attribute is not set in the request
- Access is denied by the storage-level access guard (SLAG)
- Access is denied, file is infected
- Access is denied. Central access policy DB not ready
- Access is denied. Central access rule is corrupt
- Access is denied. Central access rule explicitly denied access
- Access is denied. Matching central access policy not found
- Access is denied because the user does not have UNIX root privileges
- Access is denied because the UNIX user could not be mapped to a valid NT user
- Access is denied because the UNIX permissions/uid/gid/NFSv4 ACL cannot be set in an NTFS qtree

The command or the location at which access was denied or allowed are as follows:

- while traversing the directory.
- while truncating the file.
- while creating the directory.
- while creating the file.
- while checking parent's mode bits during delete.
- while deleting the child.
- while checking for child-delete access on the parent.
- while reading security descriptor.
- while accessing the link.
- while creating the directory.
- while creating or writing the file.
- while opening existing file or directory.
- while setting the attributes.
- while traversing the directory.
- while reading the file.
- while reading the directory.
- while deleting the target during rename.
- while deleting the child during rename.
- while writing data in the parent during rename.
- while adding a directory during rename.

- while adding a file during rename.
- while updating the target directory during rename.
- while setting attributes.
- while writing to the file.
- while extending the coral file.
- while creating the vdisk file.
- while checking for stale locks before open.
- while deleting a file or a directory.
- while truncating a hidden file.
- while truncating a file.
- while truncating a system file.
- while appending to a file or setting a file attribute.
- while opening a file or directory for delete.
- while checking for permission on parent directory during create.
- while appending to the file.
- while creating the device file.
- while reading the user's access rights on an object.

The access rights for which the file operation is allowed or denied are as follows:

+

- Append.
- Delete.
- Delete Child.
- Execute.
- Generic All.
- Generic Execute.
- Generic Read.
- Generic Write.
- Maximum Allowed.
- Read.
- Read Attributes.
- Read Control.
- Read EA.
- System Security.
- Synchronize.
- Write.
- Write Attributes.

- Write DAC.
- Write EA.
- Write Owner.
- None.

**[`-unix-user` <TextNoCase>] - UNIX User Name**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified UNIX user.

**[`-session-id` <integer>] - CIFS Session ID**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS session ID.

**[`-share-name` <TextNoCase>] - Accessed CIFS Share Name**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified CIFS share name.

**[`-protocol` {`cifs`|`nfs`}] - Protocol**

If you specify this parameter, the command displays information only about the security trace events that occurred for the specified protocol.

**[`-volume-name` <TextNoCase>] - Accessed Volume Name**

If you specify this parameter, the command displays information only about the security trace events that occurred as a result of file access by the specified volume name.

## Examples

The following example displays information about security trace records:

```
cluster1::> vserver security trace trace-result show
Vserver: vserver_1
```

| Node        | Index | Filter Details        | Reason             |
|-------------|-------|-----------------------|--------------------|
| cluster1-01 | 1     | Security Style: MIXED | Access is allowed  |
| because     |       | and NT ACL            | CIFS implicit      |
| permission  |       |                       | grants requested   |
| access      |       |                       | while opening      |
| existing    |       |                       | file or directory. |
| for:        |       |                       | Access is granted  |
|             |       |                       | "Read Attributes"  |
|             |       | Protocol: cifs        |                    |
|             |       | Share: sh1            |                    |
|             |       | Path: /stk/bit        |                    |
|             |       | Win-User: cifs1\      |                    |
|             |       | administrator         |                    |
|             |       | Unix-User: root       |                    |
|             |       | Session-ID: 58455810  |                    |

1 entries were displayed.

The following example displays information about security trace records for path /stk/bit/set:

```
cluster1::> vserver security trace trace-result show -path /stk/bit/set
```

```
Vserver: vserver_1
```

| Node        | Index | Filter Details        | Reason            |
|-------------|-------|-----------------------|-------------------|
| cluster1-01 | 1     | Security Style: MIXED | Access is allowed |
| because     |       | and UNIX permissions  | the user has UNIX |
| root        |       |                       | privileges while  |
| opening     |       |                       | existing file or  |
|             |       |                       | directory.        |

|                |   |                                         |
|----------------|---|-----------------------------------------|
|                |   | Access is granted                       |
| for: "Read"    |   |                                         |
|                |   | Protocol: cifs                          |
|                |   | Share: sh1                              |
|                |   | Path: /stk/bit/set                      |
|                |   | Win-User: cifs1\                        |
|                |   | administrator                           |
|                |   | UNIX-User: root                         |
|                |   | Session-ID: 75435293758455810           |
| cluster1-01    | 1 | Security Style: MIXED Access is denied. |
| The            |   |                                         |
|                |   | and NT ACL                              |
| permissions    |   | requested                               |
|                |   | are not granted by                      |
| the            |   | ACE while checking                      |
| for            |   | child-delete access                     |
| on             |   | the parent. Access                      |
| is not         |   | granted for:                            |
| "Delete Child" |   |                                         |
|                |   | Protocol: cifs                          |
|                |   | Share: sh1                              |
|                |   | Path: /stk/bit/set                      |
|                |   | Win-User: cifs1\                        |
|                |   | administrator                           |
|                |   | UNIX-User: root                         |
|                |   | Session-ID: 75435293758455324           |
| cluster1-01    | 1 | Security Style: MIXED Access is allowed |
| because        |   |                                         |
|                |   | and NT ACL                              |
| owner.         |   | the CIFS user is                        |
|                |   | Access is denied by                     |
| an             |   | explicit ACE while                      |
|                |   | setting the                             |
| attributes.    |   | Access is not                           |
| granted for:   |   | "Read Attributes"                       |
| Protocol: cifs |   |                                         |

# vserver services commands

## vserver services access-check authentication get-claim-name

Get the Name of a Claim

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services access-check authentication get-claim-name` command obtains the display name for a given claim.

## Parameters

**[-node {<nodename>|local}] - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver Name (privilege: advanced)**

The name of the Vserver.

**-claim-cn <text> - Claim CN (privilege: advanced)**

The claim ID of the claim display name.

## Examples

This example gets the display name of a claim for the CIFS server created on Vserver vs2

```
cluster1::vserver services access-check*> authentication get-dc-info -node  
vsim1 -vserver vs2 -claim-cn ad://ext/accountExpires:88d065c21536d9fe  
  
Name of claim ad://ext/accountExpires:88d065c21536d9fe: accountExpires
```

## vserver services access-check authentication get-dc-info

### Get Domain Controller Information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication get-dc-info` command obtains information about one of the Domain Controllers (DC) for the domain of which the CIFS server is a member. The information fetched is the Forest and Domain of which the DC is a member, the NetBIOS name of the Domain, the NetBIOS Hostname of the DC, the CIFS Server site, the CIFS Client site, GUID of the domain and flags. Flags describe the features and roles of the DC.

### Parameters

**[`-node {<nodename>|local}`}] - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver>` - Vserver Name (privilege: advanced)**

The name of the Vserver.

### Examples

This example gets the information about a Domain Controller for CIFS server created on Vserver vs2.

```
cluster1::vserver services access-check*> authentication get-dc-info -node
vsim2-dl-01 -vserver vs2
DC Information:
-----
      Forest: cifs.lab.netapp.com
      Domain: cifs.lab.netapp.com
NetBIOS Name: CIFSLAB
NetBIOS Hostname: A7-6
      Server Site: cifs-dev-j4
      Client Site:
          GUID: 0366BE1F-FA08-4747-B5AC56097189C90E
          Flags: 0x00000178
                  DS_LDAP_FLAG
                  DS_DS_FLAG
                  DS_KDC_FLAG
                  DS_TIMESERV_FLAG
                  DS_WRITABLE_FLAG
                  DS_PING_FLAGS
```

## vserver services access-check authentication login-cifs

### Authenticate a CIFS user

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication login-cifs` command authenticates a Windows user through the specified node using the specified Vserver's configuration. Upon success, it displays the user's Windows and UNIX credentials.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of a Vserver with a configured CIFS server.

**-user <text> - Windows Name (privilege: advanced)**

The name of a user that is a member of the Windows or a trusted domain that the CIFS server in the specified Vserver belongs to.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

## Examples

This example authenticates the Windows user "administrator" through node "node2" using the configuration of "vs1." Upon success, it displays the Windows and UNIX credentials for user "administrator."

```
cluster1::vserver services access-check*> authentication login-cifs
-vserver vs1 -user administrator -node node2

Enter the password:

## vserver services access-check authentication ontap-admin-ldap-fastbind

Authenticate Data ONTAP admin CIFS user

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication ontap-admin-ldap-fastbind` command authenticates the ONTAP administrator's user through the specified node using LDAP fast bind mechanism. It uses the LDAP client configuration of the specified Vserver.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of the Vserver with LDAP configuration.

**-user <text> - User Name (privilege: advanced)**

The name of the user present in LDAP server.

## Examples

This example authenticates the ONTAP administrator user "administrator" through node "node2" using the LDAP configuration of Vserver "vs1".

```
cluster1::vserver services access-check*> authentication ontap-admin-ldap-  
fastbind -vserver vs1 -user administrator -node node2
```

```
Enter the password:  
Authentication Succeeded.
```

## **vserver services access-check authentication ontap-admin-login-cifs**

### Authenticate Data ONTAP admin CIFS user

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### **Description**

The `vserver services access-check authentication ontap-admin-login-cifs` command authenticates the ONTAP administrator's user through the specified node using the specified Vserver's configuration. Upon success, it displays the user's Windows credentials.

#### **Parameters**

**[`-node {<nodename>|local}`]} - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver>` - Vserver (privilege: advanced)**

The name of a Vserver with a configured CIFS server.

**`-user <text>` - User Name (privilege: advanced)**

The name of a user that is a member of the Windows or a trusted domain that the CIFS server in the specified Vserver belongs to.

**[`-clientIp <IP Address>`] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

#### **Examples**

This example authenticates the ONTAP administrator user "administrator" through node "node2" using the configuration of Vserver "vs1." Upon success, it displays the CIFS credentials for "administrator."

```
cluster1::vserver services access-check*> authentication ontap-admin-  
login-cifs -vserver vs1 -user administrator -node node2
```

Enter the password:

Domain: S-1-5 Rids: 11, 2

Authentication Succeeded.

## vserver services access-check authentication show-creds

Display a user's credentials based on a UNIX UID or Windows SID or S3 User Name

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication show-creds` command returns the credentials for a Windows user using SID, a Windows user using a Windows username, a UNIX user using UID, or a UNIX user using a UNIX user name. This command is useful for retrieving information such as account type, SIDs, UIDs, GIDs, privileges, and domain or group membership.

### Parameters

**[`-node` {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver` <vserver> - Vserver (privilege: advanced)**

The command displays information for the specified Vserver.

**{ `-uid` <integer> - UID (privilege: advanced)**

The UNIX user's UID.

**| `-sid` <text> - SID (privilege: advanced)**

The Windows user's SID.

**| `-unix-user-name` <text> - Unix User Name (privilege: advanced)**

The UNIX username.

**| `-win-name` <text> - Windows Name (privilege: advanced)**

The Windows username.

**| `-s3-user-name` <text> - S3 User Name (privilege: advanced) }**

The S3 username.

**[-list-name {true|false}] - Display Translated Names (privilege: advanced)**

If this parameter is specified, the command displays information as translated names.

**[-list-id {true|false}] - Display IDs (privilege: advanced)**

If this parameter is specified, the command displays information as IDs.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

**[-skip-domain-group {true|false}] - Skip Domain Groups (privilege: advanced)**

If this parameter is specified, Windows domain group membership will not be fetched and only local group membership will be displayed, if any.

**[-show-partial-unix-creds {true|false}] - Display Partial UNIX Credentials (privilege: advanced)**

If this parameter is specified, partial UNIX credentials will be displayed. This can be useful in cases where ONTAP is able to fetch the UNIX credentials, but failed to fetch the Windows credentials.

## Examples

This example returns credential information for UNIX user with UID "0" on node "node1" for Vserver "vs1."

```
cluster1::*> vserver services access-check authentication show-creds -node
node1 -vserver vs1 -uid 0
(vserver services access-check authentication show-creds)
UNIX UID: root <> Windows User: CIFSQA\Administrator (User)

## vserver services access-check authentication show-ontap-admin-unix-creds

Display Data ONTAP admin Unix credentials based on username or user ID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication show-ontap-admin-unix-creds` uses the Vserver's ns-switch configuration to determine and display ONTAP administrator's UNIX information.

### Parameters

**[`-node` {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver` <vserver> - Vserver (privilege: advanced)**

The name of the Vserver.

**{ `-unix-user-name` <text> - Unix User Name (privilege: advanced)**

The UNIX username.

**| `-uid` <integer> - Unix User ID (privilege: advanced) }**

The UID of a UNIX user.

## Examples

This example shows ONTAP administrator's UNIX user's UID, GID, home directory, and login shell for user "root" on Vserver "vs1" for node "node2."

```
cluster1::vserver services access-check*> authentication show-ontap-admin-  
unix-creds -vserver vs1 -unix-user-name root -node node2  
    User ID: 0  
    Group ID: 1  
Home Directory: /  
    Login Shell: /bin/csh
```

## vserver services access-check authentication show-unix-ext-creds

Display a user's UNIX extended credentials based on a UNIX UID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication show-unix-ext-creds` command returns the credentials for a UNIX user using UID. This command is useful for retrieving information such as UIDs and GIDs.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

The command displays information for the specified Vserver.

**-uid <integer> - UID (privilege: advanced)**

The UNIX user's UID.

**[-ext-groups-limit <integer>] - Extended Groups Limit (privilege: advanced)**

The maximum number of GIDs to be fetched. The range is 32 to 1024. The default value is 32.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

## Examples

This example returns credential information for UNIX user with UID "100" on node "node1" for Vserver "vs1."

```
cluster1::*> vserver services access-check authentication show-unix-ext-
creds -node node1 -vserver vs1 -uid 100
(vserver services access-check authentication show-unix-ext-creds)
UNIX UID: 100 (user1)
  UNIX GID: 200 (group1)
  Additional GIDs (Count: 2): 200  201
```

## vserver services access-check authentication sid-to-uid

Translate a Windows SID to a UNIX user ID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication sid-to-uid` translates a Windows SID to a UNIX UID.

### Parameters

**[-node {<nodename>|local}] - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver Name (privilege: advanced)**

The name of the Vserver.

**-sid <text> - Windows SID (privilege: advanced)**

The SID of a Windows user.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

### Examples

This example translates a Windows SID on node "node2" and returns the corresponding UNIX user's UID.

```
cluster1::vserver services access-check*> sid-to-uid -vserver vs1 -sid S-
1-5-21-1407423728-2963865486-1834115207-500 -node node2
UID: 0
```

## vserver services access-check authentication sid-to-unix-name

Translate a Windows SID to a UNIX User Name

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services access-check authentication sid-to-unix-name` translates a Windows SID to a UNIX Name.

## Parameters

**`[-node {<nodename>|local}]` - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver>` - Vserver Name (privilege: advanced)**

The name of the Vserver.

**`-sid <text>` - Windows SID (privilege: advanced)**

The Windows SID which is to be translated to the corresponding UNIX name.

## Examples

This example translates a Windows SID on node "node2" and returns the corresponding UNIX name.

```
cluster1::vserver services access-check*> sid-to-unix-name -node node2
-vserver vs1 -sid S-1-5-21-1407423728-2963865486-1834115207-500
    SID Type: User
    UNIX Name: test
    Domain Name: TESTDOMAIN
    Windows Name: test
```

## vserver services access-check authentication translate

Translate between Various Names and Their Identifiers

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services access-check authentication translate` command translates SIDs, UIDs, and GIDs to names. If you enter a SID, the command returns a Windows name; if you enter a Windows name, the command returns a SID; if you enter a UNIX username, the command returns a UID; if you enter a UID, the command returns a UNIX username; if you enter a GID, the command returns a UNIX group name; if you enter a UNIX group-name, the command returns a GID.

## Parameters

**`[-node {<nodename>|local}]` - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver>` - Vserver Name (privilege: advanced)**

The name of the Vserver.

**{ -uid <integer> - UNIX User ID (privilege: advanced)**

The UNIX user's UID.

**| -gid <integer> - UNIX Group ID (privilege: advanced)**

The UNIX user's GID.

**| -sid <text> - Windows SID (privilege: advanced)**

The Windows user's SID.

**| -unix-user-name <text> - UNIX User Name (privilege: advanced)**

The UNIX username.

**| -unix-group-name <text> - UNIX Group Name (privilege: advanced)**

The UNIX group name.

**| -win-name <text> - Windows Name (privilege: advanced) }**

The Windows name.

## Examples

This example translates the UNIX UID 0 to username "root" on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate
-vserver vs1 -uid 0 -node node2
root
```

This example translates and the Windows username "administrator" to the corresponding SID on node "node2" for Vserver "vs1."

```
cluster1::vserver services access-check*> authentication translate
-vserver vs1 -win-name administrator -node node2
S-1-5-21-1407423728-2963865486-1834115207-500
```

## vserver services access-check authentication uid-to-sid

Translate a UNIX user ID to a Windows SID

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check authentication uid-to-sid` translates a UNIX UID to a Windows SID.

### Parameters

**[-node {<nodename>|local}] - Node Name (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver Name (privilege: advanced)**

The name of the Vserver.

**-uid <integer> - UNIX User ID (privilege: advanced)**

The user ID of a UNIX user.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

## Examples

This example translates a UNIX user's UID on node "node2" and returns the corresponding SID.

```
cluster1::vserver services access-check*> uid-to-sid -vserver vs1 -uid 0
-node node2
SID: S-1-5-21-1407423728-2963865486-1834115207-500
```

## vserver services access-check dns forward-lookup

Perform DNS forward lookup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check dns forward-lookup` returns the IP address of a hostname based on the lookup done on the DNS server specified or the Vserver's DNS configuration.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

This specifies the name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

This specifies the name of the Vserver.

**-hostname <text> - Hostname (privilege: advanced)**

This specifies the hostname to be looked up on the DNS server.

**[-lookup-type {ipv4|ipv6|all}] - Lookup Type (default: all) (privilege: advanced)**

This specifies the type of IP address to be looked up on the DNS server. If you specify "all", it looks up both IPv4 and IPv6 addresses.

## Examples

The following example returns the IPv6 addresses of the hostname "example" in Vserver "vs1" from the node "node2".

```
cluster1::vserver services access-check*> dns forward-lookup -vserver vs1
-node node2
-domains example.com -name-servers 10.72.46.234 -hostname example -lookup
-type ipv6
6ffe::1
3ffe::1
```

## vserver services access-check dns srv-lookup

Perform DNS lookup for SRV records

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check dns srv-lookup` returns the IP addresses of a host that is providing the specified service in the network, based on the SRV record lookup done on the Vserver's DNS server.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

This specifies the name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

This specifies the name of the Vserver.

**[-name-servers <IP Address>, ...] - (DEPRECATED)-Name Servers (privilege: advanced)**

This specifies the DNS servers in which the hostname lookup needs to be done.

**-lookup-string <text> - Name to Lookup For (privilege: advanced)**

This specifies the complete string for which SRV record needs to be looked up on the DNS server.

**[-lookup-type {ipv4|ipv6|all}] - Lookup Type (default: all) (privilege: advanced)**

This specifies the type of IP address to be looked up on the DNS server. If you specify "all", it looks up both IPv4 and IPv6 addresses. The lookup string must be in the form "service.protocol.domain".

## Examples

The following example returns the IPv6 addresses of the host providing "http" service on "tcp" protocol in Vserver "vs1" from the node "node2".

```
cluster1::vserver services access-check*> dns srv-lookup -vserver vs1
-node node2
-lookup-string _http._tcp.nw7.na -lookup-type ipv6
9ffe::1
5ffe::1
```

## vserver services access-check name-mapping show

Display or verify name mapping configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check name-mapping show` command tests the name mapping configuration for the specified Vserver on the specified node. The command can perform name mapping for Kerberos to UNIX, Windows to UNIX, UNIX to Windows, S3 to UNIX and S3 to Windows directions.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of the Vserver.

**-direction {krb-unix|win-unix|unix-win|s3-unix|s3-win} - Mapping Direction (privilege: advanced)**

The mapping direction.

**-name <text> - Name (privilege: advanced)**

The username.

**[-clientIp <IP Address>] - Client IP Address (privilege: advanced)**

The IP address of the client as specified by the user

### Examples

This example shows a name mapping on Vserver "vs1" from UNIX username "root," which is mapped to a Windows name "EXAMPLE\Administrator" on node "node2."

```
cluster1::vserver services access-check*> name-mapping show -vserver vs1
-direction unix-win -name root -node node2
root maps to EXAMPLE\Administrator
```

This example shows a name mapping on Vserver "vs1" from Windows name "EXAMPLE\Administrator" to a UNIX name "root."

```
cluster1::vserver services access-check*> name-mapping show -vserver vs1
-direction win-unix -name EXAMPLE\Administrator -node node2
EXAMPLE\Administrator maps to root
```

## vserver services access-check server-discovery reset

### Reset server discovery information for a Vserver

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver services access-check server-discovery reset` command deletes all of the discovered server information for a given Vserver on the given node. It returns a success message upon deleting. The next attempt to access external servers will trigger the server discovery process to acquire up-to-date server information.

#### Parameters

**[`-node` {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver` <vserver> - Vserver (privilege: advanced)**

The name of the Vserver on which you want to delete all of the discovered server information.

#### Examples

This example deletes all of the discovered server information for Vserver "vs1" on the node "node2."

```
cluster1::vserver services access-check*> server-discovery reset -vserver
vs1 -node node2
Discovery Reset succeeded for Vserver: vs1
```

## vserver services access-check server-discovery show-host

### Display information about service host machines

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver services access-check server-discovery show-host` command displays information about service host machines.

#### Parameters

**[`-node {<nodename>|local}`]] - Node (privilege: advanced)**

The name of the node on which the command is executed.

## Examples

This example shows the host name and IP Address for five different service host machines.

```
cluster1::vserver services access-check*> server-discovery show-host
  Host Name: 172.19.3.11
Cifs Domain:
  AD Domain:
  IP Address: 172.19.3.11
Host Name: example-dc-1
Cifs Domain:
  AD Domain:
  IP Address: 172.17.152.40
Host Name: example-dc-2
Cifs Domain:
  AD Domain:
  IP Address: 172.17.152.41
Host Name: example-dc-3
Cifs Domain:
  AD Domain:
  IP Address: 172.17.152.42
Host Name: example-dc-4
Cifs Domain:
  AD Domain:
  IP Address: 172.17.152.43
```

## **vserver services access-check server-discovery show-site**

Display site membership

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services access-check server-discovery show-site` command displays the site membership for a given Vserver on a given node.

### Parameters

**[`-node {<nodename>|local}`]] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**`-vserver <vserver>` - Vserver (privilege: advanced)**

The name of the Vserver.

## Examples

This example shows the site membership for Vserver "vs1" from the perspective of node "node2".

```
cluster1::vserver services access-check*> server-discovery show-site -node  
node2 -vserver vs1  
california
```

## vserver services access-check server-discovery test

### Verify server discovery

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The command `vserver services access-check server-discovery test` completes the entire discovery including domain controller (DC), LDAP, and NIS servers for the default domain for a given Vserver on a given node. The Vserver must have CIFS configured for it to run successfully. If the discovery is successful, the command returns a success message. The discovered server information can be seen using the command `vserver cifs domain discovered-servers`.

### Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

The name of the node on which the command is executed.

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of the Vserver on which you want to test all of the discovered server information.

## Examples

This example tests all of the discovered server information on Vserver "vs1" on node "node2."

```
cluster1::*>vserver services access-check server-discovery test -vserver  
vs1 -node node2  
Discovery Global succeeded for Vserver: vs1
```

## vserver services name-service cache group-membership delete-all

### Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache group-membership delete` command removes the cached group membership entries of the users for the specified Vserver.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

## Examples

The following example deletes all the cached group membership entries for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership delete-  
all -vserver vs0
```

## Related Links

- [vserver services name-service cache group-membership delete](#)

## **vserver services name-service cache group-membership delete**

### Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache group-membership delete` command removes the cached group membership entries of the users.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group membership entries need to be deleted.

### **-user <text> - User Name (privilege: advanced)**

Use this parameter to specify the user name for which the cached group membership entries need to be deleted.

### **-group <integer> - Gid (privilege: advanced)**

Use this parameter to specify the primary group identifier or GID for which the cached group membership entries need to be deleted.

## Examples

The following example deletes all the cached group membership entries for Vserver vs0, user 'a' and group '1':

```
cluster1::> vserver services name-service cache group-membership delete  
-vserver vs0 -user a -group 1
```

## vserver services name-service cache group-membership show

### Display group list

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache group-membership show` command displays the cached group membership information of the users.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the cached group membership details of the user.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to specify the Vserver for which the group membership entries need to be displayed.

**`[-user <text>] - User Name (privilege: advanced)`**

Use this parameter to display information only about the cached group membership entries that have the specified user name.

**`[-group <integer>] - Gid (privilege: advanced)`**

Use this parameter to display information only about the cached group membership entries of the users that have the specified primary group identifier or GID.

**`[-ngroups <integer>] - Number of Groups (privilege: advanced)`**

Use this parameter to display information only about the cached group membership entries of the users who belong to the specified number of groups.

**`[-groups <integer>,...] - Group List (privilege: advanced)`**

Use this parameter to display information only about the cached group membership entries of the users who belong to the specified group identifiers or GIDs.

**`[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)`**

Use this parameter to display information only about the group membership entries that were cached at the specified time.

**`[-is-partial {true|false}] - Is Partial Result (privilege: advanced)`**

Use this parameter to display information only about the group membership entries that have the specified value for partial result. The Value *true* displays only the cached entries that have partial result and the value *false* displays only the cached entries that do not have partial result.

## Examples

The following example displays the group membership details of the users for all the vservers:

```
cluster1::> vserver services name-service cache group-membership show
```

The following example displays all the group membership details of the users for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership show  
-vserver vs0
```

## vserver services name-service cache group-membership settings modify

### Modify Group Membership Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service cache group-membership settings modify` command modifies the group membership cache configuration of the specified Vserver.

#### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group membership cache settings need to be modified.

**[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the group membership database. The value *true* means the cache is enabled and the value *false* means the cache is disabled. The default value for this parameter is *true*.

**[-grplist-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live for Grplist (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the group membership entries need to be cached. The default value is 1 hour.

## Examples

The following example modifies the group membership cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings  
modify -vserver vs0 -grplist-ttl 600
```

The following example disables the group membership cache for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings
modify -vserver vs0 -is-enabled false
```

## vserver services name-service cache group-membership settings show

### Display Group Membership Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service cache group-membership settings show` command displays information about the group membership cache configuration for the users.

#### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the group membership cache configuration settings.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the group membership cache configuration settings for the Vserver you specify.

**`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the group membership cache configuration settings that have the specified cache enabled setting. The value *true* displays only the entries that have cache enabled and the value *false* displays only the entries that have cache disabled.

**`[-grplist-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live for Grplist (privilege: advanced)`**

Use this parameter to display information only about the group membership cache configuration settings that have the specified Time to Live.

#### Examples

The following example shows the group membership cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache group-membership settings
show
```

The following example shows the group membership cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache group-membership settings  
show -vserver vs0
```

## vserver services name-service cache hosts forward-lookup delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache hosts forward-lookup delete-all` command removes all the cached host to IP lookup entries for a Vserver.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached forward lookup entries need to be deleted.

### Examples

The following example deletes all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup  
delete-all -vserver vs0
```

## vserver services name-service cache hosts forward-lookup delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache hosts forward-lookup delete` command removes a cached host to IP lookup entry.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached forward lookup table entries need to be deleted.

**-host <text> - Hostname (privilege: advanced)**

Use this parameter to specify the hostname of the cached forward lookup table entries that need to be deleted.

**-protocol {Any|ICMP|TCP|UDP} - Protocol (privilege: advanced)**

Use this parameter to specify the protocol of the cached forward lookup table entries that need to be deleted.

**-sock-type {SOCK\_ANY|SOCK\_STREAM|SOCK\_DGRAM|SOCK\_RAW} - Sock Type (privilege: advanced)**

Use this parameter to specify the socket type of the cached forward lookup table entries that need to be deleted.

**-flags {FLAG\_NONE|AI\_PASSIVE|AI\_CANONNAME|AI\_NUMERICHOST|AI\_NUMERICSERV} - Flags (privilege: advanced)**

Use this parameter to specify the flag of the cached forward lookup table entries that need to be deleted.

**-family {Any|Ipv4|Ipv6} - Family (privilege: advanced)**

Use this parameter to specify the family of the cached forward lookup table entries that need to be deleted.

## Examples

The following example deletes the cached forward lookup entry for Vserver vs0 and host "abc":

```
cluster1::> vsriver services name-service cache hosts forward-lookup
delete -vsriver vs0 -host abc
```

## vsriver services name-service cache hosts forward-lookup show

Display host-byname struct

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *advanced* privilege level.

## Description

The `vsriver services name-service cache hosts forward-lookup show` command displays the cached host to IP lookup entries.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

Use this parameter to display detailed information about the cached forward lookup table entries.

**[`-vsriver <vsriver name>`] - Vsriver (privilege: advanced)**

Use this parameter to specify the Vsriver for which the cached forward lookup table entries need to be displayed.

**[`-host <text>`] - Hostname (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified hostname.

**[-protocol {Any|ICMP|TCP|UDP}] - Protocol (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol.

**[-sock-type {SOCK\_ANY|SOCK\_STREAM|SOCK\_DGRAM|SOCK\_RAW}] - Sock Type (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type.

**[-flags {FLAG\_NONE|AI\_PASSIVE|AI\_CANONNAME|AI\_NUMERICHOST|AI\_NUMERICSERV}] - Flags (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified flags.

**[-family {Any|Ipv4|Ipv6}] - Family (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified family.

**[-canonname <text>] - Canonical Name (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified canonical name.

**[-ips <IP Address>,...] - IP Addresses (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified IPs.

**[-ip-protocol {Any|ICMP|TCP|UDP}] - Protocol (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified protocol of the resolved IP address from forward lookup.

**[-ip-sock-type {SOCK\_ANY|SOCK\_STREAM|SOCK\_DGRAM|SOCK\_RAW}] - Sock Type (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified socket type of the resolved IP address from forward lookup.

**[-ip-family {Any|Ipv4|Ipv6}] - Family (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address family of the resolved IP address from forward lookup.

**[-ip-addr-length <integer>,...] - Length (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified IP address length of the resolved IP address from forward lookup.

**[-source {none|files|dns|nis|ldap|netgrp\_byname|dc}] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified IP source of the resolved IP address from forward lookup.

**[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified time when the entry was cached.

### **[-ttl <integer>] - DNS TTL (privilege: advanced)**

Use this parameter to display information only about the cached forward lookup table entries that have the specified Time To Live.

### **Examples**

The following example displays all the cached forward lookup entries:

```
cluster1::> vserver services name-service cache hosts forward-lookup show
```

The following example displays all the cached forward lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts forward-lookup show  
-vserver vs0
```

## **vserver services name-service cache hosts reverse-lookup delete-all**

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

The `vserver services name-service cache hosts reverse-lookup delete-all` command removes all the cached IP to host lookup entries for a Vserver.

### **Parameters**

#### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver whose cached reverse lookup entries need to be deleted.

### **Examples**

The following example deletes all the cached reverse lookup entries for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts reverse-lookup  
delete-all -vserver vs0
```

## **vserver services name-service cache hosts reverse-lookup delete**

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache hosts reverse-lookup delete` command removes a cached IP to host lookup entry.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be deleted.

### **-ip <IP Address> - IP Address (privilege: advanced)**

Use this parameter to specify the IP address of the cached reverse lookup table entries that need to be deleted.

### **-serv-flag <integer> - Service flags (privilege: advanced)**

Use this parameter to specify the service flag of the cached reverse lookup table entries that need to be deleted.

## Examples

The following example deletes the cached reverse lookup entry for Vserver `vs0` and IP address `1.1.1.1`:

```
cluster1::> vserver services name-service cache hosts reverse-lookup  
delete -vserver vs0 -ip 1.1.1.1
```

## **vserver services name-service cache hosts reverse-lookup show**

Display ip-to-host struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache hosts reverse-lookup show` command displays the cached IP to host lookup(reverse lookup) entries.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **[ -instance ] (privilege: advanced) }**

Use this parameter to display detailed information about the cached reverse lookup table entries.

### **[-vserver <vserver name>] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached reverse lookup table entries need to be displayed.

**[-ip <IP Address>] - IP Address (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified IP address.

**[-serv-flag <integer>] - Service flags (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified service flag.

**[-host <text>] - Hostname (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified hostname.

**[-service <text>] - Service Name (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified service name.

**[-aliases <text>,...] - Host Aliases (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified aliases.

**[-addrtype <integer>] - Address Type (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified address type.

**[-addrlength <integer>] - Address Length (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified address length.

**[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified create time.

**[-source {none|files|dns|nis|ldap|netgrp\_byname|dc}] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified source.

**[-ttl <integer>] - DNS TTL (privilege: advanced)**

Use this parameter to display information only about the cached reverse lookup table entries that have the specified Time To Live.

## Examples

The following example displays all the cached reverse lookup entries:

```
cluster1::> vservice services name-service cache hosts reverse-lookup show
```

The following example displays the cached reverse lookup entries for Vserver vs0:

```
cluster1::> vsriver services name-service cache hosts reverse-lookup show
-vsvrrvr vs0
```

## vsriver services name-service cache hosts settings modify

### Modify Hosts Cache Configuration

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *advanced* privilege level.

#### Description

The `vsriver services name-service cache hosts settings modify` command modifies the hosts cache configuration of the specified *Vsvrrvr*.

#### Parameters

**-vsriver <vsriver name> - Vsvrrvr (privilege: advanced)**

Use this parameter to specify the *Vsvrrvr* for which the hosts cache settings need to be modified.

**[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the hosts database. The value *true* means the cache is enabled and the value *false* means the cache is disabled. The default value for this parameter is *true*.

**[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the hosts database and the lookup fails. The default value for this parameter is *true*. Negative cache is disabled by default if the parameter *is-enabled* is set to *false*.

**[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the hosts database and the lookup succeeds. The default value is 24 hours.

**[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to specify the time for which the negative entries need to be cached. The default value is 1 minute.

**[-is-dns-ttl-enabled {true|false}] - Is TTL Taken from DNS (privilege: advanced)**

Specifies whether TTL is taken from DNS or host settings. If this parameter is true, TTL is based on the DNS setting. If false, TTL is based on the host setting. The default value is true.

#### Examples

The following example modifies the hosts cache configuration settings for *Vsvrrvr* vs0:

```
cluster1::> vserver services name-service cache hosts settings modify
-vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache hosts settings modify
-vserver vs0 -is-enabled false
```

## vserver services name-service cache hosts settings show

### Display Hosts Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service cache hosts settings show` command displays information about the hosts cache configuration of the specified Vserver.

#### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the hosts cache configuration settings.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the hosts cache configuration settings for the Vserver you specify.

**`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the hosts cache configuration settings that have the specified cache enabled setting. Value *true* displays only the entries that have cache enabled and value *false* displays only the entries that have cache disabled.

**`[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the hosts cache configuration settings that have the specified negative cache enabled setting. Value *true* displays only the entries that have negative cache enabled and value *false* displays only the entries that have negative cache disabled.

**`[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)`**

Use this parameter to display information only about the hosts cache configuration settings that have the specified Time to Live.

**[*-negative-ttl* <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to display information only about the hosts cache configuration settings that have the specified negative Time to Live.

**[*-is-dns-ttl-enabled* {true|false}] - Is TTL Taken from DNS (privilege: advanced)**

Specifies whether TTL is based on the DNS or host settings.

## Examples

The following example shows the hosts cache configuration settings for Vserver vs0:

```
cluster1::> vsriver services name-service cache hosts settings show
-vsvrrvr vs0
```

The following example shows the hosts cache configuration settings that have cache disabled:

```
cluster1::> vsriver services name-service cache hosts settings show -is
-enabled false
```

## **vsvrrvr services name-service cache netgroups ip-to-netgroup delete-all**

Delete all the entries for the vsriver

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *advanced* privilege level.

## Description

The `vsvrrvr services name-service cache netgroups ip-to-netgroup delete-all` command removes all the cached client IP to netgroup entries of the specified Vsvrrvr.

## Parameters

**-vsvrrvr <vsvrrvr name> - Vsvrrvr (privilege: advanced)**

Use this parameter to specify the Vsvrrvr for which the cached client IP to netgroup entries need to be deleted.

## Examples

The following example deletes all the cached IP to netgroup entries for Vsvrrvr vs0:

```
cluster1::> vsriver services name-service cache netgroups ip-to-netgroup
delete-all -vsvrrvr vs0
```

## vserver services name-service cache netgroups ip-to-netgroup delete

Delete netgroup.byhost cache entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache netgroups ip-to-netgroup delete` command removes the cached client IP to netgroup entries.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be deleted.

**-host <text> - Host field (privilege: advanced)**

Use this parameter to specify the IP address for which the cached IP to netgroup entries need to be deleted.

**-netgrp <text> - Netgroup field (privilege: advanced)**

Use this parameter to specify the netgroup for which the cached IP to netgroup entries need to be deleted.

### Examples

The following example deletes all the cached IP to netgroup entries for Vserver vs0, host 1.1.1.1 and netgrp 'abc':

```
cluster1::> vserver services name-service cache netgroups ip-to-netgroup
delete -vserver vs0 -host 1.1.1.1 -netgrp abc
```

## vserver services name-service cache netgroups ip-to-netgroup show

Display netgroup.byhost cache entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache netgroups ip-to-netgroup show` command displays the cached client IP to netgroup entries.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ `-instance` ] (privilege: advanced) }**

Use this parameter to display detailed information about the cached client IP to netgroup entries.

**[ `-vserver <vserver name>` ] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached client IP to netgroup entries need to be displayed.

**[ `-host <text>` ] - Host field (privilege: advanced)**

Use this parameter to display information only about the cached IP to netgroup entries that have the specified IP address.

**[ `-netgrp <text>` ] - Netgroup field (privilege: advanced)**

Use this parameter to display information only about the cached IP to netgroup entries that have the specified netgroup.

**[ `-create-time <MM/DD/YYYY HH:MM:SS>` ] - Create Time (privilege: advanced)**

Use this parameter to display information only about the IP to netgroup entries that were cached at the specified time.

**[ `-source {none|files|dns|nis|ldap|netgrp_byname|dc}` ] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the cached IP to netgroup entries that have the specified look-up source.

## Examples

The following example displays all the cached IP to netgroup entries:

```
cluster1::> vservice services name-service cache netgroups ip-to-netgroup
show
```

The following example shows all the cached IP to netgroup entries for Vserver vs0:

```
cluster1::> vservice services name-service cache netgroups ip-to-netgroup
show -vserver vs0
```

## **vservice services name-service cache netgroups members delete-all**

Delete all the entries for the vservice

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *advanced* privilege level.

### Description

The `vservice services name-service cache netgroups members delete-all` command deletes all the cached netgroup member entries of the specified Vservice.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

## Examples

The following example deletes all the cached netgroup members of Vserver vs0:

```
cluster1::> vsriver services name-service cache netgroups members delete-  
all -vserver vs0
```

## **vsvrr services name-service cache netgroups members delete**

### Delete netgroup cache entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vsvrr services name-service cache netgroups members delete` command deletes the cached members of the netgroups.

## Parameters

### **-vsvrr <vsvrr name> - Vsvrr (privilege: advanced)**

Use this parameter to specify the Vserver for which the cached netgroup members entries need to be deleted.

### **-netgroup <text> - Netgroup (privilege: advanced)**

Use this parameter to specify the netgroup for which the cached netgroup members entries need to be deleted.

## Examples

The following example deletes all the cached netgroup members entries for Vserver vs0 and netgroup 'abc':

```
cluster1::> vsriver services name-service cache netgroups members delete  
-vsvrr vs0 -netgroup abc
```

## **vsvrr services name-service cache netgroups members show**

### Display netgroup cache entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache netgroups members show` command displays the cached members of the netgroups.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the cached members of a netgroup.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to specify the Vserver for which the cached netgroup members entries need to be displayed.

**`[-netgroup <text>] - Netgroup (privilege: advanced)`**

Use this parameter to display information only about the cached members that belong to the specified netgroup.

**`[-hosts <text>] - Hosts (privilege: advanced)`**

Use this parameter to display information only about the cached netgroups that have the specified host as a member.

**`[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)`**

Use this parameter to display information only about the netgroup member entries that were cached at the specified time.

**`[-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry (privilege: advanced)`**

Use this parameter to display information only about the cached netgroup member entries that have the specified look-up source.

## Examples

The following example displays all the cached netgroup members entries:

```
cluster1::> vserver services name-service cache netgroups members show
```

The following example displays all the cached netgroup members entries for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups members show  
-vserver vs0
```

## vserver services name-service cache netgroups settings modify

### Modify Netgroup Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service cache netgroups settings modify` command modifies the netgroups cache configuration of the specified Vserver.

#### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the netgroups cache settings need to be modified.

**[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the netgroups database. The value *true* means the cache is enabled, while the value *false* means the cache is disabled. In disabled state, LDAP *netgroupname-to-members* cache in SecD will be used. The default value for this parameter is *true*. When caching is enabled, it will only cache netgroup member responses that are under 255 KB in size.

**[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the netgroups database and the look-up fails. The default value for this parameter is *true*. Negative cache is disabled by default if the parameter *is-enabled* is set to *false*.

**[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the netgroups database and the look-up succeeds. The default value is 24 hours.

**[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 30 minutes.

**[-ttl-members <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - TTL for netgroup members (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the netgroup members need to be cached. The default value is 24 hours.

#### Examples

The following example modifies the netgroups cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache netgroups settings modify
-vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vsriver services name-service cache netgroups settings modify
-vserver vs0 -is-enabled false
```

## **vserver services name-service cache netgroups settings show**

### Display Netgroup Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### **Description**

The `vserver services name-service cache netgroups settings show` command displays information about the netgroups cache configuration of the specified Vserver.

#### **Parameters**

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the netgroups cache configuration settings.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the netgroups cache configuration settings for the Vserver you specify.

**`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the netgroups cache configuration settings that have the specified cache enabled setting. Value *true* displays only the entries that have cache enabled and value *false* displays only the entries that have cache disabled.

**`[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative cache enabled setting. Value *true* displays only the entries that have negative cache enabled and value *false* displays only the entries that have negative cache disabled.

**`[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)`**

Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live.

**`[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)`**

Use this parameter to display information only about the netgroups cache configuration settings that have the specified negative Time to Live.

**`[-ttl-members <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - TTL for netgroup members (privilege: advanced)**

Use this parameter to display information only about the netgroups cache configuration settings that have the specified Time to Live for netgroup members.

## Examples

The following example shows the netgroups cache configuration settings for Vserver vs0:

```
cluster1::> vsriver services name-service cache netgroups settings show
-vserver vs0
```

The following example shows the netgroups cache configuration settings that have cache disabled:

```
cluster1::> vsriver services name-service cache netgroups settings show
-is-enabled false
```

## vsvrr services name-service cache settings modify

Modify nameservice global cache settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vsvrr services name-service cache settings modify` command modifies the global name service cache configuration.

### Parameters

**`[-eviction-time-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Cache Eviction Time Interval (privilege: advanced)**

Use this parameter to specify the time interval after which a periodic cache eviction will happen. The default value is 4 hours.

**`[-is-remote-fetch-enabled {true|false}]` - Is Remote Fetch Enabled (privilege: advanced)**

Use this parameter to specify whether a node is allowed to fetch the data from a remote node or not. If the value is set as *false*, the node is not allowed to fetch the data from the remote node. If the value is set as *true*, remote fetch is allowed.

## Examples

The following example modifies the global nameservice cache configuration:

```
cluster1::> vsriver services name-service cache settings modify -eviction
-time-interval 1h -is-remote-fetch-enabled true
```

## vserver services name-service cache settings show

Display nameservice global cache settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache settings show` command displays information about the global name service cache configuration.

### Examples

The following example shows the global nameservice cache configuration:

```
cluster1::> vserver services name-service cache settings show
```

## vserver services name-service cache unix-group group-by-gid delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-group group-by-gid delete-all` command removes all the group entries that are cached by the group identifier or GID.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.

### Examples

The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-gid  
delete-all -vserver vs0
```

## vserver services name-service cache unix-group group-by-gid delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache unix-group group-by-gid delete` command removes the group entries that are cached by the group identifier or GID. If group cache propagation is enabled, the corresponding group-by-name cache entry will also be removed.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be deleted.

### **-gr-gid <integer> - gr\_gid field (privilege: advanced)**

Use this parameter to specify the group identifier or GID for which the cached entries need to be deleted.

## Examples

The following example deletes all the cached group entries for Vserver `vs0` and the group identifier or GID `123`:

```
cluster1::> vserver services name-service cache unix-group group-by-gid
delete -vserver vs0 -gr-gid 123
```

## **vserver services name-service cache unix-group group-by-gid show**

### Display group struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache unix-group group-by-gid show` command displays the group information cached by the group identifier or GID.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] (privilege: advanced) }**

Use this parameter to display detailed information about the group entries cached by the group identifier or GID.

### **[-vserver <vserver name>] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group entries that are cached by the group identifier or GID need to be displayed.

### **[-gr-gid <integer>] - gr\_gid field (privilege: advanced)**

Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.

**[`-gr-name <text>`] - gw\_name field (privilege: advanced)**

Use this parameter to display information only about the cached group entries that have the specified group name.

**[`-create-time <MM/DD/YYYY HH:MM:SS>`] - Create Time (privilege: advanced)**

Use this parameter to display information only about the group entries that were cached at the specified time.

**[`-source {none|files|dns|nis|ldap|netgrp_byname|dc}`] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the group entries cached by the group identifier or GID that have the specified lookup source.

## Examples

The following example displays all the groups which are cached by the group identifier or GID:

```
cluster1::> vserver services name-service cache unix-group group-by-id
show
```

The following example displays all the group entries cached by the group identifier or GID for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-group group-by-id
show -vserver vs0
```

## **vserver services name-service cache unix-group group-by-name delete-all**

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-group group-by-name delete-all` command removes all the group entries that are cached by the group name for the specified Vserver.

### Parameters

**`-vserver <vserver name>` - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be deleted.

## Examples

The following example deletes all the cached group entries for Vserver vs0:

```
cluster1::> vsriver services name-service cache unix-group group-by-name
delete-all -vsriver vs0
```

## **vsriver services name-service cache unix-group group-by-name delete**

### Delete an entry

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *advanced* privilege level.

### Description

The `vsriver services name-service cache unix-group group-by-name delete` command removes the group entries that are cached by group name. If group cache propagation is enabled, the corresponding group-by-gid cache entry will also be removed.

### Parameters

**-vsriver <vsriver name> - Vsriver (privilege: advanced)**

Use this parameter to specify the Vsriver for which the group entries that are cached by group name need to be deleted.

**-gr-name <text> - gw\_name field (privilege: advanced)**

Use this parameter to specify the group name for which the cached entries need to be deleted.

### Examples

The following example deletes all the cached group entries for Vsriver vs0 and group name abc:

```
cluster1::> vsriver services name-service cache unix-group group-by-name
delete -vsriver vs0 -gr-name abc
```

## **vsriver services name-service cache unix-group group-by-name show**

### Display group struct

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *advanced* privilege level.

### Description

The `vsriver services name-service cache unix-group group-by-name show` command displays the group information cached by group name.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ `-instance` ] (privilege: advanced) }**

Use this parameter to display detailed information about the group entries cached by group name.

**[ `-vserver <vserver name>` ] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the group entries that are cached by group name need to be displayed.

**[ `-gr-name <text>` ] - gw\_name field (privilege: advanced)**

Use this parameter to display information only about the cached group entries that have the specified group name.

**[ `-gr-gid <integer>` ] - gr\_gid field (privilege: advanced)**

Use this parameter to display information only about the cached group entries that have the specified group identifier or GID.

**[ `-create-time <MM/DD/YYYY HH:MM:SS>` ] - Create Time (privilege: advanced)**

Use this parameter to display information only about the group entries that were cached at the specified time.

**[ `-source {none|files|dns|nis|ldap|netgrp_byname|dc}` ] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the group entries cached by group name that have the specified lookup source.

## Examples

The following example displays all the groups which are cached by group name:

```
cluster1::> vservice services name-service cache unix-group group-by-name
show
```

The following example displays all the group entries cached by group name for Vserver vs0:

```
cluster1::> vservice services name-service cache unix-group group-by-name
show -vserver vs0
```

## vservice services name-service cache unix-group settings modify

### Modify UNIX Group Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vservice services name-service cache unix-group settings modify` command modifies the groups cache configuration of the specified Vserver.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the groups cache settings need to be modified.

### **[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the groups database. The value *true* means the cache is enabled and the value *false* means the cache is disabled. The default value for this parameter is *true*.

### **[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the groups database and the lookup fails. The default value for this parameter is *true*. Negative cache is disabled by default if the parameter *is-enabled* is set to *false*.

### **[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to specify the time(in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the groups database and the lookup succeeds. The default value is 24 hours.

### **[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to specify the time(in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

### **[-is-propagation-enabled {true|false}] - Is Propagation Enabled? (privilege: advanced)**

Use this parameter to specify whether the cached groups entries need to be propagated to the group by the group identifier or GID cache. The default value is *true*. Specify *false* to disable propagation.

## Examples

The following example modifies the groups cache configuration settings for Vserver vs0:

```
cluster1::> vsserver services name-service cache unix-group settings modify
-vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vsserver services name-service cache unix-group settings modify
-vserver vs0 -is-enabled false
```

## **vsserver services name-service cache unix-group settings show**

### Display UNIX Group Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache unix-group settings show` command displays information about the groups cache configuration of the specified Vserver.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the groups cache configuration settings.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the groups cache configuration settings for the Vserver you specify.

**`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the groups cache configuration settings that have the specified cache enabled setting. The value `true` displays only the entries that have cache enabled and the value `false` displays only the entries that have cache disabled.

**`[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the groups cache configuration settings that have the specified negative cache enabled setting. The value `true` displays only the entries that have negative cache enabled and the value `false` displays only the entries that have negative cache disabled.

**`[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)`**

Use this parameter to display information only about the groups cache configuration settings that have the specified Time to Live.

**`[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)`**

Use this parameter to display information only about the groups cache configuration settings that have the specified negative Time to Live.

**`[-is-propagation-enabled {true|false}] - Is Propagation Enabled? (privilege: advanced)`**

Use this parameter to display information only about the groups cache configuration settings that have the specified propagation enabled setting. The value `true` displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache enabled and the value `false` displays only the entries that have the propagation of cached entries to groups by the group identifier or GID cache disabled.

## Examples

The following example shows the groups cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache unix-group settings show
```

The following example shows the groups cache configuration settings for Vserver vs0:

```
cluster1::> vsriver services name-service cache unix-group settings show
-vsvrrer vs0
```

The following example shows the groups cache configuration settings that have cache disabled:

```
cluster1::> vsriver services name-service cache unix-group settings show
-is-enabled false
```

## **vsriver services name-service cache unix-user settings modify**

### **Modify UNIX users Cache Configuration**

**Availability:** This command is available to *cluster* and *Vsvrrer* administrators at the *advanced* privilege level.

#### **Description**

The `vsriver services name-service cache unix-user settings modify` command modifies the users cache configuration of the specified Vsvrrer.

#### **Parameters**

**-vsriver <vsriver name> - Vsvrrer (privilege: advanced)**

Use this parameter to specify the Vsvrrer for which the users cache settings need to be modified.

**[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the users database. The value *true* means the cache is enabled and the value *false* means the cache is disabled. The default value for this parameter is *true*.

**[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the users database and the look-up fails. The default value for this parameter is *true*. Negative cache is disabled by default if the parameter *is-enabled* is set to *false*.

**[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the users database and the look-up succeeds. The default value is 24 hours.

**[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

### **`[-is-propagation-enabled {true|false}] - Is Propagation Enabled? (privilege: advanced)`**

Use this parameter to specify whether the cached users entries need to be propagated to the users by id cache. The default value is *true*. Specify *false* to disable propagation.

## **Examples**

The following example modifies the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify
-vserver vs0 -ttl 600 -negative-ttl 300
```

The following example disables the cache for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings modify
-vserver vs0 -is-enabled false
```

## **vserver services name-service cache unix-user settings show**

### **Display UNIX users Cache Configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

The `vserver services name-service cache unix-user settings show` command displays information about the users cache configuration of the specified Vserver.

### **Parameters**

#### **`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

#### **`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the users cache configuration settings.

#### **`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the users cache configuration settings for the Vserver you specify.

#### **`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the users cache configuration settings that have the specified cache enabled setting. Value *true* displays only the entries that have cache enabled and value *false* displays only the entries that have cache disabled.

#### **`[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the users cache configuration settings that have the

specified negative cache enabled setting. Value *true* displays only the entries that have negative cache enabled and value *false* displays only the entries that have negative cache disabled.

**[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to display information only about the users cache configuration settings that have the specified Time to Live.

**[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to display information only about the users cache configuration settings that have the specified negative Time to Live.

**[-is-propagation-enabled {true|false}] - Is Propagation Enabled? (privilege: advanced)**

Use this parameter to display information only about the users cache configuration settings that have the specified propagation enabled setting. Value *true* displays only the entries that have the propagation of cached entries to users by id cache enabled and value *false* displays only the entries that have the propagation of cached entries to users by id cache disabled.

## Examples

The following example shows the users cache configuration settings for all the Vservers:

```
cluster1::> vserver services name-service cache unix-user settings show
```

The following example shows the users cache configuration settings for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user settings show  
-vserver vs0
```

The following example shows the users cache configuration settings that have cache disabled:

```
cluster1::> vserver services name-service cache unix-user settings show  
-is-enabled false
```

## vserver services name-service cache unix-user user-by-id delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-user user-by-id delete-all` command removes all the user entries that are cached by the user identifier or UID for the specified Vserver.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

## Examples

The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vsriver services name-service cache unix-user user-by-id
delete-all -vserver vs0
```

## **vsriver services name-service cache unix-user user-by-id delete**

### Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vsriver services name-service cache unix-user user-by-id delete` command removes the user entries that are cached by the user identifier or UID. If user cache propagation is enabled, the corresponding user-by-name cache entry will also be removed.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be deleted.

### **-pw-uid <integer> - pw\_uid field (privilege: advanced)**

Use this parameter to specify the user identifier or UID for which the cached entries need to be deleted.

## Examples

The following example deletes all the user entries cached by the user identifier or UID for Vserver vs0 and user identifier or UID 123:

```
cluster1::> vsriver services name-service cache unix-user user-by-id
delete -vserver vs0 -pw-uid 123
```

## **vsriver services name-service cache unix-user user-by-id show**

### Display password struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service cache unix-user user-by-id show` command displays the user information cached by the user identifier or UID.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the user entries cached by the user identifier or UID.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to specify the Vserver for which the user entries that are cached by the user identifier or UID need to be displayed.

**`[-pw-uid <integer>] - pw_uid field (privilege: advanced)`**

Use this parameter to specify the user identifier or UID for which the cached entries need to be displayed.

**`[-pw-name <text>] - pw_name field (privilege: advanced)`**

Use this parameter to display information only about the cached user entries that have the specified user identifier or UID.

**`[-pw-gid <integer>] - pw_gid field (privilege: advanced)`**

Use this parameter to display information only about the cached user entries that have the specified group identifier or GID.

**`[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)`**

Use this parameter to display information only about the user entries that were cached at the specified time.

**`[-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry (privilege: advanced)`**

Use this parameter to display information only about the user entries cached by the user identifier or UID that have the specified lookup source.

## Examples

The following example displays all the users which are cached by the user identifier or UID:

```
cluster1::> vserver services name-service cache unix-user user-by-id show
```

The following example displays all the users entries cached by the user identifier or UID for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-id show  
-vserver vs0
```

## vserver services name-service cache unix-user user-by-name delete-all

Delete all the entries for the vsriver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-user user-by-name delete-all` command removes all the user entries that are cached by the user name for the specified Vserver.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

### Examples

The following example deletes all the cached user entries for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-name  
delete-all -vserver vs0
```

## vserver services name-service cache unix-user user-by-name delete

Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-user user-by-name delete` command removes the user entries that are cached by the user name. If user cache propagation is enabled, the corresponding user-by-id cache will also be removed.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the user entries that are cached by user name need to be deleted.

**-pw-name <text> - pw\_name field (privilege: advanced)**

Use this parameter to specify the user name for which the cached entries need to be deleted.

### Examples

The following example deletes all the cached user entries for Vserver vs0 and user name abc:

```
cluster1::> vserver services name-service cache unix-user user-by-name
delete -vserver vs0 -pw-name abc
```

## **vserver services name-service cache unix-user user-by-name show**

### Display password struct

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service cache unix-user user-by-name show` command displays the user information cached by the user name.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the user entries cached by the user name.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to specify the Vserver for which the user entries that are cached by the user name need to be displayed.

**`[-pw-name <text>] - pw_name field (privilege: advanced)`**

Use this parameter to display information only about the cached user entries that have the specified user name.

**`[-pw-uid <integer>] - pw_uid field (privilege: advanced)`**

Use this parameter to display information only about the cached user entries that have the specified user identifier or UID.

**`[-pw-gid <integer>] - pw_gid field (privilege: advanced)`**

Use this parameter to display information only about the cached user entries that have the specified group identifier or GID.

**`[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)`**

Use this parameter to display information only about the user entries that were cached at the specified time.

**`[-source {none|files|dns|nis|ldap|netgrp_byname|dc}] - Source of the Entry (privilege: advanced)`**

Use this parameter to display information only about the user entries cached by user name that have the specified look-up source.

## Examples

The following example displays all the users which are cached by user name:

```
cluster1::> vserver services name-service cache unix-user user-by-name
show
```

The following example displays all the users entries cached by user name for Vserver vs0:

```
cluster1::> vserver services name-service cache unix-user user-by-name
show -vserver vs0
```

## vserver services name-service dns check

Display validation status of a DNS configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service dns check` command to check the status of configured DNS servers.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver whose DNS mapping needs to be validated.

**[-name-server <IP Address>] - Name Server**

Use this parameter to display information only about name-servers that match the value you specify.

**[-status {up|down}] - Name Server Status**

Use this parameter to display information only about name-servers with a status that matches the value you specify.

**[-status-details <text>] - Status Details**

Use this parameter to display information only about name-servers with status details that match the value you specify.

## Examples

The following example checks the DNS server mapping on the Vserver vs0:

```
cluster1::> vserver services name-service dns check -vserver vs0
Vserver          Name Server      Status  Status Details
-----
vs0              10.11.12.13     up      Response time (msec): 55
vs0              10.11.12.14     up      Response time (msec): 70
vs0              10.11.12.15     down    Connection refused.
```

## vserver services name-service dns create

Create a new DNS table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service dns create` command creates new DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

### Parameters

#### **-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver on which to create the new DNS server mapping.

#### **-domains <text>,... - Domains**

Use this parameter to specify the domains of the Vserver. Separate multiple domains with commas.

#### **-name-servers <IP Address>,... - Name Servers**

Use this parameter to specify the IP addresses of the DNS servers that provide name service for the domains in this DNS server mapping. Separate multiple addresses with commas.

#### **[-timeout <integer>] - Timeout (secs)**

Use this parameter to specify a timeout value (in seconds) for queries to the name servers. The default value is 2 seconds.

#### **[-attempts <integer>] - Maximum Attempts**

Use this parameter to specify the number of attempts the Vserver should make when querying the DNS name servers. The default value is 1 attempt.

#### **[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)**

Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to *false*, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is *true*.

**[`-require-source-address-match {true|false}`] - Require Source and Reply IPs to Match (privilege: advanced)**

Use this parameter to allow dns responses sourced from an IP that does not match where the vserver sent the request. If the parameter is set to *false*, the resolver will allow response from an IP other than the one to which the request was sent. The default value for this parameter is *true*.

**[`-require-packet-query-match {true|false}`] - Require Packet Queries to Match (privilege: advanced)**

Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to *false*, the resolver will not check if the query section of the reply packet is equal to that of the query packet. The default value for this parameter is *true*.

**[`-skip-config-validation <true>`] - Skip Configuration Validation**

Use this parameter to skip the DNS configuration validation.

The domain name specified with the `-domains` is validated with the following rules:

- The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "-", or "\_".
- The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9.
- The last character of each label, delimited by ".", must be one of the following characters: A through Z, a through z, or 0 through 9.
- The top level domain must contain only the following characters: A through Z, a through z.
- The maximum supported length is 255 characters.
- The system reserves the following names: "all", "local", and "localhost".

The hosts specified with the `-name-servers` parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.

The validation fails, if the domain name is invalid, or there is no valid name server.

## Examples

This example creates a new DNS server mapping for the Vserver `vs0` in the domain `example.com`, specifying that `192.168.0.16` and `192.168.0.24` are the name servers for this domain.

```
cluster1::> vserver services name-service dns create -vserver vs0 -domains
example.com -name-servers 192.168.0.16,192.168.0.24
```

## vserver services name-service dns delete

### Remove a DNS table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service dns delete` command removes the DNS server mapping from a Vserver.

Deleting a DNS server mapping removes it permanently. If you delete a DNS server mapping, commands or jobs that do not use IP addresses do not succeed.

## Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver whose DNS server mapping is deleted.

## Examples

This example removes the DNS server mapping from the Vserver node1.

```
cluster1::> vserver services name-service dns delete -vserver vs0
```

## vserver services name-service dns modify

Change a DNS table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Use the `vserver services name-service dns modify` command to modify an existing DNS server mapping.

To permanently remove a mapping, use the [vserver services name-service dns delete](#) command.

## Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver whose DNS mapping is modified.

**[-domains <text>,...] - Domains**

Use this parameter to specify a domain for the Vserver.

**[-name-servers <IP Address>,...] - Name Servers**

Use this parameter to specify the IP addresses of the DNS name servers for this Vserver.

**[-timeout <integer>] - Timeout (secs)**

Use this parameter to specify a timeout value (in seconds) for queries to the DNS servers.

**[-attempts <integer>] - Maximum Attempts**

Use this parameter to specify the number of times to attempt queries to the DNS servers.

### **`[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)`**

Use this parameter to enable or disable top-level domain (TLD) queries. If the parameter is set to *false*, the resolver will not attempt to resolve a name that has no "." characters in it. The default value for this parameter is *true*.

### **`[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)`**

Use this parameter to allow dns responses sourced from an IP that does not match where the vservers sent the request. If the parameter is set to *false*, the resolver will allow response from an IP other than the one to which the request was sent.

### **`[-require-packet-query-match {true|false}] - Require Packet Queries to Match (privilege: advanced)`**

Use this parameter to check if the query section of the reply packet is equal to that of the query packet. If the parameter is set to *false*, the resolver will not check if the query section of the reply packet is equal to that of the query packet.

### **`[-skip-config-validation <true>] - Skip Configuration Validation`**

Use this parameter to skip the DNS configuration validation.

The domain name specified with the `-domains` is validated with the following rules:

- The name must contain only the following characters: A through Z, a through z, 0 through 9, ".", "-", or "\_".
- The first character of each label, delimited by ".", must be one of the following characters: A through Z or a through z or 0 through 9.
- The last character of each label, delimited by ".", must be one of the following characters: A through Z, a through z, or 0 through 9.
- The top level domain must contain only the following characters: A through Z, a through z.
- The maximum supported length is 255 characters.
- The system reserves the following names: "all", "local", and "localhost".

The hosts specified with the `-name-servers` parameter are validated to verify that each of the name servers is reachable, and is providing DNS services.

The validation fails, if the domain name is invalid, or there is no valid name server.

## **Examples**

This example modifies the DNS server mapping for the domain `example.com` on the Vserver `vs0`, specifying that `10.0.0.1` and `10.0.0.2` are the name servers for this domain.

```
cluster1:> vservice services name-service dns modify -vserver vs0 -domains
example.com -name-servers 10.0.0.1,10.0.0.2
```

## **Related Links**

- [vservice services name-service dns delete](#)

## vserver services name-service dns show

### Display DNS configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service dns show` command displays information about DNS server mappings. DNS servers provide remote connection information, such as IP addresses, based on domain and system names.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Use this parameter to display information only about the DNS server mapping of the Vservers you specify.

**[-domains <text>,...] - Domains**

Use this parameter to display information only about the DNS server mappings for Vservers in the domains you specify.

**[-name-servers <IP Address>,...] - Name Servers**

Use this parameter to display information only about DNS server mappings that use the DNS name servers you specify.

**[-timeout <integer>] - Timeout (secs)**

Use this parameter to display information only about DNS server mappings that have the timeout value you specify.

**[-attempts <integer>] - Maximum Attempts**

Use this parameter to display information only about DNS server mappings that make the maximum number of attempts you specify.

**[-is-tld-query-enabled {true|false}] - Is TLD Query Enabled? (privilege: advanced)**

Use this parameter to display information only about DNS server mappings that have the specified TLD query setting.

**[-require-source-address-match {true|false}] - Require Source and Reply IPs to Match (privilege: advanced)**

Use this parameter to display information only about DNS server mappings that have the specified setting to require the source address of the response packet to match the address where the vserver sent the request.

**[`-require-packet-query-match {true|false}`] - Require Packet Queries to Match (privilege: advanced)**

Use this parameter to display information only about DNS server mappings that have the specified setting to require the query section of the reply packet to match that of the query packet.

## Examples

The following example shows typical output from the command. Note that cluster1 uses different name servers for example.com.

```
cluster1::> vservice services name-service dns show
```

| Vserver | Domains                   | Name Servers                |
|---------|---------------------------|-----------------------------|
| vs1     | example.com               | 10.0.0.1,<br>10.0.0.2       |
| vs2     | example.com, example2.com | 10.0.0.1,<br>10.0.0.2       |
| vs3     | example.com, example2.com | 192.168.0.1,<br>192.168.0.2 |

## **vservice services name-service dns dynamic-update modify**

### Modify a Dynamic DNS Update Configuration

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The `vservice services name-service dns dynamic-update modify` command modifies the configuration for dynamic DNS updates for a Data Vservice.

### Parameters

**`-vservice <vservice name>` - Vservice**

Use this parameter to specify the Vservice for which you want to modify the dynamic DNS update configuration.

**[`-is-enabled {true|false}`] - Is Dynamic DNS Update Enabled?**

Use this parameter with value `true` to enable the dynamic DNS update feature. This field is set to `false` by default.

**[`-use-secure {true|false}`] - Use Secure Dynamic Update?**

Use this parameter with value `true` to enable secure dynamic DNS updates. This field is set to `false` by default.

**[`-vservice-fqdn <text>`] - Vservice FQDN to Be Used for DNS Updates**

Use this parameter to modify the Vservice FQDN to be used for dynamic DNS updates.

## **[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live for DNS Updates (privilege: advanced)**

Use this parameter to modify the Time to Live value for the dynamic DNS updates. The default value is set to 24 hours. The maximum supported value for TTL is 720 hours.

## **[-skip-fqdn-validation <true>] - Skip Vserver FQDN Validation**

If the parameter is specified, the FQDN name validation is skipped.

## **Examples**

The following example enables the dynamic DNS update feature and modifies the FQDN to be used for dynamic DNS updates for the Vserver vs1, specifying vs1.abcd.com as the new FQDN.

```
cluster1::*> vserver services name-service dns dynamic-update modify
-vserver vs1 -is-enabled true -vserver-fqdn vs1.abcd.com
```

The following example modifies the dynamic DNS updates configuration to only send secure updates to the DNS server configured for the Vserver vs1.

```
cluster1::*> vserver services name-service dns dynamic-update modify
-vserver vs1 -is-enabled true -use-secure true
```

## **vserver services name-service dns dynamic-update show**

### **Display Dynamic DNS Update Configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver services name-service dns dynamic-update show` command shows the dynamic DNS update configuration related to the DNS server for a Vserver.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Use this parameter to display dynamic DNS update configuration for the Vservers you specify.

**[-is-enabled {true|false}] - Is Dynamic DNS Update Enabled?**

Use this parameter with value `true` to display information about dynamic DNS update configurations that are active.

### **`[-use-secure {true|false}] - Use Secure Dynamic Update?`**

Use this parameter with value `true` to display information about dynamic DNS update configurations that are set to send secure dynamic updates only.

### **`[-vserver-fqdn <text>] - Vserver FQDN to Be Used for DNS Updates`**

Use this parameter to display information about dynamic DNS update configurations that are set to send the dynamic updates with the FQDN you have specified.

### **`[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live for DNS Updates (privilege: advanced)`**

If you specify this parameter, the command displays dynamic DNS update configurations having the specified Time to Live value .

## **Examples**

The following example shows all information about dynamic DNS update configurations.

```
cluster1::*> vsriver services name-service dns dynamic-update show
gupgclust-3::> dns dynamic-update show
Vserver          Is-Enabled Use-Secure Vserver FQDN          TTL
-----
vs1              true       false    vs1.abcd.com        24h
vs2              false      false    vs2.abcd.com        24h
2 entries were displayed.
```

## **vsriver services name-service dns dynamic-update record add**

### **Adds a New DNS Resource Record**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

The `vsriver services name-service dns dynamic-update record add` command sends an update to add a new DNS resource record of an existing logical interface (LIF) of the Vserver to the configured DNS server.

### **Parameters**

#### **`-vserver <vserver name> - Vserver (privilege: advanced)`**

Use this parameter to specify the Vserver for which you want to add a resource record on the configured DNS server.

#### **`-lif <lif-name> - Logical Interface (privilege: advanced)`**

Use this parameter to specify the Logical Interface(LIF) name for which you want to add a resource record on the configured DNS server.

## Examples

The following example adds a resource record entry for the Logical Interface lif1 belonging to the Vserver vs1 to the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record add  
-vserver vs1 -lif lif1
```

## vserver services name-service dns dynamic-update record delete

### Deletes a DNS Resource Record

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service dns dynamic-update record delete` command sends an update to remove an existing DNS resource record of the Logical Interface (LIF) of the Vserver from the configured DNS server.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver of which you want to delete a resource record from the configured DNS server.

**{ -lif <lif-name> - Logical Interface (privilege: advanced)**

Use this parameter to specify the Logical Interface(LIF) name whose corresponding resource record you want to remove from the configured DNS server.

**| -address <IP Address> - IP Address (privilege: advanced) }**

Use this parameter to specify the IP address of the Logical Interface whose corresponding resource record you want to remove from the configured DNS server.

## Examples

The following example removes a resource record entry of the Logical Interface lif1 belonging to the Vserver vs1 from the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record  
delete -vserver vs1 -lif lif1
```

The following example removes a resource record entry of the Logical Interface whose address is 1.1.1.1 belonging to the Vserver vs1 from the configured DNS server.

```
cluster1::*> vserver services name-service dns dynamic-update record  
delete -address 1.1.1.1 -vserver vs1
```

## vserver services name-service dns hosts create

Create a new host table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service dns hosts create` command to create new DNS host table entries. These entries map hostnames to IP addresses.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver on which the host table entry will be created.

**-address <IP Address> - IP Address**

Use this parameter to specify the IP address of the new host table entry.

**-hostname <text> - Canonical Hostname**

Use this parameter to specify the full hostname for the new host table entry.

**[-aliases <text>,...] - Aliases**

Use this parameter to specify any aliases to include in the new host table entry. Separate multiple aliases with commas.

### Examples

This example creates a new DNS host table entry for 10.0.0.17 on the vserver vs1, with the hostname test.example.com and the alias test.

```
cluster1::> vserver services name-service dns hosts create -vserver vs1
-address 10.0.0.17 -hostname test.example.com -aliases test
```

## vserver services name-service dns hosts delete

Remove a host table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service dns hosts delete` command to delete DNS host table entries.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver whose host table entry will be deleted.

**-address <IP Address> - IP Address**

Use this parameter to specify the IP address of the host table entry to delete.

**Examples**

This example removes the DNS host table entry of 10.0.0.15 from the host table of the vservers vs1.

```
cluster1::> vservers services name-service dns hosts delete -vservers vs1
-address 10.0.0.15

1 entry was deleted.
```

**vservers services name-service dns hosts modify**

Modify hostname or aliases

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

Use the `vservers services name-service dns hosts modify` command to modify existing DNS host table entries.

**Parameters****-vservers <vservers name> - Vservers**

Use this parameter to specify the Vserver whose host table will be modified.

**-address <IP Address> - IP Address**

Use this parameter to specify the IP address of the host table entry to modify.

**[-hostname <text>] - Canonical Hostname**

Use this parameter to specify a full hostname for the host table entry.

**[-aliases <text>,...] - Aliases**

Use this parameter to specify alternate hostnames for the host table entry.

**Examples**

This example changes the host table of vservers vs1 so that the hostname stored in the host table entry for 10.0.0.57 is pgh.example.com.

```
cluster1::> vservers services name-service dns hosts modify -vservers -vs1
-address 10.0.0.57 -hostname pgh.example.com

1 entry was modified.
```

This example changes the host table of vservers vs1 to store the name loghost as an alternate hostname for IP address 10.0.0.5.

```
cluster1::> vserver services name-service dns hosts modify -vserver vs1
-address 10.0.0.5 -aliases loghost
1 entry was modified.
```

## vserver services name-service dns hosts show

### Display IP address to hostname mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service dns hosts show` command to display Domain Name System (DNS) host table entries. These entries map hostnames to IP addresses. Entries may also include alternate hostnames, known as aliases. Host table entries enable you to refer to other Internet hosts by a memorable name instead of by a numeric IP address. This host table is similar to the `/etc/hosts` file found on most UNIX style systems.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Use this parameter to display information only about host table entries on the Vservers you specify.

**[-address <IP Address>] - IP Address**

Use this parameter to display information only about host table entries that match the IP addresses you specify.

**[-hostname <text>] - Canonical Hostname**

Use this parameter to display information only about host table entries that match the hostnames you specify.

**[-aliases <text>,...] - Aliases**

Use this parameter to display information only about host table entries that include the alternate hostnames you specify.

### Examples

The following example shows a typical host table.

```
cluster1::> vservers services name-service dns hosts show
Vserver      Address      Hostname      Aliases
-----
vs1          10.0.0.10    mail.example.com
                                mail, mailhost, snmp
vs1          10.0.0.15    ftp.example.com ftp
vs1          10.0.0.16    www.example.com www
vs2          10.0.0.10    mail.example.com
                                mail, mailhost, snmp
vs2          10.0.0.15    ftp.example.com ftp
vs2          10.0.0.16    www.example.com www
vs2          10.0.0.17    test.example.com
7 entries were displayed.
```

## vservers services name-service getxxbyyy getaddrinfo

Gets the IP address information by using the host name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``vservers services name-service getxxbyyy getaddrinfo`` gets the IP address information by using the host name for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-hostname <text> - Host Name (privilege: advanced)**

Use this parameter to specify the Host Name for which the IP address information is needed

**[-address-family {ipv4|ipv6|all}] - Return Addresses for Family (privilege: advanced)**

Use this parameter to specify the Address Family for which the IP address information is needed

**[-show-source {true|false}] - Show Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Enable/Disable cache (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

## Examples

The following example requests address information for localhost:

```
cluster1::*> vserver services name-service getxxbyyy getaddrinfo -node
cluster1-01 -vserver vs1 -hostname localhost -address-family all -show
-source true -use-cache false
  Source used for Lookup: Files
  Host name: localhost
  Canonical name: localhost
  IPv4  : 127.0.0.1
  IPv6  : ::1
```

## vserver services name-service getxxbyyy getgrbygid

Gets the group members by using the group identifier or GID.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service getxxbyyy getgrbygid` gets the group members by using the group identifier or GID for a given Vserver. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-groupID <integer> - Group ID (privilege: advanced)**

Use this parameter to specify the GroupID for which the members are requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Use Locally-Cached Values (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

## Examples

The following example requests group information for the given groupid

```
cluster1::*> vserver services name-service getxxbyyy getgrbygid -node
cluster1-01 -vserver vs1 -groupID 1
    name: daemon
    gid: 1
```

## **vserver services name-service getxxbyyy getgrbyname**

Gets the group members by using the group name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The ``vserver services name-service getxxbyyy getgrbyname`` gets the group members by using the group name.

### **Parameters**

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-groupname <text> - Group Name (privilege: advanced)**

Use this parameter to specify the Group Name for which the members are requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Use Locally-Cached Values (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

### **Examples**

The following example requests group information for the given group name

```
cluster1::*> vserver services name-service getxxbyyy getgrbyname -node
cluster1-01 -vserver vs1 -groupname daemon -show-source false
    name: daemon
    gid: 1
```

## **vserver services name-service getxxbyyy getgrlist**

Gets the group list by using the user name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``vserver services name-service getxxbyyy getgrlist`` gets the list of groups to which user belongs. This command will go through all the sources configured for the group database in the name servers ns-switch configuration.

## Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-username <text> - User Name (privilege: advanced)**

Use this parameter to retrieve the list of groups where the given user is a member

**[-use-cache <true>] - Use Locally-Cached Values (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

## Examples

The following example requests the grouplist for the given username

```
cluster1::*> vserver services name-service getxxbyyy getgrlist -node
cluster1-01 -vserver vs1 -username root
    pw_name: root
    Groups: 5
```

## vserver services name-service getxxbyyy gethostbyaddr

Gets the host information from the IP address.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``vserver services name-service getxxbyyy gethostbyaddr`` gets the host name by using the IP address. The underlying service for doing the lookup is selected based on the configured name service switch order.

## Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-ipaddress <IP Address> - IP Address (privilege: advanced)**

Use this parameter to specify the IPv4/IPv6 address for which the host information is needed

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Enable/Disable cache (privilege: advanced)**

If set to *true* , locally-cached values will be used. The default value is *false* .

## Examples

The following example requests host information for the given IP address:

```
cluster1::*> vserver services name-service getxxbyyy gethostbyaddr -node
cluster1-01 -vserver vs1 -ipaddress 127.0.0.1 -show-source false -use
-cache false
  IP address: 127.0.0.1
  Host name: localhost
```

## vserver services name-service getxxbyyy gethostbyname

Gets the IP address information from host name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service getxxbyyy gethostbyname` gets the IP address by using the host name. The underlying service for doing the lookup is selected based on the configured name service switch order. When the look up happens from the hosts file, only the first IP address is returned for a host configured with multiple IP addresses.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Node Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Vserver Name Use this parameter to specify the Vserver where the lookup will be performed

**-hostname <text> - Host Name (privilege: advanced)**

Use this parameter to specify the Hostname for which the IP address information is requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

## Examples

The following example requests IP Address information from the given hostname

```
cluster1::*> vserver services name-service getxxbyyy gethostbyname -node
cluster1-01 -vserver vs1 -hostname localhost -show-source false
Host name: localhost
Canonical name: localhost
IPv4: 127.0.0.1
```

## vserver services name-service getxxbyyy getnameinfo

Gets the name information by using the IP address.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``vserver services name-service getxxbyyy getnameinfo`` gets the host and service by using the socket address. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-ipaddress <IP Address> - IP Address (privilege: advanced)**

Use this parameter to specify IPv4/IPv6 address for which the name information is requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Enable/Disable cache (privilege: advanced)**

If set to *true* , locally-cached values will be used. The default value is *false* .

## Examples

The following example gets the name information for the given IP Address:

```
cluster1::*> vserver services name-service getxxbyyy getnameinfo -node
cluster1-01 -vserver vs1 -ipaddress 127.0.0.1 -show-source false -use
-cache false
    IP address: 127.0.0.1
    Host name: localhost
```

## vserver services name-service getxxbyyy getpwbyname

Gets the password entry by using the user name.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``vserver services name-service getxxbyyy getpwbyname`` gets the password entry by using the user name. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-username <text> - User Name (privilege: advanced)**

Use this parameter to specify the Username for which the password entry is requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Enable/Disable cache (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

### Examples

The following example requests password entry from the given username:

```
cluster1::*> vserver services name-service getxxbyyy getpwbyname -node
cluster1-01 -vserver vs1 -username vsadmin -show-source true -use-rbac
false -use-cache false
    Source used for lookup: Files
    pw_name: daemon
    pw_passwd: *
    pw_uid: 1, pw_gid: 1
    pw_gecos: Owner of many system processes
    pw_dir: /root
    pw_shell: /usr/sbin/nologin
```

## vserver services name-service getxxbyyy getpwbyuid

Gets the password entry by using the user identifier or UID.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``vserver services name-service getxxbyyy getpwbyuid`` gets the password entry by using the user identifier or UID. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-userID <integer> - User ID (privilege: advanced)**

Use this parameter to specify the UserID for whom the password entry is requested

**[-show-source {true|false}] - Source used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

**[-use-cache <true>] - Enable/Disable cache (privilege: advanced)**

If set to *true*, locally-cached values will be used. The default value is *false*.

### Examples

The following example requests password entry by using the user ID:

```
cluster1::*> vserver services name-service getxxbyyy getpwbyuid -node
cluster1-01 -vserver vs1 -userID 1001 -show-source true -use-rbac true
-use-cache false
    Source used for Lookup: Files
    pw_name: vsadmin
    pw_passwd: $1$f7b22f68$KihT1ptYqpEjcM4jfe60f0
    pw_uid: 1001
    pw_gid: 65533
    pw_gecos: User
    pw_dir: /var/home/vsadmin
    pw_shell: /sbin/ngsh
```

## vserver services name-service getxxbyyy netgrpcheck

Check if a client is part of a netgroup using combined API

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service getxxbyyy netgrpcheck` checks if a client is part of a netgroup. The underlying service for doing the lookup is selected based on the configured name service switch order.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

Use this parameter to specify the node where the lookup will be performed

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver where the lookup will be performed

**-netgroup <text> - Netgroup Name (privilege: advanced)**

Use this parameter to specify the Netgroup name

**-clientIP <IP Address> - Client IP Address (privilege: advanced)**

Use this parameter to specify the Client IP for which the membership in a given netgroup needs to be checked

**[-enable-domain-search-flag {true|false}] - Use DNS domain (privilege: advanced)**

Use this parameter to use DNS domain. Default value for this field is true

**[-trust-any-source {true|false}] - Trust any source (privilege: advanced)**

Use this parameter to set trust any source parameter. Default value for this field is false

**[-show-source {true|false}] - Source Used for Lookup (privilege: advanced)**

Use this parameter to specify if source used for lookup needs to be displayed

## Examples

The following example checks if the given client is part of the given netgroup:

```
cluster1::*> vserver services name-service getxxbyyy netgrpcheck -node
cluster1-01 -vserver vs1 -netgroup net1 -clientIP 10.232.98.198 -show
-source false
    10.232.98.198 is a member of net1
```

## vserver services name-service ldap check-ipv6

Display validation status of an IPv6 LDAP configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service ldap check-ipv6` command to check the status of an IPv6 LDAP configuration.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver whose LDAP configuration needs to be validated.

**[-client-config <text>] - Client Configuration Name**

Use this parameter to display information only about LDAP client configuration which is assigned to LDAP configuration for the specified Vserver.

**[-ldap-status {up|down}] - LDAP Status**

Use this parameter to display information only about LDAP configurations with a status that matches the value you specify.

**[-ldap-status-details <text>] - LDAP Status Details**

Use this parameter to display information only about LDAP configurations with a status detail that matches the value you specify.

**[-ldap-dn-status-details <text>,...] - LDAP DN Status Details**

Use this parameter to display information only about LDAP DN configurations with a status detail that matches the value you specify.

## Examples

The following examples check the LDAP configuration on the SVM vs1:

```
cluster1::> vserver services name-service ldap check-ipv6 -vserver vs1
                Vserver: vs1
Client Configuration Name: clientcfg1
                LDAP Status: up
                LDAP Status Details: Successfully connected to LDAP server
"2001:db8:3333:4444:5555:6666:7777:8888".
                LDAP DN Status Details: All the configured DN's are available.
```

```
cluster1::> vserver services name-service ldap check-ipv6 -vserver vs1
                Vserver: vs1
Client Configuration Name: clientcfg1
                LDAP Status: up
                LDAP Status Details: Successfully connected to LDAP server
"2001:db8:3333:4444:5555:6666:7777:8888".
                LDAP DN Status Details: Validation of Domains specified in the LDAP
client configuration failed. Reason: bind-dn is invalid or bind
credentials are invalid. Correct the configuration and try again.
```

In the above example, you can correct the LDAP configuration by performing either of the following procedures: — If the bind-dn is invalid, use the [vserver services name-service ldap client modify](#) command to correct it. — If the bind credentials are invalid, use the [vserver services name-service ldap client modify-bind-password](#) command to correct them.

## vserver services name-service ldap check

Display validation status of a LDAP configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Use the `vserver services name-service ldap check` command to check the status of the LDAP configuration.

## Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <Vserver Name> -Vserver**

Use this parameter to specify the Vserver whose LDAP configuration needs to be validated.

**[-client-config <text>] - Client Configuration Name**

Use this parameter to specify the LDAP client configuration which is assigned to LDAP configuration for the specified Vserver.

**[-ldap-status {up|down}] - LDAP Status**

Use this parameter to display information only about LDAP configurations with a status that matches the value you specify.

**[-ldap-status-details <text>] - LDAP Status Details**

Use this parameter to display information only about LDAP configurations with a status detail that matches the value you specify.

**[-ldap-dn-status-details <text>,...] - LDAP DN Status Details**

Use this parameter to display information only about LDAP DN configurations with a status detail that matches the value you specify.

## Examples

The following examples check the LDAP configuration on the SVM vs0:

```
cluster1::> vsriver services name-service ldap check -vserver vs0
                Vserver: vs0
Client Configuration Name: cl
                LDAP Status: up
                LDAP Status Details: Successfully connected to LDAP server
"10.11.12.13".
                LDAP DN Status Details: All the configured DNs are available.
```

```

cluster1::> vservice services name-service ldap check -vservice vs0
                Vservice: vs0
Client Configuration Name: cl
                LDAP Status: up
                LDAP Status Details: Successfully connected to LDAP server
"10.11.12.13".
                LDAP DN Status Details: Validation of Domains specified in the LDAP
client configuration failed. Reason: bind-dn is invalid or bind
credentials are invalid. Correct the configuration and try again.
In the above example, you can correct the LDAP configuration by performing
either of the following procedures:
    -- If the bind-dn is invalid, use the "ldap client modify" command to
correct it.
    -- If the bind credentials are invalid, use the "ldap client modify-
bind-password" command to correct them.

```

## vservice services name-service ldap create

### Create an LDAP configuration

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The `vservice services name-service ldap create` command associates an LDAP client configuration with a *Vservice*.

### Parameters

#### **-vservice <Vservice Name> - Vservice**

This parameter specifies the *Vservice* with which you want to associate the LDAP client configuration. A data *Vservice* or admin *Vservice* can be specified.

#### **-client-config <text> - LDAP Client Configuration**

This parameter specifies the name of the LDAP client configuration, defined under the `vservice services name-service ldap client` command, that you want to associate with the *Vservice*. The value of the `bind-as-cifs-server` parameter on this LDAP client should be `false`, if the CIFS server of the associated data *Vservice* does not exist or exists in workgroup mode.

#### **[-skip-config-validation <true>] - Skip Configuration Validation**

Use this parameter to skip the LDAP configuration validation.

The LDAP client configuration, specified by the `-client-config` parameter, that you want to associate with the *Vservice* is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client` `-config`.

## Examples

The following example associates the LDAP client configuration "corp" with the Vserver "vs1":

```
cluster1::> vserver services name-service ldap create -vserver vs1 -client  
-config corp
```

## vserver services name-service ldap delete

### Delete an LDAP configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service ldap delete` command removes the LDAP configuration, which is an LDAP client configuration's association with a Vserver.

Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` parameters and test connectivity before deleting a working LDAP configuration.

### Parameters

#### **-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you want to disassociate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

## Examples

The following example disassociates the current LDAP client configuration from Vserver "vs1".

```
cluster1::> vserver services name-service ldap delete -vserver vs1
```

## vserver services name-service ldap modify

### Modify an LDAP configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service ldap modify` command modifies an LDAP client configuration's association with a Vserver.

Make sure that you remove 'ldap' from the Vserver's `-ns-switch` and `-nm-switch` configurations and test connectivity before disabling a working LDAP configuration.

## Parameters

### **-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver with which you want to associate the LDAP client configuration. A data Vserver or admin Vserver can be specified.

### **[-client-config <text>] - LDAP Client Configuration**

This parameter specifies the name of the LDAP client configuration, defined under `vserver services name-service ldap client` command, that you want to associate with the Vserver. The value of the `bind-as-cifs-server` parameter on this LDAP client should be `false` if the CIFS server of the associated data Vserver does not exist or exists in workgroup mode.

### **[-skip-config-validation <true>] - Skip Configuration Validation**

Use this parameter to skip the LDAP configuration validation.

The LDAP client configuration, specified by the `-client-config` parameter, that you want to associate with the Vserver is validated to verify that at least one of the LDAP servers is reachable, and is providing LDAP services.

.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

## Examples

The following example modifies the LDAP client configuration used by Vserver "vs1" to "corpnew":

```
cluster1::> vserver services name-service ldap modify -vserver vs1 -client
-config corpnew
```

## **vserver services name-service ldap show**

Display LDAP configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service ldap show` command displays information about LDAP configurations.

## Parameters

### **{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays information about the LDAP configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

**[-client-config <text>] - LDAP Client Configuration**

If you specify this parameter, the command displays information about LDAP configurations using the specified client.

## Examples

The following example shows the LDAP configuration for Vserver "vs1":

```
cluster1::> vsriver services name-service ldap show -vserver vs1
Client
Vserver      Configuration
-----
vs1          corp
```

## vsvrrvr svcrvics nvrn-svrvic ldap clint crvr

### Create an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *admin* privilege level.

### Description

The `vsvrrvr svcrvics nvrn-svrvic ldap clint crvr` command creates an LDAP client configuration. A client configuration is associated with a Vsvrrvr using the `vsvrrvr svcrvics nvrn-svrvic ldap` commands.

### Parameters

**-vsvrrvr <Vsvrrvr Nvrn> - Vsvrrvr**

This parameter specifies the Vsvrrvr for which configuration is created. A data Vsvrrvr or admin Vsvrrvr can be specified.

**-clint-clintf <text> - Client Configuration Name**

This parameter specifies the name that you would like to use to refer to the new LDAP client configuration.

**{ -ldvr-svrers <text>,... - LDAP Svrer List**

This parameter specifies the list of LDAP svrers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-svrers`, `-ad-dvrn` or `-prfrred-ad-svrers` parameters. This parameter takes both FQDNs and IP addresses.

### **| -servers <IP Address>,... - (DEPRECATED)-LDAP Server List**

(DEPRECATED) This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-ldap-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters. This parameter is deprecated 9.1.0 and later releases. Use `-ldap-servers` instead.

### **| -ad-domain <TextNoCase> - Active Directory Domain**

This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the `-ldap-servers` and `-servers` parameter. However, you can specify a list of preferred servers using the `-preferred-ad-servers` parameter.

### **[-preferred-ad-servers <IP Address>,...] - Preferred Active Directory Servers**

This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the `-ad-domain` parameter.

### **[-restrict-discovery-to-site {true|false}] - Restrict discovery to site scope }**

This parameter specifies whether to restrict LDAP server discovery to site-scope only. The default value is *false*. The restriction only applies when the `-ad-domain` parameter is specified as part of the `create` command. This can be enabled only if `-default-site` parameter is specified in the CIFS server configuration.

### **[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials**

This parameter specifies whether LDAP binds made using this client configuration use the Vserver's CIFS server credentials. If you do not specify this parameter, and `-ad-domain` is configured, the default is *true*, otherwise the default is *false*. Note that the LDAP client always uses only *sasl* bind, if `-bind-as-cifs-server` is set to *true*. The `-min-bind-level` parameter is ignored in this case.

### **-schema <text> - Schema Template**

This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the `vserver services name-service ldap client schema` commands.

### **[-port <integer>] - LDAP Server Port**

This parameter specifies the port the LDAP client uses to connect to LDAP servers. Default value for port is 636, if `-ldaps-enabled` parameter is specified as *true*. Otherwise, default value for port is 389.

### **[-query-timeout <integer>] - Query Timeout (sec)**

This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

### **[-min-bind-level {anonymous|simple|sasl}] - Minimum Bind Authentication Level**

This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. If you do not specify this parameter, the default is *sasl* bind in case `-ad-domain` is configured, *simple* bind in case `-bind-dn` is configured, otherwise *anonymous* bind. Note that regardless of the `-min-bind-level` configured, LDAP client would always start bind mechanism in the order of *sasl*, then *simple* and lastly *anonymous*. Also, if `-bind-as-cifs-server` is set, then `-min-bind-level` is ignored, and only *sasl* will be used.

### **[`-bind-dn <ldap_dn>`] - Bind DN (User)**

This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (`DOMAIN\user`) or principal (`user@domain.com`) form. Otherwise, specify the user in distinguished name form, like `"CN=user,DC=domain,DC=com"` or `"CN=administrator,CN=users,DC=domain,DC=com"`. This parameter is ignored if `-bind-as-cifs-server` is set.

### **[`-base-dn <ldap_dn>`] - Base DN**

This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, `"DC=example,DC=com"`. If you do not specify this parameter, the default is the root, specified by an empty (`" "`) set.

### **[`-base-scope {base|onelevel|subtree}`] - Base Search Scope**

This parameter specifies the default search scope for LDAP queries. Specify `base` to search just the named entry, `onelevel` to search entries immediately below the DN, or `subtree` to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-user-dn <ldap_dn>`] - User DN (privilege: advanced)**

This parameter specifies the user DN, which overrides the base DN for user lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple user or group DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

### **[`-user-scope {base|onelevel|subtree}`] - User Search Scope (privilege: advanced)**

This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-group-dn <ldap_dn>`] - Group DN (privilege: advanced)**

This parameter specifies the group DN, which overrides the base DN for group lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple user or group DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

### **[`-group-scope {base|onelevel|subtree}`] - Group Search Scope (privilege: advanced)**

This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-netgroup-dn <ldap_dn>`] - Netgroup DN (privilege: advanced)**

This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

### **[`-netgroup-scope {base|onelevel|subtree}`] - Netgroup Search Scope (privilege: advanced)**

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to

subtree by default.

**`[-use-start-tls {true|false}] - Use start-tls Over LDAP Connections`**

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is `false`.

**`[-is-netgroup-byhost-enabled {true|false}] - Enable Netgroup-By-Host Lookup (privilege: advanced)`**

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution queries over LDAP. By default this parameter is set to `false`.

**`[-netgroup-byhost-dn <ldap_dn>] - Netgroup-By-Host DN (privilege: advanced)`**

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

**`[-netgroup-byhost-scope {base|onelevel|subtree}] - Netgroup-By-Host Scope (privilege: advanced)`**

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to `subtree` by default.

**`[-session-security {none|sign|seal}] - Client Session Security`**

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is `none`.

LDAP Client Session Security can be one of the following:

- `none` - No Signing or Sealing.
- `sign` - Sign LDAP traffic.
- `seal` - Seal and Sign LDAP traffic.

**`[-referral-enabled {true|false}] - LDAP Referral Chasing`**

This parameter specifies whether LDAP referral is enabled or not.

**`[-group-membership-filter <text>] - Group Membership Filter (privilege: advanced)`**

This parameter specifies the custom LDAP search filter to be used when looking up group membership from an LDAP server. Examples of valid filters are `"(cn=99)"`, `"(cn=1)"`, `"(|(cn=*22)(cn=*33))"`.

**`[-ldaps-enabled {true|false}] - Is LDAPS Enabled`**

This parameter specifies whether or not to use LDAPS over LDAP connections. If you do not specify this parameter, the value will be based on `port`. If `port` is mentioned as `636`, then the value will be `true`, otherwise the value will be `false`.

### **[`-try-channel-binding {true|false}`] - Try Channel Binding**

This parameter specifies whether channel binding will be tried in case of LDAP connections to the LDAP server. If you do not specify this parameter, the default is `true`. Channel binding will be tried only if `-use-start-tls` or `-ldaps-enabled` is enabled along with `-session-security` set to either `sign` or `seal`.

### **Examples**

The following example creates an LDAP client configuration named `corp` that makes anonymous binds to `ldapservers.example.com` for Vserver `vs1`:

```
cluster1::> vserver services name-service ldap client create -vserver vs1
-client-config corp -ldap-servers ldapservers.example.com
```

The following example creates an LDAP client configuration named `corp` that makes binds to `ldapservers.example.com` for Vserver `vs1` for bind-dn diag:

```
cluster1::> vserver services name-service ldap client create -vserver vs1
-client-config corp -ldap-servers ldapservers.example.com -bind-dn diag
Please enter password:
Confirm password:
```

The following example creates an LDAP client configuration with multiple user DN's.

The following commands are only available in advanced mode.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers ldapservers.example.com
-user-dn "ou=People,dc=mypc,dc=example,dc=com;
ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DN's, one of them containing a semicolon

```
cluster1::*> vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers ldapservers.example.com
-user-dn "ou=People,dc=mypc,dc=example,dc=com;
ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with multiple user DN's, one of them containing a semicolon and a backslash.

```
cluster1::*> vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers ldapserver.example.com
-user-dn "ou=People\;,dc=mypc,dc=example,dc=com\\";
ou=People1,dc=mypc1,dc=example2,dc=com"
```

The following example creates an LDAP client configuration with netgroup by host DN.

```
cluster1::*>vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers ldapserver.example.com
-netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses.

```
cluster1::*>vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers 172.16.0.100,172.16.0.101
-netgroup-byhost-dn nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

The following example creates an LDAP client configuration with ldap-servers as list of ip addresses and hostnames.

```
cluster1::*>vserver services ldap client create -vserver vs1 -client
-config corp -ldap-servers
ldapserver.example.com,172.16.0.100,172.16.0.101 -netgroup-byhost-dn
nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

## vserver services name-service ldap client delete

### Delete an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service ldap client delete` command deletes an LDAP client configuration. A Vserver administrator can only delete configurations owned by the Vserver.

### Parameters

#### **[`-vserver` <Vserver Name>] - Vserver**

This parameter specifies the name of the Vserver which owns the LDAP client you want to delete. A data Vserver or admin Vserver can be specified.

#### **`-client-config` <text> - Client Configuration Name**

This parameter specifies the name of the LDAP client configuration you want to delete.

## Examples

The following example deletes an LDAP client configuration named `corp` owned by Vserver `vs1` :

```
cluster1::> vserver services name-service ldap client delete -vserver vs1  
-client-config corp
```

## vserver services name-service ldap client modify-bind-password

### Modify Bind Password of an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The ``vserver services name-service ldap client modify-bind-password`` command modifies bind-password of a given LDAP client configuration.

#### Parameters

##### **`[-vserver <Vserver Name>]` - Vserver**

This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

##### **`-client-config <text>` - Client Configuration Name**

This parameter specifies the name of the LDAP client configuration.

## Examples

The following example modifies the password for a given LDAP client configuration

```
cluster1::> vserver services name-service ldap client modify-bind-password  
-client-config corp  
Please enter password:  
Confirm password:
```

## vserver services name-service ldap client modify

### Modify an LDAP client configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver services name-service ldap client modify` command modifies an LDAP client configuration. A Vserver administrator can modify only configurations owned by the Vserver. Use the [vserver services name-service ldap client modify-bind-password](#) command to modify the bind password.

## Parameters

### **`[-vserver <Vserver Name>] - Vserver`**

This parameter specifies the name of the Vserver which owns the LDAP client you want to modify. A data Vserver or admin Vserver can be specified.

### **`-client-config <text> - Client Configuration Name`**

This parameter specifies the name of the LDAP client configuration.

### **`{ [-ldap-servers <text>,...] - LDAP Server List`**

This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-servers`, `-ad-domain` or `-preferred-ad-servers` parameters.

### **`| [-servers <IP Address>,...] - (DEPRECATED)-LDAP Server List`**

(DEPRECATED) This parameter specifies the list of LDAP servers used when making LDAP connections using this client configuration. If you specify this parameter, you cannot specify the `-ldap-servers`, `-ad-domain`, `-preferred-ad-servers` or `-bind-as-cifs-server` parameters. This parameter is deprecated 9.1.0 and later releases. Use `-ldap-servers` instead.

### **`| [-ad-domain <TextNoCase>] - Active Directory Domain`**

This parameter specifies the name of the Active Directory domain used to discover LDAP servers for use by this client. This assumes that the Active Directory schema has been extended to act as a NIS replacement. If you use this parameter, you cannot specify the `-servers`, `-ldap-servers` parameter. However, you can specify a list of preferred servers using the `-preferred-ad-servers` parameter.

### **`[-preferred-ad-servers <IP Address>,...] - Preferred Active Directory Servers`**

This parameter specifies a list of LDAP servers that are preferred over those that are discovered in the domain specified in the `-ad-domain` parameter.

### **`[-restrict-discovery-to-site {true|false}] - Restrict discovery to site scope }`**

This parameter specifies whether to restrict server discovery to site-scope only. The default value is *false*. The restriction only applies when an `-ad-domain` is configured. This can be enabled only if `-default-site` parameter is specified in the CIFS server configuration.

### **`[-bind-as-cifs-server {true|false}] - Bind Using the Vserver's CIFS Credentials`**

This parameter specifies whether or not LDAP binds made using this client configuration use the Vserver's CIFS server credentials. Note that the LDAP client always uses only sasl bind, if `-bind-as-cifs-server` is set to *true*. The `-min-bind-level` parameter is ignored in this case.

### **`[-schema <text>] - Schema Template`**

This parameter specifies the name of the schema template the Vserver uses when making LDAP queries. You can view and modify the templates using the `vserver services name-service ldap client schema` commands.

### **`[-port <integer>] - LDAP Server Port`**

This parameter specifies the port the LDAP client uses to connect to LDAP servers. Default value for port is 636, if `-ldaps-enabled` parameter is specified as *true*. Otherwise, default value for port is 389.

### **[`-query-timeout <integer>`] - Query Timeout (sec)**

This parameter specifies the amount of time (in seconds) that the LDAP client waits for a query to complete. If you do not specify this parameter, the default is 3 seconds.

### **[`-min-bind-level {anonymous|simple|sasl}`] - Minimum Bind Authentication Level**

This parameter specifies the lowest acceptable level of security the LDAP client uses to bind to an LDAP server. Note that regardless of the `-min-bind-level` configured, LDAP client would always start bind mechanism in the order of `sasl`, then `simple` and lastly `anonymous`. Also, if `-bind-as-cifs-server` is set, then `-min-bind-level` is ignored, and only `sasl` will be used.

### **[`-bind-dn <ldap_dn>`] - Bind DN (User)**

This parameter specifies the user that binds to the LDAP servers. For Active Directory servers, specify the user in the account (DOMAIN\user) or principal ([user@domain.com](#)) form. Otherwise, specify the user in distinguished name form, like "CN=user,DC=domain,DC=com" or "CN=administrator,CN=users,DC=domain,DC=com". This parameter is ignored if `-bind-as-cifs-server` is set.

### **[`-base-dn <ldap_dn>`] - Base DN**

This parameter specifies the default base DN for all searches, including user, group, and netgroup searches. For example, "DC=example,DC=com". If you do not specify this parameter, the default is the root, specified by an empty ("") set.

### **[`-base-scope {base|onelevel|subtree}`] - Base Search Scope**

This parameter specifies the default search scope for LDAP queries. Specify `base` to search just the named entry, `onelevel` to search entries immediately below the DN, or `subtree` to search the named DN entry and the entire subtree below the DN. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-user-dn <ldap_dn>`] - User DN (privilege: advanced)**

This parameter specifies the user DN, which overrides the base DN for user lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple user or group DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks ("").

### **[`-user-scope {base|onelevel|subtree}`] - User Search Scope (privilege: advanced)**

This parameter specifies the user search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-group-dn <ldap_dn>`] - Group DN (privilege: advanced)**

This parameter specifies the group DN, which overrides the base DN for group lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple user or group DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks ("").

### **[`-group-scope {base|onelevel|subtree}`] - Group Search Scope (privilege: advanced)**

This parameter specifies the group search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-netgroup-dn <ldap_dn>`] - Netgroup DN (privilege: advanced)**

This parameter specifies the netgroup DN, which overrides the base DN netgroup lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

### **[`-netgroup-scope {base|onelevel|subtree}`] - Netgroup Search Scope (privilege: advanced)**

This parameter specifies the netgroup search scope. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-use-start-tls {true|false}`] - Use start-tls Over LDAP Connections**

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the Data ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is `false`.

### **[`-is-netgroup-byhost-enabled {true|false}`] - Enable Netgroup-By-Host Lookup (privilege: advanced)**

Use this parameter to enable or disable netgroup-by-host lookup. If your LDAP directory contains map structures equivalent to the netgroup.byhost map in NIS, enabling this feature greatly speeds up netgroup resolution over LDAP. By default this parameter is set to `false`.

### **[`-netgroup-byhost-dn <ldap_dn>`] - Netgroup-By-Host DN (privilege: advanced)**

This parameter specifies the netgroup-by-host DN, which overrides the base DN for netgroup-by-host lookups.

To specify multiple DN's, separate multiple DN entries with semicolons (;). If you configure multiple netgroup DN's and a DN contains a semicolon, add an escape character (\) immediately before the semicolon or enclose the entire DN with quotation marks (").

### **[`-netgroup-byhost-scope {base|onelevel|subtree}`] - Netgroup-By-Host Scope (privilege: advanced)**

This parameter specifies the netgroup-by-host search scope for LDAP queries. If you do not specify this parameter, the scope is set to `subtree` by default.

### **[`-session-security {none|sign|seal}`] - Client Session Security**

This parameter specifies the level of security to be used for LDAP communications. If you do not specify this parameter, the default is `none`.

LDAP Client Session Security can be one of the following:

- `none` - No Signing or Sealing.
- `sign` - Sign LDAP traffic.
- `seal` - Seal and Sign LDAP traffic.

### **[`-skip-config-validation <true>`] - Skip Configuration Validation**

Use this parameter to skip the LDAP client configuration validation.

The LDAP client configuration specified with the `-client-config` parameter is validated to verify that all the Vservers associated with this LDAP client configuration has at least one of the LDAP servers reachable, and is providing LDAP services.

The validation fails if ONTAP was unable to connect to any LDAP server with the specified `-client-config`.

#### **[`-referral-enabled {true|false}`] - LDAP Referral Chasing**

This parameter specifies whether LDAP referral is enabled or not.

#### **[`-group-membership-filter <text>`] - Group Membership Filter (privilege: advanced)**

This parameter specifies the custom LDAP search filter to be used when looking up group membership from an LDAP server. Examples of valid filters are `"(cn=99)"`, `"(cn=1)"`, `"(|(cn=*22)(cn=*33))"`.

#### **[`-ldaps-enabled {true|false}`] - Is LDAPS Enabled**

This parameter specifies whether or not to use LDAPS over LDAP connections. If you do not specify this parameter, the value will be based on `port`. If `port` is mentioned as `636`, then the value will be `true`, otherwise the value will be `false`.

#### **[`-try-channel-binding {true|false}`] - Try Channel Binding**

This parameter specifies whether to use channel binding for LDAP connections to the LDAP server. If you do not specify this parameter, the default is `true`. Channel binding will be tried only if `-use-start-tls` or `-ldaps-enabled` is enabled along with `-session-security` set to either `sign` or `seal`.

### **Examples**

The following example modifies an existing LDAP client configuration named `corp` owned by Vserver `vs1` to require simple binds using the [administrator@example.com](mailto:administrator@example.com) account:

```
cluster1::> vserver services name-service ldap client modify -client
-config corp -vserver vs1 -bind-dn administrator@example.com -min-bind
-level simple
```

The following example modifies the user DN of an existing LDAP client configuration to contain multiple DNs separated by a semicolon.

```
cluster1::> vserver services ldap client modify -client-config corp
-vserver vs1 -bind-dn administrator@example.com
-user-dn "ou=People,dc=mypc,dc=example,dc=in;
ou=People1,dc=mypc,dc=example2,dc=com" -min-bind-level simple
```

The following example demonstrates how you can use a semicolon as a valid character in a DN instead of a separator.

```
cluster1::> vservice services ldap client modify -client-config corp
-vserver vs1 -bind-dn administrator@example.com
            -user-dn "ou=People\;;,dc=mypc,dc=example,dc=com;
ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with multiple user DN's, one of them containing a semicolon and a backslash.

```
cluster1::> vservice services ldap client modify -client-config corp
-vserver vs1 -bind-dn administrator@example.com
            -user-dn "ou=People\;;,dc=mypc,dc=example,dc=com\\;
ou=People1,dc=mypc,dc=example2,dc=com"
```

The following example modifies an existing LDAP client configuration with netgroup by host DN.

```
cluster1::*>vservice services ldap client modify -vserver vs1 -client
-config corp
            -netgroup-byhost-dn
nisMapName="netgroup.byhost",dc=rfcbis,dc=com
```

## vservice services name-service ldap client show

### Display LDAP client configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservice services name-service ldap client show` command displays information about LDAP client configurations which a *Vserver* can be associated with. An LDAP client configuration created by a *Vserver's* administrator or by the cluster administrator for the *Vserver* is owned by the *Vserver*. A cluster-wide LDAP client configuration is created by a cluster administrator by specifying the admin *Vserver's* name as a value to the `-vserver` parameter. In addition to its owned LDAP client configurations, a *Vserver* can be associated with such cluster-wide LDAP client configurations.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ `-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ `-vserver <Vserver Name>` ] - Vserver**

If you specify this parameter, the command displays all LDAP client configurations that can be associated with the specified Vserver. A data Vserver or admin Vserver can be specified.

**[ `-client-config <text>` ] - Client Configuration Name**

If you specify this parameter, the command displays information about the LDAP client configuration you specify.

**[ `-ldap-servers <text>,...` ] - LDAP Server List**

If you specify this parameter, the command displays LDAP client configurations using the specified list of LDAP servers.

**[ `-servers <IP Address>,...` ] - (DEPRECATED)-LDAP Server List**

(DEPRECATED)-If you specify this parameter, the command displays LDAP client configurations using the specified list of LDAP servers.

**[ `-ad-domain <TextNoCase>` ] - Active Directory Domain**

If you specify this parameter, the command displays LDAP client configurations using the specified domain to discover their list of LDAP servers.

**[ `-preferred-ad-servers <IP Address>,...` ] - Preferred Active Directory Servers**

If you specify this parameter, the command displays LDAP client configurations using the specified list of preferred servers.

**[ `-restrict-discovery-to-site {true|false}` ] - Restrict discovery to site scope**

If you specify this parameter, the command displays only the LDAP client configurations that do site-scope discovery.

**[ `-bind-as-cifs-server {true|false}` ] - Bind Using the Vserver's CIFS Credentials**

If you specify this parameter, the command displays LDAP client configurations that bind using CIFS server credentials. If the CIFS server is in workgroup mode, the value of this parameter should be false.

**[ `-schema <text>` ] - Schema Template**

If you specify this parameter, the command displays LDAP client configurations using the specified schema.

**[ `-port <integer>` ] - LDAP Server Port**

If you specify this parameter, the command displays LDAP client configurations using the specified server port.

**[ `-query-timeout <integer>` ] - Query Timeout (sec)**

If you specify this parameter, the command displays LDAP client configurations using the specified query timeout (in seconds).

**[ `-min-bind-level {anonymous|simple|sas1}` ] - Minimum Bind Authentication Level**

If you specify this parameter, the command displays LDAP client configurations using the specified minimum bind level.

**[`-bind-dn <ldap_dn>`] - Bind DN (User)**

If you specify this parameter, the command displays LDAP client configurations using the specified bind DN.

**[`-base-dn <ldap_dn>`] - Base DN**

If you specify this parameter, the command displays LDAP client configurations using the specified base DN.

**[`-base-scope {base|onelevel|subtree}`] - Base Search Scope**

If you specify this parameter, the command displays LDAP client configurations using the specified base search scope.

**[`-user-dn <ldap_dn>`] - User DN (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified user DN.

**[`-user-scope {base|onelevel|subtree}`] - User Search Scope (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified user search scope.

**[`-group-dn <ldap_dn>`] - Group DN (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified group DN.

**[`-group-scope {base|onelevel|subtree}`] - Group Search Scope (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified group search scope.

**[`-netgroup-dn <ldap_dn>`] - Netgroup DN (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup DN.

**[`-netgroup-scope {base|onelevel|subtree}`] - Netgroup Search Scope (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup search scope.

**[`-is-owner {true|false}`] - Vserver Owns Configuration**

If you set this parameter to true, the command displays LDAP client configurations with the Vservers which own them.

**[`-use-start-tls {true|false}`] - Use start-tls Over LDAP Connections**

This parameter specifies whether or not to use Start TLS over LDAP connections. When enabled, the communication between the ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. If you do not specify this parameter, the default is `false`.

**[`-is-netgroup-byhost-enabled {true|false}`] - Enable Netgroup-By-Host Lookup (privilege: advanced)**

If you set this parameter to true, the command displays LDAP client configurations for which netgroup-by-host lookup is enabled.

**[`-netgroup-byhost-dn <ldap_dn>`] - Netgroup-By-Host DN (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host DN.

**[`-netgroup-byhost-scope {base|onelevel|subtree}`] - Netgroup-By-Host Scope (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified netgroup-by-host search scope.

**[`-session-security {none|sign|seal}`] - Client Session Security**

If this parameter is set to seal, the command displays LDAP client configurations where both signing and sealing are required for LDAP communications. If set to sign, the command displays LDAP client configurations where only signing is required for LDAP communications. If set to none, the command displays LDAP client configurations where no security is required for LDAP communications.

**[`-referral-enabled {true|false}`] - LDAP Referral Chasing**

If you specify this parameter, the command displays information about LDAP referral configurations using the specified client.

**[`-group-membership-filter <text>`] - Group Membership Filter (privilege: advanced)**

If you specify this parameter, the command displays LDAP client configurations using the specified group-membership filter.

**[`-ldaps-enabled {true|false}`] - Is LDAPS Enabled**

If you specify this parameter, the command displays LDAP client configurations using the specified value of this parameter.

**[`-try-channel-binding {true|false}`] - Try Channel Binding**

If you specify this parameter, the command displays LDAP client configurations using the specified channel binding.

## Examples

The following example shows a summary of all of the LDAP client configurations available for Vserver `vs1` :

```
cluster1:> vserver services name-service ldap client show -vserver vs1
Vserver      Client      LDAP      Active Directory
Minimum
Level
-----
vs1          corp        ldapserver.  -          RFC-2307
anonymous
vs1          corpnew     172.16.0.200 -          RFC-2307
simple
```

## vserver services name-service ldap client schema copy

### Copy an existing LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service ldap client schema copy` command creates a new LDAP schema template from an existing one. In addition to an owned LDAP schema template, a Vserver administrator can also copy a cluster-wide LDAP schema template that is owned by the admin Vserver.

#### Parameters

**`[-vserver <Vserver Name>]` - Vserver (privilege: advanced)**

This parameter specifies the Vserver for which you want to copy an existing LDAP schema template.

**`-schema <text>` - Schema Template (privilege: advanced)**

This parameter specifies the name of the existing schema template you want to copy.

**`-new-schema-name <text>` - New Schema Template Name (privilege: advanced)**

This parameter specifies the name of the schema template copy.

#### Examples

The following example creates a copy of the RFC-2307 schema template and names it `corp-schema` for Vserver "vs1":

```
cluster1::> vserver services name-service ldap client schema copy -vserver  
vs1 -schema RFC-2307 -new-schema-name corp-schema
```

## vserver services name-service ldap client schema delete

### Delete an LDAP schema template

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service ldap client schema delete` command deletes an LDAP schema template. A Vserver administrator can only delete templates owned by the Vserver.

You cannot delete the default schema templates.

#### Parameters

**`[-vserver <Vserver Name>]` - Vserver**

This parameter specifies the name of Vserver owning the LDAP schema template you want to delete.

### **-schema <text> - Schema Template**

This parameter specifies the name of the schema template you want to delete.

## **Examples**

The following example deletes a schema template named `corp-schema` owned by Vserver `vs1` :

```
cluster1::> vsriver services name-service ldap client schema delete
-vserver vs1 -schema corp-schema
```

## **vsriver services name-service ldap client schema modify**

### **Modify an LDAP schema template**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

The `vsriver services name-service ldap client schema modify` command modifies an existing LDAP schema template. You cannot modify the default schema templates. Create a copy of a default schema template using the [vsriver services name-service ldap client schema copy](#) command, and then modify the copy. A Vserver administrator can only modify templates owned by the Vserver.

### **Parameters**

#### **[-vserver <Vserver Name>] - Vserver**

This parameter specifies the name of the Vserver owning the LDAP schema template you want to modify.

#### **-schema <text> - Schema Template**

This parameter specifies the name of the schema template you want to modify.

#### **[-comment <text>] - Comment**

This parameter specifies a comment that describes the schema template.

#### **[-posix-account-object-class <text>] - RFC 2307 posixAccount Object Class**

This parameter specifies the RFC 2307 posixAccount object class name defined by the schema.

#### **[-posix-group-object-class <text>] - RFC 2307 posixGroup Object Class**

This parameter specifies the RFC 2307 posixGroup object class name defined by the schema.

#### **[-nis-netgroup-object-class <text>] - RFC 2307 nisNetgroup Object Class**

This parameter specifies the RFC 2307 nisNetgroup object class name defined by the schema.

#### **[-uid-attribute <text>] - RFC 2307 uid Attribute**

This parameter specifies the RFC 2307 uid attribute name defined by the schema.

#### **[-uid-number-attribute <text>] - RFC 2307 uidNumber Attribute**

This parameter specifies the RFC 2307 uidNumber attribute name defined by the schema.

**[-gid-number-attribute <text>] - RFC 2307 gidNumber Attribute**

This parameter specifies the RFC 2307 gidNumber attribute name defined by the schema.

**[-cn-group-attribute <text>] - RFC 2307 cn (for Groups) Attribute**

This parameter specifies the RFC 2307 cn (for Groups) attribute name defined by the schema.

**[-cn-netgroup-attribute <text>] - RFC 2307 cn (for Netgroups) Attribute**

This parameter specifies the RFC 2307 cn (for Netgroups) attribute name defined by the schema.

**[-user-password-attribute <text>] - RFC 2307 userPassword Attribute**

This parameter specifies the RFC 2307 userPassword attribute name defined by the schema.

**[-gecos-attribute <text>] - RFC 2307 gecos Attribute**

This parameter specifies the RFC 2307 gecos attribute name defined by the schema.

**[-home-directory-attribute <text>] - RFC 2307 homeDirectory Attribute**

This parameter specifies the RFC 2307 homeDirectory attribute name defined by the schema.

**[-login-shell-attribute <text>] - RFC 2307 loginShell Attribute**

This parameter specifies the RFC 2307 loginShell attribute name defined by the schema.

**[-member-uid-attribute <text>] - RFC 2307 memberUid Attribute**

This parameter specifies the RFC 2307 memberUid attribute name defined by the schema.

**[-member-nis-netgroup-attribute <text>] - RFC 2307 memberNisNetgroup Attribute**

This parameter specifies the RFC 2307 memberNisNetgroup attribute name defined by the schema.

**[-nis-netgroup-triple-attribute <text>] - RFC 2307 nisNetgroupTriple Attribute**

This parameter specifies the RFC 2307 nisNetgroupTriple attribute name defined by the schema.

**[-enable-rfc2307bis {true|false}] - Enable Support for Draft RFC 2307bis**

This parameter specifies whether RFC 2307bis is enabled for the schema.

**[-group-of-unique-names-object-class <text>] - RFC 2307bis groupOfUniqueNames Object Class**

This parameter specifies the RFC 2307bis groupOfUniqueNames object class name defined by the schema. This parameter takes effect only when RFC 2307bis is enabled for the schema.

**[-unique-member-attribute <text>] - RFC 2307bis uniqueMember Attribute**

This parameter specifies the RFC 2307bis uniqueMember attribute name defined by the schema. This parameter takes effect only when RFC 2307bis is enabled for the schema.

**[-windows-to-unix-object-class <text>] - Data ONTAP Name Mapping windowsToUnix Object Class**

This parameter specifies the name mapping windowsToUnix object class name defined by the schema.

**[-windows-account-attribute <text>] - Data ONTAP Name Mapping windowsAccount Attribute**

This parameter specifies the name mapping windowsAccount attribute name defined by the schema.

**[`-windows-to-unix-attribute <text>`] - Data ONTAP Name Mapping windowsToUnix Attribute**

This parameter specifies the name mapping windowsToUnix attribute name defined by the schema.

**[`-windows-to-unix-no-domain-prefix {true|false}`] - No Domain Prefix for windowsToUnix Name Mapping**

This parameter specifies the name mapping windowsToUnixNoDomainPrefix setting defined by the schema.

**[`-nis-object-class <text>`] - RFC 2307 nisObject Object Class**

This parameter specifies the nisObject class name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservers.

**[`-nis-mapname-attribute <text>`] - RFC 2307 nisMapName Attribute**

This parameter specifies the nisMapName attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservers.

**[`-nis-mapentry-attribute <text>`] - RFC 2307 nisMapEntry Attribute**

This parameter specifies the nisMapEntry attribute name defined by the schema. This parameter takes effect only when netgroup.byhost is enabled for the vservers.

## Examples

The following example modifies the schema template called `corp-schema` owned by Vserver `vs1` to use `User` as the uid attribute name:

```
cluster1::> vservers services name-service ldap client schema modify
-vserver vs1 -schema corp-schema -uid-attribute User
```

## vservers services name-service ldap client schema show

### Display LDAP schema templates

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vservers services name-service ldap client schema show` command shows information about LDAP schema templates which a Vserver can access. An LDAP schema template created by a Vserver's administrator or by the cluster administrator for the Vserver is owned by the Vserver. A cluster-wide LDAP schema template is created by a cluster administrator by specifying the admin Vserver's name as a value to the `-vserver` parameter. In addition to its owned LDAP schema templates, a Vserver can access such cluster-wide LDAP schema templates.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

If you specify this parameter, the command displays all LDAP schema templates that can be accessed by the specified Vserver.

**[-schema <text>] - Schema Template**

If you specify this parameter, the command displays the schema template with the specified name.

**[-comment <text>] - Comment**

If you specify this parameter, the command displays schema templates with the specified comment.

**[-posix-account-object-class <text>] - RFC 2307 posixAccount Object Class**

If you specify this parameter, the command displays schema templates with the specified posixAccount object class.

**[-posix-group-object-class <text>] - RFC 2307 posixGroup Object Class**

If you specify this parameter, the command displays schema templates with the specified posixGroup object class.

**[-nis-netgroup-object-class <text>] - RFC 2307 nisNetgroup Object Class**

If you specify this parameter, the command displays schema templates with the specified nisNetgroup object class.

**[-uid-attribute <text>] - RFC 2307 uid Attribute**

If you specify this parameter, the command displays schema templates with the specified uid attribute.

**[-uid-number-attribute <text>] - RFC 2307 uidNumber Attribute**

If you specify this parameter, the command displays schema templates with the specified uidNumber attribute.

**[-gid-number-attribute <text>] - RFC 2307 gidNumber Attribute**

If you specify this parameter, the command displays schema templates with the specified gidNumber attribute.

**[-cn-group-attribute <text>] - RFC 2307 cn (for Groups) Attribute**

If you specify this parameter, the command displays schema templates with the specified cn (for Groups) attribute.

**[-cn-netgroup-attribute <text>] - RFC 2307 cn (for Netgroups) Attribute**

If you specify this parameter, the command displays schema templates with the specified cn (for Netgroups) attribute.

**[`-user-password-attribute <text>`] - RFC 2307 userPassword Attribute**

If you specify this parameter, the command displays schema templates with the specified userPassword attribute.

**[`-gecos-attribute <text>`] - RFC 2307 gecos Attribute**

If you specify this parameter, the command displays schema templates with the specified gecos attribute.

**[`-home-directory-attribute <text>`] - RFC 2307 homeDirectory Attribute**

If you specify this parameter, the command displays schema templates with the specified homeDirectory attribute.

**[`-login-shell-attribute <text>`] - RFC 2307 loginShell Attribute**

If you specify this parameter, the command displays schema templates with the specified loginShell attribute.

**[`-member-uid-attribute <text>`] - RFC 2307 memberUid Attribute**

If you specify this parameter, the command displays schema templates with the specified memberUid attribute.

**[`-member-nis-netgroup-attribute <text>`] - RFC 2307 memberNisNetgroup Attribute**

If you specify this parameter, the command displays schema templates with the specified memberNisNetgroup attribute.

**[`-nis-netgroup-triple-attribute <text>`] - RFC 2307 nisNetgroupTriple Attribute**

If you specify this parameter, the command displays schema templates with the specified nisNetgroupTriple attribute.

**[`-enable-rfc2307bis {true|false}`] - Enable Support for Draft RFC 2307bis**

If you set this parameter to true, the command displays RFC 2307bis enabled LDAP schema templates.

**[`-group-of-unique-names-object-class <text>`] - RFC 2307bis groupOfUniqueNames Object Class**

If you specify this parameter, the command displays schema templates with the specified groupOfUniqueNames object class.

**[`-unique-member-attribute <text>`] - RFC 2307bis uniqueMember Attribute**

If you specify this parameter, the command displays schema templates with the specified uniqueMember attribute.

**[`-windows-to-unix-object-class <text>`] - Data ONTAP Name Mapping windowsToUnix Object Class**

If you specify this parameter, the command displays schema templates with the specified windowsToUnix object class.

**[`-windows-account-attribute <text>`] - Data ONTAP Name Mapping windowsAccount Attribute**

If you specify this parameter, the command displays schema templates with the specified windowsAccount attribute.

**[`-windows-to-unix-attribute <text>`] - Data ONTAP Name Mapping windowsToUnix Attribute**

If you specify this parameter, the command displays schema templates with the specified windowsToUnix

attribute.

**[-windows-to-unix-no-domain-prefix {true|false}] - No Domain Prefix for windowsToUnix Name Mapping**

If you specify this parameter, the command displays schema templates with the specified windowsToUnixNoDomainPrefix setting.

**[-is-owner {true|false}] - Vserver Owns Schema**

If you set this parameter to true, the command displays LDAP schema templates with the Vservers which own them.

**[-nis-object-class <text>] - RFC 2307 nisObject Object Class**

If you specify this parameter, the command displays schema templates with the specified nisObject attribute.

**[-nis-mapname-attribute <text>] - RFC 2307 nisMapName Attribute**

If you specify this parameter, the command displays schema templates with the specified nisMapName attribute.

**[-nis-mapentry-attribute <text>] - RFC 2307 nisMapEntry Attribute**

If you specify this parameter, the command displays schema templates with the specified nisMapEntry attribute.

## Examples

The following example shows a summary of all of the default LDAP schema templates defined in the cluster:

```
cluster1::> vservice name-service ldap client schema show
Vserver Schema Template Comment
-----
-----
cluster-node3
      MS-AD-BIS      Schema based on Active Directory Identity
Management for UNIX (read-only)
cluster-node3
      AD-IDMU        Schema based on Active Directory Identity
Management for UNIX (read-only)
cluster-node3
      AD-SFU         Schema based on Active Directory Services for UNIX
(read-only)
cluster-node3
      RFC-2307       Schema based on RFC 2307 (read-only)
4 entries were displayed.
```

## vservice name-service netgroup load

Load netgroup definitions from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service netgroup load` command loads netgroup definitions from a uniform resource identifier (URI) to a specified Vserver. You can load from a netgroup file at an FTP or a HTTP location (source URI) using the respective protocol.

Before ONTAP saves the new netgroup definitions, it checks that the netgroup file does not have any file structure issues, does not contain any syntax errors, and all entries comply with the following rules:

- A domain name consists of one or more labels separated by periods (.).
- A hostname is a valid domain name, IPv4 address, or IPv6 address.
- Valid characters for a label are all alphanumeric characters, underscore (\_), and dash (-). A label may not begin or end with a dash.
- Valid characters for a username are all ASCII printable characters with the exception of whitespace, parentheses, and comma (,).
- Valid characters for a netgroup name are all alphanumeric characters, underscore (\_), and dash (-). A netgroup name may not begin with a dash.
- A single line in the netgroup file may not exceed 4096 characters.

If the file is found to contain errors, ONTAP will issue an error to that effect and netgroup definitions will not be loaded into the specified Vserver. After correcting the error, reload the netgroup file into the specified Vserver.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver for which you want to load netgroup definitions.

**-source {scheme: //(hostname|IPv4 Address| ' 'IPv6 Address' ') ...} - URI to Load from**

This parameter specifies the source URI from which you want to load netgroup definitions. You can load from a URI either using the FTP or the HTTP protocol.

**[-foreground {true|false}] - Load Netgroup in the Foreground**

This parameter specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in foreground). When set to `true`, the command does not return until the operation completes.

**[-skip-hostname-validation <true>] - Skip Hostname Validation (privilege: advanced)**

If this parameter is specified, the hostname validation is skipped.

**[-skip-file-size-check <true>] - Skip File Size Check Before Download (privilege: advanced)**

If this parameter is specified, the file is downloaded without checking the file size. Use this parameter if the server does not supply the file size or does not provide an accurate value. This parameter can also be used to download a file greater than the default 5 MB size limit.

If this parameter is specified and the file is very large, the transfer may take a long time or fail due to disk space limitations.

**[`-skip-file-duplicate-check <true>`] - Skip Netgroup File Duplicate Check (privilege: advanced)**

If this parameter is specified, the netgroup file is downloaded even if the contents are same as the existing netgroup file. In this case, the existing file will be replaced.

## Examples

The following example loads netgroup definitions into a Vserver named vs1 from the file netgroup1 at FTP location <ftp://ftp.example.com>:

```
cluster1::> vsriver services name-service netgroup load -vsriver vs1
-source ftp://ftp.example.com/netgroup1
```

## vsvriver services name-service netgroup status

### Display local netgroup definitions status

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *advanced* privilege level.

### Description

The `vsvriver services name-service netgroup status` command displays the status of local netgroup definitions across a cluster. This enables you to verify that netgroup definitions are consistent across all nodes that back a Vsvriver into which netgroup definitions have been loaded.

The command displays the following information:

- Vsvriver name
- Node name
- Load time for netgroup definitions
- Hash value of the netgroup definitions
- Hash value of the netgroup-by-host database
- File size of the netgroup definitions file

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vsriver <vsriver name>`] - Vsvriver (privilege: advanced)**

If you specify this parameter, the command displays the netgroup status only for the specified Vsvriver.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays the netgroup status only for the specified node.

### **[`-timestamp` <MM/DD/YYYY HH:MM:SS>] - Load Time (privilege: advanced)**

If you specify this parameter, the command displays the status only for the netgroup definitions that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node downloads the definitions from the URI individually.

### **[`-hashvalue` <text>] - Hash Value (privilege: advanced)**

If you specify this parameter, command displays the status only for the netgroup definitions that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

### **[`-hashvalue-byhost` <text>] - Hash Value Byhost (privilege: advanced)**

If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified hash value for netgroup-by-host database. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value for netgroup-by-host database.

### **[`-filesize` {<integer>[KB|MB|GB|TB|PB]}] - File Size (privilege: advanced)**

If you specify this parameter, the command displays the status only for the netgroup definitions that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

## **Examples**

The following example displays the netgroup definition status for all Vservers:

```
cluster1::*> vservice services name-service netgroup status
Vserver      Node      Load Time      Hash Value
Hash Value By-Host      File Size
-----
vs1
      node1      9/20/2008 16:04:55 e6cb38ec1396a280c0d2b77e3a84eda2
913a182a72aa1872495be398ebb2cd23 1.00KB
      node2      9/20/2008 16:04:53 e6cb38ec1396a280c0d2b77e3a84eda2
913a182a72aa1872495be398ebb2cd23 1.00KB
vs2
      node1      9/20/2008 16:06:26 c0d2b77e3a84eda2e6cb38ec1396a280
009321eddb45611e95d9f7f277ec0621 2.3MB
      node2      9/20/2008 16:06:27 c0d2b77e3a84eda2e6cb38ec1396a280
009321eddb45611e95d9f7f277ec0621 2.3MB
4 entries were displayed.
```

## **vservice services name-service netgroup file delete**

### **Remove a local netgroup file**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service netgroup file delete` command deletes the local netgroup files for given Vservers.

## Parameters

### **-vserver <vserver name> - Vserver**

Use this parameter to specify the Vservers whose local netgroup file you want to delete. Separate multiple Vserver names with commas.

## Examples

The following example deletes the local netgroup file for a Vserver named `vs1`.

```
cluster1::> vserver services netgroup file delete -vserver vs1
```

## **vserver services name-service netgroup file show**

Display a local netgroup file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services netgroup file show` command displays the contents of the local netgroup file for the specified Vservers. All the entries under a given netgroup, specified in the Netgroup column of the command output, list the members of that netgroup. Each netgroup file specifies netgroups, which are sets of tuples. Each member of a netgroup is either the name of another netgroup, specified in the Member Netgroup column, or a specification of a tuple as follows: (Host, User, Domain) where Host, User, and Domain are character string names for the corresponding component. Any of the components of a tuple can either be empty to specify a wildcard value or a dash (-) to specify no valid value.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields fieldname, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-vserver <vserver name>] - Vserver**

Use this parameter to display the local netgroup file contents for the Vservers you specify.

### **[-netgroup <text>] - Netgroup Name**

If you specify this parameter, the command displays information about the netgroup you specify.

### **[-netgrpmemb <text>] - Member Netgroup**

If you specify this parameter, the command displays information about the member netgroup you specify.

**[-host <text>] - Member Host**

If you specify this parameter, the command displays information about the host you specify.

**[-user <text>] - Member User**

If you specify this parameter, the command displays information about the user you specify.

**[-domain <text>] - Member Domain**

If you specify this parameter, the command displays information about the domain you specify.

**Examples**

The following example displays the netgroup file contents for the Vserver named vs1.

```
cluster1::> vservice services netgroup file show -vserver vs1
Member
Vserver      Netgroup Netgroup      Host      User      Domain
-----
vs1
netgrp1
          netgrp9      -      -      -
          h1      d1
          h22      d22
          netgrp11     -      -      -
          netgrp18     -      -      -
          h119     u4343     d34
          netgrp8
          ' - '      u88      ' - '
```

**vserver services name-service nis-domain create**

Create a NIS domain configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver services name-service nis-domain create` command creates a configuration for an NIS domain. You can configure only one NIS domain for a given Vserver. You can also configure more than one Vserver with the same NIS domain.

**Parameters**

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver on which the NIS domain configuration is created. A data Vserver or admin Vserver can be specified.

### **-domain <nis domain> - NIS Domain**

Use this parameter to specify the NIS domain for which a configuration is created. Maximum Supported NIS Domain length: 64 characters.

### **{ -nis-servers <text>, ... - NIS Servers**

Use this parameter to specify the hostnames/IP addresses of NIS servers used by the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.

### **| -servers <IP Address>, ... - (DEPRECATED)-NIS Server }**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to specify the IP addresses of NIS servers used by the NIS domain configuration. Separate multiple IP addresses with commas.

## **Examples**

The following example creates an NIS domain configuration on the Vserver named vs0. The NIS domain is named nisdomain and uses an NIS server with the IP address 192.0.2.180.

```
cluster1::> vserver services name-service nis-domain create -vserver vs0  
-domain nisdomain -nis-servers 192.0.2.180
```

## **vserver services name-service nis-domain delete**

### **Delete a NIS domain configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver services name-service nis-domain delete` command deletes an NIS domain configuration.

Deleting a NIS domain configuration removes it permanently.

### **Parameters**

#### **-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver from which the NIS domain configuration is deleted. A data Vserver or admin Vserver can be specified.

#### **-domain <nis domain> - NIS Domain**

Use this parameter to specify the NIS domain whose configuration is deleted.

## **Examples**

The following example deletes the configuration of an NIS domain named testnisdomain from a Vserver named vs2:

```
cluster1::> vserver services name-service nis-domain delete -vserver vs2
-domain testnisdomain
```

## vserver services name-service nis-domain modify

### Modify a NIS domain configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

Use the `vserver services name-service nis-domain modify` command to modify the NIS server of a NIS domain configuration.

To change the NIS domain, delete the NIS configuration using the [vserver services name-service nis-domain delete](#) command and then create the NIS configuration with new NIS domain using the [vserver services name-service nis-domain create](#) command. To permanently remove a configuration, use the [vserver services name-service nis-domain delete](#) command.

#### Parameters

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver whose NIS domain configuration is modified. A data Vserver or admin Vserver can be specified.

**-domain <nis domain> - NIS Domain**

Use this parameter to specify the NIS domain whose configuration is modified.

**{ [-nis-servers <text>,...] - NIS Servers**

Use this parameter to specify the hostnames/IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple hostnames/IP addresses with commas.

**| [-servers <IP Address>,...] - (DEPRECATED)-NIS Server }**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to specify the IP addresses of NIS servers used by the the NIS domain configuration. Separate multiple IP addresses with commas.

#### Examples

The following example modifies the NIS servers of a NIS domain named `nisdomain` on a Vserver named `vs0`:

```
cluster1::> vserver services name-service nis-domain modify -vserver vs0
-domain nisdomain -nis-servers 192.0.2.180
```

## vserver services name-service nis-domain show-bound

Display binding status of a NIS domain configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service nis-domain show-bound` command displays binding information about NIS domain configurations.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you use this parameter, the command displays binding information only about the NIS domain configurations of the specified Vservers. Use this parameter with the `-domain` parameter to display binding information only about a particular NIS domain configuration on the specified Vserver. A data Vserver or admin Vserver can be specified.

**[-domain <nis domain>] - NIS Domain**

If you use this parameter, the command displays binding information only about the NIS domain configurations that match the specified NIS domain name. Use this parameter with the `-vserver` parameter to display binding information only about a particular Vserver on the specified NIS domain name.

**[-bound-servers <IP Address>,...] - Bound NIS Servers**

If you use this parameter, the command displays NIS binding information only about the specified NIS servers.

### Examples

The following example displays binding information about all NIS domain configurations:

```
cluster1::> vserver services name-service nis-domain show-bound
```

| Vserver | Domain         | Bound<br>NIS Server       |
|---------|----------------|---------------------------|
| vs1     | testnisdomain1 | 192.0.2.180,<br>10.0.2.15 |
| vs2     | testnisdomain2 | 10.0.2.17                 |

2 entries were displayed.

## vserver services name-service nis-domain show

### Display NIS domain configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service nis-domain show` command displays information about NIS domain configurations.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Use this parameter to display information only about the NIS domain configurations of the Vservers you specify. Use this parameter with the `-domain` parameter to display information only about a particular NIS domain configuration on the Vserver you specify. A data Vserver or admin Vserver can be specified.

**[-domain <nis domain>] - NIS Domain**

Use this parameter to display information only about the NIS domain configurations that match the NIS domain name you specify. Use this parameter with the `-vserver` parameter to display information only about a particular NIS domain configuration on the Vserver you specify.

**[-nis-servers <text>,...] - NIS Servers**

Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the hostnames/IP addresses you specify.

**[-servers <IP Address>,...] - (DEPRECATED)-NIS Server**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to display information only about the NIS domain configurations that use the NIS servers at the IP addresses you specify.

## Examples

The following example displays information about all NIS domain configurations:

```
cluster1::> vservice services name-service nis-domain show
Vserver      Domain      NIS Server
-----
vs1          nisdomain   192.0.2.180
vs2          nisdomain   10.0.2.15
vs3          testnisdomain 192.0.2.128, 192.0.2.180
3 entries were displayed.
```

## **vservice services name-service nis-domain group-database build**

Build NIS group database

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vservice services name-service nis-domain group-database build` command rebuilds the NIS group.byuser DB for a given Vserver if NIS is added as source for group and an active nis-domain exists.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver for which NIS group.byuser DB will be rebuilt. A data Vserver can be specified.

## Examples

The following example rebuilds NIS group.byuser DB for Vserver vs0.

```
cluster1::> vservice services name-service nis-domain group-database build
-vserver vs0
```

## **vservice services name-service nis-domain group-database status**

Display NIS group database status of the local node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vservice services name-service nis-domain group-database status` command displays the status of local NIS group.byuser db across a cluster. This enables you to verify that NIS group.byuser db are consistent across all nodes.

The command displays the following information:

- Vserver name
- Node name
- Last build time of NIS group.byuser db
- Hash value of the NIS group.byuser db
- File size of the NIS group.byuser db

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If you specify this parameter, the command displays the NIS group.byuser db status only for the specified Vserver.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays the NIS group.byuser db status only for the specified node.

**`[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time (privilege: advanced)`**

If you specify this parameter, the command displays the status only for the NIS group.byuser db that were built at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical definitions are different on different nodes, because each node extracts the db individually.

**`[-filesize {<integer>[KB|MB|GB|TB|PB]}] - File Size (privilege: advanced)`**

If you specify this parameter, the command displays the status only for the NIS group.byuser db that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

**`[-hashvalue <text>] - Hash Value (privilege: advanced)`**

If you specify this parameter, command displays the status only for the NIS group.byuser db that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

## Examples

The following example displays the NIS group.byuser db status for vs0 :

```
cluster1::*> vserver services name-service nis-domain group-database
status -vserver vs0
```

| Vserver                          | Node  | Last Build Time    | File Size |
|----------------------------------|-------|--------------------|-----------|
| -----                            |       |                    |           |
| Hash Value                       |       |                    |           |
| -----                            |       |                    |           |
| vs0                              | node1 | 2/14/2017 11:39:56 | 136KB     |
| a30b7d6d03197a7af25de72dcc4bd64f |       |                    |           |

## vserver services name-service nis-domain netgroup-database build

### Build NIS netgroup database

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service nis-domain netgroup-database build` command rebuilds the NIS netgroup.byhost database for a given Vserver if NIS is added as the source for netgroup and an active NIS domain exists.

#### Parameters

##### **-vserver <vserver name> - Vserver Name (privilege: advanced)**

Use this parameter to specify the Vserver for which the NIS netgroup.byhost database will be rebuilt. A data Vserver can be specified.

#### Examples

The following example rebuilds the NIS netgroup.byhost database for Vserver vs0.

```
cluster1::> vserver services name-service nis-domain netgroup-database
build -vserver vs0
```

## vserver services name-service nis-domain netgroup-database show-status

### Display NIS netgroup database status of the local node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service nis-domain netgroup-database show-status` command displays the status of local NIS netgroup.byhost databases across a cluster. This enables you to verify that NIS netgroup.byhost databases are consistent across all nodes.

The command displays the following information:

- Vserver name
- Node name
- Last build time of the NIS netgroup.byhost database
- Hash value of the NIS netgroup.byhost database
- File size of the NIS netgroup.byhost database

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <vserver name>`] - Vserver (privilege: advanced)**

If you specify this parameter, the command displays the NIS netgroup.byhost database status only for the specified Vserver.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays the NIS netgroup.byhost database status only for the specified node.

**[`-timestamp <MM/DD/YYYY HH:MM:SS>`] - Load Time (privilege: advanced)**

If you specify this parameter, the command displays the status only for the NIS netgroup.byhost databases that were built at the specified time. Specify time in the format `MM/DD/YYYY HH:MM:SS`. Note that the load time stamps for identical definitions are different on different nodes, because each node extracts the databases individually.

**[`-filesize {<integer>[KB|MB|GB|TB|PB]}`] - File Size (privilege: advanced)**

If you specify this parameter, the command displays the status only for the NIS netgroup.byhost databases that have the specified file size. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

**[`-hashvalue <text>`] - Hash Value (privilege: advanced)**

If you specify this parameter, the command displays the status only for the NIS netgroup.byhost databases that have the specified hash value. Note that the primary purpose of the command is to verify that the definitions on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

## Examples

The following example displays the NIS netgroup.byhost database status for vsriver vs0 :

```
cluster1::*> vserver services name-service nis-domain netgroup-database
status -vserver vs0
Vserver      Node                Last Build Time      File Size
-----
Hash Value
-----
vs0
node1        2/14/2019 11:39:56   136KB
a30b7d6d03197a7af25de72dcc4bd64f
```

## vserver services name-service nis-domain netgroup-database config modify

### Modify NIS netgroup database configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service nis-domain netgroup-database config modify` command modifies NIS netgroup.byhost database configuration of the specified Vserver.

#### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the settings need to be modified.

**[-state {enabled|disabled}] - State (privilege: advanced)**

Use this parameter to enable and disable NIS netgroup.byhost databases. Default value is disabled.

**[-build-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Build Interval (privilege: advanced)**

Use this parameter to specify the NIS netgroup.byhost database build time interval. Default value is 24 hours and minimum value can be set to 5 minutes. Setting build interval below 1 hour may impact the performance.

#### Examples

The following example enables NIS netgroup.byhost database and sets the build interval to 24 hours for Vserver vs0:

```
cluster1::> vserver services name-service nis-domain netgroup-database
config modify -vserver vs0 -build-interval 24h -state enabled
```

## vserver services name-service nis-domain netgroup-database config show

### Display NIS netgroup database configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service nis-domain netgroup-database config show` command displays NIS netgroup.byhost database settings.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If this parameter is specified, the command displays information only about NIS netgroup.byhost databases belonging to the specified Vservers.

**`[-state {enabled|disabled}] - State (privilege: advanced)`**

If this parameter is specified, the command displays information only about NIS netgroup.byhost databases with the specified state.

**`[-build-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Build Interval (privilege: advanced)`**

If this parameter is specified, the command displays information only about NIS netgroup.byhost databases with the specified build time interval.

## Examples

The following example displays the settings for Vserver `vs0`:

```
cluster1::> vserver services name-service nis-domain netgroup-database
config show -vserver vs0
      Vserver: vs0
      Build Interval: 30m
      State: disabled
```

## vserver services name-service ns-switch create

Create a new Name Service Switch table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service ns-switch create` command specifies the order in which to lookup the name service sources, for a given Vserver and name service database. Each name service database contains some information regarding hosts, group, password, netgroup or namemap. Such a

database comes from one or more name service sources such as files, DNS, LDAP or NIS.

Note: The ``vserver services name-service ns-switch`` command provides the functionality of the `/etc/nsswitch.conf` file on UNIX systems. For more information, see the UNIX man page for `nsswitch.conf(5)`.

Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver on which to create the new name service switch entry

**-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database**

Name Service Switch Database Use this parameter to specify the name service database for which the order of the source lookup is being specified. This parameter can have the following values:

- hosts
- group
- passwd
- netgroup
- namemap

**-sources {files|dns|ldap|nis} - Name Service Source Order**

Name Service Source Order Use this parameter to specify the name service sources and the order in which to look them up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple name service sources with commas.

For each database specified with the `-database` parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

| +-----+-----+ |                  |
|---------------|------------------|
| Database      | Valid Sources    |
| +-----+-----+ |                  |
| hosts         | files, dns       |
| group         | files, nis, ldap |
| passwd        | files, nis, ldap |
| netgroup      | files, nis, ldap |
| namemap       | files, ldap      |
| +-----+-----+ |                  |

+

NOTE: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default

user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, \_pflogd, \_dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

+

## Examples

The following example creates name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is specified as files followed by DNS.

```
cluster1::> vsserver services name-service ns-switch create -vserver vs0
-database hosts -sources files,dns
```

The following example creates the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is specified as files, NIS and LDAP.

```
cluster1::> vsserver services nameservice ns-switch create -vserver vs1
-database passwd -sources files,nis,ldap
```

## vsserver services name-service ns-switch delete

### Remove a Name Service Switch table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the ``vsserver services name-service ns-switch delete`` command to permanently remove an existing name service switch entry.

### Parameters

**-vserver <vserver name> - Vserver**

Vserver Use this parameter to specify the Vserver for which to delete the name service switch entry.

**-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database**

Name Service Switch Database Use this parameter to specify the name service database, of the Vserver, for which the name service switch entry is to be deleted. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup

- name\_map

## Examples

The following example deletes the name service switch entry for the hosts database on a Vserver named vs0.

```
cluster1::> vserver services name-service ns-switch delete -vserver vs0
-database hosts.
```

The following example deletes the name service switch entry for the group database on a Vserver named vs1.

```
cluster1::> vserver services name-service ns-switch delete -vserver vs1
-database group.
```

## vserver services name-service ns-switch modify

### Change a Name Service Switch table entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the ``vserver services name-service ns-switch modify`` command to modify the order of looking up the name service sources, for an existing name service switch entry.

### Parameters

#### **-vserver <vserver name> - Vserver**

Vserver Use this parameter to specify the Vserver on which to modify the name service switch entry. A data Vserver or admin Vserver can be specified.

#### **-database {hosts|group|passwd|netgroup|namemap} - Name Service Switch Database**

Name Service Switch Database Use this parameter to specify the name service database, of the given Vserver, for which to modify the name service switch entry. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup
- namemap

## **[`-sources {files|dns|ldap|nis}`] - Name Service Source Order**

Name Service Source Order Use this parameter to specify the name service sources and the order in which look up for the specified Vserver and name service database. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple sources with commas.

For each database specified with the `-database` parameter, one or more sources must be specified. The valid sources for each database type are shown in the following table:

| +-----+-----+ |                  |
|---------------|------------------|
| Database      | Valid Sources    |
| +-----+-----+ |                  |
| hosts         | files, dns       |
| group         | files, nis, ldap |
| passwd        | files, nis, ldap |
| netgroup      | files, nis, ldap |
| namemap       | files, ldap      |
| +-----+-----+ |                  |

+

NOTE: If "files" is not specified as the default source for the "passwd" or "group" database, ensure that default user and group entries for the 'passwd' and 'group' respectively are present in the source configured. Default entries for "passwd" database: nobody, pcuser, root, sshd, toor, daemon, operator, bin, tty, kmem, games, news, man, smmsp, mailnull, bind, proxy, uucp, pop, www, admin, diag, autosupport. Default entries for "group" database: wheel, daemon, kmem, sys, tty, operator, mail, bin, news, man, games, ftp, staff, sshd, smmsp, mailnull, guest, bind, proxy, authpf, \_pflogd, \_dhcp, uucp, dialer, network, audit, www, antivirus, nogroup, nobody.

+

## **Examples**

The following example modifies the name service source ordering for the hosts database on a Vserver named vs0. The order of looking up the sources is changed to only DNS.

```
cluster1::> vsserver services name-service ns-switch modify -vserver vs0
-database hosts -sources dns
```

The following example modifies the name service source ordering for the passwd database on a Vserver named vs1. The order of looking up the sources is changed to LDAP followed by NIS.

```
cluster1::> vserver services name-service ns-switch modify -vserver vs1
-database passwd -sources ldap,nis
```

## vserver services name-service ns-switch show

### Display Name Service Switch configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

Use the ``vserver services name-service ns-switch show`` command to display information about one or more name service switch entries. A name service switch entry provides information about the order of looking up the name service sources, for a Vserver and name service database.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields [fieldname], ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

Vserver Use this parameter to display only the name service switch entries for the Vserver you specify. A data Vserver or admin Vserver can be specified.

**[-database {hosts|group|passwd|netgroup|namemap}] - Name Service Switch Database**

Name Service Switch Database Use this parameter to display only the name service switch entries of the name service database type you specify. Following are the possible values for this parameter:

- hosts
- group
- passwd
- netgroup
- name\_map

**[-sources {files|dns|ldap|nis}] - Name Service Source Order**

Name Service Source Order Use this parameter to display only name service switch entries with the specified name service source order. Each name service source in the list for this parameter must be one of the following:

- files
- dns
- ldap
- nis

Separate multiple sources with commas.

## Examples

The following example shows the output of the ``vserver services name-service ns-switch show`` command.

```
cluster1::> `vserver services name-service ns-switch show`

      Vserver      Database      Source
-----
vs0             hosts      files,
                        dns
vs1             passwd     files,
                        ldap, nis

2 entries were displayed.
```

## vserver services name-service unix-group adduser

Add a user to a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-group adduser` command adds a user to a local UNIX group.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver location of the local UNIX group to which the user is added.

**-name <text> - Group Name**

Use this parameter to specify the local UNIX group to which to add the user.

**-username <text> - Name of User**

Use this parameter to specify the user name to add to the local UNIX group.

**[-skip-name-validation {true|false}] - Skip Name Validation**

By default, ONTAP validates the name to ensure it complies with the following rules:

- The name contains only these valid characters: 0 through 9, A through Z, a through z, "\_", ".", and "-".
- The name does not start with the character "-".
- The name does not contain "\$" except as the last character.

If the parameter is set to *true*, the name validation is skipped.

## Examples

The following example adds a user named tsmith to a local UNIX group named sales on a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group adduser -vserver vs0
-name sales -username tsmith
```

## vserver services name-service unix-group create

### Create a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-group create` command creates a local UNIX group on a Vserver. Use a local UNIX group for Windows-to-UNIX and UNIX-to-Windows group mappings.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver on which to create the local UNIX group.

**-name <text> - Group Name**

Use this parameter to specify the name of the group to create.

**-id <integer> - Group ID**

Use this parameter to specify an ID number for the group.

**[-skip-name-validation {true|false}] - Skip Name Validation**

By default, ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "\_", ".", and "-"
- The name does not start with "-"
- The name does not contain "\$" except as the last character

If the parameter is set to `true`, the name validation is skipped.

## Examples

The following example creates a group named sales on a Vserver named vs0. The group has the ID 94.

```
cluster1::> vserver services name-service unix-group create -vserver vs0
-name sales -id 94
```

## vserver services name-service unix-group delete

Delete a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-group delete` command deletes a local UNIX group from a Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver location of the local UNIX group to delete.

**-name <text> - Group Name**

Use this parameter to specify the local UNIX group to delete.

### Examples

The following example deletes a local UNIX group named testgroup from a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group delete -vserver vs0
-name testgroup
```

## vserver services name-service unix-group deluser

Delete a user from a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-group deluser` command removes a user from a local UNIX group.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver location of the local UNIX group from which the user is removed.

**-name <text> - Group Name**

Use this parameter to specify the local UNIX group from which to remove the user.

**-username <text> - Name of User**

Use this parameter to specify the user name to remove from the local UNIX group.

## Examples

The following example removes a user named testuser from a local UNIX group named sales on a Vserver named vs0:

```
cluster1::> vsserver services name-service unix-group deluser -vsserver vs0
-name eng -username testuser
```

## vsserver services name-service unix-group load-from-uri

Load one or more local UNIX groups from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver services name-service unix-group load-from-uri` command loads UNIX groups from a universal resource identifier (URI). The URI must contain group information in the UNIX `/etc/group` format:

```
group_name:password:group_ID:comma_separated_list_of_users
```

The command discards the value of the `password` field.

### Parameters

#### **-vsserver <vsserver> - Vserver**

Use this parameter to specify the Vserver on which to locate the local UNIX groups.

#### **-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to Load From**

Use this parameter to specify the URI from which the command loads group information. The URI scheme must be either `ftp(s)` or `http(s)`

#### **[-overwrite {true|false}] - Overwrite Entries**

Use this parameter with the value `true` to specify that group information loaded from the URI should overwrite existing group information. The default value is `false`, specifying that group information loaded from the URI should not overwrite existing group information.

#### **[-skip-name-validation {true|false}] - Skip Name Validation**

By default, ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "\_", ".", and "-"
- The name does not start with "-"
- The name does not contain "\$" except as the last character

If the parameter is set to `true`, the name validation is skipped.

#### **[-foreground {true|false}] - Load Unix Groups file in the Foreground**

If this parameter is set to `false`, the operation runs as a job in the background. Otherwise, the command

does not return until the operation is complete. The default value is *true* .

## Examples

The following example loads group information from the URI <ftp://ftp.example.com/groups> onto a Vserver named vs0:

```
cluster1::> vserver services name-service unix-group load-from-uri
-vserver vs0 -uri ftp://ftp.example.com/groups
```

## vserver services name-service unix-group modify

Modify a local UNIX group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `vserver services name-service unix-group modify` command to modify a local UNIX group's group ID.

### Parameters

**-vserver <vserver name> - Vserver**

Use this parameter to specify the Vserver location of the local UNIX group to modify.

**-name <text> - Group Name**

Use this parameter to specify the name of the group to modify.

**[-id <integer>] - Group ID**

Use this parameter to specify an ID number for the group.

## Examples

The following example changes a local UNIX group named sales on a Vserver named vs0 to have the group ID 100:

```
cluster1::> vserver services name-service unix-group modify -vserver vs0
-group sales -id 100
```

## vserver services name-service unix-group show

Display local UNIX groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver services name-service unix-group show` command displays information about local UNIX groups.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-members ]**

Use this parameter to display the list of users in each local UNIX group.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Use this parameter with the `-name` parameter to display information only about the local UNIX group you specify. Use this parameter without `-name` to display information only about the local UNIX groups that are located on the specified Vserver.

**[-name <text>] - Group Name**

Use this parameter with the `-vserver` parameter to display information only about the local UNIX group you specify. Use this parameter without `-vserver` to display information only about the local UNIX groups that match the name you specify.

**[-id <integer>] - Group ID**

Use this parameter to display information only about the local UNIX group that has the ID you specify.

**[-users <text>,...] - Users**

Use this parameter to display information only about the local UNIX groups that include the user names you specify.

## Examples

The following example displays information about all local UNIX groups, including lists of their users:

```
cluster1::> vserver services name-service unix-group show -members
Vserver      Name      ID
vs0          dev       44
Users: admin, jdoe, tsmith

vs0          sales    12
Users: admin, guest, pjones

vs1          testgroup 13
Users: admin, root, testuser

vs1          users    100
Users: admin, jdoe, pjones, tsmith
```

## vserver services name-service unix-group file show

### Display local UNIX groups file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver services name-service unix-group file show` command displays information about local UNIX groups. It displays the content as it is from the actual UNIX group file which resides in the `mroot` volume.

### Parameters

#### **-vserver <vserver> - Vserver (privilege: advanced)**

If you specify this parameter, the command displays information about the local UNIX group or groups that are located on the specified Vserver.

#### **[-search-string <text>] - Pattern to be searched (privilege: advanced)**

If you specify this parameter and the `-vserver` parameter, the command only displays information from the UNIX group file which matches the specified parameter.

### Examples

The following example displays information about all local UNIX groups belonging to a specific Vserver:

```
cluster1::> vsriver services name-service unix-group file show -vsriver
vs0
  Line No  File content
  -----  -
      1  daemon:*:1:
      2  nobody:*:65535:
      3  pcuser:*:65534:
      4  root:*:0:
```

## vsriver services name-service unix-group file status

### Display local Unix Groups file status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vsriver services name-service unix-group file status` command displays the status of local UNIX group file across a cluster. This enables you to verify that UNIX group files are consistent across all nodes that back a Vserver into which UNIX group files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX group file
- Hash value of the UNIX group file
- Hash value of the UNIX group database file
- Hash value of the UNIX group byuser database file
- File size of the UNIX group file

### Parameters

**[`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vsriver <vsriver name>`] - Vserver (privilege: advanced)**

If you specify this parameter, the command displays the UNIX group status only for the specified Vserver.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays the UNIX group status only for the specified node.

**[`-timestamp <MM/DD/YYYY HH:MM:SS>`] - Load Time (privilege: advanced)**

If you specify this parameter, the command displays the status only for the UNIX group file that were loaded at the specified time. Specify time in the format MM/DD/YYYY HH:MM:SS. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

**[`-hashvalue <text>`] - Hash Value (privilege: advanced)**

If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

**[`-hashvalue-db-grp <text>`] - Hash Value DB (privilege: advanced)**

If you specify this parameter, command displays the status only for the UNIX group files that have the specified hash value for the UNIX group database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

**[`-hashvalue-db <text>`] - Hash Value byuser DB (privilege: advanced)**

If you specify this parameter, the command displays the status only for the UNIX group files that have the specified hash value for the UNIX group byuser database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX group database.

**[`-filesize {<integer>[KB|MB|GB|TB|PB]}`] - File Size (privilege: advanced)**

If you specify this parameter, the command displays the status only for the UNIX group files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

## Examples

The following example displays the UNIX group file status for all Vservers:

```
cluster1::*> vservice name-service unix-group file status
-instance
Vserver: vs1
    Node: node1
    Load Time: 8/9/2016 19:56:25
    Hash Value: 835c7f530fb76f96c3bca00e380d36b7
    Hash Value DB: e6cb38ec1396a280c0d2b77e3a84eda2
    Hash Value byuser DB: 913a182a72aa1872495be398ebb2cd23
    File Size: 58B
Vserver: vs2
    Node: node1
    Load Time: 8/9/2016 20:15:40
    Hash Value: c0d2b77e3a84eda2e6cb38ec1396a280
    Hash Value DB: 009321eddb45611e95d9f7f277ec0621
    Hash Value byuser DB: 659321eddb45611e95d9f7f277ec0621
    File Size: 2.3MB
2 entries were displayed.
```

## vserver services name-service unix-group max-limit modify

### Change Configuration Limits for UNIX-Group

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service unix-group max-limit modify` command enables you to modify maximum UNIX groups and group-members that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

#### Parameters

##### **[-limit <integer>] - System Limit (privilege: advanced)**

This parameter specifies the maximum limit that you want to set for unix-group. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

#### Examples

The following example modifies the system-wide limit of the total number of UNIX groups and members that can be configured on the cluster.

```
vserver services name-service unix-group max-limit modify -limit 33792
```

## vserver services name-service unix-group max-limit show

### Display Configuration Limits for UNIX-Group

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service unix-group max-limit show` command displays information on UNIX group limits that are configurable with [vserver services name-service unix-group max-limit modify](#) command. The output will show the following:

- Limit: The configured limit on the total number of UNIX groups and group members configurable.
- Current Count: Total number of current entries for UNIX groups and group members.

#### Examples

The following example shows the limits and total number of current entries for UNIX group configuration:

```
cluster1::> vservice services name-service unix-group max-limit show
(vservice services name-service unix-group max-limit show)
Limit           Current Count
-----
400             3
```

## vservice services name-service unix-user create

### Create a local UNIX user

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The `vservice services name-service unix-user create` command creates a local UNIX user on a *Vservice*. You can use local UNIX users for Windows-to-UNIX and UNIX-to-Windows name mappings.

### Parameters

#### **-vservice <vservice name> - Vservice**

This parameter specifies the *Vservice* on which you want to create the local unix user.

#### **-user <text> - User Name**

This parameter specifies the user account that you want to create.

#### **-id <integer> - User ID**

This parameter specifies an ID number for the user.

#### **-primary-gid <integer> - Primary Group ID**

This parameter specifies the ID number of the user's primary group.

#### **[-full-name <text>] - User's Full Name**

This parameter specifies the user's full name.

#### **[-skip-name-validation {true|false}] - Skip Name Validation**

By default, ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "\_", ".", and "-"
- The name does not start with "-"
- The name does not contain "\$" except as the last character

If the parameter is set to *true*, the name validation is skipped.

## Examples

The following example creates a local UNIX user named tsmith on a Vserver named vs0. The user has the ID 4219 and the primary group ID 100. The user's full name is Tom Smith.

```
vs1::> vserver services name-service unix-user create -vserver vs0 -user  
tsmith -id 4219 -primary-gid 100 -full-name "Tom Smith"
```

## vserver services name-service unix-user delete

Delete a local UNIX user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-user delete` command deletes a local UNIX user from a Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the local UNIX user is located.

#### **-user <text> - User Name**

This parameter specifies the user that you want to delete.

## Examples

The following example deletes a local UNIX user named testuser from a Vserver named vs0:

```
vs1::> vserver services name-service unix-user delete -vserver vs0 -user  
testuser
```

## vserver services name-service unix-user load-from-uri

Load one or more local UNIX users from a URI

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services name-service unix-user load-from-uri` command loads one or more UNIX users from a universal resource identifier (URI). The URI must contain user information in the UNIX `/etc/passwd` format: `user_name:password:user_ID:group_ID:full_name:home_directory:shell`. The command discards the value of the `password` field and of the fields after the `full_name` field ( `home_directory` and `shell` ).

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the Vserver on which the local UNIX user or users are to be located.

### **-uri {scheme: //(hostname|IPv4 Address| '[' IPv6 Address' ' ]' ) ...} - URI to Load From**

This specifies the URI from which user information is to be loaded. The URI scheme must be either ftp(s) or http(s).

### **[-overwrite {true|false}] - Overwrite Entries**

This optionally specifies whether user information from the URI overwrites existing user information. The default setting is *false*.

### **[-skip-name-validation {true|false}] - Skip Name Validation**

By default, ONTAP validates the name to ensure it complies with the following rules:

- The name contains only valid characters: 0 through 9, A through Z, a through z, "\_", ".", and "-"
- The name does not start with "-"
- The name does not contain "\$" except as the last character

If the parameter is set to *true*, the name validation is skipped.

### **[-foreground {true|false}] - Load Unix Users file in the Foreground**

If this parameter is set to *false*, the operation runs as a job in the background. Otherwise, the command does not return until the operation is complete. The default value is *true*.

## Examples

The following example loads user information from the URI <ftp://ftp.example.com/users> onto a Vserver named vs0:

```
node::> vsriver services name-service unix-user load-from-uri -vserver vs0
-uri ftp://ftp.example.com/users
```

## **vsvrrvr svcrvics nrvn-srvcrvics unix-user modify**

### Modify a local UNIX user

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *admin* privilege level.

### Description

The `vsvrrvr svcrvics nrvn-srvcrvics unix-user modify` command modifies a local UNIX user's ID, primary group ID, or full name.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the local UNIX user is located.

**-user <text> - User Name**

This parameter specifies the user account that you want to modify.

**[-id <integer>] - User ID**

This optional parameter specifies an ID number for the user.

**[-primary-gid <integer>] - Primary Group ID**

This optional parameter specifies the ID number of the user's primary group.

**[-full-name <text>] - User's Full Name**

This optional parameter specifies the user's full name.

**Examples**

The following example modifies the local UNIX user named pJones on a Vserver named vs0. The user's primary group ID is changed to 100 and the user's full name is Peter Jones.

```
vs1::> vserver services name-service unix-user modify -vserver vs0 -user  
pJones -primary-gid 100 -full-name "Peter Jones"
```

**vserver services name-service unix-user show****Display local UNIX users**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver services name-service unix-user show` command displays information about local UNIX users. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all local UNIX users:

- Vserver name
- User name
- User ID
- Primary group ID
- Full name

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter and the `-user` parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that are located on the specified Vserver.

**[-user <text>] - User Name**

If you specify this parameter and the `-vserver` parameter, the command displays information only about the specified local UNIX user. If you specify this parameter by itself, the command displays information only about the local UNIX user or users that have the specified name.

**[-id <integer>] - User ID**

If you specify this parameter, the command displays information only about the local UNIX user that has the specified ID.

**[-primary-gid <integer>] - Primary Group ID**

If you specify this parameter, the command displays information only about the local UNIX user or users that have the specified primary group ID.

**[-full-name <text>] - User's Full Name**

If you specify this parameter, the command displays information only about the local UNIX user or users that match the specified name.

## Examples

The following example displays information about all local UNIX users:

```
vs1::> vserver services name-service unix-user show
```

| User    | User    | Group | Full |               |
|---------|---------|-------|------|---------------|
| Vserver | Name    | ID    | ID   | Name          |
| vs0     | admin   | 100   | 100  | administrator |
| vs0     | guest   | 1000  | 100  | guest         |
| vs0     | jdoe    | 4673  | 100  | Jane Doe      |
| vs0     | monitor | 2000  | 100  | monitor       |
| vs0     | pjones  | 4236  | 100  | Peter Jones   |
| vs0     | root    | 10    | 100  | root          |
| vs0     | tsmith  | 3289  | 100  | Tom Smith     |

## vserver services name-service unix-user file show

Display local UNIX users file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service unix-user file show` command displays information about local UNIX users. It displays the content as it is from the actual UNIX user file which resides in the `mroot` volume.

## Parameters

### **-vserver <vserver> - Vserver (privilege: advanced)**

If you specify this parameter, the command displays information about the local UNIX user or users that are located on the specified Vserver.

### **[-search-string <text>] - Pattern to be searched (privilege: advanced)**

If you specify this parameter and the `-vserver` parameter, the command only displays information from the UNIX user file which matches the specified parameter.

## Examples

The following example displays information about all local UNIX users belonging to a specific Vserver:

```
cluster1:> vserver services name-service unix-user file show -vserver vs0
  Line No  File content
  -----  -
          1  nobody:*:65535:65535:~::~
          2  pcuser:*:65534:65534:~::~
          3  root:*:0:1:~::~
```

## vserver services name-service unix-user file status

### Display local Unix Users file status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service unix-user file status` command displays the status of local UNIX user file across a cluster. This enables you to verify that UNIX user files are consistent across all nodes that back a Vserver into which UNIX user files have been loaded.

The command displays the following information:

- Vserver name
- Node name
- Load time for the UNIX user file
- Hash value of the UNIX user file
- Hash value of the UNIX user database file
- File size of the UNIX user file

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If you specify this parameter, the command displays the UNIX user status only for the specified Vserver.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays the UNIX user status only for the specified node.

**`[-timestamp <MM/DD/YYYY HH:MM:SS>] - Load Time (privilege: advanced)`**

If you specify this parameter, the command displays the status only for the UNIX user file that were loaded at the specified time. Specify time in the format `MM/DD/YYYY HH:MM:SS`. Note that the load time stamps for identical files are different on different nodes, because each node downloads the definitions from the source URI individually.

**`[-hashvalue <text>] - Hash Value (privilege: advanced)`**

If you specify this parameter, command displays the status only for the UNIX user files that have the specified hash value. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value, so querying on a specific hash value is not useful in most cases.

**`[-hashvalue-db <text>] - Hash Value DB (privilege: advanced)`**

If you specify this parameter, the command displays the status only for the UNIX user files that have the specified hash value for the UNIX user database. Note that the primary purpose of the command is to verify that the files on all nodes have the same hash value for UNIX user database.

**`[-filesize {<integer>[KB|MB|GB|TB|PB] } ] - File Size (privilege: advanced)`**

If you specify this parameter, the command displays the status only for the UNIX user files that have the specified file size. Note that the primary purpose of the command is to verify that the files on all nodes have the same file size, so querying on a specific file size is not useful in most cases.

## Examples

The following example displays the UNIX user file status for all Vservers:

```
cluster1::*> vserver services name-service unix-user file status
Vserver   Node      Load Time      Hash Value
Hash Value DB      File Size
-----
vs1
      node1      5/20/2016 16:04:55 e6cb38ec1396a280c0d2b77e3a84eda2
913a182a72aa1872495be398ebb2cd23 1.00KB
      node2      5/20/2016 16:04:53 e6cb38ec1396a280c0d2b77e3a84eda2
913a182a72aa1872495be398ebb2cd23 1.00KB
vs2
      node1      5/20/2016 16:06:26 c0d2b77e3a84eda2e6cb38ec1396a280
009321eddb45611e95d9f7f277ec0621 2.3MB
      node2      5/20/2016 16:06:27 c0d2b77e3a84eda2e6cb38ec1396a280
009321eddb45611e95d9f7f277ec0621 2.3MB
4 entries were displayed.
```

## vserver services name-service unix-user max-limit modify

### Change Configuration Limits for UNIX-User

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver services name-service unix-user max-limit modify` command enables you to modify maximum UNIX users that can be configured on the system. This allows you to set certain limits to prevent performance issues due to service configurations using excessive resources.

#### Parameters

##### **[`-limit <integer>`] - System Limit (privilege: advanced)**

This parameter specifies the maximum limit that you want to set for `unix-user`. The default setting for the limit is 32768. The supported range of values for this parameter is 0 to 65536.

#### Examples

The following example modifies the system-wide limit of the total number of UNIX users that can be configured on the cluster.

```
vserver services name-service unix-user max-limit modify -limit 33792
```

## vserver services name-service unix-user max-limit show

### Display Configuration Limits for UNIX-User

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service unix-user max-limit show` command displays information on UNIX user limits that are configurable with [vserver services name-service unix-user max-limit modify](#) command. The output will show the following:

- Limit: The configured limit on the total number of UNIX users configurable.
- Current Count: Total number of current entries for UNIX users configuration.

## Examples

The following example shows the limits and total number of current entries for UNIX user configuration:

```
cluster1::> vserver services name-service unix-user max-limit show
(vserver services name-service unix-user max-limit show)
Limit           Current Count
-----
400             3
```

## vserver services name-service ypbind start

### Start ypbind

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service ypbind start` starts the ypbind. NIS creation will fail if ypbind is stopped. This command starts ypbind on all the nodes in a cluster and is persistent across node reboots.

## Examples

The following example starts ypbind:

```
vs1::> vserver services name-service ypbind start
```

## vserver services name-service ypbind status

### Current ypbind status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service ypbind status` displays whether the ypbind is running or stopped. The ypbind service starts by default when a node comes up unless the service is in the stopped state, irrespective of whether NIS is configured.

## Examples

The following example displays ypbind status:

```
vs1::> vserver services name-service ypbind status
Status: Running
```

## vserver services name-service ypbind stop

### Stop ypbind

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver services name-service ypbind stop` stops the ypbind. Command fails if NIS entries are present. This command stops ypbind on all the nodes in a cluster and is persistent across node reboots.

## Examples

The following example stops ypbind:

```
vs1::> vserver services name-service ypbind stop
```

## vserver services ndmp generate-password

### Generates NDMP password for a user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command is used to generate NDMP password for a given user in the specified Vserver context. The generated NDMP password is based on the user's login password. For this reason regenerate it whenever the user's login password changes. This command fails if a user does not exist for the Vserver.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Specify the Vserver context for which password is to be generated.

**[-user <text>] - User**

Specify the user name for which the NDMP password needs to be generated.

**[-password <text>] - Password**

The generated NDMP password string that is used for authentication.

## Examples

The following example shows the usage this command to generate NDMP password for a user belonging to a specific Vserver:

```
cluster1::> vservice ndmp generate-password -vserver vserver1
-user user1
Vserver: vserver1
User: user1
Password: a9cCCUp32yjGmBiD
```

## vservice ndmp kill-all

Kill all NDMP sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command terminates all NDMP sessions on a particular Vserver in the cluster.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver name in which all NDMP sessions that are to be terminated are running.

## Examples

The following example shows how all NDMP sessions on the Vserver named vserver1 can be terminated:

```
cluster1::> vservice ndmp kill-all -vserver vserver1
```

## vservice ndmp kill

Kill the specified NDMP session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command terminates a specific NDMP session on a particular Vserver in the cluster.

## Parameters

### <text> - Session Identifier

Session ID of the NDMP session. A session-id is a string used to identify a particular NDMP session.

## Examples

The following example shows how a specific NDMP session on the Vserver named vserver1 can be terminated:

```
cluster1::> vserver services ndmp kill 1000:8002 -vserver vserver1
```

## vserver services ndmp modify

### Modify NDMP Properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command is used to change NDMP options on Vservers.

One or more of the options specified in the parameters section can be modified for a specific Vserver, by this command. A short description of each of the options is provided in the parameters section.

## Parameters

### -vserver <Vserver Name> - Vserver

This parameter specifies the name of the Vserver.

### [-ignore-ctime-enabled {true|false}] - Ignore Ctime

This option, when *true*, allows user to exclude files with ctime changed from storage system's incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is *false*, backup on the Vserver will include all files with a change or modified time later than the last dump in the previous level dump. The default value is *false*. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The `-option-value` for this parameter should be *true/false*.

### **`[-offset-map-enable {true|false}] - Enable Offset Map`**

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is *true*. This option is persistent across reboots.

The `-option-value` for this parameter should be *true/false*.

### **`[-tcpnodelay {true|false}] - Enable TCP Nodelay`**

Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to *true*, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is *false*. This option is persistent across reboots.

The `-option-value` for this parameter should be *true/false*.

### **`[-tcpwinsize <integer>] - TCP Window Size`**

This option can be used to change the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 7,631,441(7.2M), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The `-option-value` for this parameter should be a number between 8192(8K) and 7,631,441(7.2M).

### **`[-data-port-range <text>] - Data Port Range`**

This option allows administrators to specify a port range on which the NDMP server can listen for data connections.

The format of this option is *start\_port - end\_port* *start\_port*, *end\_port* can have values between [1024-65535]; *start\_port* must be lesser than or equal to *end\_port*. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value *all* implies that any available port can be used to listen for data connections. The default value for this option is *all*. This option is persistent across reboots.

The `-option-value` for this option should be in the format {<*start\_port*>-<*end port*> | *all*} - where *start\_port*, *end\_port* can have values between [1024-65535]; *start\_port* must be lesser than or equal to *end\_port*.

### **`[-backup-log-enable {true|false}] - Enable Backup Log`**

Backup logging captures important events during dump/restore and records them in `/mroot/etc/log/backup` on the root volume. The option allows users to enable or disable this feature. The default value for this option is *true*. This option is persistent across reboots.

The `-option-value` for this parameter should be `true/false`.

#### **`[-per-qtree-exclude-enable {true|false}] - Enable per Qtree Exclusion`**

If this option is `true`, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a `.exclude_list` file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be `true/false`.

#### **`[-authtype <NDMP Authentication types>,...] - Authentication Type`**

Allows the administrator to choose the authentication method. NDMP supports three authentication types: challenge, plaintext and plaintext\_sso. The plaintext\_sso authentication type is mutually exclusive with the other authentication types. By setting the authentication type as plaintext\_sso, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is `challenge`. This option is persistent across reboots.

The `-option-value` for this parameter can be {challenge | plaintext | plaintext\_sso | challenge, plaintext | plaintext, challenge}.

#### **`[-debug-enable {true|false}] - Enable Debug (privilege: advanced)`**

This option enables debug logging for NDMP. Debug messages will be logged to the ndmpd log file `/mroot/etc/log/mlog/ndmpd.log`. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be `true/false`.

#### **`[-debug-filter <text>] - Debug Filter (privilege: advanced)`**

This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option : all, none, normal, backend or "filter-expression".

`all` enables debug logging for all modules.

`none` disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name -debug-enable false`.

`normal` is a shortcut option that enables debug logging for all modules except verbose and io\_loop. The equivalent filter string is `all-verbose-io_loop`.

`backend` is a short cut option that enables debug logging for all modules except verbose, io\_loop, ndmps and ndmpd. The equivalent filter string is `all-verbose-io_loop-ndmps-ndmpp`.

`(filter-expression)` is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators :

- - to remove the given module from the list of specified modules in the filter string. For example the filter `all-ndmpp` will enable debug logging for all modules but not ndmpp.
- ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter `ndmpp^mover^data` will enable debug logging for ndmpp, mover and data.

The possible module names and a brief description is given below:-

| Modules    | Description                       |
|------------|-----------------------------------|
| verbose    | verbose message                   |
| io         | I/O process loop                  |
| io_loop    | I/O process loop verbose messages |
| ndmps      | NDMP service                      |
| ndmpp      | NDMP Protocol                     |
| rpc        | General RPC service               |
| fdc_rpc    | RPC to FC driver service          |
| auth       | Authentication                    |
| mover      | NDMP MOVER (tape I/O)             |
| data       | NDMP DATA (backup/restore)        |
| scsi       | NDMP SCSI (robot/tape ops)        |
| bkup_rpc   | RPC to Backup service client      |
| bkup_rpc_s | RPC to Backup service server      |
| conf       | Debug configure/reconfigure       |
| dblade     | Dblade specific messages          |
| timer      | NDMP server timeout messages      |
| vldb       | VLDB service                      |
| smf        | SMF Gateway messages              |
| common     | NDMP common state                 |
| ext        | NDMP extensions messages          |
| ndmprpc    | NDMP Mhost RPC server             |

+  
The default value for this option is *none* . This option is persistent across reboots.

+  
The `-option-value` for this parameter can be {all | none | normal | backend ['filter-expression']}.

#### **`[-dump-logical-find <text>]` - Enable Logical Find for Dump (privilege: advanced)**

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

If *default* is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If *always* is specified, all dumps will follow treewalk.

A *comma-separated* list of values in any combination from the following list:

- `vol_baseline`: Level 0 full volume backup will follow treewalk.
- `vol_incr`: Incremental full volume backup will follow treewalk.
- `qtree_baseline`: Level 0 qtree backup will follow treewalk.

- `qtree_incr`: Incremental qtree backup will follow treewalk.

The default value for this option is `default`. This option is persistent across reboots.

The `-option-value` for this parameter could be `{default | always | 'vol_baseline' | 'vol_baseline,qtree_baseline' | ...}`.

#### **`[-abort-on-disk-error {true|false}]` - Enable Abort on Disk Error (privilege: advanced)**

If this option is `true`, dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is `false`, dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is `false`. This option is persistent across reboots.

The `-option-value` for this parameter should be `true/false`.

#### **`[-fh-dir-retry-interval <integer>]` - FH Throttle Value for Dir (privilege: advanced)**

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `-option-value` for this parameter should be a number.

#### **`[-fh-node-retry-interval <integer>]` - FH Throttle Value for Node (privilege: advanced)**

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The `-option-value` for this parameter should be a number.

#### **`[-restore-vm-cache-size <integer>]` - Restore VM File Cache Size (privilege: advanced)**

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

| Meta-filename  | Number of WAFL buffers to be pinned in memory |
|----------------|-----------------------------------------------|
| dumpmap        | ndmpd.restore.vm_cache_size                   |
| filemap        | ndmpd.restore.vm_cache_size                   |
| aclfile_map    | ndmpd.restore.vm_cache_size                   |
| inomap         | ndmpd.restore.vm_cache_size / 2               |
| basemap        | ndmpd.restore.vm_cache_size / 2               |
| flipmap        | ndmpd.restore.vm_cache_size / 2               |
| revmap         | ndmpd.restore.vm_cache_size / 2               |
| clrimap        | ndmpd.restore.vm_cache_size / 4               |
| mfp_for_inotab | ndmpd.restore.vm_cache_size / 4               |
| map            | ndmpd.restore.vm_cache_size / 4               |
| offsetfile_map | ndmpd.restore.vm_cache_size / 4               |

+

The `-option-value` for this parameter should be a number between 4 and 1024.

#### **`[-enable {true|false}] - Enable NDMP on Vserver`**

When the option is set to *true*, the NDMP daemon handles requests, and when set to *false*, the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: *vserver services ndmp on* and *vserver services ndmp off* respectively. This option is persistent across reboots. The default value of this option is *false*.

The `-option-value` for this parameter is either true or false.

#### **`[-preferred-interface-role {undef|cluster|data|node-mgmt|intercluster|cluster-mgmt}] - Preferred Interface Role`**

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is *intercluster*, *cluster-mgmt*, *node-mgmt*

The default value for this option for a data Vserver is *intercluster*, *data*.

#### **`[-secondary-debug-filter <text>] - Secondary Debug Filter (privilege: advanced)`**

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is *IPADDR* which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option *debug-enable* is set to true, then the *debug-filter* option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.

## **`[-is-secure-control-connection-enabled {true|false}] - Is Secure Control Connection Enabled`**

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is *false*.

### **Examples**

The following example show how to enable NDMP on a Vserver and set authorization type to plaintext :

```
cluster1::> vserver services ndmp modify -vserver vs1 -enable true
-authtype plaintext
cluster1::>
```

## **vserver services ndmp off**

### **Disable NDMP service**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command is used to disable NDMP service on a specific Vserver.

### **Parameters**

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver.

### **Examples**

The following example disables NDMP on a specific Vserver:

```
cluster1::> vserver services ndmp off -vserver vs1
```

## **vserver services ndmp on**

### **Enable NDMP service**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command is used to enable NDMP service on a specific Vserver.

### **Parameters**

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver.

## Examples

The following example enables NDMP service on a specific Vserver:

```
cluster1::> vservice services ndmp on -vservice vs1
```

## vservice services ndmp probe

Display list of NDMP sessions

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The [system services ndmp probe](#) command displays diagnostic information about NDMP sessions belonging to a specific Vservice in the cluster. The following fields are displayed for each of the sessions:

- Vservice
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag

- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Node
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

## Parameters

### **[`-vserver <vserver name>`] - Vserver**

This parameter Specifies the Vserver context in which NDMP sessions are running.

### **[`-session-id <text>`] - Session Identifier**

If this parameter is specified, the command displays information about a specific NDMP session. A session-id is a string used to identify a particular NDMP session.

### **[`-ndmp-version <integer>`] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

### **[`-session-authorized {true|false}`] - Session Authorized**

This parameter indicates whether an NDMP session is authenticated or not.

### **[`-data-state <component state>`] - Data State**

This parameter identifies the current state of the data server's state machine.

### **[`-data-operation <data operation>`] - Data Operation**

This parameter identifies the data server's current operation.

### **[`-data-halt-reason <halt reason>`] - Data Server Halt Reason**

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

**[`-data-con-addr-type` <address type>] - Data Server Connect Type**

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[`-data-con-addr` <text>] - Data Server Connect Address**

This parameter specifies the connection endpoint information for the data server's data connection.

**[`-data-con-port` <integer>] - Data Server Connect Port**

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

**[`-data-bytes-processed` <integer>] - Data Bytes Processed**

This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[`-mover-state` <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[`-mover-mode` <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[`-mover-pause-reason` <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[`-mover-halt-reason` <halt reason>] - Mover Halt Reason**

This parameter field identifies the event that caused the mover state machine to enter the HALTED state.

**[`-mover-record-size` <integer>] - Mover Record Size**

This parameter represents the current mover record size in bytes.

**[`-mover-record-num` <integer>] - Mover Record Number**

This parameter represents the last tape record processed by the mover.

**[`-mover-bytes-moved` <integer>] - Mover Bytes Moved**

This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[`-mover-seek-position` <integer>] - Mover Seek Position**

This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[`-mover-bytes-left-to-read` <integer>] - Mover Bytes Left to Read**

This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[`-mover-window-offset` <integer>] - Mover Window Offset**

This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This parameter represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag**

This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag**

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[-mover-con-addr-type <address type>] - Mover Connect Type**

This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[-mover-con-addr <text>] - Mover Connect Address**

This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

**Examples**

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> vservice ndmp probe
Vserver Name: vservice1
    Session Identifier: 1000:7445
        NDMP Version: 4
    Session Authorized: true
        Data State: IDLE
        Data Operation: NOACTION
    Data Server Halt Reason: NA
    ....
    ...
Vserver Name: vservice2
    Session Identifier: 1000:7446
        NDMP Version: 4
    Session Authorized: true
        Data State: IDLE
        Data Operation: NOACTION
    Data Server Halt Reason: NA
    ....
    ...
```

The following example displays diagnostic information of sessions associated with Vserver vservice1 only:

```
cluster1::> vserver services ndmp probe -vserver vserver1
Vserver Name: vserver1
    Session Identifier: 1000:7445
        NDMP Version: 4
    Session Authorized: true
        Data State: IDLE
            Data Operation: NOACTION
    Data Server Halt Reason: NA
....
...
....
...
```

## vserver services ndmp show

### Display NDMP Properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command is used to display NDMP options on Vservers.

A combination of parameters can be optionally specified so as to list only a subset of Vservers where specific values of NDMP options are met. A short description of each of the options is provided in the parameters section.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

If this parameter is specified, the command displays NDMP options for that Vserver alone.

**[-maxversion <integer>] - NDMP Version**

If this parameter is specified, the command displays NDMP options for Vservers where the highest NDMP protocol version supported matches the specified input value. The only supported value is 4.

### **`[-ignore-ctime-enabled {true|false}] - Ignore Ctime`**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `ignore-ctime-enabled` matches the specified input value.

This option, when *true*, allows user to exclude files with ctime changed from storage system's incremental dumps since other processes like virus scanning often alter the ctime of files. When this option is *false*, backup on the Vserver will include all files with a change or modified time later than the last dump in the previous level dump. The default value is *false*. This option is persistent across reboots.

Most WIN32 APIs are often unaware of the "last changed time", ctime, they often incorrectly set a later time for files, causing these files to be included in the Vserver's incremental dumps, making the incremental dump very large. This is partially defying the purpose of having incremental dumps, since one uses incremental dumps to speed up the backup by only dumping files that were truly changed since the last backup.

The possible value for this parameter is either true or false.

### **`[-offset-map-enable {true|false}] - Enable Offset Map`**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `offset-map-enable` matches the specified input value.

This option is used to enable or disable generation of the inode offset map during NDMP based dump backups. The offset map is required to perform Enhanced Direct Access Restore (DAR) on the backup data. Enhanced DAR provides support for directory DAR and DAR of files with NT streams. The default value for this option is *true*. This option is persistent across reboots.

The possible value for this parameter is either true or false.

### **`[-tcpnodelay {true|false}] - Enable TCP Nodelay`**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `tcpnodelay` matches the specified input value.

This parameter Enables/Disables the TCPNODELAY configuration parameter for the socket between the Vserver and the DMA. When set to true, the Nagle algorithm is disabled and small packets are sent immediately rather than held and bundled with other small packets. This optimizes the system for response time rather than throughput.

This option becomes active when the next NDMP session starts. Existing sessions are unaffected. The default value for this option is *false*. This option is persistent across reboots.

The possible value for this parameter is either true or false.

### **`[-tcpwinsize <integer>] - TCP Window Size`**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `tcpwinsize` matches the specified input value.

This option shows the TCP buffer size of the NDMP data connection. The minimum and maximum values are 8192(8K) and 262,144(256K), respectively. The default value for this option is 32768(32K).

This option is persistent across reboots.

The possible value for this parameter is a number between 8192(8K) and 262,144(256K).

### **[`-data-port-range <text>`] - Data Port Range**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `data-port-range` matches the specified input value.

This option shows the port range on which the NDMP server can listen for data connections.

The format of this option is `start_port - end_port` `start_port`, `end_port` can have values between [1024-65535]; `start_port` must be lesser than or equal to `end_port`. If a valid range is specified, NDMP uses a port within that range to listen for data connections. A listen request fails if no ports in the specified range are free.

This option is modifiable only from the admin Vserver context and the said option is applicable for all the data Vservers and the admin Vserver. For example, if the value of the above option is set with 2000-3000, the same value will be applicable throughout the cluster. The value `all` implies that any available port can be used to listen for data connections. The default value for this option is `all`. This option is persistent across reboots.

The value for this option is displayed in the format {<start\_port>-<end port> | all }- where `start_port`, `end_port` can have values between [1024-65535]; `start_port` must be lesser than or equal to `end_port`.

### **[`-backup-log-enable {true|false}`] - Enable Backup Log**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `>backup-log-enable` matches the specified input value.

Backup logging captures important events during dump/restore and records them in `/mroot/etc/log/backup` on the root volume. The default value for this option is `true`. This option is persistent across reboots.

The possible value for this parameter is `true/false`.

### **[`-per-qtree-exclude-enable {true|false}`] - Enable per Qtree Exclusion**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `per-qtree-exclude-enable` matches the specified input value.

If this option is `true`, users can specify exclude list on a per qtree basis to be excluded from backup. This exclude list will override any values already present due to 'EXCLUDE' environment variable. The user can specify the exclusion list through a `.exclude_list` file which resides at the root of the qtree. The exclusion list can be a list of files or files that match a specified pattern. The default value for this option is `false`. This option is persistent across reboots.

The possible value for this parameter is either `true` or `false`.

### **[`-authtype <NDMP Authentication types>,...`] - Authentication Type**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `authtype` matches the specified input value.

Allows the administrator to choose the authentication method. NDMP supports three authentication types: `challenge`, `plaintext` and `plaintext_sso`. The `plaintext_sso` authentication type is mutually exclusive with the other authentication types. By setting the authentication type as `plaintext_sso`, the actual password for the user can be used to authenticate instead of having to generate an NDMP specific password. The default of this option is `challenge`. This option is persistent across reboots.

The possible value for this parameter can be {`challenge` | `plaintext` | `plaintext_sso` | `challenge, plaintext` | `plaintext, challenge`}.

### **[`-debug-enable {true|false}`] - Enable Debug (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-enable` matches the specified input value.

This option enables debug logging for NDMP. Debug messages will be logged to the `ndmpd` log file `/mroot/etc/log/mlog/ndmpd.log`. The default value for this option is `false`. This option is persistent across reboots.

The possible value for this parameter is either `true` or `false`.

### **[`-debug-filter <text>`] - Debug Filter (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `debug-filter` matches the specified input value.

This option controls the NDMP modules for which debug logging is to be enabled. option-value can take five values for this option : `all`, `none`, `normal`, `backend` or `"filter-expression"`.

`all` enables debug logging for all modules.

`none` disables debug logging for all modules. It is equivalent to `modify -vserver vserver_name -debug-enable false`.

`normal` is a shortcut option that enables debug logging for all modules except `verbose` and `io_loop`. The equivalent filter string is `all-verbose-io_loop`.

`backend` is a short cut option that enables debug logging for all modules except `verbose`, `io_loop`, `ndmps` and `ndmpp`. The equivalent filter string is `all-verbose-io_loop-ndmps-ndmpp`.

`(filter-expression)` is a combination of one or more modules for which debug logs needs to be enabled. Multiple module names can be combined using following operators :

- `-` to remove the given module from the list of specified modules in the filter string. For example the filter `all-ndmpp` will enable debug logging for all modules but not `ndmpp`.
- `^` to add the given module or modules to the list of modules specified in the filter string. For example the filter `ndmppmoverdata` will enable debug logging for `ndmpp`, `mover` and `data`.

The possible module names and a brief description is given below:-

| Modules    | Description                       |
|------------|-----------------------------------|
| verbose    | verbose message                   |
| io         | I/O process loop                  |
| io_loop    | I/O process loop verbose messages |
| ndmps      | NDMP service                      |
| ndmpp      | NDMP Protocol                     |
| rpc        | General RPC service               |
| fdc_rpc    | RPC to FC driver service          |
| auth       | Authentication                    |
| mover      | NDMP MOVER (tape I/O)             |
| data       | NDMP DATA (backup/restore)        |
| scsi       | NDMP SCSI (robot/tape ops)        |
| bkup_rpc   | RPC to Backup service client      |
| bkup_rpc_s | RPC to Backup service server      |
| conf       | Debug configure/reconfigure       |
| dblade     | Dblade specific messages          |
| timer      | NDMP server timeout messages      |
| vldb       | VLDB service                      |
| smf        | SMF Gateway messages              |
| common     | NDMP common state                 |
| ext        | NDMP extensions messages          |
| ndmprpc    | NDMP Mhost RPC server             |

+  
The default value for this option is *none* . This option is persistent across reboots.

+  
The possible value for this parameter can be {all | none | normal | backend ['filter-expression']}.

#### **[-dump-logical-find <text>] - Enable Logical Find for Dump (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for dump-logical-find matches the specified input value.

This option specifies whether to follow inode-file walk or tree walk for phase I of the dump. Choosing inode-file walk or tree walk affects the performance of the dump. This option can take following values:

If *default* is specified, then level 0 and incremental volume as well as qtree dumps will use inode walk. All the subtree dumps will use tree walk.

If *always* is specified, all dumps will follow treewalk.

A *comma-separated* list of values in any combination from the following list:

- *vol\_baseline*: Level 0 full volume backup will follow treewalk.

- `vol_incr`: Incremental full volume backup will follow treewalk.
- `qtree_baseline`: Level 0 qtree backup will follow treewalk.
- `qtree_incr`: Incremental qtree backup will follow treewalk.

The default value for this option is *default* . This option is persistent across reboots.

The possible value for this parameter could be {*default* | *always* | '*vol\_baseline*' | '*vol\_baseline,qtree\_baseline*' | ...}.

#### **`[-abort-on-disk-error {true|false}]` - Enable Abort on Disk Error (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `abort-on-disk-error` matches the specified input value.

If this option is *true* , dump will abort the backup operation on detection of irrecoverable data blocks in user files. If this option is *false* , dump will proceed with backup operation - even if irrecoverable data blocks in user files are detected. On detection of irrecoverable data blocks, dump will send a log message to DMA and also log an entry in `/mroot/etc/log/backup` file. The default value for this option is *false* . This option is persistent across reboots.

The value for this parameter is either true or false.

#### **`[-fh-dir-retry-interval <integer>]` - FH Throttle Value for Dir (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `fh-dir-retry-interval` matches the specified input value.

NDMP protocol sends back file history information for all directories in phase 3 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle a slow reader, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

#### **`[-fh-node-retry-interval <integer>]` - FH Throttle Value for Node (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `fh-node-retry-interval` matches the specified input value.

NDMP protocol sends back file history information for all files in phase 4 of dump to DMA. In the presence of slow DMA or high latency networks, the amount of file history being generated exceeds the amount being consumed by the DMA. To handle slow reader conditions, a flow control mechanism is now introduced where file history generation is throttled when a DMA is slow in consuming them. The value for this option indicates how frequently should the file history be resent if it was throttled. The default value is 250 milliseconds. This option is persistent across reboots.

The value for this parameter is a number.

#### **`[-restore-vm-cache-size <integer>]` - Restore VM File Cache Size (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `restore-vm-cache-size` matches the specified input value.

This option mandates the number of WAFL buffers pinned in memory by various meta-files used by logical

restore. The minimum and maximum values are 4 and 1024, respectively. The default value for this option is 64. This option is persistent across reboots.

Depending on the value of this option, various meta-files are assigned a number of WAFL buffers that need to be pinned in memory.

| Meta-filename  | Number of WAFL buffers to be pinned in memory |
|----------------|-----------------------------------------------|
| dumpmap        | ndmpd.restore.vm_cache_size                   |
| filemap        | ndmpd.restore.vm_cache_size                   |
| aclfile_map    | ndmpd.restore.vm_cache_size                   |
| inomap         | ndmpd.restore.vm_cache_size / 2               |
| basemap        | ndmpd.restore.vm_cache_size / 2               |
| flipmap        | ndmpd.restore.vm_cache_size / 2               |
| revmap         | ndmpd.restore.vm_cache_size / 2               |
| clrimap        | ndmpd.restore.vm_cache_size / 4               |
| mfp_for_inotab | ndmpd.restore.vm_cache_size / 4               |
| map            | ndmpd.restore.vm_cache_size / 4               |
| offsetfile_map | ndmpd.restore.vm_cache_size / 4               |

The possible value for this parameter is a number between 4 and 1024.

**[*-enable {true|false}*] - Enable NDMP on Vserver**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *enable* matches the specified input value.

When the option is set to *true* , the NDMP daemon handles requests, and when set to *false* , the NDMP daemon does not handle requests. Enabling and disabling the option is equivalent to executing the following commands: *vserver services ndmp on* and *vserver services ndmp off* respectively. This option is persistent across reboots. The default value of this option is *false* .

The value for this parameter is either true or false.

**[*-preferred-interface-role {undef|cluster|data|node-mgmt|intercluster|cluster-mgmt}*] - Preferred Interface Role**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for *preferred-interface-role* matches the specified input value.

This option allows the user to specify the preferred Logical Interface (LIF) role while establishing an NDMP data connection channel. The NDMP data server or the NDMP mover establishes a data channel from the node that owns the volume or the tape device respectively. This option is used on the node that owns the volume or the tape device. The order of IP addresses that are used to establish the data connection depends on the order of LIF roles specified in this option.

The default value for this option for the admin Vserver is *intercluster*, *cluster-mgmt*, *node-mgmt*

The default value for this option for a data Vserver is *intercluster, data*.

**`[-secondary-debug-filter <text>]` - Secondary Debug Filter (privilege: advanced)**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `secondary-debug-filter` matches the specified input value.

This option allows control on NDMP debug logging. This option takes a comma separated tag=value pairs. The supported tag is *IPADDR* which can be used to specify Vserver IP addresses for which NDMP debugging is required. If this option is set and the option `debug-enable` is set to true, then the `debug-filter` option is applicable to sessions whose control connection IP addresses match the IP addresses that are listed in the option. If this option is not set, the debug filter is applicable to all Vserver sessions. By default, this option does not have a value set.

**`[-is-secure-control-connection-enabled {true|false}]` - Is Secure Control Connection Enabled**

If this parameter is specified, the command displays NDMP options for Vservers, where the value for `is-secure-control-connection-enabled` matches the specified input value.

This option enables NDMP service to accept control connections over secure sockets on TCP port 30000. This option is persistent across reboots. The default value of this option is *false*.

## Examples

The following example displays NDMP options for the Vserver(s).

```
cluster1::> vserver services ndmp show
```

| VServer | Enabled | Authentication type |
|---------|---------|---------------------|
| -----   | -----   | -----               |
| cluster | true    | plaintext           |
| vs1     | true    | plaintext           |
| vs2     | true    | plaintext           |

3 entries were displayed.

```
cluster1::>
```

The following example displays detailed NDMP options for a Vserver.

```

cluster1::*> vserver services ndmp show -vserver vs1 -instance
Vserver: vs1
                NDMP Version: 4
                Ignore Ctime: false
                Enable Offset Map: true
                Enable TCP Nodelay: false
                TCP Window Size: 32768
                Data Port Range: all
                Enable Backup Log: true
                Enable per Qtree Exclusion: false
                Authentication Type: plaintext
                Enable Debug: false
                Debug Filter: none
                Enable Logical Find for Dump: default
                Enable Abort on Disk Error: false
                FH Throttle Value for Dir: 250
                FH Throttle Value for Node: 250
                Restore VM File Cache Size: 64
                Enable Logging of VM Stats for Dump: false
                Enable NDMP on Vserver: true
                Preferred Interface Role: intercluster, data
                Secondary Debug Filter: -
Is Secure Control Connection Enabled: false
cluster1::*>

```

## vserver services ndmp status

### Display list of NDMP sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services ndmp status` command lists NDMP sessions belonging to a specific Vserver in the cluster. By default it lists the following details about the active sessions:

- Vserver Name
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

### Parameters

**{ [-fields <fieldname>,...]**

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port
- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device
- tape-modes
- node
- is-secure-control-connection

- data-backup-mode
- data-path
- source-addr

**[ -instance ] }**

If this parameter is specified, the command displays detailed information about all the active sessions.

**[ -vserver <vserver name> ] - Vserver**

Specifies the Vserver context in which NDMP sessions are running.

**[ -session-id <text> ] - Session Identifier**

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a string used to identify a particular NDMP session.

**[ -ndmp-version <integer> ] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

**[ -session-authorized {true|false} ] - Session Authorized**

This field indicates whether an NDMP session is authenticated or not.

**[ -data-state <component state> ] - Data State**

This field identifies the current state of the data server's state machine.

**[ -data-operation <data operation> ] - Data Operation**

This field identifies the data server's current operation.

**[ -data-halt-reason <halt reason> ] - Data Server Halt Reason**

This field identifies the event that caused the data server state machine to enter the HALTED state.

**[ -data-con-addr-type <address type> ] - Data Server Connect Type**

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[ -data-con-addr <text> ] - Data Server Connect Address**

This specifies the connection endpoint information for the data server's data connection.

**[ -data-con-port <integer> ] - Data Server Connect Port**

This specifies the TCP/IP port that the data server will use when establishing a data connection.

**[ -data-bytes-processed <integer> ] - Data Bytes Processed**

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[ -mover-state <component state> ] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[ -mover-mode <mover mode> ] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[`-mover-pause-reason` <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[`-mover-halt-reason` <halt reason>] - Mover Halt Reason**

This integer field identifies the event that caused the mover state machine to enter the HALTED state.

**[`-mover-record-size` <integer>] - Mover Record Size**

This field represents the current mover record size in bytes.

**[`-mover-record-num` <integer>] - Mover Record Number**

This field represents the last tape record processed by the mover.

**[`-mover-bytes-moved` <integer>] - Mover Bytes Moved**

This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[`-mover-seek-position` <integer>] - Mover Seek Position**

This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[`-mover-bytes-left-to-read` <integer>] - Mover Bytes Left to Read**

This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[`-mover-window-offset` <integer>] - Mover Window Offset**

This field represents the absolute offset of the first byte of the mover window within the overall data stream.

**[`-mover-window-length` <integer>] - Mover Window Length**

This field represents the length of the current mover window in bytes.

**[`-mover-position` <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[`-mover-setrecordsize-flag` {true|false}] - Mover SetRecordSize Flag**

This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[`-mover-setwindow-flag` {true|false}] - Mover SetWindow Flag**

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[`-mover-con-addr-type` <address type>] - Mover Connect Type**

This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[`-mover-con-addr` <text>] - Mover Connect Address**

This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> vserver services ndmp status

              Session
Vserver      Id
-----
vserver1     1000:7445
vserver2     1000:7446
vserver2     1000:7447
3 entries were displayed.
```

The following example shows how to display only the sessions running belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp status -vserver vserver2

              Session
Vserver      Id
-----
vserver2     1000:7446
vserver2     1000:7447
2 entries were displayed.
```

## vserver services ndmp extensions modify

### Modify NDMP extension status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command is used to enable/disable an NDMP extension in the Vserver-aware NDMP mode.

### Parameters

**`[-is-extension-0x2050-enabled {true|false}]` - Is Extension 0x2050 Enabled (privilege: advanced)**

If this parameter is specified, the command can be used to modify the status of the extension in the Vserver-aware mode.

## Examples

The following example shows how to enable NDMP extension 0x2050 in the Vserver-aware NDMP mode of operation:

```
cluster1::> vserver services ndmp extension modify -is-extension-0x2050
-enabled true
cluster1::>
```

## vserver services ndmp extensions show

### Display NDMP extension status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command displays whether an NDMP extension is enabled in the Vserver-aware NDMP mode or not.

### Examples

The following example shows how to check the status of NDMP extension 0x2050 in a cluster :

```
cluster1::> vserver services ndmp extension show
Is Extension 0x2050 Enabled: true
cluster1::>
```

## vserver services ndmp log start

### Start logging for the specified NDMP session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command is used to start logging on an active NDMP session on a vserver.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the name of the Vserver.

**-session-id <text> - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be started.

**-filter <text> - Level Filter (privilege: advanced)**

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow : *all* , *none* , *normal* , *backend* or "*filter-expression*". The default value for this is *none* .

- *all* turns on logging for all modules.
- *none* disables logging for all modules.

- *normal* is a short cut parameter that enables logging for all modules except *verbose* and *io\_loop*. The equivalent filter string is *all-verbose-io\_loop*
- *backend* is a short cut parameter that enables logging for all modules except *verbose*, *io\_loop*, *ndmps* and *ndmpp*. The equivalent filter string is *all-verbose-io\_loop-ndmps-ndmpp*
- (*filter-expression*) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
  - - to remove the given module from the list of specified modules in the filter string. For example the filter *all-ndmpp* will enable logging for all modules but not *ndmpp*.
  - ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter *ndmpp<sup>mover</sup>data* will enable logging for *ndmpp*, *mover* and *data*.

The possible module names and a brief description is given below:

| Modules    | Description                       |
|------------|-----------------------------------|
| verbose    | verbose message                   |
| io         | I/O process loop                  |
| io_loop    | I/O process loop verbose messages |
| ndmps      | NDMP service                      |
| ndmpp      | NDMP Protocol                     |
| rpc        | General RPC service               |
| fdc_rpc    | RPC to FC driver service          |
| auth       | Authentication                    |
| mover      | NDMP MOVER (tape I/O)             |
| data       | NDMP DATA (backup/restore)        |
| scsi       | NDMP SCSI (robot/tape ops)        |
| bkup_rpc   | RPC to Backup service client      |
| bkup_rpc_s | RPC to Backup service server      |
| cleaner    | Backup/Mover session cleaner      |
| conf       | Debug configure/reconfigure       |
| dblade     | Dblade specific messages          |
| timer      | NDMP server timeout messages      |
| vldb       | VLDB service                      |
| smf        | SMF Gateway messages              |
| vol        | VOL OPS service                   |
| sv         | SnapVault NDMP extension          |
| common     | NDMP common state                 |
| ext        | NDMP extensions messages          |
| sm         | SnapMirror NDMP extension         |
| ndmprpc    | NDMP Mhost RPC server             |

## Examples

The following example shows how to start logging on a specific NDMP session 1000:35512, running on vserver cluster1-01 with filter all.

```
cluster1::*> vserver services ndmp log start -vserver cluster1-01 -session  
-id 1000:35512 -filter all
```

## vserver services ndmp log stop

Stop logging for the specified NDMP session

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command is used to stop logging on an active NDMP session on a vserver.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the name of the Vserver.

**-session-id <text> - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be stopped.

## Examples

The following example shows how to stop logging on a specific NDMP session 1000:35512 , running on vserver cluster1-01.

```
cluster1::*> vserver services ndmp log stop -vserver cluster1-01 -session  
-id 1000:35512
```

## vserver services ndmp restartable-backup delete

Delete an NDMP restartable backup context

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver services ndmp restartable-backup delete` command deletes an NDMP restartable backup context. The `-force` flag can be used to forcibly destroy a NDMP restartable backup context.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the name of the Vserver for which NDMP restartable backup context is to be deleted.

**-context-id <UUID> - Context Identifier**

This parameter specifies the NDMP restartable backup context ID which needs to be deleted.

**[-force <true>] - Force Delete (privilege: advanced)**

If this parameter is specified, the context is deleted even if there are internal errors.

**Examples**

The following example shows how to delete an NDMP restartable backup context:

```
cluster1::> vservice ndmp restartable-backup delete -vserver
cluster1-01 -context-id 0f8f5c44-d540-11e5-8c45-005056963504
cluster1::>
```

**vservice ndmp restartable-backup show**

Display NDMP restartable backup contexts

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

**Description**

The `vservice ndmp restartable-backup show` command lists the NDMP restartable backup contexts present in the cluster. By default it lists the following details about the context:

- Vserver Name
- Context Identifier
- Is Cleanup Pending?

A combination of parameters can be optionally supplied so as to list only those contexts which match specific conditions. A short description of each of the parameter is provided in the parameters section.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

If this parameter is specified, the command displays NDMP restartable backup contexts that match the specified Vserver.

**[-context-id <UUID>] - Context Identifier**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-context-id` matches the specified input value.

This parameter specifies the UUID of NDMP restartable backup contexts.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `volume` matches the specified input value.

This parameter specifies the volume path information

**[-is-cleanup-pending {true|false}] - Is Cleanup Pending?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `-is-cleanup-pending` matches the specified input value.

This parameter indicates whether the context is being deleted.

**[-engine-type <text>] - Backup Engine Type**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `engine-type` matches the specified input value.

This parameter specifies the backup engine type.

**[-auto-snapshot {true|false}] - Is Snapshot Copy Auto-created?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `auto-snapshot` matches the specified input value.

This parameter indicates if the snapshot was created by DUMP engine.

**[-no-acls {true|false}] - Is NO\_ACLS Set? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `no-acls` matches the specified input value.

This parameter specifies if NO\_ACLS environment variable is set.

**[-dump-path <text>] - Dump Path**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `dump-path` matches the specified input value.

This parameter represents the corresponding local volume path which is being backed up.

**[-backup-level <integer>] - Incremental Backup Level ID**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `backup-level` matches the specified input value.

This parameter specifies the backup level.

**[-dump-date <integer>] - Dump Date (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `dump-date` matches the specified input value.

This parameter specifies the dumpdate value in epoch.

**[-base-date <integer>] - Base Date (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for basedate matches the specified input value.

This parameter specifies the basedate value in epoch.

**[-update-dump-dates {true|false}] - Dump Dates Require Update? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for update-dumpdates matches the specified input value.

This parameter indicates if dumpdates needs to be updated.

**[-dump-name <text>] - Dump Name**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for dumpname matches the specified input value.

This parameter indicates the name for the dump instance.

**[-all-non-qtrees {true|false}] - Is NON\_QUOTA\_QTREE Set? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for all-non-qtrees matches the specified input value.

This parameter indicates if NON\_QUOTA\_TREE environment variable is set.

**[-print-options <integer>] - Backup Log Level (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for print-options matches the specified input value.

This parameter specifies the logging level during dump.

**[-last-update <integer>] - Context Last Updated Time**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for last-update matches the specified input value.

This parameter specifies the last time(in epoch) when the context was modified.

**[-has-offset-map {true|false}] - Has Offset Map?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for has-offset-map matches the specified input value.

This parameter indicates if offset map is present in the backup image.

**[-offset-verify {true|false}] - Offset Verify**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for offset-verify matches the specified input value.

This parameter indicates if offset map is successfully verified during backup.

**[-ndmp-env-keys <text>, ...] - NDMP Environment Keys (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for

ndmpenvkeys matches the specified input value.

This parameter represents the list of NDMP environment variables set during backup.

**[`-ndmp-env-values <text>,...`] - NDMP Environment Values (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvvalues matches the specified input value.

This parameter represents the values set for the NDMP environment variables.

**[`-ndmp-env-count <integer>`] - Count of NDMP Environment Variables (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for ndmpenvcount matches the specified input value.

This parameter represents the number of NDMP environment variables set during backup.

**[`-is-restartable {true|false}`] - Is Context Restartable?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-restartable matches the specified input value.

This parameter indicates if the NDMP restartable backup context is restartable.

**[`-is-busy {true|false}`] - Is Context Busy?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for is-busy matches the specified input value.

This parameter indicates if the NDMP restartable backup context is busy.

**[`-multi-subtree {true|false}`] - Is MULTI\_SUBTREE\_NAMES Set? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for multi-subtree matches the specified input value.

This parameter indicates if the NDMP environment variable MULTI\_SUBTREE\_NAMES is set.

**[`-logical-find {true|false}`] - Is LOGICAL\_FIND Set? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for logical-find matches the specified input value.

This parameter indicates if the NDMP environment variable LOGICAL\_FIND is set.

**[`-exclude-list <text>`] - Is EXCLUDE Set? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for exclude-list matches the specified input value.

This parameter represents the value of the the NDMP environment variable EXCLUDE.

**[`-restart-pass <integer>`] - Restart Pass**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for restart-pass matches the specified input value.

This parameter specifies the dump phase from which to restart.

### **[`-backup-results <integer>`] - Status of Backup**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `backup-results` matches the specified input value.

This parameter specifies the status of the backup.

### **[`-snap-name <text>`] - Snapshot Copy Name**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `snap-name` matches the specified input value.

This parameter specifies the name of the snapshot.

### **[`-is-dp-vol {true|false}`] - Is DP Volume? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `is-dp-vol` matches the specified input value.

This parameter indicates if the volume specified in the NDMP restartable context is of type DP.

### **[`-context-status <integer>`] - State of the Context**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `context-status` matches the specified input value.

This parameter specifies the state of the NDMP restartable context.

### **[`-is-fg-vol {true|false}`] - Is FlexGroup Volume?**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `is-fg-vol` matches the specified input value.

This parameter indicates if the volume specified in the NDMP restartable context is a FlexGroup volume or not.

### **[`-is-64bit-atime-backup {true|false}`] - Is 64bit Atime Backup? (privilege: advanced)**

If this parameter is specified, the command displays NDMP restartable backup contexts where the value for `is-64bit-atime-backup` matches the specified input value.

This parameter indicates if the backup specified in the NDMP restartable context is a 64bit atime backup or not.

## **Examples**

The following example displays all the NDMP restartable contexts on the cluster:

```
cluster1::> vservice services ndmp restartable-backup show
Vserver      Context Identifier                               Is Cleanup Pending?
-----
vserver1     53a6760e-d245-11e5-a33b-005056bb2685 false
vserver2     68902360-d245-11e5-a33b-005056bb2685 true
vserver2     d7b74e0d-d24c-11e5-a33b-005056bb2685 false
3 entries were displayed.
```

The following example shows how to display only the contexts belonging to Vserver vserver2:

```
cluster1::> vserver services ndmp restartable-backup show -vserver
vserver2
Vserver      Context Identifier      Is Cleanup Pending?
-----
vserver2     68902360-d245-11e5-a33b-005056bb2685 true
vserver2     d7b74e0d-d24c-11e5-a33b-005056bb2685 false
2 entries were displayed.
```

## vserver services web modify

### Modify the configuration of web services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command modifies the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the `vserver services web access` command for the services to be externally available.

#### Parameters

**-vserver <Vserver Name> - Vserver**

Identifies a Vserver for hosting a specific web service.

**-name <text> - Service Name**

Identifies the name of the web service.

**[-enabled {true|false}] - Enabled**

Defines the availability of a service on the Vserver. Disabled services are not accessible through the Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

**[-ssl-only {true|false}] - SSL Only**

Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

#### Examples

The following command sets access to the web port to SSL only:

```
cluster1::> vserver services web modify -vserver vs1 -name portal -ssl
-only true
```

## vserver services web show

Display the current configuration of web services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the availability of the web services on Vservers. Only the services that are installed on every node in the cluster can be configured on Vservers whose type is not 'node'. Enabled services must include authorization configuration in the `vserver services web access` command for the services to be externally available.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Identifies a Vserver for hosting a specific web service.

**[-name <text>] - Service Name**

Identifies the name of the web service.

**[-type <vserver type>] - Type of Vserver**

Identifies the type of Vserver on which the service is hosted.

**[-version <text>] - Version of Web Service**

Defines the version number of the service in the format of major.minor.patch.

**[-description <text>] - Description of Web Service**

Provides a short description of the web service.

**[-long-description <text>] - Long Description of Web Service**

Provides a long description of the web service.

**[-requires <requirement>,...] - Service Requirements**

Defines the list of requirements that must be met for the service to be successfully executed. Requirements are defined as a service name, a comparison operator ( $<\Rightarrow$ ), and a version number.

**[-default-roles <text>,...] - Default Authorized Roles**

Defines the roles that are automatically granted access to the service in the [vserver services web access show](#) configuration.

**[-enabled {true|false}] - Enabled**

Defines the availability of a service on the Vserver. Disabled services are not accessible through the

Vserver's network interfaces. This parameter's default value is dependent on the service. In general, services that provide commonly used features are enabled by default.

**`[-ssl-only {true|false}] - SSL Only`**

Defines the encryption enforcement policy for a service on the Vserver. Services for which this parameter is set to true support SSL only and cannot be used over unencrypted HTTP. The default for this value is 'false'.

**Examples**

This example displays the availability of the web services on the Vservers.

```

cluster1::vserver services web> show
Vserver      Type      Service Name      Description
Enabled
-----
cluster1     admin     cem                OBSOLETE
true
cluster1     admin     ontapi             Remote Administrative API
true
cluster1     admin     portal             Data ONTAP Web Services
true

## vserver services web access create

Authorize a new role for web service access

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command authorizes roles to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by [security login show](#) , must be included in this configuration.

Node Vserver services are authorized with the data Vserver's roles.

### Parameters

**-vserver <Vserver Name> - Vserver**

Identifies a Vserver for hosting a specific web service.

**-name <text> - Service Name**

Identifies the name of the web service.

**-role <text> - Role Name**

Identifies the new role to be authorized for this service.

### Examples

The following example authorizes the role *auditor* - created previously - for the web service:

```
cluster1::> vserver services web access create -name ontapi -role auditor
```

### Related Links

- [security login show](#)

## vserver services web access delete

Remove role authorization for web service access

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command removes the authorization of a role from the Vserver's web services. A service for which no roles are defined has a single role of 'none' automatically displayed in this configuration.

Node Vserver services are authorized with the data Vserver's roles.

## Parameters

### **-vserver <Vserver Name> - Vserver**

Identifies a Vserver for hosting a specific web service.

### **-name <text> - Service Name**

Identifies the name of the web service.

### **-role <text> - Role Name**

Identifies the role whose authorization is to be removed. You cannot remove the authorization of the role 'none'. Use [vserver services web access create](#) to authorize access for the role.

## Examples

The following example removes authorization for the role *auditor* for the web service:

```
cluster1::> vserver services web access delete -name ontapi -role auditor
```

## Related Links

- [vserver services web access create](#)

## vserver services web access show

Display web service authorization for user roles

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the roles that are authorized to access the Vserver's web services. For the user to access services that require authentication, the user's roles, as defined by [security login show](#), must be included in this configuration.

Node Vserver services are authorized with the data Vserver's roles.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Identifies a Vserver for hosting a specific web service.

**[*-name* <text>] - Service Name**

Identifies the name of the web service.

**[*-role* <text>] - Role Name**

Identifies a role assigned for accessing the service. A service without any authorizations has a role of 'none' assigned to it automatically.

**[*-type* <vserver type>] - Type of Vserver**

Identifies the type of Vserver on which the service is hosted.

**Examples**

The following example displays the roles that are authorized to access the web services.

```
cluster1::vserver services web access> show
Vserver      Type      Service Name      Role
-----
cluster1     admin     cem                none
cluster1     admin     ontapi             readonly
cluster1     admin     portal            none
cluster1     admin     spi               none
cluster1     admin     supdiag           none
vs0          cluster   ontapi             admin
6 entries were displayed.

cluster1::vserver services web access>
```

## vserver smtape commands

### vserver smtape break

Make a restored volume read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

**Parameters**

**-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located.

**-volume <volume name> - Volume Name**

Use this parameter to specify the name of the read-only volume that needs to be changed into a read/writeable volume after an smtape restore.

**Examples**

Make the read-only volume *datavol* on Vserver *vserver0* writeable after a restore.

```
cluster1::> vsriver smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

## vserver snapdiff-rpc-server commands

**vserver snapdiff-rpc-server off**

Stop the SnapDiff RPC server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**

The `vserver snapdiff-rpc-server off` command turns the SnapDiff RPC server off.

**Parameters****-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server off.

**Examples**

The following example turns the SnapDiff RPC server off for a Vserver named *vs0*:

```
cluster1::> vserver snapdiff-rpc-server off -vserver vs0
```

**vserver snapdiff-rpc-server on**

Start the SnapDiff RPC Server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

**Description**

The `vserver snapdiff-rpc-server on` command turns the SnapDiff RPC server on.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver for which you want to turn the SnapDiff RPC server on.

## Examples

The following example enables the SnapDiff RPC server access for a Vserver named vs0:

```
cluster1::> vserver snapdiff-rpc-server on -vserver vs0
```

## vserver snapdiff-rpc-server show

Display the SnapDiff RPC server configurations of Vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver snapdiff-rpc-server show` command displays the state of the SnapDiff RPC server for all the Vservers. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the configured Vservers:

- Vserver name
- Whether SnapDiff RPC server access is enabled

You can specify additional parameters to display only the information that matches those parameters. For instance, to display the information only for the Vservers that have access enabled, enter the command with the `-state on` parameter.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-vserver <vserver name>] - Vserver (privilege: advanced)**

If you specify this parameter, the command displays information only about the specified Vserver.

### **[-state {on|off}] - SnapDiff RPC Server state (privilege: advanced)**

If you specify this parameter, the command displays information only about the specified SnapDiff RPC server state.

## Examples

The following example displays information about all the Vservers with SnapDiff RPC server configured:

```
cluster1::> vsserver snapdiff-rpc-server show
Vserver      SnapDiff RPC Server State
-----
vs0          on
vs1          off
2 entries were displayed.
```

## vsserver vscan commands

### vsserver vscan disable

Disable Vscan on a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver vscan disable` command disables Vscan on a Vserver.

#### Parameters

**-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to disable Vscan.

## Examples

The following example disables Vscan on Vserver vs1.

```
cluster1::> vsserver vscan disable -vsserver vs1

cluster1::> vsserver vscan show -vsserver vs1
Vserver: vs1
Vscan Status: off
```

### vsserver vscan enable

Enable Vscan on a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver vscan enable` command enables Vscan on a Vserver.

## Parameters

### **-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver on which you want to enable Vscan. The Vscan configuration must already exist.

## Examples

The following example enables Vscan on Vserver vs1.

```
cluster1::> vserver vscan enable -vserver vs1

cluster1::> vserver vscan show -vserver vs1
Vserver: vs1
Vscan Status: on
```

## **vserver vscan reset**

Discard cached scan information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver vscan reset` command discards the cached information of the files that have been successfully scanned. After running this command, the files are scanned again when they are accessed.

## Parameters

### **-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver for which you want to discard the cached information.

## Examples

The following example discards the cached information of the successfully scanned files.

```
cluster1::> vserver vscan reset -vserver vs1
Warning: Running this command can cause performance degradation because
files are scanned again when they are accessed.
Do you want to continue? {y|n}: y

cluster1::>
```

## **vserver vscan show-events**

Display Vscan events

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver vscan show-events` command displays contents of the event log, which is generated by the cluster to capture important events. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Event type
- Event time

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- File path
- Vscan server vendor
- Vscan server version
- Disconnect reason
- Scan engine status code
- Vserver LIF used for connection
- Consecutive occurrence count

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[ -instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays information only about the events that have occurred on the specified node.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If you specify this parameter, the command displays information only about the events that have occurred for the specified Vserver.

**`[-event-time <MM/DD/YYYY HH:MM:SS>] - Event Log Time (privilege: advanced)`**

If you specify this parameter, the command displays information only about the events that have occurred at the specified time.

**`[-server <IP Address>] - Server (privilege: advanced)`**

If you specify this parameter, the command displays information only about the events that have occurred for the specified server.

**[`-event-type <event-type>`] - Event Type (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that are of the specified event type.

**[`-file-path <text>`] - File Path (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that have the specified file path.

**[`-vendor <text>`] - Vscanner Vendor (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that have the specified scan-engine vendor.

**[`-version <text>`] - Vscanner Version (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that have the specified scan-engine version.

**[`-disconnect-reason <reason>`] - Server Disconnect Reason (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that have the specified reason of the server disconnection.

**[`-lif <IP Address>`] - Vserver LIF Used for Connection (privilege: advanced)**

If you specify this parameter, the command displays information only about the events that have the specified IP address, which is used for connecting ONTAP with the Vscan server.

## Examples

The following example displays all the events captured in the cluster:

```
cluster1::*> vserver vscan show-events
```

| Vserver  | Node       | Server      | Event Type        | Event Time |
|----------|------------|-------------|-------------------|------------|
| -----    | -----      | -----       | -----             | -----      |
| vs1      | Cluster-01 | 192.168.1.1 | file-infected     | 9/5/2014   |
| 11:37:38 |            |             |                   |            |
| vs1      | Cluster-01 | 192.168.1.1 | scanner-updated   | 9/5/2014   |
| 11:37:08 |            |             |                   |            |
| vs1      | Cluster-01 | 192.168.1.1 | scanner-connected | 9/5/2014   |
| 11:34:55 |            |             |                   |            |

3 entries were displayed.

The following example displays detailed event information about all the infected files:

```
cluster1::*> vserver vscan show-events -event-type file-infected -instance
Node: Cluster-01
          Vserver: vs1
      Event Log Time: 9/5/2014 11:37:38
          Server: 192.168.1.1
      Event Type: file-infected
          File Path: \\1
      Vscanner Vendor: mighty master anti-evil scanner
      Vscanner Version: 1.0
      Server Disconnect Reason: -
Vserver LIF Used for Connection: 192.168.41.231
```

## vserver vscan show

### Display Vscan status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The ``vserver vscan show`` command displays Vscan status information of the Vservers. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- Vscan status

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the specified Vserver.

**[-vscan-status {on|off}] - Vscan Status**

If you specify this parameter, the command displays information only about the Vservers that have the specified status.

### Examples

The following example displays the Vscan status information.

```
cluster1::> vserver vscan show
Vserver          Vscan Status
-----
vs1              on
vs2              off
2 entries were displayed.
```

## vserver vscan connection-status show-all

### Display Vscan servers connection status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver vscan connection-status show-all` command displays connection status information of the external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server vendor
- Vscan server version
- Privileged user
- Vscan server connected since
- Vscan server disconnected since
- Vserver LIF used for connection

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

**[`-vserver <vserver name>`] - Vserver**

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

**[`-server <IP Address>`] - Server**

If you specify this parameter, the command displays information only about the Vscan server that you specify.

**[`-server-status <Status>`] - Server Status**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

**[`-server-type <Server type>`] - Server Type**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

**[`-vendor <text>`] - Vscanner Vendor**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

**[`-version <text>`] - Vscanner Version**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

**[`-disconnect-reason <reason>`] - Server Disconnect Reason**

If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

**[`-disconnected-since <MM/DD/YYYY HH:MM:SS>`] - Time When Vscanner Was Disconnected**

If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

**[`-privileged-user <text>`] - Privileged User Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that are connected to ONTAP using the specified privileged user.

**[`-connected-since <MM/DD/YYYY HH:MM:SS>`] - Time When Vscanner Was Connected**

If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

**[`-lif <IP Address>`] - Vserver LIF Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to ONTAP.

## Examples

The following example displays connection-status information about all Vscan servers.

```
cluster1::> vserver vscan connection-status show-all
```

| Vserver | Node       | Server  | Connection<br>Status | Disconnect<br>Reason |
|---------|------------|---------|----------------------|----------------------|
| vs1     | Cluster-01 | 1.1.1.1 | disconnected         | remote-closed        |
| vs1     | Cluster-01 | 2.2.2.2 | connected            | -                    |
| vs2     | Cluster-01 | 3.3.3.3 | disconnected         | no-data-lif          |
| vs2     | Cluster-01 | 4.4.4.4 | disconnected         | no-data-lif          |

4 entries were displayed.

The following example displays detailed connection-status information about all Vscan servers which are connected.

```
cluster1::> vserver vscan connection-status show-all -instance
               -server-status connected
Node: Cluster-01
               Vserver: vs1
               Server: 2.2.2.2
               Server Status: connected
               Server Type: primary
               Vscanner Vendor: XYZ
               Vscanner Version: 1.12.2
               Server Disconnect Reason: -
Time When Server Was Disconnected: -
Privileged User Used for Connection: cifs\u2
               Time When Server Was Connected: 6/3/2013 08:44:21
               Vserver LIF Used for Connection: 10.238.41.223
```

## vserver vscan connection-status show-connected

Display connection status of connected Vscan servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan connection-status show-connected` command displays connection status information of the connected external virus-scanning servers, or "Vscan servers". If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Vscan server vendor
- Privileged user

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server version
- Vscan server connected since
- Vserver LIF used for connection

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

**[-server <IP Address>] - Server**

If you specify this parameter, the command displays information only about the Vscan server that you specify.

**[-vendor <text>] - Vscan Server Vendor**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified vendor.

**[-version <text>] - Vscan Server Version**

If you specify this parameter, the command displays information only about the Vscan servers that are running scan-engine of the specified version.

**[-privileged-user <text>] - Privileged User Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that are connected to ONTAP using the specified privileged user.

### **[-connected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Connected**

If you specify this parameter, the command displays information only about the Vscan servers that have been connected since the specified time.

### **[-server-type <Server type>] - Server Type**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

### **[-lif <IP Address>] - Vserver LIF Used for Connection**

If you specify this parameter, the command displays information only about the Vscan servers that have used the specified IP address for connecting to ONTAP.

## **Examples**

The following example displays connection-status information about all connected Vscan servers.

```
cluster1::> vserver vscan connection-status show-connected
```

| Vserver | Node       | Server  | Vendor | Privileged User |
|---------|------------|---------|--------|-----------------|
| vs1     | Cluster-01 | 1.1.1.1 | ABC    | cifs\u2         |
| vs1     | Cluster-01 | 2.2.2.2 | XYZ    | cifs\u2         |

2 entries were displayed.

The following example displays detailed connection-status information about connected Vscan servers which are running XYZ scan-engine.

```
cluster1::> vserver vscan connection-status show-connected -instance
-vendor XYZ
Node: Cluster-01
Vserver: vs1
Server: 2.2.2.2
Vscanner Vendor: XYZ
Vscanner Version: 1.12
Privileged User Used for Connection: cifs\u2
Time When Vscanner Was Connected: 6/3/2013 08:44:21
Server Type: primary
Vserver LIF Used for Connection: 10.238.41.223
```

## **vserver vscan connection-status show-not-connected**

Display connection status of Vscan servers which are allowed to connect but not yet connected

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver vscan connection-status show-not-connected` command displays connection status information of the external virus-scanning servers, or "Vscan servers" that are ready to accept connection but are not yet connected. This command could be useful for troubleshooting. If you do not specify any parameters, the command displays the following information for all Vscan servers:

- Vserver name
- Node name
- Vscan server
- Connection status
- Disconnect reason

You can specify the `-fields` parameter to specify which fields of information to display. In addition to the fields above, you can display the following fields:

- Server type
- Vscan server disconnected since

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

**[-server <IP Address>] - Server**

If you specify this parameter, the command displays information only about the Vscan server that you specify.

**[-server-status <Status>] - Server Status**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified status.

**[-disconnect-reason <reason>] - Server Disconnect Reason**

If you specify this parameter, the command displays information only about the Vscan servers that are disconnected because of the specified reason.

### **[-disconnected-since <MM/DD/YYYY HH:MM:SS>] - Time When Vscan Server Was Disconnected**

If you specify this parameter, the command displays information only about the Vscan servers that have been disconnected since the specified time.

### **[-server-type <Server type>] - Server Type**

If you specify this parameter, the command displays information only about the Vscan servers that have the specified server type.

## **Examples**

The following example displays connection-status information about all Vscan servers which are ready to accept connection but not yet connected.

```
cluster1::> vserver vscan connection-status show-not-connected
```

| Vserver | Node       | Server  | Connection Status | Disconnect Reason  |
|---------|------------|---------|-------------------|--------------------|
| vs2     | Cluster-01 | 3.3.3.3 | disconnected      | invalid-session-id |
| vs2     | Cluster-01 | 4.4.4.4 | disconnected      | remote-closed      |

2 entries were displayed.

The following example displays detailed connection-status information about Vscan servers which are disconnected because the connection is remotely closed.

```
cluster1::> vserver vscan connection-status show-not-connected -instance
               -disconnect-reason remote-closed
Node: Cluster-01
               Vserver: vs2
               Server: 4.4.4.4
               Server Status: disconnected
               Server Disconnect Reason: remote-closed
Time When Vscanner Was Disconnected: 6/4/2013 06:51:32
               Server Type: primary
```

## **vserver vscan connection-status show**

### **Display Vscan servers connection status summary**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver vscan connection-status show` command displays connection status summary of the external virus-scanning servers, or "Vscan servers" for a Vserver. If you do not specify any parameters, the

command displays the following information for all Vservers:

- Vserver name
- Node name
- List of connected Vscan servers
- Connected count

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] }

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If you specify this parameter, the command displays information only about the Vscan servers attached to the specified node.

[-vserver <vserver name>] - Vserver

If you specify this parameter, the command displays information only about the Vscan servers for the specified Vserver.

[-servers <IP Address>,...] - List of Connected Vscan Servers

If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers.

[-connection-count <integer>] - Number of Connected Vscan Servers Serving the Vserver

If you specify this parameter, the command displays information only about the Vservers that have the specified connection count.

Examples

The following example displays connection-status summary for all Vservers.

```
cluster1::> vserver vscan connection-status show
                                     Connected Connected
Vserver      Node      Server-Count Servers
-----
vs1          Cluster-01      2 1.1.1.1, 2.2.2.2
vs2          Cluster-01      0 -
2 entries were displayed.
```

## vserver vscan on-access-policy create

### Create an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy create` command creates an On-Access policy.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create an On-Access policy.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the On-Access policy that you want to create. An On-Access policy name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_", "-" and ".".

#### **-protocol <CIFS> - File-Access Protocol**

This parameter specifies the protocol name for which the On-Access policy will be created. Currently only CIFS is supported.

#### **[-filters {scan-ro-volume|scan-execute-access}] - Filters**

This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

- *scan-ro-volume* - Enable scans for read-only volume.
- *scan-execute-access* - Scan only files opened with execute-access (CIFS only).

#### **[-scan-mandatory {on|off}] - Mandatory Scan**

This parameter specifies if access to a file is allowed or denied when there are no external virus-scanning servers available for virus scanning. The default value for this parameter is "on", this denies file access if an external virus-scanning server is not available. This parameter has no impact when an external virus-scanning server is available for file scanning because access to the file is allowed or denied based on the response from the virus-scanning server.

#### **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

This parameter specifies the maximum size of the file which will be considered for virus scanning. By default, it is *2GB*.

#### **[-paths-to-exclude <File path>,...] - File Paths Not to Scan**

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. By default, no paths are excluded. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:

- *\dir1\dir2\name* - This would match "\dir1\dir2\name" as well as "\dir1\dir2\name..."
- *\dir1\dir2\name\* - This would only match "\dir1\dir2\name..."

If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "\vol\ a b\" and "\vol\ a, b\" to the `-paths-to-exclude` in the CLI, type "`\vol\ a b\`", "`\vol\ a, b\`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

#### **[`-file-ext-to-exclude` <File extension>,...] - File Extensions Not to Scan**

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The `-file-ext-to-exclude` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- \* - Matches any string, including the empty string. For example, `mp*` would match mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, `mp?` would match mp3, mp4 but not mp and mpeg.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "`mp*`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

#### **[`-file-ext-to-include` <File extension>,...] - File Extensions to Scan**

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is \*, which means all the file extensions are considered for virus scanning except those which match one of the patterns provided in `-file-ext-to-exclude` list. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- \* - Matches any string, including the empty string. For example, `mp*` would match mp, mp3, mp4, mpeg etc.
- ? - Matches any single character. For example, `mp?` would match mp3, mp4 but not mp and mpeg.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "`mp*`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

#### **[`-scan-files-with-no-ext` {true|false}] - Scan Files with No Extension**

This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

### **Examples**

The following example creates an On-Access policy.

```

cluster1::> vserver vscan on-access-policy create -vserver vs1 -policy
-name test
                -protocol CIFS -scan-mandatory on -filters scan-ro-volume
-max-file-size 3GB
                -file-ext-to-exclude "mp3","txt" -file-ext-to-include
"mp*","tx*"
                -paths-to-exclude "\vol\a b\","\vol\a,b\"

cluster1::> vserver vscan on-access-policy show -instance -vserver vs1
-policy-name test
Vserver: vs1
                Policy: test
                Policy Status: off
                Policy Config Owner: vserver
                File-Access Protocol: CIFS
                Filters: scan-ro-volume
                Mandatory Scan: on
Max File Size Allowed for Scanning: 3GB
                File Paths Not to Scan: \vol\a b\, \vol\a,b\
                File Extensions Not to Scan: mp3, txt
                File Extensions to Scan: mp*, tx*
                Scan Files with No Extension: true

```

## vserver vscan on-access-policy delete

### Delete an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy delete` command deletes an On-Access policy.

### Parameters

**-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver from which you want to delete an On-Access policy.

**-policy-name <Policy name> -Policy**

This parameter specifies the name of the On-Access policy that you want to delete.

### Examples

The following example deletes an On-Access policy.

```
cluster1::> vsriver vscan on-access-policy delete -vsriver vs1 -policy
-name test

cluster1::> vsriver vscan on-access-policy show -vsriver vs1 -policy-name
test
There are no entries matching your query.
```

## **vsriver vscan on-access-policy disable**

### Disable an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver vscan on-access-policy disable` command disable an On-Access policy for the specified Vserver.

### Parameters

#### **-vsriver <vsriver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to disable an On-Access policy. The Vserver administrator can disable On-Access policies created within the scope of the Vserver and can also disable an On-Access policy created by the cluster administrator. The cluster administrator can disable On-Access policies for any Vserver.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the On-Access policy you want to disable.

### Examples

The following command disable an On-Access policy on specified Vserver.

```

cluster1::> vsserver vscan on-access-policy disable -vsserver vs1 -policy
-name new

cluster1::> vsserver vscan on-access-policy show -instance -vsserver vs1
-policy-name new
Vserver: vs1
Policy: new
Policy Status: off
Policy Config Owner: vsserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File-Paths Not to Scan: \vol\temp
File-Extensions Not to Scan: txt

```

## vsserver vscan on-access-policy enable

Enable an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-access-policy enable` command enables an On-Access policy for the specified Vserver. Only one On-Access policy of a specific protocol can be enabled at one time.

### Parameters

#### **-vsserver <vsserver name> -Vserver**

This parameter specifies the name of the Vserver on which you want to enable an On-Access policy. The Vserver administrator can enable On-Access policy created within the scope of the Vserver or the cluster. The cluster administrator can enable On-Access policy for any Vserver but cannot enable them with a scope of cluster. The scope is determined at a Vserver level.

#### **-policy-name <Policy name> -Policy**

This parameter specifies the name of the On-Access policy you want to enable.

### Examples

The following command enables an On-Access policy on specified Vserver.

```

cluster1::> vserver vscan on-access-policy enable -vserver vs1 -policy
-name new

cluster1::> vserver vscan on-access-policy show -instance -vserver vs1
-policy-name new
Vserver: vs1
Policy: new
Policy Status: on
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File-Paths Not to Scan: \vol\temp
File-Extensions Not to Scan: txt

```

## vserver vscan on-access-policy modify

### Modify an On-Access policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy modify` command modifies an On-Access policy.

### Parameters

#### **-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver on which you want to modify an On-Access policy.

#### **-policy-name <Policy name> -Policy**

This parameter specifies the name of the On-Access policy that you want to modify.

#### **[-filters {scan-ro-volume|scan-execute-access}] -Filters**

This parameter specifies a list of filters which can be used to define the scope of the On-Access policy more precisely. The list can include one or more of the following:

- *scan-ro-volume* - Enable scans for read-only volume.
- *scan-execute-access* - Scan only files opened with execute-access (CIFS only).

#### **[-scan-mandatory {on|off}] -Mandatory Scan**

This parameter specifies whether access to a file is allowed if there are no external virus-scanning servers available for virus scanning.

### **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

This parameter specifies the maximum size of the file which will be considered for virus scanning.

### **[-paths-to-exclude <File path>,...] - File Paths Not to Scan**

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver and can be up to 255 characters long. CIFS protocol based On-Access policies must use "\" as the path separator. The path can be in one of the following forms:

- `\dir1\dir2\name` - This would match "`\dir1\dir2\name`" as well as "`\dir1\dir2\name...`".
- `\dir1\dir2\name\` - This would only match "`\dir1\dir2\name...`".

If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths "`vol a b`" and "`vol a,b`" to the `-paths-to-exclude` in the CLI, type "`vol a b`", "`vol a,b`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

### **[-file-ext-to-exclude <File extension>,...] - File Extensions Not to Scan**

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The `-file-ext-to-exclude` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- \* - Matches any string, including the empty string. For example, `mp*` would match `mp`, `mp3`, `mp4`, `mpeg` etc.
- ? - Matches any single character. For example, `mp?` would match `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "`mp*`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

### **[-file-ext-to-include <File extension>,...] - File Extensions to Scan**

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- \* - Matches any string, including the empty string. For example, `mp*` would match `mp`, `mp3`, `mp4`, `mpeg` etc.
- ? - Matches any single character. For example, `mp?` would match `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type "`mp*`" at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

## **[`-scan-files-with-no-ext {true|false}`] - Scan Files with No Extension**

This parameter specifies if the files without any extension are considered for virus scanning or not.

### **Examples**

The following example modifies an On-Access policy.

```
cluster1::> vserver vscan on-access-policy modify -vserver vs1 -policy
-name test
                -protocol CIFS -scan-mandatory on -filters scan-ro-volume
-max-file-size 10GB
                -file-ext-to-exclude "mp3" -file-ext-to-include "mp*"
-scan-files-with-no-ext false
                -paths-to-exclude "\vol1\temp","\vol2\a"

cluster1::> vserver vscan on-access-policy show -instance -vserver vs1
-policy-name test
Vserver: vs1
                Policy: test
                Policy Status: off
                Policy Config Owner: vserver
                File-Access Protocol: CIFS
                Filters: scan-ro-volume
                Mandatory Scan: off
Max File Size Allowed for Scanning: 10GB
                File Paths Not to Scan: \vol1\temp, \vol2\
                File Extensions Not to Scan: mp3
                File Extensions to Scan: mp*
                Scan Files with No Extension: false
```

## **vserver vscan on-access-policy show**

### **Display On-Access policies**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver vscan on-access-policy show` command displays information about the On-Access policies belonging to the Vserver. It also displays the current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all On-Access policies:

- Vserver name
- Policy name
- Policy status
- Policy owner

- Protocol
- File paths to exclude
- File extensions to exclude

You can specify the `-fields` parameter to specify which fields of information to display about On-Access policies. In addition to the fields above, you can display the following fields:

- List of filters
- Mandatory scan
- Max file size
- File extensions to include
- Scan files without extension

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the On-Access policies for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the specified On-Access policy.

**[-policy-status {on|off}] - Policy Status**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified status.

**[-owner <Configuration owner>] - Policy Config Owner**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified owner.

**[-protocol <CIFS>] - File-Access Protocol**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified protocol.

**[-filters {scan-ro-volume|scan-execute-access}] - Filters**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified filter or filters in the filter list.

**[-scan-mandatory {on|off}] - Mandatory Scan**

If you specify this parameter, the command displays information only about the On-Access policies that have mandatory scanning enabled.

### **[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified max-file-size.

### **[-paths-to-exclude <File path>,...] - File Paths Not to Scan**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified path or paths in the exclude list.

### **[-file-ext-to-exclude <File extension>,...] - File Extensions Not to Scan**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the exclude list.

### **[-file-ext-to-include <File extension>,...] - File Extensions to Scan**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified file extension or extensions in the include list.

### **[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension**

If you specify this parameter, the command displays information only about the On-Access policies that have the specified value.

## **Examples**

The following example displays information about all On-Access policies.

```
cluster1::> vserver vscan on-access-policy show
```

|         | Policy           | Policy  |          |                | File-Ext |       |
|---------|------------------|---------|----------|----------------|----------|-------|
| Policy  |                  |         |          |                |          |       |
| Vserver | Name             | Owner   | Protocol | Paths Excluded | Excluded |       |
| Status  |                  |         |          |                |          |       |
| -----   | -----            | -----   | -----    | -----          | -----    | ----- |
| Cluster | default_<br>CIFS | cluster | CIFS     | -              | -        | off   |
| vs1     | default_<br>CIFS | cluster | CIFS     | -              | -        | on    |
| vs1     | new              | vserver | CIFS     | \vol\temp      | txt      | off   |
| vs2     | default_<br>CIFS | cluster | CIFS     | -              | -        | on    |

4 entries were displayed.

The following example displays detailed information about an On-Access policy.

```
cluster1::> vserver vscan on-access-policy show -instance -vserver vs1
-policy-name new
Vserver: vs1

Policy: new
Policy Status: off
Policy Config Owner: vserver
File-Access Protocol: CIFS
Filters: scan-ro-volume
Mandatory Scan: on
Max File Size Allowed for Scanning: 4GB
File Paths Not to Scan: \vol\temp
File Extensions Not to Scan: txt
File Extensions to Scan: *
Scan Files with No Extension: true
```

## **vserver vscan on-access-policy file-ext-to-exclude add**

Add to the list of file extensions to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver vscan on-access-policy file-ext-to-exclude add` command adds a file extension or a list of file extensions that must be excluded from scanning to the specified policy name.

### **Parameters**

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions that must be excluded from scanning.

#### **-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan**

This parameter specifies the file extension or a list of file extensions that must be excluded from scanning.

### **Examples**

The following example adds a list of file extensions that must be excluded from scanning to the specified on-access policy:

```
cluster1::> vsserver vscan on-access-policy file-ext-to-exclude add
-vserver vs1
      -policy-name policy1 -file-ext-to-exclude txt,mp4

cluster1::> vsserver vscan on-access-policy file-ext-to-exclude show
-vserver vs1
      -policy-name policy1
Vserver: vs1
      Policy: policy1
File-Extensions Not to Scan: mp3, mp4, txt, wav
```

## **vserver vscan on-access-policy file-ext-to-exclude remove**

Remove from the list of file extensions to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver vscan on-access-policy file-ext-to-exclude remove` command removes a file extension or a list of file extensions that are excluded from scanning from the specified policy name.

### **Parameters**

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are excluded from scanning.

#### **-file-ext-to-exclude <File extension>, ... - File Extensions Not to Scan**

This parameter specifies the file extension or a list of file extensions that must be removed from the on-access policy.

### **Examples**

The following example removes a list of file extensions that are to be excluded from scanning from the specified on-access policy:

```

cluster1::> vsserver vscan on-access-policy file-ext-to-exclude remove
-vserver vs1
        -policy-name policy1 -file-ext-to-exclude mp3,txt

cluster1::> vsserver vscan on-access-policy file-ext-to-exclude show
-vserver vs1
        -policy-name policy1
Vserver: vs1
        Policy: policy1
File-Extensions Not to Scan: mp4, wav

```

## vsserver vscan on-access-policy file-ext-to-exclude show

Display list of file extensions to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-access-policy file-ext-to-exclude show` command displays the list of file extensions that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of File-Extensions to exclude

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the specified policy name.

**[-file-ext-to-exclude <File extension>,...] - File Extensions Not to Scan**

If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are excluded from scanning.

## Examples

The following example displays the list of file extensions that are excluded from scanning for all the policies:

```
cluster1::> vsserver vscan on-access-policy file-ext-to-exclude show
Vserver          Policy Name          File-Ext Excluded
-----
cluster1         default_CIFS          txt
vs1              default_CIFS          txt
vs1              policy1              mp4, wav
vs1              policy3              wmv
vs2              default_CIFS          txt
vs2              policy2              mp3
6 entries were displayed.
```

## vsserver vscan on-access-policy file-ext-to-include add

Add to the list of file extensions to include

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-access-policy file-ext-to-include add` command adds a file extension or list of file extensions to include for virus scanning to the specified policy.

### Parameters

#### **-vsserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy to which you want to add a file extension or a list of file extensions to include for virus scanning.

#### **-file-ext-to-include <File extension>, ... - File Extensions to Scan**

This parameter specifies the file extension or a list of file extensions to include for virus scanning.

## Examples

The following example adds a list of file extensions to include for virus scanning to the specified on-access policy.

```

cluster1::> vserver vscan on-access-policy file-ext-to-include add
-vserver vs1
        -policy-name policy1 -file-ext-to-include "mp*", "tx*"

cluster1::> vserver vscan on-access-policy file-ext-to-include show
-vserver vs1
        -policy-name policy1
Vserver: vs1
        Policy: policy1
        File Extensions to Scan: mp*, tx*, wav

```

## vserver vscan on-access-policy file-ext-to-include remove

Remove from the list of file extensions to include

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy file-ext-to-include remove` command removes a file extension or list of file extension that are included for virus scanning from the specified policy.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a file extension or list of file extensions that are included for virus scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy from which you want to remove a file extension or a list of file extensions that are included for virus scanning.

#### **-file-ext-to-include <File extension>, ... - File Extensions to Scan**

This parameter specifies the file extension or a list of file extensions that you want to remove from the specified on-access policy.

### Examples

The following example removes a list of file extensions from the specified on-access policy.

```

cluster1::> vserver vscan on-access-policy file-ext-to-include remove
-vserver vs1
        -policy-name policy1 -file-ext-to-include "txt*", "wav"

cluster1::> vserver vscan on-access-policy file-ext-to-include show
-vserver vs1
        -policy-name policy1
Vserver: vs1
        Policy: policy1
        File Extensions to Scan: mp*

```

## vserver vscan on-access-policy file-ext-to-include show

Display list of file extensions to include

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy file-ext-to-include show` command displays the list of file extensions to include for virus scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on access policies:

- Vserver name
- Policy name
- List of File-Extensions to Scan

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the policies for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the specified policy.

**[-file-ext-to-include <File extension>,...] - File Extensions to Scan**

If you specify this parameter, the command displays information only about the policies that have the specified file extensions that are included for virus scanning.

## Examples

The following example displays the list of file extensions that are included for virus scanning for all policies.

```
cluster1::> vsserver vscan on-access-policy file-ext-to-include show
Vserver          Policy Name      File-Ext Included
-----
cluster1         default_CIFS      *
vs1              default_CIFS      *
vs1              policy1           mp*
vs1              policy3           doc*, xl*
vs2              default_CIFS      *
vs2              policy2           d*, m*, t*
6 entries were displayed.
```

## vsserver vscan on-access-policy paths-to-exclude add

Add to the list of paths to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-access-policy paths-to-exclude add` command adds a path or a list of paths that must be excluded from scanning to the specified policy name.

### Parameters

#### **-vsserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy to which you want to add a path or a list of paths that must be excluded from scanning.

#### **-paths-to-exclude <File path>, ... - Paths Not to Scan**

This parameter specifies the path or list of paths that must be excluded from scanning.

## Examples

The following example adds a list of paths that must be excluded from scanning to the specified on-access policy:

```

cluster1::> vsserver vscan on-access-policy paths-to-exclude add -vsserver
vs1
                -policy-name policy1 -paths-to-exclude \test\test2,\test\test3

cluster1::> vsserver vscan on-access-policy paths-to-exclude show -vsserver
vs1
                -policy-name policy1
Vserver: vs1
                Policy: policy1
File-Paths Not to Scan: \test\test1, \test\test2, \test\test3

```

## vsserver vscan on-access-policy paths-to-exclude remove

Remove from the list of paths to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-access-policy paths-to-exclude remove` command removes a path or a list of paths that are excluded from scanning from the specified policy name.

### Parameters

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified on-access policy from which you want to remove a path or list of paths that are excluded from scanning.

#### **-policy-name <Policy name> - Policy**

This parameter specifies the name of the on-access policy from which you want to remove a path or a list of paths that are excluded from scanning.

#### **-paths-to-exclude <File path>,... - Paths Not to Scan**

This parameter specifies the path or a list of paths that must be removed from the on-access policy.

### Examples

The following example removes a list of paths that are excluded from scanning from the specified policy name:

```

cluster:> vserver vscan on-access-policy paths-to-exclude remove -vserver
vs1
        -policy-name policy1 -paths-to-exclude \test\test2,\test\test3

cluster1:> vserver vscan on-access-policy paths-to-exclude show -vserver
vs1
        -policy-name policy1
Vserver: vs1
        Policy: policy1
File-Paths Not to Scan: \test\test1

```

## vserver vscan on-access-policy paths-to-exclude show

Display list of paths to exclude

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-access-policy paths-to-exclude show` command displays the list of paths that are excluded from scanning belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all on-access policies:

- Vserver name
- Policy name
- List of Paths to exclude

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the policy names for the specified Vserver.

**[-policy-name <Policy name>] - Policy**

If you specify this parameter, the command displays information only about the specified policy name.

**[-paths-to-exclude <File path>,...] - File Paths Not to Scan**

If you specify this parameter, the command displays information only about the policies that have the specified paths that are excluded from scanning.

## Examples

The following example displays the list of paths that are excluded from scanning for all the policies:

```
cluster1::> vsserver vscan on-access-policy paths-to-exclude show
Vserver          Policy Name      Paths Excluded
-----
cluster1         default_CIFS      \test\test1
vs1              default_CIFS      \test\test1
vs1              policy1           \test\test2,\test\test3
vs1              policy3           \test\test4
vs2              default_CIFS      \test\test1
vs2              policy2           \test\test5
6 entries were displayed.
```

## vsserver vscan on-demand-task create

### Create an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-demand-task create` command creates an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

### Parameters

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create an On-Demand task.

#### **-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to create. An On-Demand task name can be up to 256 characters long.

#### **-scan-paths <text>, ... - List of Scan Paths**

This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter `"/"`.

#### **-report-directory <text> - Report Directory Path**

This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter `"/"`.

#### **[-schedule <text>] - Job Schedule**

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

A Vserver can have only one scheduled task at a time.

### **[`-max-file-size` {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

This parameter specifies the maximum size of the file that will be considered for virus scanning. By default, it is `10GB`.

### **[`-paths-to-exclude` <text>,...] - File Paths Not to Scan**

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter `/`. By default, no paths are excluded. The path can be in one of the following forms:

- `/dir1/dir2/name` - This would match `/dir1/dir2/name` as well as `/dir1/dir2/name/...`.
- `/dir1/dir2/name/` - This would only match `/dir1/dir2/name/...`.

If you are using the CLI, you must delimit all paths with double quotation marks (`"`). For instance, to add the paths `/vol/a b/` and `/vol/a,b/` to the `-paths-to-exclude` in the CLI, type `"/vol/a b/"`, `"/vol/a,b/"` at the command prompt.

### **[`-file-ext-to-exclude` <File extension>,...] - File Extensions Not to Scan**

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. By default, no file extensions are excluded. Each file extension can be up to 16 characters long. The `-file-ext-to-exclude` supports wildcard patterns containing `"*"` and `"?"`. Pattern matching is defined as:

- `*` - Matches any string, including the empty string. For example, `mp*` matches `mp`, `mp3`, `mp4`, `mpeg` etc.
- `?` - Matches any single character. For example, `mp?` matches `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks (`"`). For instance, to enter the pattern `mp*` in the CLI, type `"mp*"` at the command prompt. To add a `"?"` to the expression, press `ESC` followed by the `"?"`.

### **[`-file-ext-to-include` <File extension>,...] - File Extensions to Scan**

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. By default it is `*`, which means all the file extensions are considered for virus scanning except those that match one of the patterns provided in `-file-ext-to-exclude` list. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing `"*"` and `"?"`. Pattern matching is defined as:

- `*` - Matches any string, including the empty string. For example, `mp*` matches `mp`, `mp3`, `mp4`, `mpeg` etc.
- `?` - Matches any single character. For example, `mp?` matches `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks (`"`). For instance, to enter the pattern `mp*` in the CLI, type `"mp*"` at the command prompt. To add a `"?"` to the expression, press `ESC` followed by the `"?"`.

If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

#### **`[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension`**

This parameter specifies if the files without any extension are considered for virus scanning or not. By default, it is true.

#### **`[-request-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout`**

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h. By default, it is 5m.

#### **`[-cross-junction {true|false}] - Cross Junction`**

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed. By default, it is true.

#### **`[-directory-recursion {true|false}] - Directory Recursion`**

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed. By default, it is true.

#### **`[-scan-priority {low|normal}] - Scan Priority`**

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests. By default, it is low.

#### **`[-report-log-level {verbose|info|error}] - Report Log Level`**

This parameter specifies the log level of the On-Demand report. By default, it is info.

#### **`[-report-expiry-time <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Expiration Time for Report`**

This parameter specifies the expiration time for the reports generated by On-Demand scans. Once this time elapses, the reports are auto-deleted. The default value is 0, which means reports are retained until they are manually deleted.

## **Examples**

The following example creates an On-Demand task:

```
cluster1::> vsserver vscan on-demand-task create -vsserver vs1 -task-name t1
            -scan-paths "/vol1/","/vol2/cifs/" -report-directory "/report"
            -schedule daily -max-file-size 5GB -paths-to-exclude
"/vol1/cold-files/"
            -file-ext-to-include "vmdk?","mp*" -file-ext-to-exclude
"mp3","mp4"
            -scan-files-with-no-ext false -request-timeout 2m -cross
-junction false
            -directory-recursion true -scan-priority low -report-log-level
verbose
            -report-expiry-time 12h
[Job 126]: Vscan On-Demand job is queued. Use the "job show -id 126"
command to view the status.
```

```
cluster1::> vsserver vscan on-demand-task show -instance -vsserver vs1 -task
-name t1
Vserver: vs1
                Task Name: t1
                List of Scan Paths: /vol1/, /vol2/cifs/
                Report Directory Path: /report
                Job Schedule: daily
Max File Size Allowed for Scanning: 5GB
                File Paths Not to Scan: /vol1/cold-files/
                File Extensions Not to Scan: mp3, mp4
                File Extensions to Scan: vmdk, mp*
Scan Files with No Extension: false
                Request Service Timeout: 2m
                Cross Junction: false
                Directory Recursion: true
                Scan Priority: low
                Report Log Level: verbose
```

## vsserver vscan on-demand-task delete

### Delete an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-demand-task delete` command deletes an On-Demand task.

### Parameters

**-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver from which you want to delete an On-Demand task.

**-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to delete.

**Examples**

The following example deletes an On-Demand task:

```
cluster1::> vsserver vscan on-demand-task delete -vsserver vs1 -task-name t1

cluster1::> vsserver vscan on-demand-task show -vsserver vs1 -task-name t1
There are no entries matching your query.
```

**vsserver vscan on-demand-task modify****Modify an On-Demand task**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vsserver vscan on-demand-task modify` command modifies an On-Demand task. The On-Demand task consists of a set of attributes that are used for configuring the scope of scanning. It also specifies the cron schedule at which the task should run.

**Parameters****-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to modify an On-Demand task.

**-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to modify.

**[-scan-paths <text>,...] - List of Scan Paths**

This parameter specifies a list of paths, separated by commas, for virus scanning. This path is given from the root of the Vserver using UNIX path delimiter `/`.

**[-report-directory <text>] - Report Directory Path**

This parameter specifies a directory path where the On-Demand report file is created. Each run for a task creates a new file. The report directory path is given from the root of the Vserver using UNIX path delimiter `/`.

**[-schedule <text>] - Job Schedule**

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule. Providing empty schedule (`""`) unchedules the task.

A Vserver can have only one scheduled task at a time.

### **[`-max-file-size` {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

This parameter specifies the maximum size of the file which will be considered for virus scanning.

### **[`-paths-to-exclude` <text>,...] - File Paths Not to Scan**

This parameter specifies a list of paths, separated by commas, to exclude from virus scanning. This path is given from the root of the Vserver using UNIX path delimiter "/". The path can be in one of the following forms:

- `/dir1/dir2/name` - This would match `/dir1/dir2/name` as well as `/dir1/dir2/name/...`.
- `/dir1/dir2/name/` - This would only match `/dir1/dir2/name/...`.

If you are using the CLI, you must delimit all paths with double quotation marks ("). For instance, to add the paths `/vol/a b/` and `/vol/a,b/` to the `-paths-to-exclude` in the CLI, type `"vol/a b/"`, `"vol/a,b/"` at the command prompt.

### **[`-file-ext-to-exclude` <File extension>,...] - File Extensions Not to Scan**

This parameter specifies a list of file extensions, separated by commas, to exclude from virus scanning. Each file extension can be up to 16 characters long. The `-file-ext-to-exclude` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- `*` - Matches any string, including the empty string. For example, `mp*` matches `mp`, `mp3`, `mp4`, `mpeg` etc.
- `?` - Matches any single character. For example, `mp?` matches `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type `"mp*"` at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

### **[`-file-ext-to-include` <File extension>,...] - File Extensions to Scan**

This parameter specifies a list of file extensions, separated by commas, to include for virus scanning. Each file extension can be up to 16 characters long. The `-file-ext-to-include` supports wildcard patterns containing "\*" and "?". Pattern matching is defined as:

- `*` - Matches any string, including the empty string. For example, `mp*` matches `mp`, `mp3`, `mp4`, `mpeg` etc.
- `?` - Matches any single character. For example, `mp?` matches `mp3`, `mp4` but not `mp` and `mpeg`.

If you are using the CLI, you must delimit all patterns with double quotation marks ("). For instance, to enter the pattern `mp*` in the CLI, type `"mp*"` at the command prompt. To add a "?" to the expression, press ESC followed by the "?".

If you specify both `-file-ext-to-include` and `-file-ext-to-exclude` lists, then only those file extensions are considered for virus scanning which match one of the patterns provided in `-file-ext-to-include` list but do not match any of the patterns provided in `-file-ext-to-exclude` list.

### **[`-scan-files-with-no-ext` {true|false}] - Scan Files with No Extension**

This parameter specifies if the files without any extension are considered for virus scanning or not.

**[-request-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout**

This parameter specifies the timeout value for a scan request. It is used to specify the time interval in which the node waits for a response from the Vscan server. Beyond this timeout period, the scan request is considered as failed. The value for this field must be between 10s and 1h.

**[-cross-junction {true|false}] - Cross Junction**

This parameter specifies if the On-Demand task is allowed to cross volume junctions. If the parameter is set to false, crossing junctions is not allowed.

**[-directory-recursion {true|false}] - Directory Recursion**

This parameter specifies if the On-Demand task is allowed to recursively scan through sub-directories. If the parameter is set to false, recursive scanning is not allowed.

**[-scan-priority {low|normal}] - Scan Priority**

This parameter specifies the priority of the On-Demand scan requests generated by this task compared to On-Access scan requests.

**[-report-log-level {verbose|info|error}] - Report Log Level**

This parameter specifies the log level of the On-Demand report.

**[-report-expiry-time <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Expiration Time for Report**

This parameter specifies the expiration time for the reports generated by On-Demand scans. Once this time elapses, the reports are auto-deleted. The default value is 0, which means reports are retained until they are manually deleted.

## Examples

The following example modifies an On-Demand task:

```

cluster1::> vserver vscan on-demand-task modify -vserver vs1 -task-name t1
            -scan-paths "/vol3/","/vol4/cifs/" -report-directory "/report-
dir"
            -schedule custom -max-file-size 2GB -paths-to-exclude
"/vol1/cold-files/"
            -file-ext-to-include "*" -file-ext-to-exclude "mp3","mp4"
            -scan-files-with-no-ext true -request-timeout 1m -cross
-junction true
[Job 136]: Vscan On-Demand job is queued. Use the "job show -id 136"
command to view the status.

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task
-name t1
Vserver: vs1
            Task Name: t1
            List of Scan Paths: /vol3/, /vol4/cifs/
            Report Directory Path: /report-dir
            Job Schedule: custom
Max File Size Allowed for Scanning: 2GB
            File Paths Not to Scan: /vol1/cold-files/
            File Extensions Not to Scan: mp3, mp4
            File Extensions to Scan: *
Scan Files with No Extension: true
            Request Service Timeout: 1m
            Cross Junction: true
            Directory Recursion: true
            Scan Priority: low
            Report Log Level: verbose

```

## vserver vscan on-demand-task run

### Run an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-demand-task run` command start virus scanning immediately for an On-Demand task.

### Parameters

**-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver on which you want to start start virus scanning.

**-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to start virus scanning.

## Examples

The following example starts virus scanning an On-Demand task:

```
cluster1::> vserver vscan on-demand-task run -vserver vs1 -task-name t1
[Job 161]: Vscan On-Demand job is queued. Use the "job show -id 161"
command to view the status.
```

## vserver vscan on-demand-task schedule

### Schedule an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-demand-task schedule` command schedules an On-Demand task.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to schedule an On-Demand task.

**-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to schedule.

**-schedule <text> - Schedule Name**

This parameter specifies the already existing cron schedule. The On-Demand task triggers virus scanning for the specified scan-paths at the time configured in the schedule.

A Vserver can have only one scheduled task at a time.

## Examples

The following example schedules an On-Demand task:

```

cluster1::> vserver vscan on-demand-task schedule -vserver vs1 -task-name
t1 -schedule daily
[Job 150]: Vscan On-Demand job is queued. Use the "job show -id 150"
command to view the status.

cluster1::> vserver vscan on-demand-task show -instance -vserver vs1 -task
-name t1
Vserver: vs1
                Task Name: t1
        List of Scan Paths: /test
    Report Directory Path: /report
            Job Schedule: daily
Max File Size Allowed for Scanning: 2GB
        File Paths Not to Scan: /voll/cold-files/
    File Extensions Not to Scan: mp3, mp4
    File Extensions to Scan: *
Scan Files with No Extension: true
    Request Service Timeout: 1m
            Cross Junction: true
    Directory Recursion: true
            Scan Priority: low
            Report Log Level: verbose

```

## vserver vscan on-demand-task show

### Display On-Demand tasks

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-demand-task show` command displays information about the On-Demand tasks belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Scan paths
- Report directory path
- Schedule

You can specify the `-fields` parameter to specify which fields of information to display about On-Demand tasks. In addition to the fields above, you can display the following fields:

- Max file size
- File paths to exclude

- File extensions to exclude
- File extensions to include
- Scan files without extension
- Scan timeout
- Cross junction
- Directory recursion
- Scan priority
- Report log level

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the On-Demand tasks for the specified Vserver.

**[-task-name <text>] - Task Name**

If you specify this parameter, the command displays information only about the specified On-Demand task.

**[-scan-paths <text>,...] - List of Scan Paths**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the scan-paths list.

**[-report-directory <text>] - Report Directory Path**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-directory.

**[-schedule <text>] - Job Schedule**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified schedule.

**[-max-file-size {<integer>[KB|MB|GB|TB|PB]}] - Max File Size Allowed for Scanning**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified max-file-size.

**[-paths-to-exclude <text>,...] - File Paths Not to Scan**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified path or paths in the exclude list.

**[-file-ext-to-exclude <File extension>,...] - File Extensions Not to Scan**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the exclude list.

### **[-file-ext-to-include <File extension>,...] - File Extensions to Scan**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified file extension or extensions in the include list.

### **[-scan-files-with-no-ext {true|false}] - Scan Files with No Extension**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

### **[-request-timeout <[<integer>d [<integer>h [<integer>m [<integer>s]>] - Request Service Timeout**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified request-timeout.

### **[-cross-junction {true|false}] - Cross Junction**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

### **[-directory-recursion {true|false}] - Directory Recursion**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified value.

### **[-scan-priority {low|normal}] - Scan Priority**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified scan-priority.

### **[-report-log-level {verbose|info|error}] - Report Log Level**

If you specify this parameter, the command displays information only about the On-Demand tasks that have the specified report-log-level.

### **[-report-expiry-time <[<integer>d [<integer>h [<integer>m [<integer>s]>] - Expiration Time for Report**

This parameter specifies the expiration time for the reports generated by On-Demand scans. Once this time elapses, the reports are auto-deleted. The default value is 0, which means reports are retained until they are manually deleted.

## **Examples**

The following example displays information about all On-Demand tasks:

```
cluster1::> vserver vscan on-demand-task show
```

| Vserver | Task Name | Scan Paths | Report Directory Path | Schedule |
|---------|-----------|------------|-----------------------|----------|
| vs1     | t1        | /test      | /report               | -        |
| vs2     | t2        | /, /test/  | /report               | daily    |

2 entries were displayed.

The following example displays detailed information about an On-Demand task:

```

cluster1::> vsserver vscan on-demand-task show -instance -vsserver vs1 -task
-name t1
Vserver: vs1
                Task Name: t1
                List of Scan Paths: /test
                Report Directory Path: /report
                Job Schedule: -
Max File Size Allowed for Scanning: 2GB
                File Paths Not to Scan: /vol1/cold-files/
                File Extensions Not to Scan: mp3, mp4
                File Extensions to Scan: *
Scan Files with No Extension: true
                Request Service Timeout: 1m
                Cross Junction: true
                Directory Recursion: true
                Scan Priority: low
                Report Log Level: verbose

```

## vsserver vscan on-demand-task unschedule

### Unschedule an On-Demand task

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-demand-task unschedule` command unschedules an On-Demand task.

### Parameters

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to unschedule an On-Demand task.

#### **-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task that you want to unschedule.

### Examples

The following example unschedules an On-Demand task:

```

cluster1::> vsserver vscan on-demand-task unschedule -vsserver vs1 -task
-name t1

cluster1::> vsserver vscan on-demand-task show -instance -vsserver vs1 -task
-name t1
Vserver: vs1
                Task Name: t1
        List of Scan Paths: /test
        Report Directory Path: /report
                Job Schedule: -
Max File Size Allowed for Scanning: 2GB
        File Paths Not to Scan: /voll/cold-files/
        File Extensions Not to Scan: mp3, mp4
        File Extensions to Scan: *
Scan Files with No Extension: true
        Request Service Timeout: 1m
                Cross Junction: true
        Directory Recursion: true
                Scan Priority: low
                Report Log Level: verbose

```

## vsserver vscan on-demand-task report delete

### Delete an On-Demand report

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan on-demand-task report delete` command deletes an On-Demand report.

### Parameters

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver from which you want to delete an On-Demand report.

#### **-task-name <text> - Task Name**

This parameter specifies the name of the On-Demand task whose report you want to delete.

#### **-report-file <text> - Report File Path**

This parameter specifies the path of the report-file whose report record you want to delete.

#### **[-delete-report-file {true|false}] - Delete Report File Also**

This parameter specifies if the corresponding report file is also to be deleted. By default, it is false.

## Examples

The following example deletes only On-Demand report record:

```
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task
-name t1
               -report-file /rep/avod_146_20150902_161439.log

cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task
-name t1
               -report-file /rep/avod_146_20150902_161439.log
There are no entries matching your query.
```

The following example deletes an On-Demand report file along with the report record:

```
cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task
-name t1
               -report-file /rep/avod_146_20150902_161439.log -delete-report
-file true

cluster1::> vserver vscan on-demand-task report delete -vserver vs1 -task
-name t1
               -report-file /rep/avod_146_20150902_161439.log -delete-report
-file true
There are no entries matching your query.
```

## vserver vscan on-demand-task report show

### Display On-Demand reports

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan on-demand-task report show` command displays information about the On-Demand reports belonging to the Vserver. A new report record is generated at the end of an On-Demand task run. If you do not specify any parameters, the command displays the following information about all On-Demand tasks:

- Vserver name
- Task name
- Report file path
- Number of clean files
- Number of infected files

You can specify the `-fields` parameter to specify which fields of information to display about On-Demand

report. In addition to the fields above, you can display the following fields:

- Job ID
- Job duration
- Number of attempted scans
- Number of files skipped from scanning
- Number of already scanned files
- Number of successful scans
- Number of failed scans
- Number of timed-out scans
- Job start time
- Job end time

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the On-Demand reports for the specified Vserver.

**[-task-name <text>] - Task Name**

If you specify this parameter, the command displays information only about the On-Demand reports for the specified task.

**[-report-file <text>] - Report File Path**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified report file-path.

**[-job-id <integer>] - Job ID**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified job ID.

**[-job-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Job Duration**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[-attempted-scans <integer>] - Number of Attempted Scans**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-skipped-scans <integer>`] - Number of Files Skipped from Scanning**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-already-scanned-files <integer>`] - Number of Already Scanned Files**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-successful-scans <integer>`] - Number of Successful Scans**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-failed-scans <integer>`] - Number of Failed Scans**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-timedout-scans <integer>`] - Number of Timedout Scans**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-files-cleaned <integer>`] - Number of Clean Files**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-files-infected <integer>`] - Number of Infected Files**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-internal-error <integer>`] - Number of Internal Error (privilege: advanced)**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-scan-retries <integer>`] - Number of Scan Retries (privilege: advanced)**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-job-start-time <MM/DD/YYYY HH:MM:SS>`] - Job Start Time**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

**[`-job-end-time <MM/DD/YYYY HH:MM:SS>`] - Job End Time**

If you specify this parameter, the command displays information only about the On-Demand reports that have the specified value.

## Examples

The following example displays information about all On-Demand reports:

```
cluster1::> vscan on-demand-task report show
```

|          |           |                                   | Files   |
|----------|-----------|-----------------------------------|---------|
| Files    |           |                                   |         |
| Vserver  | Task Name | Report File Path                  | Cleaned |
| Infected |           |                                   |         |
| -----    | -----     | -----                             | -----   |
| -----    |           |                                   |         |
| vs1      | t1        | /rep/avod_146_20150902_161439.log | 6240    |
| 5        |           |                                   |         |
| vs1      | t1        | /rep/avod_149_20150903_160313.log | 115     |
| 0        |           |                                   |         |

2 entries were displayed.

The following example displays detailed information about an On-Demand task:

```
cluster1::> vscan on-demand-task report show -vserver vs1 -task-name t1
          -report-file /rep/avod_146_20150902_161439.log
Vserver: vs1
                Task Name: t1
          Report File Path: /rep/avod_146_20150902_161439.log
                Job ID: 146
          Job Duration: 76s
    Number of Attempted Scans: 6245
Number of Files Skipped from Scanning: 1286
    Number of Already Scanned Files: 987
    Number of Successful Scans: 6245
        Number of Failed Scans: 0

```

## vserver vscan scanner-pool apply-policy

### Apply scanner-policy to a scanner pool

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan scanner-pool apply-policy` command applies a scanner policy to the specified scanner pool on a specified Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to apply the scanner policy. The Vserver administrator can apply the scanner policy to a scanner pool created within the scope of the Vserver or the cluster. The cluster administrator can apply the scanner policy to a scanner pool for any Vserver but cannot apply it within the scope of cluster. The scope is determined at a Vserver level.

### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool.

### **-scanner-policy <Scanner policy> - Scanner Policy**

This parameter specifies the scanner policy that you want to apply to the specified scanner pool on a Vserver. Currently only system policies are available. Available system policies are:

- *primary* - Makes it active always.
- *secondary* - Makes it active only when none of the primary external virus-scanning servers are connected.
- *idle* - Makes it inactive always.

### **[-cluster <Cluster name>] - Cluster on Which Policy Is Applied**

This parameter specifies the name of the cluster on which you want to apply the scanner policy of a scanner pool. By default, it is applied on the local cluster. This parameter does not have any significance if the cluster is not in a DR relationship.

## Examples

The following command applies a scanner policy to the specified scanner pool on a specified Vserver.

```
cluster1::> vsender vscan scanner-pool apply-policy -vserver vs1
               -scanner-pool p1 -scanner-policy primary -cluster cluster2

cluster1::> vsender vscan scanner-pool show -vserver vs1 -scanner-pool p1
Vserver: vs1

               Scanner Pool: p1
               Applied Policy: primary
               Current Status: on
Cluster on Which Policy Is Applied: cluster2
               Scanner Pool Config Owner: vsender
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
               List of Privileged Users: cifs\u1, cifs\u2
```

## **vsender vscan scanner-pool create**

### Create a scanner pool

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver vscan scanner-pool create` command creates a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management. After creating a scanner pool, a scanner-policy must be applied to it using the command `vserver vscan scanner-pool apply-policy`. The default applied policy is `idle`, which means the scanner pool is inactive.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to create a scanner pool.

### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_", "-" and ".".

### **-hostnames <text>,... - List of Host Names of Allowed Vscan Servers**

This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to ONTAP.

### **-privileged-users <Privileged user>,... - List of Privileged Users**

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remediating and quarantining operations.

### **[-request-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout (privilege: advanced)**

This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s. The default value is 30s.

### **[-scan-queue-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Scan Queue Timeout (privilege: advanced)**

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s. By default, it is 20s.

### **[-session-setup-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session Setup Timeout (privilege: advanced)**

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s. By default, it is 10s.

### **[-session-teardown-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session Teardown Timeout (privilege: advanced)**

This parameter specifies the timeout value for a response for session-teardown-message, or for any

message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s. By default, it is 10s.

**[`-max-session-setup-retries <integer>`] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)**

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10. By default, it is 5.

## Examples

The following example creates a scanner pool.

```
Cluster1::> vsender vscan scanner-pool create -vsender vs1 -scanner-pool
SP
                -hostnames 1.1.1.1,vmwin204-27.fsct.nb -privileged-users
cifs\u1,cifs\u2

Cluster1::> vsender vscan scanner-pool show -vsender vs1 -scanner-pool SP
Vsender: vs1
                Scanner Pool: SP
                Applied Policy: idle
                Current Status: off
                Cluster on Which Policy Is Applied: -
                Scanner Pool Config Owner: vsender
                List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
                List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
                List of Privileged Users: cifs\u1, cifs\u2
```

## vsender vscan scanner-pool delete

Delete a scanner pool

**Availability:** This command is available to *cluster* and *Vsender* administrators at the *admin* privilege level.

## Description

The `vsender vscan scanner-pool delete` command deletes a scanner pool.

## Parameters

**`-vsender <vsender name>` - Vsender**

This parameter specifies the name of the Vsender from which you want to delete a scanner pool.

### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner-pool that you want to delete.

## **Examples**

The following example deletes a scanner pool.

```
cluster1::> vsriver vscan scanner-pool delete -vsriver vs1 -scanner-pool
test

cluster1::> vsriver vscan scanner-pool show -vsriver vs1 -scanner-pool
test
There are no entries matching your query.
```

## **vsriver vscan scanner-pool modify**

### **Modify a scanner pool**

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### **Description**

The `vsriver vscan scanner-pool modify` command modifies a Vscan scanner pool. Scanner pool is a set of attributes which are used to validate and manage connection between ONTAP and external virus-scanning server, or "Vscan server". It also specifies other parameters which are used for connection management.

### **Parameters**

#### **-vsriver <vsriver name> - Vsriver**

This parameter specifies the name of the Vsriver on which you want to modify a scanner pool.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool. Scanner pool name can be up to 256 characters long and is a string that can only contain any combination of ASCII-range alphanumeric characters (a-z, A-Z, 0-9), "\_", "-" and ".".

#### **[-hostnames <text>,...] - List of Host Names of Allowed Vscan Servers**

This parameter specifies a list of host names or IP addresses of the Vscan servers which are allowed to connect to ONTAP.

#### **[-privileged-users <Privileged user>,...] - List of Privileged Users**

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remediating and quarantining operations.

**`[-request-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Request Service Timeout (privilege: advanced)**

This parameter specifies the timeout value for a scan request. It specifies the time interval in which the node waits for a response from the Vscan server. If the timeout is reached, the node allows the file-operation if the applicable On-Access policy has scan-mandatory set to 'off'. If the policy has scan-mandatory set to 'on', then the node will retry the scan or disallow the file-operation depending on the remaining lifetime of the CIFS request. Valid values for this field are from 10s to 40s. However, if scan-mandatory is set to 'off', the effective value is limited to a maximum of 35s.

**`[-scan-queue-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Scan Queue Timeout (privilege: advanced)**

This parameter specifies the timeout value for a scan request in scan-engine's queue. The value for this field must be between 10s and 30s.

**`[-session-setup-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Session Setup Timeout (privilege: advanced)**

This parameter specifies the timeout value for a response for session-setup-message. The value for this field must be between 5s and 10s.

**`[-session-teardown-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Session Teardown Timeout (privilege: advanced)**

This parameter specifies the timeout value for a response for session-teardown-message, or for any message to be received for a session-id, after the underlying connection has been disconnected. The value for this field must be between 5s and 10s.

**`[-max-session-setup-retries <integer>]` - Max Number of Consecutive Session Setup Attempts (privilege: advanced)**

This parameter specifies the maximum number of consecutive session-setup attempts. The value for this field must be between 1 and 10.

## Examples

The following example modifies a scanner pool.

```
Cluster1::> vservice vscan scanner-pool modify -vservice vs1 -scanner-pool
SP
                -hostnames 2.2.2.2,vmwin204-29.fsct.nb -privileged-users
cifs\u3

Cluster1::> vservice vscan scanner-pool show -vservice vs1 -scanner-pool SP
Vservice: vs1
                Scanner Pool: SP
                Applied Policy: idle
                Current Status: off
                Cluster on Which Policy Is Applied: -
                Scanner Pool Config Owner: vservice
                List of IPs of Allowed Vscan Servers: 2.2.2.2, 10.72.204.29
                List of Host Names of Allowed Vscan Servers: 2.2.2.2, vmwin204-29.fsct.nb
                List of Privileged Users: cifs\u3
```

## vserver vscan scanner-pool resolve-hostnames

Resolve the hostnames configured in the scanner pool

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan scanner-pool resolve-hostnames` command resolves the host names configured in the scanner pool and update it with the IP addresses. This command also updates the active scanner pool configuration of the Vserver if the scanner pool is part of that. You must run this command for the scanner pool whose host name entry is modified in the DNS server.

### Parameters

#### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver for which you want to resolve host names.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool for which you want to resolve host names.

### Examples

The following example resolves the host names of a scanner pool:

```
cluster1::> vserver vscan scanner-pool resolve-hostnames -vserver vs1
-scanner-pool SP

Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP
Vserver: vs1

                Scanner Pool: SP
                Applied Policy: primary
                Current Status: on
    Cluster on Which Policy Is Applied: Cluster1
                Scanner Pool Config Owner: vserver
    List of IPs of Allowed Vscan Servers: 10.72.204.27, 10.72.204.29
List of Host Names of Allowed Vscan Servers: vmwin204-27.fsct.nb,
vmwin204-29.fsct.nb
                List of Privileged Users: cifs\u1, cifs\u2
```

## vserver vscan scanner-pool show-active

Display active scanner pools

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver vscan scanner-pool show-active` command displays active scanner pool information available to the Vserver. The active scanner pool configuration is derived by merging the information of the scanner pools which are currently active on a Vserver. If you do not specify any parameters, the command displays the following information about all Vservers:

- Vserver name
- List of scanner pools
- List of servers
- List of privileged user

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the specified Vserver.

**[-scanner-pools <Scanner pool>,...] - List of Enabled Scanner Pools**

If you specify this parameter, the command displays information only about the Vservers that have the specified scanner pool or pools. A scanner pool becomes part of this list if it is active at this time.

**[-servers <IP Address>,...] - Merged List of IPs of Allowed Vscan Servers**

If you specify this parameter, the command displays information only about the Vservers that have the specified server or servers. Servers of all active scanner pools on a Vserver are merged to derive this effective server list.

**[-privileged-users <Privileged user>,...] - Merged List of Privileged Users**

If you specify this parameter, the command displays information only about the Vservers that have the specified privileged user or users. Privileged users of all active scanner pools on a Vserver are merged to derive this effective privileged user list.

**[-request-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vservers that have the specified request-timeout. This is set to the maximum value of the request-timeout of all active scanner pools on a Vserver.

**[-scan-queue-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Scan Queue Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vservers that have the specified scan-queue-timeout. This is set to the maximum value of the scan-queue-timeout of all active scanner pools on a Vserver.

**`[-session-setup-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] -`**

**Session Setup Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vservers that have the specified session-setup-timeout. This is set to the maximum value of the session-setup-timeout of all active scanner pools on a Vserver.

**`[-session-teardown-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] -`**

**Session Teardown Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the Vservers that have the specified session-teardown-timeout. This is set to the maximum value of the session-teardown-timeout of all active scanner pools on a Vserver.

**`[-max-session-setup-retries <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)`**

If you specify this parameter, the command displays information only about the Vservers that have the specified max-session-setup-retries. This is set to the maximum number of the max-session-setup-retry of all active scanner pools on a Vserver.

## Examples

The following example displays information about active scanner pool on all Vservers.

```

cluster1::> vsriver vscan scanner-pool show
Scanner      Pool      Privileged
Scanner
Vserver      Pool      Owner      Servers      Users      Policy
-----
Cluster      clus      cluster 5.5.5.5      cifs\u5      idle
vs1          new      vsriver 1.1.1.1, 2.2.2.2      cifs\u1
primary
vs1          clus      cluster 5.5.5.5      cifs\u5      idle
vs1          p1      vsriver 3.3.3.3      cifs\u4
primary
vs2          clus      cluster 5.5.5.5      cifs\u5
primary
vs2          p2      vsriver 3.3.3.3, 4.4.4.4      cifs\u2
primary
6 entries were displayed.

cluster1::> vsriver vscan scanner-pool show-active
Vserver      Scanner Pools      Servers      Privileged
Users
-----
vs1          new, p1      1.1.1.1, 2.2.2.2, 3.3.3.3      cifs\u1, cifs\u4
vs2          clus, p2      3.3.3.3, 4.4.4.4, 5.5.5.5      cifs\u2, cifs\u5
2 entries were displayed.

```

## vsriver vscan scanner-pool show

### Display scanner pools

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver vscan scanner-pool show` command displays information about the Vscan scanner pools belonging to the Vserver. It also displays the scanner policy applied to the scanner pool and its current status in Vserver scope. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- Scanner pool owner
- Scanner policy
- Current status

- Cluster on which policy is applied
- List of servers
- List of host names
- List of privileged user

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

**[-scanner-pool <Scanner pool>] - Scanner Pool**

If you specify this parameter, the command displays information only about the specified scanner pool.

**[-scanner-policy <Scanner policy>] - Applied Policy**

If you specify this parameter, the command displays information only about the scanner pools for the specified scanner policy.

**[-current-status {on|off}] - Current Status**

If you specify this parameter, the command displays information only about the scanner pools that have the specified status.

**[-cluster <Cluster name>] - Cluster on Which Policy Is Applied**

If you specify this parameter, the command displays information only about the scanner pools that are applied to the specified cluster.

**[-owner <Configuration owner>] - Scanner Pool Config Owner**

If you specify this parameter, the command displays information only about the scanner pools that have the specified owner.

**[-servers <IP Address>,...] - List of IPs of Allowed Vscan Servers**

If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

**[-hostnames <text>,...] - List of Host Names of Allowed Vscan Servers**

If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

**[-privileged-users <Privileged user>,...] - List of Privileged Users**

If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

**[`-request-timeout` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Request Service Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the scanner pools that have the specified request-timeout.

**[`-scan-queue-timeout` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Scan Queue Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the scanner pools that have the specified scan-queue-timeout.

**[`-session-setup-timeout` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session Setup Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the scanner pools that have the specified session-setup-timeout.

**[`-session-teardown-timeout` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Session Teardown Timeout (privilege: advanced)**

If you specify this parameter, the command displays information only about the scanner pools that have the specified session-teardown-timeout.

**[`-max-session-setup-retries` <integer>] - Max Number of Consecutive Session Setup Attempts (privilege: advanced)**

If you specify this parameter, the command displays information only about the scanner pools that have the specified max-session-setup-retries.

**Examples**

The following example displays information about all scanner pools.

```
Cluster1::> vserverscan scanner-pool show
```

| Scanner          | Pool | Owner   | Servers                  | Users               | Policy |
|------------------|------|---------|--------------------------|---------------------|--------|
| vs1<br>primary   | SP   | vserver | 1.1.1.1,<br>10.72.204.27 | cifs\u1,<br>cifs\u2 |        |
| vs1<br>secondary | p1   | vserver | 3.3.3.3                  | cifs\u1,<br>cifs\u2 |        |

2 entries were displayed.

The following example displays detailed information about one scanner pool.

```

Cluster1::> vserver vscan scanner-pool show -vserver vs1 -scanner-pool SP
Vserver: vs1

Scanner Pool: SP
Applied Policy: primary
Current Status: on
Cluster on Which Policy Is Applied: Cluster1
Scanner Pool Config Owner: vserver
List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
List of Privileged Users: cifs\u1, cifs\u2

```

## vserver vscan scanner-pool privileged-users add

Add to the list of privileged users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan scanner-pool privileged-users add` command adds one privileged users or list of privileged users to the specified scanner pool.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a privileged user or users.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool to which you want to add a privileged user or users.

#### **-privileged-users <Privileged user>, ... - List of Privileged Users**

This parameter specifies a list of privileged users. A valid form of privileged user-name is "domain-name\user-name" and can be up to 256 characters long. Privileged user-names are stored and treated as case-insensitive strings. Virus scanners must use one of the registered privileged users for connecting to ONTAP for exchanging virus-scanning protocol messages and to access file for scanning, remediating and quarantining operations.

### Examples

The following example adds a list of privileged users to the specified scanner pool.

```
cluster1::> vserver vscan scanner-pool privileged-users add -vserver vs1
               -scanner-pool p1 -privileged-users cifs\u2,cifs\u3

cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
               -scanner-pool p1
Vserver: vs1
        Scanner Pool: p1
List of Privileged Users: cifs\u1, cifs\u2, cifs\u3
```

## **vserver vscan scanner-pool privileged-users remove**

Remove from the list of privileged users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver vscan scanner-pool privileged-users remove` command removes one privileged users or list of privileged users from the specified scanner pool. All the existing privileged users of a scanner pool cannot be removed.

### **Parameters**

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a privileged user or users.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool from which you want to remove a privileged user or users.

#### **-privileged-users <Privileged user>, ... - List of Privileged Users**

This parameter specifies the privileged user or users that you want to remove from the specified scanner pool.

### **Examples**

The following example removes a list of privileged users from the specified scanner pool.

```

cluster1::> vserver vscan scanner-pool privileged-users remove -vserver
vs1
                -scanner-pool p1 -privileged-users cifs\u2,cifs\u3

cluster1::> vserver vscan scanner-pool privileged-users show -vserver vs1
                -scanner-pool p1
Vserver: vs1
        Scanner Pool: p1
List of Privileged Users: cifs\u1

```

## vserver vscan scanner-pool privileged-users show

Display list of privileged users

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan scanner-pool privileged-users show` command displays the list of privileged users of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about the scanner pools:

- Vserver name
- Scanner pool
- List of privileged users

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

**[-scanner-pool <Scanner pool>] - Scanner Pool**

If you specify this parameter, the command displays information only for the specified scanner pool.

**[-privileged-users <Privileged user>,...] - List of Privileged Users**

If you specify this parameter, the command displays information only about the scanner pools that have the specified privileged user or users.

## Examples

The following example displays the list of privileged users of all scanner pools.

```
cluster1::> vsserver vscan scanner-pool privileged-users show
Vserver          Scanner Pool      Privileged Users
-----
Cluster          clus              cifs\u5
vs1               new              cifs\u7
vs1               clus             cifs\u5
vs1               p1               cifs\u1, cifs\u2
vs2               clus             cifs\u5
vs2               p2               cifs\u2
6 entries were displayed.
```

## vsserver vscan scanner-pool servers add

Add to the list of hostnames

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver vscan scanner-pool servers add` command adds one server or list of servers to the specified scanner pool.

### Parameters

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to add a server or servers.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool to which you want to add a server or servers.

#### **-hostnames <text>, ... - List of Host Names for Vscan Servers**

This parameter specifies the host name or host names that you want to add to the specified scanner pool.

## Examples

The following example adds a list of servers to the specified scanner pool.

```
Cluster1::> vsserver vscan scanner-pool servers add -vsserver vs1
               -scanner-pool SP -hostnames 2.2.2.2, vmwin204-27.fsct.nb

Cluster1::> vsserver vscan scanner-pool servers show -vsserver vs1 -scanner
-pool SP
Vserver: vs1
               Scanner Pool: SP
      List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2,
10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2,
               vmwin204-27.fsct.nb
```

## **vsserver vscan scanner-pool servers remove**

Remove from the list of hostnames

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsserver vscan scanner-pool servers remove` command removes one server or list of servers from the specified scanner pool. All the existing servers of a scanner pool cannot be removed.

### **Parameters**

#### **-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver containing the specified scanner pool on which you want to remove a server or servers.

#### **-scanner-pool <Scanner pool> - Scanner Pool**

This parameter specifies the name of the scanner pool from which you want to remove a server or servers.

#### **-hostnames <text>, ... - List of hostnames for Vscan Servers**

This parameter specifies the host name or host names that you want to remove from the specified scanner pool.

### **Examples**

The following example removes a list of servers from the specified scanner pool.

```
Cluster1::> vserver vscan scanner-pool servers remove -vserver vs1
-scanner-pool SP -hostnames vmwin204-27.fsct.nb

Cluster1::> vserver vscan scanner-pool servers show -vserver vs1 -scanner
-pool SP
Vserver: vs1
Scanner Pool: SP
List of IPs of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
List of Host Names of Allowed Vscan Servers: 1.1.1.1, 2.2.2.2
```

## vserver vscan scanner-pool servers show

### Display list of servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver vscan scanner-pool servers show` command displays the list of servers of the Vscan scanner pools belonging to the Vserver. If you do not specify any parameters, the command displays the following information about all scanner pools:

- Vserver name
- Scanner pool
- List of servers

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the scanner pools for the specified Vserver.

**[-scanner-pool <Scanner pool>] - Scanner Pool**

If you specify this parameter, the command displays information only for the specified scanner pool.

**[-servers <IP Address>,...] - List of IPs of Allowed Vscan Servers**

If you specify this parameter, the command displays information only about the scanner pools that have the specified IP address or IP addresses.

### **[-hostnames <text>,...] - List of Host Names of Allowed Vscan Servers**

If you specify this parameter, the command displays information only about the scanner pools that have the specified host name or host names.

### **Examples**

The following example displays the list of servers of all scanner pools.

```
cluster1::> vserver vscan scanner-pool servers show
Vserver          Scanner Pool      Servers
-----
-----
vs1              SP              1.1.1.1, 10.72.204.27
vs2              pl              10.72.204.29
6 entries were displayed.
```

The following example displays the list of servers and host names of all scanner pools.

```
cluster1::> vserver vscan scanner-pool servers show -instance
Vserver: vs1
                Scanner Pool: SP
                List of IPs of Allowed Vscan Servers: 1.1.1.1, 10.72.204.27
List of Host Names of Allowed Vscan Servers: 1.1.1.1, vmwin204-27.fsct.nb
Vserver: vs2
                Scanner Pool: pl
                List of IPs of Allowed Vscan Servers: 10.72.204.29
List of Host Names of Allowed Vscan Servers: vmwin204-29.fsct.nb
2 entries were displayed.
```
