This specifies the Application Programming Interface (API) to which the REST role has access. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
  - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
  - `/api/storage/volumes/{volume.uuid}/files`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/files`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/users`
  - `/api/svm/svms/{svm.uuid}/top-metrics/clients`
  - `/api/svm/svms/{svm.uuid}/top-metrics/directories`
  - `/api/svm/svms/{svm.uuid}/top-metrics/files`
  - `/api/svm/svms/{svm.uuid}/top-metrics/users`

- ONTAP S3 APIs
- `/api/protocols/s3/services/{svm.uuid}/users`

In the above APIs, wildcard character `*` could be used in place of `{volume.uuid}` or `{svm.uuid}` to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

### **`[-access {none|readonly|read_create|read_modify|read_create_modify|all}] - Access Level`**

This specifies a new access level for the REST role. Possible access level settings are *none*, *readonly*, *read\_create*, *read\_modify*, *read\_create\_modify* and *all*.

### **Examples**

The following command modifies a REST access-control role with the role name *readonly* and the API `/api/storage/volumes` to have the access level *readonly* for Vserver *vs.example.com*:

```
cluster1::> security login rest-role modify -role readonly -api
"/api/storage/volumes" -access readonly -vserver vs.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *rest\_role1* and the API `/api/snapmirror/policies` to have the access level *read\_create* for Vserver *cluster1.example.com*:

```
cluster1::> security login rest-role modify -role rest_role1 -api
"/api/snapmirror/policies" -access read_create -vserver
cluster1.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs1\_role* and the resource-qualified endpoint `/api/storage/volumes/*/snapshots` to have the access level *readonly* for Vserver *vs1.example.com*:

```
cluster1::> security login rest-role modify -role vs1_role -api
"/api/storage/volumes/*/snapshots" -access readonly -vserver
vs1.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs2\_role* and the resource-qualified endpoint `/api/storage/volumes/4d383f47-1d40-11ec-81af-005056bb3eae/top-metrics/users` to have the access level *none* for Vserver *vs2.example.com*:

```
cluster1::> security login rest-role modify -role vs2_role -api
"/api/storage/volumes/4d383f47-1d40-11ec-81af-005056bb3eae/top-
metrics/users" -access none -vserver vs2.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs3\_role* and the resource-qualified endpoint */api/svm/svms/6dfef406-9a16-11ec-819e-005056bb1a7c/top-metrics/files* to have the access level *read\_modify* for Vserver *vs3.example.com*:

```
cluster1::> security login rest-role modify -role vs3_role -api
"/api/svm/svms/6dfef406-9a16-11ec-819e-005056bb1a7c/top-metrics/files"
-access read_modify -vserver vs3.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs3\_role2* and the wildcard resource-qualified endpoint */api/svm/svms/\*/top-metrics/clients* to have the access level *readonly* for Vserver *vs3.example.com*:

```
cluster1::> security login rest-role modify -role vs3_role2 -api
"/api/svm/svms/*/top-metrics/clients" -access readonly -vserver
vs3.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs4\_role* and api */api/private/cli/cluster* to have the access level *readonly* for Vserver *vs4.example.com*:

```
cluster1::> security login rest-role modify -role vs4_role -api
"/api/private/cli/cluster" -access readonly -vserver vs4.example.com
cluster1::>
```

## security login rest-role show

### Show REST access control roles

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security login rest-role show` command displays the following information about Representational State Transfer (REST) access-control roles:

- Vserver
- Role name

- Application Programming Interface (API) to which the REST role has access
- Access Level (*none*, *readonly*, *read\_create*, *read\_modify*, *read\_create\_modify*, or *all*)

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Selects the REST roles that match this parameter value.

**[-role <text>] - Role Name**

Selects the REST roles that match this parameter value. If this parameter and the `-api` parameter are both used, the command displays detailed information about the specified REST access-control role.

**[-api <text>] - API Path**

Selects the REST roles that match this parameter value. If this parameter and the `-role` parameter are both used, the command displays detailed information about the specified REST access-control role. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
  - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
  - `/api/storage/volumes/{volume.uuid}/files`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/files`
  - `/api/storage/volumes/{volume.uuid}/top-metrics/users`
- ONTAP SVM APIs
  - `/api/svm/svms/{svm.uuid}/top-metrics/clients`
  - `/api/svm/svms/{svm.uuid}/top-metrics/directories`
  - `/api/svm/svms/{svm.uuid}/top-metrics/files`
  - `/api/svm/svms/{svm.uuid}/top-metrics/users`
- ONTAP S3 APIs
  - `/api/protocols/s3/services/{svm.uuid}/users`
- Private-cli APIs
  - `/api/private/cli/cluster`

In the above APIs, wildcard character `*` could be used in place of `{volume.uuid}` or `{svm.uuid}` to

denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

**[*-access {none|readonly|read\_create|read\_modify|read\_create\_modify|all}*]] - Access Level**

Selects the roles that match this parameter value.

**Examples**

The example below displays information about all REST access-control roles:

```
cluster1::> security login rest-role show
Role                                     Access
Vserver                                Name      API      Level
-----                                -
vs                                     vsrole1   /api     none
vs                                     vsrole1   /api/storage/volumes/f8a541b5-
b68c-11ea-9581-005056bbabe6/files
                                     all
vs                                     vsrole1   /api/storage/volumes/f8a541b5-
b68c-11ea-9581-005056bbabe6/snapshots
                                     readonly
vs                                     vsrole1   /api/storage/volumes/843b87f9-
2f5e-11ec-9524-005056bb0bee/snapshots
                                     read_create
vs                                     vsrole1   /api/svm/svms/843b87f9-2f5e-11ec-
9524-005056bb0bee/top-metrics/clients
                                     read_create
cluster1                               readonly  /api/storage  none
cluster1                               custom    /api/cluster  read_modify
cluster1                               custom    /api/security/accounts
                                     read_create_modify
cluster1                               custom    /api/storage/volumes/*/top-
metrics/users
                                     readonly
cluster1                               custom    /api/storage/volumes/*/snapshots
                                     all
cluster1::>
```

**security login rest-role expanded-rest-roles modify**

Modify the status of Expanded REST roles for granular resource control feature

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `security login rest-role expanded-rest-roles modify` command enables or disables *Expanded REST roles for granular resource control* feature.

## Parameters

### `[-is-enabled {true|false}] - Is Enabled? (privilege: advanced)`

This parameter specifies whether the *Expanded REST roles for granular resource control* feature is enabled or disabled. The default value is `true` i.e. the feature is enabled by default.

## Examples

The following command disables the *Expanded REST roles for granular resource control* feature.

```
cluster1::*> security login rest-role expanded-rest-roles modify -is
-enabled false
cluster1::*>
```

## security login rest-role expanded-rest-roles show

Show the status of *Expanded REST roles for granular resource control* feature

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `security login rest-role expanded-rest-roles show` command specifies whether the *Expanded REST roles for granular resource control* feature is enabled (`true`) or disabled (`false`).

## Examples

The command below specifies that the *Expanded REST roles for granular resource control* feature is enabled.

```
cluster1:::> security login rest-role expanded-rest-roles show

Is Enabled? true
```

## security login role create

Add an access control role

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security login role create` command creates an access-control role. An access-control role consists of a role name and a command or directory to which the role has access. It optionally includes an access level (none, readonly, or all) and a query that applies to the specified command or command directory. After you create an access-control role, you can apply it to a management-utility login account by using the [security login modify](#) or [security login create](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver**

This optionally specifies the Vserver name associated with the role.

### **-role <text> - Role Name**

This specifies the role that is to be created.

### **-cmddirname <text> - Command / Directory**

This specifies the command or command directory to which the role has access. The command or command directory must be specified either within double quotes or inside curly brackets. To specify the default setting, use the special value `"DEFAULT"`.

### **[-access {none|readonly|read\_create|read\_modify|read\_create\_modify|all}] - Access Level**

This optionally specifies an access level for the role. Possible access level settings are none, readonly, and all. The default setting is `all`.

### **[-query <query>] - Query**

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by `-cmddirname`. The query object must be enclosed in double quotation marks (`"`), and it must be a valid field name.

## Examples

The following command creates an access-control role named "admin" for the `vs1.example.com` Vserver. The role has all access to the "volume" command but only within the "aggr0" aggregate.

```
cluster1::> security login role create -role admin -cmddirname volume
-query "-aggr aggr0" -access all -vserver vs1.example.com
```

## Related Links

- [security login modify](#)
- [security login create](#)

## security login role delete

Delete an access control role

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security login role delete` command deletes an access-control role.

## Parameters

### **-vserver <vserver name> - Vserver**

This optionally specifies the Vserver name associated with the role.

### **-role <text> - Role Name**

This specifies the role that is to be deleted.

### **-cmddirname <text> - Command / Directory**

This specifies the command or command directory to which the role has access. To specify the default setting, use the special value `"DEFAULT"`.

## Examples

The following command deletes an access-control role with the role name `readonly` and the command access `"volume"` for Vserver `vs.example.com`.

```
cluster1::> security login role delete -role readonly -cmddirname volume
-vserver vs.example.com
```

## security login role modify

Modify an access control role

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security login role modify` command modifies an access-control role.

## Parameters

### **-vserver <vserver name> - Vserver**

This optionally specifies the Vserver name associated with the role.

### **-role <text> - Role Name**

This specifies the role that is to be modified.

### **-cmddirname <text> - Command / Directory**

This specifies the command or command directory to which the role has access. To specify the default setting for a role, use the special value `"DEFAULT"`. This value can be modified only for the roles created for the admin Vserver.

### **[-access {none|readonly|read\_create|read\_modify|read\_create\_modify|all}] - Access Level**

This optionally specifies a new access level for the role. Possible access level settings are `none`, `readonly`,

and all. The default setting is `all`.

### **`[-query <query>]` - Query**

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by `-cmddirname`. The query object must be enclosed in double quotation marks (`""`), and it must be a valid field name.

### **Examples**

The following command modifies an access-control role with the role name `readonly` and the command access `"volume"` to have the access level `readonly` for `Vserver vs.example.com`:

```
cluster1::> security login role modify -role readonly -cmddirname volume
-access readonly -vserver vs.example.com
```

## **security login role prepare-to-downgrade**

Update role configurations so that they are compatible with earlier releases of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `security login role prepare-to-downgrade` command restores predefined roles of all Vservers earlier than ONTAP 8.3.2. You must run this command in advanced privilege mode when prompted to do so during the release downgrade.

### **Examples**

The following command restores predefined roles of all Vservers earlier than ONTAP 8.3.2.

```
cluster1::*> security login role prepare-to-downgrade
```

## **security login role show-ontapi**

Display the mapping between Data ONTAP APIs and CLI commands

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `security login role show-ontapi` command displays ONTAP APIs (ONTAPIs) and the CLI commands that they are mapped to.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-ontapi <text>] - ONTAPI Name**

Use this parameter to view the corresponding CLI command for the specified API.

**[-command <text>] - CLI Command**

Use this parameter to view the corresponding API or APIs for the specified CLI command.

## Examples

The following command displays all ONTAP APIs and their mapped CLI commands:

```
cluster1::> security login role show-ontapi
ONTAPI                               Command
-----
-----
aggr-add                             storage aggregate add-disks
aggr-check-spare-low                 storage aggregate check_spare_low
aggr-create                          storage aggregate create
aggr-destroy                         storage aggregate delete
aggr-get-filer-info                  aggr
aggr-get-iter                        storage aggregate show-view
aggr-offline                         storage aggregate offline
aggr-online                          storage aggregate online
aggr-options-list-info               storage aggregate show
aggr-rename                          storage aggregate rename
aggr-restrict                       storage aggregate restrict
aggr-set-option                      storage aggregate modify
autosupport-budget-get               system node autosupport budget show
autosupport-budget-get-iter          system node autosupport budget show
autosupport-budget-get-total-records
                                     system node autosupport budget show
autosupport-budget-modify            system node autosupport budget modify
autosupport-config-get               system node autosupport show
autosupport-config-get-iter          system node autosupport show
autosupport-config-get-total-records
                                     system node autosupport show
autosupport-config-modify            system node autosupport modify
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following example displays all ONTAP APIs which are mapped to the specified CLI command:

```
cluster1::> security login role show-ontapi -command version
ONTAPI                               Command
-----
-----
system-get-ontapi-version            version
system-get-version                   version
2 entries were displayed.
```

The following example displays the CLI command that is mapped to the specified Data ONTAPI API:

```
cluster1::> security login role show-ontapi -ontapi aggr-create

ONTAPI Name: aggr-create
Command: storage aggregate create
```

## security login role show-rest

Display the mapping between ONTAP REST APIs and CLI commands

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security login role show-rest` command displays ONTAP REST APIs and the CLI commands that they are mapped to.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-endpoint <text>] - URI of the REST endpoint**

This parameter will filter the output to show CLI commands that match the provided REST endpoint.

**[-commands <text>,...] - CLI Command**

This parameter will filter the output to show the REST API or APIs that match the provided CLI command.

**[-supported-operations <text>,...] - Supported REST operations <GET,POST,PATCH,DELETE>**

This parameter filters the output to show REST APIs or CLI commands that match the provided REST operations `<GET,POST,PATCH,DELETE>`

## Examples

The following command displays all the ONTAP REST APIs and their mapped CLI commands:

```
cluster1::> security login role show-rest
REST Endpoint          CLI Commands          Supported
Operations
-----
/application/applications  application            GET, PATCH,
POST, DELETE
/application/applications/$id/components/$id/metadata
                        -            GET, PATCH,
POST, DELETE
/application/applications/$id/metadata
                        application metadata  GET, PATCH,
POST, DELETE
/application/applications/{application.uuid}/components
                        -            GET
/application/applications/{application.uuid}/components/{component.uuid}/s
napshots
                        -            GET, POST,
DELETE
/application/applications/{application.uuid}/components/{component.uuid}/s
napshots/{uuid}/restore
                        -            POST, DELETE
/application/applications/{application.uuid}/snapshots
                        -            GET, POST,
DELETE
/application/applications/{application.uuid}/snapshots/{uuid}/restore
                        -            POST, DELETE
/application/consistency-groups
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following examples display all ONTAP REST APIs that are mapped to a specified CLI command:

```
cluster1::> security login role show-rest -commands statistics
REST Endpoint          CLI Commands          Supported
Operations
-----
/cluster/counter/tables  statistics            GET
/cluster/counter/tables/{counter_table.name}/rows
                        statistics            GET
2 entries were displayed.
```

```

cluster1::> security login role show-rest -commands "network interface"*
REST Endpoint          CLI Commands          Supported
Operations
-----
-----
/cluster/nodes          cluster add-node, network interface create,

## security login role show

### Show access control roles

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security login role show` command displays the following information about access-control roles:

- Role name
- Command or command directory to which the role has access
- Access level (none, read-only, or all)
- Query (detailed view only)

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Selects the roles that match this parameter value.

**[-role <text>] - Role Name**

Selects the roles that match this parameter value. If this parameter and the `-cmddirname` parameter are both used, the command displays detailed information about the specified access-control role.

### **[-cmddirname <text>] - Command / Directory**

Selects the roles that match this parameter value. If this parameter and the `-role` parameter are both used, the command displays detailed information about the specified access-control role.

### **[-access {none|readonly|read\_create|read\_modify|read\_create\_modify|all}] - Access Level**

Selects the roles that match this parameter value.

### **[-query <query>] - Query**

Selects the roles that match this parameter value.

## **Examples**

The example below displays information about all access-control roles:

```
cluster1::> security login role show
```

| Vserver     | RoleName | Command/Directory        | Query    |
|-------------|----------|--------------------------|----------|
| AccessLevel |          |                          |          |
| -----       | -----    | -----                    | -----    |
| vs          | vsadmin  | DEFAULT                  | none     |
| vs          | vsadmin  | dashboard health vsadmin | readonly |
| vs          | vsadmin  | job                      | readonly |
| vs          | vsadmin  | job schedule             | none     |
| vs          | vsadmin  | lun                      | all      |
| vs          | vsadmin  | network connections      | readonly |
| cluster1    | admin    | DEFAULT                  | all      |
| cluster1    | readonly | DEFAULT                  | readonly |
| cluster1    | readonly | volume                   | none     |

## **security login role config modify**

### **Modify local user account restrictions**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `security login role config modify` command modifies user account and password restrictions.

For the password character restrictions documented below (uppercase, lowercase, digits, etc.), the term "characters" refers to ASCII-range characters only - not extended characters.

### **Parameters**

#### **-vserver <vserver name> - Vserver**

This specifies the Vserver name associated with the profile configuration.

**-role <text> - Role Name**

This specifies the role whose account restrictions are to be modified.

**[-username-minlength <integer>] - Minimum Username Length Required**

This specifies the required minimum length of the user name. Supported values are 3 to 16 characters. The default setting is 3 characters.

**[-username-alphanum {enabled|disabled}] - Username Alpha-Numeric**

This specifies whether a mix of alphabetic and numeric characters are required in the user name. If this parameter is enabled, a user name must contain at least one letter and one number. The default setting is *disabled*.

**[-passwd-minlength <integer>] - Minimum Password Length Required**

This specifies the required minimum length of a password. Supported values are 3 to 127 characters. The default setting is 8 characters.

**[-passwd-alphanum {enabled|disabled}] - Password Alpha-Numeric**

This specifies whether a mix of alphabetic and numeric characters is required in the password. If this parameter is enabled, a password must contain at least one letter and one number. The default setting is *enabled*.

**[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password**

This specifies the minimum number of special characters required in a password. Supported values are from 0 to 127 special characters. The default setting is 0, which requires no special characters.

**[-passwd-expiry-time <integer\_or\_unlimited>] - Password Expires In (Days)**

This specifies password expiration in days. A value of 0 means all passwords associated with the accounts in the role expire now. The default setting is *unlimited*, which means the passwords never expire.

**[-require-initial-passwd-update {enabled|disabled}] - Require Initial Password Update on First Login**

This specifies whether users must change their passwords when logging in for the first time. Initial password changes can be done only through SSH or serial-console connections. The default setting is *disabled*.

**[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts**

This specifies the allowed maximum number of consecutive invalid login attempts. When the failed login attempts reach the specified maximum, the account is automatically locked. The default is 5, which means 5 failed login attempts will cause an account to be locked.

**[-lockout-duration <integer>] - (DEPRECATED)-Maximum Lockout Period (Days)**

(DEPRECATED)-This specifies the number of days for which an account is locked if the failed login attempts reach the allowed maximum. The default is 0, which means the accounts will be locked for 1 hour. For roles which were created in a release before ONTAP 9.15.0 with the default value of 0, this value will be automatically changed to 1 during upgrade to ONTAP 9.15.0. In other words, the value of this field for roles created before ONTAP 9.15.0 is defaulted to 24 hrs. For the roles which are created in ONTAP 9.15.0 or later, the value of this field defaults to 1 hour. This parameter is deprecated in ONTAP 9.15.0 and later. It may be removed from a future release of ONTAP.

**`[-disallowed-reuse <integer>]` - Disallow Last 'N' Passwords**

This specifies the number of previous passwords that are disallowed for reuse. The default setting is six, meaning that the user cannot reuse any of their last six passwords. The minimum allowed value is 6 .

**`[-change-delay <integer>]` - Delay Between Password Changes (Days)**

This specifies the number of days that must pass between password changes. The default setting is 0 .

**`[-delay-after-failed-login <integer>]` - Delay after Each Failed Login Attempt (Secs)**

This specifies the amount of delay observed by the system in seconds upon invalid login attempts. The default setting is 4 seconds.

**`[-passwd-min-lowercase-chars <integer>]` - Minimum Number of Lowercase Alphabetic Characters Required in the Password**

This specifies the minimum number of lowercase characters required in a password. Supported values are from 0 to 127 lowercase characters. The default setting is 0 , which requires no lowercase characters.

**`[-passwd-min-uppercase-chars <integer>]` - Minimum Number of Uppercase Alphabetic Characters Required in the Password**

This specifies the minimum number of uppercase characters required in a password. Supported values are from 0 to 127 uppercase characters. The default setting is 0 , which requires no uppercase characters.

**`[-passwd-min-digits <integer>]` - Minimum Number of Digits Required in the Password**

This specifies the minimum number of digits required in a password. Supported values are from 0 to 127 digits characters. The default setting is 0 , which requires no digits.

**`[-passwd-expiry-warn-time <integer_or_unlimited>]` - Display Warning Message Days Prior to Password Expiry (Days)**

This specifies the warning period for password expiry in days. A value of 0 means warn user about password expiry upon every successful login. The default setting is *unlimited* , which means never warn about password expiry.

**`[-account-expiry-time <integer_or_unlimited>]` - Account Expires in (Days)**

This specifies account expiration in days. The default setting is *unlimited* , which means the accounts never expire. The account expiry time must be greater than account inactive limit.

**`[-account-inactive-limit <integer_or_unlimited>]` - Maximum Duration of Inactivity before Account Expiration (Days)**

This specifies inactive account expiry limit in days. The default setting is *unlimited* , which means the inactive accounts never expire. The account inactive limit must be less than account expiry time.

**`[-account-lockout-duration {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled}]` - Account Lockout Duration (ISO 8601 Duration Format)**

This specifies the duration in ISO 8601 format for which an account is locked if the failed login attempts reach the allowed maximum. The default is 1 hour. Specifying this field will set the field `lockout-duration` as 0 and the field `account-lockout-duration` will be used for further operations.

## Examples

The following command modifies the user-account restrictions for an account with the role name admin for a Vserver named vs1. The minimum size of the password is set to 12 characters.

```
cluster1::> security login role config modify -role admin -vserver vs1
            -passwd-minlength 12
```

The following command sets the maximum allowed number of consecutive invalid login attempts to 3 and the maximum account lockout duration to 1 minute 30 seconds after 3 failed login attempts for role admin for vs1:

```
cluster1::> security login role config modify -role admin -vserver vs1
            -max-failed-login-attempts 3 -account-lockout-duration PT1M30S
```

## security login role config reset

Reset RBAC characteristics supported on releases later than Data ONTAP 8.1.2

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `security login role config reset` command resets the following role based access control (RBAC) characteristics to their default values. The system prompts you to run this command if you revert to ONTAP 8.1.2 or earlier. If you do not reset these characteristics, the revert process will fail.

- Minimum number of special characters required in password ("0")
- Minimum number of uppercase characters required in password ("0")
- Minimum number of lowercase characters required in password ("0")
- Minimum number of digits required in password ("0")
- Password-expiration time, in days ("unlimited")
- Whether the password must be changed at the initial login ("disabled")
- Maximum number of failed login attempts permitted before the account is locked out ("5")
- Maximum time period for which the user account is locked out after the maximum number of failed login attempts is reached ("1 Hour")

### Examples

The following command resets the above mentioned RBAC characteristics of all cluster and Vserver roles to their default values.

```
cluster1::> security login role config reset
```

## security login role config show

Show local user account restrictions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security login role config show` command displays the following information about account restrictions for management-utility user accounts:

- Role name `-role`
- Minimum size of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Number of previous passwords that cannot be reused `-disallowed-reuse`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`

You can display detailed information about the restrictions on a specific account by specifying the `-role` parameter. This adds the following information:

- Minimum length of the user name, in characters `-username-minlength`
- Whether the user name requires alphanumeric characters `-username-alphanum`
- Minimum length of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Minimum number of special characters required in password `-passwd-min-special-chars`
- Minimum number of lowercase characters required in password `-passwd-min-lowercase-chars`
- Minimum number of uppercase characters required in password `-passwd-min-uppercase-chars`
- Minimum number of digits required in password `-passwd-min-digits`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`
- Whether the password must be changed at the initial login `-require-initial-passwd-update`
- Password-expiration time, in days `-passwd-expiry-time`
- Display warning message days prior to password expiry `-passwd-expiry-warn-time`
- Number of previous passwords that cannot be reused `-disallowed-reuse`
- Maximum number of failed login attempts permitted before the account is locked out `-max-failed-login-attempts`
- (DEPRECATED)-Number of days for which the user account is locked after the maximum number of failed login attempts is reached. For roles which were created in a release before ONTAP 9.15.0 with the default value of `0`, this value will be automatically changed to `1` during upgrade to ONTAP 9.15.0. In other words, the value of this field for roles created before ONTAP 9.15.0 is defaulted to 24 hrs. For the roles which are created in ONTAP 9.15.0 or later, the value of this field defaults to 1 hour. This parameter is deprecated in ONTAP 9.15.0 and later. It may be removed from a future release of ONTAP `-lockout-duration`
- Account-expiration time, in days `-account-expiry-time`
- Maximum duration of inactivity before account expiration, in days `-account-inactive-limit`
- Delay after each failed login attempt, in secs `-delay-after-failed-login`
- Duration for which the user account is locked after the maximum number of failed login attempts is reached `-account-lockout-duration`

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Selects the profile configurations that match this parameter value

**[-role <text>] - Role Name**

If this parameter is specified, the command displays detailed information about restrictions for the specified user account.

**[-username-minlength <integer>] - Minimum Username Length Required**

Selects the profile configurations that match this parameter value.

**[-username-alphanum {enabled|disabled}] - Username Alpha-Numeric**

Selects the profile configurations that match this parameter value. Enabled means a user name must contain both letters and numbers.

**[-passwd-minlength <integer>] - Minimum Password Length Required**

Selects the profile configurations that match this parameter value.

**[-passwd-alphanum {enabled|disabled}] - Password Alpha-Numeric**

Selects the profile configurations that match this parameter value. Enabled means a password must contain both letters and numbers.

**[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password**

Selects the profile configurations that match this parameter value.

**[-passwd-expiry-time <integer\_or\_unlimited>] - Password Expires In (Days)**

Selects the profile configurations that match this parameter value.

**[-require-initial-passwd-update {enabled|disabled}] - Require Initial Password Update on First Login**

Selects the profile configurations that match this parameter value.

**[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts**

Selects the profile configurations that match this parameter value.

**[-lockout-duration <integer>] - (DEPRECATED)-Maximum Lockout Period (Days)**

Selects the profile configurations that match this parameter value.

**[-disallowed-reuse <integer>] - Disallow Last 'N' Passwords**

Selects the profile configurations that match this parameter value.

**[-change-delay <integer>] - Delay Between Password Changes (Days)**

Selects the profile configurations that match this parameter value.

**[-delay-after-failed-login <integer>] - Delay after Each Failed Login Attempt (Secs)**

Selects the profile configurations that match this parameter value.

**[-passwd-min-lowercase-chars <integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password**

Selects the profile configurations that match this parameter value.

**[-passwd-min-uppercase-chars <integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password**

Selects the profile configurations that match this parameter value.

**[-passwd-min-digits <integer>] - Minimum Number of Digits Required in the Password**

Selects the profile configurations that match this parameter value.

**[-passwd-expiry-warn-time <integer\_or\_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)**

Selects the profile configurations that match this parameter value.

**[-account-expiry-time <integer\_or\_unlimited>] - Account Expires in (Days)**

Selects the profile configurations that match this parameter value.

**[-account-inactive-limit <integer\_or\_unlimited>] - Maximum Duration of Inactivity before Account Expiration (Days)**

Selects the profile configurations that match this parameter value.

**[-account-lockout-duration {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled]}] - Account Lockout Duration (ISO 8601 Duration Format)**

Selects the profile configurations that match this parameter value.

## Examples

The example below displays restriction information about all user accounts:

```
cluster1::> security login role config show
                ----- Password Restrictions -----
Vserver      RoleName      Size AlphaNum NoReuse ChangeDelay
-----
vs           vsadmin        8  enabled      6      0 days
vs           vsadmin-protocol 8  enabled      6      0 days
vs           vsadmin-readonly 8  enabled      6      0 days
vs           vsadmin-volume  8  enabled      6      0 days
cluster1     admin          6  enabled      6      0 days
cluster1     readonly       6  enabled      6      0 days
```

## security login totp create

### Add a TOTP secret

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `security login totp create` associates an new secret key with a user account. This command requires that you enter a user name.

#### Parameters

**-vserver <vserver name> - Vserver**

This parameter optionally specifies the Vserver of the user for whom you are adding the secret key.

**-username <text> - Username**

This parameter specifies the name of the user for whom you are adding the secret key. If you do not specify a user in case of Cserver, the user named admin is specified by default. If it is a data vserver, it defaults to logged-in user

**[-comment <text>] - Comment**

This optionally specifies comment text for the TOTP key. Note that comment text should be enclosed in quotation marks.

#### Examples

The following command creates a secret key with a user named tsmith for Vserver vs1. The secret key has a comment text is "This is a new key".

```
cluster1::> security login totp create -vserver vs1 -username tsmith  
-comment "This is a new key"
```

## security login totp delete

### Delete a TOTP secret

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `security login totp delete` command deletes secret key for a specific user. To delete a secret key, you must specify a user name.

#### Parameters

**-vserver <vserver name> - Vserver**

This parameter optionally specifies the Vserver of the user for whom you are deleting the secret key.

### **-username <text> - Username**

This parameter specifies the name of the user for whom you are deleting a secret key. If you do not specify a user in case of cserver, the user named admin is specified by default. In case of data vserver, it defaults to logged-in user

### **Examples**

The following command deletes the secret key for the user named tsmith.

```
cluster1::> security login totp delete -username tsmith
```

## **security login totp modify**

### **Modify a TOTP status**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `security login totp modify` command modifies the TOTP status. Only admin can modify the TOTP status and it requires that you enter a user name and enabled

### **Parameters**

#### **-vserver <vserver name> - Vserver**

This parameter optionally specifies the Vserver of the user for whom you are modifying the TOTP status or comment.

#### **-username <text> - Username**

This parameter specifies the name of the user for whom you are modifying the TOTP status.

#### **[-enabled {true|false}] - TOTP Status**

This parameter specifies the TOTP status of the user for whom you are modifying.

#### **[-comment <text>] - Comment**

This optionally specifies comment text for the TOTP key. Note that comment text should be enclosed in quotation marks.

### **Examples**

The following command disable the TOTP for the user named tsmith for Vserver vs1.

```
cluster1::> security login totp modify -vserver vs1 -username tsmith  
-enabled false
```

## **security login totp show**

### **Display TOTP secret**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security login totp show` command displays information about secret keys.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Selects the secret keys that match this parameter value.

**[-username <text>] - Username**

Selects the secret keys that match this parameter value.

**[-fingerprint <text>] - TOTP Secret key fingerprint**

Select the secret keys that match this parameter value.

**[-enabled {true|false}] - TOTP Status**

Selects the secret keys that match this parameter value.

**[-comment <text>] - Comment**

Selects the secret keys that match this parameter value.

## Examples

The example below displays secret key information for the user named tsmith.

```
cluster1::> security login totp show -username tsmith
UserName: tsmith
TOTP SHA Fingerprint:
7038eb494f8b86726bdfae9da1fbadb348f8fe26116f49e09f718a7b8bdd73b8
TOTP status: true
Comment: This is a new key
```

# security multi-admin-verify commands

## security multi-admin-verify modify

Modify multi-admin-verify settings

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify modify` command is used to modify the Multi-Admin-Verify global settings.

## Parameters

### **`[-approval-groups <text>,...]` - List of Global Approval Groups**

This specifies the list of global approval groups which are inherited by the rule if the `approval-groups` is not provided for the rule. The default value is an empty list. The `approval-groups` should be defined to enable multi-admin verification. The supplied value replaces the list. You can create an approval-group by using the [security multi-admin-verify approval-group create](#) command.

### **`[-required-approvers <integer>]` - Number of Required Approvers**

This specifies the required number of approvers to approve the request which is inherited by the rule if `required-approvers` is not provided for the rule. The default and minimum number of required approvers is 1.

### **`[-enabled {true|false}]` - Is Multi-Admin-Verify Enabled**

This specifies the current state. Multi-admin verification is not required to enable the feature. However, it is required to disable the feature. By default, the feature is disabled and the value is set to false. It is recommended that multi-admin-verify is enabled equally on peered ONTAP clusters.

### **`[-execution-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>]` - Execution Expiry**

This is the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

### **`[-approval-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>]` - Approval Expiry**

This is the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

### **`[-smtp-encryption {true|false}]` - Utilize TLS to access mail server**

This specifies whether TLS will be established for email (SMTP) communication. The default is set to false.

### **`[-validate-smtp-certificate {true|false}]` - Validate SMTP certificate**

This specifies whether the server certificate authority is validated when `smtp-encryption` is enabled. The default is set to true.

## Examples

This command changes the approval groups:

```
cluster1::> security multi-admin-verify modify -approval-groups group1,
group2
```

This command changes the required number of approvers:

```
cluster1::> security multi-admin-verify modify -required-approvers 3
```

This command enables the feature. The default is false (disabled):

```
cluster1::> security multi-admin-verify modify -enabled true
```

This command changes the execution expiry:

```
cluster1::> security multi-admin-verify modify -execution-expiry 14d
```

This command changes the approval expiry:

```
cluster1::> security multi-admin-verify modify -approval-expiry 48h
```

## Related Links

- [security multi-admin-verify approval-group create](#)

## security multi-admin-verify show

Display multi-admin-verify configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify show` command displays the object store that contains the global setting values of the multi-admin-verify feature.

- **Is Enabled:** Displays the current state of the feature. This feature is, by default, disabled and the value is set to false.
- **Required Approvers:** Displays the required number of approvers to approve the ONTAP execution request. This is inherited by the rule if `required-approvers` is not provided for the rule. The default and minimum number of required approvers is 1.
- **Approval Expiry:** Displays the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires.
- **Execution Expiry:** Displays the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires.
- **Approval Groups:** Displays the list of global approval groups. This will be in effect if the approval groups is not specified for a multi-admin-verify rule.

## Examples

The following example displays typical global settings information:

```
cluster1::> security multi-admin-verify show
Is      Required  Execution Approval Approval
Enabled Approvers Expiry    Expiry    Groups
-----
false   1           1h       1h       group1, group2
```

## security multi-admin-verify approval-group create

### Create an Approval Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify approval-group create` command creates an approval group for a specified Vserver for a specified list of ONTAP users.

### Parameters

#### **-vserver <vserver> - Vserver**

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

#### **-name <text> - Group Name**

This specifies the name of an approval group.

#### **-approvers <text>,... - Approvers**

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

#### **[-email <mail address>,...] - Email Addresses**

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

### Examples

The following example creates a new approval group named `group1` with approver `admin1` that is associated with the default Vserver `cluster1`:

```
cluster1::> security multi-admin-verify approval-group create -name group1
-approvers admin1
```

## security multi-admin-verify approval-group delete

### Delete an Approval Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify approval-group delete` command deletes the specified approval group.

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the Vserver information to which the approval group is associated with. This is an optional parameter. This parameter defaults to Cluster server and supports only Cluster servers.

### **-name <text> - Group Name**

This specifies the name of an approval group to be deleted.

## Examples

The following example deletes the approval group, group1:

```
cluster1::> security multi-admin-verify approval-group delete -name group1
```

## security multi-admin-verify approval-group modify

### Modify an Approval Group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify approval-group modify` command is used to modify attributes of an approval group.

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

### **-name <text> - Group Name**

This specifies the name of an approval group.

### **[-approvers <text>,...] - Approvers**

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

### **[-email <mail address>,...] - Email Addresses**

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

## Examples

This command changes the approvers:

```
cluster1::> security multi-admin-verify approval-group modify -name group1  
-approvers admin1
```

## security multi-admin-verify approval-group replace

Add and/or remove approvers from the list

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify approval-group replace` command is used to replace the list of approvers of an approval group.

### Parameters

#### **-vserver <vserver> - Vserver**

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to Cluster server and supports only Cluster servers.

#### **-name <text> - Group Name**

This specifies the name of the approval group whose approvers are to be replaced.

#### **[-approvers-to-add <text>,...] - New Approvers**

This specifies the list of ONTAP users that are to be added to the current list of approvers of the approval group.

#### **[-approvers-to-remove <text>,...] - Existing Approvers**

This specifies the list of ONTAP users that are to be removed from the current list of approvers of the approval group.

## Examples

The following example adds user `admin2` and removes user `admin` from the current approvers list, while `group1` is associated with the default Vserver:

```
cluster1::> security multi-admin-verify approval-group replace -name  
group1 -approvers-to-add admin2 -approvers-to-remove admin.
```

## security multi-admin-verify approval-group show

Display Approval Groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify approval-group show` command displays information about approval groups and the users that are registered with each group.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

**[-name <text>] - Group Name**

This specifies the name of an approval group.

**[-approvers <text>,...] - Approvers**

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

**[-email <mail address>,...] - Email Addresses**

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

## Examples

The following example displays typical approval groups information:

```
cluster1::> security multi-admin-verify approval-group show
Vserver  Name                Approvers
-----  -
cluster1
          group1         admin
          group2         admin, admin1
2 entries were displayed.
```

## security multi-admin-verify request approve

### Approve a request

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify request approve` command approves the specified request. Cluster peering commands might require remote approvals.

## Parameters

### **-index <integer> - Request Index**

This allows the user to specify the index of the request to be approved.

### **[-execute-on-approval {true|false}] - Execute Command On Final Approval**

If set to `true`, the operation will automatically execute on final approval.

## Examples

The following example approves the request with index 1:

```
cluster1::> security multi-admin-verify request approve -index 1
```

## security multi-admin-verify request create

### Create a request

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security multi-admin-verify request create` command creates a request for the specified ONTAP operation.

## Parameters

### **[-index <integer>] - Request Index**

This specifies the index of the request which is automatically generated for each request.

### **-operation <text> - Operation**

This specifies the ONTAP operation information for which the request is to be created.

### **-query <query> - Query**

This identifies the object (or objects) upon which the user wants to apply the operation. Any field or query supported by the operation can be supplied.

### **[-comment <text>] - Comment**

This is an optional parameter where users creating a request can provide comments related to the request.

### **[-users-permitted <text>, ...] - Users Permitted**

This is an optional parameter where a user creating the request can specify the list of ONTAP users who are permitted to perform the ONTAP operation specified by the request, once it is approved. If this parameter is not provided, then any user with default permissions to perform the ONTAP operation is allowed to perform the ONTAP operation specified by the request.

## Examples

The following example creates a new request for ONTAP operation volume delete which is applicable to objects of vserver vs0.

```
cluster1::> security multi-admin-verify request create -operation "volume delete" -query "-vserver vs0"
```

The following example creates a new request for the ONTAP operation volume snapshot delete which is applicable to Vserver objects vs0 and volume v1. Users permitted to perform this operation on the specified subset of objects are user1 and user2:

```
cluster1::> security multi-admin-verify request create -operation "volume delete" -query "-vserver vs0 -volume v1" -users-permitted user1, user2
```

## security multi-admin-verify request delete

### Delete a request

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify request delete` command deletes the specified request.

### Parameters

#### **-index <integer> - Request Index**

This allows the user to specify the index of the request to be deleted.

## Examples

The following example deletes the request with index 1:

```
cluster1::> security multi-admin-verify request delete -index 1
```

## security multi-admin-verify request show-pending

### Show only pending requests

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify request show-pending` command displays information about multi-admin verification requests that are in the pending state.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-index <integer>] - Request Index**

This specifies the index of the request.

**[-operation <text>] - Operation**

This specifies the ONTAP operation for which the request is created.

**[-query <query>] - Query**

This identifies the object (or objects) upon which the user wants to apply the operation.

**[-required-approvers <integer>] - Required Approvers**

This specifies the number of distinct users that are required to approve the request. A user can set the required-approvers to the ONTAP operation rule. If a user does not set the required-approvers to the rule, then the required-approvers from the global setting is applied.

**[-pending-approvers <integer>] - Pending Approvers**

This specifies the number of distinct users that are still required to approve the request for the request to be marked as approved.

**[-approval-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Approval Expiry**

This specifies the expiry information within which an approve or veto action is to be taken by the approvers from the time the request is submitted. Any authorized user can set the approval-expiry to the ONTAP operation rule. If the user does not set the approval-expiry to the rule, then the approval-expiry from the global setting is applied.

**[-execution-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Execution Expiry**

This specifies the expiry information within which an ONTAP operation is to be executed from the time the request is approved. An authorized user can set the execution-expiry to the ONTAP operation rule. If the user does not set the execution-expiry to the rule, then the execution-expiry from the global setting is applied.

**[-users-approved <text>,...] - Approvals**

This specifies the list of users that have approved the request.

**[-user-vetoed <text>] - User Vetoed**

This specifies the user who vetoed the request.

**[-vserver <vserver>] - Vserver**

This specifies the Vserver information to which the request is associated with.

### **[-user-requested <text>] - User Requested**

This specifies the username who created the request.

### **[-time-created <MM/DD/YYYY HH:MM:SS>] - Time Created**

This specifies the time at which the request is created.

### **[-time-approved <MM/DD/YYYY HH:MM:SS>] - Time Approved**

This specifies the time at which the request state changed to approved.

### **[-comment <text>] - Comment**

This specifies the comments that are associated with the request.

### **[-users-permitted <text>,...] - Users Permitted**

This specifies the list of users that are permitted to perform the ONTAP operation for which the request is approved. If users-permitted is empty, then any user who, by default, has permission to perform the ONTAP operation is allowed.

### **[-execute-on-approval {true|false}] - Execute Approved Command**

This specifies whether the operation being approved is automatically executed. If set, the operation is executed immediately when the request is marked as approved.

## **Examples**

The following example displays typical request information:

```
cluster1::> security multi-admin-verify request show-pending
Pending
      Index Operation                Query                State
  Approvers Requestor
  -----
  1 volume delete                pending 3
admin
```

## **security multi-admin-verify request show**

### **Display requests**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `security multi-admin-verify request show` command displays information about multi-admin verification requests.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-index <integer>] - Request Index**

This specifies the index of the request.

**[-operation <text>] - Operation**

This specifies the ONTAP operation for which the request is created.

**[-query <query>] - Query**

This identifies the object (or objects) upon which the user wants to apply the operation.

**[-state {pending|approved|vetoed|expired|executed}] - State**

This specifies the query information that is applied to the subset of objects of ONTAP operation of the request.

**[-required-approvers <integer>] - Required Approvers**

This specifies the number of distinct users that are required to approve the request. A user can set the required-approvers to the ONTAP operation rule. If a user does not set the required-approvers to the rule, then the required-approvers from the global setting is applied.

**[-pending-approvers <integer>] - Pending Approvers**

This specifies the number of distinct users that are still required to approve the request for the request to be marked as approved.

**[-approval-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Approval Expiry**

This specifies the expiry information within which an approve or veto action is to be taken by the approvers from the time the request is submitted. Any authorized user can set the approval-expiry to the ONTAP operation rule. If the user does not set the approval-expiry to the rule, then the approval-expiry from the global setting is applied.

**[-execution-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Execution Expiry**

This specifies the expiry information within which an ONTAP operation is to be executed from the time the request is approved. An authorized user can set the execution-expiry to the ONTAP operation rule. If the user does not set the execution-expiry to the rule, then the execution-expiry from the global setting is applied.

**[-users-approved <text>,...] - Approvals**

This specifies the list of users that have approved the request.

**[-user-vetoed <text>] - User Vetoed**

This specifies the user who vetoed the request.

**[`-vserver <vserver>`] - Vserver**

This specifies the Vserver information to which the request is associated with.

**[`-user-requested <text>`] - User Requested**

This specifies the username who created the request.

**[`-time-created <MM/DD/YYYY HH:MM:SS>`] - Time Created**

This specifies the time at which the request is created.

**[`-time-approved <MM/DD/YYYY HH:MM:SS>`] - Time Approved**

This specifies the time at which the request state changed to approved.

**[`-comment <text>`] - Comment**

This specifies the comments that are associated with the request.

**[`-users-permitted <text>,...`] - Users Permitted**

This specifies the list of users that are permitted to perform the ONTAP operation for which the request is approved. If `users-permitted` is empty, then any user who, by default, has permission to perform the ONTAP operation is allowed.

**[`-execute-on-approval {true|false}`] - Execute Approved Command**

This specifies whether the operation being approved is automatically executed. If set, the operation is executed immediately when the request is marked as approved.

**Examples**

The following example displays typical request information:

```
cluster1::> security multi-admin-verify request show
Pending
      Index Operation                Query                State
  Approvers Requestor
  -----
  1 volume delete                pending 3
admin
```

**security multi-admin-verify request veto****Veto a request**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `security multi-admin-verify request veto` command vetoes the specified request.

## Parameters

### **-index <integer> - Request Index**

This allows the user to specify the index of the request to be vetoed.

## Examples

The following example vetoes the request with index 1:

```
cluster1::> security multi-admin-verify request veto -index 1
```

## security multi-admin-verify rule create

### Create a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify rule create` command creates a rule for the specified ONTAP operation.

## Parameters

### **[-vserver <vserver>] - Vserver**

This specifies Vserver information for which the rule should be associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

### **-operation <text> - Operation**

This specifies the ONTAP operation information for the rule to be created.

### **[-auto-request-create {true|false}] - Automatic Request Creation**

This specifies rule information for the auto request create state. Auto request creation for the rule is enabled by default, by setting this value to true.

### **[-query <query>] - Query**

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule to be created. This is an optional parameter. If a query is not specified for the rule, the rule applies to all objects of the ONTAP operation.

### **[-required-approvers {<integer>|-}] - Required Number of Approvers**

This specifies the required number of approvers to approve the ONTAP execution request. This is an optional parameter. If required-approvers is not specified for the rule, the required-approvers from the global setting is applied to the ONTAP operation request. The required-approvers from the global setting can be viewed using the [security multi-admin-verify show](#) command. The minimum supported value is 1.

### **[-approval-groups <text>,...] - Approval Groups**

This specifies the list of users who can approve the ONTAP operation request. This is an optional parameter. If approval-groups is not specified for the rule, the approval-groups from the global setting is applied to the ONTAP operation request. The approval-groups from the global setting can be viewed using

the [security multi-admin-verify show](#) command.

### **[`-execution-expiry` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Execution Expiry**

This specifies the amount of time after a request has been approved by which the operation must be executed before the approved execution request expires. This is an optional parameter. If `execution-expiry` is not specified for the rule, the `execution-expiry` from the global setting is applied to the ONTAP execution request. The `execution-expiry` from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (`1h`), the minimum supported value is one second (`1s`), and the maximum supported value is 14 days (`14d`).

### **[`-approval-expiry` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Approval Expiry**

This specifies the amount of time after a new execution request is submitted by which approvers have to approve or disapprove the request before the pending execution request expires. This is an optional parameter. If `approval-expiry` is not specified for the rule, the `approval-expiry` from the global setting is applied to the ONTAP execution request. The `approval-expiry` from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (`1h`), the minimum supported value is one second (`1s`), and the maximum supported value is 14 days (`14d`).

## **Examples**

The following example creates a new rule for the ONTAP operation volume delete with 3 required approvers and is applicable to Vserver vs0 objects:

```
cluster1::> security multi-admin-verify rule create -operation "volume delete" -query "-vserver vs0" -required-approvers 3
```

## **Related Links**

- [security multi-admin-verify show](#)

## **security multi-admin-verify rule delete**

Delete a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `security multi-admin-verify rule delete` command deletes the specified rule.

## **Parameters**

### **`-vserver` <vserver> - Vserver**

This specifies the Vserver information to which the rule is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

### **`-operation` <text> - Operation**

This specifies the ONTAP operation whose associated rule is to be deleted.

## Examples

The following example deletes the rule for ONTAP operation volume delete and the default Vserver cluster1:

```
cluster1::> security multi-admin-verify rule delete -operation "volume delete"
```

## security multi-admin-verify rule modify

### Modify a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify rule modify` command is used to modify the attributes of the rule.

### Parameters

#### **-vserver <vserver> - Vserver**

This specifies Vserver information for which the rule should be associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

#### **-operation <text> - Operation**

This specifies the ONTAP operation information for the rule to be created.

#### **[-auto-request-create {true|false}] - Automatic Request Creation**

This specifies rule information for the auto request create state. Auto request creation for the rule is enabled by default, by setting this value to true.

#### **[-query <query>] - Query**

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule to be created. This is an optional parameter. If a query is not specified for the rule, the rule applies to all objects of the ONTAP operation.

#### **[-required-approvers {<integer>|-}] - Required Number of Approvers**

This specifies the required number of approvers to approve the ONTAP execution request. This is an optional parameter. If required-approvers is not specified for the rule, the required-approvers from the global setting is applied to the ONTAP operation request. The required-approvers from the global setting can be viewed using the [security multi-admin-verify show](#) command. The minimum supported value is 1.

#### **[-approval-groups <text>,...] - Approval Groups**

This specifies the list of users who can approve the ONTAP operation request. This is an optional parameter. If approval-groups is not specified for the rule, the approval-groups from the global setting is applied to the ONTAP operation request. The approval-groups from the global setting can be viewed using the [security multi-admin-verify show](#) command.

#### **[-execution-expiry [<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Execution Expiry**

This specifies the amount of time after a request has been approved by which the operation must be

executed before the approved execution request expires. This is an optional parameter. If execution-expiry is not specified for the rule, the execution-expiry from the global setting is applied to the ONTAP execution request. The execution-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

### **[-approval-expiry <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Approval Expiry**

This specifies the amount of time after a new execution request is submitted by which approvers have to approve or disapprove the request before the pending execution request expires. This is an optional parameter. If approval-expiry is not specified for the rule, the approval-expiry from the global setting is applied to the ONTAP execution request. The approval-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

### **Examples**

This command changes the approval groups:

```
cluster1::> security multi-admin-verify rule modify -operation "volume delete" -approval-groups group1, group2
```

This command changes the required number of approvers:

```
cluster1::> security multi-admin-verify rule modify -operation "volume snapshot delete" -required-approvers 3
```

This command changes the query:

```
cluster1::> security multi-admin-verify rule modify -operation "volume delete" -query "-vserver vs1"
```

This command changes the execution expiry:

```
cluster1::> security multi-admin-verify rule modify -operation "volume delete" -execution-expiry 14d
```

This command changes the approval expiry:

```
cluster1::> security multi-admin-verify rule modify -operation "volume delete" -approval-expiry 48h
```

## Related Links

- [security multi-admin-verify show](#)

## security multi-admin-verify rule show

### Display rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security multi-admin-verify rule show` command displays information about multi admin verification rules.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

This specifies the Vserver information to which the rule is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

**[-operation <text>] - Operation**

This specifies the ONTAP operation information for which the rule is created.

**[-auto-request-create {true|false}] - Automatic Request Creation**

This specifies the information of the auto request create state for the rule.

**[-query <query>] - Query**

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule.

**[-required-approvers {<integer>|-}] - Required Number of Approvers**

This specifies the number of approvers that are required to approve the ONTAP execution request.

**[-approval-groups <text>,...] - Approval Groups**

This specifies the list of approval groups that lists the users who can approve the ONTAP execution request.

**[-execution-expiry [<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Execution Expiry**

This specifies the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires.

### **[-approval-expiry <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Approval Expiry**

This is the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires.

### **[-time-created <MM/DD/YYYY HH:MM:SS>] - Time Created**

This specifies the time at which the rule is created.

### **[-system-defined {true|false}] - Is System Defined**

Displays the value true if rule is defined by the system. Displays the value false if rule is defined by the user.

## **Examples**

The following example displays typical rule information:

```
cluster1:> security multi-admin-verify rule show
```

| Approval |                                                        | Required  |
|----------|--------------------------------------------------------|-----------|
| Vserver  | Operation                                              | Approvers |
| Groups   |                                                        |           |
| -----    | -----                                                  | -----     |
| -----    |                                                        |           |
| cluster1 |                                                        |           |
|          | security login password                                | 1 -       |
|          | Query: -multi-admin-approver true -different-user true |           |
|          | security multi-admin-verify approval-group create      | 1 -       |
|          | security multi-admin-verify approval-group delete      | 1 -       |
|          | security multi-admin-verify approval-group modify      | 1 -       |
|          | security multi-admin-verify approval-group replace     | 1 -       |
|          | security multi-admin-verify modify                     | 1 -       |
|          | security multi-admin-verify rule create                | 1 -       |
|          | security multi-admin-verify rule delete                | 1 -       |
|          | security multi-admin-verify rule modify                | 1 -       |
|          | volume delete                                          | 3 -       |
|          | Query: -vserver vs0                                    |           |

10 entries were displayed.

## **security oauth2 commands**

### **security oauth2 modify**

Modify global OAuth 2.0 configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security oauth2 modify` command enables or disables the OAuth 2.0 feature for token-based authentication.

## Parameters

### **[`-enabled {true|false}`]] - OAuth 2.0 Enabled**

Use this parameter to enable or disable the OAuth 2.0 feature for the cluster.

## Examples

The following example enables the OAuth 2.0 feature for the cluster:

```
cluster1::> security oauth2 modify -enabled true
```

## security oauth2 show

Display global OAuth 2.0 configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security oauth2 show` command displays the status of the OAuth 2.0 feature.

## Examples

The following example displays the OAuth 2.0 feature status information -

```
cluster1::> security oauth2 show
Is OAuth 2.0 Enabled: true
```

## security oauth2 client create

Configure OAuth 2.0 Provider

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `security oauth2 client create` command creates OAuth 2.0 Provider configuration with the specified configuration name for token-based authentication. This command does not enable the OAuth 2.0 feature, it only configures it. Configuring and enabling the OAuth2.0 feature is a two-step process:

- Create an OAuth 2.0 Provider configuration using the `security oauth2 client create` command.

- Enable the OAuth 2.0 feature using the `security oauth2 modify--enabled true` command. This step must be performed once regardless of the number of providers configured. If you have already enabled the OAuth 2.0 feature as part of configuring another provider, you do not have to perform this step again for this provider.

After an OAuth 2.0 configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

Enabling/Disabling OAuth 2.0 restarts the web server. Any HTTP/S connections that are active will be disrupted.

## Parameters

### **-config-name <text> - Configuration Entry Name**

This is the OAuth 2.0 configuration entry name.

### **-application <OAuth 2.0 Applications> - Application**

This is the application for which OAuth 2.0 is configured. Currently only the `http` application is supported.

### **-issuer {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - OAuth 2.0 Issuer**

This is the OAuth 2.0 issuer to match with the "iss" field from the access token.

### **[-audience <text>] - OAuth 2.0 Audience**

This is the OAuth 2.0 audience to match with the "aud" field from the access token. If this parameter is not set, then the "aud" field will not be matched and the REST API request will be forwarded to the provider with the matching "iss" field.

### **[-client-id <text>] - OAuth 2.0 Client ID**

This is the Client identifier used in token introspection calls to the IdP server.

### **[-introspection-endpoint {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - OAuth 2.0 Token Introspection Endpoint Location**

This is the URI of the desired IdP server used for token introspection.

### **[-introspection-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled]}] - OAuth 2.0 Token Introspection Refresh Interval in ISO-8601 format**

This is the refresh interval in ISO-8601 format for caching the introspected tokens. When not set, the default value of `0s` is used, which caches introspected tokens for a period of "exp" value in the access token. This can be set to the value `disabled` to disable caching of tokens. Otherwise, it can be set to a value from `1s` to `2147483647s`.

### **[-remote-user-claim <text>] - OAuth 2.0 Remote User Claim**

When the `-use-local-roles-if-present` parameter is set to true, and the token scope rules do not explicitly allow or deny the request, the value of the `-remote-user-claim` field will be used to find a match in the local user database for a user of the same name with the application of type `http` and authentication method `password`. When not set, the default value of `sub` is used.

### **[-provider-jwks-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - OAuth 2.0 Provider JSON Web Key Set Location**

This is the URI where the JSON Web Key Set (JWKS) is hosted by the Identity Provider server.

**`[-jwks-refresh-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}] - OAuth 2.0 JSON Web Key Set Refresh Interval in ISO-8601 format`**

This is the refresh interval in ISO-8601 format for caching the JSON Web Key Set (JWKS) key set obtained from the provider-jwks-uri. When not set, the default value of *1h* is used. This can be set to a value from *3600s* to *2147483647s*.

**`[-outgoing-proxy <text>] - OAuth 2.0 Outgoing Proxy To Access External IdPs`**

This is the value for outgoing proxy to access external identity providers (IdPs). Use this parameter for local validation to download the JWKS key set in the JWKS URI, or for remote introspection for validating the access token in the Bearer field of the REST API request when the system is behind a proxy.

**`[-use-local-roles-if-present {true|false}] - Use Local Roles, If Present`**

When this parameter is set to *true*, and the scopes in the access token do not explicitly allow or deny the request, the local user role matching the user in the `-remote-user-claim` field (defaults to value of the "sub" field of the access token if not specified) will be checked for authorization of the request. The default value is *false* when not set, which means only the scopes in the access token is used to approve or deny the request.

**`[-skip-uri-validation {true|false}] - Skip URI Validations`**

When this parameter is set to *true*, validation of provider-jwks-uri is skipped. The default value of this parameter is *false*.

**`[-use-mutual-tls {none|request|required}] - Mutual TLS enforcement`**

This is the Mutual TLS setting for the OAuth 2.0 configuration. When set to *required*, OAuth 2.0 mutual TLS authentication is enforced for all access tokens and any token that does not have `x5t#S256` property in the `cnf` section is rejected. The default value is *request* when not set, which means OAuth 2.0 mutual TLS authentication is enforced only if the `x5t#S256` property is present in the `cnf` section of the access token. This can be disabled by setting to value *none*.

**`[-provider {basic|keycloak|auth0|adfs|entra}] - OAuth 2.0 Provider`**

This parameter optionally specifies the Identity Provider type. The default value of this parameter is *basic*.

## Examples

The following example creates OAuth 2.0 Provider configuration for Local Validation:

```
cluster1::> security oauth2 client create -config-name auth1 -application
http -issuer https://issuer.example.com/ -provider-jwks-uri
https://issuer.example.com/.well-known/jwks.json -use-local-roles-if
-present true -remote-user-claim preferred_username -outgoing-proxy
https://outgoing_proxy
```

The following example creates OAuth 2.0 Provider configuration for Remote Introspection:

```
cluster1::> security oauth2 client create -config-name auth1 -application
http -issuer https://issuer.example.com/ -client-id client_id -client
-secret client_secret -use-local-roles-if-present true -remote-user-claim
preferred_username -outgoing-proxy https://outgoing_proxy -use-mutual-tls
required
```

- [security oauth2 modify](#)

## security oauth2 client delete

### Delete OAuth 2.0 Provider

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security oauth2 client delete` command is used to remove an OAuth 2.0 Provider configuration.

### Parameters

**-config-name <text> - Configuration Entry Name**

This is the OAuth 2.0 configuration entry name.

### Examples

The following example removes the OAuth 2.0 Provider configuration named `auth1`:

```
cluster1::> security oauth2 client delete -config-name auth1
```

The following example removes all OAuth2.0 Provider configurations:

```
cluster1::> security oauth2 client delete -config-name *
```

## security oauth2 client show

### Display OAuth 2.0 Provider

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security oauth2 client show` command displays the configured OAuth 2.0 Provider configuration.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all OAuth 2.0 configuration entries.

**[-config-name <text>] - Configuration Entry Name**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified config-name.

**[-application <OAuth 2.0 Applications>] - Application**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified application. Currently only the *http* application is supported.

**[-issuer {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Issuer**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified issuer.

**[-audience <text>] - OAuth 2.0 Audience**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified audience.

**[-client-id <text>] - OAuth 2.0 Client ID**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified client-id.

**[-hashed-client-secret <Hex String>] - Hashed representation of client secret**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified hashed-client-secret.

**[-introspection-endpoint {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Token Introspection Endpoint Location**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified introspection-endpoint.

**[-introspection-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W] | disabled}] - OAuth 2.0 Token Introspection Refresh Interval in ISO-8601 format**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified introspection-interval.

**[-remote-user-claim <text>] - OAuth 2.0 Remote User Claim**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified remote-user-claim.

**[-provider-jwks-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Provider JSON Web Key Set Location**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified provider-jwks-uri.

**`[-jwks-refresh-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}]` - OAuth 2.0 JSON Web Key Set Refresh Interval in ISO-8601 format**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified `jwks-refresh-interval`.

**`[-outgoing-proxy <text>]` - OAuth 2.0 Outgoing Proxy To Access External IdPs**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified `outgoing-proxy`.

**`[-use-local-roles-if-present {true|false}]` - Use Local Roles, If Present**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified `use-local-roles-if-present`.

**`[-use-mutual-tls {none|request|required}]` - Mutual TLS enforcement**

This is the Mutual TLS setting for the OAuth 2.0 configuration. When set to *required*, OAuth 2.0 mutual TLS authentication is enforced for all access tokens and any token that does not have `x5t#S256` property in the `cnf` section is rejected. The default value is *request* when not set, which means OAuth 2.0 mutual TLS authentication is enforced only if the `x5t#S256` property is present in the `cnf` section of the access token. This can be disabled by setting to value *none*.

**`[-provider {basic|keycloak|auth0|adfs|entra}]` - OAuth 2.0 Provider**

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified Identity Provider.

## Examples

The following example displays the OAuth 2.0 Provider configuration for Local Validation:

```
cluster1::> security oidc client show
Configuration Name: auth1
Application: http
Issuer: https://issuer.example.com/
Audience: -
Client ID: -
Hashed Client Secret: -
Introspection Endpoint: -
Introspection Refresh Interval : -
Use local roles: true
Provider JSON Web Key Set Location:
https://issuer.example.com/.well-known/jwks.json
JSON Web Key Set Refresh Interval: 1h
Remote User Claim: preferred_username
Outgoing Proxy: https://outgoing_proxy
Mutual TLS enforcement: request
Provider: basic
```

The following example displays the OAuth 2.0 Provider configuration for Remote Introspection:

```

cluster1::> security oidc client show
Configuration Name: auth1
Application: http
Issuer:
https://issuer.example.com/
Audience: -
Client ID: client_id
Hashed Client Secret:
e194e3472ee55c4202582cfbf59a03a37ef27085d2baf1b2fd7f7da3973c56fa
Introspection Endpoint: -
Introspection Refresh Interval : 0s
Use local roles: true
Provider JSON Web Key Set Location: -
JSON Web Key Set Refresh Interval: -
Remote User Claim: preferred_username
Outgoing Proxy: https://outgoing_proxy
Mutual TLS enforcement: required
Provider: basic

```

## security oauth2 scope cli-to-scope generate

Generate OAuth 2.0 scope for the given CLI REST role creation command parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security oauth2 scope cli-to-scope generate` command generates an ONTAP-specific OAuth 2.0 scope string based on local ONTAP custom roles created using `security login rest-role create`.

### Parameters

#### **-role <text> - Role name**

The role name as in the `security login rest-role create -role` parameter. This parameter is required.

#### **-access <text> - Access level**

The access level as in the `security login rest-role create -access` parameter. Valid access levels are `none`, `readonly`, `all`, `read_create`, `read_modify` and `read_create_modify`. This parameter is required.

#### **[-api <text>] - API path**

The REST API URI as in the `security login rest-role create -api` parameter. Valid APIs start with `/api/`. This parameter is required.

#### **[-cluster-uuid <text>] - Cluster UUID**

The cluster UUID for which this scope applies. This parameter is optional. If not specified, the OAuth 2.0 scope is applicable to all clusters.

## Examples

To generate the OAuth 2.0 scope string applicable to all clusters for an ONTAP role named myrole for the REST API URI /api/cluster with admin (all) access:

```
cluster1::gt; security oauth2 scope cli-to-scope generate -role myrole
-api /api/cluster -access all -cluster-uuid *
ontap*:myrole:all:*/api/cluster
```

## security oauth2 scope scope-to-cli generate

Generate CLI REST role command for the given OAuth 2.0 scope

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security oauth2 scope scope-to-cli generate` command generates an ONTAP CLI security login rest-role create command that is the equivalent of the specified OAuth 2.0 scope string.

### Parameters

**-scopeString <text> - OAuth 2.0 scope**

The OAuth 2.0 scope string. This parameter is required.

## Examples

To generate ONTAP CLI command given an OAuth 2.0 scope string applicable to all clusters for an ONTAP role named restclusterrole for the REST API URI /api/cluster with readonly access:

```
cluster1::gt; security oauth2 scope scope-to-cli generate -scopeString
ontap*:restclusterrole:readonly:*/api/cluster
Command for cluster <All>:
security login rest-role create -role restclusterrole -access readonly
-api /api/cluster
```

## security protocol commands

### security protocol modify

Modify application configuration options

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `security protocol modify` command modifies the existing cluster-wide configuration of RSH and Telnet. Enable RSH and Telnet in the cluster by setting the `enabled` field as `true`.

## Parameters

### **-application <text> - application (privilege: advanced)**

Selects the application. Supported values are *rsh* and *telnet*.

### **[-enabled {true|false}] - enabled (privilege: advanced)**

Enables or disables the corresponding application. The default value is *false*.

## Examples

The following command enables RSH in the cluster. The default setting for RSH is *false*:

```
cluster1::> security protocol modify -application rsh -enabled true
```

The following command enables Telnet in the cluster. The default setting for Telnet is *false*:

```
cluster1::> security protocol modify -application telnet -enabled true
```

## security protocol show

### Show application configuration options

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `security protocol show` command displays the cluster-wide configuration of RSH and Telnet in the cluster in advanced privilege mode. RSH and Telnet are disabled by default. Use the [security protocol modify](#) command to change the RSH and Telnet configuration that the cluster supports.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **[-instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-application <text>] - application (privilege: advanced)**

Displays the nonsecure applications in the cluster.

### **[-enabled {true|false}] - enabled (privilege: advanced)**

Displays whether the application is enabled or disabled in the cluster.

## Examples

The following example shows the default security protocol configurations for a cluster:

```
cluster1::> security protocol show
```

| Application | Enabled |
|-------------|---------|
| -----       | -----   |
| rsh         | false   |
| telnet      | false   |

The following example shows the security protocol configuration after RSH and Telnet have been enabled:

```
cluster1::> security protocol show
```

| Application | Enabled |
|-------------|---------|
| -----       | -----   |
| rsh         | true    |
| telnet      | true    |

## Related Links

- [security protocol modify](#)

## security protocol ssh modify

Modify the SSH configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `security protocol ssh modify` command modifies the existing cluster-wide configuration of SSH

### Parameters

**`[-per-source-limit <integer>]` - Per-Source Limit (privilege: advanced)**

Modifies the maximum number of SSH instances per source IP address on a per-node basis.

**`[-max-instances <integer>]` - Maximum Number of Instances (privilege: advanced)**

Modifies the maximum number of SSH instances that can be handled on a per-node basis.

**`[-connections-per-second <integer>]` - Connections Per Second (privilege: advanced)**

Modifies the maximum number of SSH connections per second on a per-node basis.

## Examples

The following example modifies cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh modify -per-source-limit 30 -max
-instances 60 -connections-per-second 5
```

## security protocol ssh show

Show the SSH configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `security protocol ssh show` command displays the cluster-wide SSH configuration in advanced privilege mode. Use the [security protocol ssh modify](#) command to change the SSH configuration that the cluster supports.

### Examples

The following example displays cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh show
Per-Source Limit: 32
Maximum Number of Instances: 64
Connections Per Second: 10
```

### Related Links

- [security protocol ssh modify](#)

## security saml-sp commands

### security saml-sp create

Configure SAML service provider for authentication

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security saml-sp create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) for single sign-on authentication. This command does not enable SAML SP, it just configures it. Configuring and enabling SAML SP is a two-step process:

- Create a SAML SP configuration using `security saml-sp create` command.
- Enable SAML SP by using [security saml-sp modify](#) `-is-enabled true`

After the SAML SP configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

## Parameters

**-idp-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...} - Identity Provider (IdP) Metadata Location**

This is the URI of the desired identity provider's (IdP) metadata.

**[-sp-host <Remote InetAddress>] - SAML Service Provider Host**

This specifies the SAML service provider host IP address.

**{ -cert-ca <text> - Server Certificate Issuing CA**

This specifies the service provider's certificate issuing CA.

**-cert-serial <text> - Server Certificate Serial Number**

This specifies the service provider's certificate's serial number.

**[-cert-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name }**

This specifies the service provider certificate's common name.

**[-verify-metadata-server {true|false}] - Verify IdP Metadata Server Identity**

When the IdP metadata is downloaded, the identity of the server hosting the metadata is verified using Transport Layer Security (TLS), validating the server's X.509 certificate against the list of certificate authorities (CAs) in ONTAP, and verifying that the host in the server certificate matches the host in the URI (the `idp-uri` field). This verification can be bypassed by setting this field to `false`. Bypassing the server verification is not recommended as the server can not be trusted that way, but will be necessary to use non-TLS URIs, e.g. with the "http" scheme, or when the server certificates are self-signed. If the server's certificate was signed by a CA that is not installed in ONTAP, the [security certificate install -type server-ca](#) command can be used to install it.

**[-foreground {true|false}] - Foreground Process**

When this parameter is set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.

## Examples

The following example configures ONTAP with SAML SP IdP information:

```
cluster1::> security saml-sp create -idp-uri http://public-idp-uri -sp
-host 1.1.1.1
[Job 9] Job succeeded.
cluster1::>
```

## Related Links

- [security saml-sp modify](#)
- [security certificate install](#)

## security saml-sp delete

### Delete SAML service provider for authentication

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `security saml-sp delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP). Running this command frees resources used by the SP. SAML SP services will no longer be available after the SP is removed.

If the SAML SP is currently enabled, it is necessary to first use `security saml-sp modify -is-enabled false` prior to `security saml-sp delete`. The `security saml-sp modify -is-enabled false` command must be issued by a password authenticated console application user or from a SAML authenticated command interface.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

#### Examples

The following example unconfigures SAML SP:

```
cluster1::> security saml-sp delete
cluster1::>
```

#### Related Links

- [security saml-sp modify](#)

## security saml-sp modify

### Modify SAML service provider authentication

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `security saml-sp modify` command modifies the Security Assertion Markup Language (SAML) Service Provider (SP) configuration for single sign-on authentication. This command is used to enable or disable an existing SAML SP, `security saml-sp modify -is-enabled true` or `false` respectively.

This command will check the validity of the current SAML SP configuration before enabling the SP. Also, it is necessary to use this command with the `-is-enabled false` parameter prior to deleting an existing SAML SP configuration. SAML SP can only be disabled in this way by a password authenticated console application user or from a SAML authenticated command interface. The delete command must be used if the SAML configuration settings are to be changed, as only the `is-enabled` parameter can be modified.

This may restart the web server. Any HTTP/S connections that are active may be disrupted.

## Parameters

### **`[-is-enabled {true|false}]` - SAML Service Provider Enabled**

Use this parameter to enable or disable the SAML SP.

## Examples

The following example enables SAML SP:

```
cluster1::> security saml-sp modify -is-enabled true
cluster1::>
```

## security saml-sp repair

Repair a failed SAML SP configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `security saml-sp repair` command attempts to repair a failed SAML SP configuration on a given node. The status of the individual nodes can be viewed using the [security saml-sp status show](#) command.

This restarts the web server. Any active HTTP/S requests to the web server will be disrupted.

## Parameters

### **`-node {<nodename>|local}` - Node (privilege: advanced)**

This identifies a single node that matches the input. The repair job will run on this node.

### **`[-foreground {true|false}]` - Foreground Process (privilege: advanced)**

When this parameter is set to *false* the command runs in the background as a job. The default is *true*, which causes the command to return after the operation completes.

## Examples

The following example repairs a failed SAML SP configuration:

```
cluster1:> security saml-sp repair -node node-2
Warning: This restarts the web server. Any active HTTP/S requests to the
web
           server will be disrupted
Do you want to continue? {y|n}: y
      [Job 1321] Job succeeded.
cluster1:>
```

## Related Links

- [security saml-sp status show](#)

## security saml-sp show

Display SAML service provider for authentication

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security saml-sp show` command displays the Security Assertion Markup Language (SAML) Service Provider (SP) configuration.

The `Identity Provider (IdP) URI` indicates the URI of the desired IdP's metadata.

The `Service Provider (SP) host` indicates the IP address containing SAML SP metadata.

The `Certificate Common Name` indicates the SAML SP certificate's common name.

The `Certificate Serial` indicates the SAML SP certificate's serial number.

### Examples

The following example displays the SAML SP configuration:

```
cluster1::> security saml-sp show
Identity Provider URI: https://www.my.idp.com
  Service Provider Host: 1.1.1.1
    Certificate Name: mycert
      Certificate Serial: 1234abcd
        Is SAML Enabled: false
```

## security saml-sp default-metadata create

Create SAML Default Metadata

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security saml-sp default-metadata create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) default metadata for single sign-on authentication. The default metadata is used while configuring the Identity Provider (IDP).

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

## Parameters

### **`[-sp-host <Remote InetAddress>]` - SAML Service Provider Host**

This specifies the SAML service provider host IP address.

### **`{ -cert-ca <text> }` - Server Certificate Issuing CA**

This specifies the service provider's certificate issuing CA.

### **`-cert-serial <text>` - Server Certificate Serial Number**

This specifies the service provider's certificate's serial number.

### **`[-cert-common-name <FQDN or Custom Common Name>]` - Server Certificate Common Name }**

This specifies the service provider certificate's common name.

### **`[-foreground {true|false}]` - Foreground Process**

When this parameter is set to *false* the command runs in the background as a job. The default is *true*, which causes the command to return after the operation completes.

## Examples

The following example configures ONTAP with SAML default metadata:

```
cluster1::> security saml-sp default-metadata create -sp-host 1.1.1.1
[Job 9] Job succeeded: Access the SAML SP default metadata using the
URL:
https://1.1.1.1/saml-sp/Metadata
cluster1::>
```

## security saml-sp default-metadata delete

### Delete SAML Default Metadata

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security saml-sp default-metadata delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP) default metadata configuration.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

### Examples

The following example unconfigures SAML SP default metadata:

```
cluster1::> security saml-sp default-metadata delete
cluster1::>
```

## security saml-sp default-metadata show

### Display SAML Default Metadata configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `security saml-sp default-metadata show` command displays the Security Assertion Markup Language (SAML) Service Provider (SP) default metadata configuration.

The `Service Provider (SP) host` indicates the IP address containing SAML SP metadata.

The `Certificate Issuing CA` indicates the issuing Certificate Authority (CA) of the SAML SP certificate.

The `Certificate Common Name` indicates the SAML SP certificate's common name.

The `Certificate Serial` indicates the SAML SP certificate's serial number.

#### Examples

The following example displays the SAML SP default metadata configuration:

```
cluster1::> security saml-sp default-metadata show
SAML Service Provider Host: 1.1.1.1
    Server Certificate Issuing CA: cluster-1
    Server Certificate Serial Number: 180D4457AB87E889
    Server Certificate Common Name: cluster-1
```

## security saml-sp status show

### Display SAML service provider configuration status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `security saml-sp status show` command displays the SAML Service Provider (SP) status for all nodes in the cluster.

#### Parameters

**[`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[*-node* {<nodename>|local}] - Node (privilege: advanced)**

This identifies the node in the cluster.

**[*-status* {not-configured|config-in-progress|config-failed|config-success}] - Update Status (privilege: advanced)**

This identifies the SAML SP status on the specified node.

**[*-error-text* <text>] - Error Text (privilege: advanced)**

This identifies the error text associated with the latest saml SP update for this node.

**[*-is-enabled* {true|false}] - SAML Service Provider Enabled (privilege: advanced)**

When this parameter is set to *true* it indicates that the SAML SP is enabled on this node. Similarly, when this parameter is set to *false*, it indicates that the SAML SP is not enabled on this node.

**[*-default-metadata* {not-configured|config-in-progress|config-failed|config-success}] - Default Metadata Status (privilege: advanced)**

This identifies the SAML default metadata status on the specified node.

## Examples

The following example displays the SAML SP status information for all nodes in the cluster.

```
cluster::security saml-sp status> show
```

| Node          | SAML SP Status | Enabled | Default Metadata Status |
|---------------|----------------|---------|-------------------------|
| cluster-node1 | not-configured | false   | config-success          |
| cluster-node2 | not-configured | false   | config-success          |

2 entries were displayed.  
cluster::\*>

## security session commands

### security session kill-cli

Kill a CLI session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `security session kill-cli` command is used to terminate CLI sessions. If the session being killed is actively processing a non-read command, the kill will wait until the command is complete before terminating the session. If the session being killed is actively processing a read (show) command, the kill will wait until the current row is returned before terminating the session.

## Parameters

### **-node {<nodename>|local} - Node**

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

### **[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

### **[-start-time <MM/DD HH:MM:SS>] - Start Time**

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

### **-session-id <integer> - Session ID**

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

### **[-vserver <vserver>] - Vserver**

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

### **[-username <text>] - Username**

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

### **[-application <text>] - Client Application**

Selects the sessions that match this parameter value. This identifies the calling application by name.

### **[-location <text>] - Client Location**

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

### **[-idle-seconds <integer>] - Idle Seconds**

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

### **[-state {pending|active|idle}] - Session State**

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

### **[-request <text>] - Active Command**

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

## Examples

The following example illustrates killing a CLI session by specifying the node and the session id.

```

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show
03/27 16:58:17 1359      ssh          10.98.16.164 cluster1 admin
650
2 entries were displayed.

cluster1::>

cluster1::> security session kill-cli -node node1 -session-id 1359
1 entry was acted on.

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show

cluster1::>

```

The following example illustrates killing a CLI session by specifying the node and specifying a query on idle-seconds.

```

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show
03/27 17:13:36 1479      ssh          10.98.16.164 cluster1 admin
83
2 entries were displayed.

cluster1::> security session kill-cli -node node1 -session-id * -idle
-seconds > 80
1 entry was acted on.

cluster1::> security session show

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show

cluster1::>

```

## security session show

Show current CLI, ONTAPI, and REST sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security session show` command displays all active management sessions across the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

**[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

**[-start-time <MM/DD HH:MM:SS>] - Start Time**

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

**[-session-id <integer>] - Session ID**

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

**[-vserver <vserver>] - Vserver**

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

**[-username <text>] - Username**

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

**[-application <text>] - Client Application**

Selects the sessions that match this parameter value. This identifies the calling application by name.

**[-location <text>] - Client Location**

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

**[-ipspace <IPspace>] - IPspace of Location**

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

**[-total <integer>] - Total Requests**

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made thus far in the active session. The following commands are not counted: top, up, cd, rows, history, exit.

**[-failed <integer>] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that have failed for any reason (including if they were blocked by configured limits).

**[`-max-time` <integer>] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took for this session.

**[`-last-time` <integer>] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took for this session.

**[`-total-seconds` <integer>] - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that has been taken by all completed requests for the current session; it does not include session idle time.

**[`-state {pending|active|idle}`] - Session State**

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

**[`-request` <text>] - Request Input**

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

**[`-idle-seconds` <integer>] - Idle Seconds**

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

**[`-active-seconds` <integer>] - Active Seconds**

Selects the sessions that match this parameter value. When a session is actively executing a command request, this indicates the time (in seconds) since the current request started.

**Examples**

The following example illustrates displaying all active sessions across the cluster. In this example, we see one active session on node *node2* from the *console* application. We also see three active sessions on node *node1*. One is from the *console* application and two are from the *ssh* application. Also one of the *ssh* sessions is from user *diag* and the other *ssh* session is from user *admin*.

```
cluster1::> security session show
```

```
Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show
03/27 17:17:04 1514      ssh          10.98.16.164 cluster1 admin
139
03/27 17:17:29 1515      ssh          10.98.16.164 cluster1 diag
115

Node: node2                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 17:18:54 1509      console      console      cluster1 admin
23
4 entries were displayed.

cluster1::>
```

The following example illustrates displaying all active sessions that have been idle for longer than 500 seconds.

```

cluster1::> security session show -idle-seconds > 500

Node: node1                      Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 17:17:04 1514      ssh          10.98.16.164    cluster1 admin
607
03/27 17:17:29 1515      ssh          10.98.16.164    cluster1 diag
583

```

## security session limit create

Create default session limit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command allows creation of a default management session limit that does not yet exist. The default limits can be overridden for specific values within each category by using advanced privilege level commands.

### Parameters

#### **-interface {cli|ontapi|rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

#### **-category {application|location|request|user|vserver} - Category**

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

#### **-max-active-limit <integer> - Max-Active Limit**

The maximum number of concurrent sessions allowed for this interface and category.

### Examples

The following example illustrates creating a default limit for management sessions using the same application.

```

cluster1::> security session limit create -interface ontapi -category
application -max-active-limit 8

```

## security session limit delete

Delete default session limit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command allows deletion of a default management session limit.

### Parameters

**-interface {cli|ontapi|rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-category {application|location|request|user|vserver} - Category**

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

### Examples

The following example illustrates deleting all default limits for CLI management sessions.

```
cluster1::> security session limit delete -interface cli -category *  
3 entries were deleted.
```

## security session limit modify

Modify default session limit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command allows modification of a default management session limit.

### Parameters

**-interface {cli|ontapi|rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-category {application|location|request|user|vserver} - Category**

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

**[-max-active-limit <integer>] - Max-Active Limit**

The maximum number of concurrent sessions allowed for this interface and category.

## Examples

The following example illustrates modifying the default limit for CLI management sessions from the same location.

```
cluster1::> security session limit modify -interface cli -category
location -max-active-limit 4
```

## security session limit show

Show default session limits

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command shows the default management session limits that have been configured for each interface and category.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

**[-category {application|location|request|user|vserver}] - Category**

Selects the sessions that match this parameter value. This identifies the category for the limit. The following categories are supported: application, location, request, user, and Vserver.

**[-max-active-limit <integer>] - Max-Active Limit**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying the default limits for management sessions.

```
cluster1::> security session limit show
Interface Category      Max-Active
-----
cli      user            2
cli      vserver          4
ontapi   vserver            2
3 entries were displayed.
```

## security session limit application create

Create per-application session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows creation of a per-application management session limit that does not yet exist.

### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-application <text> - Application (privilege: advanced)**

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

**-max-active-limit <integer> - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and application.

### Examples

The following example illustrates creating a limit for management sessions from a custom application.

```
cluster1::*> security session limit application create -interface ontapi
-application "custom_app" -max-active-limit 8
```

## security session limit application delete

Delete per-application session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows deletion of a per-application management session limit.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-application <text> - Application (privilege: advanced)**

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

## Examples

The following example illustrates deleting a limit for management sessions from a custom application.

```
cluster1::*> security session limit application delete -interface ontapi  
-application "custom_app"
```

## security session limit application modify

### Modify per-application session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows modification of a per-application management session limit.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-application <text> - Application (privilege: advanced)**

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

### **[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and application.

## Examples

The following example illustrates modifying management session limits for some custom applications.

```
cluster1::*> security session limit application modify -interface ontapi  
-application custom* -max-active-limit 4  
2 entries were modified.
```

## security session limit application show

Show per-application session limits

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command shows the per-application management session limits that have been configured for each interface and application.

### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

**[*-application* <text>] - Application (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the application for the limit. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

**[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

### Examples

The following example illustrates displaying the per-application limits for ONTAPI management sessions.

```
cluster1::*> security session limit application show -interface ontapi
Interface Application          Max-Active
-----
ontapi    -default-            5
ontapi    custom_app           10
2 entries were displayed.
```

## security session limit location create

Create per-location session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows creation of a per-location management session limit that does not yet exist.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-location <text> - Location (privilege: advanced)**

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

### **[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)**

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

### **-max-active-limit <integer> - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and location.

## Examples

The following example illustrates creating a CLI limit for specific location.

```
cluster1::*> security session limit location create -interface cli
-location 10.98.16.164 -max-active-limit 1
```

## security session limit location delete

Delete per-location session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows deletion of a per-location management session limit.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-location <text> - Location (privilege: advanced)**

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

### **[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)**

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

## Examples

The following example illustrates deleting limits for management sessions from a specific set of locations.

```
cluster1::*> security session limit location delete -interface * -location 10.98.*
3 entries were deleted.
```

## security session limit location modify

Modify per-location session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows modification of a per-location management session limit.

### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-location <text> - Location (privilege: advanced)**

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

**[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)**

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

**[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and location.

## Examples

The following example illustrates modifying management sessions limits for specific locations.

```
cluster1::*> security session limit location modify -interface * -location 10.98.* -max-active-limit 2
3 entries were modified.
```

## security session limit location show

Show per-location session limits

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command shows the per-location management session limits that have been configured for each interface and location.

## Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

**[*-location* <text>] - Location (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the location for the limit. The limit with the location name *-default-* (only in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

**[*-ipspace* <IPspace>] - IPspace of Location (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the IPspace of the client location. The default IPspace is *Default*.

**[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying the per-location limits for management sessions.

```
cluster1::*> security session limit location show
Interface Location          IPspace      Max-Active
-----
cli      -default-             Default      16
cli      10.98.16.164        Default      0
ontapi   -default-             Default      6
ontapi   10.98.16.164        Default      0
4 entries were displayed.
```

## security session limit request create

### Create per-request session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows creation of a per-request management session limit that does not yet exist.

## Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-request <text> - Request Name (privilege: advanced)**

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

**-max-active-limit <integer> - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and request.

## Examples

The following example illustrates creating a limit for number of clients executing a specific API.

```
cluster1::*> security session limit request create -interface ontapi  
-request storage-disk-get-iter -max-active-limit 2
```

## security session limit request delete

Delete per-request session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows deletion of a per-request management session limit.

## Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-request <text> - Request Name (privilege: advanced)**

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

## Examples

The following example illustrates deleting custom limits for that were configured for the volume commands and APIs.

```
cluster1::*> security session limit request delete -interface * -request
volume*
4 entries were deleted.
```

## security session limit request modify

### Modify per-request session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command allows modification of a per-request management session limit.

#### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-request <text> - Request Name (privilege: advanced)**

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

**[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and request.

#### Examples

The following example illustrates modifying the limit of the number of clients simultaneously executing a specific API.

```
cluster1::*> security session limit request modify -interface ontapi
-request storage-disk-get-iter -max-active-limit 4
```

## security session limit request show

### Show per-request session limits

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command shows the per-request management session limits that have been configured for each interface and request.

#### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

**[*-request* <text>] - Request Name (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the request (command or API) for the limit. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

**[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying the per-request limits for management sessions.

```
cluster1::*> security session limit request show
Interface Request                               Max-Active
-----
cli          -default-                           10
ontapi       -default-                           5
ontapi       storage-disk-get-iter                2
3 entries were displayed.
```

## security session limit user create

### Create per-user session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows creation of a per-user management session limit that does not yet exist.

### Parameters

***-interface* {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

**-user <text> - User (privilege: advanced)**

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

**-max-active-limit <integer> - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

## Examples

The following example illustrates creating a per-user limit override for ONTAPI requests for the *admin* user in the admin Vserver.

```
cluster1::*> security session limit user create -interface ontapi -vserver
cluster1 -username admin -max-active-limit 16
```

## security session limit user delete

Delete per-user session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows deletion of a per-user management session limit.

### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

**-user <text> - User (privilege: advanced)**

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

## Examples

The following example illustrates deleting all user-specific limits for CLI management sessions.

```
cluster1::*> security session limit user delete -interface cli -user !"-  
default-"  
2 entries were deleted.
```

## security session limit user modify

### Modify per-user session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command allows modification of a per-user management session limit.

#### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

**-user <text> - User (privilege: advanced)**

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

**[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

#### Examples

The following example illustrates modifying the admin user's limit for CLI management sessions.

```
cluster1::*> security session limit user modify -interface cli -vserver  
cluster1 -username admin -max-active-limit 30
```

## security session limit user show

### Show per-user session limits

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command shows the per-user management session limits that have been configured for each interface, Vserver, and user.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-interface {cli|ontapi|rest}] - Interface (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

**`[-vserver <vserver>] - Vserver (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

**`[-user <text>] - User (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the user for the limit. The limit with the user name `-default-` is the limit used for any user without a specific configured limit.

**`[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying the per-user limits for CLI management sessions. In this example, there is a default limit of 4 sessions for each user. That limit is expanded to 8 for the admin Vserver. That limit is further expanded to 20 for the `admin` user in the admin Vserver.

```
cluster1::*> security session limit user show -interface cli
Interface Vserver                User                Max-Active
-----
cli        Cluster                -default-           4
cli        cluster1                -default-           8
cli        cluster1                admin               20
3 entries were displayed.
```

## security session limit vsver create

### Create per-vserver session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command allows creation of a per-Vserver management session limit that does not yet exist.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

### **-max-active-limit <integer> - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and Vserver.

## Examples

The following example illustrates creating a per-Vserver limit override for ONTAPI requests on the admin Vserver.

```
cluster1::*> security session limit vsriver create -interface ontapi
-vserver cluster1 -max-active-limit 4
```

## security session limit vsriver delete

### Delete per-vserver session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command allows deletion of a per-Vserver management session limit. The "Cluster" vsriver is used when the specific Vserver doesn't have a configured limit.

## Parameters

### **-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

### **-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

## Examples

The following example illustrates deleting all per-Vserver limits for management sessions except the default limit.

```
cluster1::*> security session limit vsriver delete -interface * -vserver
!Cluster
1 entries was deleted.
```

## security session limit vserver modify

### Modify per-vserver session limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command allows modification of a per-Vserver management session limit.

#### Parameters

**-interface {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

**-vserver <vserver> - Vserver (privilege: advanced)**

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

**[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

The maximum number of concurrent sessions allowed for this interface and Vserver.

#### Examples

The following example illustrates modifying the admin Vserver's limit for CLI management sessions.

```
cluster1::*> security session limit vserver modify -interface cli -vserver  
cluster1 -max-active-limit 40
```

## security session limit vserver show

### Show per-vserver session limits

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command shows the per-Vserver management session limits that have been configured for each interface and Vserver.

#### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **`[-interface {cli|ontapi|rest}] - Interface (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

### **`[-vserver <vserver>] - Vserver (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

### **`[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)`**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## **Examples**

The following example illustrates displaying the per-Vserver limits for management sessions.

```
cluster1::*> security session limit vsver show
Interface Vserver                Max-Active
-----
cli      Cluster                4
ontapi   Cluster                2
ontapi   cluster1              16
3 entries were displayed.
```

## **security session request-statistics show-by-application**

Show session request statistics by application

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `security session request-statistics show-by-application` command shows historical statistics for management session activity, categorized by application name. CLI sessions connections will have an application name based on the connection method, i.e.: *ssh*, *telnet*, *rsh*, *console*, or *ngsh*. ONTAPI sessions will extract the application name from the ZAPI request. ONTAP looks for the application name in the following three locations, in the following order of precedence:

1. The "X-Dot-Client-App" HTTP header;
2. The "app-name" attribute of the "netapp" element, within the ZAPI XML request;
3. The "User-Agent" HTTP header.

### **Parameters**

**`{ [-fields <fieldname>, ...]`**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ -node {<nodename>|local} ] - Node**

Selects the sessions that match this parameter value. This identifies the node that processed the session.

**[ -interface {cli|ontapi|rest} ] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

**[ -application <text> ] - Application**

Selects the sessions that match this parameter value. This identifies the calling application by name.

**[ -total <integer> ] - Total Requests**

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

**[ -blocked <integer> ] - Blocked Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

**[ -failed <integer> ] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

**[ -max-time <integer> ] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

**[ -last-time <integer> ] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

**[ -active <integer> ] - Number Active Now**

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

**[ -max-active <integer> ] - Max Number Active**

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

**[ -last-active-seconds <integer> ] - Seconds Since Last Session Start**

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

**[ -idle-seconds <integer> ] - Idle Seconds**

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

**`[-total-seconds <integer>]` - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

**`[-average-time <integer>]` - Average Time (ms)**

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

**`[-success-percent <percent>]` - Success Percent**

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

**`[-blocked-percent <percent>]` - Blocked Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

**`[-failed-percent <percent>]` - Failed Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

**`[-max-active-limit <integer>]` - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by application name.

```
cluster1::> security session request-statistics show-by-application
```

```
Node: node1                Interface: cli                Idle    Total
Application                Total Now Max Pass Fail  Seconds Seconds Avg
(ms)
-----
-----
console                    2126   0   6  95%   96    68    361
170
ssh                        6     2   3 100%    0     -    794
132444
```

```
Node: node1                Interface: ontapi                Idle    Total
Application                Total Now Max Pass Fail  Seconds Seconds Avg
(ms)
-----
-----
api_test                   2     0   1 100%    0    13     0
18
```

```
Node: node2                Interface: cli                Idle    Total
Application                Total Now Max Pass Fail  Seconds Seconds Avg
(ms)
-----
-----
console                    2090   0   6  95%   96    90    655
313
4 entries were displayed.
```

```
cluster1::>
```

The following example illustrates displaying historical statistics for management session activity on a specific node and for a specific application.

```
cluster1::> security session request-statistics show-by-application -node
node1 -application api_test
```

| Node: node1 | Interface: ontapi |     |     |       |       | Idle    | Total       |
|-------------|-------------------|-----|-----|-------|-------|---------|-------------|
| Application | Total             | Now | Max | Pass  | Fail  | Seconds | Seconds Avg |
| (ms)        |                   |     |     |       |       |         |             |
| -----       | -----             | --- | --- | ----- | ----- | -----   | -----       |

## security session request-statistics show-by-location

Show session request statistics by location

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security session request-statistics show-by-location` command shows historical statistics for management session activity, categorized by client location.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the sessions that match this parameter value. This identifies the node that processed the session.

**[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

**[-location <text>] - Client Location**

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

**[-ipspace <IPspace>] - IPspace of Location**

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

**[-total <integer>] - Total Requests**

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

**[-blocked <integer>] - Blocked Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

**[-failed <integer>] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

**[-max-time <integer>] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

**[-last-time <integer>] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

**[-active <integer>] - Number Active Now**

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

**[-max-active <integer>] - Max Number Active**

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

**[-last-active-seconds <integer>] - Seconds Since Last Session Start**

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

**[-idle-seconds <integer>] - Idle Seconds**

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

**[-total-seconds <integer>] - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

**[-average-time <integer>] - Average Time (ms)**

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

**[-success-percent <percent>] - Success Percent**

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

**[-blocked-percent <percent>] - Blocked Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

### **[-failed-percent <percent>] - Failed Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

### **[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## **Examples**

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by location.

```
cluster1::> security session request-statistics show-by-location
```

| Node: node1 |         | Interface: cli |     |     |      |      | Idle    | Total   |     |
|-------------|---------|----------------|-----|-----|------|------|---------|---------|-----|
| Location    | IPspace | Total          | Now | Max | Pass | Fail | Seconds | Seconds | Avg |
| (ms)        |         |                |     |     |      |      |         |         |     |
| -----       |         |                |     |     |      |      |         |         |     |
| console     | Default | 21             | 1   | 1   | 100% | 0    | -       | 127     |     |
| 6063        |         |                |     |     |      |      |         |         |     |
| localhost   | Default | 2523           | 0   | 5   | 95%  | 115  | 20      | 280     |     |
| 111         |         |                |     |     |      |      |         |         |     |

  

| Node: node1  |         | Interface: ontapi |     |     |      |      | Idle    | Total   |     |
|--------------|---------|-------------------|-----|-----|------|------|---------|---------|-----|
| Location     | IPspace | Total             | Now | Max | Pass | Fail | Seconds | Seconds | Avg |
| (ms)         |         |                   |     |     |      |      |         |         |     |
| -----        |         |                   |     |     |      |      |         |         |     |
| 10.98.17.254 | Default | 2                 | 0   | 1   | 100% | 0    | 2419    | 0       |     |
| 18           |         |                   |     |     |      |      |         |         |     |

  

| Node: node2 |         | Interface: cli |     |     |      |      | Idle    | Total   |     |
|-------------|---------|----------------|-----|-----|------|------|---------|---------|-----|
| Location    | IPspace | Total          | Now | Max | Pass | Fail | Seconds | Seconds | Avg |
| (ms)        |         |                |     |     |      |      |         |         |     |

### security session request-statistics show-by-request

Show session request statistics by request name

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `security session request-statistics show-by-request` command shows historical statistics for management session activity, categorized by request (command or API name).

#### Parameters

- { [-fields <fieldname>,...]**  
If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
- | [-instance ] }**  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
- [-node {<nodename>|local}] - Node**  
Selects the sessions that match this parameter value. This identifies the node that processed the session.
- [-interface {cli|ontapi|rest}] - Interface**  
Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.
- [-request <text>] - Request Name**  
Selects the sessions that match this parameter value. This identifies the command associated with these requests.
- [-total <integer>] - Total Requests**  
Selects the sessions that match this parameter value. This identifies the total number of requests that have

been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

**[-blocked <integer>] - Blocked Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

**[-failed <integer>] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

**[-max-time <integer>] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

**[-last-time <integer>] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

**[-active <integer>] - Number Active Now**

Selects the sessions that match this parameter value. This identifies the number of currently active requests.

**[-max-active <integer>] - Max Number Active**

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active requests.

**[-last-active-seconds <integer>] - Seconds Since Last Request Start**

Selects the sessions that match this parameter value. When requests are active, this indicates the time (in seconds) since the last request started.

**[-idle-seconds <integer>] - Idle Seconds**

Selects the sessions that match this parameter value. When no requests are active, this indicates the time (in seconds) since the last request ended.

**[-total-seconds <integer>] - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

**[-average-time <integer>] - Average Time (ms)**

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

**[-success-percent <percent>] - Success Percent**

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

**[-blocked-percent <percent>] - Blocked Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

### **[*-failed-percent* <percent>] - Failed Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

### **[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## **Examples**

The following example illustrates displaying historical statistics for all management session activity on a specific node, with a specific request query.

```
cluster1::> security session request-statistics show-by-request -node
node1 -request network*

Node: node1                      Interface: cli                      Idle      Total
Request Name                    Total Now Max Pass Fail  Seconds  Seconds Avg
(ms)

## **security session request-statistics show-by-user**

Show session request statistics by username

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `security session request-statistics show-by-user` command shows historical statistics for management session activity, categorized by username. Entries for username 'autosupport' reflect commands that are executed by the AutoSupport OnDemand feature.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the sessions that match this parameter value. This identifies the node that processed the session.

**[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

**[-vserver <vserver>] - Vserver**

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

**[-username <text>] - Username**

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

**[-total <integer>] - Total Requests**

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

**[-blocked <integer>] - Blocked Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

**[-failed <integer>] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

**[-max-time <integer>] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

**[-last-time <integer>] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

**[-active <integer>] - Number Active Now**

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

**[-max-active <integer>] - Max Number Active**

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently

active sessions.

**`[-last-active-seconds <integer>]` - Seconds Since Last Session Start**

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

**`[-idle-seconds <integer>]` - Idle Seconds**

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

**`[-total-seconds <integer>]` - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

**`[-average-time <integer>]` - Average Time (ms)**

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

**`[-success-percent <percent>]` - Success Percent**

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

**`[-blocked-percent <percent>]` - Blocked Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

**`[-failed-percent <percent>]` - Failed Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

**`[-max-active-limit <integer>]` - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

## Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by username.

```
cluster1::> security session request-statistics show-by-user
```

| Node: node1 |             | Interface: cli |     |     |      |      | Idle    | Total   |     |
|-------------|-------------|----------------|-----|-----|------|------|---------|---------|-----|
| Vserver     | Username    | Total          | Now | Max | Pass | Fail | Seconds | Seconds | Avg |

## security session request-statistics show-by-vserver

Show session request statistics by Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `security session request-statistics show-by-vserver` command shows historical statistics for management session activity, categorized by vservers.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the sessions that match this parameter value. This identifies the node that processed the session.

**[-interface {cli|ontapi|rest}] - Interface**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

**[-vserver <vserver>] - Vserver**

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

**[-total <integer>] - Total Requests**

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

**[-blocked <integer>] - Blocked Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

**[-failed <integer>] - Failed Requests**

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

**[-max-time <integer>] - Maximum Time (ms)**

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

**[-last-time <integer>] - Last Time (ms)**

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

**[-active <integer>] - Number Active Now**

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

**[-max-active <integer>] - Max Number Active**

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

**[-last-active-seconds <integer>] - Seconds Since Last Session Start**

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

**[-idle-seconds <integer>] - Idle Seconds**

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

**[-total-seconds <integer>] - Total Seconds**

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

**[-average-time <integer>] - Average Time (ms)**

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

**[-success-percent <percent>] - Success Percent**

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

**[-blocked-percent <percent>] - Blocked Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

**[-failed-percent <percent>] - Failed Percent**

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

### **[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

### **Examples**

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by Vserver.

```
cluster1::> security session request-statistics show-by-vserver
```

| Node: node1 | Interface: cli |     |     |      |      | Idle    | Total   |     |
|-------------|----------------|-----|-----|------|------|---------|---------|-----|
| Vserver     | Total          | Now | Max | Pass | Fail | Seconds | Seconds | Avg |
| (ms)        |                |     |     |      |      |         |         |     |

## security ssh commands

### security ssh add

#### Add SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `security ssh add` command adds additional SSH key exchange algorithms or ciphers or MAC algorithms to the existing configurations of the cluster or a Vserver. The added algorithms or ciphers or MAC algorithms are enabled on the cluster or Vserver. If you change the cluster configuration settings, it is used as the default for all newly created Vservers. The existing SSH key exchange algorithms, ciphers, and MAC algorithms remain unchanged in the configuration. If the SSH key exchange algorithms or ciphers or MAC algorithms are already enabled in the current configuration, the command will does not not fail. ONTAP supports the *diffie-hellman-group-exchange-sha256*, *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm*, and *3des-cbc*. ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *umac-64*,

*umac-64* , *umac-128* , *hmac-sha2-256* , *hmac-sha2-512* , *hmac-sha1-etm* , *hmac-sha1-96-etm* , *hmac-sha2-256-etm* , *hmac-sha2-512-etm* , *hmac-md5-etm* , *hmac-md5-96-etm* , *umac-64-etm* , and *umac-128-etm* .

## Parameters

### **-vserver <Vserver Name> - Vserver**

Identifies the Vserver to which you want to add additional SSH key exchange algorithms or ciphers.

### **[-key-exchange-algorithms <algorithm name>,...] - List of SSH Key Exchange Algorithms to Add**

Adds the specified SSH key exchange algorithm or algorithms to the Vserver.

### **[-ciphers <cipher name>,...] - List of SSH Ciphers to Add**

Adds the specified cipher or ciphers to the Vserver.

### **[-mac-algorithms <MAC name>,...] - List of SSH MAC Algorithms to Add**

Adds the specified MAC algorithm or algorithms to the Vserver.

### **[-host-key-algorithms <HostKey Algorithms>,...] - List of SSH Host Key Algorithms to Add**

Adds the specified host key algorithms to the Vserver.

## Examples

The following command adds the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group-exchange-sha1* key exchange algorithms for the cluster1 Vserver. It also adds the *aes256-cbc* and *aes192-cbc* ciphers and the *hmac-sha1* and *hmac-sha2-256* MAC algorithms to the cluster1 Vserver.

```
cluster1::> security ssh add -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group-exchange-sha1
-ciphers aes256-cbc,aes192-cbc -mac-algorithms hmac-sha1,hmac-sha2-256
-host-key-algorithms ecdsa-sha2-nistp256,ssh-rsa
```

## security ssh modify

### Modify SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security ssh modify` command replaces the existing configurations of the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether *ssh-rsa* signature scheme is enabled for RSA keys in publickey algorithms, for the cluster or a Vserver, with the configuration settings you specify. If you modify the cluster configuration settings, it will be used as the default for all newly created Vservers. ONTAP supports the *diffie-hellman-group-exchange-sha256* , *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1* , *diffie-hellman-group14-sha1* and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2

key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm* and *3des-cbc*. ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *umac-64*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-etm*, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *umac-64-etm* and *umac-128-etm*. ONTAP supports host key algorithms of the following types: *ecdsa-sha2-nistp256*, *ssh-rsa* and *ssh-ed25519*.

## Parameters

### **-vserver <Vserver Name> - Vserver**

Identifies the Vserver for which you want to replace the existing SSH configurations.

### **[-key-exchange-algorithms <algorithm name>,...] - Key Exchange Algorithms**

Enables the specified SSH key exchange algorithm or algorithms for the Vserver. This parameter also replaces all existing SSH key exchange algorithms with the specified settings.

### **[-ciphers <cipher name>,...] - Ciphers**

Enables the specified cipher or ciphers for the Vserver. This parameter also replaces all existing ciphers with the specified settings.

### **[-mac-algorithms <MAC name>,...] - MAC Algorithms**

Enables the specified MAC algorithm or algorithms for the Vserver. This parameter also replaces all existing MAC algorithms with the specified settings.

### **[-max-authentication-retry-count <integer>] - Max Authentication Retry Count**

Modifies the maximum number of authentication retry count for the Vserver.

### **[-host-key-algorithms <HostKey Algorithms>,...] - Host Key Algorithms**

Enables the specified host key algorithm or algorithms for the Vserver. This parameter also replaces all existing host key algorithms with the specified settings.

### **[-is-rsa-in-publickey-algorithms-enabled {true|false}] - Is ssh-rsa in Publickey Algorithms Enabled**

Modifies the flag to enable or disable *ssh-rsa* signature scheme, which is based on SHA-1 hash algorithm, for RSA keys in publickey algorithms.

## Examples

The following command enables the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group14-sha1* key exchange algorithms for the "cluster1" Vserver. It also enables the *aes256-ctr*, *aes192-ctr* and *aes128-ctr* ciphers, *hmac-sha1* and *hmac-sha2-256* MAC algorithms for the "cluster1" Vserver. It also disables *ssh-rsa* signature scheme for RSA keys in publickey algorithms and modifies the maximum authentication retry count to 3 for the "cluster1" Vserver:

```
cluster1::> security ssh modify -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group14-sha1 -ciphers
aes256-ctr,aes192-ctr,aes128-ctr -mac-algorithms hmac-sha1,hmac-sha2-256
-is-rsa-in-publickey-algorithms-enabled false -max-authentication-retry
-count 3
```

## security ssh prepare-to-downgrade

Downgrade the SSH configuration to be compatible with releases earlier than Data ONTAP 9.2.0.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command downgrades the SSH configurations of all Vservers and the cluster to settings compatible with releases earlier than ONTAP 9.2.0. This command also disables the max-authentication-retry feature. You must run this command in advanced privilege mode when prompted to do so during the release downgrade. Otherwise, the release downgrade process will fail.

### Examples

The following command downgrades the SSH security configurations of all Vservers and the cluster to settings compatible with releases earlier than ONTAP 9.2.0.

```
cluster1::*> security ssh prepare-to-downgrade
```

## security ssh remove

### Remove SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security ssh remove` command removes the specified SSH key exchange algorithms or ciphers from the existing configurations of the cluster or a Vserver. The removed algorithms or ciphers are disabled on the cluster or Vserver. If you changed the cluster configuration settings, it will be used as the default for all newly created Vservers. If the SSH key exchange algorithms or ciphers that you specify with this command are not currently enabled, the command does not fail. ONTAP supports the *diffie-hellman-group-exchange-sha256*, *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. ONTAP also supports the AES and 3DES symmetric encryption (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm* and *3des-cbc*. ONTAP supports MAC algorithms of the following types: *hmac-*

*sha1* , *hmac-sha1-96* , *hmac-md5* , *hmac-md5-96* , *umac-64* , *umac-64* , *umac-128* , *hmac-sha2-256* , *hmac-sha2-512* , *hmac-sha1-etm* , *hmac-sha1-96-etm* , *hmac-sha2-256-etm* , *hmac-sha2-512-etm* , *hmac-md5-etm* , *hmac-md5-96-etm* , *umac-64-etm* , and *umac-128-etm* .

## Parameters

### **-vserver <Vserver Name> - Vserver**

Identifies the Vserver from which you want to remove the SSH key exchange algorithms or ciphers.

### **[-key-exchange-algorithms <algorithm name>,...] - List of SSH Key Exchange Algorithms to Remove**

Removes the specified key exchange algorithm or algorithms from the Vserver.

### **[-ciphers <cipher name>,...] - List of SSH Ciphers to Remove**

Removes the specified cipher or ciphers from the Vserver.

### **[-mac-algorithms <MAC name>,...] - List of SSH MAC Algorithms to Remove**

Removes the specified MAC algorithm or algorithms from the Vserver.

### **[-host-key-algorithms <HostKey Algorithms>,...] - List of SSH Host Key Algorithms to Remove**

Removes the specified host key algorithms from the Vserver.

## Examples

The following command removes the *diffie-hellman-group1-sha1* and *diffie-hellman-group-exchange-sha1* key exchange algorithms from the cluster1 Vserver. It also removes the *aes128-cbc* and *3des-cbc* ciphers and the *hmac-sha1-96* and *hmac-sha2-256* MAC algorithms from the cluster1 Vserver.

```
cluster1::> security ssh remove -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group1-sha1,diffie-hellman-group-exchange-sha1 -ciphers
aes128-cbc,3des-cbc -mac-algorithms hmac-sha1-96,hmac-sha2-256
```

## security ssh show

Display SSH configuration options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `` security ssh show`` command displays the configurations of the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether ```_ssh-rsa_``` signature scheme is enabled for RSA keys in publickey algorithms, for the cluster and Vservers. The SSH protocol uses a Diffie-Hellman based key exchange method to establish a shared secret key during the SSH negotiation phrase. The key exchange method specifies how one-time session keys are generated for encryption and authentication and how the server authentication takes place. ONTAP supports the ```_diffie-hellman-group-exchange-sha256_```, ```_diffie-hellman-group16-sha512_``` and ```_diffie-hellman-group18-sha512_``` key exchange algorithms for SHA-2. ONTAP also supports the ```_diffie-hellman-group-exchange-sha1_```, ```_diffie-hellman-group14-sha1_```, and ```_diffie-hellman-group1-sha1_``` key exchange algorithms for SHA-1. ONTAP also supports ```_ecdh-sha2-nistp256_```, ```_ecdh-sha2-nistp384_```, ```_ecdh-sha2-nistp521_``` and ```_curve25519-sha256_```. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: ```_aes256-ctr_```, ```_aes192-ctr_```, ```_aes128-ctr_```, ```_aes256-cbc_```, ```_aes192-cbc_```, ```_aes128-cbc_```, ```_aes128-gcm_```, ```_aes256-gcm_``` and ```_3des-cbc_```. ONTAP supports MAC algorithms of the following types: ```_hmac-sha1_```, ```_hmac-sha1-96_```, ```_hmac-md5_```, ```_hmac-md5-96_```, ```_umac-64_```, ```_umac-128_```, ```_hmac-sha2-256_```, ```_hmac-sha2-512_```, ```_hmac-sha1-etm_```, ```_hmac-sha1-96-etm_```, ```_hmac-sha2-256-etm_```, ```_hmac-sha2-512-etm_```, ```_hmac-md5-etm_```, ```_hmac-md5-96-etm_```, ```_umac-64-etm_``` and ```_umac-128-etm_```. ONTAP supports host key algorithms of the following types: ```_ecdsa-sha2-nistp256_```, ```_ssh-rsa_``` and ```_ssh-ed25519_```.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Identifies the Vserver for which you want to display the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether `ssh-rsa` signature scheme is enabled for RSA keys in publickey algorithms.

**[-key-exchange-algorithms <algorithm name>,...] - Key Exchange Algorithms**

Displays the Vserver or Vservers that have the specified key exchange algorithms enabled.

**[-ciphers <cipher name>,...] - Ciphers**

Displays the Vserver or Vservers that have the specified ciphers enabled.

**[-mac-algorithms <MAC name>,...] - MAC Algorithms**

Displays the Vserver or Vservers that have the specified MAC algorithm or algorithms.

**[-max-authentication-retry-count <integer>] - Max Authentication Retry Count**

Displays Vservers with a matching maximum authentication retry count value. The default value of this parameter is *6*.

**[-host-key-algorithms <HostKey Algorithms>,...] - Host Key Algorithms**

Displays Vservers with matching host key algorithms.

**[-is-rsa-in-publickey-algorithms-enabled {true|false}] - Is ssh-rsa in Publickey Algorithms Enabled**

Identifies whether *ssh-rsa* signature scheme, which uses the SHA-1 hash algorithm, is enabled or disabled for RSA keys in publickey algorithms. The default value of this parameter is *true*.

**Examples**

The following command displays the enabled SSH ciphers, key exchange algorithms, MAC algorithms, host key algorithms, whether *ssh-rsa* signature scheme is enabled for RSA keys in publickey algorithms and maximum number of authentication retry count for the cluster and all Vservers. The cluster settings are used as the default for all newly created Vservers:

```
cluster1::> security ssh show
```

```
Is ssh-rsa      Max
```

```
in Publickey Auth
```

| Algorithms<br>Vserver<br>Enabled | Retry<br>Ciphers<br>Count    | Key Exchange<br>Algorithms                                      | MAC<br>Algorithms                                         | Host Key<br>Algorithms  |

## security ssl commands

## security ssl modify

### Modify the SSL configuration for HTTP servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command modifies the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

#### Parameters

##### **-vserver <Vserver Name> - Vserver**

Identifies a Vserver for hosting SSL-encrypted web services.

##### **[-ca <text>] - Server Certificate Issuing CA**

Identifies a Certificate Authority (CA) of a certificate to be associated with the instance of a given Vserver. If this parameter, along with serial, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

##### **[-serial <text>] - Server Certificate Serial Number**

Identifies a serial number of a certificate to be associated with the instance of a given Vserver. If this parameter, along with ca, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

##### **[-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name**

Identifies the common name (CN) of a certificate to be associated with the instance of a given Vserver. This parameter becomes optional if serial and ca are specified. You can use the [security certificate create](#) and [security certificate install](#) commands to add new certificates to Vservers.

The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the [security certificate install](#) command to configure it before enabling SSL on a Vserver.

##### **[-server-enabled {true|false}] - SSL Server Authentication Enabled**

Defines the working condition of SSL server authentication in an instance of the Vserver. Any Vserver with a valid certificate of type server is server-enabled.

##### **[-client-enabled {true|false}] - SSL Client Authentication Enabled**

Defines the working condition of SSL client authentication in an instance of the Vserver. Any Vserver with a valid certificate of type client-ca is client-enabled. It can only be enabled if server-enabled is true.

##### **[-ocsp-enabled {true|false}] - Online Certificate Status Protocol Validation Enabled**

This parameter enables OCSP validation of the client certificate chain. When this parameter is enabled, certificates in the certificate chain of the client will be validated against an OCSP responder after normal verification (including CRL checks) has occurred. The OCSP responder used for validation process is either extracted from the certificate itself, or it is derived by configuration.

**`[-ocsp-default-responder <text>]` - URI of the Default Responder for OCSP Validation**

This parameter sets the default OCSP responder to use. If this parameter is not enabled, the URI given will be used only if no responder URI is specified in the certificate that are being verified.

**`[-ocsp-override-responder {true|false}]` - Force the Use of the Default Responder URI for OCSP Validation**

This parameter forces the configured default OCSP responder to be used during OCSP certificate validation, even if the certificate that is being validated references an OCSP responder.

**`[-ocsp-responder-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for OCSP Queries**

Use this parameter to specify the timeout in seconds for OSCP responders. Specify zero for the minimum possible timeout. The default value is 10 seconds.

**`[-ocsp-max-response-age <integer_or_unlimited>]` - Maximum Allowable Age for OCSP Responses (secs)**

This parameter sets the maximum allowable age (freshness) in seconds for the OCSP responses. The default value for this parameter is unlimited, which does not enforce a maximum age and the OCSP responses are considered valid as long as their expiration date field is in the future.

**`[-ocsp-max-response-time-skew <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Maximum Allowable Time Skew for OCSP Response Validation**

This parameter sets the maximum allowable time difference for OCSP responses (when validating their "ThisUpdate" and "NextUpdate" fields).

**`[-ocsp-use-request-nonce {true|false}]` - Use a NONCE within OCSP Queries**

This parameter determines whether the queries to the OCSP responders should contain a NONCE or not. By default, a query NONCE is always used and checked against the OCSP response. When the responder does not use NONCEs, this parameter should be disabled.

A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

## Examples

The following example enables SSL server authentication for a Vserver named vs0 with a certificate that has ca as www.example.com and serial as 4F4EB629.

```
cluster1::> security ssl modify -vserver vs0 -ca www.example.com -serial
4F4EB629 -server-enabled true
```

The following example disables SSL server authentication for a Vserver name vs0.

```
cluster1::> security ssl modify -vserver vs0 -server-enabled false
```

The following example enables SSL client authentication for a Vserver named vs0.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled true
```

The following example disables SSL client authentication for a Vserver named vs0.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled false
```

## security ssl show

Display the SSL configuration for HTTP servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-ocsp ]**

If you specify the `-ocsp` parameter, the command displays the Online Certificate Status Protocol configuration.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Identifies a Vserver for hosting SSL-encrypted web services.

**[-ca <text>] - Server Certificate Issuing CA**

Filters the display of SSL configuration by specifying the Certificate Authority (CA) that issued the server certificate.

**[`-serial <text>`] - Server Certificate Serial Number**

Filters the display of SSL configuration by specifying the serial number of a server certificate.

**[`-common-name <FQDN or Custom Common Name>`] - Server Certificate Common Name**

Filters the display of SSL configuration by specifying the common name for the server certificate.

**[`-server-enabled {true|false}`] - SSL Server Authentication Enabled**

Filters the display of SSL configuration according to whether the SSL server authentication is enabled or disabled. Vservers have self-signed certificates automatically generated during their creation. These Vserver self-signed certificates are server-enabled by default.

**[`-client-enabled {true|false}`] - SSL Client Authentication Enabled**

Filters the display of SSL configuration according to whether the SSL client authentication is enabled or disabled. You can enable client authentication only when server authentication is enabled.

**[`-ocsp-enabled {true|false}`] - Online Certificate Status Protocol Validation Enabled**

Filters the display of SSL configuration when the Online Certificate Status Protocol validation is enabled.

**[`-ocsp-default-responder <text>`] - URI of the Default Responder for OCSP Validation**

Filters the display of SSL configuration according to the URI of the default responder for OCSP validation.

**[`-ocsp-override-responder {true|false}`] - Force the Use of the Default Responder URI for OCSP Validation**

Filters the display of SSL configuration, which forces the use of the default responder URI for OCSP validation.

**[`-ocsp-responder-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>`] - Timeout for OCSP Queries**

Filters the display of SSL configuration according to the timeout for queries to OCSP responders.

**[`-ocsp-max-response-age <integer_or_unlimited>`] - Maximum Allowable Age for OCSP Responses (secs)**

Filters the display of SSL configuration according to the maximum allowable age (freshness) in seconds for the OCSP responses.

**[`-ocsp-max-response-time-skew <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>`] - Maximum Allowable Time Skew for OCSP Response Validation**

Filters the display of SSL configuration according to the maximum allowable time difference for OCSP responses (when validating their "ThisUpdate" and "NextUpdate" fields).

**[`-ocsp-use-request-nonce {true|false}`] - Use a NONCE within OCSP Queries**

Filters the display of SSL configuration by specifying whether the queries to the OCSP responders should contain a NONCE or not.

A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

## Examples

The following example displays the configured certificates for Vservers.

```
cluster1::security ssl> show
```

| Vserver  | Serial Number | Common Name          | Server Enabled | Client Enabled |
|----------|---------------|----------------------|----------------|----------------|
| cluster1 | 516C3CB3      | cluster1.company.com | true           | true           |
| vs0      | 516816D4      | vs0.company.com      | true           | false          |

2 entries were displayed.

# security tpm commands

## security tpm show

Display the status of TPM

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays information about the status of the Trusted Platform Module(TPM) device. By default, this command displays the following information:

- Node name
- Availability of the device
- State of the device, if available
- Firmware version
- Firmware upgrade counter

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value

### **[`-is-available {yes|no}`] - Is TPM Available?**

Selects the nodes that match this parameter value.

- yes - The TPM device is mounted and available.
- no - The node does not support a TPM.

### **[`-is-active {yes|no}`] - Is TPM Active?**

Selects the nodes that match this parameter value.

- yes - The TPM device is available and active.
- no - if `-is-available` parameter is `yes`, the TPM device is mounted and available but is not responding to TPM commands.

### **[`-version <text>`] - Firmware Version**

Selects the nodes that match this firmware version.

### **[`-upgrade-count <integer>`] - Firmware Counter**

Selects the nodes that match the given number of firmware upgrade tries left.

### **[`-sym-key-size <integer>`] - Size of Primary Symmetric Key**

Selects the nodes that match the given symmetric key size for the primary symmetric key.

## **Examples**

```
cluster1::> security tpm show
```

| Node  | Available? | Active? | Firmware Version | Firmware Counter |
|-------|------------|---------|------------------|------------------|
| node1 | yes        | yes     | 2.5              | 64               |
| node2 | yes        | yes     | 2.5              | 64               |

2 entries were displayed.

# **security webauthn commands**

## **security webauthn show**

Show Webauthn Global Settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `security webauthn show` displays information on the global FIDO2/WebAuthn settings.

## **Parameters**

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays all the fields for the global WebAuthn settings.

**[-vserver <vserver name>] - Vserver**

Selects the WebAuthn settings that match this parameter value. If not specified, all cluster-level and Vserver-level settings are displayed.

**[-timeout <integer>] - Timeout (ms)**

Displays all the fields for the FIDO2/WebAuthn global settings.

**[-attestation {none|indirect|direct|enterprise}] - Attestation Conveyance Type**

Displays all the fields for the FIDO2/WebAuthn global settings.

**[-require-rk {true|false}] - Require Resident Key**

Displays all the fields for the FIDO2/WebAuthn global settings.

**[-resident-key {required|preferred|discouraged}] - Resident Key**

Displays all the fields for the FIDO2/WebAuthn global settings.

**[-user-verification {required|preferred|discouraged}] - User Verification**

Displays all the fields for the FIDO2/WebAuthn global settings.

**[-scope {svm|cluster}] - Cluster or SVM**

Displays all the fields for the FIDO2/WebAuthn global settings.

## Examples

The example below displays information on FIDO2/WebAuthn global settings:

```
cluster1::> security webauthn show
Vserver: cluster1
          Timeout (ms): 600000
Attestation Conveyance Type: none
          Require Resident Key: false
          Resident Key: discouraged
          User Verification: discouraged
```

## security webauthn credentials delete

### Delete Webauthn Credentials Data

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `security webauthn credentials delete` command deletes a previously registered FIDO2/WebAuthn credential. All users can delete their own registered FIDO2/WebAuthn credentials, regardless of their authorization role. Only users with *admin* privileges can delete FIDO2/WebAuthn credentials belonging to other users.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter optionally specifies the Vserver associated with the FIDO2/WebAuthn credential. If not specified, this defaults to the cluster Vserver.

### **-username <text> - Username**

Name of the user whose credential is to be deleted.

### **-index <integer> - Index**

The index of the FIDO2/WebAuthn credential to be deleted. This is used to identify the specific credential if the user has multiple FIDO2/WebAuthn credentials registered and only one of them is to be deleted.

### **-rpId <text> - Relying Party ID**

The rpId of the FIDO2/WebAuthn credential to be deleted.

## Examples

The following command, when executed by a user with admin privileges, deletes all registered FIDO2/WebAuthn credentials for the Administrative Vserver. When executed by users without admin privileges, the command only deletes that user's own registered credentials:

```
cluster1::> security webauthn credentials delete *  
4 entries were deleted.
```

The following command, when executed by a user with admin privileges, deletes all registered FIDO2/WebAuthn credentials for the Administrative Vserver for the username *user1*:

```
cluster1::> security webauthn credentials delete -username user1 *  
1 entry was deleted.
```

The following command, when executed by a user with admin privileges, deletes the registered FIDO2/WebAuthn credentials for the Administrative Vserver for the username *user1* at index *1* for the rpId *myontap.example.com*:

```
cluster1::> security webauthn credentials delete -username user1 -index 1  
-rpId myontap.example.com  
1 entry was deleted.
```

## security webauthn credentials show

### Show Webauthn Credentials Data

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `security webauthn credentials show` displays information on the FIDO2/WebAuthn registered credentials.

#### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays all the fields for the FIDO2/WebAuthn registered credentials.

**[-vserver <vserver name>] - Vserver**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value. Only cluster-level credentials are supported at this time.

**[-username <text>] - Username**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-index <integer>] - Index**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-rpId <text>] - Relying Party ID**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-credential-id-sha <text>] - SHA-256 Hashed Credential ID**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-publickey-algorithm <text>] - Public Key Algorithm**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-publickey <text>] - Public Key**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-display-name <text>] - Display Name**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-credential-type <public-key>] - Credential Type**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[-rpName <text>] - Relying Party Name**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[*-creation-time* <MM/DD/YYYY HH:MM:SS>] - Creation Time**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[*-last-used* <MM/DD/YYYY HH:MM:SS>] - Last Used**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

**[*-scope* {*svm*|*cluster*}] - Cluster or SVM**

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

## Examples

The example below displays information on the FIDO2/WebAuthn registered credentials:

```
cluster1:> security webauthn credentials show
Vserver: cluster1
                                Username: admin
                                Index: 0
                                Relying Party ID: myontap.example.com
                                SHA-256 Hashed Credential ID: aaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
                                Public Key Algorithm: ES256
                                Public Key: abcd=
                                Display Name: admin
                                Credential Type: public-key
                                Relying Party Name: myontap.example.com
                                Creation Time: 6/10/2024 15:01:00
                                Last Used: 6/10/2024 15:01:00
```

## security webauthn supported-algorithms show

### Show WebAuthn Supported Algorithms

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `security webauthn supported-algorithms show` displays information on the FIDO2/WebAuthn supported algorithms.

### Parameters

**{ [*-fields* <fieldname>,...]**

Selects the fields that you specify.

**| [*-instance* ] }**

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

**[-vserver <vserver name>] - Vserver**

Selects the FIDO2/WebAuthn settings that match this parameter value. If not specified, all cluster-level and Vserver-level settings are displayed.

**[-alg-name <text>] - Algorithm Name**

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

**[-alg-id <integer>] - Algorithm ID**

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

**[-alg-type <public-key>] - Algorithm Type**

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

**[-scope {svm|cluster}] - Cluster or SVM**

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

## Examples

The example below displays information on the FIDO2/WebAuthn supported algorithms:

```
cluster1::> security webauthn supported-algorithms show
```

```
Vserver: cluster1
```

| ID    | Name   | Type       |
|-------|--------|------------|
| ----- | -----  | -----      |
| -7    | ES-256 | public-key |
| -35   | ES-384 | public-key |
| -257  | RS-256 | public-key |

```
3 entries were displayed.
```

# snaplock commands

## snaplock compliance-clock commands

### snaplock compliance-clock initialize

Initializes the node ComplianceClock

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

`snaplock compliance-clock initialize` command is used to initialize System ComplianceClock from the system clock. User should ensure that the system clock is correct before initializing the System ComplianceClock. System ComplianceClock can be initialized multiple times as long as all nodes in the cluster are healthy, all volumes are in online state, no volumes are present in the volume recovery queue and there are no SnapLock volumes or volumes with "snapshot-locking-enabled" parameter set to true or S3 buckets with object locking enabled.

#### Parameters

**-node {<nodename>|local} - Node**

Specifies the name of the node on which System ComplianceClock needs to be initialized.

**[-force <true>] - Forces Initialization**

If you use this parameter, it will suppress the warning message during `snaplock compliance-clock initialize` operation.

#### Examples

```
cluster-1::> snaplock compliance-clock initialize -node node1
```

```
Warning: You are about to initialize the secure ComplianceClock of the
node
```

```
node1 to the current value of the node's system clock. This
procedure can be performed only once on a given node, so you
should
```

```
ensure that the system time is set correctly before proceeding.
```

```
The current node's system clock is: Wed Nov 26 16:18:30 IST 2014
```

```
Do you want to continue? {y|n}: y
```

```
cluster-1::>
```

### snaplock compliance-clock show

Displays the node ComplianceClock

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The ``snaplock compliance-clock show`` command will display System ComplianceClock of the nodes in the cluster. It will display the following information:

- Node name
- ComplianceClock Time

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command will display ComplianceClock for that particular node only.

**[-time <text>] - ComplianceClock Time of the Node**

If this parameter is specified, the command will display nodes having the same `-time` value.

## Examples

```
cluster1::> snaplock compliance-clock show
Node                               ComplianceClock Time
-----
node1                             Mon Jan 12 11:34:15 IST 2015 +05:30
node2                             Mon Jan 12 11:34:10 IST 2015 +05:30
2 entries were displayed.
```

```
cluster1::> snaplock compliance-clock show -node node1
Node                               ComplianceClock Time
-----
node1                             Mon Jan 12 11:34:45 IST 2015 +05:30
```

## snaplock compliance-clock ntp modify

Modify SnapLock ComplianceClock synchronization setting

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `snaplock compliance-clock ntp modify` command modifies the option to enable or disable the SnapLock ComplianceClock synchronization with the system time. The ComplianceClock is synchronized only when an NTP server has been configured so that the system time follows the NTP time and the skew between the ComplianceClock time and the system time is greater than 1 day.

## Parameters

**`[-is-sync-enabled {true|false}]` - Enable ComplianceClock sync to NTP system time (privilege: advanced)**

Specifies whether synchronization should be enabled or not. This is a cluster wide option.

## Examples

```
cluster1::> snaplock compliance-clock ntp modify -is-sync-enabled true
```

## snaplock compliance-clock ntp show

Display SnapLock ComplianceClock synchronization setting

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `snaplock compliance-clock ntp show` command will display ComplianceClock synchronization setting. It will display the following information:

- `is-sync-enabled` - Displays if the option to synchronize the ComplianceClock with system time has been enabled or not.

## Examples

```
cluster1::> snaplock compliance-clock ntp show
Enable clock sync to NTP system time: true
```

# snaplock event-retention commands

## snaplock event-retention abort

Abort an Event Based Retention policy operation.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock event-retention abort` is used to abort an ongoing Event Based Retention (EBR) operation. This command only aborts the operations that have not yet completed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the vservers on which the EBR operation is running.

### **-operation-id <integer> - Operation ID**

Specifies the operation ID of the EBR operation that needs to be aborted.

## Examples

The following example aborts an ongoing EBR operation with operation-id 16842754 :

```
vs1::> snaplock event-retention abort -operation-id 16842754
vs1::>
```

## snaplock event-retention apply

Apply an Event Based Retention policy on all files within a user specified path.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock event-retention apply` command starts a new operation to apply the specified Event Based Retention (EBR) policy to all files in the specified path. If a file is a regular file, it will be made a WORM file and retained for a retention-period as defined by the specified policy name. If a file is already WORM, its retention time will be extended to a retention-period as defined by the specified policy name, starting from the current time. The retention time of a file will be extended only if the file's current retention time is less than the new retention time value to be set. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver which has the EBR policy defined to be applied on one or more files.

### **-policy-name <text> - Policy Name**

Specifies the name of the EBR policy to be applied on one or more files.

### **-volume <volume name> - Volume**

Specifies the name of the SnapLock volume containing a file path or a directory path as specified by the path parameter. The specified EBR policy is applied to one or more files depending on the value of path.

### **-path <text> - Path**

Specifies the path relative to the output volume root, of the form `"/path"`. The path can be path to a file or a directory. The EBR policy is applied to all files under the specified path. To apply the EBR policy to all files in a volume, specify the path as `"/"`.

## Examples

The following example starts an EBR operation to apply a policy on files for specified volume:

```
vs1::> snaplock event-retention apply -policy-name p1 -volume slc -path /
        SnapLock event based retention operation is queued. Run
"snaplock event-retention show -operation-id 16842754 -instance" to view
the operation status.
```

## snaplock event-retention show-vservers

Show Vservers with SnapLock Event Based Retention policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock event-retention show-vservers` command is used to display the Vservers that have SnapLock Event Based Retention (EBR) policies created.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## Examples

The following example displays all Vservers that have SnapLock EBR policies:

```
cluster-1::*> snaplock event-retention show-vservers
Vserver
-----
vs1
```

## snaplock event-retention show

Show status of Event Based Retention operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock event-retention show` command displays the status of an Event Based Retention (EBR) operation. Information about completed operations will be cleaned up after an hour after completion. Only a

user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays all EBR operations that match the specified Vserver.

**[-operation-id <integer>] - Operation ID**

If this parameter is specified, the command displays all EBR operations that match the specified operation ID.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays all EBR operations that match the specified volume. The parameter specifies the volume on which EBR operation is running or has completed.

**[-path <text>] - Path**

If this parameter is specified, the command displays all EBR operations that match the specified path. The parameter specifies the path on which EBR operation is running or has completed.

**[-policy-name <text>] - Policy Name**

If this parameter is specified, the command displays all EBR operations that match the specified policy name. The parameter specifies the EBR policy name.

**[-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Retention Period**

If this parameter is specified, the command displays all EBR operations that match the specified retention period. The parameter specifies the retention period of the EBR policy.

**[-num-files-processed <integer>] - Number of Files Processed**

If this parameter is specified, the command displays all EBR operations that match the specified number of processed files. The parameter specifies the number of files on which EBR policy was applied successfully.

**[-num-files-failed <integer>] - Number of Files Failed**

If this parameter is specified, the command displays all EBR operations that match the specified number of failed files. The parameter specifies the number of files on which the application of EBR policy failed.

**[-num-files-skipped <integer>] - Number of Files Skipped**

If this parameter is specified, the command displays all EBR operations that match the specified number of skipped files. The parameter specifies the number of files on which the application of EBR policy was skipped. A file that is under legal-hold will be skipped. If the retention time of a file is being shortened as a result of applying the EBR policy, that file will also be skipped.

### **[-num-inodes-ignored <integer>] - Number of Inodes Ignored**

If this parameter is specified, the command displays all EBR operations that match the specified number of ignored inodes. The parameter specifies the number of inodes on which the application of EBR policy was not attempted because they were not regular files.

### **[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status**

If this parameter is specified, the command displays all EBR operations that match the specified operation status. The parameter specifies the operation status of an EBR operation.

### **[-status-details <text>] - Status Details**

If this parameter is specified, the command displays all EBR operations that match the specified status details. The parameter specifies the status details of an EBR operation.

## **Examples**

The following examples show the status of EBR operations for Vserver "vs1" and volume "slc" and the status of event-retention operation for operation ID *16842753* respectively.

```
vs1::*> snaplock event-retention operation show -volume slc
      Operation ID   Vserver      Volume      Operation
      Status
      -----
      16842753      vs1        slc         Completed
      16842754      vs1        slc         In-progress
vs1::*> snaplock event-retention operation show -operation-id 16842753
Operation ID: 16842753
      Vserver: vs1
      Volume: slc
      Path: /vol/slc/d1
      Policy Name: p1
      Retention Period: 10 years
Number of Files Processed: 50
      Number of Files Failed: 0
      Number of Inodes Ignored: 2
      Operation Status: Completed
      Status Details: No error
```

## **snaplock event-retention policy create**

Create SnapLock Event Based Retention policies for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock event-retention policy create` command is used to create Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which a policy needs to be created.

### **-name <text> - Policy Name**

Specifies the name of the EBR policy to be created.

### **-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite} - Event Retention Period**

Specifies the retention period for an EBR policy.

## Examples

The following example creates a new EBR policy "p1" for Vserver "vs1" with a retention period of "10 years":

```
vs1::> snaplock event-retention policy create -name p1 -retention-period "10 years"
```

## snaplock event-retention policy delete

Delete SnapLock Event Based Retention policies for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock event-retention policy delete` command is used to delete Event Based Retention (EBR) policies for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

### **-vserver <vserver name> - Vserver Name**

If this parameter is specified, the command deletes all EBR policies that match the specified Vserver.

### **-name <text> - Policy Name**

If this parameter is specified, the command deletes all EBR policies that match the specified *name*.

## Examples

The following example deletes retention policy "p1" for Vserver "vs1":

```
vs1::> snaplock event-retention policy delete -name p1
```

## snaplock event-retention policy modify

Modify SnapLock Event Based Retention policies for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock event-retention policy modify` command is used to modify the retention period of an Event Based Retention (EBR) policy for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which retention period of a policy needs to be modified.

**-name <text> - Policy Name**

Specifies the name of the EBR policy for which the retention period needs to be modified.

**[-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Event Retention Period**

Specifies the new value of retention period.

### Examples

The following example modifies the retention period of policy "p1" for Vserver "vs1" to "5 years":

```
vs1::> snaplock event-retention policy modify -name p1 -retention-period  
"5 years"
```

## snaplock event-retention policy show

Show SnapLock Event Based Retention policies for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock event-retention policy show` command is used to show Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. The command output depends on the parameter or parameters specified. If no parameters are specified, all policies for all vservers will be displayed. If one or more parameters are specified, only those entries matching the specified values will be displayed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays all EBR policies that match the specified Vserver.

**[-name <text>] - Policy Name**

If this parameter is specified, the command displays all EBR policies that match the specified *name* .

**[-retention-period [{<integer> seconds|minutes|hours|days|months|years} | infinite]] - Event Retention Period**

If this parameter is specified, the command displays all EBR policies that match the specified *retention-period* .

## Examples

The following example displays all event-retention policies for vservers "vs1":

```
vs1::> snaplock event-retention policy show
```

| Vserver | Name | Retention Period |
|---------|------|------------------|
| vs1     | p1   | 10 years         |
| vs1     | p2   | 5 years          |

# snaplock legal-hold commands

## snaplock legal-hold abort

Abort Snaplock legal-hold operation.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock legal-hold abort` is used to abort an ongoing legal-hold operation. The type of legal-hold operations that can be aborted using this command are begin, end and dump-files. This command only aborts operations that have not yet completed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the vservers on which the legal-hold operation is running.

**-operation-id <integer> - Operation ID**

Specifies the operation ID of the legal-hold operation to be aborted.

## Examples

The following example aborts an ongoing legal-hold operation with operation-id *16842754* :

```
vs1::> snaplock legal-hold abort -operation-id 16842754
vs1::>
```

## snaplock legal-hold begin

Starts an operation to place files under legal-hold in the user specified path on a SnapLock compliance volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock legal-hold begin` command is used to place specified file or files under legal-hold for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver which owns the volume. The specified file or files to be placed under legal-hold reside on this volume.

**-litigation-name <text> - Litigation Name**

Specifies the name of the litigation for which the file or files have to be placed under legal-hold.

**-volume <volume name> - Volume**

Specifies the name of the SnapLock compliance volume on which the file or files to be placed under legal-hold reside.

**-path <text> - Path**

Specifies a path relative to the volume root. The path can be either a file path of the single file to be placed under legal-hold or a directory path where all regular files under it must be placed under legal-hold.

## Examples

The following example starts a legal-hold begin operation on file *file1* in volume *slc\_vol1* :

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /file1
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold
show -operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold begin operation on all files in the volume `slc_voll`:

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold
show -operation-id 16842775 -instance" to view the operation status.
```

## snaplock legal-hold dump-files

Dump list of files under legal-hold to specified output path.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock legal-hold dump-files` is used to dump the list of files under legal-hold for a given vservers, volume and litigation to an auto-generated file in the user specified path. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which the list of files under legal-hold is to be dumped.

**-litigation-name <text> - Litigation Name**

Specifies the name of the litigation for which the list of files under legal-hold is to be dumped.

**-volume <volume name> - Volume Name**

Specifies the name of the SnapLock compliance volume for which the list of files under legal-hold is to be dumped.

**-output-volume <volume name> - Output Volume Name**

Specifies the name of the output volume containing the output directory path where the list of files under legal-hold is to be dumped. The output volume must be a regular read-write volume.

**-output-directory-path <text> - Path Relative to Output Volume Root**

Specifies the output directory path relative to the output volume root, where the list of files under legal-hold is to be dumped. The output directory path should be of the form `"/directory-path"`. If output needs to be dumped on the volume root, specify the path as `"/"`.

## Examples

The following example starts a legal-hold dump-files operation:

```
vs1::> snaplock legal-hold dump-files -volume voll_slc -litigation-name
lit1 -output-volume voll -output-directory-path /d1
        SnapLock legal-hold dump-files operation is queued. Run
"snaplock legal-hold show -operation-id 16842754 -instance" to view the
operation status.
        vs1::>
```

## snaplock legal-hold dump-litigations

Dump list of litigations for a given Vserver to specified output path.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock legal-hold dump-litigations` is used to dump the list of litigations for a given vservers to a user specified path. Under the user specified path, we create a directory with a unique name. Under the user specified path, a directory with an auto-generated name is created. Under this directory, multiple files are created. Each file represents a unique litigation name that was found in the given vservers. Each file contains a list of volume names that have files under legal-hold for that given litigation. For example, if the file name is "lit1" and the contents of the file are "volume1" and "volume2", then it indicates that both these volumes have files under legal-hold for litigation "lit1". Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

### Parameters

#### **-vservers <vservers name> - Vserver Name**

Specifies the name of the Vserver for which the list of litigations is to be dumped.

#### **[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays the list of litigations for volume that matches the specified value. The volume must be of type SnapLock compliance.

#### **-output-volume <volume name> - Output Volume Name**

Specifies the name of the output volume containing the output directory path where the list of litigations is to be dumped. The output volume must be a regular read-write volume.

#### **-output-directory-path <text> - Path Relative to Output Volume Root**

Specifies the output directory path relative to the volume root, where the list of litigations is to be dumped. The output directory path should be of the form `"/directory-path"`. If output needs to be dumped to the volume root, specify the path as `"/"`.

## Examples

The following example starts a legal-hold dump-litigations job:

```
vs1::> snaplock legal-hold dump-litigations -output-volume vol1 -output
-directory-path /d1
        Dump Litigations job for Vserver "vs1" has been queued. Run
"job show -id 22 -instance" to view the status.
        vs1::>
```

## snaplock legal-hold end

Starts an operation to release legal-hold on files in the user specified path on a SnapLock compliance volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock legal-hold end` command is used to release legal-hold on specified file or files for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver which owns the volume. The specified file or files to be released from legal-hold reside on this volume.

#### **-litigation-name <text> - Litigation Name**

Specifies the name of the litigation for which the file or files have to release from legal-hold.

#### **-volume <volume name> - Volume**

Specifies the name of the SnapLock compliance volume on which the file or files to be released from legal-hold reside.

#### **-path <text> - Path**

Specifies a path relative to the volume root. The path can be either a file path of the single file to be released from legal-hold or a directory path where all regular files under it must be released from legal-hold.

### Examples

The following example starts a legal-hold end operation on file *file1* in volume *slc\_vol1*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume
slc_vol1 -path /file1
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show
-operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold end operation on all files in the volume *slc\_vol1*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume
slc_voll -path /
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show
-operation-id 16842775 -instance" to view the operation status.
```

## snaplock legal-hold show

Show status of a legal-hold operation.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock legal-hold show` command displays the status of a legal-hold operation. Information about completed operations will be cleaned up after an hour of completion. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays all legal-hold operations that match the specified Vserver.

**[-operation-id <integer>] - Operation ID**

If this parameter is specified, the command displays all legal-hold operations that match the specified operation ID.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays all legal-hold operations that match the specified volume. The parameter specifies the volume on which legal-hold operation is running or has completed.

**[-path <text>] - Path**

If this parameter is specified, the command displays all legal-hold operations that match the specified path. The parameter specifies the path on which legal-hold operation is running or has completed.

**[-litigation-name <text>] - Litigation Name**

If this parameter is specified, the command displays all legal-hold operations that match the specified litigation name. The parameter specifies the legal-hold litigation name.

**[-operation-type {unknown|begin|end|dump-files}] - Operation Type**

If this parameter is specified, the command displays all legal-hold operations that match the specified

operation type. The parameter specifies the type of legal-hold operation.

**[`-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}`] - Operation Status**

If this parameter is specified, the command displays all legal-hold operations that match the specified operation status. The parameter specifies the status of legal-hold operation.

**[`-num-files-processed <integer>`] - Number of Files Processed**

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files processed. The parameter specifies the number of files on which legal-hold operation was successful.

**[`-num-files-failed <integer>`] - Number of Files Failed**

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files failed. The parameter specifies the number of files on which legal-hold operation failed.

**[`-num-files-skipped <integer>`] - Number of Files Skipped**

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files skipped.

The parameter specifies the number of files on which legal-hold begin operation was skipped. The legal-hold begin operation is skipped on a file if it is already under hold for a given litigation or if it is a hard link to a file that is already under hold for a given litigation.

**[`-num-inodes-ignored <integer>`] - Number of Inodes Ignored**

If this parameter is specified, the command displays all legal-hold operations that match the specified number of inodes ignored. The parameter specifies the number of inodes on which the legal-hold operation was not attempted because they were not regular files.

**[`-status-details <text>`] - Status Details**

If this parameter is specified, the command displays all legal-hold operations that match the specified status details. The parameter specifies the status details of an legal-hold operation.

## Examples

The following examples show the status of legal-hold operations for Vserver `vs1` and volume `slc_vol1` and the status of legal-hold operation for operation ID `16842786` respectively:

```
vs1::> snaplock legal-hold show -volume slc_voll
```

| Operation  | Operation ID | Vserver | Volume   | Operation Status |
|------------|--------------|---------|----------|------------------|
| begin      | 16842784     | vs1     | slc_voll | Completed        |
| begin      | 16842786     | vs1     | slc_voll | Completed        |
| begin      | 16842788     | vs1     | slc_voll | In-Progress      |
| dump-files | 16842790     | vs1     | slc_voll | Completed        |
| end        | 16842794     | vs1     | slc_voll | Completed        |

5 entries were displayed.

```
vs1::> snaplock legal-hold show -operation-id 16842786
```

```
Vserver: vs1
      Volume: slc_voll
      Operation ID: 16842786
      Litigation Name: litigation1
      Path: /
      Operation Type: begin
      Status: Completed
Number of Files Processed: 100
      Number of Files Failed: 15
      Number of Files Skipped: 20
      Number of Inodes Ignored: 0
      Status Details: No error
```

## snaplock log commands

### snaplock log create

Create audit log configuration for a Vserver.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `snaplock log create` command is used to create a SnapLock log configuration for the Vserver. A SnapLock log configuration consists of volume to store the log, the maximum size of the log file, and the default period of time for which the log file should be retained.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which the configuration needs to be created.

### **-volume <volume name> - Log Volume Name**

Specifies the name of the volume that is used for logging. This must be a SnapLock Compliance volume.

### **[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File**

Specifies the maximum size of the log file. Once a log file reaches this limit, it is archived and a new log file is created. This parameter is optional. The default value is *10MB*.

### **[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Default Log Record Retention Period**

Specifies the default period of time a record (which is logged) is retained. This parameter is optional. The default value is *"6 months"*.

## Examples

```
cluster1::> snaplock log create -volume voll -max-log-size 50MB -default
-retention-period "1 year" -vserver vs1
[Job 47] Job succeeded: SnapLock log created for Vserver "vs1".
```

## snaplock log delete

Delete audit log configuration for a Vserver.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock log delete` command deletes the SnapLock log configuration associated with the Vserver. This command closes all the active log files in the log volume and mark the volume as disabled for SnapLock logging.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver whose SnapLock log configuration is deleted.

## Examples

```
cluster1::> snaplock log delete -vserver vs1
[Job 47] Job succeeded: SnapLock log deleted for Vserver "vs1".
```

## snaplock log modify

Modify audit log configuration for a Vserver.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock log modify` command modifies the SnapLock log configuration of the Vserver. Log volume, maximum size of log file, and default retention period can be modified. If the log volume is modified, then the active log files in the existing log volume is closed and the log volume is marked as disabled for logging. The new log volume is enabled for logging.

### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which the SnapLock log configuration needs to be modified.

**[-volume <volume name>] - Log Volume Name**

Specifies the new log volume that is configured for this Vserver for logging.

**[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File**

Specifies the new value for maximum log file size.

**[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Default Log Record Retention Period**

Specifies the new value for default retention period.

### Examples

```
cluster1::> snaplock log modify -volume vol1 -vserver vs1 -max-log-size 15MB
[Job 48] Job succeeded: SnapLock log modified for Vserver "vs1".
```

## snaplock log show

Display audit log configuration.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snaplock log show` command displays the following information about the SnapLock log infrastructure:

- Vserver name
- Volume name
- Maximum log size
- Default retention period

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays the log information for Vservers that match the specified value.

**[-volume <volume name>] - Log Volume Name**

If this parameter is specified, the command displays the log configuration for volumes that match the specified value.

**[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File**

If this parameter is specified, the command displays the log configuration with a matching `-max-log-size` value.

**[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Default Log Record Retention Period**

If this parameter is specified, the command displays the log configuration with a matching `-default-retention-period` value.

## Examples

```
cluster1::> snaplock log show -vserver vs1
Vserver Name                : vs1
  Log Volume Name            : 15MB
  Maximum Size of Log File    : 15MB
  Default Log Record Retention Period : 6 months
```

```
cluster1::> snaplock log show
      Vserver      Volume      Maximum Size
Retention Period
-----
vs1              vol1          15MB          6 months
```

## snaplock log file archive

### Archive Active Log Files in Log Volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock log file archive` command archives the currently active log file by closing it and creating a new active log file. If `base-name` is not provided, the command archives all active log files associated with the Vserver. Otherwise, the command archives the active log file associated with the `base-name` provided.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which active log files need to be archived.

### **[-base-name {privileged-delete | system | legal-hold}] - Base Name of Log File**

Specifies the log base-name, whose active log file needs to be archived. The base-name is the name of the source of log records. Valid base-names are *system*, *privileged-delete* and *legal-hold*. Each base-name has its own directory in which log files containing log records generated by base-name are stored.

## Examples

```
cluster1::> snaplock log archive -vserver vs1
[Job 48] Job succeeded: SnapLock log archived for Vserver "vs1".
```

## snaplock log file show

Display audit log file information.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snaplock log file show` command displays the following information about the log files:

- Vserver name
- Volume name
- File path
- Expiry time of the file
- File size

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, then log files in the Vserver that match the specified value is displayed.

**[-base-name {privileged-delete | system | legal-hold}] - Base Name of Log File**

If this parameter is specified, then the log files having a matching -base-name is displayed.

**[-volume <volume name>] - Log Volume Name**

If this parameter is specified, then the log files in volumes that match the specified value are shown.

**[-file-path <text>] - Log File Path**

If this parameter is specified, then the log files that match the specified value are displayed.

**[-expiry-time <text>] - Log File Expiry Time**

If this parameter is specified, then the log files having a matching -expiry-time value are displayed.

**[-file-size {<integer>[KB|MB|GB|TB|PB] }] - File Size**

If this parameter is specified, then the log files having a matching -file-size value are displayed.

**Examples**

```
cluster1::> snaplock log file show
      Vserver      Volume      Base Name      File
Path
-----
      vs1          vol1          system
/vol/vol1/snaplock_log/system_logs/20160120_183756_GMT-present
```

```
cluster1::> snaplock log file show -vserver vs1 -base-name system
Vserver      : vs1
      Volume      : vol1
      Base Name    : system
      File Path    :
/vol/vol1/snaplock_log/system_logs/20160120_183756_GMT-present
      Expiry Time  : Wed Jul 20 18:37:56 GMT 2016
      File Size    : 560B
```

# snapmirror commands

## snapmirror abort

Abort an active transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror abort` command stops SnapMirror transfers that might have started and not completed. A SnapMirror transfer is an operation on a given SnapMirror relationship and the relationship is identified by its destination endpoint, which can be a volume, a Vserver, an Application Consistency Group or a non-Data ONTAP endpoint. You identify the SnapMirror relationship with this command and the command aborts the transfer for the relationship. For load-sharing mirrors, the command also aborts transfers for other relationships that are part of the same load-sharing set. For SolidFire destination endpoints, the `snapmirror abort` command is only supported if the endpoint is in a SnapMirror relationship.

Load-sharing mirrors are either up to date and serving data to clients, or they are lagging and not serving data to clients. If the `snapmirror abort` command identifies an up-to-date load-sharing mirror, then SnapMirror transfers to the up-to-date load-sharing mirror and associated up-to-date load-sharing mirrors in the set of load-sharing mirrors are aborted. If the `snapmirror abort` command identifies a lagging load-sharing mirror, then only the SnapMirror transfer associated with the lagging load-sharing mirror is aborted.

After the `snapmirror abort` command successfully completes its operation, the volume on the receiving side of the transfer might contain a restart checkpoint. The restart checkpoint can be used by a subsequent transfer to restart and continue the aborted SnapMirror transfer.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

This command is not supported for SnapMirror active sync relationships with policy of type *automated-failover* or *automated-failover-duplex* in admin privilege level.

The use of wildcards in parameter values is not supported from the source Vserver or cluster for relationships with *"Relationship Capability"* of *"8.2 and above"*.

You can use this command from the source or the destination Vserver or cluster for FlexVol volume relationships.

For SnapMirror Synchronous relationships, this command aborts any ongoing transfer and takes the relationship OutOfSync. This can result in primary client IO failure for relationships with a policy of type *strict-sync-mirror*. Instead, the best practice recommendation is to use the [snapmirror quiesce](#) command.

Beginning with ONTAP 9.12.1, for SnapMirror Synchronous relationships on platforms that support NDO, `snapmirror abort` triggered in *"InSync"* state will not change the relationship status to *"OutOfSync"*. Instead, it will internally trigger the feature *"Fast Resync"* which will try to keep the relationship status *"InSync"*.

For Vserver SnapMirror relationships, this command must be run only from the cluster containing the destination Vserver.

## Parameters

### { [-S, -source-path

{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

### | [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the *-source* *-vserver* and *-source-volume* parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters *-source-volume* and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, *-source-cluster* must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### [-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters *-source-vserver* and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, *-source-cluster* must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### { -destination-path

{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

### | [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters *-destination-vserver* and *-destination-volume* must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **[-h, -hard <true>] - Discard Restart Checkpoint**

If this option is specified true, the restart checkpoint is discarded and the destination volume is restored to the last snapshot that was successfully transferred. You can use the `-hard` option to discard the restart checkpoint of a previous transfer attempt which forces the subsequent transfer to start with a fresh snapshot on the destination volume. This option can only be used from the destination Vserver or cluster. This parameter is not supported for relationships with non-Data ONTAP endpoints.

### **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability" of "Pre 8.2"*.

## **Examples**

To stop the active SnapMirror replication to the destination volume

`vs2.example.com:dept_eng_dp_mirror1`, type the following command:

```
vs2.example.com::> snapmirror abort -destination-path  
vs2.example.com:dept_eng_dp_mirror1
```

For relationships with *"Relationship Capability" of "Pre 8.2"*, to stop the active SnapMirror replication to the destination volume `cluster2://vs2.example.com/dept_eng_dp_mirror1`, type the following command:

```
cluster2::> snapmirror abort -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop the active SnapMirror replication to the destination Vserver `dvs1.example.com`, type the following command:

```
cluster2::> snapmirror abort -destination-path  
dvs1.example.com:
```

To stop the active SnapMirror replication to the destination Application Consistency Group *cg\_dst* in Vserver *vs2.example.com*, type the following command:

```
cluster2::> snapmirror abort -destination-path  
vs2.example.com:/cg/cg_dst
```

# snapmirror break

## Make SnapMirror destination writable

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror break` command breaks a SnapMirror relationship between a source and destination endpoint of a data protection mirror. The destination endpoint can be a Vserver, volume, Application Consistency Group or SolidFire endpoint. When ONTAP breaks the relationship, if the endpoint is a volume, Application Consistency Group or SolidFire endpoint, the destination is made read/write and can diverge from the source volume, client redirection is turned off on the destination, the restart checkpoint is cleared, and the clients can see the latest snapshot. If the endpoint is a Vserver, the subtype of the destination Vserver is changed to *default*, volumes in the destination Vserver are made read/write and the clients can now access the Vserver namespace for modifications. For SolidFire destination endpoints, the `snapmirror break` command is only supported if the endpoint is in a SnapMirror relationship. For an Application Consistency Group the item volumes are changed to read/write volumes and can diverge from the corresponding items on the source.

Subsequent manual or scheduled SnapMirror updates to the broken relationship will fail until the SnapMirror relationship is reestablished using the [snapmirror resync](#) command.

This command applies to data protection mirrors. For vault relationships, this command is only intended for use when preparing for a ONTAP revert operation (see the `-delete-snapshots` parameter in advanced privilege level). This command is not intended for use with load-sharing mirrors.

For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, the relationship must be *Quiesced* before running the `snapmirror break` command.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

The `snapmirror break` command must be used from the destination Vserver or cluster.

## Parameters

**{ [-S, -source-path**  
**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/**  
**share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source` `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ -destination-path**  
**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/**  
**share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

**| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

### **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability" of "Pre 8.2"*.

### **[-delete-snapshots <true>] - Delete Snapshots for Revert (privilege: advanced)**

Using this parameter causes break to delete snapshots on a vault destination so that the system can be reverted. Note that the only snapshots that will be deleted are those that were created with the current version of ONTAP. Any snapshots that might be present created with a different version will not be deleted. This parameter is not supported for SnapLock Compliance destinations.

### **[-s, -restore-destination-to-snapshot <text>] - Restore Destination to Snapshot Copy**

This optional parameter specifies the snapshot to which the destination volume is restored after a successful break operation. If the parameter is not specified, the destination is restored to the latest snapshot. This parameter is not supported for Vserver, Application Consistency Group or FlexGroup relationships or SnapLock Compliance destinations.

### **[-recover <true>] - Recover (privilege: advanced)**

When a SnapMirror break operation fails on a FlexGroup or Application Consistency Group relationship, a subset of the destination FlexGroup or Application Consistency Group constituents could have been made writable and subsequently user data could have been written to these constituents. To recover from this failure, you can execute the `snapmirror break` command again specifying the `-recover` parameter. All constituents will be restored to the latest snapshot, and any writes to the read-write constituents will be lost. This parameter is applicable only for SnapMirror relationships with FlexGroup and or Application Consistency Group endpoints.

## **Examples**

To stop the SnapMirror replication to the destination volume `vs2.example.com:dept_eng_dp_mirror1`, type the following command:

```
vs2.example.com::> snapmirror break -destination-path  
vs2.example.com:dept_eng_dp_mirror1
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to stop the SnapMirror replication to the destination volume `cluster2://vs2.example.com/dept_eng_dp_mirror1`, type the following command:

```
cluster2::> snapmirror break
               -destination-path cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop replication to the destination Vserver `dvs1.example.com` of a Vserver SnapMirror relationship, type the following command:

```
cluster2::> snapmirror break -destination-path dvs1.example.com:
```

To stop SnapMirror replication to the destination Application Consistency Group `app_cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror break -destination-path
vs2.example.com:/cg/app_cg_dst
```

## snapmirror create

Create a new SnapMirror relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror create` command creates a SnapMirror relationship between a source and destination endpoint. You can use this command to create a data protection relationship, an extended data protection relationship, or a load-sharing relationship between FlexVol volumes. You can also use it to create a data protection relationship between Vservers. A SnapMirror relationship between Vservers can only be created if the system containing the source Vserver is also running ONTAP 8.3 or later. You can also use the `snapmirror create` command to create an extended data protection relationship between FlexGroup volumes. FlexGroup volumes only support extended data protection relationships. A SnapMirror relationship between FlexGroup volumes is only supported if the system containing the source FlexGroup volume is also running ONTAP 9.1.0 or later. The source or destination of a FlexGroup SnapMirror relationship cannot be the source or destination of any non-FlexGroup SnapMirror relationship.

You can use the `snapmirror create` command to create a data protection relationship or an extended data protection relationship between SnapLock source and SnapLock destination endpoints. When the cluster containing the source is running ONTAP 9.5.0 or later, the default relationship type is extended data protection (XDP), otherwise it is data protection (DP).

A SnapMirror relationship can also be created between a non-SnapLock source and a SnapLock destination to WORM-protect snapshots. In this case, the relationship type is always set to extended data protection (XDP).

The `snapmirror create` command can be used to create an extended data protection (XDP) relationship between a ONTAP volume and a non-ONTAP endpoint that supports SnapMirror (AltaVault, Solidfire). AltaVault endpoints can only be used as destinations. SolidFire endpoints can be used as sources or destinations.

The `snapmirror create` command can be used to create a synchronous relationship between FlexVol volumes, which provides zero Recovery Point Objective (RPO) data protection. SnapMirror Synchronous supports two policy types, `sync-mirror` and `strict-sync-mirror`. Upon a permanent replication failure, the strict-sync-mirror variant restricts further client IO on the primary, whereas the sync-mirror variant does not.

The `snapmirror create` command can be used to create a SnapMirror active sync relationship between Consistency Groups that have FlexVol volumes as items. This provides zero RPO and zero Recovery Time Objective (RTO) data protection, also known as transparent application failover, for SAN workloads. An SnapMirror active sync relationship supports the `automated-failover` or `automated-failover-duplex` policy type and can only be created when the systems containing the source items and the destination items are running ONTAP 9.9.1 or later.

Asynchronous SnapMirror relationships can also be created between the source Application Consistency Groups and the destination Application Consistency Groups. In this case, the relationship type is always set to extended data protection (XDP). An Application Consistency Group consists of FlexVol volumes as items and the SnapMirror relationships can only be created when the systems containing the source items and the destination items are running ONTAP 9.13.1 or later.

Before using this command to create a SnapMirror relationship between Vservers, you typically create a source and destination Vserver using the `vserver create` command. The source Vserver should be of `subtype default` and the destination Vserver of `subtype dp-destination`. Also, before creating the relationship between Vservers, you must setup Vserver peer by using the `vserver peer create` command between the source and destination Vservers. A Vserver relationship cannot be created between two Vservers within the same cluster. The root volume of the destination Vserver will be read-write and data from the source Vserver's root volume will not be replicated. Therefore there will be no volume level relationship created between the root volumes of the two Vservers.

After creating the relationship, the destination Vserver must be initialized by using the `snapmirror initialize` command.

Before using this command to create a volume SnapMirror relationship, you typically create a source and destination volume using the `volume create` command. The source volume should be in the online state and a read-write (RW) type. The destination volume should be in the online state and a data protection (DP) type. For FlexGroup SnapMirror relationships, the source and destination FlexGroup volumes must be spread over the same number of aggregates as specified in the `-aggr-list` parameter with the same number of constituents per aggregate as specified in the `-aggr-list-multiplier` parameter of the `volume create` command.

When a FlexGroup SnapMirror relationship is created, normally hidden relationships are also created for the constituent volumes. These relationships can be seen by using the `-expand` parameter of the `snapmirror show` command. Source information for these relationships can be seen using the `-expand` parameter of the `snapmirror list-destinations` command. Other SnapMirror commands are disabled for FlexGroup constituent relationships and FlexGroup constituent volumes.

If all systems involved are running ONTAP version 8.2 and later, a Vserver peering relationship must be set up using the `vserver peer create` command between the source and the destination Vservers to create a relationship between the source and destination volumes. To enable interoperability with ONTAP 8.1, if the source volume is on a storage system running ONTAP 8.1, the cluster administrator can create a data

protection relationship between the source and destination volumes without a Vserver peering relationship between the source and destination Vservers. These relationships are managed the same way as on ONTAP 8.1 and the *"Relationship Capability"* field, as shown in the output of the [snapmirror show](#) command, is set to *"Pre 8.2"*.

SnapMirror relationships, except load-sharing relationships, which are created between two volumes which are both on a storage system running ONTAP version 8.2 and later have the *"Relationship Capability"* field set to *"8.2 and above"*.

Load-sharing mirrors must be confined to a single Vserver; they are not allowed to span Vservers. Load-sharing relationships are created with the *"Relationship Capability"* field set to *"Pre 8.2"* even if both the source and destination volumes are on a storage system running ONTAP version 8.2 and later. There is no *"8.2 and above"* implementation for load-sharing relationships.

A set of load-sharing mirrors can have one or more destination volumes. You create separate SnapMirror relationships between the common source volume and each destination volume to create the set of load-sharing mirrors.

The source or destination of a load-sharing relationship cannot be the source or destination of any other SnapMirror relationship.

After creating the relationship, the destination volume can be initialized using the [snapmirror initialize](#) command. The destination volumes in a set of load-sharing mirrors are initialized using the [snapmirror initialize-ls-set](#) command.

The `snapmirror create` command must be used from the destination Vserver or cluster.

## Parameters

**{ -S, -source-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}** - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source` `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-source-vserver <vserver name> - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not

supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ -destination-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

**| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**[-type <snapmirrorType>] - Relationship Type**

This parameter specifies the type of SnapMirror relationship that will be created. You can create a data protection (DP) relationship (deprecated), an extended data protection (XDP) relationship or a load-sharing (LS) relationship. The default value is XDP for all relationships except for Vserver DR relationships. FlexGroup volumes, Application Consistency Groups and non-ONTAP endpoints support only XDP relationships. For FlexVol volume relationships, when DP is specified as the type, an XDP relationship will be created unless a relationship of type DP in the opposite direction already exists. In that case the new relationship will be of type DP.

**[-vserver <vserver name>] - Managing Vserver**

If this optional parameter is specified, it designates the managing Vserver. The managing Vserver is authorized to use SnapMirror commands to manage the SnapMirror relationship. The `-vserver` parameter is currently a reserved parameter.

### **`[-schedule <text>]` - SnapMirror Schedule**

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the [snapmirror update](#) command or, in the case of a set of load-sharing mirrors, using the [snapmirror update-ls-set](#) command .

You define and name a schedule using the [job schedule cron create](#) command.

### **`[-policy <sm_policy>]` - SnapMirror Policy**

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. For FlexVol volume relationships, the default policy when the data protection (DP) type is specified is *MirrorAllSnapshots* and the default policy when no type is specified or when the extended data protection (XDP) type is specified is *MirrorAndVault* . For FlexGroup volume and Application Consistency Group relationships, the *MirrorAndVault* policy is applied. For SnapMirror relationships between SnapLock volumes, if no policy is specified the default policy *MirrorAllSnapshots* is applied. For relationships with a SolidFire endpoint, there is no default policy. For these relationships a policy as described below must be specified. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2" .

In ONTAP 8.2 data protection (DP) relationships were used for mirroring, while extended data protection (XDP) relationships were used for vaulting. In ONTAP 8.3 extended data protection (XDP) relationships support two more use cases, mirroring and unified mirror-vault. The exact behavior of an extended data protection (XDP) relationship is governed by the `snapmirror policy` associated with that relationship. In ONTAP 8.3 the `snapmirror policy` has a new field *type* to indicate how the relationships with that policy will behave. The supported types are *async-mirror* (mirroring), *vault* (vaulting) and *mirror-vault* (unified mirroring and vault). For XDP relationships between a ONTAP source volume and an AltaVault destination endpoint, only policies of type *vault* are supported. For XDP relationships between a ONTAP source volume and a SolidFire destination endpoint, only policies of type *async-mirror* without an *all\_source\_snapshots* rule are supported. For XDP relationships between a SolidFire source endpoint and a ONTAP destination volume, only policies of type *async-mirror* without an *all\_source\_snapshots* rule, and policies of type *mirror-vault* are supported. SnapMirror policies of type *async-mirror* associated with FlexVol volume relationships when relationship type DP is specified or when no relationship type is specified, must include the label *all\_source\_snapshots* . Refer to the man page for the [snapmirror policy create](#) command for more information.

You define and name a policy using the [snapmirror policy create](#) command.

### **`[-tries <integer_or_unlimited>]` - Tries Limit**

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The `-tries` parameter can be set to *0* to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2" . For relationships with "8.2 and above" capability, the tries limit is controlled by the value of tries in the SnapMirror policy that is associated with the relationship.

### **`[-k, -throttle <throttleType>]` - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or *0* . The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4* ,

it will be treated as 4 . For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The `-throttle` parameter does not affect load-sharing mirrors and other SnapMirror relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

**`[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings`**

This optional parameter specifies a list of the consistency group (CG) item mappings. It is considered only if the supplied source and destination path values denote valid CG paths. For CG level relationships, this parameter must be specified. The value for this parameter must contain mappings of one or more pairs of constituent source and destination volumes of the form `srcvol1:@dstvol1,...`.

**`[-identity-preserve {true|false}] - Identity Preserve Vserver DR`**

Specifies whether or not the identity of the source Vserver is replicated to the destination Vserver of the Vserver SnapMirror relationship that will be created. If this parameter is set to true, the source Vserver's configuration will additionally be replicated to the destination. If the parameter is set to false, then only the source Vserver's volumes and RBAC configuration are replicated to the destination. This parameter is applicable only for SnapMirror relationships with Vserver endpoints. The default value is false.

**`[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled`**

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup volume should be auto-expanded if the source FlexGroup volume is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. The default value is true. For Application Consistency Groups, this parameter is always set to true.

**`[-backoff-level {high|medium|none}] - SM Backoff Level due to Client Ops`**

This optional parameter specifies the SnapMirror backoff level due to client ops. This parameter is supported only for FlexVol SnapMirror relationships. The default value is `high`.

## Examples

To create an extended data protection relationship between the source endpoint

`vs1.example.com:dept_eng`, and the destination endpoint `vs2.example.com:dept_eng_dp_mirror2`, with the default policy of `MirrorAndVault`, type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:dept_eng_dp_mirror2 -source-path
vs1.example.com:dept_eng
```

To create an extended data protection relationship between the source FlexGroup

`vs1.example.com:fg_src` and the destination FlexGroup `vs2.example.com:fg_dst`, with the default policy of `MirrorAndVault`, type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:fg_dst -source-path
vs1.example.com:fg_src
```

To create a SnapMirror Synchronous relationship between the source FlexVol `vs1.example.com:vol_log`, and the destination FlexVol `vs2.example.com:vol_log_sync_dp` when the source cluster is running

ONTAP 9.5 or above, type the following command:

```
vs2.example.com::> snapmirror create -destination-path  
vs2.example.com:vol_log_sync_dp -source-path  
vs1.example.com:vol_log -policy Sync
```

To create a strict SnapMirror Synchronous relationship between the source FlexVol *vs1.example.com:vol\_log*, and the destination FlexVol *vs2.example.com:vol\_log\_sync\_dp* when the source cluster is running ONTAP 9.5 or above, type the following command:

```
vs2.example.com::> snapmirror create -destination-path  
vs2.example.com:vol_log_sync_dp -source-path  
vs1.example.com:vol_log -policy StrictSync
```

To create a data protection mirror between the source endpoint *cluster1://vs1.example.com/dept\_eng*, and the destination endpoint *cluster2://vs2.example.com/dept\_eng\_dp\_mirror2* when the source cluster is running ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror create -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2 -source-path  
cluster1://vs1.example.com/dept_eng  
-type DP
```

To create a load-sharing mirror between the source endpoint *cluster1://vs1.example.com/vs1\_root* which is a Vserver root volume, and the destination endpoint *cluster1://vs1.example.com/vs1\_root\_ls1* with the schedule named *5min* used to update the relationship, type the following command:

```
cluster1::> snapmirror create  
-destination-path cluster1://vs1.example.com/vs1_root_ls1  
-source-path cluster1://vs1.example.com/vs1_root -type LS  
-schedule 5min
```

To create a SnapMirror relationship between the source Vserver *vs1.example.com*, and the destination Vserver *dvs1.example.com* with the schedule named *hourly* used to update the relationship, type the following command:

```
cluster2::> snapmirror create  
-destination-path dvs1.example.com:  
-source-path vs1.example.com:  
-schedule hourly
```

To create an extended data protection (XDP) relationship between the ONTAP source endpoint `vs1.example.com:data_ontap_vol`, and the AltaVault destination endpoint `10.0.0.11:/share/share1`, type the following command:

```
vs1.example.com::> snapmirror create -destination-path
10.0.0.11:/share/share1 -source-path
vs1.example.com:data_ontap_vol
-type XDP
```

To create an extended data protection (XDP) relationship between the SolidFire source endpoint `10.0.0.12:/lun/0001`, and the ONTAP destination endpoint `vs2.example.com:data_ontap_vol2`, type the following command:

```
vs2.example.com::> snapmirror create -source-path
10.0.0.12:/lun/0001 -destination-path
vs2.example.com:data_ontap_vol2
-type XDP -policy MirrorLatest
```

To create an SnapMirror active sync relationship with the following attributes:

- It is between the source Consistency Group `cg_src` in Vserver `vs1.example.com`, and the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`.
- It has item mappings between volumes `srcvol1` and `srcvol2` and volumes `dstvol1` and `dstvol2`.
- It can use the default policy named `AutomatedFailOver` that has a policy type of `automated-failover` or `AutomatedFailOverDuplex` that has a policy type of `automated-failover-duplex`.

Type the following command from the destination cluster:

```
destination::> snapmirror create -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src
-policy AutomatedFailOver
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

To create an extended data protection relationship between the source Application Consistency Group `vs1.example.com:/cg/cg_src` and the destination Application Consistency Group `vs2.example.com:/cg/cg_dst`, with the policy of `MirrorAllSnapshots`, type the following command:

```
destination::> snapmirror create -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src
-policy MirrorAllSnapshots
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

## snapmirror delete

### Delete a SnapMirror relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror delete` command removes the SnapMirror relationship between a source endpoint and a destination endpoint. The destination endpoint can be a Vserver, a volume, an Application Consistency Group, or a non-ONTAP endpoint. The Vservers, volumes, FlexVol volumes of the Consistency Group and non-ONTAP destinations are not destroyed and snapshots on the volumes are not removed.

For relationships with SolidFire endpoints, the SnapMirror source commands [snapmirror release](#) and [snapmirror list-destinations](#) are not supported. Therefore, snapshots that are locked by SnapMirror on the source container cannot be cleaned up using the [snapmirror release](#) command. If the source container is a ONTAP volume, in order to reclaim space captured in the base snapshot on the volume, issue a `snapshot delete` command specifying the `-ignore-owners` parameter in diag privilege level. To reclaim space captured in a snapshot locked by SnapMirror on a SolidFire system, refer to SolidFire documentation.

The `snapmirror delete` command fails if a SnapMirror transfer for the SnapMirror relationship is in progress for relationships with "*Relationship Capability*" of "*Pre 8.2*". For relationships with "*8.2 and above*" capability the delete will succeed even if a transfer is in progress and the transfer will ultimately stop.

A set of load-sharing mirrors can contain multiple destination volumes, each destination volume having a separate SnapMirror relationship with the common source volume. When used on one of the SnapMirror relationships from the set of load-sharing mirrors, the `snapmirror delete` command deletes the specified SnapMirror relationship from the set of load-sharing mirrors.

The `snapmirror delete` command preserves the read-write or read-only attributes of the volumes of a SnapMirror relationship after the relationship is deleted. Therefore, a read-write volume that was the source of a SnapMirror relationship retains its read-write attributes, and a data protection volume or a load-sharing volume that was a destination of a SnapMirror relationship retains its read-only attributes. Similarly, the

*subtype* attribute of source and destination Vservers is not modified when a Vserver SnapMirror relationship is deleted.

When a SnapMirror relationship from a set of load-sharing mirrors is deleted, the destination volume becomes a data protection volume and retains the read-only attributes of a data protection volume.

For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, the relationship must be *Quiesced* before it can be deleted.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, the `snapmirror delete` command must be used from the destination Vserver or cluster. The SnapMirror relationship information is deleted from the destination Vserver, but no cleanup or deletion is performed on the source Vserver. The [snapmirror release](#) command must be issued on the source Vserver to delete the source relationship information.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, you can use this command from the source or from the destination cluster. When used from the destination cluster, the SnapMirror relationship information on the source and destination clusters is deleted. When used from the source cluster, only the SnapMirror relationship information on the source cluster is deleted.

## Parameters

**{ [-S, -source-path  
<[vserver:] [volume]>|<[[cluster:] //vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source` `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### **[`-source-volume <volume name>`] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### **{ `-destination-path`**

**{`<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>`} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

### **[`-destination-cluster <Cluster name>`] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **`-destination-vserver <vserver name>` - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **`-destination-volume <volume name>` - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **[`-unmap-namespace <true>`] - Unmap namespace**

If specified, namespace mapping and the subsystem are deleted

### **[`-f, -force <true>`] - Force**

If specified, the delete proceeds even if it cannot clean up all artifacts of the relationship.

### **[`-w, -foreground <true>`] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

## Examples

To delete the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, type the following command:

```
vs2.example.com::> snapmirror delete -destination-path  
vs2.example.com:dept_eng_dp_mirror4
```

For relationships with "Relationship Capability" of "Pre 8.2", to delete the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror4`, type the following command:

```
cluster2::> snapmirror delete -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror4
```

To delete the SnapMirror relationship with destination endpoint `dvs1.example.com:`, type the following command:

```
cluster2::> snapmirror delete -destination-path  
dvs1.example.com:
```

To delete the SnapMirror active sync relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command from the destination cluster:

```
destination::> snapmirror delete -destination-path  
vs2.example.com:/cg/cg_dst
```

To delete the Application Consistency Group SnapMirror relationship with the destination Application Consistency Group `app_cg_dst` in Vserver `vs2.example.com` and all item mappings, type the following command:

```
vs2.example.com::> snapmirror delete -destination-path  
vs2.example.com:/cg/app_cg_dst
```

## Related Links

- [snapmirror release](#)
- [snapmirror list-destinations](#)
- [snapmirror show](#)

# snapmirror flexgroup-euuid-prefix-prepare-to-downgrade

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `flexgroup-euuid-prefix-prepare-to-downgrade` command prepares nodes to downgrade to a release without FlexGroup endpoint prefixed with the group endpoint uuid capability. Prior to disabling the capability, remove all FlexGroup SnapMirror object store relationships which have a source or destination endpoint prefixed with the group endpoint uuid.

## Examples

The following example disables the FlexGroup endpoint prefixed with group endpoint uuid capability in the local cluster:

```
cluster1::> snapmirror flexgroup-euuid-prefix-prepare-to-downgrade
```

# snapmirror initialize-ls-set

Start a baseline load-sharing set transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror initialize-ls-set` command initializes and updates a set of load-sharing mirrors. This command is usually used after the [snapmirror create](#) command is used to create a SnapMirror relationship for each of the destination volumes in the set of load-sharing mirrors. The initial transfers to empty load-sharing mirrors are baseline transfers done in parallel. During a baseline transfer ONTAP takes a snapshot on the source volume to capture the current image of the source volume and transfers all of the snapshots on the source volume to each of the destination volumes.

After the `snapmirror initialize-ls-set` command successfully completes, the last snapshot transferred is made the exported snapshot on the destination volumes.

The parameter that identifies the set of load-sharing mirrors is the source volume. Data and snapshots are transferred from the source volume to all up-to-date destination volumes in the set of load-sharing mirrors.

Use the [snapmirror initialize](#) command to add and initialize a new destination volume to an existing set of load-sharing mirrors.

Even if the load-sharing set only has one mirror, you still need to use the `snapmirror initialize-ls-set` command to initialize the set. The [snapmirror initialize](#) command can only be used to initialize a new destination volume, if the load-sharing set has already been initialized.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"*

showing as *"Pre 8.2"* in the output of the `snapmirror show` command.

## Parameters

**{ -S, -source-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cname]>} - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**[-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-source-vserver <vserver name> - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**-source-volume <volume name> - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

## Examples

To initialize the group of load-sharing mirrors for the source endpoint *//vs1.example.com/vs1\_root*, type the following command:

```
cluster1::> snapmirror initialize-ls-set -source-path
//vs1.example.com/vs1_root
```

## Related Links

- [snapmirror initialize](#)
- [snapmirror show](#)

# snapmirror initialize

Start a baseline transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror initialize` command initializes the destination Vserver, volume, Application Consistency Group or a non-ONTAP endpoint of a SnapMirror relationship. The command behaves differently between data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships.

If you specify a *sync-mirror* or *strict-sync-mirror* type policy, the `snapmirror initialize` command creates and initializes a synchronous relationship and brings it InSync, providing zero RPO data protection.

If you are initializing a relationship with a policy of type *automated-failover* the `snapmirror initialize` command initializes a SnapMirror active sync relationship and brings the status to InSync, providing zero RPO and zero RTO data protection.

If you are initializing a relationship with a policy of type *automated-failover-duplex* the `snapmirror initialize` command initializes a SnapMirror active sync relationship and brings the status to InSync, providing zero RPO, zero RTO data protection and load balanced solution.

SnapMirror active sync is only supported for SAN. As a result, NAS access is not supported on SnapMirror active sync volumes and SnapMirror active sync initialization is not supported on volumes with NAS access.

For data protection (DP) and extended data protection (XDP) relationships, the `snapmirror initialize` command initializes the destination volume.

For load-sharing (LS) relationships, the `snapmirror initialize` command initializes a new load-sharing mirror in an existing set of load-sharing mirrors. If the command finishes before the start of a scheduled or manual transfer of the set of load-sharing mirrors, the load-sharing mirror is up to date with the set of load-sharing mirrors; otherwise, the load-sharing mirror will be brought up to date at the next scheduled or manual transfer of the set of load-sharing mirrors.

The initial transfer to an empty destination volume is called a baseline transfer. During a baseline transfer for a data protection (DP) or extended data protection (XDP) relationship, the `snapmirror initialize` command takes a snapshot on the source volume to capture the current image of the source volume. For data protection relationships, the `snapmirror initialize` command transfers all of the snapshots up to and including the snapshot created by it from the source volume to the destination volume. For extended data protection (XDP) relationships, the `snapmirror initialize` command behavior depends on the `snapmirror policy` associated with the relationship. If the policy type is *async-mirror* then depending on the rules in the policy it can transfer either all the snapshots up to and including the snapshot created by it or only the snapshot created by it from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type *vault* or *mirror-vault* the `snapmirror initialize`

transfers only the snapshot created by it.

After the `snapmirror initialize` command successfully completes, the last snapshot transferred is made the exported snapshot on the destination volume.

You can use the `snapmirror initialize` command to initialize a specific load-sharing mirror that is new to the set of load-sharing mirrors. An initialize of the new load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

Using the `snapmirror initialize` command to initialize a set of load-sharing mirrors will not work. Use the `snapmirror initialize-ls-set` command to initialize a set of load-sharing mirrors.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror initialize` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before initializing the relationship. This implicit create feature is not supported for Vservers.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror initialize` command must be used from the destination Vserver or cluster.

If a node is rebooted then the initialization will not automatically resume, must be restarted by the user.

## Parameters

**{ [-S, -source-path <[vserver:] [volume]>|<[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **[`-source-vserver <vserver name>`] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### **[`-source-volume <volume name>`] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### **{ `-destination-path`**

**{`<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>`} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

### **| [`-destination-cluster <Cluster name>`] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **`-destination-vserver <vserver name>` - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **`-destination-volume <volume name>` - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **[`-s, -source-snapshot <text>`] - Source Snapshot**

This optional parameter specifies the snapshot that `snapmirror initialize` will use for the baseline transfer. For data protection (DP) relationships, the baseline transfer will include all of the snapshots up to and including the specified snapshot. For extended data protection (XDP) relationships, the `snapmirror initialize` command behavior depends on the `snapmirror policy` associated with the relationship. If the policy type is *async-mirror* then depending on the rules in the policy it can transfer either all the snapshots up to and including the specified snapshot or only the specified snapshot from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type *vault* or

`mirror-vault` the `snapmirror initialize` transfers only the specified snapshot. This parameter is not supported for SnapMirror Synchronous relationships and relationships with *"Relationship Capability"* of *"Pre 8.2"*.

#### **`[-type <snapmirrorType>]` - Snapmirror Relationship Type**

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the [snapmirror create](#) command.

#### **`[-policy <sm_policy>]` - SnapMirror Policy**

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

You define and name a policy using the [snapmirror policy create](#) command.

#### **`[-k, -throttle <throttleType>]` - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the initialize transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the [snapmirror create](#) or [snapmirror modify](#) command will be used. To fully use the network bandwidth available, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*. For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. For SnapMirror Synchronous relationships the throttle value is applicable only for asynchronous transfers performed as part of user-initiated operations. The `-throttle` parameter does not affect load-sharing transfers and transfers for other relationships with *"Relationship Capability"* of *"Pre 8.2"* confined to a single cluster.

#### **`[-transfer-priority {low|normal}]` - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a *"Relationship Capability"* of *"Pre 8.2"*.

#### **`[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}]` - Consistency Group Item Mappings**

This optional parameter specifies a list of the consistency group (CG) item mappings. It is considered only if the supplied source and destination path values denote valid CG paths. For CG level relationships, this parameter must be specified. The value for this parameter must contain mappings of one or more pairs of constituent source and destination volumes of the form *srcvoll:@dstvoll,...*.

#### **`[-is-auto-expand-enabled {true|false}]` - Is Auto Expand Enabled**

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this initialize is creating a new SnapMirror relationship, the default value is *true*. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is not specified the existing value will be retained.

#### **`[-backoff-level {high|medium|none}]` - SM Backoff Level due to Client Ops**

This optional parameter specifies the SnapMirror backoff level due to client ops. This parameter is supported only for FlexVol SnapMirror relationships. The default value is *high*.

## **[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

## **Examples**

To start the initial transfer for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept\_eng\_dp\_mirror2* after the relationship has been created with the [snapmirror create](#) command, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path  
vs2.example.com:dept_eng_dp_mirror2
```

For relationships with "Relationship Capability" of "Pre 8.2", to start the initial transfer for the SnapMirror relationship with the destination endpoint *cluster2://vs2.example.com/dept\_eng\_dp\_mirror2* after the relationship has been created with the [snapmirror create](#) command, type the following command:

```
cluster2::> snapmirror initialize -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To create a data protection mirror relationship between the source endpoint *vs1.example.com:dept\_mkt*, and the destination endpoint *vs2.example.com:dept\_mkt\_dp\_mirror*, and start the initial transfer, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path  
vs.example.com2:dept_mkt_dp_mirror  
-source-path vs1.example.com:dept_mkt
```

To create a data protection mirror relationship between the source endpoint *cluster1://vs1.example.com/dept\_mkt*, and the destination endpoint *cluster2://vs2.example.com/dept\_mkt\_dp\_mirror*, and start the initial transfer when the source cluster is running ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror initialize -destination-path  
cluster2://vs2.example.com/dept_mkt_dp_mirror  
-source-path cluster1://vs1.example.com/dept_mkt
```

To create an extended data protection (XDP) relationship between the ONTAP source endpoint *vs1.example.com:data\_ontap\_vol*, and the AltaVault destination endpoint *10.0.0.11:/share/share1*, and start the initial transfer, type the following command:

```
vs1.example.com::> snapmirror initialize -destination-path
10.0.0.11:/share/share1
-source-path vs1.example.com:data_ontap_vol -type XDP
```

To start the initial transfer for the Vserver SnapMirror relationship with destination endpoint *dvs1.example.com*: after the relationship was created with the [snapmirror create](#) command, type the following command:

```
cluster2::> snapmirror initialize -destination-path
dvs1.example.com:
```

To initialize the SnapMirror Synchronous relationship between FlexVol volumes *vol\_log* and *vol\_log\_sync\_dp* and bring it to InSync, after it is created using the [snapmirror create](#) command, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
vs2.example.com:vol_log_sync_dp
```

To create a strict SnapMirror Synchronous relationship between FlexVol volumes *vol\_log* and *vol\_log\_sync\_dp*, to initialize it and bring it to InSync, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
vs2.example.com:vol_log_sync_dp -source-path
vs1.example.com:vol_log -policy StrictSync
```

To create and initialize an SnapMirror active sync relationship with the following attributes:

- It is between the source Consistency Group *cg\_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*.
- It has item mappings between volumes *srcvol1* and *srcvol2* and volumes *dstvol1* and *dstvol2*.
- It uses the policy named *AutomatedFailOver* that has a policy type of *automated-failover*.

Type the following command from the destination cluster:

```
destination::> snapmirror initialize -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src
-policy AutomatedFailOver
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

To initialize the previously created SnapMirror active sync relationship, type the following command from the destination cluster:

```
destination:> snapmirror initialize -destination-path  
vs2.example.com:/cg/cg_dst
```

To create and initialize an Application Consistency Group relationship with the following attributes:

- It is between the source Application Consistency Group *app\_cg\_src* in Vserver *vs1.example.com*, and the destination Application Consistency Group *app\_cg\_dst* in Vserver *vs2.example.com*. It has item mappings between volumes *srcvol1* and *dstvol2* and volumes *srcvol2* and *dstvol1*. It uses the default policy named *MirrorAndVault* that has a policy type of *mirror-vault*.

Type the following command from the destination cluster:

```
destination:> snapmirror initialize -destination-path  
vs2.example.com:/cg/app_cg_dst -source-path  
vs1.example.com:/cg/app_cg_src  
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

To initialize the previously created Application Consistency Group relationship, type the following command from the destination cluster:

```
destination:> snapmirror initialize -destination-path  
vs2.example.com:/cg/app_cg_dst
```

## snapmirror list-destinations

Display a list of destinations for SnapMirror sources

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror list-destinations` command displays information including the destination endpoints, the relationship status, and transfer progress, for SnapMirror relationships whose source endpoints are in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context. +

The command might display several relationships that have the same source and destination endpoints, but have different relationship IDs. If this is the case, some of the information is stale. It corresponds to relationships that have been deleted on the destination Vserver or cluster, and have not been released yet on the source Vserver or source cluster.

The relationships and the information displayed are controlled by the parameters that you specify. If no parameters are specified, the command displays the following information associated with each SnapMirror relationship whose source endpoint is in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context:

- Source path
- Relationship Type
- Destination Path
- Relationship Status
- Transfer Progress
- Progress Last Updated
- Relationship ID

Note the following limitations on the information displayed by the `snapmirror list-destinations` command:

- The *"Relationship Status"* field is not valid after the node hosting the source volume joins the cluster quorum, until at least one transfer is performed on the SnapMirror relationship.
- *"Transfer Progress"* and *"Progress Last Updated"* fields are only valid if a snapshot transfer is in progress.
- The *"Relationship ID"* field is not valid for Vserver SnapMirror relationships.
- The *"Relationship Status"*, *"Transfer Progress"*, and *"Progress Last Updated"* fields are not valid for FlexGroup relationships, but they are valid for FlexGroup constituent relationships.

The `-instance` and `-fields` parameters are mutually exclusive and select the fields that are displayed. The `-instance` parameter if specified, displays detailed information about the relationships. The `-fields` parameter specifies what fields should be displayed. The other parameters of the `snapmirror list-destinations` command, select the SnapMirror relationships for which the information is displayed.

This command is not supported for SnapMirror relationships with non-ONTAP endpoints.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command only displays the fields that you have specified.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all relationships selected.

**{ [-S, -source-path**

**<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

Selects SnapMirror relationships that have a matching source path name.

**| [-source-vserver <vserver name>] - Source Vserver**

Selects SnapMirror relationships that have a matching source Vserver name.

**[-source-volume <volume name>] - Source Volume }**

Selects SnapMirror relationships that have a matching source volume name.

**{ [-destination-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Destination Path**

Selects SnapMirror relationships that have a matching destination path name.

**| [-destination-vserver <vserver name>] - Destination Vserver**

Selects SnapMirror relationships that have a matching destination Vserver name.

**[-destination-volume <volume name>] - Destination Volume }**

Selects SnapMirror relationships that have a matching destination volume name.

**[-relationship-id <UUID>] - Relationship ID**

Selects SnapMirror relationships that have a matching relationship identifier. This parameter is not supported for Vserver SnapMirror relationships.

**[-type <snapmirrorType>] - Relationship Type**

Selects SnapMirror relationships that have a matching relationship type. Possible values are:

- DP
- XDP
- RST

**[-relationship-group-type**

**{none|vserver|consistencygroup|flexgroup|vserverflexgroup|vserverconsistencygroup  
}] - Relationship Group Type**

Selects SnapMirror relationships that have a matching relationship group type. Possible values are:

- *none*
- *vserver*
- *flexgroup*

**[-policy-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|automated-failover-duplex|continuous|undefined}] - SnapMirror Policy Type**

Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:

- async-mirror
- vault
- mirror-vault

**`[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings`**

Selects SnapMirror relationships that have a matching list of Consistency Group (CG) item mappings. This parameter is applicable to CG level relationships only.

**`[-status <mirror status>] - Relationship Status`**

Selects SnapMirror relationships that have a matching relationship status. Possible values are:

- Idle
- Transferring

This parameter is not supported for FlexGroup and Application Consistency Group SnapMirror relationships, but it is supported for FlexGroup and Application Consistency Group constituent relationships.

**`[-transfer-progress {<integer>[KB|MB|GB|TB|PB]}] - Transfer Progress`**

Selects SnapMirror relationships that have a matching transfer progress. This parameter is not supported for FlexGroup and Application Consistency Group SnapMirror relationships, but it is supported for FlexGroup and Application Consistency Group constituent relationships.

**`[-progress-last-updated <MM/DD HH:MM:SS>] - Timestamp of Last Progress Update`**

Selects SnapMirror relationships that have a matching transfer progress last updated timestamp. This parameter is not supported for FlexGroup and Application Consistency Group SnapMirror relationships, but it is supported for FlexGroup and Application Consistency Group constituent relationships.

**`[-source-volume-node <nodename>] - Source Volume Node Name`**

Selects SnapMirror relationships that have a matching source volume node name. For FlexGroup relationships, it is the node which owns the root constituent source volume. This parameter is not supported for Vserver SnapMirror relationships.

**`[-expand <true>] - Show Constituents of the Group`**

Specifies whether to display constituent relationships of Vserver and FlexGroup SnapMirror relationships. By default, the constituents are not displayed.

## Examples

To display summary information about all relationships whose source endpoints are in the current cluster, type the following command:

```
cluster1::> snapmirror list-destinations
Progress
Source          Destination      Transfer  Last      Relationship
Path           Type   Path           Status    Progress  Updated   ID
-----
vserver1.example.com:dp_s1
                DP      vserver2.example.com:dp_d1
                                Idle      -         -         06b4327b-954f-
11e1-af65-123478563412
vserver1.example.com:xdp_s1
                XDP      vserver2.example.com:xdp_d1
                                Idle      -         -         a9c1db0b-954f-
11e1-af65-123478563412
vserver2.example.com:
                DP      dvserver2.example2.com:
                                Idle      -         -         -
3 entries were displayed.
```

To display summary information about all relationships whose source endpoints are in the current Vserver, type the following command:

```
vserver1.example.com::> snapmirror list-destinations
Progress
Source          Destination      Transfer  Last      Relationship
Path           Type   Path           Status    Progress  Updated   ID
-----
vserver1.example.com:dp_s1
                DP      vserver2.example.com:dp_d1
                                Idle      -         -         06b4327b-954f-
11e1-af65-123478563412
vserver1.example.com:xdp_s1
                XDP      vserver2.example.com:xdp_d1
                                Idle      -         -         a9c1db0b-954f-
11e1-af65-123478563412
2 entries were displayed.
```

To display detailed information about SnapMirror relationships whose source endpoints are in the current Vserver, type the following command:

```
vserver1.example.com::> snapmirror list-destinations -instance
Source Path: vserver1.example.com:dp_s1
    Destination Path: vserver2.example.com:dp_d1
    Relationship Type: DP
Relationship Group Type: none
Relationship Status: Idle
Transfer Progress: -
Progress Last Updated: -
Source Volume Node: node1
    Relationship ID: 06b4327b-954f-11e1-af65-123478563412
Source Path: vserver1.example.com:xdp_s1
    Destination Path: vserver2.example.com:xdp_d1
    Relationship Type: XDP
Relationship Group Type: none
Relationship Status: Idle
Transfer Progress: -
Progress Last Updated: -
Source Volume Node: node2
    Relationship ID: a9c1db0b-954f-11e1-af65-123478563412

2 entries were displayed.
```

To display summary information about all relationships including constituent relationships whose source endpoints are in the current Vserver, type the following command:

```
cluster-1::> snapmirror list-destinations -expand
```

| Source                      |       | Destination     |        | Transfer | Progress |           |

## snapmirror modify

Modify a SnapMirror relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror modify` command allows you to change one or more properties of SnapMirror relationships. The key parameter that identifies any SnapMirror relationship is the destination endpoint. The destination endpoint can be a Vserver, a volume, an Application Consistency Group or a non-ONTAP endpoint.

For load-sharing mirrors, a change to a property affects all of the SnapMirror relationships in the set of load-sharing mirrors. Destination volumes in a set of load-sharing mirrors do not have individual property settings.

Changes made by the `snapmirror modify` command do not take effect until the next manual or scheduled update of the SnapMirror relationship. Changes do not affect updates that have started and have not finished yet.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

The `snapmirror modify` command must be used from the destination Vserver or cluster.

## Parameters

**{ [-S, -source-path <[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ -destination-path**  
**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}** - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

**[ -destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**[ -vserver <vserver name>] - Managing Vserver**

If this optional parameter is specified, designates the managing Vserver. The managing Vserver is authorized to use some SnapMirror commands to manage the SnapMirror relationship. The `-vserver` option is currently a reserved option.

**[ -schedule <text>] - SnapMirror Schedule**

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the [snapmirror update](#) command or, in the case of a set of load-sharing mirrors, using the [snapmirror update-ls-set](#) command.

You define and name a schedule using the [job schedule cron create](#) command.

**[ -policy <sm\_policy>] - SnapMirror Policy**

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. Modification of the policy is not supported for relationships with a policy of type *strict-sync-mirror*, *sync-mirror*, or *automated-failover-duplex*. If you want to use a different policy for SnapMirror Synchronous relationships, you need to delete the relationship and create it again with the new policy. This parameter is not applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

You define and name a policy using the `snapmirror policy create` command.

#### **[`-tries <integer_or_unlimited>`] - Tries Limit**

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The `-tries` parameter can be set to `0` to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*". For relationships with "*8.2 and above*" capability, the tries limit is controlled by the value of tries in the SnapMirror policy that is associated with the relationship.

#### **[`-k, -throttle <throttleType>`] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or `0`. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between `1` and `4`, it will be treated as `4`. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The `-throttle` parameter does not affect load-sharing mirrors and other SnapMirror relationships with "*Relationship Capability*" of "*Pre 8.2*" confined to a single cluster.

#### **[`-is-auto-expand-enabled {true|false}`] - Is Auto Expand Enabled**

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If you do not specify the parameter, the current value of auto expand will be retained. Application Consistency Group destinations are always automatically expanded when the source Application Consistency Group is expanded.

#### **[`-backoff-level {high|medium|none}`] - SM Backoff Level due to Client Ops**

This optional parameter specifies the SnapMirror backoff level due to client ops. This parameter is supported only for FlexVol SnapMirror relationships. The default value is *high*.

#### **[`-w, -foreground <true>`] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

## Examples

To change the schedule to *halfhour* for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror2`, type the following command:

```
vs2.example.com::> snapmirror modify -destination-path
vs2.example.com:dept_eng_dp_mirror2 -schedule halfhour
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to change the schedule to *halfhour* for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror2`, type the following command:

```
cluster2::> snapmirror modify -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2  
-schedule halfhour
```

To change the schedule to *halfhour* for the Vserver SnapMirror relationship with destination endpoint *dvs1.example.com*: , type the following command:

```
cluster2::> snapmirror modify -destination-path  
dvs1.example.com: -schedule halfhour
```

To change the policy associated with the SnapMirror Synchronous Consistency Group relationship with the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com* to the policy *Sync2* , type the following command:

```
vs2.example.com::> snapmirror modify -destination-path  
vs2.example.com:/cg/cg_dst -policy Sync2
```

## snapmirror promote

Promote the destination to read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror promote` command performs a failover to the destination volume of a SnapMirror relationship. This command changes the destination volume from a read-only volume to a read-write volume and makes the destination volume assume the identity of the source volume. The command then destroys the original source volume. The destination volume must be a load-sharing volume. Note that you can promote a load-sharing volume that has been left in read-write state by a previously failed promote operation.

Client accesses are redirected from the original source volume to the promoted destination volume. The view clients see on the promoted destination volume is the latest transferred snapshot, which might lag behind the view clients had of the original source volume before the promote.

The SnapMirror relationship is always deleted as part of the promotion process.

It is possible that the original source volume is the source of multiple SnapMirror relationships. For such a configuration, the promoted destination volume becomes the new source volume of the other SnapMirror relationships.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the `snapmirror show` command.

The `snapmirror promote` command fails if a SnapMirror transfer is in progress for any SnapMirror relationship with *"Relationship Capability"* of *"Pre 8.2"* involving the original source volume. It does not fail if a SnapMirror transfer is in progress for a relationship with *"Relationship Capability"* of *"8.2 and above"*.

## Parameters

**{ [-S, -source-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ -destination-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name

of the cluster (cluster) is provided. The "Pre 8.2" format cannot be used when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above". For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

#### **| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2". This parameter cannot be specified when operating in a Vserver context on relationships with "Relationship Capability" of "8.2 and above".

#### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "Relationship Capability" of "Pre 8.2", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

#### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with "Relationship Capability" of "Pre 8.2", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

#### **[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

## **Examples**

To promote a mirror named *vs1\_root\_ls1* to be the source read-write volume for mirroring and client access, type the following command:

```
cluster1::> snapmirror promote -destination-path
//vs1.example.com/vs1_root_ls1
-source-path //vs1.example.com/vs1_root -f true
```

## **Related Links**

- [snapmirror show](#)

## **snapmirror protect**

Start protection for Vservers and volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror protect` command establishes SnapMirror protection for the specified Vserver or a list of volumes. For each endpoint, the command creates a data protection destination endpoint in the Vserver specified by the `-destination-vserver` parameter, creates an extended data protection (XDP) SnapMirror relationship, and starts the initialization of the SnapMirror relationship. This command must be used from the destination Vserver or cluster. This command is not supported for FlexGroup volume constituents or non ONTAP endpoints. When source volumes are specified they must be read-write (RW) volumes.

## Parameters

### **`[-source-cluster <Cluster name>]` - Source Cluster**

This optional parameter specifies the source cluster name. This parameter is valid only when only a single Vserver is specified in the path-list parameter.

### **`{ -path-list`**

**`{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}` - Path List**

This parameter specifies the list of source endpoints to be protected. The list is a comma separated list of paths of the form `vserver:volume` or `vserver:` , for example `vs1.example.com:dept_eng1`, `vs1.example.com:dept_eng2` or `vs1.example.com:` . If the list contains a Vserver endpoint, then the Vserver is the only endpoint that can be specified, and the list cannot contain a mixture of volume and Vserver endpoints.

### **`| -source-path`**

**`{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}` - Source Path }**

This optional parameter specifies the path of the source endpoint to be protected. This parameter is valid only when `-path-list` parameter is not specified. This is the alias of `-path-list` parameter.

### **`[-destination-vserver <vserver name>]` - Destination Vserver**

This parameter specifies the Vserver in which to create the destination volumes of the SnapMirror relationships. When protecting a single Vserver, this parameter specifies the destination Vserver endpoint for protection.

### **`[-destination-vserver-ipSpace <IPspace>]` - Destination Vserver IPspace Name**

This optional parameter specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace. This parameter is supported while protecting a Vserver.

### **`[-schedule <text>]` - SnapMirror Schedule**

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationships.

### **`[-policy <sm_policy>]` - SnapMirror Policy**

This parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationships. The default value is `MirrorAndVault`.

### **`[-auto-initialize {true|false}]` - Auto Initialize**

This optional parameter specifies whether or not initializes of the SnapMirror relationships should be started after the relationships are created. The default value for this parameter is `true`.

### **`[-destination-volume-prefix <text>]` - Destination Volume Name Prefix**

This optional parameter designates the prefix for the destination volume name. For example if the source path is of the form *vserver:volume* and the destination-volume-prefix specified is *prefix* and no destination-volume-suffix is specified, then the destination volume name will be *\_prefix\_volume\_dst* or possibly *prefix\_volume\_1\_dst* if a name conflict is encountered. If both prefix and suffix are specified as *prefix* and *\_\_suffix*, then the destination volume name will be *prefix\_volume\_suffix* or *prefix\_volume\_1\_suffix*, if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

### **`[-destination-volume-suffix <text>]` - Destination Volume Name Suffix**

This optional parameter designates the suffix for the destination volume name. If you do not designate a suffix, a destination volume name with suffix *dst\_* will be used. For example if the source path is of the form *vserver:volume*, and the suffix specified is *DP\_*, the destination volume will be created with the name *volume\_DP* or *volume\_1\_DP* if a name conflict is encountered. If both prefix and suffix are specified as *prefix* and *suffix*, then the destination volume name will be *prefix\_volume\_suffix* or *prefix\_volume\_1\_suffix*, if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

### **`[-support-tiering {true|false}]` - Provision Destination Volumes on FabricPools**

This optional parameter specifies whether or not FabricPools are selected when provisioning a FlexVol volume or a FlexGroup volume during protection workflows. When this parameter is set to true, only FabricPools are used; when set to false, only non-FabricPools are used. Tiering support for a FlexVol volume can be changed by moving the volume to the required aggregate. Tiering support for a FlexGroup volume can be changed by moving all of the constituents to the required aggregates. The default value is *false*. This parameter is supported only for FlexVol volumes and FlexGroup volumes. This parameter is supported only if the cluster where the destination is being provisioned is Unified ONTAP.

### **`[-tiering-policy <Tiering Policy>]` - Destination Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the destination FlexVol volume or FlexGroup volume. This policy determines whether the user data blocks of a FlexVol volume or FlexGroup volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. The default tiering policy is 'snapshot-only' for a FlexVol volume and 'none' for a FlexGroup volume. The temperature of a FlexVol volume or FlexGroup volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- **snapshot-only** - This policy allows tiering of only the FlexVol volume or FlexGroup volume snapshots not associated with the active file system. The default minimum cooling period is 2 days. The `-tiering -minimum-cooling-days` parameter can be used to override the default using the `volume modify` command after the destination FlexVol volume or FlexGroup volume has been created.
- **auto** - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The `-tiering -minimum-cooling-days` parameter can be used to override the default using the `volume modify` command after the destination FlexVol volume or FlexGroup volume has been created.
- **none** - FlexVol volume or FlexGroup volume blocks will not be tiered to the capacity tier.
- **all** - On a DP FlexVol volume or FlexGroup volume this policy allows all transferred user data blocks to start in the capacity tier.

This parameter is supported only for FlexVol volumes and FlexGroup volumes.

**`[-destination-path`**

**`{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}} - Destination Path`**

This optional parameter specifies the path of the destination endpoint to be created. This parameter is valid only when a single path is specified in the `-path-list` parameter. If this parameter is specified, the `-destination-vserver`, `-destination-object-store`, `-destination-volume-prefix`, and `-destination-volume-suffix` parameters cannot be specified.

**`[-destination-snaplock-type {non-snaplock|compliance|enterprise}] - Destination Volume SnapLock Type`**

Optional parameter to create the destination endpoint with the specified SnapLock type for establishing a SnapMirror relationship. This parameter is only supported for relationships with the SnapMirror policy of type *vault*

**`[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite | unspecified}} - Default Retention Period`**

Specifies the default retention period that is applied to snapshots while committing them to the locked state without an associated retention period. This parameter is only supported when the `-destination-snaplock-type` type is specified.

**`[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}} - Minimum Retention Period`**

Specifies the minimum allowed retention period for snapshots committed to the locked state on the volume. This parameter is only supported when the `-destination-snaplock-type` type is specified.

**`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}} - Maximum Retention Period`**

Specifies the maximum allowed retention period for snapshots committed to the locked state on the volume. This parameter is only supported when the `-destination-snaplock-type` type is specified.

## Examples

To establish SnapMirror protection for the source volumes *vs1.example.com:dept\_eng1* and *vs1.example.com:dept\_eng2* using destination-vserver *vs2.example.com* and policy *MirrorAllSnapshots* type the following command:

```
vs2.example.com::> snapmirror protect -path-list
    vs1.example.com:dept_eng1,vs1.example.com:dept_eng2 -destination
-vserver
    vs2.example.com -policy MirrorAllSnapshots
```

To establish SnapMirror protection for the source Vserver *vs1.example.com* which is on cluster *cluster1* creating a destination-vserver named *vs1dp.example.com* and using policy *MirrorAllSnapshots* type the following command:

```
cluster2::> snapmirror protect -source-cluster cluster1 -path-list
vs1.example.com: -destination-vserver vs1dp.example.com -policy
MirrorAllSnapshots
```

To establish SnapMirror protection for the source Consistency Group endpoint *vs1.example.com:/cg/cg1* which is on cluster *cluster1* creating a destination Consistency Group *vs2.example.com:/cg/cg1\_dst* and using policy *MirrorAndVault* type the following command:

```
cluster2::> snapmirror protect -path-list vs1.example.com:/cg/cg1 -policy
MirrorAndVault
```

## snapmirror quiesce

### Disable future transfers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror quiesce` command disables future transfers for a SnapMirror relationship. If there is no transfer in progress, the relationship becomes *"Quiesced"*.

If there is a transfer in progress, it is not affected, and the relationship becomes *"Quiescing"* until the transfer completes. If the current transfer aborts, it will be treated like a future transfer and will not restart.

If applied to a load-sharing (LS) SnapMirror relationship, all the relationships in the load-sharing set will be quiesced.

If applied to a relationship with a policy of type *strict-sync-mirror* or *sync-mirror*, any ongoing operation is aborted, and if the relationship is InSync, synchronous replication is stopped. If the replication policy type is "strict-sync-mirror", then the primary client I/O disruption is not enforced. A new common snapshot is created if the relationship is InSync, unless a recent one exists. The relationship becomes *"Quiescing"* until these operations complete.

When a SnapMirror relationship is quiesced, it remains quiesced across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

This command is not supported for SnapMirror active sync relationships with policy of type *automated-failover* or *automated-failover-duplex*.

The `snapmirror quiesce` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror quiesce`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

## Parameters

### { [-S, -source-path

{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

### | [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the *-source* *-vserver* and *-source-volume* parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters *-source-volume* and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, *-source-cluster* must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### [-source-volume <volume name>] - Source Volume }

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters *-source-vserver* and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, *-source-cluster* must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

### { -destination-path

{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

### | [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters *-destination-vserver* and *-destination-volume* must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability" of "Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

## **Examples**

To quiesce the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_mirror2`, type the following command:

```
vs2.example.com::> snapmirror quiesce -destination-path  
vs2.example.com:dept_eng_mirror2
```

For relationships with *"Relationship Capability" of "Pre 8.2"*, to quiesce the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_mirror2`, type the following command:

```
cluster2::> snapmirror quiesce -destination-path  
cluster2://vs2.example.com/dept_eng_mirror2
```

To quiesce the Vserver SnapMirror relationship with the destination endpoint `dvs1.example.com:`, type the following command:

```
cluster2::> snapmirror quiesce -destination-path  
dvs1.example.com:
```

To quiesce the Application Consistency Group SnapMirror relationship with the destination Application Consistency Group `app_cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror quiesce -destination-path  
vs2.example.com:/cg/app_cg_dst
```

## **Related Links**

- [snapmirror show](#)

# snapmirror release

Remove source information for a SnapMirror relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror release` command removes the relationship information from the source Vserver. The command also removes any snapshot owner tags and any snapshots which were created for the specified relationship from the source volumes. It does not destroy any volumes or Vservers. This command must be used from the source Vserver or cluster.

For relationships with a policy of type *strict-sync-mirror*, it additionally resumes primary volume access if the IO was restricted because the relationship was *OutOfSync*.

For relationship having Application Consistency Groups, `snapmirror release` command used on the source of a Application Consistency Group relationship, removes the relationship information from the source side and deletes snapshots which were created on the source volumes.

You can use the [snapmirror list-destinations](#) command to display source Vservers' relationship information. This information is populated during the first SnapMirror transfer, not when the [snapmirror create](#) command is issued.

This command is not supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the [snapmirror show](#) command.

This command is not supported for SnapMirror relationships with non-ONTAP endpoints.

The `snapmirror release` operation fails if a SnapMirror transfer for the SnapMirror relationship is in a data phase of the transfer.

## Parameters

**{ [-S, -source-path  
<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

Specifies the source endpoint of the SnapMirror relationship in one of three formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other SnapMirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context. For relationships between Application Consistency Groups, the source endpoint is specified in the form *[vserver:]/cg/cg-name*.

**| [-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-source-volume` must also be specified.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameter `-source-vserver` must also be specified.

**{ -destination-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}** - Destination Path

Specifies the destination endpoint of the SnapMirror relationship in one of three formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other SnapMirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context. For relationships between Application Consistency Groups the destination endpoint is specified in the form

*[vserver:]/cg/cg-name*

**| -destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-destination-volume` must also be specified.

**[-destination-volume <volume name>] - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameter `-destination-vserver` must also be specified.

**[-relationship-info-only <true>] - Remove relationship info only (skip cleanup of snapshots)**

If this parameter is specified, the cleanup of snapshots is bypassed and only the source relationship information is removed. It is recommended to specify this parameter only when the source volume is not accessible.

**[-relationship-id <UUID>] - Relationship ID**

This optional parameter specifies the relationship identifier of the relationship. It must be specified when information for more than one relationship with the same source and destination paths is present. This parameter is not supported for Vserver SnapMirror relationships.

**[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

## Examples

To release the source information for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept\_eng\_dp\_mirror4*, type the following command:

```
vs1.example.com:> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
```

To release the source information for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept\_eng\_dp\_mirror4*, and relationship-id *5f91a075-6a72-11e1-b562-123478563412*, type the following command:

```
vs1.example.com:> snapmirror release
    -destination-path vs2.example.com:dept_eng_dp_mirror4
    -relationship-id 5f91a075-6a72-11e1-b562-123478563412
```

To release the source information for the SnapMirror relationship with the destination endpoint `dvs1.example.com`: , type the following command:

```
cluster1::> snapmirror release
      -destination-path dvs1.example.com:
```

To release the Application Consistency Group SnapMirror relationship with the destination Application Consistency Group `cg_dst` in Vserver `vs2.example.com` and the source Application Consistency Group `cg_src` in Vserver `vs1.example.com` , type the following command from the source cluster:

```
source::> snapmirror release
      vs2.example.com:/cg/cg_dst
```

To release just the source information but not remove the snapshots that might be needed for a subsequent resync for the Asynchronous SnapMirror Application Consistency Group relationship with the destination Application Consistency Group `cg_dst` in Vserver `vs2.example.com` , type the following command:

```
vs2.example.com::> snapmirror release
      -destination-path vs2.example.com:/cg/cg_dst
      -relationship-info-only true
```

To release the SnapMirror active sync relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` and the source Consistency Group `cg_src` in Vserver `vs1.example.com` , type the following command from the source cluster:

```
source::> snapmirror release
      vs2.example.com:/cg/cg_dst
```

## snapmirror restore

Restore a Snapshot copy from a source volume to a destination volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror restore` command restores the entire contents of a snapshot or one or more files, LUNs or NVMe namespaces of a snapshot from one volume to another volume.

The `snapmirror restore` command, in context to Application Consistency Groups, restores the entire content of a snapshot from one Application Consistency Group to another Application Consistency Group. Each Application Consistency Group is considered as atomic entity in restore operation

The source of the restore can be a volume or an Application Consistency Group that is:

- the destination volume or destination Application Consistency Group of a extended data protection (XDP) relationship
- the destination volume of a data protection (DP) relationship with *"Relationship Capability"* of *"8.2 and above"*
- a data-protection volume or an Application Consistency Group which is not the destination endpoint of any SnapMirror relationship
- a read-write volume or an Application Consistency Group.
- an AltaVault endpoint. In this case the destination must be an empty ONTAP volume.

The following cannot be used as either the source or destination volume or destination Application Consistency Group of a restore:

- a volume or Application Consistency Group that is the source or destination endpoint of a SnapMirror load-sharing relationship.
- a volume that is the destination endpoint of a SnapMirror relationship with the *"Relationship Capability"* of *"Pre 8.2"*.
- a SolidFire endpoint.

A SnapMirror relationship of type *RST* is created from the source volume or source Application Consistency Group to the destination volume or destination Application Consistency Group by the `snapmirror restore` command. This relationship lasts for the duration of the restore operation and is deleted when the command completes successfully.

The following paragraphs describe the behavior when restoring the entire contents of a snapshot to a destination volume or destination Application Consistency Group.

By default the `snapmirror restore` will copy the latest snapshot from the source volume or source Application Consistency Group to the destination volume or destination Application Consistency Group. A specific snapshot can be selected with the `-source-snapshot` parameter.

Any quota rules defined for the destination volume are deactivated prior to restoring the entire contents of a snapshot. Run the command `volume quota modify -vserver destination-volume -vserver-volume destination-volume-name-state on` to reactivate quota rules after the entire contents of the snapshot have been restored.

If the destination Application Consistency Group contains empty data protection volumes, the `snapmirror restore` command performs a baseline restore.

If the destination volume is an empty data protection volume, the `snapmirror restore` command performs a baseline restore. For a baseline restore the following steps are performed:

- Create the *RST* SnapMirror relationship.
- The entire contents of the snapshot selected to be restored are copied to the active file system of the destination volume or destination Application Consistency Group.

- The destination volume or destination Application Consistency Group is made read-write.
- The *RST* SnapMirror relationship is deleted.

If the destination volume is a read-write volume, an incremental restore is performed. The incremental restore fails if it cannot find a common snapshot between the source and destination volumes. Restoring a snapshot to an empty read-write volume is not supported. Incremental restore from a non-ONTAP endpoint to a ONTAP volume is not supported.

If the destination Application Consistency Group contains a read-write flex volume, an incremental restore is performed. The incremental restore fails if it cannot find a common snapshot between the source and destination Application Consistency Group. Restoring a snapshot to an empty read-write flex volumes which are the part of Application Consistency Group is not supported.

An incremental restore preserves all snapshots on the destination volume but does not preserve changes to the active file system since the latest snapshot. To preserve changes to the destination volume since the latest snapshot use the [volume snapshot create](#) command. Restore is a disruptive operation so client access of the destination volume is not advised for the duration of the operation.

For an incremental restore the following steps are performed:

- Create the *RST* SnapMirror relationship.
- The active file system of the destination volume is reverted to the latest snapshot on the destination volume and the destination volume is made read-only.
- In context to Application Consistency Group, the active file system of the destination Application Consistency Group is reverted to the latest snapshot on the destination Application Consistency Group and the flex volumes inside destination Application Consistency Group is made read-only.
- This snapshot is the exported snapshot and it is the view to which clients are redirected when accessing the destination volume or destination Application Consistency Group.
- The contents of the snapshot selected to be restored are copied to the active file system of the destination volume or destination Application Consistency Group.
- The destination volume or destination Application Consistency Group is made read-write.
- The *RST* SnapMirror relationship is deleted.

If `snapmirror restore` fails or is aborted, the *RST* relationship remains. Use the [snapmirror show](#) command with the destination volume name or destination Application Consistency Group name to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use the original command with `-clean-up-failure` to cancel the request.

When specifying `-clean-up-failure` to cancel an incremental restore request, the following steps are performed:

- If the snapshot has not been restored to the destination volume or destination Application Consistency Group, all data copied to the active file system by `snapmirror restore` to the destination volume or destination Application Consistency Group is reverted.
- The destination volume or destination Application Consistency Group is made read-write.
- The *RST* SnapMirror relationship is deleted.

When specifying `-clean-up-failure` to cancel a baseline restore request, the following steps are performed:

- If the snapshot has been restored to the destination volume or destination Application Consistency Group, the volume or Application Consistency Group is made read-write.
- The *RST* SnapMirror relationship is deleted.

The following paragraphs describe the behavior and requirements when restoring one or more files, LUNs or NVMe namespaces to the destination volume.

The destination volume must be a read-write volume. Restoring files, LUNs or NVMe namespaces to a data protection volume is not supported. When restoring files, LUNs or NVMe namespaces the source and destination volumes are not required to have a common snapshot. If a common snapshot exists, an incremental restore is performed for those files, LUNs or NVMe namespaces being restored which exist in the common snapshot.

The destination Application Consistency Group must contain a read-write volume. While restoring, source and destination Application Consistency Group are not required to have a common snapshot. If a common snapshot exists, an incremental restore is performed.

The contents of the files, LUNs or NVMe namespaces to which data is being restored on the destination volume are not preserved by this command. To preserve the contents of the destination files, LUNs or NVMe namespaces, create a snapshot on the destination volume prior to running this command. Client I/O is not allowed to a file, LUN or NVMe namespace to which data is being restored on the destination volume.

The `-source-snapshot` parameter is required when restoring files, LUNs or NVMe namespaces. It identifies the snapshot on the source volume from which the files, LUNs or NVMe namespaces to be restored are copied. If all files, LUNs or NVMe namespaces to be restored do not exist in this snapshot the command fails.

The source path for each file, LUN or NVMe namespace being restored is required. The source path of a file, LUN or NVMe namespace is from the root of the source snapshot of the source volume. The file is restored to the same path on the destination volume unless an optional destination path is specified. The destination path is from the root of the destination volume. If a file, LUN or NVMe namespace to which data is being restored on the destination volume does not exist, the file, LUN or NVMe namespace is created. If any directory in the path of the file, LUN or NVMe namespace being restored does not exist on the destination volume, the command fails. Overwriting the contents of an existing file with the contents of a different file is supported. Similarly, overwriting the contents of an existing LUN or NVMe namespace with the contents of a different LUN or NVMe namespace is supported. However, overwriting a file with the contents of a LUN or NVMe namespace is not supported. Overwriting a LUN with the contents of a file or NVMe namespace is not supported. Overwriting an NVMe namespace with the contents of a file or LUN is not supported. Client I/O is not allowed to all files, LUNs and NVMe namespaces to which data is being restored on the destination volume.

If quota rules have been defined for the destination volume, resource usage is updated during file restore, but limits of quota rules are not enforced. Therefore, resource limits might be exceeded during a file restore.

Multiple concurrent `snapmirror restore` commands, restoring one or more files, LUNs or NVMe namespaces to the same destination volume, are not supported. The destination volume of a `snapmirror restore` to which one or more files, LUNs or NVMe namespaces are being restored, can simultaneously be the source volume of a [snapmirror update](#).

For a file, LUN or NVMe namespace restore the following steps are performed:

- Create the *RST* SnapMirror relationship.

- If any file, LUN or NVMe namespace being restored does not exist on the destination volume, create all such files, LUNs or NVMe namespaces.
- Prevent client I/O to files, LUNs or NVMe namespaces to which data is being restored on the destination volume.
- Revoke locks and space reservations held by NAS clients for files being restored.
- Copy the contents of all source files, LUNs or NVMe namespaces to the corresponding file, LUN or NVMe namespace on the destination volume.
- Allow client I/O to files, LUNs or NVMe namespaces to which data has been restored on the destination volume.
- Delete the *RST* SnapMirror relationship.

Some file restore operations require a snapshot to be created. This snapshot is temporary, it is deleted before the operation completes.

Since client I/O is not allowed to files, LUNs or NVMe namespaces being restored, client I/O to files, LUNs or NVMe namespaces being restored should be quiesced. Mapped LUNs or NVMe namespaces remain mapped throughout the operation. SAN clients do not need to rediscover a mapped LUN that has been restored. Restoring an NVMe namespace on top of another NVMe namespace with a different attribute relevant to NVMe protocol accessibility (like size) is not supported.

If `snapmirror restore` fails or is aborted, the *RST* relationship remains. Use the `snapmirror show` command with the destination volume or destination Application Consistency Group to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use `snapmirror restore -clean-up-failure` along with specifying the destination volume or destination Application Consistency Group to cancel the request.

When specifying `-clean-up-failure` to cancel a file restore request, the following steps are performed:

- Any files to which client I/O is not allowed are removed.
- Any snapshot created for use during a file restore operation is deleted.
- The *RST* SnapMirror relationship is deleted.

LUNs to which client I/O is not allowed remain. For LUNs to which client I/O is not allowed, do one of the following:

- Use the `snapmirror restore` command to restore data to the LUN. Once the command completes successfully, client I/O to the LUN is allowed.
- Delete the LUN using the `lun delete` command with the `-force-fenced` parameter.

Similarly, NVMe namespaces to which client I/O is not allowed remain. For NVMe namespaces to which client I/O is not allowed, do one of the following:

- Use the `snapmirror restore` command to restore data to the NVMe namespace. Once the command completes successfully, client I/O to the NVMe namespace is allowed.
- Delete the NVMe namespace using the `vserver nvme namespace delete` command with the `-skip`

-mapped-check parameter.

The `snapmirror restore` command must be used from the destination Vserver or cluster.

## Parameters

**{ [-S, -source-path**

**<[vserver:] [volume]>>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

Specifies the source endpoint in one of four formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format which also includes the name of the cluster (cluster) is supported for consistency with other `snapmirror` commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context. Source endpoint having Application Consistency Group includes vserver name followed by `cg` and Application Consistency Group name. A non-ONTAP source endpoint (for example, AltaVault) can be specified in the form `hostip:/share/share-name`.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the cluster in which the source volume resides. This parameter is not needed; it is provided for consistency with other `snapmirror` commands. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is not supported if the source is a non-ONTAP endpoint.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. If this parameter is specified, the `-source-volume` parameter must also be specified. This parameter is not supported if the source is a non-ONTAP endpoint.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` parameter must also be specified. This parameter is not supported if the source is a non-ONTAP endpoint.

**{ -destination-path**

**<[vserver:] [volume]>>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Destination Path**

Specifies the destination endpoint in one of three formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format that also includes the name of the cluster (cluster) is supported for consistency with other `snapmirror` commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context. Destination endpoint having Application Consistency Group includes vserver name followed by `cg` and Application Consistency Group name.

**| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the cluster in which the destination volume resides. This parameter is not needed; it is provided for consistency with other `snapmirror` commands. If this parameter is specified, the `-destination-vserver` and `-destination-volume` parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2".

**-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver. If this parameter is specified, the `-destination-volume` parameter must also be specified.

**-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume. If this parameter is specified, the `-destination-vserver` parameter must also be specified.

**[-s, -source-snapshot <text>] - Source Snapshot**

When restoring the entire contents of a snapshot, this optional parameter identifies the snapshot to be restored from the source volume to the destination volume. The default value is the latest snapshot on the source volume. When restoring one or more files, LUNs or NVMe namespaces from a snapshot, this parameter is required.

**[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the restore transfer when the source and destination volumes belong to different clusters. It sets the maximum rate (in Kbytes/sec) at which data can be transferred between the clusters during the operation. To fully use the network bandwidth available between the clusters, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*.

**[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is *normal*.

**[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings**

This optional parameter specifies a list of the consistency group (CG) item mappings. It is considered only if the supplied source and destination path values denote valid CG paths. For CG level relationships, this parameter must be specified. The value for this parameter must contain mappings of one or more pairs of constituent source and destination volumes of the form *srcvol1:@dstvol1,...*.

**[-disable-storage-efficiency <true>] - Disable Storage Efficient Transfer**

The default behavior of restore is to preserve storage efficiency when possible. Use this optional parameter to turn off storage efficiency for data transferred over the wire and written to the destination volume.

**[-clean-up-failure <true>] - Clean up after Failure**

Use this optional parameter to recover from an aborted or failed restore operation. Any temporary *RST* relationship is removed from the destination Vserver. An attempt is made to remove any temporary *RST* relationship from the source Vserver. If cleaning up an incomplete restore of the entire contents of a snapshot and the destination volume was read-write prior to the failed or aborted restore operation, it is converted back to read-write if necessary, while removing all data transferred or copied during the restore operation. If cleaning up an incomplete restore of one or more files, LUNs or NVMe namespaces of a snapshot, any file to which client I/O is not allowed is deleted.

**[-tries <integer\_or\_unlimited>] - Tries Limit**

Specifies the total number of attempts to transfer data in cases where a transfer is interrupted by an error that SnapMirror can recover from. The value of this parameter must be a positive integer or *unlimited*.

**[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

**{ [-file-list <<source path>[,@<destination path>]>,...] - File List**

Specifies the files, LUNs or NVMe namespaces to be restored. The list can contain specifications for up to 8

files, LUNs or NVMe namespaces. Specification for each file, LUN or NVMe namespace consists of a *source\_path* and an optional *destination\_path*, and is of the form '*source\_path*[@*destination\_path*]' . *source\_path* is required and is the path of the file from the source snapshot, e.g. /dira/file1 or /lun1. The source path does not include the snapshot name nor the source volume name. The path to each file to be restored in the active file system of the destination volume is the same as the path specified by *source\_path*, unless an optional *destination\_path* is specified. *destination\_path* begins with the @ symbol followed by the path of the file from the root of the active file system of the destination volume, e.g. @/file1 or @/dira/lun1. File restore is not supported if the *source\_path* or *destination\_path* contains commas in its directory or file name. Each *source\_path* and *destination\_path* is a separate entity in the list of paths. A *destination\_path* is associated with the *source\_path* that immediately precedes it. If this parameter is specified, -source-snapshot must also be specified. Examples: /dira/file1 . /dira/file1,@/dirb/file2 . /dira/file1,@/dirb/file2,/dirc/file3 .

#### **| [-lun-list [source lun]:@<destination lun>,...] - Lun List }**

Specifies the source and destination LUN pairs to be restored. Specification for each LUN list consists of a *source\_lun* and *destination\_lun*, and is of the form '*source\_lun*:@*destination\_lun*'. *source\_lun* is required and is the name of the LUN from the source snapshot. A source LUN name is considered as destination LUN if destination LUNs are not provided. Examples: *source\_lun1*:@*destination\_lun1* ,or *source\_lun1* ,*source\_lun2*

#### **[-use-network-compression <true>] - Use Network Compression**

Use this optional parameter to use network compression for data transfer over the wire. This parameter is not supported for relationships with non-ONTAP endpoints.

#### **[-backoff-level {high|medium|none}] - SM Backoff Level due to Client Ops**

This optional parameter specifies the SnapMirror backoff level due to client ops. This parameter is supported only for FlexVol SnapMirror relationships. The default value is *high* .

## **Examples**

The following example does an incremental restore between the restore source volume *vs2.example.com:dept\_eng\_dp\_mirror2* and the restore destination volume *vs1.example.com:dept\_eng*:

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
Warning: All data newer than snapshot snap6 on volume
        vs1.example.com:dept_eng will be deleted.
Do you want to continue? {y|n}: y
[Job 34] Job is queued: snapmirror restore from source
vs2.example.com:dept_eng_dp_mirror2 for the snapshot snap3.
vs1.example.com::>
```

The following example does a restore between the source Application Consistency Group *vs2.example.com:/cg/src\_cg* and destination Application Consistency Group *vs1.example.com:/cg/dst\_cg*:

```
vs1.example.com::> snapmirror restore
    -destination-path vs1.example.com:/cg/dst_cg
    -source-path vs2.example.com:/cg/src_cg
    -source-snapshot snap3
[Job 34] Job is queued: snapmirror restore from source
vs2.example.com:/cg/src_cg for the snapshot snap3.
vs1.example.com::>
```

The following example restores `/file3` from the source snapshot `snap3` on the source volume `vs2.example.com:dept_eng_dp_mirror2` to the active file system of the restore destination volume `vs1.example.com:dept_eng`:

```
vs1.example.com::> snapmirror restore
    -destination-path vs1.example.com:dept_eng
    -source-path vs2.example.com:dept_eng_dp_mirror2
    -source-snapshot snap3
    -file-list /file3
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 35] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

The following example restores `/file3` from the source snapshot `snap3` on the source volume `vs2.example.com:dept_eng_dp_mirror2` to `/file3.new` in the active file system of the restore destination volume `vs1.example.com:dept_eng`:

```
vs1.example.com::> snapmirror restore
    -destination-path vs1.example.com:dept_eng
    -source-path vs2.example.com:dept_eng_dp_mirror2
    -source-snapshot snap3
    -file-list /file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

The following example restores `/file1`, `/file2`, and `/file3` from the source snapshot `snap3` on the source volume

`vs2.example.com:dept_eng_dp_mirror2` respectively to `/file1.new`, `/file2`, and `/file3.new` in the active file system of the restore destination volume `vs1.example.com:dept_eng`:

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file1,@/file1.new,/file2,/file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com::>
```

## snapmirror resume

### Enable future transfers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror resume` command enables future transfers for a SnapMirror relationship that has been quiesced.

If there is a scheduled transfer for the relationship, it will be triggered on the next schedule. If there is a restart checkpoint, it will be re-used if possible.

If applied on a load-sharing (LS) SnapMirror relationship, it enables future transfers for all the relationships in the load-sharing set.

If applied on a relationship with a policy of type *strict-sync-mirror* or *sync-mirror*, it enables future resync operations and initiates an Auto Resync.

When a quiesced SnapMirror relationship is resumed, future transfers remain enabled across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

The `snapmirror resume` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror resume`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

## Parameters

**{ [-S, -source-path <[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**[-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ -destination-path <[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination

endpoint is specified in the form *hostip:/lun/name*.

### **| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

### **-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with "*Relationship Capability*" of "*Pre 8.2*", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

### **-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with "*Relationship Capability*" of "*Pre 8.2*", `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

## **Examples**

To re-enable future transfers for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept\_eng\_dp\_mirror2* that has been previously quiesced, type the following command:

```
vs2.example.com::> snapmirror resume -destination-path  
vs2.example.com:dept_eng_dp_mirror2
```

To re-enable future transfers for the SnapMirror relationship with the destination endpoint *cluster2://vs2.example.com/dept\_eng\_dp\_mirror2* that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To re-enable future transfers for the Vserver SnapMirror relationship with the destination endpoint *dvs1.example.com:* that has been previously quiesced, type the following command:

```
cluster2::> snapmirror resume -destination-path  
dvs1.example.com:
```

To re-enable future transfers of the Application Consistency Group SnapMirror relationship with the destination Consistency Group *app\_cg\_dst* in Vserver *vs2.example.com*, type the following command:

```
vs2.example.com::> snapmirror resume -destination-path  
vs2.example.com:/cg/app_cg_dst
```

# snapmirror resync

Start a resynchronize operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror resync` command establishes or reestablishes a mirroring relationship between a source and a destination endpoint. The endpoints can be Vservers, volumes, Application Consistency Groups or non-ONTAP endpoints that support SnapMirror. `snapmirror resync` for a SnapMirror relationship with volumes as endpoints is typically executed in the following cases:

- The destination mirror is broken (that is, the destination volume is a read-write volume and no longer a data protection mirror). After the `snapmirror resync` command completes, the destination volume is made a data protection mirror and the mirror can be manually updated or scheduled for updates.
- [snapmirror update](#) command failed because the required common snapshot was deleted on the source volume.
- The volumes are the first and third endpoints in a cascade chain of relationships and they have a common snapshot. In this case, `snapmirror resync` might implicitly create the SnapMirror relationship between them.

The `snapmirror resync` command can cause data loss on the destination volume because the command can remove the exported snapshot on the destination volume.

The default behavior of the `snapmirror resync` command for volume relationships is defined as follows:

- Finds the most recent common snapshot between the source and destination volumes, removes snapshots on the destination volume that are newer than the common snapshot and mounts the destination volume as a DP volume with the common snapshot as the exported snapshot.
- For data protection (DP) relationships, takes a snapshot of the source volume to capture the current image and transfers snapshots that are newer than the common snapshot from the source volume to the destination volume. For extended data protection (XDP) relationships, transfers snapshots newer than the common snapshot according to the relationship policy, i.e., snapshots will match rules associated with the policy as defined by the `snapmirror policy` commands. For relationships associated with `snapmirror policy` of type *async-mirror* and *mirror-vault* the `snapmirror resync` first takes a snapshot of the source volume and includes it in the snapshots selected for transfer.
- For a SnapLock Compliance volume in an XDP relationship with SnapMirror policy of type *async-mirror*, if SnapMirror resync operation detects data divergence between the common snapshot and the AFS on the destination volume, the resync operation preserves the data changes in a locked snapshot for the duration of the current volume expiry time. If the volume expiry time is in the past or has not been set, then the

snapshot is locked for a duration of 30 days. The common snapshot is also locked for the same duration.

For Vserver SnapMirror relationships, a resync operation is typically executed when the relationship is broken-off, the *subtype* of the destination Vserver is *default* and the destination volumes are of type read-write. Once the command is queued, the subtype of the destination Vserver changes from *default* to *dp-destination*. A successful resync operation also makes the destination Vserver's volumes data protection volumes.

If the resync command is executed on a Vserver SnapMirror relationship, and the corresponding source and destination Vservers have volumes with volume level SnapMirror relationships, then the volume level SnapMirror relationships will be converted to volumes under the Vserver SnapMirror relationship. This conversion is supported only for source and destination Vservers which have been transitioned from a 7-Mode vFile into a C-Mode Vserver. Some basic pre-requisites for the conversion are that the destination Vserver should be in a *stopped* state and all the destination Vserver volumes except the root volume should be in a volume level SnapMirror relationship with volumes of the source Vserver. The state of these volume level SnapMirror relationships should be *Snapmirrored* and status should be *Idle*.

When the destination Application Consistency Group relationship is broken-off, the `snapmirror resync` changes the destination Application Consistency Group to read-only and the relationship will be SnapMirrored.

`snapmirror resync` for a relationship with a policy of type *strict-sync-mirror* or *sync-mirror* is typically executed in the following case:

- The destination mirror is broken (that is, the destination volume is read-write and no longer read-only). After the `snapmirror resync` command completes, the destination volume changes to read-only and the relationship to InSync.

The `snapmirror resync` command is typically not required to return a relationship that has fallen out of sync due to an error condition to InSync because SnapMirror has Auto Resync for synchronous relationships. When SnapMirror detects that the relationship has fallen out of sync for any reason other than a [snapmirror quiesce](#), [snapmirror break](#) or [snapmirror delete](#) command was executed on the relationship, it will automatically initiate a resync operation.

The default behavior of the `snapmirror resync` command for relationships with a policy of type *strict-sync-mirror* or *sync-mirror* is defined as follows:

- Creates a snapshot on the destination of the current image of the destination file system. This snapshot becomes the exported snapshot for the volume during the resync operation.
- Finds the most recent common snapshot between the source and destination volumes. Performs a local rollback transfer to give the active file system the same data as the common snapshot. It then loops through a sequence, creating a snapshot on the source volume, transferring the data captured in that snapshot, creating a snapshot of the data on the destination, and repeating until the relationship is close to InSync. After the last transfer, it enters cutover to bring the relationship to InSync.
- User-created snapshots are not replicated by a resync operation.
- At the conclusion of the resync operation, the exported snapshot on the destination is removed and the client will then see the active file system on the destination volume. The relationship will be InSync and periodic creation of common snapshots will resume.

The `snapmirror resync` command supports an optional parameter *"preserve"*. The parameter *"preserve"* is only supported for extended data protection (XDP) relationships. It is not supported for relationships with a non-ONTAP endpoint. It is not supported for relationships with a policy of type *strict-sync-mirror* and *sync-mirror*. When used, the parameter *"preserve"* changes the behavior of the

`snapmirror resync` command. The changed behavior of the command can be described as follows:

- Finds the most recent common snapshot between the source and destination volumes, preserves all snapshots on the destination volume that are newer than the common snapshot, and mounts the destination volume as a DP volume with the common snapshot as the exported snapshot.
- Performs a local rollback transfer to make a copy of the common snapshot on the destination volume and establish it as the latest snapshot on the destination volume. The command then transfers all snapshots that are newer than the common snapshot, from the source volume to the destination volume. The command only transfers snapshots that match the relationship's policy, i.e., snapshots will match rules associated with the policy as defined by the `snapmirror policy` commands.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror resync` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before resyncing it.

For Vservers, you must create SnapMirror relationships between Vservers by using the `snapmirror create` command before you run the `snapmirror resync` command. The `snapmirror resync` command does not implicitly create the relationship.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror resync` command fails if the destination volume does not have a snapshot in common with the source volume.

The `snapmirror resync` command does not work on load-sharing mirrors.

The `snapmirror resync` command must be used from the destination Vserver or cluster.

## Parameters

**{ [-S, -source-path {<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`

`-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

#### **[`-source-vserver <vserver name>`] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

#### **[`-source-volume <volume name>`] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

#### **{ `-destination-path`**

**{`<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>`} - Destination Path**

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

#### **| [`-destination-cluster <Cluster name>`] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

#### **`-destination-vserver <vserver name>` - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

#### **`-destination-volume <volume name>` - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

#### **[`-s, -source-snapshot <text>`] - Source Snapshot**

This optional parameter specifies a snapshot to transfer. The default behavior for a data protection relationship with a read-write source is that ONTAP creates a new snapshot and uses it as the basis for

determining what data is replicated; with this option, the specified snapshot will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified snapshot must be newer than the latest common snapshot. For an extended data protection relationship, the specified snapshot can be newer or older than the common snapshot. This parameter is not supported for relationships with *"Relationship Capability"* of *"Pre 8.2"*.

### **[-type <snapmirrorType>] - Snapmirror Relationship Type**

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the [snapmirror create](#) command.

### **[-policy <sm\_policy>] - SnapMirror Policy**

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

You define and name a policy using the [snapmirror policy create](#) command.

### **[-f, -force <true>] - Force**

If this parameter is specified, the command proceeds without prompting for confirmation.

### **[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the resync transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the [snapmirror create](#) or [snapmirror modify](#) command will be used. To fully use the network bandwidth available, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*. For FlexGroup and Application Consistency Group relationships, the throttle value is applied individually to each constituent relationship. For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, the throttle value is applicable only for the asynchronous transfers of the resync operation. The *-throttle* parameter does not affect load-sharing transfers and transfers for other relationships with *"Relationship Capability"* of *"Pre 8.2"* confined to a single cluster.

### **[-transfer-priority {low|normal}] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a *"Relationship Capability"* of *"Pre 8.2"*.

### **[-preserve <true>] - Preserve**

This parameter is only supported for extended data protection (XDP) relationships with policies of type *vault*, and *mirror-vault*. It is not supported for relationships with a policy of type *async-mirror* and data protection and load-sharing relationships. This parameter is not supported for relationships with non-ONTAP endpoints. It is not supported for relationships with a policy of type *strict-sync-mirror* and *sync-mirror*. When specified, it changes the behavior of the `snapmirror resync` command to preserve snapshots on the destination volume that are newer than the latest common snapshot. This parameter is not supported for relationships with *"Relationship Capability"* of *"Pre 8.2"*.

### **[-quick-resync <true>] - Quick Resync**

This parameter is only supported for extended data protection (XDP) relationships. This parameter is not supported for relationships with non-ONTAP endpoints. It is not supported for relationships with a policy of type *strict-sync-mirror* and *sync-mirror*. Specifying this optional parameter reduces the resync

time because the resync does not incur storage efficiency overhead before the transfer of new data. Specifying this parameter is recommended if the source of the resync does not have volume efficiency enabled or if reducing resync time is more important than preserving all possible storage efficiency. When this parameter is specified, resync does not preserve the storage efficiency of the new data with existing data over the wire and on the destination.

**`[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings`**

This optional parameter specifies a list of the consistency group (CG) item mappings. It is considered only if the supplied source and destination path values denote valid CG paths. For CG level relationships, this parameter must be specified. The value for this parameter must contain mappings of one or more pairs of constituent source and destination volumes of the form *srcv11:@dstv11,...*.

**`[-is-auto-expand-enabled {true|false}] - Is Auto Expand Enabled`**

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this resync is creating a new SnapMirror relationship, the default value is *true*. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is not specified, the existing value will be retained.

**`[-backoff-level {high|medium|none}] - SM Backoff Level due to Client Ops`**

This optional parameter specifies the SnapMirror backoff level due to client ops. This parameter is supported only for FlexVol SnapMirror relationships. The default value is *high*.

**`[-w, -foreground <true>] - Foreground Process`**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

## Examples

To reestablish mirroring for the destination endpoint *vs2.example.com:dept\_mkt\_mirror* that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path
vs2.example.com:dept_mkt_dp_mirror
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to reestablish mirroring for the destination endpoint *cluster2://vs2.example.com/dept\_mkt\_mirror* that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
cluster2::> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_mkt_dp_mirror
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named *vs2.example.com:dept\_eng\_dp\_mirror2* and the source endpoint named *vs1.example.com:dept\_eng*, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path  
vs2.example.com:dept_eng_dp_mirror2  
-source-path vs1.example.com:dept_eng
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named *cluster2://vs2.example.com/dept\_eng\_dp\_mirror2* and the source endpoint named *cluster1://vs1.example.com/dept\_eng* when the source cluster is running ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror resync -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror2  
-source-path cluster1://vs1.example.com/dept_eng
```

To create and reestablish an extended data protection (XDP) relationship between the ONTAP source endpoint *vs1.example.com:data\_ontap\_vol*, and the non-ONTAP (for example, AltaVault) destination endpoint *10.0.0.11:/share/share1*, and start the initial transfer, type the following command:

```
vs1.example.com::> snapmirror resync -destination-path  
10.0.0.11:/share/share1  
-source-path vs1.example.com:data_ontap_vol -type XDP
```

To reestablish mirroring for the destination endpoint *dvs1.example.com:* of a Vserver relationship that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
cluster2::> snapmirror resync -destination-path  
dvs1.example.com:
```

To resynchronize the SnapMirror active sync relationship with the source Consistency Group *cg\_src* in Vserver *vs1.example.com* and the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*, type the following command from the destination cluster:

```
destination::> snapmirror resync -destination-path  
vs2.example.com:/cg/cg_dst
```

To resynchronize an SnapMirror active sync relationship with the following attributes:

- It is between the source Consistency Group *cg\_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*.
- It has item mappings between volumes *srcvol1* and *srcvol2* and volumes *dstvol1* and *dstvol2*.

Type the following command from the destination cluster:

```
destination::> snapmirror resync -destination-path  
vs2.example.com:/cg/cg_dst -source-path  
vs1.example.com:/cg/cg_src  
-cg-item-mappings srcvol1:@dstvol1,srcvol2:@dstvol2
```

To reestablish mirroring to the destination Application Consistency Group *app\_cg\_dst* in Vserver *vs2.example.com* that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
vs2.example.com::> snapmirror resync -destination-path  
vs2.example.com:/cg/app_cg_dst
```

## snapmirror set-options

Display/Set SnapMirror options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror set-options` command can be used to display or set SnapMirror options.

### Parameters

**`[-dp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for DP Source Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for source DP transfers

**`[-xdp-source-xfer-reserve-pct {0|25%|50%|75%|100%}]` - Percentage Reserved for XDP Source Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for source XDP transfers

**[`-dp-destination-xfer-reserve-pct {0|25%|50%|75%|100%}`] - Percentage Reserved for DP Destination Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for destination DP transfers

**[`-xdp-destination-xfer-reserve-pct {0|25%|50%|75%|100%}`] - Percentage Reserved for XDP Destination Transfers**

Specifies the percentage of maximum allowed concurrent transfers reserved for destination XDP transfers

## Examples

The following example displays SnapMirror options:

```
cluster1::> snapmirror set-options
    Percentage Reserved for DP Source Transfers:  0
    Percentage Reserved for XDP Source Transfers:  0
    Percentage Reserved for DP Destination Transfers: 0
    Percentage Reserved for XDP Destination Transfers: 0

cluster1::> snapmirror set-options -dp-source-xfer-reserve-pct 25
    -xdp-source-xfer-reserve-pct 50 -dp-destination-xfer
    reserve-pct 0 -xdp-destination-xfer-reserve-pct 50

cluster1::> snapmirror set-options
    Percentage Reserved for DP Source Transfers:  25
    Percentage Reserved for XDP Source Transfers:  50
    Percentage Reserved for DP Destination Transfers: 0
    Percentage Reserved for XDP Destination Transfers: 50
```

## snapmirror set-preferred-cluster

Set this cluster as the preferred cluster

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror set-preferred-cluster` sets the local cluster as the preferred cluster for SnapMirror active sync relationships of policy-type 'automated-failover-duplex'. Note that the 'preferred-cluster' will be the one serving IO upon scenarios like a network partition between primary and secondary.

You should execute the `snapmirror set-preferred-cluster` command from the destination cluster.

Make sure the relationship status is InSync and the ONTAP Mediator is configured, connected, and in quorum before using this command.

## Parameters

### **-destination-path**

{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path

Specifies the destination endpoint of the SnapMirror relationship.

## Examples

To perform a set-preferred-cluster operation of an SnapMirror active sync relationship with source Consistency Group *cg\_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*, type the following command from the destination cluster:

```
destination::> snapmirror set-preferred-cluster -destination-path  
vs2.example.com:/cg/cg_dst
```

Note: The SnapMirror set-preferred-cluster operation internally triggers a planned failover operation. The SnapMirror active sync relationship information in the [snapmirror show](#) command will now be available on the new destination that is Vserver *vs2.example.com* with *cg\_dst* as the new source and *cg\_src* as the new destination Consistency Groups after the SnapMirror set-preferred-cluster operation is completed.

## Related Links

- [snapmirror show](#)

## snapmirror show-history

Displays history of SnapMirror operations.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror show-history` command displays the history of the last 24 hours of SnapMirror operations. This command is not supported for relationships with non-ONTAP endpoints.

By default, the command displays the following information:

- Destination Path
- Source Path
- Operation
- Start Time
- End Time
- Result

The `snapmirror show-history` command displays - in reverse chronological order - the history of completed SnapMirror operations whose destination endpoints are in the current Vserver for Vserver administrators, or the current cluster for cluster administrators. This command does not return information on

the following operations and relationships:

- Operations that happened prior to installing ONTAP 8.3.
- Relationships with the *"Relationship Capability"* field, as shown in the output of the SnapMirror show command, set to *"Pre 8.2"*.
- Operations on FlexGroup relationships that happened prior to installing ONTAP 9.5.
- Operations on FlexGroup constituent relationships.

The `-instance` parameter displays the following detailed information:

Destination Path: Path of the destination endpoint.

Source Path: Path of the source endpoint.

Relationship ID: The unique identifier of the relationship.  
This parameter is not supported for  
Vserver SnapMirror relationships.

Relationship Group Type: For FlexVol relationships, specifies the  
type of the group relationship that  
includes this FlexVol. For group  
relationships, specifies the type of the  
group relationship. Can be one of the  
following:

- none: No group relationship.
- vservers: Vserver relationship.
- flexgroup: FlexGroup relationship.

Operation: Type of the operation.

Can be one of the following:

- create
- modify
- quiesce
- resume
- delete
- initialize
- manual update
- scheduled update
- break
- resync
- abort
- restore

Operation ID: The unique identifier of the operation.

Start Time: Timestamp of the start of the operation.

End Time: Timestamp of the end of the operation.

Result: Result of the SnapMirror operation.

Can be one of the following:

- success
- failure

Transfer Size: Total amount of data transferred during the  
SnapMirror operation.

Additional Information: A message describing the cause of the  
failure or additional information about a  
successful operation, such as if a

checkpoint

was cleared as part of an abort operation.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**{ [-destination-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}} - Destination Path**

Select SnapMirror operations that have a matching destination path name.

**| [-destination-vserver <vserver name>] - Destination Vserver**

Select SnapMirror operations that have a matching destination Vserver name.

**[-destination-volume <volume name>] - Destination Volume }**

Select SnapMirror operations that have a matching destination volume name.

**[-operation-id <UUID>] - Operation ID**

Select SnapMirror operations that have a matching operation ID.

**[-source-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}} - Source Path**

Select SnapMirror operations that have a matching source path name.

**[-source-vserver <vserver name>] - Source Vserver**

Select SnapMirror operations that have a matching source Vserver name.

**[-source-volume <volume name>] - Source Volume**

Select SnapMirror operations that have a matching source volume name.

**[-operation-type {create|modify|quiesce|resume|delete|initialize|manual-update|scheduled-update|break|resync|abort|restore|failover|rsetup|baseline-gather}] - Operation Type**

Select SnapMirror operations that have a matching operation type. Possible values are:

- create
- modify
- quiesce
- resume
- delete
- initialize
- manual-update
- scheduled-update

- break
- resync
- abort
- restore

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Select SnapMirror operations that have a matching start time.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time**

Select SnapMirror operations that have a matching end time.

**[-relationship-id <UUID>] - Relationship ID**

Select SnapMirror operations that have a matching relationship ID.

**[-relationship-group-type**

**{none|vserver|consistencygroup|flexgroup|vserverflexgroup|vserverconsistencygroup  
}] - Relationship Group Type**

Select SnapMirror relationships that have a matching relationship group type. Possible values are:

- *none*
- *vserver*
- *flexgroup*

**[-result {success|failure}] - Result of the Operation**

Select SnapMirror operations that have a matching result. Possible values are:

- success
- failure

**[-transfer-size {<integer>[KB|MB|GB|TB|PB]}] - Transfer Size**

Select SnapMirror operations that have a matching transfer size.

**[-additional-info <text>] - Additional Information**

Select SnapMirror operations that have matching additional information.

**[-max-rows-per-relationship <integer>] - Maximum Number of Rows per Relationship**

Select a matching number of SnapMirror operations per relationship.

**[-expand <true>] - Show Constituents of the Group.**

Select SnapMirror operations on relationships that are constituents and non-constituents of a group.

## Examples

The example below displays summary information for all SnapMirror operations on relationships with destination endpoints in the current cluster:

```

cluster2::> snapmirror show-history
Destination Source          Start      End
Path        Path          Operation Time      Time      Result

# snapmirror show

Display a list of SnapMirror relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror show` command displays information associated with SnapMirror relationships. By default, the command displays the following information:

- Source path
- Relationship Type
- Destination Path
- Mirror State
- Relationship Status
- Total Progress
- Healthy
- Progress Last Updated

For backward compatibility with ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote ONTAP 8.1 cluster; (3) The local cluster was upgraded from ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with ONTAP 8.2 capabilities. These relationships have the same limitations as on ONTAP 8.1. Especially, they support the same set of information fields. The *"Relationship Capability"* field is set to *"Pre 8.2"* for these relationships.

The `snapmirror show` command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with ONTAP 8.1, the command also displays information for SnapMirror relationships with the *"Relationship Capability"* of *"Pre 8.2"*, and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the [snapmirror list-destinations](#) command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The `snapmirror show` command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the `snapmirror show` output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the `snapmirror show` output.

The `-instance` and `-fields` parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the `snapmirror show` command select the SnapMirror relationships for which information is displayed. The `-instance` displays detailed information fields including:

Source Path: Path of the source endpoint.

Destination Path: Path of the destination endpoint.

Relationship Type: Type of the SnapMirror relationship. Can be one of the following:

- DP: Data protection relationship.
- LS: Load-sharing relationship.
- XDP: Extended data protection relationship.
- RST: Temporary relationship created during a restore operation, and deleted if the operation completes successfully.
- TDP: 7-mode to ONTAP transition data protection relationship.

Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following:

- none: No group relationship.
- vserver: Vserver relationship.
- flexgroup: FlexGroup relationship.
- consistencygroup: Consistency Group relationship.

Only for relationships with

"Relationship Capability"  
of "8.2 and above" .

Relationship Status: Status of the SnapMirror relationship. Can be one of the following:

- Idle: No transfer operation is in progress and future transfers are not disabled.
- Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled.
- Transferring: A transfer operation is in progress and future transfers are not disabled.
- Preparing: Pre-transfer phase for Vault incremental transfers. For Vault relationships only.

- Finalizing: Post-transfer phase for Vault incremental transfers. Network traffic will be low as processing is primarily on the destination volume.  
For Vault relationships only.
- Aborting: A transfer abort operation that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with "Relationship Capability" of "8.2 and above" .
- Quiesced: No transfer operation is in progress and future transfers are disabled.
- Quiescing: A transfer operation is in progress and future transfers are disabled.
- Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with "Relationship Capability" of "Pre 8.2" .
- Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

The following values are only applicable to

relationships with a policy of type  
sync-mirror, strict-sync-mirror,  
automated-failover, or  
automated-failover-duplex:

- OutOfSync: The SnapMirror relationship is not InSync and no async transfer operation is in progress.
- Transitioning: The SnapMirror relationship is transitioning to InSync.
- InSync: The SnapMirror relationship is

InSync.

The following values are only applicable to  
relationships with a policy of type  
automated-failover:

- Modifying: One or more properties of  
the SnapMirror relationship are  
being modified.

Mirror State: State of the destination volume. Can be one  
of the following:

- Uninitialized: Destination volume has not  
been initialized.
- Snapmirrored: Destination volume has been  
initialized and is ready to  
receive SnapMirror updates.
- Broken-off: Destination volume is RW  
and snapshots are present.

----

The following values are applicable only to  
the relationships with a policy of type  
automated-failover or  
automated-failover-duplex:

- Expanding: Addition of one or more volumes  
to the SnapMirror relationship  
is in progress.

----

The following values are applicable only to  
the relationships with a policy of type  
automated-failover-duplex:

- Shrinking: Removal of one or more volumes  
from the SnapMirror  
relationship is in progress.

Healthy: Condition of the relationship. Can be one of  
the following:

- true: The SnapMirror relationship is  
healthy. It has not missed a  
scheduled transfer, or experienced  
a manual update failure.
- false: The SnapMirror relationship is not  
healthy. It has missed a scheduled  
transfer, or has experienced a manual  
update failure.

Unhealthy Reason: Reason the SnapMirror relationship is not  
healthy. Only for relationships with

"Relationship Capability"  
 of "8.2 and above"  
 Newest Snapshot: Name of the newest snapshot on the  
 destination volume.  
 Newest Snapshot Timestamp: Timestamp of the newest snapshot.  
 Exported Snapshot: Name of the exported snapshot on the  
 destination volume. This field is not applicable  
 to the policy of type  
 automated-failover-duplex .  
 Exported Snapshot Timestamp: Timestamp of the exported snapshot.  
 Lag Time: Time since the exported snapshot  
 was created. It is displayed in the  
 format: hours:minutes:seconds.  
 Only for relationships with  
 "Relationship Capability"  
 of "8.2 and above" .  
 Transfer Type: Type of the current transfer operation.  
 Can be one of the following:  
 - initialize  
 - update  
 - resync  
 - restore  
 Only for relationships with  
 "Relationship Capability"  
 of "8.2 and above" .  
 Transfer Snapshot: Name of the snapshot being transferred.  
 Snapshot Progress: Amount of data transferred for the transfer  
 snapshot. This parameter is not supported  
 for SnapMirror FlexGroup relationships, but  
 it is supported for FlexGroup constituent  
 relationships.  
 Total Progress: Total amount of data transferred for the  
 current transfer operation.  
 Percent Complete for Current Status: Percent complete for the current  
 value  
 of status. This field is only valid when the  
 "Relationship Status" is  
 "Finalizing" .  
 Network Compression Ratio: The compression ratio achieved for the data  
 sent over the wire as a part of the current  
 transfer operation. The ratio is not  
 maintained across checkpoint restarts. If  
 network compression is disabled for the  
 transfer, the ratio will be set to 1:1.  
 Only for relationships with  
 "Relationship Capability"

of "8.2 and above" .

This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

in Snapshot Checkpoint: The amount of data transferred as recorded

most the restart checkpoint of the current or

recent transfer snapshot. If a restart checkpoint is present the next transfer will continue from the checkpoint. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Transfer Error: Possible transient error condition if any, encountered by the current transfer operation.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above".

Current Throttle: The maximum transfer rate in Kilobytes per second, used for the current transfer between clusters.

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

Current Transfer Priority: Priority assigned to the current transfer.  
Possible values are:

- low
- normal

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

Last Transfer Type: Type of the previous transfer operation:

- initialize
- update
- resync
- restore

Only for relationships with  
"Relationship Capability"  
of "8.2 and above" .

Last Transfer Size: Total amount of data transferred during the previous transfer operation if it was successful.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Last Transfer Network Compression Ratio: The compression ratio achieved for the data sent over the wire as a part of the previous transfer operation. If network compression was disabled for the transfer, the ratio will be set to 1:1.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but

it

is supported for FlexGroup constituent relationships.

Last Transfer Duration: Duration of the previous transfer operation if it was successful.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

Last Transfer From: Source endpoint of the previous transfer operation.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

Last Transfer End Timestamp: Timestamp of the end of the previous transfer operation.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

Last Transfer Error: Cause of the failure of the previous transfer operation.

Only for relationships with

"Relationship Capability"

of "8.2 and above" .

Relationship Capability: Management and control compatibility:

- "Pre 8.2": Management and control of the relationship is compatible with ONTAP 8.1.

- "8.2 and above": Full support of ONTAP 8.2 or later SnapMirror relationship management and control.

This parameter is not supported for Vserver SnapMirror relationships.

Relationship ID: The unique identifier of the relationship. Only for relationships with "Relationship Capability" of "8.2 and above" . This parameter is not supported for Vserver SnapMirror relationships.

Current Operation ID: Operation unique identifier of the currently executing SnapMirror operation. Only for relationships with "Relationship Capability" of "8.2 and above" .

Throttle (KB/sec): Configured maximum transfer rate for cross-cluster transfers.

SnapMirror Policy Type: Type of the SnapMirror policy associated with the relationship. Can be one of the following:

- async-mirror
- vault
- mirror-vault

Refer to the man page for the

`xref:{relative_path}snapmirror-policy-create.html[snapmirror policy create]` command for a description of what these types mean. Only for relationships with "Relationship Capability" of "8.2 and above" .

SnapMirror Policy: Name of the SnapMirror policy associated with the relationship. Only for relationships with "Relationship Capability" of "8.2 and above" .

SnapMirror Schedule: Name of the schedule (empty if there is no schedule) associated with the relationship.

Tries Limit: Maximum number of times a transfer will be tried.

Only for relationships with "Relationship Capability" of "Pre 8.2" .

This parameter is not supported for Vserver SnapMirror relationships.

Destination Volume Node: Node which owns the destination volume

of the relationship. For FlexGroup relationships it is the node which owns the root constituent destination volume. For object store relationships it is the node which owns the source volume.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

Identity Preserve Vserver DR: Whether or not the identity of the source Vserver is replicated to the destination Vserver. Can be:

- true: Source Vserver's configuration will additionally be replicated to the destination, along with the Vserver's volumes and RBAC configuration.
- false: Only volumes and RBAC configuration of the source Vserver is replicated to the destination.

This parameter is supported only for Vserver SnapMirror relationships.

Volume MSIDs Preserved: Whether or not the MSIDs of the source volumes are retained while creating destination volumes.

Can be:

- true: MSIDs of source Vserver volumes and destination Vserver volumes match.
- false: MSIDs of source Vserver volumes

and

destination Vserver volumes do not match.

This parameter is supported only for Vserver SnapMirror relationships.

Is Auto Expand Enabled: Whether or not the auto expand is enabled.

Can be:

- true: Auto Expand is enabled.
- false: Auto Expand is disabled.

This parameter is supported only for FlexGroup SnapMirror relationships.

Is Adaptive Enabled: Whether or not adaptive is enabled.

Can be:

- true: Adaptive is enabled.
- false: Adaptive is disabled.

This parameter is supported only for FlexVol

SnapMirror relationships between ONTAP endpoints.

Backoff level: Level of backoff of SnapMirror relationship transfers in the presence of client ops.

Can be:

- high
- medium
- none

This parameter is supported only for FlexVol SnapMirror relationships.

Number of Successful Updates: The number of successful SnapMirror update operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Updates: The number of failed SnapMirror update operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

Number of Successful Resyncs: The number of successful SnapMirror resync operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with "Relationship Capability" of "8.2 and above" .

This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Resyncs: The number of failed SnapMirror resync operations for the relationship since the last reboot, aggregate relocation, takeover/giveback, or metrocluster switchover/switchback involving the node that hosts the relationship.

Only for relationships with

```

        "Relationship Capability"
        of "8.2 and above" .
        This parameter is not supported for Vserver
        SnapMirror relationships.
Number of Successful Breaks: The number of successful SnapMirror break
        operations for the relationship since the
        last reboot, aggregate relocation, takeover/
        giveback, or metrocluster switchover/switchback
        involving the node that hosts the relationship.
        Only for relationships with
        "Relationship Capability"
        of "8.2 and above" .
        This parameter is not supported for Vserver
        SnapMirror relationships.
Number of Failed Breaks: The number of failed SnapMirror break
        operations for the relationship since the
        last reboot, aggregate relocation, takeover/
        giveback, or metrocluster switchover/switchback
        involving the node that hosts the relationship.
        Only for relationships with
        "Relationship Capability"
        of "8.2 and above" .
        This parameter is not supported for Vserver
        SnapMirror relationships.
Total Transfer Bytes: Cumulative bytes transferred for the
        relationship. Only for relationships with
        "Relationship Capability"
        of "8.2 and above" .
        This parameter is not supported for Vserver
        SnapMirror relationships.
Total Transfer Time: Cumulative total transfer time in seconds for
        the relationship since the last reboot, aggregate
        relocation, takeover/giveback, or metrocluster
        switchover/switchback involving the node that
        hosts the relationship. Only for relationships with
        "Relationship Capability"
        of "8.2 and above" .
        This parameter is not supported for Vserver
        SnapMirror relationships.

```

## Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**{ [-S, -source-path  
<[vserver:] [volume]>>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

Select SnapMirror relationships that have a matching source path name.

**| [-source-cluster <Cluster name>] - Source Cluster**

Select SnapMirror relationships that have a matching source cluster name. This parameter is not supported for relationships with non-ONTAP, FlexGroup volume, or Vserver source endpoints.

**[-source-vserver <vserver name>] - Source Vserver**

Select SnapMirror relationships that have a matching source Vserver name. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Select SnapMirror relationships that have a matching source volume name. This parameter is not supported for relationships with non-ONTAP source endpoints.

**{ [-destination-path  
<[vserver:] [volume]>>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Destination Path**

Select SnapMirror relationships that have a matching destination path name.

Using wildcards with this parameter:

- To match all Vserver SnapMirror relationships, use: `-destination-path *`
- To match all the SnapMirror relationships except Vserver SnapMirror relationships in the cluster, use: `-destination-path *`

**| [-destination-cluster <Cluster name>] - Destination Cluster**

Select SnapMirror relationships that have a matching destination cluster name. This parameter is not supported for relationships with non-ONTAP, FlexGroup volume, or Vserver destination endpoints.

**[-destination-vserver <vserver name>] - Destination Vserver**

Select SnapMirror relationships that have a matching destination Vserver name. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**[-destination-volume <volume name>] - Destination Volume }**

Select SnapMirror relationships that have a matching destination volume name. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**[-type <snapmirrorType>] - Relationship Type**

Select SnapMirror relationships that have a matching relationship type. Vservers support only DP SnapMirror relationships. Possible values are:

- DP
- LS

- XDP
- TDP
- RST

**`[-relationship-group-type`**

**`{none|vserver|consistencygroup|flexgroup|vserverflexgroup|vserverconsistencygroup`**

**`}] - Relationship Group Type`**

Select SnapMirror relationships that have a matching relationship group type. Possible values are:

- *none*
- *vserver*
- *flexgroup*
- *consistencygroup*

**`[-vserver <vserver name>] - Managing Vserver`**

Select SnapMirror relationships that have a matching managing Vserver name. The `-vserver` option is currently a reserved option.

**`[-schedule <text>] - SnapMirror Schedule`**

Select SnapMirror relationships that have a matching schedule.

**`[-policy-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|automated-failover-duplex|continuous|undefined}] - SnapMirror Policy Type`**

Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:

- *async-mirror*
- *vault*
- *mirror-vault*
- *automated-failover*
- *automated-failover-duplex*
- *sync-mirror*
- *strict-sync-mirror*

**`[-policy <sm_policy>] - SnapMirror Policy`**

Select SnapMirror relationships that have a matching SnapMirror policy.

**`[-tries <integer_or_unlimited>] - Tries Limit`**

Select SnapMirror relationships that have a matching tries limit.

**`[-k, -throttle <throttleType>] - Throttle (KB/sec)`**

Select SnapMirror relationships that have a matching throttle.

**`[-cg-item-mappings {<source volume>:@<destination volume>|<source item path>:@<destination item path>}] - Consistency Group Item Mappings`**

Select SnapMirror relationships that have a matching cg-item-mappings.

**`[-current-throttle <throttleType>]` - Current Transfer Throttle (KB/sec)**

Select SnapMirror relationships that have a matching current throttle.

**`[-state <mirror state>]` - Mirror State**

Select SnapMirror relationships that have a matching mirror state. Possible values are:

- Uninitialized
- Snapmirrored
- Broken-off

**`[-status <mirror status>]` - Relationship Status**

Select SnapMirror relationships that have a matching relationship status. Possible values are:

- Idle
- Queued
- Transferring
- Preparing
- Finalizing
- Aborting
- Quiesced
- Quiescing
- Checking

Status values Finalizing, Checking, Waiting and Preparing are not supported for Vserver SnapMirror relationships.

**`[-file-restore-file-count <integer>]` - File Restore File Count**

The number of files being restored by file restore.

**`[-file-restore-file-list <text>,...]` - File Restore File List**

List of the destination file names of the files being restored by file restore.

**`[-transfer-snapshot <text>]` - Transfer Snapshot**

Select SnapMirror relationships that have a matching transfer snapshot.

**`[-snapshot-progress {<integer>[KB|MB|GB|TB|PB]}]` - Snapshot Progress**

Select SnapMirror relationships that have a matching snapshot progress.

**`[-total-progress {<integer>[KB|MB|GB|TB|PB]}]` - Total Progress**

Select SnapMirror relationships that have a matching total progress.

**`[-network-compression-ratio <text>]` - Network Compression Ratio**

Select SnapMirror relationships that have a matching network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

**`[-snapshot-checkpoint {<integer>[KB|MB|GB|TB|PB] }]` - Snapshot Checkpoint**

Select SnapMirror relationships that have a matching snapshot checkpoint. This parameter is not supported for Vserver SnapMirror relationships.

**`[-newest-snapshot <text>]` - Newest Snapshot**

Select SnapMirror relationships that have a matching newest snapshot.

**`[-newest-snapshot-timestamp <MM/DD HH:MM:SS>]` - Newest Snapshot Timestamp**

Select SnapMirror relationships that have a matching newest snapshot timestamp.

**`[-exported-snapshot <text>]` - Exported Snapshot**

Select SnapMirror relationships that have a matching exported snapshot name. For load-sharing mirror relationships, if the exported-snapshot field for a relationship has a dash (-), the load-sharing mirror is lagging behind the up-to-date mirrors in the set.

**`[-exported-snapshot-timestamp <MM/DD HH:MM:SS>]` - Exported Snapshot Timestamp**

Select SnapMirror relationships that have a matching exported snapshot timestamp.

**`[-healthy {true|false}]` - Healthy**

Select SnapMirror relationships that have a matching healthy condition.

**`[-relationship-id <UUID>]` - Relationship ID**

Select SnapMirror relationships that have a matching relationship ID. This parameter is not supported for Vserver SnapMirror relationships.

**`[-current-operation-id <UUID>]` - Current Operation ID**

Select SnapMirror relationships that have a matching operation unique identifier of the currently executing SnapMirror operation.

**`[-current-transfer-type`**

**`{initialize|update|resync|restore|check|file_restore|cggrs_initialize|cggrs_resync|cg_update|cg_initialize|cg_resync|cg_restore|catalog_metadata|cg_file_restore|failover|aufo|failover_incapable|cg_migrate}]` - Transfer Type**

Select SnapMirror relationships that have a matching current transfer type.

**`[-current-transfer-error <text>]` - Transfer Error**

Select SnapMirror relationships that have a matching current transfer error.

**`[-last-transfer-type`**

**`{initialize|update|resync|restore|check|file_restore|cggrs_initialize|cggrs_resync|cg_update|cg_initialize|cg_resync|cg_restore|catalog_metadata|cg_file_restore|failover|aufo|failover_incapable|cg_migrate}]` - Last Transfer Type**

Select SnapMirror relationships that have a matching last transfer type.

**`[-last-transfer-error <text>]` - Last Transfer Error**

Select SnapMirror relationships that have a matching last transfer error.

**`[-last-transfer-size {<integer>[KB|MB|GB|TB|PB] }]` - Last Transfer Size**

Select SnapMirror relationships that have a matching last transfer size.

**`[-last-transfer-network-compression-ratio <text>]` - Last Transfer Network Compression Ratio**

Select SnapMirror relationships that have a matching last transfer network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

**`[-last-transfer-duration <[[<hours>:]<minutes>:]<seconds>>]` - Last Transfer Duration**

Select SnapMirror relationships that have a matching last transfer duration.

**`[-last-transfer-from <text>]` - Last Transfer From**

Select SnapMirror relationships that have a matching last transfer source.

**`[-last-transfer-end-timestamp <MM/DD HH:MM:SS>]` - Last Transfer End Timestamp**

Select SnapMirror relationships that have a matching last transfer end timestamp.

**`[-unhealthy-reason <text>]` - Unhealthy Reason**

Select SnapMirror relationships that have a matching unhealthy reason.

**`[-progress-last-updated <MM/DD HH:MM:SS>]` - Progress Last Updated**

Select SnapMirror relationships that have a matching progress last updated.

**`[-relationship-capability <text>]` - Relationship Capability**

Select SnapMirror relationships that have a matching relationship capability. This parameter is not supported for Vserver SnapMirror relationships.

**`[-lag-time <[[<hours>:]<minutes>:]<seconds>>]` - Lag Time**

Select SnapMirror relationships that have a matching lag time.

**`[-current-transfer-priority {low|normal}]` - Current Transfer Priority**

Select SnapMirror relationships that have a matching current transfer priority.

**`[-is-smtape-op {true|false}]` - SMTape Operation**

Select SnapMirror relationships that have a matching smtape operation.

**`[-destination-volume-node <nodename>]` - Destination Volume Node Name**

Select SnapMirror relationships that have a matching destination volume node name. This parameter is not supported for Vserver SnapMirror relationships.

**`[-identity-preserve {true|false}]` - Identity Preserve Vserver DR**

Select SnapMirror relationships that have a matching value for identity-preserve. This parameter is valid only for Vserver SnapMirror relationships.

**`[-expand <true>]` - Show Constituents of the Group**

Specifies whether to display constituent relationships of Vserver, FlexGroup and Consistency Group SnapMirror relationships. By default, the constituents are not displayed.

**`[-update-successful-count <integer>]` - Number of Successful Updates**

Select SnapMirror relationships that have a matching number of successful updates. This parameter is not supported for Vserver SnapMirror relationships.

**[`-update-failed-count <integer>`] - Number of Failed Updates**

Select SnapMirror relationships that have a matching number of failed updates. This parameter is not supported for Vserver SnapMirror relationships.

**[`-resync-successful-count <integer>`] - Number of Successful Resyncs**

Select SnapMirror relationships that have a matching number of successful resyncs. This parameter is not supported for Vserver SnapMirror relationships.

**[`-resync-failed-count <integer>`] - Number of Failed Resyncs**

Select SnapMirror relationships that have a matching number of failed resyncs. This parameter is not supported for Vserver SnapMirror relationships.

**[`-break-successful-count <integer>`] - Number of Successful Breaks**

Select SnapMirror relationships that have a matching number of successful breaks. This parameter is not supported for Vserver SnapMirror relationships.

**[`-break-failed-count <integer>`] - Number of Failed Breaks**

Select SnapMirror relationships that have a matching number of failed breaks. This parameter is not supported for Vserver SnapMirror relationships.

**[`-total-transfer-bytes <integer>`] - Total Transfer Bytes**

Select SnapMirror relationships that have a matching total transfer bytes. This parameter is not supported for Vserver SnapMirror relationships.

**[`-total-transfer-time-secs <integer>`] - Total Transfer Time in Seconds**

Select SnapMirror relationships that have a matching total transfer time in seconds. This parameter is not supported for Vserver SnapMirror relationships.

**[`-msid-preserve {true|false}`] - Source Volume MSIDs Preserved**

This parameter specifies whether the volume MSIDs are preserved at the destination. This parameter is applicable only for Vserver SnapMirror relationships.

**[`-is-auto-expand-enabled {true|false}`] - Is Auto Expand Enabled**

Select SnapMirror relationships that have a matching value for auto expand. This parameter is supported only for FlexGroup SnapMirror relationships. Possible values are:

- true
- false

**[`-percent-complete-cur-status <integer>`] - Percent Complete for Current Status**

Select SnapMirror relationships that have a matching percent complete for the current status.

**[`-discard-configs {true|false}`] - Discard configuration in IDP**

Select SnapMirror relationships that have a matching value for discard-configs. This parameter is valid only for Vserver SnapMirror relationships.

**[`-backoff-level {high|medium|none}`] - SM Backoff Level due to Client Ops**

Select SnapMirror relationships that have a matching value for backoff level. This parameter is supported only for FlexVol SnapMirror relationships. Possible values are:

- high
- medium
- none

## Examples

The example below displays summary information for all SnapMirror relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show
Source          Destination  Mirror  Relationship  Total
Last
Path           Type  Path          State   Status          Progress  Healthy
Updated

## snapmirror update-ls-set

Start an incremental load-sharing set transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror update-ls-set` command updates a set of load-sharing mirrors. The command makes destination volumes, in the group of load-sharing mirrors, up-to-date mirrors of the source volume.

The key parameter that identifies the set of load-sharing mirrors is the source volume. SnapMirror transfers are performed from the source volume to each of the up-to-date destination volumes in the set of load-sharing mirrors.

The `snapmirror update-ls-set` command performs an incremental transfer to each of the destination volumes. During an incremental transfer, ONTAP takes a snapshot on the source volume to capture the current image of the source volume, finds the most recent common snapshot between the source and destination volumes, and incrementally transfers snapshots that are newer than the common snapshot to the destination volume.

You still need to use the `snapmirror update-ls-set` command to manually update the set of load-sharing mirrors even if the set only has one destination mirror. The [snapmirror update](#) command can only be used to bring up to date a specific destination mirror that is lagging to the set.

After an update using the `snapmirror update-ls-set` command successfully completes, the last snapshot transferred is made the new exported snapshot on the destination volumes.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the [snapmirror show](#) command.

## Parameters

**{ -S, -source-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-source-vserver <vserver name> - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**-source-volume <volume name> - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-w, -foreground <true>] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

## Examples

To update the group of load-sharing mirrors for the source endpoint named `//vs1.example.com/vs1_root`, type the following command:

```
cluster1::> snapmirror update-ls-set -source-path  
//vs1.example.com/vs1_root
```

## snapmirror update

Start an incremental transfer

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror update` command updates the destination volume or non-Data ONTAP endpoint of a SnapMirror relationship. The `snapmirror update` command behaves differently for data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships. Refer to the `-type` parameter of the [snapmirror create](#) command to understand different types of relationships supported by SnapMirror.

The `snapmirror update` command performs an incremental transfer.

Before using this command, the relationship must be initialized using the [snapmirror initialize](#) or [snapmirror initialize-ls-set](#) commands.

For data protection SnapMirror relationships with volumes as endpoints, the `snapmirror update` command makes the destination volume an up-to-date mirror of the source volume with the following steps:

- If the source volume is read-write, takes a snapshot on the source volume to capture the current image of the source volume
- Finds the most recent snapshot on the destination volume and validates that the corresponding snapshot is still present on the source
- Incrementally transfers snapshots that are newer than the corresponding snapshot to the destination volume

You can use the `snapmirror update` command to update a specific load-sharing mirror that lags behind up-to-date destination volumes in the set of load-sharing mirrors. An update to the lagging load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

Using the `snapmirror update` command to update a set of load-sharing mirrors will not work. Use the [snapmirror update-ls-set](#) command to update a set of load-sharing mirrors.

For extended data protection (XDP) relationships with a `snapmirror policy` of type *async-mirror*, a

`snapmirror update` always creates a new snapshot on the source volume. Depending on the rules in the policy, the command might transfer just the newly created snapshot or all snapshots that are newer than the common snapshot including the newly created snapshot to the destination volume.

For extended data protection (XDP) relationships with a `snapmirror` policy of type `vault`, a `snapmirror update` does not create a new snapshot on the source volume but transfers only selected snapshots that are newer than the common snapshot to the destination volume. (Those older than the common copy can be transferred by using the `-source-snapshot` parameter.) snapshots are selected by matching the value of `-snapmirror-label` of a snapshot with the value of `-snapmirror-label` of one of the rules from the corresponding SnapMirror policy associated with the SnapMirror relationship. All matching snapshots are incrementally transferred to the destination volume.

For extended data protection (XDP) relationships with a `snapmirror` policy of type `mirror-vault`, a `snapmirror update` always creates a new snapshot on the source volume and transfers only selected snapshots that are newer than the common snapshot. The newly created snapshot is always selected.

For extended data protection (XDP) relationships with a `snapmirror` policy of type `vault` or `mirror-vault`, the `snapmirror update` command also manages expiration of snapshots on the destination volume. It does so by deleting snapshots that have exceeded the value of `-keep` for the matching rule from the corresponding SnapMirror policy associated with the SnapMirror relationship. snapshots that match the same `-snapmirror-label` will be deleted in oldest-first order.

For relationships with a policy of type `strict-sync-mirror` or `sync-mirror`, this command creates a new common snapshot and designates it as the exported snapshot on the destination volume. It updates the destination read-only view because IO is redirected to the new exported snapshot. Clients could experience a brief latency spike during this process as the primary IO is temporarily fenced. This command is allowed only when the relationship-status is InSync. The command retains two pairs of common snapshots and deletes the older ones.

For SnapMirror active sync relationships with Consistency Groups of FlexVol volumes as endpoints, the `snapmirror update` command creates a new coordinated common snapshot. The command retains two coordinated common snapshots and deletes the oldest one.

For data protection relationships, the parameter `-source-snapshot` is optional and only allows for the transfer of snapshots newer than the common snapshot up to the specified `-source-snapshot`.

For extended data protection (XDP) relationships the parameter `-source-snapshot` is optional.

For extended data protection (XDP) relationships with a `snapmirror` policy of type `vault` or `mirror-vault`, the parameter `-source-snapshot` allows transfer of a snapshot that is older than the common snapshot and/or might not be selected for transfer based on policy-based selection of a scheduled update transfer.

For extended data protection (XDP) relationships with a `snapmirror` policy of type `async-mirror`, the `snapmirror update` with parameter `-source-snapshot` does not create a new snapshot on the source volume. Depending on the rules in the policy, the command might transfer just the specified snapshot or snapshots that are newer than the common snapshot up to and including the specified snapshot to the destination volume.

After the `snapmirror update` command successfully completes, the last snapshot transferred is designated as the new exported snapshot on the destination volume. If an update to an extended data protection (XDP) relationship specifies a snapshot using the `-source-snapshot` parameter that is older than the common snapshot, after the `snapmirror update` successfully completes, the exported snapshot on the destination volume will remain unchanged.

If the `snapmirror update` does not finish successfully—for example, due to a network failure or because a `snapmirror abort` command was issued—a restart checkpoint might be recorded on the destination volume. If a restart checkpoint is recorded, the next update restarts and continues the transfer from the restart checkpoint. For extended data protection (XDP) relationships, the next update will restart and continue the old transfer regardless of whether the snapshot being transferred is a matching snapshot or not.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

For Vserver SnapMirror relationships, the `snapmirror update` command makes the destination Vserver an up-to-date mirror of the source Vserver.

The `snapmirror update` command must be used from the destination Vserver or cluster.

## Parameters

**{ [-S, -source-path <[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

**| [-source-cluster <Cluster name>] - Source Cluster**

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source`, `-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**[-source-vserver <vserver name>] - Source Vserver**

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP source endpoints.

**[-source-volume <volume name>] - Source Volume }**

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP

source endpoints.

**{ -destination-path**  
**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}** - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

**| [-destination-cluster <Cluster name>] - Destination Cluster**

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and `-destination-volume` must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

**-destination-vserver <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-destination-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**-destination-volume <volume name> - Destination Volume }**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters `-destination-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-destination-cluster` must also be specified. This parameter is not supported for relationships with non-ONTAP destination endpoints.

**[-s, -source-snapshot <text>] - Source Snapshot**

This optional parameter specifies a snapshot to transfer. The default behavior for a data protection relationship with a read-write source is that ONTAP creates a new snapshot and uses it as the basis for determining what data is replicated; with this option, the specified snapshot will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified snapshot must be newer than the latest common snapshot. For an extended data protection relationship, the specified snapshot can be newer or older than the common snapshot. This parameter is not supported for relationships with *"Relationship Capability"* of *"Pre 8.2"*.

**[-k, -throttle <throttleType>] - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for the update transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the `snapmirror create` or `snapmirror modify` command will be used. To fully use the network bandwidth available, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*. For FlexGroup and Application Consistency Group relationships, the throttle value is applied individually to each constituent relationship. The `-throttle` parameter does not affect load-sharing transfers and transfers for other relationships with *"Relationship Capability"* of *"Pre*

8.2" confined to a single cluster.

#### **[`-transfer-priority {low|normal}`] - Transfer Priority**

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a *"Relationship Capability"* of *"Pre 8.2"*.

#### **[`-enable-storage-efficiency <true>`] - Enable Storage Efficient Transfers**

This is an optional parameter. For an extended data protection (XDP) relationship that is currently not storage efficient, set this parameter to true to enable storage efficient transfers. Storage efficient in this context refers to both over the wire efficiency and how the data is written to the destination volume. The transfer fails if storage efficiency cannot be achieved. If the transfer succeeds, future transfers will continue being storage efficient as long as it is still feasible, but will not fail if the transfer is not storage efficient. The default value is false. This parameter is not supported for relationships with non-Data ONTAP endpoints.

#### **[`-w, -foreground <true>`] - Foreground Process**

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

## **Examples**

To update the mirror relationship between the destination endpoint

*vs2.example.com:dept\_eng\_dp\_mirror3* and its source endpoint, type the following command:

```
vs2.example.com::> snapmirror update -destination-path  
vs2.example.com:dept_eng_dp_mirror3
```

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, to update the mirror relationship between the destination endpoint *cluster2://vs2.example.com/dept\_eng\_dp\_mirror3* and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path  
cluster2://vs2.example.com/dept_eng_dp_mirror3
```

To update the Vserver SnapMirror relationship between destination endpoint *dvs1.example.com:* and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path  
dvs1.example.com:
```

To update the SnapMirror active sync relationship with the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*, type the following command on the destination cluster:

```
destination::> snapmirror update -destination-path  
vs2.example.com:/cg/cg_dst
```

To update the Application Consistency Group relationship with the destination Application Consistency Group *app\_cg\_dst* in Vserver *vs2.example.com*, type the following command on the destination cluster:

```
destination::> snapmirror update -destination-path  
vs2.example.com:/cg/app_cg_dst
```

# snapmirror config-replication commands

## snapmirror config-replication cluster-storage-configuration modify

Modify SnapMirror storage configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `snapmirror config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

### Parameters

**`[-disallowed-aggregates <aggregate name>, ...]` - Disallowed Aggregates (privilege: advanced)**

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

### Examples

The following example disallows two aggregates named *aggr1* and *aggr2*:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration
modify -disallowed-aggregates aggr1,aggr2
```

## snapmirror config-replication cluster-storage-configuration show

Display SnapMirror storage configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `snapmirror config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- Disallowed Aggregates - The list of storage aggregates that are configured as not allowed to host storage areas.
- Auto-Repair - Displays *true* if the automatic repair of storage areas used by configuration replication is enabled.
- Auto-Recreate - Displays *true* if the automatic recreation of storage volumes used by configuration replication is enabled.
- Use Mirrored Aggregate - Displays *true* if storage areas for configuration replication are to be hosted on a mirrored aggregate.

### Examples

The following is an example of the `snapmirror config-replication cluster-storage-configuration show` command:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration
show
Disallowed Aggregates: -
      Auto-Repair: true
      Auto-Recreate: true
Use Mirrored Aggregate: true
```

## snapmirror config-replication status show-aggregate-eligibility

Display the SnapMirror configuration replication aggregate eligibility

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror config-replication status show-aggregate-eligibility` command displays the SnapMirror configuration replication aggregate eligibility.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Display only rows that have a matching aggregate name.

**[-hosted-configuration-replication-volumes <volume name>,...] - Currently Hosted Configuration Replication Volumes**

Display only rows that have matching configuration replication volumes hosted on this aggregate.

**[-is-eligible-to-host-additional-volumes {true|false}] - Eligibility to Host Another Configuration Replication Volume**

Display only rows that have a matching eligibility of the aggregate to host additional configuration replication volumes.

**[-comment <text>] - Comment for Eligibility Status**

Display only rows that have a matching comment regarding the eligibility of the aggregate to host configuration replication volumes.

## Examples

The following example shows the execution of the command in a SnapMirror configuration with thirteen aggregates in the cluster:

```
clusA::snapmirror config-replication status> show-aggregate-eligibility
```

| Aggregate                                        | Hosted Config Replication Vols             | Eligible to Host Addl Vols |
|--------------------------------------------------|--------------------------------------------|----------------------------|
| Comments                                         |                                            |                            |
| -----                                            | -----                                      | -----                      |
| a0                                               | -                                          | false                      |
| Root Aggregate                                   |                                            |                            |
| a1                                               | MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A | true -                     |
| a2                                               | MDV_CRS_1bc7134a5ddf11e3b63f123478563412_B | true -                     |
| a3                                               | -                                          | false                      |
| Unable to determine available space of aggregate |                                            |                            |
| a4                                               | -                                          | false                      |
| Non-Local Aggregate                              |                                            |                            |
| a5                                               | -                                          | false                      |
| Non-Home Aggregate                               |                                            |                            |
| a6                                               | -                                          | false                      |
| Unable to determine mirror configuration         |                                            |                            |
| a7                                               | -                                          | false                      |
| Mirror configuration does not match requirement  |                                            |                            |
| a8                                               | -                                          | false                      |
| Disallowed Aggregate                             |                                            |                            |
| a9                                               | -                                          | false                      |
| Insufficient Space - 10GB required               |                                            |                            |
| a10                                              | -                                          | false                      |
| Aggregate Offline                                |                                            |                            |
| a11                                              | -                                          | false                      |
| Inconsistent Aggregate                           |                                            |                            |
| a12                                              | -                                          | false                      |
| Aggregate Full                                   |                                            |                            |

## snapmirror config-replication status show-communication

Display SnapMirror configuration replication communication status information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror config-replication status show-communication` command displays the current SnapMirror configuration replication communication status.

The command displays the following aspects of SnapMirror configuration replication for each peer cluster:

- Remote Heartbeat: Verifies that the SnapMirror configuration replication heartbeat with the remote cluster is healthy.

- Last Heartbeat Sent: Prints the timestamp of the last SnapMirror configuration replication heartbeat sent to the remote cluster.
- Last Heartbeat Received: Prints the timestamp of the last SnapMirror configuration replication heartbeat received from the remote cluster.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-cluster-uuid <UUID>] - Remote Cluster**

Display only rows that have a matching peer cluster UUID.

**[-cluster <text>] - Peer Cluster Name**

Display only rows that have matching peer cluster name.

**[-remote-heartbeat {ok|warning|not-run|not-applicable}] - Remote Heartbeat**

Display only rows that have a matching remote heartbeat status.

**[-last-heartbeat-sent <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Sent Time**

Display only rows that have a matching timestamp of the last heartbeat sent.

**[-last-heartbeat-received <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Received Time**

Display only rows that have a matching timestamp of the last heartbeat received.

**[-heartbeat-recovery-steps <text>] - Heartbeat Recovery Steps**

Display only rows that have matching heartbeat recovery steps.

## Examples

The following example shows the execution of the command in a SnapMirror configuration with two peer clusters:

```
clus1::*> snapmirror config-replication status show-communication
      Peer Cluster: clus2
      Remote Heartbeat: ok
      Last Heartbeat Sent: 11/11/2014 11:11:45
      Last Heartbeat Received: 11/11/2014 11:11:46
      Peer Cluster: clus3
      Remote Heartbeat: ok
      Last Heartbeat Sent: 11/11/2014 11:11:26
      Last Heartbeat Received: 11/11/2014 11:11:27

2 entries were displayed.
```

## snapmirror config-replication status show

Display SnapMirror configuration replication status information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror config-replication status show` command displays the current SnapMirror configuration replication status.

The command displays the following aspects of SnapMirror configuration replication:

- **Enabled:** Verifies that SnapMirror configuration replication is enabled on the cluster.
- **Running:** Verifies that SnapMirror configuration replication is running on the cluster.
- **Storage Status:** Verifies that SnapMirror configuration replication storage is healthy.
- **Storage In Use:** Prints the location of SnapMirror configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non-healthy SnapMirror configuration storage.
- **Vserver Streams:** Verifies that SnapMirror configuration replication Vserver streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

### Parameters

**[`-instance` ]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### Examples

The following example shows the execution of the command:

```
clus1::*> snapmirror config-replication status show
      Enabled: true
      Running: true
      Storage Status: ok
      Storage In Use: Cluster-wide Volume:
MDV_CRS_3d47e9106b7d11e4a77b000c29f810a2_A
      Storage Remarks: -
      Vserver Streams: ok
```

## snapmirror failover commands

### snapmirror failover show

Display failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `snapmirror failover show` command is used to monitor the progress of the failover operation on the SnapMirror active sync relationship. You must execute this command from the destination cluster of the SnapMirror active sync relationship.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Start operation time of the failover.

**[-source-path**

**<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Source Path**

Specifies the source endpoint of the SnapMirror relationship.

**[-destination-path**

**<[vserver:] [volume]>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Destination Path**

Specifies the destination endpoint of the SnapMirror relationship.

**[-status {started|failed|completed|completed\_with\_warnings}] - Failover Status**

The status of SnapMirror failover.

**[`-error-reason` <text>] - Error Reason**

The reason for failure occurred during SnapMirror failover.

**[`-end-time` <MM/DD/YYYY HH:MM:SS>] - End Time**

End operation time of the failover.

**[`-primary-data-cluster` <text>] - Primary Data Cluster**

Primary data cluster.

**[`-last-progress-update` <text>] - Last Progress Update**

Last progress update.

**[`-type` {`planned`|`unplanned`|`incapable`}] - Failover Type**

Whether the SnapMirror failover was planned or unplanned.

**[`-error-reason-codes` <integer>,...] - Error Reason codes**

The reason codes for failure occurred during SnapMirror failover.

**Examples**

To see the progress of the failover operation performed on an SnapMirror active sync relationship with destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command from the destination cluster:

```
destination::> snapmirror failover show -destination-path  
vs2.example.com:/cg/cg_dst
```

**snapmirror failover start**

Start planned failover for SnapMirror relationships with 'automated-failover' policy-type

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snapmirror failover start` command initiates a planned failover operation to change the roles of copies in a SnapMirror active sync relationship without disrupting the client operations. The primary writable volumes become the secondary data protection volumes while the secondary data protection volumes become the primary writable volumes. The new primary volumes can begin processing I/O requests locally without disrupting the client operations. Asymmetric Logical Unit Access (ALUA) reporting will also change as a part of this role change.

You should execute the `snapmirror failover start` command from the destination cluster.

Make sure the relationship status is InSync and the ONTAP Mediator is configured, connected, and in quorum before using this command to switch the primary and secondary roles.

## Parameters

### **-destination-path**

{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>} - Destination Path

Specifies the destination endpoint of the SnapMirror relationship.

## Examples

To perform a planned failover operation of an SnapMirror active sync relationship with source Consistency Group *cg\_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg\_dst* in Vserver *vs2.example.com*, type the following command from the destination cluster:

```
destination:> snapmirror failover start -destination-path  
vs2.example.com:/cg/cg_dst
```

Note: The SnapMirror active sync relationship information in the [snapmirror show](#) command will now be available on the new destination that is Vserver *vs2.example.com* with *cg\_dst* as the new source and *cg\_src* as the new destination Consistency Groups after the SnapMirror failover operation is completed.

# snapmirror mediator commands

## snapmirror mediator add

Create mediator config entry

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `snapmirror mediator add` command configures the connection between a pair of clusters and an ONTAP Mediator. It is mandatory to initialize the ONTAP Mediator on one of the cluster peers before the SnapMirror active sync relation with policy type *automated-failover* performs a planned or an unplanned failover. You can initialize the ONTAP Mediator from either cluster. When you issue the ONTAP Mediator add command on one cluster, the ONTAP Mediator is automatically added on the other cluster.

## Parameters

### **-peer-cluster <text> - Peer cluster**

Peer cluster with AutomatedFailOver SnapMirror relationships.

### **[-type {on-prem|cloud}] - Mediator Type**

Specifies the type of the mediator. The value *on-prem* represents ONTAP Mediator. The value *cloud* represents ONTAP cloud mediator. The default value is *on-prem*.

**{ -mediator-address <IP Address> - Mediator Ip Address**

Specifies the IP address of the mediator. This is only applicable for ONTAP Mediator.

**-username <text> - Username**

User account at the mediator. This is only applicable for ONTAP Mediator.

**[-port-number <integer>] - Port Number**

This optional parameter specifies the mediator service port number to communicate with the mediator. The port number must be in the range 1025 to 65535 inclusive. The default port number is 31784. This is only applicable to ONTAP Mediator.

**[-bluexp-org-id <text>] - BlueXP Organization ID**

BlueXP Organization ID of the user. This is only applicable for ONTAP cloud mediator.

**[-service-account-client-id <text>] - Service Account Client ID }**

Specifies BlueXP Service Account Client ID. This is only applicable for ONTAP cloud mediator.

**[-use-http-proxy-local {true|false}] - Use HTTP Proxy on Local Cluster**

Specifies if the local cluster should use http-proxy server while making REST API calls to mediator. This option is only supported for ONTAP cloud mediator.

**[-use-http-proxy-remote {true|false}] - Use HTTP Proxy on Remote Cluster**

Specifies if the remote cluster should use http-proxy server while making REST API calls to mediator. This option is only supported for ONTAP cloud mediator.

## Examples

The following example configures the ONTAP Mediator.

```
clusA::> snapmirror mediator add -peer-cluster clusB -mediator-address
10.234.102.227 -username mediatoradmin
Notice: Enter the mediator password.
Enter the password:
Enter the password again:
Info: [Job: 114] 'mediator add' job queued
```

The following example configures the ONTAP cloud mediator.

```
clusA::> snapmirror mediator add -peer-cluster clusB -type cloud -bluexp
-org-id 2e32bd61-1cf2-4b70-9c5f-xxxxxxxxxxxx -service-account-client-id
i7SOpgeAEaxa3tqteaFN39J5xxxxxxxx -service-account-client-secret
HaDT6fcZVZWhTtdDuzvaAgJky6T9swAZhLcoF3LSWghBPfUeasjaqSKxxxxxxxx -use-http
-proxy-local true -use-http-proxy-remote true -strict-cert-validation true
Info: [Job: 52] 'mediator add' job queued
```

## snapmirror mediator modify

### Modify mediator configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `snapmirror mediator modify` command is used to modify a mediator configuration entry.

#### Parameters

**-peer-cluster <text> - Peer cluster**

Peer cluster for which the mediator is configured.

**[-mediator-address <IP Address>] - Mediator Ip Address**

Specifies the IP address of the mediator. This is only applicable for ONTAP Mediator.

**[-type {on-prem|cloud}] - Mediator Type**

Specifies the type of the mediator. The value *on-prem* represents ONTAP Mediator. The value *cloud* represents ONTAP cloud mediator.

**[-use-http-proxy-local {true|false}] - Use HTTP Proxy on Local Cluster**

Specifies if the local cluster should use http-proxy server while making REST API calls to mediator. This option is only supported for ONTAP cloud mediator.

**[-use-http-proxy-remote {true|false}] - Use HTTP Proxy on Remote Cluster**

Specifies if the remote cluster should use http-proxy server while making REST API calls to mediator. This option is only supported for ONTAP cloud mediator.

#### Examples

The following example modifies a mediator configuration entry.

```
clusA::> snapmirror mediator modify -peer-cluster clusB -type cloud -use
-http-proxy-local true -use-http-proxy-remote true -strict-cert-validation
true
```

## snapmirror mediator remove

### Remove mediator config entry

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `snapmirror mediator remove` command deletes a mediator configuration entry.

## Parameters

### **-peer-cluster <text> - Peer cluster**

Peer cluster with AutomatedFailOver SnapMirror relationships.

### **[-type {on-prem|cloud}] - Mediator Type**

Specifies the type of the mediator. The value *on-prem* represents ONTAP Mediator. The value *cloud* represents ONTAP cloud mediator. The default value is *on-prem*.

### **[-mediator-address <IP Address>] - Mediator Ip Address**

Specifies the IP address of the mediator. This is only applicable for ONTAP Mediator.

### **[-f, -force <true>] - Force (privilege: advanced)**

The force option deletes the local configuration even if the peer cluster or mediator is not reachable.

## Examples

The following example removes a mediator configuration entry for ONTAP Mediator.

```
clusA::> snapmirror mediator remove -peer-cluster clusB -mediator-address 10.140.102.227
Info: [Job 36] 'mediator remove' job queued
```

The following example removes a mediator configuration entry for ONTAP cloud mediator.

```
clusA::> snapmirror mediator remove -peer-cluster clusB -type cloud
Info: [Job 53] 'mediator remove' job queued
```

## snapmirror mediator show

Show mediator information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror mediator show` command shows the status of the ONTAP Mediator configuration.

### Parameters

#### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

#### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-mediator-address <IP Address>]` - Mediator IP Address**

Ip address of the mediator.

**`[-peer-cluster <text>]` - Peer Cluster Name**

Peer cluster name.

**`[-connection-status`**

**`{connected|unreachable|suspended|unusable|misconfigured|removing|not-configured|unknown|adding|down-high-latency}]` - Connection Status**

Connection status of the cluster with the mediator.

**`[-quorum-status {unknown|true|false}]` - Mediator Quorum Status**

Shows whether the SnapMirror Consistency Group relationships are synchronized with mediator.

**`[-health-fetch-timeout <integer>]` - Peer Health Fetch Timeout**

Timeout value (in seconds) for peer-cluster health fetch via mediator.

**`[-connection-timeout <integer>]` - Connection Timeout**

Timeout value (in seconds) for mediator connection.

**`[-type {on-prem|cloud}]` - Mediator Type**

Specifies the type of the mediator. The value *on-prem* represents ONTAP Mediator. The value *cloud* represents ONTAP cloud mediator.

**`[-critical-api-timeout <integer>]` - Critical API Timeout**

Timeout value (in seconds) for the critical APIs invoked in IO-impacting workflows of a SnapMirror active sync relationship, such as planned failover, automatic unplanned failover and OutOfSync handling. The default value is 5 sec for ONTAP Mediator and 7 sec for ONTAP cloud mediator.

**`[-non-critical-api-timeout <integer>]` - Non-critical API Timeout**

Timeout value (in seconds) for the non-critical APIs invoked in non-IO-impacting workflows, such as mediator configuration, mediator removal, creation and deletion of a SnapMirror active sync relationship. The default value is 5 sec for ONTAP Mediator and 34 sec for ONTAP cloud mediator.

**`[-use-http-proxy {true|false}]` - Use HTTP Proxy on Cluster**

Whether this cluster uses an http proxy server while making REST API calls to mediator or not.

**`[-ping-network-rtt <integer>]` - Network RTT Ms**

Network RTT (in milliseconds) between ONTAP and the BlueXP cloud server as observed during the ping-test.

**`[-latency-status-list <text>, ...]` - Node-wise API Latency Status List**

List of API call latency status being reported by the nodes of the cluster. This option is only supported for ONTAP cloud mediator.

## Examples

The following example shows an ONTAP Mediator configuration.

```
clusA::> snapmirror mediator show
      Mediator Address Peer Cluster      Connection Status Quorum Status
Type -----
-----
      10.140.102.227   clusB           connected         true
on-prem
clusA::> snapmirror mediator show -instance
Mediator Uuid: 416fbdee-c982-11e9-9034-005056a7124c
      Mediator IP Address: 10.140.102.227
      Peer Cluster: clusB
      Peer Cluster Uuid: 771d9b13-c973-11e9-928e-
005056a7a882
      Connection Status: connected
      Quorum Status: true
      Type: on-prem
      Health Fetch Timeout: 5
      Connection Timeout: 5
      Mediator Read Timeout: 5
      Mediator Write Timeout: 5
      Use HTTP Proxy Server: false
      Strict Certificate Validation: false
      BlueXP Server Ping URL: -
      Ping Network RTT (ms): -
      Node-wise API Latency Status: -
```

The following example shows an ONTAP cloud mediator configuration.

```

clusA::> snapmirror mediator show
      Mediator Address Peer Cluster      Connection Status Quorum Status
Type
-----
cloud 0.0.0.0          clusB          connected          true

clusA::> snapmirror mediator show -instance
Mediator Uuid: e314083d-053f-11f0-badf-005056ae1773
      Mediator IP Address: 0.0.0.0
      Peer Cluster: clusB
      Peer Cluster Uuid: 9a21429f-0487-11f0-ac98-
005056ae112c
      Connection Status: true
      Quorum Status: true
      Type: cloud
      Health Fetch Timeout: 5
      Connection Timeout: 5
      Mediator Read Timeout: 6
      Mediator Write Timeout: 6
      Use HTTP Proxy Server: true
      Strict Certificate Validation: true
      BlueXP Server Ping URL: api.bluexp.netapp.com
      Ping Network RTT (ms): 100
      Node-wise API Latency Status: NodeA: normal, NodeB: normal

```

## snapmirror mediator primary-bias show

### Show Primary Bias Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror mediator primary-bias show` command shows the status of primary-bias. This command is applicable when mediator status is shown as unreachable/misconfigured from both primary and secondary cluster.

This will also show the state corresponding to each CG endpoint residing on the given cluster. Slave CG endpoints will show the state of "Failover disabled". Master CG endpoints will show the state of Primary-bias activation.

The status of primary-bias can be one of the following. + primary-bias-activated - represents the state that allows master endpoints to assume the I/O serving authority + primary-bias-not-activated - represents the state that mediator is reachable from primary and secondary clusters and IO serving authority set to default + mediator-engaged-for-failover - represents the state that mediator is engaged and Failover on slave endpoints is possible + mediator-disengaged-for-failover - represents the setting of the intermediate state preventing Failover on slave endpoints of a CG +

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-cg-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}} - Cg Path**

CG path.

**[-cg-role {destination|source}] - Role**

Indicates if CG is primary or secondary on local cluster.

**[-mb-state {Primary bias activated. Mediator Disengaged|Primary bias not-activated. Mediator engaged|Mediator disengaged for failover|Mediator engaged for failover}] - MB state**

Primary bias State.

## Examples

The following example shows the status of primary bias

```
cluster1::> snapmirror mediator primary-bias show
CG Path           Role           Status
-----
vs1:/cg/dcg       destination    mediator-engaged-for-failover
```

## snapmirror mediator primary-bias history show

### Show Primary Bias History

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror mediator primary-bias history show` command shows the history of Primary bias events.

The setting/clearing of the Primary Bias states (including the intermediate state) will be logged as event history per CG endpoint in the "snapmirror mediator primary bias history" command. The "mediator-engaged/disengaged-for-failover" actions will represent the setting/clearing of the intermediate state preventing Failover on slave endpoints of a CG. The "primary-bias-activated/not-activated" will represent the state that allows master endpoints to assume the I/O serving authority.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-cg-path**

**{<[vserver:] [volume]>|<[[cluster:]//vserver/] volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Cg Path**

CG path.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - TBA Task Start Time**

Time of event

**[-action {Primary bias activated. Mediator Disengaged|Primary bias not-activated. Mediator engaged|Mediator disengaged for failover|Mediator engaged for failover}] - Event**

Primary bias event.

## Examples

The following example shows the history output

```
C1_sti7-vsimg-ucs569m_cluster::*> snapmirror mediator primary-bias history
show -cg-path vs0:/cg/scg
  CG Path          Time          Action
  -----
  vs0:/cg/scg      7/25/2022 10:33:28
                    primary-bias-activated
  vs0:/cg/scg      7/25/2022 22:42:33
                    primary-bias-not-activated
  2 entries were displayed.
C1_sti7-vsimg-ucs569m_cluster::*>
```

## snapmirror mediator tba-history show

### Show Mediator Agent Event History

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `snapmirror mediator tba-history show` command shows the history of the ONTAP Mediator Agent events..

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-cg-rel-uuid <UUID>] - Cg Relationship Uuid**

Cg Relationship Uuid.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - TBA Task Start Time**

Mediator Agent Task Start Time.

**[-token-num <integer>] - Token Number**

Token Number.

**[-cg-path**

**{<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>|<[vserver:]/cg/[app-cgname]>}] - Cg Path**

Cg Path.

**[-aux-generation-num <integer>] - Auxillary Generation Number**

Auxiliary Generation Number.

**[-cg-rel-task <text>] - TBA Task Type**

Mediator Agent Task Type.

**[-cg-rel-state {invalid-state|waiting|task-processing|task-complete}] - Cg Management State**

Cg Management State.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - TBA Task End Time**

Mediator Agent Task End Time.

**[-cg-rel-action {invalid|none|continue|stop|failover-incapable|auto-failover|success|failed|mismatch|retry|success-pending|stop-pending|continue-pending|failover-incapable-pending|try-failover-incapable-ic|try-failover-incapable-med|try-auto-failover}] - Cg Management Action**

Cg Management Action.

**[-errCode <integer>] - Error Code for Task Failure**

Error Code for Task Failure.

## Examples

The following example shows the list of mediator configurations.

```

C1_sti89-vsim-ucs525q_cluster::> snapmirror mediator tba-history show
      (snapmirror mediator tba-history show)
      Path          Token API   Event   Start Time   State       End Time
Action
-----
vs0:/cg/cg1_src 5   4      Process Set Resync Context 4/28/2021
11:09:52 task-complete 4/28/2021 11:09:52 continue
vs0:/cg/cg1_src 6   1      Process Master InSync 4/28/2021 11:10:08
task-complete 4/28/2021 11:10:08 success
2 entries were displayed.
C1_sti89-vsim-ucs525q_cluster::> snapmirror mediator tba-history
show -instance

      Cg Management Action: success
Error Code for Task Failure: 0

```

## snapmirror object-store commands

### snapmirror object-store config create

Define the configuration for a SnapMirror object store

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `snapmirror object-store config create` command is used by a cluster administrator to tell ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store

configuration in ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The ONTAP node must be able to connect to the object store. This includes
- Fast, reliable connectivity to the object store.
- An inter-cluster LIF (Logical Interface) must be configured on the cluster.
- If SSL/TLS authentication is required, then valid certificates must be installed.

An object-store configuration once created must not be reassocated with a different object-store or container. See [snapmirror object-store config modify](#) command for more information.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the vservers on which the object store configuration needs to be created.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "", "-", A-Z, a-z, and 0-9. *The first character must be one of the following: "", A-Z, or a-z.*

### **-usage {data|metadata} - Object Store Use**

This parameter specifies the usage for an object store configuration.

### **-provider-type <providerType> - Type of the Object Store Provider**

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: AWS\_S3 (Amazon S3 storage), Azure\_Cloud (Microsoft Azure Cloud), SGWS (StorageGrid WebScale), IBM\_COS (IBM Cloud Object Storage), AliCloud (Alibaba Cloud Object Storage Service), GoogleCloud (Google Cloud Storage) and ONTAP\_S3.

### **-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server**

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the -server is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then a value of -azure-account followed by a period will be added in front of the server.

### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is `true`.

### **[-port <integer>] - Port Number of the Object Store**

This parameter specifies the port number on the remote server that ONTAP will use while establishing connection to the object store.

### **-container-name <text> - Data Bucket/Container Name**

This parameter specifies the data bucket or container that will be used for read and write operations.

This name cannot be modified once a configuration is created.

### **[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. For an Azure object store see `-azure-account`.

### **[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies the IPspace to use to connect to the object store. Default value: *Default*.

### **[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

This optional parameter is deprecated. Use `-auth-type` instead. Note, that `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`.

### **[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. If the `-access-key` is specified but the `-secret-password` is not, then one will be asked to enter the `-secret-password` without echoing the input.

### **[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. The default value is `true`. It is recommended to use the default value to make sure that ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

### **[-azure-account <text>] - Azure Account**

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see `access-key`.

The value of this field cannot be modified once a configuration is created.

### **[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this parameter is `true` then one will be asked to enter `-azure-private-key` without echoing the input. Default value: *true*.

### **[-azure-private-key <text>] - Azure Access Key**

This parameter specifies the access key required to authenticate requests to the Azure object store. See also `ask-azure-private-key`. For other object store providers see `-secret-password`.

### **[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on `provider-type`. `none` encryption (no encryption required) is supported by all

types of S3 (non-Azure) object store servers. SSE-S3 encryption is supported by and is a default for all types of S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of "sse\_s3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level.

#### **[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

#### **[-iamra-session-token <text>] - IAMRA Session Token for Authentication**

This parameter specifies a temporary token for S3 SnapMirror which will expire periodically. This will increase security.

#### **[-azure-msi-token <text>] - Azure MSI Token for Authentication**

This optional parameter specifies the Managed Service Identity (MSI) token required to authenticate to the Azure object store. This form of authentication is only supported on Azure NetApp Files.

## **Examples**

The following example creates a cluster scoped object store configuration named *objectStoreName*.

```
cluster1::*> snapmirror object-store config create
      -object-store-name objectStoreName -usage data -owner snapmirror
      -provider-type SGWS -server objectStoreServer.com
      -container-name containerName -is-ssl-enabled true
      -is-certificate-validation-enabled false
      -ipspace Default -access-key userAccessKey
      -secret-password userSecretPassWord
```

## **Related Links**

- [snapmirror object-store config modify](#)

## **snapmirror object-store config delete**

Delete SnapMirror object store configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `snapmirror object-store config delete` command removes an existing object store configuration in ONTAP.

## **Parameters**

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the vservers name on which the object store configuration has been configured.

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration to be deleted.

## Examples

The following example deletes an object store configuration named *objectStoreName*.

```
cluster1::*> snapmirror object-store config delete
      -object-store-name objectStoreName
```

## snapmirror object-store config modify

### Modify SnapMirror object store configuration attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The [storage aggregate object-store config modify](#) command is used to update one or more of object store configuration parameters.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the vservers on which the object store configuration needs to be created.

**-object-store-name <text> - Object Store Configuration Name**

This parameter identifies the configuration to be modified.

**[-usage {data|metadata}] - Object Store Use**

This parameter specifies the usage for an object store configuration.

**[-new-object-store-name <text>] - Object Store Configuration New Name**

This optional parameter specifies the new name for the object store configuration.

**[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format s3.amazonaws.com or s3-<region>.amazonaws.com, for example, s3-us-west-2.amazonaws.com. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then the value of `azure-account` in the configuration followed by a period will be added in front of the server. Note that the value of `azure-account` cannot be modified.

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This optional parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store.

**[`-port <integer>`] - Port Number of the Object Store**

This optional parameter specifies a new port number to connect to the object store server indicated in the `-server` parameter.

**[`-access-key <text>`] - Access Key ID for S3 Compatible Provider Types**

This optional parameter specifies a new access key (access key ID) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3.

**[`-ipspace <IPspace>`] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies new ipspace values for the configuration.

**[`-use-iam-role {true|false}`] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

This optional parameter is deprecated. Use `-auth-type` instead. Note, that `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`.

**[`-secret-password <text>`] - Secret Access Key for S3 Compatible Provider Types**

This optional parameter specifies a new password (secret access key) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3. For an Azure object store see `-azure-private-key`. If the `-access-key` is specified but the `-secret-password` is not then one will be asked to enter the `-secret-password` without echoing the input.

**[`-is-certificate-validation-enabled {true|false}`] - Is SSL/TLS Certificate Validation Enabled**

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. It is recommended to keep the default value which is `true` to make sure that ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

**[`-ask-azure-private-key {true|false}`] - Ask to Enter the Azure Access Key without Echoing**

If this optional parameter is `true` then one will be asked to enter the `-azure-private-key` without echoing the input.

**[`-azure-private-key <text>`] - Azure Access Key**

This optional parameter specifies a new access key for Azure object store. For other object store providers see `secret-password`. See also `ask-azure-private-key`.

**[`-server-side-encryption {none | SSE-S3}`] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. `none` encryption (no encryption required) is supported by all S3 (non-Azure) object store servers. `SSE-S3` encryption is supported by all S3 (non-Azure) object store servers except ONTAP\_S3. This is an advanced property. In most cases it is best not to change default value of `"sse_s3"` for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level. Note that changing this option does not change encryption of data which already exist in the object store.

**[`-url-style {path-style | virtual-hosted-style}`] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

### **`[-iamra-session-token <text>]` - IAMRA Session Token for Authentication**

This parameter specifies a temporary token for S3 SnapMirror which will expire periodically. This will increase security.

### **`[-azure-msi-token <text>]` - Azure MSI Token for Authentication**

This optional parameter specifies the new Managed Service Identity (MSI) token required to authenticate to the Azure object store. This form of authentication is only supported on Azure NetApp Files.

## **Examples**

The following example modifies an object-store configuration named *objectStoreName* to a new name *newName*.

```
cluster::*> snapmirror object-store config modify
      -object-store-name objectStoreName
      -new-object-store-name newName
```

## **Related Links**

- [storage aggregate object-store config modify](#)

## **snapmirror object-store config show**

Display a list of SnapMirror object store configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `snapmirror object-store config show` command displays information about all existing object store configurations in the cluster.

## **Parameters**

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>]` - Vserver Name**

If this parameter is specified, the command displays information only about object store configurations which are configured within this vservers.

**`[-object-store-name <text>]` - Object Store Configuration Name**

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

**[`-usage {data|metadata}`] - Object Store Use**

Specifies what this object store configuration is used for.

**[`-vsUuid <UUID>`] - Vserver UUID**

Vserver UUID.

**[`-config-id <integer>`] - Object Store Configuration ID**

If this parameter is specified, the command displays information only about object store configurations whose configuration ID matches the specified value.

**[`-provider-type <providerType>`] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[`-server <Remote InetAddress>`] - Fully Qualified Domain Name of the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

**[`-is-ssl-enabled {true|false}`] - Is SSL/TLS Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

**[`-port <integer>`] - Port Number of the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

**[`-container-name <text>`] - Data Bucket/Container Name**

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. ONTAP uses this container name or object store data bucket while accessing data from the object store.

**[`-access-key <text>`] - Access Key ID for S3 Compatible Provider Types**

If this parameter is specified, the command displays information only about AWS S3, SGWS, IBM COS object store configurations and ONTAP S3 whose access key matches the specified value. ONTAP requires the access key for authorized access to the object store.

**[`-ipspace <IPspace>`] - IPspace to Use in Order to Reach the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. ONTAP uses the IPspace value to connect to the object store.

**[`-use-iam-role {true|false}`] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM role status flag matches the specified value. The `-iam-role` and `-use-iam-role` parameters are relevant only in the context of AWS object store and indicates whether IAM role must be used for accessing it. The IAM credentials can be obtained only through AWS Cloud Volumes ONTAP.

**[`-is-certificate-validation-enabled {true|false}`] - Is SSL/TLS Certificate Validation Enabled**

If this parameter is specified, the command displays information only about object store configurations

whose status about the validation of SSL/TLS certificate matches the specified value.

**`[-azure-account <text>] - Azure Account`**

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. ONTAP requires the Azure account for authorized access to the Azure object store.

**`[-server-side-encryption {none | SSE-S3}] - Encryption of Data at Rest by the Object Store Server`**

If this parameter is specified, the command displays information only about object store configurations whose server-side encryption matches the specified value.

**`[-url-style {path-style | virtual-hosted-style}] - URL Style Used to Access S3 Bucket`**

If this parameter is specified, the command displays information only about object store configurations whose URL style matches the specified value.

## Examples

The following example displays information about all existing object store configurations in the cluster.

```
cluster1::*> snapmirror object-store config show
```

# snapmirror policy commands

## snapmirror policy add-rule

Add a new rule to SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror policy add-rule` command adds a rule to a SnapMirror policy. Rules define which snapshots are protected by vault relationships or define the schedule at which snapshots are created on the SnapMirror destination. Rules which do not include a schedule are rules for protecting snapshots. Rules which include a schedule are rules for creating snapshots on the SnapMirror destination. A rule with a schedule can only be added to SnapMirror policies of type *vault* or *mirror-vault*. A rule must not be added to a policy that will be associated with a SnapMirror data protection relationship. A policy that will be associated with a SnapMirror vault relationship must have at least one rule and at most ten rules. A SnapMirror policy with rules must have at least one rule without a schedule.

### Parameters

**`-vserver <vserver name> - Vserver Name`**

Specifies the Vserver for the SnapMirror policy.

**`-policy <sm_policy> - SnapMirror Policy Name`**

Specifies the SnapMirror policy name.

### **-snapmirror-label <text> - Snapshot Copy Label**

This parameter is primarily used for the purpose of snapshot selection for extended data protection (XDP) relationships. Only snapshots that have a SnapMirror label that matches this parameter will be transferred to the SnapMirror destination. However, when this parameter is associated with a rule containing a schedule, snapshots will be created on the SnapMirror destination using this snapmirror-label parameter. The label can be 31 or fewer characters in length. SnapMirror policies of type *async-mirror* and *mirror-vault* have a rule added for label *sm\_created* at the time of policy creation. This rule cannot be removed or modified by the user. This rule when coupled with *create-snapshot* field set to *true* indicates that the SnapMirror relationship using this policy shall create a new snapshot and transfer it as part of a [snapmirror update](#) operation. SnapMirror policies of type *async-mirror* support one additional rule with SnapMirror label *all\_source\_snapshots*. This rule along with the rule for SnapMirror label *sm\_created* indicates that *all* new snapshots on the primary volume along with the newly created snapshot are transferred as a part of a [snapmirror update](#) or [snapmirror initialize](#) operation. Rules with any other SnapMirror labels cannot be added to SnapMirror policies of type *async-mirror*. The rule for label *sm\_created* when added to a snapmirror policy of type *vault* indicates that all SnapMirror created snapshots of the primary volume are selected for transfer.

### **-keep <text> - Snapshot Copy Retention Count**

Specifies the maximum number of snapshots that are retained on the SnapMirror destination volume for a rule. The total number of snapshots retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type *async-mirror*, this parameter must be set to value *1*.

### **[-preserve {true|false}] - Snapshot Copy Preserve Enabled**

Specifies the behavior when the snapshot retention count is reached on the SnapMirror vault destination for the rule. The default value is *false*, which means that the oldest snapshot will be deleted to make room for new ones only if the number of snapshots has exceeded the retention count specified in the "keep" parameter. When set to *true*, and when the snapshots have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, snapshots will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type *async-mirror* this parameter must be set to value *false*.

### **[-warn <integer>] - Warning Threshold Count**

Specifies the warning threshold count for the rule. The default value is *0*. When set to a value greater than zero, an event is generated after the number of snapshots (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be *true* to set the warn parameter to a value greater than zero.

### **[-schedule <text>] - Snapshot Copy Creation Schedule**

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. When this parameter is specified, snapshots are directly created on the SnapMirror destination. The snapshots created will have the same content as the latest snapshot already present on the SnapMirror destination. snapshots on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is *-*.

You define and name a schedule using the [job schedule cron create](#) command.

### **[-prefix <text>] - Snapshot Copy Creation Prefix**

This optional parameter specifies the prefix for the snapshot name to be created as per the schedule. If no value is specified, then the *snapmirror-label* will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

**[*-retention-period* {{<integer> seconds|minutes|hours|days|months|years} | infinite}}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the snapshots associated with this rule will be locked. The parameter is specified as a number followed by a suffix. The valid suffixes are *seconds* , *minutes* , *hours* , *days* , *months* , and *years* . For example, a value of *6months* represents a retention period of 6 months. It can also be set to a special value of *infinite* for infinite retention. The destination volume must have the *snapshot-locking-enabled* parameter set to true for this field to take effect else it will be ignored.

## Examples

The following example adds a rule named *nightly* to the SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com* . The rule will retain a maximum of 5 *nightly* snapshots.

```
vs0.example.com::> snapmirror policy add-rule -vserver vs0.example.com
                    -policy TieredBackup -snapmirror-label nightly -keep 5
```

## snapmirror policy create

### Create a new SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy create` command creates a SnapMirror policy. When applied to a SnapMirror relationship, the SnapMirror policy controls the behavior of the relationship and specifies the configuration attributes for that relationship. The policies *DPDefault* , *MirrorAllSnapshots* , *MirrorAndVault* , *MirrorLatest* , *Unified7year* , and *XDPCDefault* are created by the system for asynchronous replication. The policies *Sync* , *StrictSync* , *AutomatedFailOver* , and *AutomatedFailOverDuplex* are created by the system for synchronous replication.

All SnapMirror policies have a field *create-snapshot* . This field specifies whether SnapMirror creates a new snapshot on the primary volume at the beginning of a [snapmirror update](#) or [snapmirror resync](#) operation. Currently this field cannot be set or modified by the user. It is set to *true* for SnapMirror policies of type *async-mirror* and *mirror-vault* at the time of creation. SnapMirror policies of type *vault* have *create-snapshot* set to *false* at the time of creation.

Use the [snapmirror policy add-rule](#) command to add a rule to a policy.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

### **-policy <sm\_policy> - SnapMirror Policy Name**

This parameter specifies the SnapMirror policy name. A policy name can be made up of the characters A to Z, a to z, 0 to 9, ".", "-", and "\_". The name can be up to 256 characters in length.

### **[-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|automated-failover-duplex|continuous|undefined}] - Snapmirror Policy Type**

This parameter specifies the SnapMirror policy type. The supported values are *async-mirror*, *vault*, *mirror-vault*, *sync-mirror* and *strict-sync-mirror*. Data protection (DP) relationships support only *async-mirror* policy type, while extended data protection (XDP) relationships support all policy types.

If the type is set to *async-mirror* then the policy is for Disaster Recovery. When the policy type is associated with extended data protection (XDP) relationships, [snapmirror update](#) and [snapmirror resync](#) operations transfer selected snapshots from the primary volume to the secondary volume. The selection of snapshots is governed by the rules in the policy. However [snapmirror initialize](#) and [snapmirror update](#) operations on data protection (DP) relationships ignore the rules in the policy and transfer *all* snapshots of the primary volume which are newer than the common snapshot on the destination. For both data protection (DP) and extended data protection (XDP) relationships, the snapshots are kept on the secondary volume as long as they exist on the primary volume. Once a protected snapshot is deleted from the primary volume, it is deleted from the secondary volume as part of the next transfer. The policy type supports rules with certain pre-defined label names only. Refer to the man page for the [snapmirror policy add-rule](#) command for the details.

If the type is set to *vault* then the policy is used for Backup and Archive. The rules in this policy type determine which snapshots are protected and how long they are retained on the secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to *mirror-vault* then the policy is used for unified data protection which provides both Disaster Recovery and Backup using the same secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to *sync-mirror* or *strict-sync-mirror* then the policy is used for synchronous Disaster Recovery. These are supported only by extended data protection (XDP) relationships between FlexVol volumes. Once the relationship is initialized with [snapmirror initialize](#), the relationship will be InSync such that all writes to the primary will be replicated to the secondary before the write is acknowledged to the client. Upon a replication failure, relationship falls OutOfSync. Upon an OutOfSync event, the *strict-sync-mirror* variant restricts further client IO on the primary, whereas the *sync-mirror* variant does not. SnapMirror will automatically trigger resync to bring the OutOfSync relationships back InSync as soon as it can, unless the relationship is *Quiesced* or *Broken-off*. Once a relationship is initialized, you normally use the [snapmirror quiesce](#) command to stop synchronous replication and the [snapmirror resume](#) command to resume synchronous replication. These policy types do not support replication of user snapshots.

### **[-comment <text>] - Comment**

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

**[-tries <integer\_or\_unlimited>] - Tries Limit**

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or *unlimited*. The default value is *8*.

**[-transfer-priority {low|normal}] - Transfer Scheduling Priority**

Specifies the priority at which a transfer runs. The supported values are *normal* or *low*. The *normal* transfers are scheduled before the *low* priority transfers. The default is *normal*.

**[-ignore-atime {true|false}] - Ignore File Access Time**

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are *true* or *false*. The default is *false*.

**[-restart {always|never|default}] - Restart Behavior**

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are *always*, *never*, or *default*. If the value is set to *always*, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror snapshot is created which will then be transferred. If the value is set to *never*, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror snapshot will still be created and transferred. ONTAP version 8.2 will interpret a value of *default* as being the same as *always*. Vault transfers will always resume based on a restart checkpoint, provided the snapshot still exists on the source volume.

**[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled**

Specifies whether network compression is enabled for transfers. The supported values are *true* or *false*. The default is *false*.

**[-rpo <integer>] - Recovery Point Objective (seconds)**

Specifies the time for recovery point objective, in seconds. This parameter is only supported for a policy of type *continuous*.

**[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication**

If this parameter is set to *true*, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is *false*.

**[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)**

Specifies the common snapshot creating schedule. This parameter is only supported for SnapMirror Synchronous relationships.

**[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled? (privilege: advanced)**

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting I/O sequentially will make the system more robust, and less prone to I/O errors. Starting 9.11.1, enabling this feature improves the performance when the workload is NAS based and is metadata heavy. However, it will make the IO performance slower for large file workloads like LUNs, databases, virtualization containers, etc. The default value for the parameter *-are-data-ops-sequentially-split* is *false*. The parameter *-are-data-ops-sequentially-split* should only be used if frequent I/O timeout or "OutOfSync" has happened.

The parameter `-are-data-ops-sequentially-split` requires an effective cluster version of ONTAP 9.6.0 or later on both the source and destination clusters.

**`[-sequential-split-op-timeout-secs <integer>]` - Sequential Split Op Timeout in Seconds (privilege: advanced)**

This parameter specifies the op timeout value used when the splitting mode is sequential. This parameter is used only for Sync relationships. Supported values are from 15 to 25 seconds.

**`[-disable-fast-resync {true|false}]` - Disable Fast Resync (privilege: advanced)**

Specifies whether fast resync for a SnapMirror Synchronous relationship is disabled or not. The default value for this parameter is *false*.

**`[-discard-configs <network>,...]` - Configurations Not Replicated During Identity Preserve Vserver DR**

Specifies the configuration to be dropped during replication. The supported values are:

- *network* - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type *async-mirror* and applicable only for identity-preserve Vserver SnapMirror relationships.

**`[-transfer-schedule-name <text>]` - Transfer Schedule Name**

This optional parameter specifies the schedule which is used to update the SnapMirror relationships.

**`[-throttle <throttleType>]` - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for transfers. It configures for the relationships the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationships fully use the network bandwidth available. You can also configure the relationships to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or *0*. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as *4*. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship.

## Examples

The following example creates a SnapMirror policy named *TieredBackup* on a Vserver named *vs0.example.com*.

```
vs0.example.com::> snapmirror policy create -vserver vs0.example.com
                        -policy TieredBackup -type vault -tries 10 -restart never
```

## snapmirror policy delete

### Delete a SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `snapmirror policy delete` command deletes a SnapMirror policy. A policy that is to be deleted must not be associated with any SnapMirror relationship. The built-in policies cannot be deleted.

#### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

#### Examples

The following example deletes a SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*:

```
vs0.example.com::> snapmirror policy delete -vserver vs0.example.com  
-policy TieredBackup
```

## snapmirror policy modify-rule

### Modify an existing rule in SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `snapmirror policy modify-rule` command can be used to modify the retention count, preserve setting, warning threshold count, schedule, and prefix for a rule in a SnapMirror policy. Reducing the retention count or disabling the preserve setting for a rule in a SnapMirror policy might result in the deletion of snapshots on the vault destination when the next transfer by the [snapmirror update](#) command occurs or when the next scheduled snapshot creation on the destination for the rule occurs. Modifying a rule to add a schedule will enable creation of snapshots on the SnapMirror destination. snapshots on the source that have a SnapMirror label matching this rule will not be selected for transfer. Schedule and prefix can only be modified for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. A SnapMirror policy with rules must have at least one rule without a schedule.

The rules in SnapMirror policies of type *async-mirror* cannot be modified.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

### **-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

### **-snapmirror-label <text> - Snapshot Copy Label**

This parameter specifies the rule that is to be modified in a SnapMirror policy.

### **[-keep <text>] - Snapshot Copy Retention Count**

Specifies the maximum number of snapshots that are retained on the SnapMirror destination volume for a rule. The total number of snapshots retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type *async-mirror*, this parameter must be set to value *1*.

### **[-preserve {true|false}] - Snapshot Copy Preserve Enabled**

Specifies the behavior when the snapshot retention count is reached on the SnapMirror vault destination for the rule. The default value is *false*, which means that the oldest snapshot will be deleted to make room for new ones only if the number of snapshots has exceeded the retention count specified in the "keep" parameter. When set to *true*, and when the snapshots have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, snapshots will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type *async-mirror* this parameter must be set to value *false*.

### **[-warn <integer>] - Warning Threshold Count**

Specifies the warning threshold count for the rule. The default value is *0*. When set to a value greater than zero, an event is generated after the number of snapshots (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be *true* to set the warn parameter to a value greater than zero.

### **[-schedule <text>] - Snapshot Copy Creation Schedule**

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. When this parameter is specified, snapshots are directly created on the SnapMirror destination. The snapshots created will have the same content as the latest snapshot already present on the SnapMirror destination. snapshots on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is *-*.

You define and name a schedule using the [job schedule cron create](#) command.

### **[-prefix <text>] - Snapshot Copy Creation Prefix**

This optional parameter specifies the prefix for the snapshot name to be created as per the schedule. If no value is specified, then the *snapmirror-label* will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

### **[-retention-period [{<integer> seconds|minutes|hours|days|months|years} | infinite]] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the snapshots associated with this rule will be locked. The parameter is specified as a number followed by a suffix. The valid suffixes are *seconds*,

*minutes*, *hours*, *days*, *months*, and *years*. For example, a value of *6months* represents a retention period of 6 months. It can also be set to a special value of *infinite* for infinite retention. The destination volume must have the *snapshot-locking-enabled* parameter set to true for this field to take effect else it will be ignored.

## Examples

The following example changes the retention count for *nightly* snapshots to *6* for a rule named *nightly* on a SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*:

```
vs0.example.com::> snapmirror policy modify-rule -vserver vs0.example.com
                    -policy TieredBackup -snapmirror-label nightly -keep 6
```

## Related Links

- [snapmirror update](#)
- [job schedule cron create](#)

## snapmirror policy modify

### Modify a SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror policy modify` command can be used to modify the policy attributes.

Use the [snapmirror policy modify-rule](#) command to modify a rule in a SnapMirror policy.

### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

**[-comment <text>] - Comment**

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

**[-tries <integer\_or\_unlimited>] - Tries Limit**

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or *unlimited*. The default value is *8*.

**[-transfer-priority {low|normal}] - Transfer Scheduling Priority**

Specifies the priority at which a transfer runs. The supported values are *normal* or *low*. The *normal* transfers are scheduled before the *low* priority transfers. The default is *normal*.

### **`[-ignore-atime {true|false}] - Ignore File Access Time`**

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are *true* or *false*. The default is *false*.

### **`[-restart {always|never|default}] - Restart Behavior`**

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are *always*, *never*, or *default*. If the value is set to *always*, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror snapshot is created which will then be transferred. If the value is set to *never*, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror snapshot will still be created and transferred. ONTAP version 8.2 will interpret a value of *default* as being the same as *always*. Vault transfers will always resume based on a restart checkpoint, provided the snapshot still exists on the source volume.

### **`[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled`**

Specifies whether network compression is enabled for transfers. The supported values are *true* or *false*. The default is *false*.

### **`[-rpo <integer>] - Recovery Point Objective (seconds)`**

Specifies the time for recovery point objective, in seconds. This parameter is only supported for a policy of type *continuous*.

### **`[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication`**

If this parameter is set to *true*, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is *false*.

### **`[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)`**

Specifies the common snapshot creating schedule. This parameter is only supported for SnapMirror Synchronous relationships.

### **`[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled? (privilege: advanced)`**

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting the I/O sequentially will make the system more robust, and less prone to I/O errors. Starting 9.11.1, enabling this feature improves the performance when the workload is NAS based and is metadata heavy. However, it will make the IO performance slower for large file workloads like LUNs, databases, virtualization containers, etc. The default value of parameter `-sequential-split-data-ops` is *false*. The parameter `-are-data-ops-sequentially-split` should only be used if frequent I/O timeout or "OutOfSync" has happened. Changes made by the `snapmirror policy modify -sequential-split-data-ops` command do not take effect until the next resync. Changes do not affect resync or initialize operations that have started and have not finished yet. The parameter `-are-data-ops-sequentially-split` requires an effective cluster version of ONTAP 9.6.0 or later on both the source and destination clusters.

### **`[-sequential-split-op-timeout-secs <integer>] - Sequential Split Op Timeout in Seconds (privilege: advanced)`**

This parameter specifies the op timeout value used when the splitting mode is sequential. This parameter is

used only for Sync relationships. Supported values are from 15 to 25 seconds. The default value of the parameter `-sequential-split-op-timeout` is *15 seconds*. Changes made by the `snapmirror policy modify -sequential-split-op-timeout-secs` command do not take effect until the next resync. Changes do not affect resync or initialize operations that have started and have not finished yet.

**`[-disable-fast-resync {true|false}]` - Disable Fast Resync (privilege: advanced)**

Specifies whether fast resync for a SnapMirror Synchronous relationship is disabled or not. The default value for this parameter when a policy is created is *false*.

**`[-discard-configs <network>,...]` - Configurations Not Replicated During Identity Preserve Vserver DR**

Specifies the configuration to be dropped during replication. The supported values are:

- *network* - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type *async-mirror* and applicable only for identity-preserve Vserver SnapMirror relationships.

**`[-transfer-schedule-name <text>]` - Transfer Schedule Name**

This optional parameter specifies the schedule which is used to update the SnapMirror relationships.

**`[-throttle <throttleType>]` - Throttle (KB/sec)**

This optional parameter limits the network bandwidth used for transfers. It configures for the relationships the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationships fully use the network bandwidth available. You can also configure the relationships to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or *0*. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as *4*. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship.

## Examples

The following example changes the "transfer-priority" and the "comment" text of a SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*:

```
vs0.example.com::> snapmirror policy modify -vserver vs0.example.com
-policy TieredBackup -transfer-priority low -comment "Use for tiered
backups"
```

- [snapmirror policy modify-rule](#)

## snapmirror policy remove-rule

Remove a rule from SnapMirror policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy remove-rule` command removes a rule from a SnapMirror policy. On the destination of a SnapMirror relationship with `snapmirror policy` of type `vault` or `mirror-vault`, all snapshots with a SnapMirror label matching the rule being removed are no longer processed by SnapMirror and might need to be deleted manually. A `snapmirror policy` of type `vault` must have at least one rule if that policy is associated with a SnapMirror relationship. A SnapMirror policy with rules must have at least one rule without a schedule.

## Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver for the SnapMirror policy.

**-policy <sm\_policy> - SnapMirror Policy Name**

Specifies the SnapMirror policy name.

**-snapmirror-label <text> - Snapshot Copy Label**

This parameter specifies the rule that is removed from the SnapMirror policy.

The rule for SnapMirror label `sm_created` cannot be removed from SnapMirror policies of type `async-mirror` or `mirror-vault`.

## Examples

The following example removes a rule named `nightly` from a SnapMirror policy named `TieredBackup` on Vserver `vs0.example.com`:

```
vs0.example.com::> snapmirror policy remove-rule -vserver vs0.example.com  
-policy TieredBackup -snapmirror-label nightly
```

## snapmirror policy show

Show SnapMirror policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `snapmirror policy show` command displays the following information about SnapMirror policies:

- Vserver Name
- SnapMirror Policy Name
- SnapMirror Policy Type
- Number of Rules in the policy
- Tries
- Transfer Priority
- Comment for the policy

- Individual Rule Names
- Keep value for the Rule
- Total of Keep values across all Rules in the policy

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Selects the policies that match this parameter value.

**[-policy <sm\_policy>] - SnapMirror Policy Name**

Selects the policies that match this parameter value.

**[-type {vault|async-mirror|mirror-vault|strict-sync-mirror|sync-mirror|automated-failover|automated-failover-duplex|continuous|undefined}] - Snapmirror Policy Type**

Selects the policies that match this parameter value. A policy can be of type *async-mirror*, *vault* or *mirror-vault*.

**[-owner {cluster-admin|vserver-admin}] - Owner of the Policy**

Selects the policies that match this parameter value. A policy can be owned by either the *"Cluster Admin"* or a *"Vserver Admin"*.

**[-comment <text>] - Comment**

Selects the policies that match this parameter value.

**[-tries <integer\_or\_unlimited>] - Tries Limit**

Selects the policies that match this parameter value.

**[-transfer-priority {low|normal}] - Transfer Scheduling Priority**

Selects the policies that match this parameter value.

**[-ignore-atime {true|false}] - Ignore File Access Time**

Selects the policies that match this parameter value.

**[-restart {always|never|default}] - Restart Behavior**

Selects the policies that match this parameter value.

**[-is-network-compression-enabled {true|false}] - Is Network Compression Enabled**

Selects the policies that match this parameter value.

**[-create-snapshot {true|false}] - Create a New Snapshot Copy**

Selects the policies that match this parameter value.

**[-rpo <integer>] - Recovery Point Objective (seconds)**

Selects the policies that match this parameter value.

**[-always-replicate-snapshots {true|false}] - This prioritizes replication of app-consistent snapshots over synchronous replication**

Selects the policies that match this parameter value.

**[-snapmirror-label <text>,...] - Snapshot Copy Label**

Selects the policies that match this parameter value.

**[-keep <text>,...] - Snapshot Copy Retention Count**

Selects the policies that match this parameter value.

**[-preserve {true|false}] - Snapshot Copy Preserve Enabled**

Selects the policies that match this parameter value.

**[-warn <integer>,...] - Warning Threshold Count**

Selects the policies that match this parameter value.

**[-schedule <text>,...] - Snapshot Copy Creation Schedule**

Selects the policies that match this parameter value.

**[-prefix <text>,...] - Snapshot Copy Creation Prefix**

Selects the policies that match this parameter value.

**[-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Snapshot Copy Retention Period**

This optional parameter specifies the duration for which the snapshots associated with this rule will be locked. The parameter is specified as a number followed by a suffix. The valid suffixes are *seconds* , *minutes* , *hours* , *days* , *months* , and *years* . For example, a value of *6months* represents a retention period of 6 months. It can also be set to a special value of *infinite* for infinite retention. The destination volume must have the *snapshot-locking-enabled* parameter set to true for this field to take effect else it will be ignored.

**[-total-rules <integer>] - Total Rules in the Policy**

Selects the policies that match this parameter value.

**[-total-keep <integer>] - Total Retention Count for All Rules in the Policy**

Selects the policies that match this parameter value.

**[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)**

Selects the policies that match this parameter value.

**[-are-data-ops-sequentially-split {true|false}] - Is Sequential Splitting of Data Operations Enabled? (privilege: advanced)**

Selects the policies that match this parameter value.

**[-sequential-split-op-timeout-secs <integer>] - Sequential Split Op Timeout in Seconds (privilege: advanced)**

Selects the policies that match this parameter value.

**[-disable-fast-resync {true|false}] - Disable Fast Resync (privilege: advanced)**

Selects the policies that match this parameter value.

**[-discard-configs <network>,...] - Configurations Not Replicated During Identity Preserve Vserver DR**

Selects the policies that match this parameter value.

**[-transfer-schedule-name <text>] - Transfer Schedule Name**

Selects the policies that match this parameter value.

**[-throttle <throttleType>] - Throttle (KB/sec)**

Selects the policies that match this parameter value.

## Examples

The following example displays information about all SnapMirror policies:

```
cs::> snapmirror policy show
Vserver Policy          Policy Number      Transfer
Name      Name          Type    Of Rules Tries Priority Comment
-----

                  weekly                             52
                  Total Keep:                        60
```

```

cs      MirrorLatest      async-mirror  1      8  normal  Asynchronous
SnapMirror policy for mirroring the latest active file system.
  SnapMirror Label: sm_created                                Keep:      1
                                                            Total Keep:  1

vs0.example.com
  TieredBackup      vault      0      8  normal  Use for tiered
backups
  Snapmirror-label: -                                Keep:      -
                                                            Total Keep:  0

cs  Unified7year      mirror-vault  4      8  normal  Unified SnapMirror
policy with 7year retention.
  SnapMirror Label: sm_created                                Keep:      1
                    daily                                    7
                    weekly                                   52
                    monthly                                  84
                                                            Total Keep:  144

cs      XDPDefault      vault      2      8  normal  Vault policy
with daily and weekly rules.
  SnapMirror Label: daily                                Keep:      7
                    weekly                                   52
                                                            Total Keep:  59

7 entries were displayed.

```

The following example shows all the policies with the following fields - vserver (default), policy (default) and transfer-priority:

```
cs::> snapmirror policy show -fields transfer-priority
vserver      policy      transfer-priority
-----
cs           DPDefault  normal
cs           MirrorAllSnapshots
              normal
cs           MirrorAndVault
              normal
cs           MirrorLatest
              normal
vs0.example.com
  TieredBackup
              normal
cs           Unified7year
              normal
cs           XDPDefault
              normal
7 entries were displayed.
```

## snapmirror snapshot-owner commands

### snapmirror snapshot-owner create

Add an owner to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `snapmirror snapshot-owner create` command adds an owner on the specified snapshot. A snapshot can have at most one owner. An owner can only be added to a snapshot on a read-write volume. The snapshot must have a valid SnapMirror label.

Refer to the *ONTAP Data Protection Guide* for valid use cases to add an owner on a snapshot.

#### Parameters

##### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

##### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot.

**[-owner <owner name>] - Snapshot Copy Owner Name**

This parameter specifies the name of the owner for the snapshot. The owner name can be made up of the characters A to Z, a to z, 0 to 9, and "\_". The name can be up to 32 characters in length. When not specified, an owner will be added with a system-generated default name.

**Examples**

The following example adds owner *appl* on snapshot *snap1* on volume *vol1* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
           -volume vol1 -snapshot snap1 -owner appl
```

The following example adds a default owner on snapshot *snap2* on volume *vol1* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
           -volume vol1 -snapshot snap2
```

**snapmirror snapshot-owner delete**

Delete an owner used to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `snapmirror snapshot-owner delete` command removes an owner on the specified snapshot, which was added using the [snapmirror snapshot-owner create](#) command.

**Parameters****-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot.

**[-owner <owner name>] - Snapshot Copy Owner Name**

This parameter specifies the name of the owner for the snapshot. When not specified, the owner with the

system-generated default name will be removed.

## Examples

The following example removes owner *app1* on snapshot *snap1* on volume *vol1* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
             -volume vol1 -snapshot snap1 -owner app1
```

The following example removes the default owner on snapshot *snap2* on volume *vol1* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
             -volume vol1 -snapshot snap2
```

## Related Links

- [snapmirror snapshot-owner create](#)

## snapmirror snapshot-owner show

### Display Snapshot Copies with Owners

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `snapmirror snapshot-owner show` command is used to list all snapshots with owners that were added using the [snapmirror snapshot-owner create](#) command.

### Parameters

**{ [-fields <fieldname>,...]**

If this parameter is specified, the command displays information about the specified fields.

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume.

**[-snapshot <snapshot name>] - Snapshot Copy Name**

If this parameter is specified, the command displays the owner name for the specified snapshot.

## Examples

The following example lists all snapshots with owners on volume *vol1* in Vserver *vs0*. The system-generated default owner name is displayed as "-".

```
cluster1::> snapmirror snapshot-owner show
      -vserver vs0.example.com -volume vol1
Vserver  Volume                Snapshot                Owner Names
-----  -
vs0.example.com
      vol1                snap2                -
                        snap1                appl
```

The following example displays the owner name for snapshot *snap1* on volume *vol1* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner show
      -vserver vs0.example.com -volume vol1 -snapshot snap1
Vserver: vs0.example.com
      Volume: vol1
      Snapshot: snap1
      Owner Names: appl
```

# statistics commands

## statistics show-periodic

Continuously display current performance data at regular interval

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command continuously displays specified performance data at a regular interval. The command output displays data in the following columns:

This command has been deprecated and may be removed from a future version of ONTAP. Use the "statistics show" command with the tabular format instead.

- **cpu avg:** Average processor utilization across all processors in the system.
- **cpu busy:** Overall system utilization based on CPU utilization and subsystem utilization. Examples of subsystems include the storage subsystem and RAID subsystem.
- **total ops:** Number of total operations per second.
- **nfs-ops:** Number of NFS operations per second.
- **cifs-ops:** Number of CIFS operations per second.
- **fcache ops:** Number of 7M FlexCache operations per second.
- **pkts recv:** Number of packets received over physical ports per second.
- **pkts sent:** Number of packets sent over physical ports per second.
- **total recv:** Total network traffic received over physical ports per second (KBps).
- **total sent:** Total network traffic sent over physical ports per second (KBps).
- **data busy:** The percentage of time that data ports sent or received data.
- **data recv:** Network traffic received on data ports (KBps).
- **data sent:** Network traffic sent on data ports (KBps).
- **cluster busy:** The percentage of time that cluster ports sent or received data.
- **cluster recv:** Network traffic received on cluster ports (KBps).
- **cluster sent:** Network traffic sent on cluster ports (KBps).
- **disk read:** Data read from disk (KBps).
- **disk write:** Data written to disk (KBps).

### Parameters

**[`-object <text>`] - Object (privilege: advanced)**

Selects the object for which you want to display performance data. The default object is "*cluster*".

**[`-instance <text>`] - Instance (privilege: advanced)**

Selects the instance for which you want to display performance data. This parameter is required if you specify the `-object` parameter and enter any object other than `"cluster"`. Multiple values for this parameter are not supported.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view.

**[`-counter <text>`] - Counter (privilege: advanced)**

Selects the counters for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the counters in the specified objects. To specify multiple counters, use `"|"` between each counter.

**[`-preset <text>`] - Preset (privilege: advanced)**

If this parameter is specified, the command displays statistics for the specified preset.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Selects the nodes for which you want to display performance data. The default node is `"cluster:summary"`.

**[`-vserver <vserver name>`] - Vserver (privilege: advanced)**

Selects the Vserver for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the Vservers in the cluster.

**[`-interval <integer>`] - Interval in Seconds (privilege: advanced)**

Specifies, in seconds, the interval between statistics updates. The default setting is 1 second.

**[`-iterations <integer>`] - Number of Iterations (privilege: advanced)**

Specifies the number of iterations the command runs before terminating. The default setting is 0 (zero); this means that the command continues to run until you interrupt it by pressing Ctrl-C.

**[`-summary {true|false}`] - Print Summary (privilege: advanced)**

Specifies whether the command prints a final summary of statistics after the command has gone through all of its iterations. The default setting is `true`.

**[`-filter <text>`] - Filter Data (privilege: advanced)**

Selects instances that match the specified filter criteria. For example, to display instances from node1, specify `-filter "node_name=node1"`.

## Examples

The following example displays the "cluster" statistics for a node named node1. Because no number of iterations is specified, this command will continue to run until you interrupt it by pressing Ctrl-C.

```

cluster1::*> statistics show-periodic -node node1
cpu  cpu   cpu   total          fcache      pkts      pkts
total    total data      data      data cluster  cluster  cluster      disk
disk
avg busy total      ops  nfs-ops cifs-ops      ops      recv      sent
recv      sent busy      recv      sent      busy      recv      sent      read
write
-----
6%   6%   26%           0           0           0           0      641      39
126KB  4.68KB  0%   7.33KB           0B           0%   111KB  4.68KB      0B

```

## statistics show

Display performance data for a time interval

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command displays performance data for a period of time .

To display data for a period of time, collect a sample using the [statistics start](#) and [statistics stop](#) commands. The data that displays is calculated data based on the samples the cluster collects. To view the sample, specify the -sample-id parameter.

### Parameters

**[-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

### **[ -tab ] (privilege: advanced) }**

If this parameter is specified, the command displays performance data in tabular format.

### **[ -object <text>] - Object (privilege: advanced)**

Selects the objects for which you want to display performance data. To view a list of valid object names, type `statistics show-object ?`` or [statistics catalog object show](#) . To specify multiple objects, use "|" between each object.

You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

### **[ -instance <text>] - Instance (privilege: advanced)**

Selects the instances for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command displays statistics for all disks in the system.

### **[ -counter <text>] - Counter (privilege: advanced)**

Selects the counters for which you want to display performance data. To specify multiple counters, use "|" between each counter.

### **[ -preset <text>] - Preset (privilege: advanced)**

If this parameter is specified, the command displays statistics for the specified preset.

### **[ -node {<nodename>|local}] - Node (privilege: advanced)**

Selects the nodes for which you want to display performance data.

### **[ -vserver <vserver name>] - Vserver (privilege: advanced)**

Selects the Vserver for which you want to display performance data.

### **[ -value <text>] - Text Value (privilege: advanced)**

Selects the performance data that matches the specified counter value.

### **[ -labels <text>,...] - List of Labels (privilege: advanced)**

Selects the performance data that matches the specified label.

### **[ -values <text>,...] - List of Values (privilege: advanced)**

Displays only the statistics that have the specified values.

### **[ -filter <text>] - Filter Data (privilege: advanced)**

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances that match a value of greater than 50 for the total\_ops counter, specify `-filter "total_ops>50"` .

### **[ -sample-id <text>] - Sample Identifier (privilege: advanced)**

Displays performance data for the specified sample. You collect a sample by using the statistics start and statistics stop commands.

**[-interval <integer>] - Interval (privilege: advanced)**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**[-iterations <integer>] - Iterations (privilege: advanced)**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**[-sort-key <text>] - Counter Used For Sorting (privilege: advanced)**

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

**[-sort-order {ascending|descending}] - Sort Order (privilege: advanced)**

This parameter may be used in conjunction with the `-sort-key` parameter. This parameter changes the order in which statistics are sorted. Possible values are *ascending* and *descending*. The default setting is *descending*.

**[-max <integer>] - Tracker Size (privilege: advanced)**

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

## Examples

The following example starts collecting statistics and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter
avg_processor_busy|cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
```

| Counter            | Value |
|--------------------|-------|
| avg_processor_busy | 6%    |
| cpu_busy           | 6%    |

The following example starts and stops data collection and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter
avg_processor_busy|cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1
```

| Counter            | Value |
|--------------------|-------|
| avg_processor_busy | 6%    |
| cpu_busy           | 6%    |

- [statistics catalog object show](#)

## statistics start

Start data collection for a sample

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command starts the collection of performance data. Use the [statistics stop](#) command to stop the collection. You view the sample of performance data by using the [statistics show](#) command. You can collect more than one sample at a time.

## Parameters

### **[-object <text>] - Object (privilege: advanced)**

Selects the objects for which you want to collect performance data. This parameter is required. To view a list of valid object names, type [statistics catalog object show](#) at the command prompt. To specify multiple objects, use "|" between each object.

You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

**[`-instance <text>`] - Instance (privilege: advanced)**

Selects the instances for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.

For example, if you want to collect disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command will collect statistics for all disks in the system.

**[`-counter <text>`] - Counter (privilege: advanced)**

Selects the counters for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

**[`-preset <text>`] - Preset (privilege: advanced)**

If this parameter is specified, the command displays statistics for the specified preset.

**[`-sample-id <text>`] - Sample Identifier (privilege: advanced)**

Specifies an identifier for the sample. Identifiers must be unique and are restricted to the characters 0-9, a-z, A-Z, and "\_". If you do not specify this parameter, the command generates a sample identifier for you and defines this sample as the default sample for the CLI session. When you run the [statistics show](#) command without specifying the `-sample-id` parameter, data from the default sample displays. If you run this command during the same CLI session and do not specify the `-sample-id` parameter, the command overwrites the previous sample. The command does not delete the default sample when you close your session.

**[`-vserver <vserver name>`] - Vserver (privilege: advanced)**

Selects the vservers for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the Vservers in the cluster.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Selects the node for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the nodes in the cluster.

**[`-filter <text>`] - Filter (privilege: advanced)**

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances from node1, specify `-filter "node_name=node1"`.

**[`-duration <integer>`] - Sample Duration in Minutes (privilege: advanced)**

If this parameter is specified, the command will collect the closing sample after the time specified. Duration can be specified in minutes.

**[`-max <integer>`] - Tracker Size (privilege: advanced)**

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

**[`-sort-key <text>`] - Counter Used For Sorting (privilege: advanced)**

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

### **[`-sort-order {ascending|descending}`] - Sort Order (privilege: advanced)**

This parameter may be used in conjunction with the `-sort-key` parameter. This parameter changes the order in which statistics are sorted. Possible values are `ascending` and `descending`. The default setting is `descending`.

## **Examples**

The following example starts statistics collection for sample "smpl\_1":

```
cluster1::*> statistics start -object system -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1
```

The following example starts collecting statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter
avg_processor_busy|cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1
```

# **statistics stop**

Stop data collection for a sample

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## **Description**

This command stops the collection of performance data. You view the sample of performance data by using the [statistics show](#) command.

## **Parameters**

### **[`-sample-id <text>`] - Sample Identifier (privilege: advanced)**

Specifies the identifier of the sample for which you want to stop data collection. If you do not specify this parameter, the command stops data collection for the last sample that you started by running the [statistics start](#) command without the `-sample-id` parameter.

## **Examples**

The following example stops data collection for sample "smpl\_1":

```
cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1
```

# statistics aggregate commands

## statistics aggregate show

Aggregate throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command continuously displays performance data for aggregates at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Node - node name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

### Parameters

#### **[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

#### **[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

#### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

#### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

#### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies maximum number of aggregates to display. The default setting is 25.

## **Examples**

The following example displays aggregate statistics:

```
cluster1::> statistics aggregate show
cluster-1 : 12/31/1969 16:00:04
```

| Aggregate             | Node          | *Total<br>Ops | Read<br>Ops | Write<br>Ops |
|-----------------------|---------------|---------------|-------------|--------------|
| aggr0_cluster_node2_0 | cluster-node2 | 9             | 0           | 8            |
| aggr0                 | cluster-node1 | 6             | 0           | 5            |

[...]

## **statistics cache commands**

### **statistics cache flash-pool show**

Flash pool throughput metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command continuously displays performance data for Flash Pool caches at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Vserver - vservers name.
- Volume - volume name.
- Read Hit - percent of IOs serviced from a cache level.
- Write Hit - percent of IOs serviced from a cache level.
- Cache Used - SSD cache blocks used.
- Read Blocks - read blocks.
- Write Blocks - write blocks.
- Rejects - cache rejects.

### **Parameters**

#### **[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

**[*-vserver* <*vserver name*>] - Vserver**

Selects the vservers for which you want to display performance data.

**[*-volume* <*text*>] - Volume**

Selects the volume for which you want to display performance data.

**[*-sort-key* <*text*>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

***-interval* <*integer*> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

***-iterations* <*integer*> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

***-max* <*integer*> - Maximum Number of Instances**

Specifies the maximum number of Flash Pool aggregates to display. The default setting is 25.

**Examples**

The following example displays Flash Pool statistics:

```
cluster1::> statistics cache flash-pool show
cluster1 : 12/31/2013 16:00:04
Read Write
Aggregate  Vserver  Volume  Hit    Hit    Cache  Read  Write
Rejects                                Used  Blocks Blocks
-----
-----
0      aggr1      - -total-  0      0      0      0      0
0      aggr2      vs1      vol1    0      0      0      0      0
[...]
```

## statistics catalog commands

### statistics catalog counter show

Display the list of counters in an object

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names and descriptions of counters. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-describe ] (privilege: advanced) }`**

Displays detailed information about each counter, including privilege level, label, and whether the counter is a key counter.

**`-object <text> - Object (privilege: advanced)`**

Selects the object for which you want to display the list of counters. This parameter is required. To view a list of valid object names, type `statistics catalog counter show-object ?` or [statistics catalog object show](#).

**`[-counter <text>] - Counter (privilege: advanced)`**

Selects the counters that match this parameter value. If you do not specify this parameter, the command displays details for all counters.

**`[-filter <text>] - Filter Data (privilege: advanced)`**

Selects the counters that match this parameter value. For example, to display counters from node1, specify `-filter "node_name=node1"`.

**`[-label <text>,...] - Labels for Array Counters (privilege: advanced)`**

Selects the counters that match this parameter value. A label is the name of the bucket to which an array counter belongs.

**`[-description <text>] - Description (privilege: advanced)`**

Selects the counters that match this parameter value.

**`[-privilege <text>] - Privilege Level (privilege: advanced)`**

Selects the counters that match this parameter value.

**`[-is-key-counter {true|false}] - Is Key Counter (privilege: advanced)`**

Selects the counters that are key counters (true) or are not key counters (false). A key counter is a counter that uniquely identifies an instance across the cluster. The default setting is false. For example, `"vserver_name"` and `"node_name"` are key counters because they identify the specific Vserver or node to which the instance belongs.

**`[-is-deprecated {true|false}] - Is Counter Deprecated (privilege: advanced)`**

Selects the counters that are deprecated (true) or are not deprecated (false).

**`[-replaced-by <text>] - Replaced By Counter If Deprecated (privilege: advanced)`**

Selects all deprecated counters that are replaced by the counter provided to this parameter.

## Examples

The following example displays the list of counters in the processor object.

```
cluster1::> statistics catalog counter show -object processor
Object: processor
  Counter                               Description
  -----
instance_name                          Instance Name
instance_uuid                          Instance UUID
node_name                             System node name
node_uuid                             System node id
process_name                           Ontap process that provided this instance
processor_busy                          Percentage of elapsed time that the
processor                               is executing non-idle processes
processor_elapsed_time                  Wall-clock time since boot used for
                                       calculating processor utilization
sk_switches                           Number of sk switches per second
8 entries were displayed.
```

## Related Links

- [statistics catalog object show](#)

## statistics catalog instance show

Display the list of instances associated with an object

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names of instances associated with the specified object. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**-object <text> - Object (privilege: advanced)**

Selects the object for which you want to display the list of instances. This parameter is required. To view a list of valid object names, type `statistics catalog instance show-object ?` or [statistics catalog object show](#).

**[`-instance <text>`] - Instance Name (privilege: advanced)**

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays all the instances.

**[`-filter <text>`] - Filter Data (privilege: advanced)**

Selects the instances that match this parameter value. For example, to display instances from `vserver1`, specify `-filter "vserver_name=vserver1"`.

**[`-vserver <vserver name>,...`] - Vserver Name (privilege: advanced)**

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the Vservers in the cluster.

**[`-node {<nodename>|local}`] - Node Name (privilege: advanced)**

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the nodes in the cluster.

## Examples

The following example displays the list of instances associated with the processor object.

```
cluster1::> statistics catalog instance show -object processor
Object: processor
  processor0
  processor0
  processor1
  processor1
4 entries were displayed.
```

## Related Links

- [statistics catalog object show](#)

## statistics catalog object show

Display the list of objects

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays the names and descriptions of objects from which you can obtain performance data. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -describe ] (privilege: advanced) }**

Displays detailed information about each object, including privilege level.

**[ -object <text>] - Object (privilege: advanced)**

Selects the objects for which you want to display information. If you do not specify this parameter, the command displays details for all of the objects.

**[ -privilege <text>] - Privilege Level (privilege: advanced)**

Selects the objects that match this parameter value.

**[ -is-deprecated {true|false}] - Is Object Deprecated (privilege: advanced)**

Selects the objects that are deprecated (true) or are not deprecated (false).

**[ -replaced-by <text>] - Replaced By Object If Deprecated (privilege: advanced)**

Selects all deprecated objects that are replaced by the object provided to this parameter.

**[ -is-statistically-tracked {true|false}] - Is Object Statistically Tracked (privilege: advanced)**

Specifies if the object is statistically tracked

**[ -description <text>] - Description (privilege: advanced)**

Selects the objects that match this parameter value.

## Examples

The following example displays descriptions of all objects in the cluster:

```

cluster1::> statistics catalog object show
    aggregate          CM object for exporting aggregate
performance
    counters

## statistics cluster commands

### statistics cluster space show

Display a list of cluster space metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command displays space metrics for cluster.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

This specifies the additional cluster metrics details.

**[-uuid <UUID>] - Cluster UUID**

Shows information about the specified cluster UUID.

**[-name <Cluster name>] - Cluster Name**

Shows information about the specified cluster name.

**[-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp of Sample**

Shows information about the cluster metrics under the specified timestamp.

**[-interval {1h|1d|1w|1m|1y}] - Interval for Collection**

Shows information about the cluster metrics under the specified interval.

**[-status**

**{ok|error|partial\_no\_data|partial\_no\_response|partial\_other\_error|negative\_delta|not\_found|backfilled\_data|inconsistent\_delta\_time|partial\_no\_uuid|undefined}] -**

**Result Code of Sample**

Shows information about the cluster metrics under the specified status.

**[-duration <text>] - Duration for Measuring Sample**

Shows information about the cluster metrics under the specified duration.

**[-available-size <integer>] - Available Size in the Cluster**

Shows information about the cluster metrics under the specified size availability.

**[-used-size <integer>] - Size Used in the Cluster**

Shows information about the cluster metrics under the specified used size.

**[-total-size <integer>] - Total Size of the Cluster**

Shows information about the cluster metrics under the specified size.

## Examples

The following command lists all the historical metrics for 1 hour interval for cluster

```

statistics cluster space show -interval -1h
  (statistics cluster space show)
Cluster UUID: dcb7040c-adbe-11ef-9e85-005056a7d44b

## statistics disk commands

### statistics disk show

Disk throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command continuously displays performance data for disks at a regular interval. The command output displays data in the following columns:

- Disk - disk name.
- Node - node name.
- Busy (%) - percentage of time there was at least one outstanding request to the disk.

- Total Ops - total operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

## Parameters

### **[-disk <text>] - Disk (privilege: advanced)**

Selects the disk for which you want to display performance data.

### **[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects the node for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By (privilege: advanced)**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval (privilege: advanced)**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations (privilege: advanced)**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances (privilege: advanced)**

Specifies the maximum number of disks to display. The default setting is 25.

## Examples

The following example displays disk statistics:

```
cluster1::> statistics disk show
cluster1 : 12/31/1969 16:00:04
```

| Disk     | Node  | Busy<br>(%) | *Total<br>Ops | Read<br>Ops | Write<br>Ops |
|----------|-------|-------------|---------------|-------------|--------------|
| VMw-1.31 | node2 | 0           | 2             | 2           | 0            |
| VMw-1.30 | node2 | 0           | 3             | 0           | 3            |
| VMw-1.3  | node1 | 0           | 0             | 0           | 0            |
| VMw-1.29 | node2 | 0           | 1             | 0           | 1            |

[...]

## statistics lif commands

## statistics lif show

### Logical network interface throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command continuously displays performance data for LIFs at a regular interval. The command output displays data in the following columns:

- LIF - logical interface name.
- Vserver - vservers name.
- Recv Packet - packets received per second.
- Recv Data (Bps) - bytes received per second.
- Recv Errors - receive errors per second.
- Sent Packet - packets sent per second.
- Sent Data (Bps) - bytes sent per second.
- Sent Errors - transfer errors per second.
- Current Port - current use port.

#### Parameters

**[-lif <text>] - LIF**

Selects the LIF for which you want to display performance data.

**[-vserver <vserver name>] - Vserver**

Selects the vservers for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies the maximum number of LIFs to display. The default setting is 25.

#### Examples

The following example displays LIFs statistics:

```
cluster1::> statistics lif show
cluster1 : 12/31/1969 16:00:04
```

|              |            |        | Recv  |       |        | Sent   |       |        |
|--------------|------------|--------|-------|-------|--------|--------|-------|--------|
|              |            |        | Recv  | Data  | Recv   | Sent   | Data  | Sent   |
| LIF          | Vserver    | Packet |       | (Bps) | Errors | Packet | (Bps) | Errors |
| -----        | -----      | -----  | ----- | ----- | -----  | -----  | ----- | -----  |
| node2_clus_1 | Cluster    | 3      | 536   | 0     | 3      | 338    | 0     | e0a    |
| node2_clus_2 | Cluster    | 3      | 398   | 0     | 3      | 287    | 0     | e0b    |
| node1_clus_2 | Cluster    | 3      | 338   | 0     | 3      | 536    | 0     | e0b    |
| node1_clus_1 | Cluster    | 3      | 287   | 0     | 3      | 398    | 0     | e0a    |
| node2_mgmt1  | ncluster-1 | 0      | 0     | 0     | 0      | 0      | 0     | e0c    |
| node1_mgmt1  | ncluster-1 | 0      | 0     | 0     | 0      | 0      | 0     | e0c    |

```
[...]
```

## statistics lun commands

### statistics lun show

#### LUN throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command continuously displays performance data for LUNs at a regular interval. The command output displays data in the following columns:

- Lun - LUN name.
- Vserver - vservers name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

#### Parameters

##### **[-lun <text>] - Lun**

Selects the LUN for which you want to display performance data.

**[*-vserver* <*vserver name*>] - Vserver**

Selects the vservers for which you want to display performance data.

**[*-sort-key* <*text*>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

***-interval* <*integer*> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

***-iterations* <*integer*> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

***-max* <*integer*> - Maximum Number of Instances**

Specifies the maximum number of LUNs to display. The default setting is 25.

**Examples**

The following example displays LUN statistics:

```
cluster1::> statistics lun show
cluster1 : 12/31/2013 16:00:04
*Total Read Write Other   Read Write Latency
  Lun Vserver      Ops  Ops   Ops   Ops  (Bps) (Bps)    (us)
  ----
lun1    vs1       58   13   15    29 310585  3014    39
lun0    vs2       56    0   11    45  8192 28826    47
[...]
```

## statistics namespace commands

### statistics namespace show

Namespace throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command continuously displays performance data for Namespaces at a regular interval. The command output displays data in the following columns:

- Namespace - Namespace name.
- Vserver - vservers name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.

- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(ms) - average latency for an operation in milliseconds.

## Parameters

### **[-namespace <text>] - Namespace**

Selects the Namespace for which you want to display performance data.

### **[-vserver <vserver name>] - Vserver**

Selects the vservers for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of Namespaces to display. The default setting is 25.

## Examples

The following example displays Namespace statistics:

```
cluster1::> statistics namespace show
cluster1 : 12/31/2017 16:00:04
*Total Read Write Other   Read Write Latency
  Namespace Vserver      Ops  Ops   Ops   Ops   (Bps) (Bps)   (ms)
-----
ns1          vs1        58   13   15    29 310585 3014    39
ns0          vs2        56    0   11    45  8192 28826   47
[...]
```

## statistics nfs commands

### statistics nfs show-mount

Display mount statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `statistics nfs show-mount` command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays statistics only for the specified node.

**`[-result {success|failure|all}] - Result (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**`[-null <Counter with Delta>] - Null Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**`[-mount <Counter with Delta>] - Mount Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

**`[-dump <Counter with Delta>] - Dump Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

**[-unmnt <Counter with Delta>] - UnMount Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

**[-unmntall <Counter with Delta>] - UnMountAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

**[-export <Counter with Delta>] - Export Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

**[-exportall <Counter with Delta>] - ExportAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

**[-pathconf <Counter with Delta>] - PathConf Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics nfs show-mount -node node1
```

| Node             | Value             | Delta   |
|------------------|-------------------|---------|
| node1            | -----success----- |         |
| Null Ops:        | 2                 | 0/s:16s |
| Mount Ops:       | 1                 | 0/s:16s |
| Dump Ops:        | 0                 | -       |
| Unmount Ops:     | 1                 | 0/s:16s |
| Unmount All Ops: | 0                 | -       |
| Export Ops:      | 0                 | -       |
| ExportAll Ops    | 0                 | -       |
| PathConf Ops:    | 0                 | -       |
| Total Ops:       | 4                 | 0/s:16s |

| Node             | Value             | Delta |
|------------------|-------------------|-------|
| node1            | -----failure----- |       |
| Null Ops:        | 0                 | -     |
| Mount Ops:       | 0                 | -     |
| Dump Ops:        | 0                 | -     |
| Unmount Ops:     | 0                 | -     |
| Unmount All Ops: | 0                 | -     |
| Export Ops:      | 0                 | -     |
| ExportAll Ops    | 0                 | -     |
| PathConf Ops:    | 0                 | -     |
| Total Ops:       | 0                 | -     |

## statistics nfs show-nlm

(DEPRECATED)-Display NLM statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `statistics nfs show-nlm` command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations

- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

This command requires an effective cluster version earlier than ONTAP 9.0. Data for nodes running ONTAP 9.0 or later is not collected, and will not be displayed. Use the [statistics show -object nlm](#) command instead.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays statistics only for the specified node.

**[`-result {success|failure|all}`] - Result (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[`-null <Counter with Delta>`] - Null Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[`-test <Counter with Delta>`] - Test Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

**[`-lock <Counter with Delta>`] - Lock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[`-cancel <Counter with Delta>`] - Cancel Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

**[`-unlock <Counter with Delta>`] - Unlock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

**[-granted <Counter with Delta>] - Granted Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

**[-share <Counter with Delta>] - Share Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

**[-unshare <Counter with Delta>] - Unshare Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

**[-nmlock <Counter with Delta>] - NmLock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

**[-freeall <Counter with Delta>] - FreeAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

**[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics nfs show-nlm -node node1
```

| Node     | Value             | Delta   |
|----------|-------------------|---------|
| node1    | -----success----- |         |
| Null:    | 0                 | -       |
| Test:    | 0                 | -       |
| Lock:    | 2                 | 0/s:23s |
| Cancel:  | 0                 | -       |
| Unlock:  | 1                 | 0/s:23s |
| Granted: | 0                 | -       |
| Share:   | 0                 | -       |
| Unshare: | 0                 | -       |
| NmLock:  | 0                 | -       |
| FreeAll: | 0                 | -       |
| Total:   | 3                 | 0/s:23s |

| Node     | Value             | Delta |
|----------|-------------------|-------|
| node1    | -----failure----- |       |
| Null:    | 0                 | -     |
| Test:    | 0                 | -     |
| Lock:    | 0                 | -     |

## statistics nfs show-statusmon

Display status monitor statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `statistics nfs show-statusmon` command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)

- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays statistics only for the specified node.

**`[-result {success|failure|all}] - Result (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**`[-null <Counter with Delta>] - Null Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**`[-stat <Counter with Delta>] - Stat Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

**`[-monitor <Counter with Delta>] - Monitor Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

**`[-unmonitor <Counter with Delta>] - Unmonitor Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

**`[-unmonall <Counter with Delta>] - Unmonitor All Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

### **[-simucrash <Counter with Delta>] - SimuCrash Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

### **[-notify <Counter with Delta>] - Notify Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

### **[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## **Examples**

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics nfs show-statusmon -node node1
```

| Node           | Value             | Delta |
|----------------|-------------------|-------|
| node1          | -----success----- |       |
| Null Ops:      | 0                 | -     |
| Stat Ops:      | 0                 | -     |
| Monitor Ops:   | 0                 | -     |
| Unmonitor Ops: | 0                 | -     |
| Unmon All Ops: | 0                 | -     |
| SimuCrash Ops: | 0                 | -     |
| Notify Ops:    | 0                 | -     |
| Total Ops:     | 0                 | -     |

| Node           | Value             | Delta |
|----------------|-------------------|-------|
| node1          | -----failure----- |       |
| Null Ops:      | 0                 | -     |
| Stat Ops:      | 0                 | -     |
| Monitor Ops:   | 0                 | -     |
| Unmonitor Ops: | 0                 | -     |
| Unmon All Ops: | 0                 | -     |
| SimuCrash Ops: | 0                 | -     |
| Notify Ops:    | 0                 | -     |
| Total Ops:     | 0                 | -     |

## **statistics nfs show-v3**

### **Display NFSv3 statistics**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `statistics nfs show-v3` command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations
- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations
- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations

- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

**[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-lookup <Counter with Delta>] - LookUp Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

#### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

#### **[-rsym <Counter with Delta>] - ReadSymlink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

#### **[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

#### **[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

#### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

#### **[-mkdir <Counter with Delta>] - Mkdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

#### **[-symln <Counter with Delta>] - SymLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

#### **[-mknod <Counter with Delta>] - Mknod Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

#### **[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

#### **[-rmdir <Counter with Delta>] - Rmdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

#### **[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-rdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of readdir operations.

**[-rdirp <Counter with Delta>] - ReadDirPlus Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

**[-fsstat <Counter with Delta>] - FsStat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

**[-fsinfo <Counter with Delta>] - FsInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

**[-pconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

**[-null-pct <Counter with Delta>] - Percent Null Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-lookup-pct <Counter with Delta>] - Percent LookUp Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-access-pct <Counter with Delta>] - Percent Access Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsym link operations.

**[-read-pct <Counter with Delta>] - Percent Read Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-write-pct <Counter with Delta>] - Percent Write Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-create-pct <Counter with Delta>] - Percent Create Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

**[-symlink-pct <Counter with Delta>] - Percent SymLink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

**[-mknod-pct <Counter with Delta>] - Percent Mknod Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-link-pct <Counter with Delta>] - Percent Link Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

**[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of fsstat operations.

**[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

**[-pconf-pct <Counter with Delta>] - Percent PathConf Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**Examples**

The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics nfs show-v3 -node node1
```

| Node             | Value             | Delta | Percent Ops | Delta |
|------------------|-------------------|-------|-------------|-------|
| node1            | -----success----- |       |             |       |
| Null Ops:        | 4                 | -     | 7%          | -     |
| GetAttr Ops:     | 10                | -     | 19%         | -     |
| SetAttr Ops:     | 2                 | -     | 4%          | -     |
| Lookup Ops:      | 2                 | -     | 4%          | -     |
| Access Ops:      | 14                | -     | 26%         | -     |
| ReadSymlink Ops: | 0                 | -     | 0%          | -     |
| Read Ops:        | 0                 | -     | 0%          | -     |
| Write Ops:       | 0                 | -     | 0%          | -     |
| Create Ops:      | 2                 | -     | 4%          | -     |
| MkDir Ops:       | 1                 | -     | 2%          | -     |
| Symlink Ops:     | 0                 | -     | 0%          | -     |
| MkNod Ops:       | 0                 | -     | 0%          | -     |
| Remove Ops:      | 1                 | -     | 2%          | -     |
| RmDir Ops:       | 0                 | -     | 0%          | -     |
| Rename Ops:      | 0                 | -     | 0%          | -     |
| Link Ops:        | 0                 | -     | 0%          | -     |
| ReadDir Ops:     | 2                 | -     | 4%          | -     |
| ReadDirPlus Ops: | 10                | -     | 19%         | -     |

## statistics nfs show-v4

### Display NFSv4 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `statistics nfs show-v4` command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations

- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-compound <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

#### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

#### **[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

#### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

#### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

#### **[-delpur <Counter with Delta>] - Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

#### **[-delrtn <Counter with Delta>] - Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempret operations.

#### **[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

#### **[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

#### **[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

#### **[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

#### **[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattr <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdr <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

**[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

**[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

**[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

**[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-sclid <Counter with Delta>] - SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

**[-scidc <Counter with Delta>] - SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

**[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-delpur-pct <Counter with Delta>] - Percent Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opattnr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDwng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendwng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

### **[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

### **[-relovn-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

## **Examples**

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics nfs show-v4 -node node1
```

| Node           | Value             | Delta | Percent Ops | Delta |
|----------------|-------------------|-------|-------------|-------|
| node1          | -----success----- |       |             |       |
| Null Procs:    | 2                 | -     | 1%          | -     |
| Cmpnd Procs:   | 92                | -     |             | -     |
| Access Ops:    | 16                | -     | 6%          | -     |
| Close Ops:     | 8                 | -     | 3%          | -     |
| Commit Ops:    | 0                 | -     | 0%          | -     |
| Create Ops:    | 0                 | -     | 0%          | -     |
| Delpur Ops:    | 0                 | -     | 0%          | -     |
| Delrtn Ops:    | 0                 | -     | 0%          | -     |
| Getattr Ops:   | 76                | -     | 27%         | -     |
| Getfh Ops:     | 22                | -     | 8%          | -     |
| Link Ops:      | 0                 | -     | 0%          | -     |
| Lock Ops:      | 0                 | -     | 0%          | -     |
| Lockt Ops:     | 0                 | -     | 0%          | -     |
| Locku Ops:     | 0                 | -     | 0%          | -     |
| Lookup Ops:    | 13                | -     | 5%          | -     |
| Lookupp Ops:   | 0                 | -     | 0%          | -     |
| Nverify Ops:   | 0                 | -     | 0%          | -     |
| Open Ops:      | 8                 | -     | 3%          | -     |
| Openattr Ops:  | 0                 | -     | 0%          | -     |
| Openconf Ops:  | 0                 | -     | 0%          | -     |
| Opendowng Ops: | 0                 | -     | 0%          | -     |
| Putfh Ops:     | 92                | -     | 32%         | -     |
| Putpubfh Ops:  | 0                 | -     | 0%          | -     |
| Putrootfh Ops: | 2                 | -     | 1%          | -     |
| Read Ops:      | 0                 | -     | 0%          | -     |
| Readdir Ops:   | 2                 | -     | 1%          | -     |
| Readlink Ops:  | 0                 | -     | 0%          | -     |
| Remove Ops:    | 5                 | -     | 2%          | -     |
| Rename Ops:    | 3                 | -     | 1%          | -     |
| Renew Ops:     | 0                 | -     | 0%          | -     |
| Restorefh Ops: | 11                | -     | 4%          | -     |

|                  |       |         |             |       |
|------------------|-------|---------|-------------|-------|

## statistics nfs show-v41

### Display NFSv4.1 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `statistics nfs show-v41` command displays the following statistics about the NFSv4.1 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations

- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of setattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations

- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4.1 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-cmpnd <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

#### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

#### **[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

#### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

#### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

#### **[-delpur <Counter with Delta>] - Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

#### **[-delrtn <Counter with Delta>] - Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempret operations.

#### **[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

#### **[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

#### **[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

#### **[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

#### **[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattn <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdr <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

#### **[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

#### **[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **[-renew <Counter with Delta>] - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

#### **[-restfh <Counter with Delta>] - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

#### **[-savefh <Counter with Delta>] - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

#### **[-secinf <Counter with Delta>] - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

#### **[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

#### **[-sclid <Counter with Delta>] - SetClild Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

#### **[-scidc <Counter with Delta>] - SetClildConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

#### **[-verify <Counter with Delta>] - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

#### **[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

#### **[-relown <Counter with Delta>] - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

#### **[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of total nfsv4.1 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-delpur-pct <Counter with Delta>] - Percent Deleypurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of deleypurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opattnr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

### **[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

### **[-relovn-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

## **Examples**

The following example displays statistics about the NFSv4.1 operations for a node named node1:

```
cluster1::> statistics nfs show-v41 -node node1
```

| Node           | Value             | Delta | Percent Ops | Delta |
|----------------|-------------------|-------|-------------|-------|
| node1          | -----success----- |       |             |       |
| Null Procs:    | 2                 | -     | 1%          | -     |
| Cmpnd Procs:   | 92                | -     |             | -     |
| Access Ops:    | 16                | -     | 6%          | -     |
| Close Ops:     | 8                 | -     | 3%          | -     |
| Commit Ops:    | 0                 | -     | 0%          | -     |
| Create Ops:    | 0                 | -     | 0%          | -     |
| Delpur Ops:    | 0                 | -     | 0%          | -     |
| Delrtn Ops:    | 0                 | -     | 0%          | -     |
| Getattr Ops:   | 76                | -     | 27%         | -     |
| Getfh Ops:     | 22                | -     | 8%          | -     |
| Link Ops:      | 0                 | -     | 0%          | -     |
| Lock Ops:      | 0                 | -     | 0%          | -     |
| Lockt Ops:     | 0                 | -     | 0%          | -     |
| Locku Ops:     | 0                 | -     | 0%          | -     |
| Lookup Ops:    | 13                | -     | 5%          | -     |
| Lookupp Ops:   | 0                 | -     | 0%          | -     |
| Nverify Ops:   | 0                 | -     | 0%          | -     |
| Open Ops:      | 8                 | -     | 3%          | -     |
| Openattr Ops:  | 0                 | -     | 0%          | -     |
| Openconf Ops:  | 0                 | -     | 0%          | -     |
| Opendowng Ops: | 0                 | -     | 0%          | -     |
| Putfh Ops:     | 92                | -     | 32%         | -     |
| Putpubfh Ops:  | 0                 | -     | 0%          | -     |
| Putrootfh Ops: | 2                 | -     | 1%          | -     |

## statistics node commands

### statistics node show

System utilization metrics for each node in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command continuously displays performance data for nodes at a regular interval. The command output displays data in the following columns:

- Node - node name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(us) - average latency for an operation in microseconds.

#### Parameters

**[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies the maximum number of aggregates to display. The default setting is 25.

#### Examples

The following example displays node statistics:

```
cluster1::> statistics node show
cluster1 : 12/31/2013 16:00:04
CPU *Total Latency
  Node (%)      Ops      (us)
  -----
node2   76      113       -
node1   58       10       -

[...]
```

## statistics oncrpc commands

### statistics oncrpc show-rpc-calls

#### Display ONC RPC Call Statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command is deprecated and will be removed in a future major release.

The `statistics oncrpc show-rpc-calls` command displays information about the Open Network Computing Remote Procedure Call (ONC RPC) calls performed by the nodes of a cluster.

#### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ](privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`]} - Node (privilege: advanced)**

Use this parameter to display information only about the RPC calls performed by the node you specify.

**[`-protocol {TCP|UDP|RDMA}`]} - Transport Protocol (privilege: advanced)**

Use this parameter to display information only about the RPC calls performed using the network protocol you specify.

**[`-badproc <Counter with Delta>]` - Bad Procedure Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the number of bad procedure calls you specify. Bad procedure calls are RPC requests that contain invalid procedure numbers and cannot be completed.

**[-badlen <Counter with Delta>] - Bad Length Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the number of bad length calls you specify.

**[-badhdr <Counter with Delta>] - Bad Header Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the number of bad header calls you specify.

**[-badcalls <Counter with Delta>] - Bad Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the number of bad calls you specify.

**[-badprogcalls <Counter with Delta>] - Bad Program Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the number of bad program calls you specify.

**[-calls <Counter64 with Delta>] - Total Calls (privilege: advanced)**

Use this parameter to display information only about the RPC calls that have the total number of bad calls you specify.

**Examples**

```
cluster1::> statistics oncrpc show-rpc-calls
```

| Node            | Value | Delta |
|-----------------|-------|-------|
| -----tcp-----   |       |       |
| node1           |       |       |
| Bad Proc:       | 0     | -     |
| Bad Len:        | 0     | -     |
| Bad Hdr:        | 0     | -     |
| Bad Calls:      | 0     | -     |
| Bad Prog Calls: | 0     | -     |
| Total Calls:    | 0     | -     |

| Node            | Value | Delta |

| Bad Proc:       | 0     | -     |
| Bad Len:        | 0     | -     |
| Bad Hdr:        | 0     | -     |
| Bad Calls:      | 0     | -     |
| Bad Prog Calls: | 0     | -     |
| Total Calls:    | 0     | -     |

4 entries were displayed.

## statistics port commands

### statistics port fcp show

FCP port interface throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continuously displays performance data for FCP ports at a regular interval. The command output displays data in the following columns:

- Port - port name.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.

## Parameters

### **[-port <text>] - Port**

Selects the port for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of ports to display. The default setting is 25.

## Examples

The following example displays port statistics:

```
cluster1::> statistics port fcp show
cluster1 : 12/31/2013 16:00:04

      *Total Read Write
Port      Ops   Ops   Ops
-----
port1      2     2     0
port2      3     0     3

[...]
```

# statistics preset commands

## statistics preset delete

Delete an existing Performance Preset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Deletes a performance preset configuration and all of its associated details.

### Parameters

**-preset <text> - Preset Name (privilege: advanced)**

Specifies the name of the performance presets that you want to delete.

### Examples

```
cluster1::*> statistics preset show
    Preset Name: asup-event
    Preset UUID: 55c03699-01db-11e2-8e3e-123478563412
    Comment: The event-based AutoSupport Data ONTAP Performance
Archive
    preset configuration. This preset configuration is
used
    whenever an event-based AutoSupport is triggered.
    Privilege: diagnostic
    Read-Only: true
    Negative Preset: false
    Application Order: 1
    Archive Enabled: false
    Generation ID: 0
Preset Name: asup-hourly
    Preset UUID: 56178a2a-01db-11e2-8e3e-123478563412
    Comment: The hourly AutoSupport Data ONTAP Performance Archive
used by
    the hourly AutoSupport collection events.
    Privilege: diagnostic
    Read-Only: true
    Negative Preset: false
    Application Order: 1
    Archive Enabled: true
    Generation ID: 0
Preset Name: default
    Preset UUID: 55ac6297-01db-11e2-8e3e-123478563412
```

```

        Comment: The default Data ONTAP Performance Archive preset
                  configuration. This preset configuration includes
troubleshooting of                  essential counters to assist in general
                                     system performance.
        Privilege: diagnostic
        Read-Only: true
        Negative Preset: false
        Application Order: 1
        Archive Enabled: true
        Generation ID: 0
Preset Name: diagnostic
        Preset UUID: 561db291-01db-11e2-8e3e-123478563412
        Comment: The diagnostic Data ONTAP Performance Archive preset
                  configuration. This preset configuration includes more
                  counters at faster sample periods than the default
                  configuration to assist in troubleshooting abnormal
                  system performance.
        Privilege: diagnostic
        Read-Only: true
        Negative Preset: false
        Application Order: 1
        Archive Enabled: false
        Generation ID: 0
Preset Name: foo
        Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412

## statistics preset modify

### Modify an existing Performance Preset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

Modifies an existing performance preset configuration. The command modifies the global properties of a preset, but does not modify the details of the preset, such as specific objects and counters sampled.

#### Parameters

**-preset <text> - Preset Name (privilege: advanced)**

Name of the performance preset to be modified.

**[-new-name <text>] - New Preset Name (privilege: advanced)**

Set preset name to the given new name.

**[-comment <text>] - Preset Description (privilege: advanced)**

Set comment to the given value.

**[-privilege <PrivilegeLevel>] - Preset Privilege Level (privilege: advanced)**

Set privilege level at which this preset can be viewed or modified to the given value. Possible values: admin, advanced, diagnostic.

#### Examples

```

cluster1:*> statistics preset show
    Preset Name: delta
    Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
    Comment: custom preset description
    Privilege: diagnostic
    Read-Only: false
    Negative Preset: false
    Application Order: 1
    Archive Enabled: false
    Generation ID: 0

1 entry was displayed.

cluster1:*> statistics preset modify -preset delta -comment "new comment"

cluster1:*> statistics preset show

    Privilege: diagnostic
    Read-Only: false
    Negative Preset: false
    Application Order: 1
    Archive Enabled: false
    Generation ID: 0

1 entry was displayed.

```

## statistics preset show

Display information about Performance Presets

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Displays information about performance preset configurations.

### Parameters

**[-fields <fieldname>,...]**

Selects which performance preset attributes to display.

**[ -instance ] (privilege: advanced) }**

Shows details of all attributes of performance preset configuration.

**[`-preset <text>`] - Preset Name (privilege: advanced)**

Selects the performance presets that match the specified preset name.

**[`-comment <text>`] - Preset Description (privilege: advanced)**

Selects the performance presets that match the specified comment.

**[`-privilege <PrivilegeLevel>`] - Preset Privilege Level (privilege: advanced)**

Selects the performance presets that are available with the specified privilege.

**[`-store <text>`] - Name of Store Where Data is Saved (privilege: advanced)**

Selects the store where data is saved.

**[`-is-read-only {true|false}`] - Is Preset Read-Only? (privilege: advanced)**

Selects the performance presets that are read-only (true) or are not read-only (false). Read-only presets cannot be modified.

## Examples

```
cluster1::*> statistics preset show
    Preset Name: aggregate_overview
    Preset UUID: 4ec14b86-34a0-11ef-8db4-005056bb1920
    Comment: This preset configuration is used by statistics
aggregate
    show command. Provides overview of aggregate object.
    Privilege: admin
    Read-Only: true
    Negative Preset: false
Application Order: 1
    Archive Enabled: false
    Store Name: -
    Generation ID: 0
Preset Name: disk_overview
    Preset UUID: 4e7471b3-34a0-11ef-8db4-005056bb1920

    Application Order: 1
    Archive Enabled: false
    Store Name: -
    Generation ID: 0
[...]
```

## statistics preset detail show

### Display information about Performance Preset Details

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

Displays the specific details of each preset, including the objects sampled, the counter sample periods, and the counters sampled.

#### Parameters

**[-fields <fieldname>,...]**

Selects which performance preset detail attributes to display.

**[ -instance ] (privilege: advanced) }**

Displays all of the performance preset detail attributes.

**[-preset <text>] - Preset Name (privilege: advanced)**

Selects the performance preset details that match the specified preset name.

**[-object <text>] - Performance Object (privilege: advanced)**

Selects the performance preset details that match the specified object name.

**[-sample-period <sample\_period>] - Archive Sample period (privilege: advanced)**

Selects the performance preset details that are collected at the specified sample period.

**[-counter-set <text>,...] - Performance Counter Name Set (privilege: advanced)**

Selects the performance preset details that match the specified counters in the counter set. Use "|" to separate multiple counters.

**[-instance-filters <text>,...] - Performance Instance Filters (privilege: advanced)**

Selects the performance preset details that match the specified instance filters. Use "|" to separate multiple instance filters. This field is reserved for future use.

## Examples

```
cluster1::*> statistics preset detail show
Preset Name Object      Sample Counter      Instance
Period Set              Filters
-----
asup-event  aggregate  1w  instance_name, -
                                node_name,
                                process_name,
                                parent_host,
                                total_
                                transfers,
                                user_reads,
                                user_writes,
                                cp_reads,
                                user_read_
                                blocks,
                                user_write_
                                blocks,
                                cp_read_
                                blocks,
                                wv_fsid,
                                wv_vol_type,
                                wv_fsinfo_fs_
                                version,
                                wv_volinfo_fs_
                                options,
. . .
```

## statistics qtree commands

## statistics qtree show

### Qtree I/O operation rates

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command continuously displays performance data for qtrees at a regular interval. The command output displays data in the following columns:

- Qtree - Qtree name.
- Vserver - Vserver name.
- Volume - Volume name.
- NFS Ops - NFS operations per second.
- CIFS Ops - CIFS operations per second.
- Internal Ops - Internal operations per second.
- Total Ops - Total number of operations per second.

### Parameters

#### **[-qtree <text>] - Qtree**

Selects the qtree for which you want to display performance data. The qtree name has to be given in the format "vol\_name/qtree\_name"

#### **[-vserver <vserver name>] - Vserver**

Selects the Vserver for which you want to display performance data.

#### **[-volume <text>] - Volume**

Selects the volume for which you want to display performance data.

#### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

#### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

#### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

#### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of qtrees to display. The default setting is 25.

### Examples

The following example displays qtree statistics:

```
C1_sti20-vsrm-ucs429g_1520278254::> statistics qtree show
C1_sti20-vsrm-ucs429g_1520278254 : 3/14/2018 15:40:46
NFS CIFS Internal *Total
      Qtree Vserver  Volume ops   ops      ops      ops
-----
flexvol/qt1      vs0 flexvol    7     0         0         7
dp_vol/qt9       vs0 dp_vol     7     0         0         7
dp_vol/qt8       vs0 dp_vol     7     0         0         7
[...]
```

## statistics samples commands

### statistics samples delete

Delete statistics samples

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

This command deletes samples that you created using the [statistics start](#) command.

#### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Selects the Vserver for which you want to delete the sample. The default Vserver is admin Vserver.

**-sample-id <text> - Sample Identifier (privilege: advanced)**

Specifies the sample that you want to delete. This is a required parameter.

#### Examples

The following example deletes the sample "smpl\_1":

```
cluster1::*> statistics samples delete -sample-id smpl_1
```

#### Related Links

- [statistics start](#)

### statistics samples show

Display statistics samples

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command displays information about the samples that you created using the [statistics start](#) command.

## Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-describe* ] (privilege: advanced) }**

Displays detailed information about each sample.

**[*-vserver* <vserver name>] - Vserver (privilege: advanced)**

Selects the samples that match this parameter value. If you omit this parameter, the command displays details for all samples.

**[*-sample-id* <text>] - Sample Identifier (privilege: advanced)**

Selects the samples that match this parameter value. If you do not specify this parameter, the command will display information about all the samples in the cluster.

## Examples

The following example displays information for sample "smpl\_1":

```
cluster1::*> statistics samples show -sample-id smpl_1
Vserver          Sample ID          Start Time      Stop Time      Status
-----
cluster-d1       smpl_1              09/13 18:06:46 -      Ready
```

The following example displays detailed information for sample "smpl\_1":

```
cluster1::*> statistics samples show -sample-id smpl_1 -describe
Vserver: vs1
Sample ID: smpl_1
Object: processor
Instance: -
Counter: -
Start Time: 09/13 18:06:46
Stop Time: -
Status: Ready      - -
Privilege: admin
```

# statistics settings commands

## statistics settings modify

Modify settings for the statistics commands

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command modifies the settings for all of the `statistics` commands.

### Parameters

**`[-display-rates {true|false}] - Display Rates (privilege: advanced)`**

Specifies whether the `statistics` commands display rate counters in rates/second. The default is `true`.

**`[-client-stats {enabled|disabled}] - Collect Per-Client Statistics (privilege: advanced)`**

Specifies whether `statistics` commands display per-client information. The default is `disabled`.

If you enable this setting, you might significantly impact system performance.

**`[-counter-display-units {B|KB|MB|GB}] - Counter Display Units (privilege: advanced)`**

Specifies display units for the counters. The default setting is `MB`.

**`[-display-count-exponent <integer>] - Display Count Exponent (privilege: advanced)`**

Specifies display exponent value for the counters representing counts. The default setting is 3 (thousand).

### Examples

The following example sets the value of the `-display-rates` parameter to `false` :

```
cluster1::*> statistics settings modify -display-rates false
```

## statistics settings show

Display settings for the statistics commands

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command displays the current settings for all of the `statistics` commands.

### Examples

The following example displays the current settings for all `statistics` commands:

```
cluster1::*> statistics settings show
Display rate Counters in rate/sec: true

Counter Display: full
Counter Display Units: MB
Display Count Exponent: 3
```

## statistics system commands

### statistics system show

System utilization metrics for the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command continuously displays performance data for cluster at a regular interval. The command output displays data in the following columns:

- System - cluster.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

#### Parameters

##### **[-system <text>] - System**

Selects the system for which you want to display performance data.

##### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

##### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

##### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

##### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of systems to display. The default setting is 25.

#### Examples

The following example displays system statistics:

```
cluster1::> statistics system show
cluster1 : 12/31/2013 16:00:04
```

|         | CPU | *Total | Latency |
|---------|-----|--------|---------|
| System  | (%) | Ops    | (ms)    |
| -----   | --- | -----  | -----   |
| Cluster | 76  | 113    | -       |

```
[...]
```

## statistics top commands

### statistics top client show

Most active NFS and CIFS clients

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command continuously displays performance data for the top NFS and CIFS clients at a regular interval. The command output displays data in the following columns:

- Client - client name.
- Vserver - vservers name.
- Node - node name.
- Total IOPs - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

#### Parameters

**[-node {<nodename>|local}] - Node**

Selects the node for which you want to display performance data.

**[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

**-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**-max <integer> - Maximum Number of Instances**

Specifies maximum number of top clients to display. The default setting is 10.

## Examples

The following example displays top client statistics:

```
cluster1::> statistics top client show
cluster-1 : 12/31/1969 16:00:04
*Total Total
      Client      Vserver      Node      Ops  (Bps)
-----
 172.17.236.53:938 vserver01 cluster-node2      9    80
172.17.236.160:898 vserver02 cluster-node1      6    50

[...]
```

## statistics top file show

### Most actively accessed files

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command continuously displays performance data for top files at a regular interval. The command output displays data in the following columns:

- Total IOPS - total number of input/output operations per second.
- Node - node name.
- Vserver - vservers name.
- Aggregate - aggregate name.
- Volume - volume name.
- File - file name.

### Parameters

#### **[*-node* {<nodename>|local}]** - Node

Selects the node for which you want to display performance data.

#### **[*-sort-key* <text>]** - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

#### ***-interval* <integer>** - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 30 seconds.

#### ***-iterations* <integer>** - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies maximum number of top files to display. The default setting is 10.

### **Examples**

The following example displays top files statistics:

```
cluster1::> statistics top file show
cluster-1 : 12/31/1969 16:00:04
*Estimated
      Total
      IOPS           Node   Vserver Aggregate Volume           File
-----
          9 cluster-node2 vserver01      aggr1  vol01 /vol/vol01/clus/cache
          6 cluster-node1 vserver02      aggr2  vol02      /vol/vol02
[...]
```

## **statistics volume commands**

### **statistics volume show**

Volume throughput and latency metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command continuously displays performance data for volumes at a regular interval. The command output displays data in the following columns:

- Volume - volume name.
- Vserver - vservers name.
- Aggregate - aggregate name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

### **Parameters**

**[*-volume* <text>] - Volume**

Selects the volume for which you want to display performance data.

**[*-vserver* <*vserver name*>] - Vserver**

Selects the vservers for which you want to display performance data.

**[*-aggregate* <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

**[*-sort-key* <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

***-interval* <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

***-iterations* <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

***-max* <integer> - Maximum Number of Instances**

Specifies the maximum number of volumes to display. The default setting is 25.

**Examples**

The following example displays volume statistics:

```
cluster1::> statistics volume show
cluster1 : 12/31/2013 16:00:04
```

| Volume | Vserver | Aggregate | *Total<br>Ops | Read<br>Ops | Write<br>Ops | Other<br>Ops | Read<br>(Bps) | Write<br>(Bps) | Latency<br>(us) |
|--------|---------|-----------|---------------|-------------|--------------|--------------|---------------|----------------|-----------------|
| vol0   | -       | aggr0     | 58            | 13          | 15           | 29           | 310585        | 3014           | 39              |
| vol0   | -       | aggr0_n0  | 56            | 0           | 11           | 45           | 8192          | 28826          | 47              |

[...]

## statistics vservers commands

### statistics vservers show

Vserver throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command continuously displays performance data for Vservers at a regular interval. The command output displays data in the following columns:

- Vserver - Vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

## Parameters

### **[-vserver <vserver name>] - Vserver**

Selects the vservers for which you want to display performance data.

### **[-sort-key <text>] - Column to Sort By**

If this parameter is specified, the command displays statistics sorted by the specified column.

### **-interval <integer> - Interval**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

### **-iterations <integer> - Iterations**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

### **-max <integer> - Maximum Number of Instances**

Specifies the maximum number of Vservers to display. The default setting is 25.

## Examples

The following example displays Vserver statistics:

```
cluster1::> statistics vservers show
cluster1 : 12/31/2013 16:00:04
```

| Vserver | *Total<br>Ops | Read<br>Ops | Write<br>Ops | Other<br>Ops | Read<br>(Bps) | Write<br>(Bps) | Latency<br>(us) |

## statistics workload commands

## statistics workload show

### QoS workload throughput and latency metrics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command continuously displays performance data for workloads at a regular interval. The command output displays data in the following columns:

- Workload - workload name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

#### Parameters

**[`-workload <text>`] - Workload (privilege: advanced)**

Selects the workload for which you want to display performance data.

**[`-sort-key <text>`] - Column to Sort By (privilege: advanced)**

If this parameter is specified, the command displays statistics sorted by the specified column.

**`-interval <integer>` - Interval (privilege: advanced)**

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

**`-iterations <integer>` - Iterations (privilege: advanced)**

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

**`-max <integer>` - Maximum Number of Instances (privilege: advanced)**

Specifies the maximum number of workloads to display. The default setting is 25.

#### Examples

The following example displays workload statistics:

```
cluster1::> statistics workload show
```

```
cluster1 : 12/31/2013 16:00:04
```

| Workload        | *Total<br>Ops | Read<br>Ops | Write<br>Ops | Other<br>Ops | Read<br>(Bps) | Write<br>(Bps) | Latency<br>(us) |
|-----------------|---------------|-------------|--------------|--------------|---------------|----------------|-----------------|
| -----           | -----         | -----       | -----        | -----        | -----         | -----          | -----           |
| _USERSPACE_APPS | 30            | 1           | 3            | 0            | 30765         | 8553           | 0               |
| _WAFL_SCAN      | 20            | 0           | 0            | 0            | 0             | 0              | 0               |
| _WAFL_CP        | 0             | 0           | 0            | 0            | 0             | 0              | -               |

# statistics-v1 commands

## statistics-v1 nfs commands

### statistics-v1 nfs show-mount

Display mount statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `statistics-v1 nfs show-mount` command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

#### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

If you specify this parameter, the command displays statistics only for the specified node.

**`[-result {success|failure|all}] - Result (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**`[-null <Counter with Delta>] - Null Operations (privilege: advanced)`**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of null operations.

**[-mount <Counter with Delta>] - Mount Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

**[-dump <Counter with Delta>] - Dump Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

**[-unmnt <Counter with Delta>] - UnMount Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

**[-unmntall <Counter with Delta>] - UnMountAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

**[-export <Counter with Delta>] - Export Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

**[-exportall <Counter with Delta>] - ExportAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

**[-pathconf <Counter with Delta>] - PathConf Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics-v1 nfs show-mount -node node1
```

| Node             | Value             | Delta   |
|------------------|-------------------|---------|
| node1            | -----success----- |         |
| Null Ops:        | 2                 | 0/s:16s |
| Mount Ops:       | 1                 | 0/s:16s |
| Dump Ops:        | 0                 | -       |
| Unmount Ops:     | 1                 | 0/s:16s |
| Unmount All Ops: | 0                 | -       |
| Export Ops:      | 0                 | -       |
| ExportAll Ops    | 0                 | -       |
| PathConf Ops:    | 0                 | -       |
| Total Ops:       | 4                 | 0/s:16s |

| Node             | Value             | Delta |
|------------------|-------------------|-------|
| node1            | -----failure----- |       |
| Null Ops:        | 0                 | -     |
| Mount Ops:       | 0                 | -     |
| Dump Ops:        | 0                 | -     |
| Unmount Ops:     | 0                 | -     |
| Unmount All Ops: | 0                 | -     |
| Export Ops:      | 0                 | -     |
| ExportAll Ops    | 0                 | -     |
| PathConf Ops:    | 0                 | -     |
| Total Ops:       | 0                 | -     |

## statistics-v1 nfs show-nlm

(DEPRECATED)-Display NLM statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `statistics-v1 nfs show-nlm` command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations

- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

This command requires an effective cluster version earlier than ONTAP 9.0. Data for nodes running ONTAP 9.0 or later is not collected, and will not be displayed. Use the [statistics show -object nlm](#) command instead.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If you specify this parameter, the command displays statistics only for the specified node.

**[`-result {success|failure|all}`] - Result (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[`-null <Counter with Delta>`] - Null Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[`-test <Counter with Delta>`] - Test Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

**[`-lock <Counter with Delta>`] - Lock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

**[`-cancel <Counter with Delta>`] - Cancel Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

**[`-unlock <Counter with Delta>`] - Unlock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

**[-granted <Counter with Delta>] - Granted Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

**[-share <Counter with Delta>] - Share Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

**[-unshare <Counter with Delta>] - Unshare Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

**[-nmlock <Counter with Delta>] - NmLock Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

**[-freeall <Counter with Delta>] - FreeAll Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

**[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics-v1 nfs show-nlm -node node1
```

| Node     | Value             | Delta   |
|----------|-------------------|---------|
| node1    | -----success----- |         |
| Null:    | 0                 | -       |
| Test:    | 0                 | -       |
| Lock:    | 2                 | 0/s:23s |
| Cancel:  | 0                 | -       |
| Unlock:  | 1                 | 0/s:23s |
| Granted: | 0                 | -       |
| Share:   | 0                 | -       |
| Unshare: | 0                 | -       |
| NmLock:  | 0                 | -       |
| FreeAll: | 0                 | -       |
| Total:   | 3                 | 0/s:23s |

| Node     | Value             | Delta |
|----------|-------------------|-------|
| node1    | -----failure----- |       |
| Null:    | 0                 | -     |
| Test:    | 0                 | -     |
| Lock:    | 0                 | -     |
| Cancel:  | 0                 | -     |
| Unlock:  | 0                 | -     |
| Granted: | 0                 | -     |
| Share:   | 0                 | -     |
| Unshare: | 0                 | -     |
| NmLock:  | 0                 | -     |
| FreeAll: | 0                 | -     |
| Total:   | 0                 | -     |

- [statistics show](#)

## statistics-v1 nfs show-statusmon

Display status monitor statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `statistics-v1 nfs show-statusmon` command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)

- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

If you specify this parameter, the command displays statistics only for the specified node.

**[-result {success|failure|all}] - Result (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-stat <Counter with Delta>] - Stat Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

**[-monitor <Counter with Delta>] - Monitor Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

**[-unmonitor <Counter with Delta>] - Unmonitor Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

**[-unmonall <Counter with Delta>] - Unmonitor All Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

### **[-simucrash <Counter with Delta>] - SimuCrash Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

### **[-notify <Counter with Delta>] - Notify Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

### **[-total <Counter64 with Delta>] - Total Operations (privilege: advanced)**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

## **Examples**

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics-v1 nfs show-statusmon -node node1
```

| Node           | Value             | Delta |
|----------------|-------------------|-------|
| node1          | -----success----- |       |
| Null Ops:      | 0                 | -     |
| Stat Ops:      | 0                 | -     |
| Monitor Ops:   | 0                 | -     |
| Unmonitor Ops: | 0                 | -     |
| Unmon All Ops: | 0                 | -     |
| SimuCrash Ops: | 0                 | -     |
| Notify Ops:    | 0                 | -     |
| Total Ops:     | 0                 | -     |

| Node           | Value             | Delta |
|----------------|-------------------|-------|
| node1          | -----failure----- |       |
| Null Ops:      | 0                 | -     |
| Stat Ops:      | 0                 | -     |
| Monitor Ops:   | 0                 | -     |
| Unmonitor Ops: | 0                 | -     |
| Unmon All Ops: | 0                 | -     |
| SimuCrash Ops: | 0                 | -     |
| Notify Ops:    | 0                 | -     |
| Total Ops:     | 0                 | -     |

## **statistics-v1 nfs show-v3**

### **Display NFSv3 statistics**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `statistics-v1 nfs show-v3` command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations
- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations
- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations

- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

**[-sattr <Counter with Delta>] - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

**[-lookup <Counter with Delta>] - LookUp Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

**[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

**[-rsym <Counter with Delta>] - ReadSymlink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-write <Counter with Delta>] - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

**[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

**[-mkdir <Counter with Delta>] - Mkdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

**[-symln <Counter with Delta>] - SymLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

**[-mknod <Counter with Delta>] - Mknod Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

**[-remove <Counter with Delta>] - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

**[-rmdir <Counter with Delta>] - Rmdir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

**[-rename <Counter with Delta>] - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

**[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

**[-rdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of readdir operations.

**[-rdirp <Counter with Delta>] - ReadDirPlus Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

**[-fsstat <Counter with Delta>] - FsStat Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

**[-fsinfo <Counter with Delta>] - FsInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

**[-pconf <Counter with Delta>] - PathConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

**[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

**[-total <Counter64 with Delta>] - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

**[-null-pct <Counter with Delta>] - Percent Null Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-lookup-pct <Counter with Delta>] - Percent LookUp Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-access-pct <Counter with Delta>] - Percent Access Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

**[-read-pct <Counter with Delta>] - Percent Read Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

**[-write-pct <Counter with Delta>] - Percent Write Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

**[-create-pct <Counter with Delta>] - Percent Create Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

**[-symlink-pct <Counter with Delta>] - Percent SymLink Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

**[-mknod-pct <Counter with Delta>] - Percent Mknod Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-link-pct <Counter with Delta>] - Percent Link Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

**[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

**[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of fsstat operations.

**[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

**[-pconf-pct <Counter with Delta>] - Percent PathConf Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Ops**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**Examples**

The following example displays statistics about the NFSv3 operations for a node named node1:

cluster1::> statistics-v1 nfs show-v3 -node node1

| Node             | Value             | Delta | Percent Ops | Delta |
|------------------|-------------------|-------|-------------|-------|
| node1            | -----success----- |       |             |       |
| Null Ops:        | 4                 | -     | 7%          | -     |
| GetAttr Ops:     | 10                | -     | 19%         | -     |
| SetAttr Ops:     | 2                 | -     | 4%          | -     |
| Lookup Ops:      | 2                 | -     | 4%          | -     |
| Access Ops:      | 14                | -     | 26%         | -     |
| ReadSymlink Ops: | 0                 | -     | 0%          | -     |
| Read Ops:        | 0                 | -     | 0%          | -     |
| Write Ops:       | 0                 | -     | 0%          | -     |
| Create Ops:      | 2                 | -     | 4%          | -     |
| Mkdir Ops:       | 1                 | -     | 2%          | -     |
| Symlink Ops:     | 0                 | -     | 0%          | -     |
| Mknod Ops:       | 0                 | -     | 0%          | -     |
| Remove Ops:      | 1                 | -     | 2%          | -     |
| Rmdir Ops:       | 0                 | -     | 0%          | -     |
| Rename Ops:      | 0                 | -     | 0%          | -     |
| Link Ops:        | 0                 | -     | 0%          | -     |
| ReadDir Ops:     | 2                 | -     | 4%          | -     |
| ReadDirPlus Ops: | 10                | -     | 19%         | -     |
| FsStat Ops:      | 1                 | -     | 2%          | -     |
| FsInfo Ops:      | 5                 | -     | 9%          | -     |
| PathConf Ops:    | 0                 | -     | 0%          | -     |
| Commit Ops:      | 0                 | -     | 0%          | -     |
| Total Ops:       | 54                | -     |             |       |
| Node             | Value             | Delta | Percent Ops | Delta |
| node1            | -----failure----- |       |             |       |

## statistics-v1 nfs show-v4

### Display NFSv4 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `statistics-v1 nfs show-v4` command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations

- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of getattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations

- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-compound <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

#### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

#### **[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

#### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

#### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

#### **[-delpur <Counter with Delta>] - Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

#### **[-delrtn <Counter with Delta>] - Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempret operations.

#### **[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

#### **[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

#### **[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

#### **[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

#### **[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattn <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdir <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

#### **`[-remove <Counter with Delta>]` - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

#### **`[-rename <Counter with Delta>]` - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **`[-renew <Counter with Delta>]` - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

#### **`[-restfh <Counter with Delta>]` - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

#### **`[-savefh <Counter with Delta>]` - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

#### **`[-secinf <Counter with Delta>]` - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

#### **`[-sattr <Counter with Delta>]` - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

#### **`[-sclid <Counter with Delta>]` - SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

#### **`[-scidc <Counter with Delta>]` - SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

#### **`[-verify <Counter with Delta>]` - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

#### **`[-write <Counter with Delta>]` - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

#### **`[-relown <Counter with Delta>]` - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

#### **`[-total <Counter64 with Delta>]` - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-delpur-pct <Counter with Delta>] - Percent Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opattnr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

### **[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

### **[-relovn-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

## **Examples**

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v4 -node node1
```

| Node           | Value             | Delta | Percent Ops | Delta |
|----------------|-------------------|-------|-------------|-------|
| node1          | -----success----- |       |             |       |
| Null Procs:    | 2                 | -     | 1%          | -     |
| Cmpnd Procs:   | 92                | -     |             | -     |
| Access Ops:    | 16                | -     | 6%          | -     |
| Close Ops:     | 8                 | -     | 3%          | -     |
| Commit Ops:    | 0                 | -     | 0%          | -     |
| Create Ops:    | 0                 | -     | 0%          | -     |
| Delpur Ops:    | 0                 | -     | 0%          | -     |
| Delrtn Ops:    | 0                 | -     | 0%          | -     |
| Getattr Ops:   | 76                | -     | 27%         | -     |
| Getfh Ops:     | 22                | -     | 8%          | -     |
| Link Ops:      | 0                 | -     | 0%          | -     |
| Lock Ops:      | 0                 | -     | 0%          | -     |
| Lockt Ops:     | 0                 | -     | 0%          | -     |
| Locku Ops:     | 0                 | -     | 0%          | -     |
| Lookup Ops:    | 13                | -     | 5%          | -     |
| Lookupp Ops:   | 0                 | -     | 0%          | -     |
| Nverify Ops:   | 0                 | -     | 0%          | -     |
| Open Ops:      | 8                 | -     | 3%          | -     |
| Openattr Ops:  | 0                 | -     | 0%          | -     |
| Openconf Ops:  | 0                 | -     | 0%          | -     |
| Opendowng Ops: | 0                 | -     | 0%          | -     |
| Putfh Ops:     | 92                | -     | 32%         | -     |
| Putpubfh Ops:  | 0                 | -     | 0%          | -     |
| Putrootfh Ops: | 2                 | -     | 1%          | -     |
| Read Ops:      | 0                 | -     | 0%          | -     |

## statistics-v1 nfs show-v41

### Display NFSv41 statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `statistics-v1 nfs show-v41` command displays the following statistics about the NFSv4.1 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations

- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of setattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations

- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

**[-result {success|failure|all}] - Result**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

**[-null <Counter with Delta>] - Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

**[-cmpnd <Counter with Delta>] - Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

#### **[-access <Counter with Delta>] - Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

#### **[-close <Counter with Delta>] - Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

#### **[-commit <Counter with Delta>] - Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

#### **[-create <Counter with Delta>] - Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

#### **[-delpur <Counter with Delta>] - Delempurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

#### **[-delrtn <Counter with Delta>] - Delempret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempret operations.

#### **[-gattr <Counter with Delta>] - GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

#### **[-getfh <Counter with Delta>] - GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

#### **[-link <Counter with Delta>] - Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

#### **[-lock <Counter with Delta>] - Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

#### **[-lockt <Counter with Delta>] - LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

#### **[-locku <Counter with Delta>] - LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

#### **[-lookup <Counter with Delta>] - Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of lookup operations.

**[-lookpp <Counter with Delta>] - LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

**[-nverify <Counter with Delta>] - Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

**[-open <Counter with Delta>] - Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

**[-opattn <Counter with Delta>] - OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

**[-opconf <Counter with Delta>] - OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

**[-opndg <Counter with Delta>] - OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

**[-putfh <Counter with Delta>] - PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

**[-putpfh <Counter with Delta>] - PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

**[-putrfh <Counter with Delta>] - PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

**[-read <Counter with Delta>] - Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

**[-readdr <Counter with Delta>] - ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

**[-rlink <Counter with Delta>] - ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

#### **`[-remove <Counter with Delta>]` - Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

#### **`[-rename <Counter with Delta>]` - Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

#### **`[-renew <Counter with Delta>]` - Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

#### **`[-restfh <Counter with Delta>]` - RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

#### **`[-savefh <Counter with Delta>]` - SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

#### **`[-secinf <Counter with Delta>]` - SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

#### **`[-sattr <Counter with Delta>]` - SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

#### **`[-sclid <Counter with Delta>]` - SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

#### **`[-scidc <Counter with Delta>]` - SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

#### **`[-verify <Counter with Delta>]` - Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

#### **`[-write <Counter with Delta>]` - Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

#### **`[-relown <Counter with Delta>]` - RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

#### **`[-total <Counter64 with Delta>]` - Total Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified number of total nfsv4 operations.

**[-null-pct <Counter with Delta>] - Percent Null Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

**[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

**[-access-pct <Counter with Delta>] - Percent Access Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

**[-close-pct <Counter with Delta>] - Percent Close Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

**[-commit-pct <Counter with Delta>] - Percent Commit Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

**[-create-pct <Counter with Delta>] - Percent Create Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

**[-delpur-pct <Counter with Delta>] - Percent Delegpurge Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegpurge operations.

**[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

**[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

**[-getfh-pct <Counter with Delta>] - Percent GetFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

**[-link-pct <Counter with Delta>] - Percent Link Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

**[-lock-pct <Counter with Delta>] - Percent Lock Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

**[-lockt-pct <Counter with Delta>] - Percent LockT Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

**[-locku-pct <Counter with Delta>] - Percent LockU Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

**[-lookup-pct <Counter with Delta>] - Percent Lookup Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

**[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

**[-nverify-pct <Counter with Delta>] - Percent Nverify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

**[-open-pct <Counter with Delta>] - Percent Open Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

**[-opattnr-pct <Counter with Delta>] - Percent OpenAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

**[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

**[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

**[-putfh-pct <Counter with Delta>] - Percent PutFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

**[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

**[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

**[-read-pct <Counter with Delta>] - Percent Read Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the

specified percentage of read operations.

**[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

**[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

**[-remove-pct <Counter with Delta>] - Percent Remove Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

**[-rename-pct <Counter with Delta>] - Percent Rename Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

**[-renew-pct <Counter with Delta>] - Percent Renew Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

**[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

**[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

**[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

**[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

**[-sclid-pct <Counter with Delta>] - Percent SetClid Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclid operations.

**[-scidc-pct <Counter with Delta>] - Percent SetClidConf Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setclidconf operations.

**[-verify-pct <Counter with Delta>] - Percent Verify Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

### **[-write-pct <Counter with Delta>] - Percent Write Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

### **[-relovn-pct <Counter with Delta>] - Percent RelLockOwn Operations**

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

## **Examples**

The following example displays statistics about the NFSv4.1 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v41 -node node1
```

| Node           | Value             | Delta | Percent Ops | Delta |
|----------------|-------------------|-------|-------------|-------|
| node1          | -----success----- |       |             |       |
| Null Procs:    | 2                 | -     | 1%          | -     |
| Cmpnd Procs:   | 92                | -     |             | -     |
| Access Ops:    | 16                | -     | 6%          | -     |
| Close Ops:     | 8                 | -     | 3%          | -     |
| Commit Ops:    | 0                 | -     | 0%          | -     |
| Create Ops:    | 0                 | -     | 0%          | -     |
| Delpur Ops:    | 0                 | -     | 0%          | -     |
| Delrtn Ops:    | 0                 | -     | 0%          | -     |
| Getattr Ops:   | 76                | -     | 27%         | -     |
| Getfh Ops:     | 22                | -     | 8%          | -     |
| Link Ops:      | 0                 | -     | 0%          | -     |
| Lock Ops:      | 0                 | -     | 0%          | -     |
| Lockt Ops:     | 0                 | -     | 0%          | -     |
| Locku Ops:     | 0                 | -     | 0%          | -     |
| Lookup Ops:    | 13                | -     | 5%          | -     |
| Lookupp Ops:   | 0                 | -     | 0%          | -     |
| Nverify Ops:   | 0                 | -     | 0%          | -     |
| Open Ops:      | 8                 | -     | 3%          | -     |
| Openattr Ops:  | 0                 | -     | 0%          | -     |
| Openconf Ops:  | 0                 | -     | 0%          | -     |
| Opendowng Ops: | 0                 | -     | 0%          | -     |
| Putfh Ops:     | 92                | -     | 32%         | -     |
| Putpubfh Ops:  | 0                 | -     | 0%          | -     |
| Putrootfh Ops: | 2                 | -     | 1%          | -     |
| Read Ops:      | 0                 | -     | 0%          | -     |
| Readdir Ops:   | 2                 | -     | 1%          | -     |
| Readlink Ops:  | 0                 | -     | 0%          | -     |

## statistics-v1 protocol-request-size commands

### statistics-v1 protocol-request-size show

Display size statistics for CIFS and NFS protocol read and write requests

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command displays size statistics for CIFS and NFS protocol read and write requests. The output of the command includes the following information:

- Node name
- Statistic type
- Average size of request
- Total request count
- Current number of requests in each category of request size
- Number of requests after the command was last executed

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays statistics only for the specified node.

**[-stat-type <Protocol Type>] - RW Request Stat Type**

If this parameter is specified, the command displays only the statistics of the specified protocol type.

Protocol types include the following: `cifs_read`, `cifs_write`, `nfs2_read`, `nfs2_write`, `nfs3_read`, and `nfs3_write`.

**[-total-req-count <Counter64 with Delta>] - Total Request Count**

If this parameter is specified, the command displays only statistics with the specified total number of requests.

**[-average-size <Counter64 with Delta>] - Average Request Size**

If this parameter is specified, the command displays only statistics with the specified average request size.

**[-histo08 <Counter64 with Delta>] - 0 - 511**

If this parameter is specified, the command displays only statistics with the specified number of requests in

this size range.

**[-histo09 <Counter64 with Delta>] - 512 - 1023**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo10 <Counter64 with Delta>] - 1024 - 2047**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo11 <Counter64 with Delta>] - 2048 - 4096**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo12 <Counter64 with Delta>] - 4096 - 8191**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo13 <Counter64 with Delta>] - 8192 - 16K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo14 <Counter64 with Delta>] - 16K - 32K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo15 <Counter64 with Delta>] - 32K - 64K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo16 <Counter64 with Delta>] - 64K - 128K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

**[-histo17 <Counter64 with Delta>] - Greater than 128K**

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

## Examples

The following example displays the number of NFS v3 requests in each size range for only one node in the cluster.

```
cluster1::> statistics protocol-request-size show -stat-type nfs3_* -node
node0
```

| Node:                | node0     |       |  |
|----------------------|-----------|-------|--|
| Stat Type:           | nfs3_read |       |  |
|                      | Value     | Delta |  |
| -----                | -----     | ----- |  |
| Average Size:        | 6         | -     |  |
| Total Request Count: |           |       |  |
|                      | 465947409 | -     |  |
| 0-511:               | 567023    | -     |  |
| 512-1023:            | 4306      | -     |  |

# storage-service commands

## storage-service show

Display the available storage services

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command displays the available storage services.

The available storage services are defined by the type of storage making up an aggregate.

### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-vserver* <vserver name>] - Vserver (privilege: advanced)**

Selects the available storage services for Vservers that match the parameter value.

**[*-storage-service* <text>] - Storage Service (privilege: advanced)**

Selects the available storage services whose name matches the parameter value.

**[*-description* <text>] - Description (privilege: advanced)**

Selects the available storage services whose description matches the parameter value. This field is a text description of the storage service.

**[*-expected-iops-per-tb* <integer>] - Expected IOPS per TB (privilege: advanced)**

Selects the available storage services whose expected IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS nominally guaranteed by the storage service. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of *expected-iops-allocation* .

**[*-expected-iops-allocation* {*used-space*|*allocated-space*}] - Expected IOPS Allocation (privilege: advanced)**

Selects the available storage services whose expected IOPS allocation policy matches the parameter value. The allocation policy is either *allocated-space* or *used-space* . When the *expected-iops-allocation* policy is *allocated-space* , the expected IOPS is calculated based on the size of the storage object. When the *expected-iops-allocation* policy is set to *used-space* , the expected IOPS is calculated based on the amount of data logically stored in the storage object.

**[`-peak-iops-per-tb <integer>`] - Peak IOPS per TB (privilege: advanced)**

Selects the available storage services whose peak IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS for the maximum Quality of Service (QoS) throttle. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of `peak-iops-allocation`.

**[`-peak-iops-allocation {used-space|allocated-space}`] - Peak IOPS Allocation (privilege: advanced)**

Selects the available storage services whose peak IOPS allocation policy matches the parameter value. The allocation policy is either *allocated-space* or *used-space*. When the `peak-iops-allocation` policy is *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the `peak-iops-allocation` policy is set to *used-space*, the peak IOPS is calculated based on the amount of data logically stored in the storage object.

**[`-absolute-min-iops <integer>`] - Absolute Minimum IOPS (privilege: advanced)**

Selects the available storage services whose absolute minimum IOPS matches the parameter value. This field is the minimum number of IOPS used as the Quality of Service (QoS) throttle, if larger than the values calculated using the IOPS per TB parameters.

**[`-target-latency <integer>`] - Target Latency (ms) (privilege: advanced)**

Selects the available storage service whose target latency matches the parameter value.

**[`-aggr-list <aggregate name>,...`] - Aggregate List (privilege: advanced)**

Selects the available storage services whose aggregate list matches the parameter value. The aggregates shown are the only ones used for provisioning when the corresponding Vserver and storage service are selected.

## Examples

```
cluster1::*> storage-service show
Vserver Storage Service  Description
-----
vs1
    extreme      Extreme Performance
    performance  Performance
    value        Value
3 entries were displayed.
```

The example above displays all the storage services in the cluster.

# storage commands

## storage aggregate commands

### storage aggregate add-disks

Add disks to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage aggregate add-disks` command adds disks to an existing aggregate. You must specify the number of disks or provide a list of disks to be added. If you specify the number of disks without providing a list of disks, the system selects the disks.

#### Parameters

##### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to which disks are to be added.

##### **[-diskcount <integer>] - Disk Count**

This parameter specifies the number of disks that are to be added to the aggregate.

##### **{ [-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter specifies the type of disk that is to be added. It must be specified with the `-diskcount` parameter when adding disks to a Flash Pool.

Use this parameter when adding spare SSDs to an aggregate to convert it to a Flash Pool.

Only the aggregates marked as `hybrid-enabled` can be converted to Flash Pool aggregates. Use [storage aggregate modify](#) command to mark the aggregate as `hybrid-enabled`.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`. Only disks of the specified type are considered eligible for selection.

##### **[-C, -diskclass {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

This parameter specifies the class of disk that is to be added. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- `capacity` = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- `performance` = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- `archive` = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.

- solid-state = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- array = Logical storage devices backed by storage arrays and used by ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`.

### **[`-chksumstyle <aggrChecksumStyle>`] - Checksum Style**

This parameter specifies the checksum style for the disks to be added to an aggregate. It is not applicable if `-disklist` or `-mirror-disklist` is specified. The possible values are *block* for block checksum and *advanced\_zoned* for advanced zoned checksum (AZCS). By default, disks with the same checksum style as the aggregate are selected. This behavior can be overridden by using this parameter to create a mixed checksum aggregate. A mixed checksum aggregate can support only the *block* and *advanced\_zoned* checksum styles.

### **[`-disksize <integer>`] - Disk Size(GB)**

This parameter specifies the size, in GB, of the disks that are to be added to the aggregate. Disks with a usable size between 90% and 105% of the specified size are selected.

### **[`-d`, `-disklist <disk path name>,...`] - Disks**

This parameter specifies a list of disks to be added. If you specify the `-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style, size or type.

### **[`-mirror-disklist <disk path name>,...`] - Disks for Mirrored Plex**

This parameter specifies a list of mirror disks to be added. It must contain the same number of disks specified in `-disklist` parameter. If you specify the `-mirror-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style or type.

### **{ [`-ignore-pool-checks <true>`] - Don't Enforce Plex Pool Best Practices**

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to *true*.

### **[`-f`, `-allow-mixed-rpm <true>`] - Allow Disks With Different RPM Values**

This parameter specifies whether disks that have different RPM values can be added. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to *true* and a list of disks are provided by using the `-disklist` parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

+

NOTE: This parameter is applicable only when the `-disklist` or `-mirror-disklist` parameter is used.

### **[`-allow-same-carrier <true>`] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can add a disk to an aggregate

that causes this situation, but when an alternate disk becomes available, ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow ONTAP to choose disks that need to be added to the aggregate.

This parameter affects only the add-disks operation. It is not a persistent attribute of the aggregate.

#### **| [-storage-pool <storage pool name>] - Storage Pool**

This parameter specifies the name of the SSD storage pool from which available allocation units are added to a given aggregate. This parameter cannot be used with the `-disk-list` or `-disk-count` parameters.

#### **[-allocation-units <integer>] - Allocation Units }**

This parameter specifies the number of allocation units to be added to a given aggregate from an SSD storage pool. Number of allocation units available and size of each unit can be found using the [storage pool show-available-capacity](#) command. This parameter works only when you also use the `-storage-pool` parameter.

#### **[-n, -simulate <true>] - Simulate Addition of Disks**

This parameter is used with the `disktype` and `diskcount` parameters to determine which disks would be added without actually performing the addition of disks operation.

#### **[-g, -raidgroup {new|all|<raidgroup>}] - RAID Group**

This parameter enables the administrator to specify which RAID group will receive the added disks. If this parameter is not used, the disks are added to the most recently created RAID group until it is full, then new raid groups are created and filled until all the disks are added. If a RAID group name *rgX* is specified, the disks are added to that RAID group. If *new* is specified, the disks are added to a new RAID group, even if the disks would fit into an existing RAID group. If *all* is specified, the disks are added to existing RAID groups until all existing RAID groups are full. Then ONTAP creates one or more new RAID groups and adds the remaining disks to the new groups. If the disk type or checksum style parameters are specified with this parameter, the command operates only on the RAID groups with the matching disk type or checksum style, even if *all* is specified.

#### **[-cache-raid-group-size <integer>] - RAID Group Size for Cache Tier**

This parameter specifies the maximum number of disks that can be included in an SSD RAID group for this aggregate.

This parameter is applicable only when adding SSDs for the first time to a hybrid-enabled aggregate. If this parameter is not used when the first SSDs are added to the aggregate, the maximum RAID group size for the SSD cache is set to the default SSD RAID group size for the RAID type of the SSD cache.

#### **[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

This parameter specifies the type for the new RAID groups that would be created while adding disks to the aggregate. Use this parameter when you add the first RAID group comprised of SSDs to a hybrid-enabled aggregate. The values are *raid4* for RAID4, *raid\_dp* for RAID Double Parity, and *raid\_tec* for RAID-TEC. The default value is the type of RAID groups of the aggregate, except for RAID-TEC hybrid-enabled aggregates where the SSD tier will default to *raid\_dp*. An aggregate might include a mix of different RAID types.

## Examples

The following example adds 10 disks to an aggregate named `aggr0`. The disks are added to a RAID group named `rg1`:

```
cluster1::> storage aggregate add-disks -aggregate aggr0 -diskcount 10
             -raidgroup rg1
```

In this example, an aggregate is converted to a Flash Pool aggregate using SSD capacity from a storage pool. The aggregate was created using RAID-DP for the hard disks and the SSDs are added using RAID4.

```
cluster1::> storage aggregate add-disks -aggregate FlashPool -storage-pool
SP1 -allocation-units 1 -raidtype raid4
```

## storage aggregate auto-provision

Recommend and create new aggregates in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command analyzes available spare disks in the cluster, and it provides a recommendation how spare disks should be used to create aggregates according to best practices. The command prints the summary of recommended aggregates including their names and usable size. It then prompts the user whether or not the aggregates should be created as recommended. On positive response, ONTAP creates the aggregates as described in the recommendation.

The command parameters allow to restrict the command to some nodes in the cluster, print more details about recommended aggregates, and to skip the prompt.

## Parameters

### **[`-nodes` {<nodename>|local}] - List of Nodes**

Comma separated list of node names to which the command applies. If this parameter is not used, the command applies to all nodes in the cluster.

### **[`-verbose` <true>] - Report More Details**

Report additional details about recommended aggregates and spare disks. Per node summary shows number and total size of aggregates to create, discovered spares, and also remaining spare disks and partitions after aggregate creation. RAID group layout shows how spare disks and partitions will be used in new data aggregates to be created. The last table shows spare disks and partitions remaining unused after aggregate creation.

**[`-skip-confirmation <true>`] - Skip the Confirmation and Create Recommended Aggregates**

When this parameter is used, the command automatically creates the recommended aggregates. When this parameter is not used, the command checks to proceed with aggregate creation or not.

The command is not affected by the CLI session setting: `set-confirmations on/off`.

**Examples**

```
cluster1::storage aggregate> auto-provision
Node                New Data Aggregate                Usable Size
-----
node1                node1_SSD_1                3.66TB
node2                node2_SSD_1                3.66TB

```

Details about spare disks and partitions remaining after aggregate creation:

| Disk Node | Device | Disk Or Type | Usable Size | Pool Remaining Partition Number | Spares |
|-----------|--------|--------------|-------------|---------------------------------|--------|
| node1     | SSD    | 185.5GB disk | Pool0       | 1                               |        |
| node2     | SSD    | 185.5GB disk | Pool0       | 1                               |        |

Do you want to create recommended aggregates? {y|n}: y

## storage aggregate create

### Create an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate create` command creates an aggregate. An aggregate consists of disks. You must specify the number of disks or provide a list of disks to be added to the new aggregate. If you specify the number of disks without providing a list of disks, the system selects the disks.

When creating an aggregate, you can optionally specify the aggregate's home node, the RAID type for RAID groups on the aggregate, and the maximum number of disks that can be included in a RAID group.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the name of the aggregate that is to be created.

### **[-chksumstyle <aggrChecksumStyle>] - Checksum Style**

This parameter specifies the checksum style for the aggregate. The values are *block* for Block Checksum and *advanced\_zoned* for Advanced Zoned Checksum (AZCS).

### **-diskcount <integer> - Number Of Disks**

This parameter specifies the number of disks that are to be included in the aggregate, including the parity disks. The disks in this newly created aggregate come from the pool of spare disks. The smallest disks in this pool are added to the aggregate first, unless you specify the *-disksize* parameter.

### **[-R, -diskrpm <integer>] - Disk RPM**

This parameter specifies the RPM of the disks on which the aggregate is to be created. The possible values include 5400, 7200, 10000, and 15000.

### **[-disksize <integer>] - Disk Size(GB)**

This parameter specifies the size, in GB, of the disks on which the aggregate is to be created. Disks with a usable size between 90% and 105% of the specified size are selected.

### **{ [-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter specifies the type of disk on which the aggregate is to be created.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`. Only disks of the specified type are considered eligible for selection.

### **[-C, -diskclass {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

This parameter specifies the class of disks on which the aggregate is to be created. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- `capacity` = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- `performance` = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- `archive` = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- `solid-state` = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- `array` = Logical storage devices backed by storage arrays and used by ONTAP as disks. Includes disk type LUN.
- `virtual` = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`.

### **[`-m, -mirror <true>`] - Is Mirrored**

This parameter specifies that the new aggregate be mirrored (have two plexes). If this parameter is set to *true*, the specified disks are split between the two plexes. By default, the new aggregate will not be mirrored. You cannot use the `-mirror` parameter when supplying a specific list of disks with either the `-disklist` or `-mirror-disklist` parameters.

### **[`-pool <aggrSparePool>`] - Spare Pool**

This parameter specifies the SyncMirror pool to be used to supply the disks for the aggregate. Valid values are `Pool0` or `Pool1`.

### **[`-d, -disklist <disk path name>,...`] - Disks for First Plex**

This parameter specifies a list of disks to be added to the new aggregate. If you specify the `-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You cannot use the `-disklist` parameter when the `-mirror` parameter is set to *true*.

### **[`-mirror-disklist <disk path name>,...`] - Disks for Mirrored Plex**

This parameter specifies a list of mirror disks to be added to the new mirrored aggregate. It must contain the same number of disks specified in `-disklist` parameter. If you specify the `-mirror-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You cannot use the `-mirror-disklist` parameter when the `-mirror` parameter is set to *true*.

### **[`-ignore-pool-checks <true>`] - Don't Enforce Plex Pool Best Practices**

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to *true*. This option cannot be used when the `-mirror` option is set to *true*.

### **[`-f, -allow-mixed-rpm <true>`] - Allow Disks With Different RPM Values**

This parameter specifies whether the aggregate can contain disks that have different RPM values. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to *true* and a list of disks are provided by using the `-disklist` parameter, the aggregate will be created even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

### **[`-allow-same-carrier <true>`] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You create an aggregate with this characteristic, but when an alternate disk becomes available, ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow ONTAP to choose the disks from which to create the aggregate.

This parameter affects only the aggregate creation operation. It is not a persistent attribute of the aggregate.

### **[`-node {<nodename>|local}`] - Node**

This parameter specifies the home node for the aggregate. If this parameter is not specified, ONTAP selects the node where the aggregate is created.

**-ha-policy {sfo|cfo} - HA Policy**

This parameter specifies the high-availability policy of the aggregate.

**[-s, -maxraidsize <integer>] - Max RAID Size**

This parameter specifies the maximum number of disks that can be included in a RAID group.

**[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

This parameter specifies the type for RAID groups on the aggregate. The values are *raid4* for RAID4, *raid\_dp* for RAID Double Parity, and *raid\_tec* for RAID Triple-Erasure-Code. The default setting is *raid\_dp* unless the disks are HDDs with a capacity larger than 4 TB, in which case the default will be *raid\_tec*. This parameter is not needed for array LUNs because they are always created with the *raid0* raidtype. *raid4* is not compatible with shared disks unless the shared disks belong to a storage pool.

**[-simulate <true>] - Simulate Aggregate Provisioning Operation**

This option simulates the aggregate creation and prints the layout of the new aggregate.

**[-force-small-aggregate <true>] - Force the Creation of a Small Aggregate (privilege: advanced)**

This parameter can be used to force the creation of a 2-disk RAID4 aggregates, or a 3-disk or 4-disk RAID-DP aggregate.

**[-l, -snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

This parameter specifies the type of SnapLock aggregate to be created. In order to create a SnapLock Compliance aggregate, specify *compliance*. To create a SnapLock Enterprise aggregate, specify *enterprise*.

**[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)**

This parameter specifies the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

**[-autobalance-available-threshold-percent <integer>] - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)**

This parameter specifies the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

**[-encrypt-with-aggr-key {true|false}] - Enable Aggregate level Encryption**

This parameter specifies the data encryption policy for the contained volumes. If this parameter is set to *true*, then by default, the volumes created in this aggregate will be encrypted, using the aggregate level encryption keys.

**Examples**

The following example creates an aggregate named *aggr0* on a home node named *node0*. The aggregate contains 20 disks and uses RAID-DP. The aggregate contains regular FlexVol volumes:

```
cluster1::> storage aggregate create -aggregate aggr0 -node node0
-diskcount 20 -raidtype raid_dp -volume-style flex
```

The following example creates an aggregate named `aggr0` on a home node named `node0`. The aggregate contains the disks specified and uses RAID-DP

```
cluster1::> storage aggregate create -aggregate aggr0 -node node0
-disklist 1.0.15,1.0.16,1.0.17,1.0.18,1.0.19 -raidtype raid_dp
```

The following example creates an aggregate named `aggr0` on a home node named `node0`. The aggregate contains 20 disks of size 6 TB and of type FSAS and uses RAID-TEC:

```
cluster1::> storage aggregate create -aggregate aggr0 -node node0
-diskcount 20 -raidtype raid_tec -disksize 6000 -disktype FSAS
```

The following example creates a mirrored aggregate named `aggr0` on the local node. The aggregate contains 10 disks in each plex:

```
cluster1::> storage aggregate create -aggregate aggr0 -mirror
-diskcount 20
```

## storage aggregate delete

### Delete an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate delete` command deletes a storage aggregate. The command fails if there are volumes present on the aggregate. If the aggregate has an object store attached to it, then in addition to deleting the aggregate the command deletes the objects in the object store as well. No changes are made to the object store configuration as part of this command.

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate that is to be deleted.

#### **[-preserve-config-data <true>] - Delete Physical Aggregate but Preserve Configuration Data (privilege: advanced)**

Deletes the physical aggregate, but preserves the aggregate configuration data. The aggregate must not have any disks associated with it. If the parameter `-preserve-config-data` is specified without a value, the default value is *true*; if this parameter is not specified, the default value is *false*.

### Examples

The following example deletes an aggregate named `aggr1`:

```
cluster1::> storage aggregate delete -aggregate aggr1
```

## storage aggregate mirror

### Mirror an existing aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate mirror` command adds a plex to an existing unmirrored aggregate. You can specify a list of disks to be used for the mirrored plex. If you do not specify the disks, the system automatically selects the disks based on the aggregate's existing plex.

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to mirror.

#### **[-f, -allow-mixed-rpm <true>] - Allow Disks With Different RPM Values**

This parameter specifies whether disks that have different RPM values can be used. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to *true* and a list of disks are provided by using the `-mirror-disklist` parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

+

NOTE: This parameter is only applicable when the `-mirror-disklist` parameter is used.

#### **[-d, -mirror-disklist <disk path name>,...] - Disks for Mirrored Plex**

This parameter specifies a list of disks to be used for the plex to be added. It must contain the same number of disks as the existing plex of the unmirrored aggregate specified using the `-aggregate` parameter.

#### **[-ignore-pool-checks <true>] - Don't Enforce Plex Pool Best Practices**

For maximum reliability, all disks from a plex should come from the same SyncMirror pool, and the disks for the second plex should all come from the other pool. If needed, this behavior can be overridden by setting this parameter to *true*. This parameter can be used only with the `-mirror-disklist` parameter.

#### **[-f, -allow-same-carrier <true>] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group for a mirrored aggregate. Having disks in the same carrier in the same RAID group is not desirable, because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. For this reason, this configuration is not allowed by default. This restriction can be overridden by setting this parameter to *true*.

+

NOTE: This parameter is accepted only when the `-mirror-disklist` parameter is used.

### **[-n, -simulate <true>] - Simulate Mirroring of an Existing Aggregate**

This option simulates the mirroring of an existing aggregate and prints the layout of the new plex.

### **Examples**

The following example mirrors an unmirrored aggregate `aggr1`:

```
cluster1::> storage aggregate mirror -aggregate aggr1
```

The following example mirrors an unmirrored aggregate `aggr1`. The specified disks are used for the new plex.

```
cluster1::> storage aggregate mirror -aggregate aggr1 -mirror-disklist  
1.2.12, 1.2.14, 1.2.16
```

## **storage aggregate modify**

### **Modify aggregate attributes**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage aggregate modify` command can be used to modify attributes of an aggregate such as RAID type and maximum RAID group size.

Changing the RAID type immediately changes the RAID group type for all RAID groups in the aggregate.

Changing the maximum RAID size does not cause existing RAID groups to grow or to shrink; rather, it affects the size of RAID groups created in the future, and determines whether more disks can be added to the RAID group that was most recently created.

### **Parameters**

#### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the storage aggregate that is to be modified.

#### **[-T, -disktype {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter specifies the disk type of the RAID groups to be modified. In case of Flash Pool, it specifies either the HDD tier or the SSD tier. If the HDD tier is composed of more than one type of disk, specifying any of the disk types in use causes that tier to be modified. If the current aggregate RAID type is `mixed_raid_type`, this parameter is mandatory.

#### **[-free-space-realloc {on|off}] - Free Space Reallocation**

This parameter specifies whether free space reallocation is enabled on the aggregate.

Free space reallocation optimizes the free space in an aggregate immediately before ONTAP writes data to the blocks in that aggregate.

The default setting is `off`.

#### **`[-ha-policy {sfo|cfo}] - HA Policy`**

This parameter specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support representative.

#### **`[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies`**

This parameter is used to set the space reserved for snapshots to the specified value. For example, to set the snapshot reserve to 5%, you should enter `-percent-snapshot-space 5`.

#### **`[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent`**

This optionally specifies the percentage at which the aggregate is considered nearly full, and above which an EMS warning will be generated. The default value is 93%. The maximum value for this option is 99%. Setting this threshold to 0 disables the aggregate nearly full space alerts.

#### **`[-space-full-threshold-percent <percent>] - Aggregate Full Threshold Percent`**

This optionally specifies the percentage at which the aggregate is considered full, and above which a critical EMS error will be generated. The default value is 96%. The maximum value for this option is 100%. Setting this threshold to 0 disables the aggregate full space alerts.

#### **`[-hybrid-enabled {true|false}] - Hybrid Enabled`**

If the hybrid-enabled option is set to "true", the aggregate is marked as `hybrid_enabled`, that is, the aggregate can contain a mix of SSDs and HDDs (Hard Disk Drives, e.g., SAS, SATA, and/or FC). By default, aggregates cannot be marked "hybrid\_enabled" if the aggregate contains FlexVol volumes that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in ONTAP 7. Use `-force-hybrid-enabled` to over-ride this behavior.

#### **`[-f, -force-hybrid-enabled <true>] - Force Marking of Aggregate as Hybrid Enabled`**

By default, aggregates cannot be marked "hybrid\_enabled" if the aggregate contains FlexVol volumes that cannot be write cached. A FlexVol cannot be write-cached if it is part of an aggregate created in ONTAP 7. Use `-force-hybrid-enabled` to over-ride this behavior. Note that read caching will be enabled on these FlexVol volumes, but write caching will be disabled.

#### **`[-s, -maxraidspace <integer>] - Max RAID Size`**

This parameter specifies the maximum number of disks that can be included in a RAID group for this aggregate.

For Flash Pool aggregates, this option controls the maximum size of the HDD RAID groups.

#### **`[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size`**

This parameter specifies the maximum number of disks that can be included in a SSD RAID group for this Flash Pool.

This parameter is applicable only for Flash Pool aggregates.

#### **`[-t, -raidtype {raid_tec|raid_dp|raid4|raid_ep}] - RAID Type`**

This parameter specifies the RAID type for RAID groups on the aggregate. The possible values are `raid4` for RAID4, `raid_dp` for RAID-DP, and `raid_tec` for RAID-TEC. If you change the RAID type from RAID4 to RAID-DP, each RAID group allocates a spare disk for the group's second parity disk and begins a reconstruction process. If you change the RAID type from RAID-DP to RAID-TEC, each RAID group

allocates a spare disk for the group's third parity disk and begins a reconstruction process. Changing the RAID type from RAID4 to RAID-TEC or vice-versa is not supported. To change the RAID type from RAID4 to RAID-TEC, first change from RAID4 to RAID-DP and then to RAID-TEC.

**`[-resyncsnaptime <integer>]` - SyncMirror Resync Snapshot Frequency in Minutes**

This parameter sets the mirror resynchronization snapshot frequency to be the given number of minutes. The default value is 5 (minutes).

**`[-state <aggregate state>]` - State**

This deprecated parameter specifies the state of the aggregate. The possible values are as follows:

- online - Immediately sets the aggregate online. All volumes on the aggregate are set to the state they were in when the aggregate was taken offline or restricted. The preferred command to bring an aggregate online is `storage aggregate online`.
- offline - Takes an aggregate offline. You cannot take an aggregate offline if any of its volumes are online. The preferred command to take an aggregate offline is `storage aggregate offline`.
- restricted - Restricts the aggregate. You cannot restrict an aggregate if any of its volumes are online. The preferred command to restrict an aggregate is `storage aggregate restrict`.

**`[-autobalance-unbalanced-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)**

This parameter sets the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

**`[-autobalance-available-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)**

This parameter sets the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

**`[-resync-priority {high(fixed)|high|medium|low}]` - Resynchronization Priority**

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or ONTAP system aggregates.

Possible values for this parameter are:

- high: Mirrored data aggregates with this priority value start resynchronization first.
- medium: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

**`[-single-instance-data-logging {off|on}]` - Enable SIDL**

This parameter specifies whether Single Instance Data Logging feature is enabled on the aggregate and the constituent volumes on the aggregate. This feature improves user write performance by optimizing the amount of data nvlogged by user writes on platforms where NVRAM and secondary storage are of same media type.

**`[-is-inactive-data-reporting-enabled {true|false}]` - Inactive Data Reporting Enabled**

This parameter specified whether the reporting of how much user data is inactive should be enabled on the

aggregate and volumes on the aggregate. This parameter is not allowed on FabricPools.

#### **`[-encrypt-with-aggr-key {true|false}] - Enable Aggregate level Encryption`**

This parameter specifies that the volumes within the new aggregate can be encrypted with aggregate keys. If this parameter is set to *true*, the aggregate will support encryption with aggregate keys.

#### **`[-force-disable-encrypt-with-aggr-key <true>] - Force disable NAE. Skip aggregate snapshot check.`**

This parameter allows disabling NetApp Aggregate Encryption (NAE) on an aggregate if the user is certain there is no aggregate snapshot for that aggregate containing NAE volumes. If the parameter is set to *true*, aggregate snapshot check is skipped and NAE is disabled.

#### **`[-azcs-read-optimization {on|off}] - azcs read optimization`**

This parameter specifies whether azcs read optimization is enabled on the aggregate. This feature improves read performance on cloud platforms.

### **Examples**

The following example changes all RAID groups on an aggregate named `aggr0` to use RAID-DP:

```
cluster1::> storage aggregate modify -aggregate aggr0 -raidtype raid_dp
```

The following example changes all RAID groups with FSAS disks in an aggregate named `aggr0` to use RAID-TEC:

```
cluster1::> storage aggregate modify -aggregate aggr0 -disktype FSAS  
-raidtype raid_tec
```

## **storage aggregate offline**

### **Offline an aggregate**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage aggregate offline` command takes an aggregate offline.

If you are taking a root aggregate offline, the node owning the aggregate must be in maintenance mode.

### **Parameters**

#### **`-aggregate <aggregate name> - Aggregate`**

The name of the aggregate to be taken offline.

### **Examples**

The following example takes an aggregate named `aggr1` offline:

```
cluster1::> storage aggregate offline -aggregate aggr1
```

## storage aggregate online

### Online an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage aggregate online` command brings an aggregate online if the aggregate is in offline or restricted state. If an aggregate is in an inconsistent state, it must be brought to a consistent state before it can be brought online. If you have an aggregate that is in an inconsistent state, contact technical support.

#### Parameters

**-aggregate <aggregate name> - Aggregate**

The name of the aggregate to be brought online.

#### Examples

The following example brings an aggregate named `aggr1` online:

```
cluster1::> storage aggregate online -aggregate aggr1
```

## storage aggregate remove-stale-record

### Remove a stale aggregate record

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage aggregate remove-stale-record` command removes a stale storage aggregate record on disk. A stale aggregate record refers to an aggregate that has been removed from the storage system, but whose information remains recorded on disk. Stale aggregate records are displayed in the `nodeshell aggr status -r` command, but the `storage aggregate show` command does not show the aggregate as hosted on that node.

#### Parameters

**-aggregate <aggregate name> - Aggregate (privilege: advanced)**

This parameter specifies the aggregate that corresponds to the stale aggregate record that is to be deleted.

**-nodename {<nodename>|local} - Node Name (privilege: advanced)**

This parameter specifies the node that contains the aggregate.

## Examples

The following example removes a stale aggregate record that refers to aggregate "aggr1":

```
cluster1::> storage aggregate remove-stale-record -aggregate aggr1
-nodename node1
```

## storage aggregate rename

Rename an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate rename` command renames an aggregate.

### Parameters

**-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be renamed.

**-newname <aggregate name> - New Name**

This parameter specifies the new name for the aggregate.

## Examples

The following example renames an aggregate named `aggr5` as `sales-aggr`:

```
cluster1::> storage aggregate rename -aggregate aggr5 -newname sales-aggr
```

## storage aggregate restrict

Restrict an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate restrict` command puts an aggregate in restricted state to make data in the aggregate's volumes unavailable to clients. When an aggregate is in restricted state data access is not allowed. However, few operations such as aggregate copy, parity recomputation, scrub and RAID reconstruction are allowed. You can also use this command if you want the aggregate to be the target of an aggregate copy or SnapMirror replication operation.

### Parameters

### **-aggregate <aggregate name> - Aggregate**

The name of the aggregate to be restricted.

### **Examples**

The following example restricts an aggregate named `aggr1`:

```
cluster1::> storage aggregate restrict -aggregate aggr1
```

## **storage aggregate scrub**

### **Aggregate parity scrubbing**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage aggregate scrub` command scrubs an aggregate for media and parity errors. Parity scrubbing compares the data disks to the parity disks in their RAID group and corrects the parity disks contents, as required. If no name is given, parity scrubbing is started on all online aggregates.

By default, scrubs are scheduled to run for a specified time on a weekly basis. However, you can use this command to run scrubs manually to check for errors and data inconsistencies.

### **Parameters**

#### **{ -aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be scrubbed for errors.

#### **[-plex <text>] - Plex**

This parameter specifies the name of the plex to scrub. If this parameter is not specified, the command scrubs the entire aggregate.

#### **[-raidgroup <text>] - RAID Group**

This parameter specifies the RAID group to be scrubbed. If this parameter is not specified, the command scrubs the entire aggregate.

+

NOTE: This parameter is only applicable when the `-plex` parameter is used.

#### **| -node {<nodename>|local} - Node }**

This parameter specifies the name of the node associated with the aggregate to be scrubbed. The value *local* specifies the current node.

#### **-action {start|stop|resume|suspend|status} - Action**

This parameter specifies the action to be taken. The possible actions are:

- `start` - Starts a scrub.

- stop - Permanently stops a scrub. A stopped scrub cannot be resumed.
- resume - Resumes a suspended parity scrub.
- suspend - Suspends a parity scrub.
- status - Displays the current status of a scrub.

## Examples

The following example starts a scrub on a RAID group named rg0 of plex named plex0 on an aggregate named aggr0:

```
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex
plex0 -action start
```

The following example queries the status of a scrub:

```
cluster1::> storage aggregate scrub -aggregate aggr0 -raidgroup rg0 -plex
plex0 -action status
```

```
Raid Group:/aggr0/plex0/rg0, Is Suspended:false, Last Scrub:Sun Nov 13
01:30:55 2011
, Percentage Completed:7%
```

The following example starts a scrub on plex1 of an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action
start
```

The following example queries the status of plex1 of an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -plex plex1 -action
status
```

```
Raid Group:/aggr1/plex1/rg0, Is Suspended:false, Last Scrub:Sun Nov 13
02:07:29
2011
, Percentage Completed:1%
```

The following example queries the status of all the plexes for an aggregate named aggr1:

```
cluster1::> storage aggregate scrub -aggregate aggr1 -action status

## storage aggregate show-auto-provision-progress

Display aggregate auto provision status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-auto-provision-progress` command displays the status of the most recent auto provision operation. The command output displays the progress for all the aggregates included in the provisioning operation. The command displays the following information about each aggregate:

- Aggregate
- Current Usable Size
- Target Usable Size
- Provisioning Progress

### Examples

The following example displays the information about all aggregates that are provisioned during the aggregate auto provision operation:

```

cluster1::> aggr auto-provision
Node                               New Data Aggregate          Usable Size
-----
node1                             node1_SSD_1                  23.65GB
node2                             node2_SSD_1                  23.65GB
-----
Total:                            2    new data aggregates    47.30GB

Do you want to create recommended aggregates? {y|n}: y

Info: Aggregate auto provision has started. Use the "storage aggregate
      show-auto-provision-progress" command to track the progress.

cluster1::> storage aggregate show-auto-provision-progress
Aggregate                               Current      Target
Progress                               Usable Size  Usable Size  Provisioning
-----
node1_SSD_1                           0B          23.65GB  Creating
node2_SSD_1                           0B          23.65GB  Creating

cluster1::> storage aggregate show-auto-provision-progress
Aggregate                               Current      Target
Progress                               Usable Size  Usable Size  Provisioning
-----
node1_SSD_1                           23.65GB     23.65GB  Completed
node2_SSD_1                           23.65GB     23.65GB  Completed

```

## storage aggregate show-cumulated-efficiency

Display cumulated storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-cumulated-efficiency` command displays information about the cumulated storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume

- Snapshot and FlexClone volume

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-all-details ] (privilege: advanced)**

Use this parameter to show additional Storage Efficiency Ratios and size values.

**| [-details ]**

Use this parameter to show additional Storage Efficiency Ratios.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregates <aggregate name>,...] - List of Aggregates to cumulate Storage Efficiency ratio**

If this parameter is specified, the command calculates the cumulated storage efficiency of the specified list of aggregates.

**[-nodes {<nodename>|local}] - List of Aggregates to cumulate Storage Efficiency ratio**

If this parameter is specified, the command calculates the cumulated storage efficiency of aggregates that are located on the specified list of node.

**[-total-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by volumes, clones, Snapshot copies in the Aggregate (privilege: advanced)**

Displays the total logical size used in all the specified aggregates. This includes volumes, clones, and snapshots in all the specified aggregates. The logical size is computed based on physical usage and savings obtained in all the specified aggregates.

**[-total-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used (privilege: advanced)**

Displays the physical size used by all the specified aggregates.

**[-total-storage-efficiency-ratio <text>] - Total Storage Efficiency Ratio**

Displays the total storage efficiency ratio of the aggregate.

**[-total-data-reduction-logical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used Without Snapshots (privilege: advanced)**

Displays the total logical size used in all the specified aggregates excluding snapshots.

**[-total-data-reduction-physical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used Without Snapshots (privilege: advanced)**

Displays the total physical size used by all the specified aggregates excluding snapshots.

**[-total-data-reduction-efficiency-ratio-wo-snapshots <text>] - Total Data Reduction Efficiency Ratio Without Snapshots**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection and FlexClone data reduction technologies excluding snapshots on the specified aggregates.

**[`-total-data-reduction-logical-used-wo-snapshots-flexclones` {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used without snapshots and flexclones (privilege: advanced)**

Displays the total logical size used in all the specified aggregates excluding snapshots and clones.

**[`-total-data-reduction-physical-used-wo-snapshots-flexclones` {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones (privilege: advanced)**

Displays the total physical size used by all the specified aggregates aggregates excluding snapshots and clones.

**[`-total-data-reduction-efficiency-ratio-wo-snapshots-flexclones` <text>] - Total Data Reduction Efficiency Ratio without snapshots and flexclones**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection data reduction technologies excluding snapshots on the specified aggregates.

**[`-total-performance-tier-data-reduction-physical-used-wo-snapshots-flexclones` {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones in the FabricPool Performance Tier**

Displays the total performance tier physical size used by all the specified aggregates aggregates excluding snapshots and clones.

**[`-volume-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used for All volumes (privilege: advanced)**

Displays the total logical size used by all the volumes in all the specified aggregates.

**[`-volume-physical-used` {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used for All volumes (privilege: advanced)**

Displays the total physical size used by all volumes in all the specified aggregates.

**[`-volume-dedupe-zero-pattern-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by volume Deduplication and pattern detection (privilege: advanced)**

Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files, LUNs or NVMe namespaces by all volumes in all the specified aggregates.

**[`-volume-efficiency-saved-ratio` <text>] - Volume Deduplication Savings ratio**

Displays the storage efficiency ratio for savings by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in all the specified aggregates.

**[`-volume-compression-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by volume Compression (privilege: advanced)**

Displays the total disk space that is saved by compressing blocks by all volumes in all the specified aggregates.

**[`-volume-compression-saved-ratio` <text>] - Volume Compression Savings ratio**

Displays the storage efficiency ratio for savings by compressing blocks on all volumes in all the specified aggregates.

**[`-volume-data-reduction-storage-efficiency-ratio` <text>] - Volume Data Reduction SE Ratio**

Displays the storage efficiency ratio of all the volumes in all the specified aggregates.

**[`-aggr-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate (privilege: advanced)**

Displays the logical size used by all the specified aggregates.

**[`-aggr-physical-used` {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate (privilege: advanced)**

Displays the physical size used by all the specified aggregates.

**[`-aggr-data-reduction-storage-efficiency-ratio` <text>] - Aggregate Data Reduction SE Ratio**

Displays the storage efficiency ratio of the aggregate.

**[`-snapshot-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot copies (privilege: advanced)**

Displays the logical size used by all volume snapshots residing in all the specified aggregates.

**[`-snapshot-physical-used` {<integer>[KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot copies (privilege: advanced)**

Displays the physical size used by all volume snapshots residing in all the specified aggregates.

**[`-snapshot-volume-data-reduction-storage-efficiency-ratio` <text>] - Snapshot volume Data Reduction Ratio**

Displays the snapshot volume storage efficiency ratio of the aggregate.

**[`-flexclone-volume-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone volumes (privilege: advanced)**

Displays the logical size used by all FlexClone volumes residing in all the specified aggregates.

**[`-flexclone-volume-physical-used` {<integer>[KB|MB|GB|TB|PB]}] - Physical Sized Used by FlexClone volumes (privilege: advanced)**

Displays the physical size used by all FlexClone volumes in all the specified aggregates.

**[`-flexclone-volume-data-reduction-storage-efficiency-ratio` <text>] - FlexClone volume Data Reduction Ratio**

Displays the FlexClone volume storage efficiency ratio of the aggregate.

**[`-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio` <text>] - Snapshot And FlexClone volume Data Reduction SE Ratio**

Displays the snapshot and FlexClone volume storage efficiency ratio of the aggregate.

**[`-number-of-offline-volumes` <integer>] - Number of volumes Offline**

Displays the number of volumes that are offline in all the specified aggregates.

**[`-number-of-sis-disabled-volumes` <integer>] - Number of SIS Disabled volumes**

Displays the number of volumes on which volume efficiency is disabled in all the specified aggregates.

**[`-number-of-sis-change-log-disabled-volumes` <integer>] - Number of SIS Change Log Disabled volumes (privilege: advanced)**

Displays the number of volumes on which efficiency change log is disabled in all the specified aggregates. The scheduled background Deduplication will be disabled on these volumes.

### **[-number-of-skipped-aggregates <integer>] - Number of Skipped Aggregates**

Displays the number of aggregates that were skipped for calculating the cumulated storage efficiency.

### **[-skipped-aggregates <aggregate name>,...] - List of Aggregates skipped**

Displays the list of aggregates that were skipped for calculating the cumulated storage efficiency.

## **Examples**

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster::> aggr show-cumulated-efficiency
Total Data Reduction Efficiency Ratio:  5.00:1
Total Storage Efficiency Ratio:         6.97:1

## storage aggregate show-efficiency

Display aggregate storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-efficiency` command displays information about the storage efficiency of all the aggregates. The storage efficiency is displayed at four different levels:

- Total
- Aggregate
- Volume
- Snapshot and FlexClone volume

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-advanced ] (privilege: advanced)**

Use this parameter to show additional Storage Efficiency Ratios and size values.

**| [-details ]**

Use this parameter to show additional Storage Efficiency Ratios.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Name of the Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node where Aggregate Resides**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-total-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Volumes, Clones, Snapshot Copies in the Aggregate (privilege: advanced)**

Displays the logical size used in the aggregate. This includes volumes, clones, and snapshots in the aggregate. The logical size is computed based on physical usage and savings obtained in the aggregate.

**[-total-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used (privilege: advanced)**

Displays the physical size used by the aggregate.

**[-total-storage-efficiency-ratio <text>] - Total Storage Efficiency Ratio**

Displays the total storage efficiency ratio of the aggregate.

**[-total-data-reduction-logical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used Without Snapshots (privilege: advanced)**

Displays the logical size used in the aggregate excluding snapshots.

**[-total-data-reduction-physical-used-wo-snapshots {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used Without Snapshots (privilege: advanced)**

Displays the physical size used by the aggregate excluding snapshots.

**[-total-data-reduction-efficiency-ratio-wo-snapshots <text>] - Total Data Reduction Efficiency Ratio Without Snapshots**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection and FlexClone data reduction technologies excluding snapshots on the aggregate.

**[-total-data-reduction-logical-used-wo-snapshots-flexclones {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Logical Used without snapshots and flexclones (privilege: advanced)**

Displays the logical size used in the aggregate excluding snapshots and clones.

**[`-total-data-reduction-physical-used-wo-snapshots-flexclones` {<integer>[KB|MB|GB|TB|PB]}] - Total Data Reduction Physical Used without snapshots and flexclones (privilege: advanced)**

Displays the physical size used by the aggregate excluding snapshots and clones.

**[`-total-data-reduction-efficiency-ratio-wo-snapshots-flexclones` <text>] - Total Data Reduction Efficiency Ratio without snapshots and flexclones**

Displays the total storage efficiency ratio obtained by Deduplication, Compression, Data Compaction, Pattern Detection data reduction technologies excluding snapshots and FlexClone volumes on the aggregate.

**[`-volume-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used for All Volumes**

Displays the logical size used by all the volumes in the aggregate.

**[`-volume-physical-used` {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used for All Volumes**

Displays the physical size used by all volumes in the aggregate.

**[`-volume-efficiency-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Deduplication (privilege: advanced)**

Displays the total disk space that is saved by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[`-volume-dedupe-zero-pattern-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Deduplication and pattern detection (privilege: advanced)**

Displays the total disk space that is saved by deduplication, Zero pattern detection and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[`-volume-efficiency-saved-ratio` <text>] - Volume Deduplication Savings ratio**

Displays the storage efficiency ratio for savings by deduplication and FlexClone for files, LUNs or NVMe namespaces by all volumes in the aggregate.

**[`-volume-compression-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Volume Compression (privilege: advanced)**

Displays the total disk space that is saved by compressing blocks by all volumes in the aggregate.

**[`-volume-compression-saved-ratio` <text>] - Volume Compression Savings ratio**

Displays the storage efficiency ratio for savings by compressing blocks on all volumes in the aggregate.

**[`-volume-vbn-zero-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Inline Zero Pattern Detection**

Displays the total disk space that is saved by inline zero pattern detection by all the volumes in the aggregate.

**[`-volume-data-reduction-storage-efficiency-ratio` <text>] - Volume Data Reduction SE Ratio**

Displays the storage efficiency ratio of all the volumes in the aggregate.

**[`-aggr-logical-used` {<integer>[KB|MB|GB|TB|PB]}] - Logical Space Used by the Aggregate (privilege: advanced)**

Displays the logical size used by the aggregate.

**[-aggr-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Space Used by the Aggregate (privilege: advanced)**

Displays the physical size used by the aggregate.

**[-aggr-efficiency-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Aggregate Data Reduction (privilege: advanced)**

Displays the total disk space that is saved by aggregate data reduction.

**[-aggr-data-reduction-storage-efficiency-ratio <text>] - Aggregate Data Reduction SE Ratio (privilege: advanced)**

Displays the storage efficiency ratio of the aggregate.

**[-snapshot-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by Snapshot Copies (privilege: advanced)**

Displays the logical size used by all volume snapshots residing in the aggregate.

**[-snapshot-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Size Used by Snapshot Copies (privilege: advanced)**

Displays the physical size used by all volume snapshots residing in the aggregate.

**[-snapshot-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot Volume Data Reduction Ratio**

Displays the snapshot volume storage efficiency ratio of the aggregate.

**[-flexclone-volume-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Size Used by FlexClone Volumes (privilege: advanced)**

Displays the logical size used by all FlexClone volumes residing in the aggregate.

**[-flexclone-volume-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Physical Sized Used by FlexClone Volumes (privilege: advanced)**

Displays the physical size used by all FlexClone volumes in the aggregate.

**[-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - FlexClone Volume Data Reduction Ratio**

Displays the FlexClone volume storage efficiency ratio of the aggregate.

**[-snapshot-flexclone-volume-data-reduction-storage-efficiency-ratio <text>] - Snapshot And FlexClone Volume Data Reduction SE Ratio**

Displays the snapshot and FlexClone volume storage efficiency ratio of the aggregate.

**[-number-of-offline-volumes <integer>] - Number of Volumes Offline**

Displays the number of volumes that are offline in the aggregate.

**[-number-of-sis-disabled-volumes <integer>] - Number of SIS Disabled Volumes**

Displays the number of volumes on which volume efficiency is disabled in the aggregate.

**[-number-of-sis-change-log-disabled-volumes <integer>] - Number of SIS Change Log Disabled Volumes (privilege: advanced)**

Displays the number of volumes on which efficiency change log is disabled in the aggregate. The scheduled

background Deduplication will be disabled on these volumes.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster::*> aggr show-efficiency
```

```

## storage aggregate show-resync-status

Display aggregate resynchronization status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-resync-status` command displays resync status information for each plex. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate Name
- Resyncing Plex Name
- Resyncing Percentage

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

This parameter specifies the name of the aggregate.

**[-plex <text>] - Plex Name**

This parameter specifies the name of the plex.

**[-status <text>] - Status**

Displays plex status. Possible values are:

- *normal*
- *failed*
- *empty*
- *invalid*
- *uninitialized*
- *failed assimilation*
- *limbo*
- *active*
- *inactive*
- *resyncing*

These values may appear by themselves or in combination separated by commas; for example, "*normal*

,*active*".

**`[-is-online {true|false}] - Is Online`**

Indicates whether the plex is online.

**`[-in-progress {true|false}] - Resync is in Progress`**

Indicates whether the plex is currently resyncing.

**`[-resyncing-percent <percent>] - Resyncing Percentage`**

Displays the resynchronization completion percentage if the plex is currently being resynced, '-' otherwise.

**`[-resync-level <integer>] - Resync Level`**

Displays the resync level if the plex is currently being resynced, '-' otherwise.

**`[-pool <integer>] - Pool`**

The pool number to which the majority of disks in the plex belong.

## Examples

The following example displays resynchronization status for all the aggregates:

```
cluster1::> storage aggregate show-resync-status
```

| Aggregate | Resyncing Plex | Complete Percentage |
|-----------|----------------|---------------------|
| aggr0     | plex0          | -                   |
| aggr1     | plex0          | -                   |
| aggr1     | plex1          | 10.00               |
| aggr2     | plex0          | -                   |
| aggr2     | plex2          | -                   |

5 entries were displayed.

## storage aggregate show-scrub-status

Display aggregate scrubbing status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-scrub-status` command displays the following information about the scrub status of aggregates:

- Aggregate name
- RAID groups
- Whether the scrub is suspended
- Percentage of the scrub that is completed

- Last scrub time of the aggregate

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays detailed scrub-status information about the specified aggregate.

**[-raidgroup <text>] - RAID Group**

If this parameter is specified, the command displays information only about the aggregate that contains the specified RAID group.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information only about the aggregates on the specified node. The value `local` specifies the current node.

**[-suspended {true|false}] - Is Suspended**

If this parameter is specified, the command displays information only about the aggregates that have the specified scrub-suspension state (true or false).

**[-complete-percentage <percent>] - Percentage Completed**

If this parameter is specified, the command displays information only about the aggregates whose scrubs have the specified completed percentage.

**[-last-scrub-time <MM/DD/YYYY HH:MM:SS>] - Last Scrub Time**

If this parameter is specified, the command displays information only about the aggregates that have the specified last-scrub time, in the format `MM/DD/YYYY HH:MM:SS`.

## Examples

The following example displays scrub-status information for all the aggregates:

```
cluster1:> storage aggregate show-scrub-status
Aggregate RAID Groups      Suspended  Percentage Last Scrub Time
-----
aggr0      /aggr0/plex0/rg0      true           0% 3/31/2011  21:23:02
aggr1      /aggr1/plex0/rg1      true          45% 3/30/2011  01:05:00
aggr2      /aggr2/plex0/rg0      true          33% 3/30/2011  23:43:34
aggr3      /aggr3/plex0/rg1      true          79% 3/29/2011  00:34:36
4 entries were displayed.
```

The following example displays detailed information about the aggregate named `aggr1`:

```
cluster1::> storage aggregate show-scrub-status -instance -aggregate aggr1
      Aggregate: aggr1
      RAID Group: /aggr1/plex0/rg0
      Is Suspended: false
      Percentage Completed: 2%
      Last Scrub Time: 3/31/2011 22:02:50
```

## storage aggregate show-space

Display details of space utilization within an aggregate.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-space` command displays information about space utilization within aggregates and any attached external capacity tier. The command output breaks down space usage in the specified aggregate by feature. If no parameters are specified, the command displays this information about all aggregates. Note that used percentage for an external capacity tier will be non-zero only if a size limit was set for that aggregate's attached tier.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate-name <aggregate name>] - Aggregate**

If this parameter is specified, the command displays information only about the specified aggregates.

**[-bin-num <integer>] - Bin Number**

If this parameter is specified, the command displays information only about the aggregates whose bin number for the storage tier matches the specified value. Typically, bin 0 refers to the performance tier or active file system and bin numbers greater than 0 refer to the external capacity tiers attached to the aggregate.

**[-tier-name <text>] - Tier Name For Show Command**

If this parameter is specified, the command displays information only about the aggregates whose attached storage tier name matches the specified value.

**[-aggregate <aggregate name>] - Aggregate Display Name**

If this parameter is specified, the command displays information only about space used in the specified aggregate or aggregates.

**[-aggregate-uuid <UUID>] - Uuid of the Aggregate**

If this parameter is specified, the command displays information only about the aggregates whose UUID matches the specified value.

**[-volume-footprints {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprints**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by volume footprints. A volume's footprint is the overall amount of space that a volume occupies in the aggregate, including the volume metadata and data.

**[-volume-footprints-percent <percent\_no\_limit>] - Volume Footprints Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates whose volume footprints occupy the specified percentage of space.

**[-snap-size-total {<integer>[KB|MB|GB|TB|PB]}] - Total Space for Snapshot Copies in Bytes**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate snapshots. This field includes the space that is reserved for snapshots and is not available to volumes or aggregate data and metadata. It is set to 0 by default.

**[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate snapshots.

**[-aggregate-metadata {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by aggregate metadata.

**[-aggregate-metadata-percent <percent\_no\_limit>] - Aggregate Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by aggregate metadata.

**[-used-including-snapshot-reserve {<integer>[KB|MB|GB|TB|PB]}] - Total Used**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use in the aggregate.

It is important to note that this parameter treats the entire snapshot reserve as used space since it is not available for volumes.

**[-used-including-snapshot-reserve-percent <percent\_no\_limit>] - Total Used Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use in the aggregate and its snapshot reserve.

**[-aggregate-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified size.

**[-snapshot-reserve-unusable {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Reserve Unusable**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space reserved but unusable in the volume.

snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating

space in the aggregate will make this space available.

**`[-snapshot-reserve-unusable-percent <percent_no_limit>]` - Snapshot Reserve Unusable Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space reserved but unusable.

**`[-physical-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of physical space in use by the aggregate.

This differs from *total-used* space by the space that is guaranteed for future writes. The value includes blocks in use by snapshots.

**`[-physical-used-percent <percent_no_limit>]` - Physical Used Percentage**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of physical space in use in the aggregates.

**`[-performance-tier-inactive-user-data {<integer>[KB|MB|GB|TB|PB]}]` - Performance Tier Inactive User Data**

If this parameter is specified, the command displays information only about the aggregates whose amount of inactive user data in the performance tier matches the specified value. The inactive user data can be tiered out to a capacity tier if the aggregate is a FabricPool.

**`[-performance-tier-inactive-user-data-percent <percent>]` - Performance Tier Inactive User Data Percent**

If this parameter is specified, the command displays information only about the aggregates whose percentage of inactive user data in the performance tier matches the specified value.

**`[-cross-volume-dedupe-metadata {<integer>[KB|MB|GB|TB|PB]}]` - Aggregate Dedupe Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by cross volume deduplication metadata.

**`[-cross-volume-dedupe-metadata-percent <percent_no_limit>]` - Aggregate Dedupe Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by cross volume deduplication metadata.

**`[-cross-volume-dedupe-temp-metadata {<integer>[KB|MB|GB|TB|PB]}]` - Aggregate Dedupe Temporary Metadata**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified amount of space in use by cross volume deduplication temporary metadata.

**`[-cross-volume-dedupe-temp-metadata-percent <percent_no_limit>]` - Aggregate Dedupe Temporary Metadata Percent**

If this parameter is specified, the command displays information only about the aggregate or aggregates that have the specified percentage of space in use by cross volume deduplication temporary metadata.

**`[-total-provisioned-space {<integer>[KB|MB|GB|TB|PB]}]` - Total Space Provisioned inside Aggregate**

If this parameter is specified, the command displays information about the total provisioned space across all

the volumes in the aggr.

**`[-total-provisioned-space-percent <percent_no_limit>]` - Percentage Space Provisioned inside Aggregate**

If this parameter is specified, the command displays information about the percentage of total provisioned space across all the volumes against aggr's size.

**`[-object-store-physical-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Object Store Physical Used Size**

If this parameter is specified, the command displays information only about the aggregates whose physical space use in the attached object store matches the specified value.

**`[-object-store-physical-used-percent <percent_no_limit>]` - Object Store Physical Used Percentage**

If this parameter is specified, the command displays information only about aggregates whose physical space in use in the attached object store as a percentage of the license limit matches the specified value.

**`[-object-store-referenced-capacity {<integer>[KB|MB|GB|TB|PB]}]` - Total Object Store Logical Referenced Capacity**

If this parameter is specified, the command displays information only about the aggregates whose logical reference capacity space in use in the attached object store matches the specified value.

**`[-object-store-referenced-capacity-percent <percent_no_limit>]` - Object Store Logical Referenced Capacity Percentage**

If this parameter is specified, the command displays information only about aggregates whose logical reference capacity space in use in the attached object store as a percentage of the license limit matches the specified value.

**`[-object-store-metadata {<integer>[KB|MB|GB|TB|PB]}]` - (DEPRECATED)-Object Store Metadata**

This parameter is deprecated in ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about the aggregates whose metadata space in use in the attached object store matches the specified value.

**`[-object-store-metadata-percent <percent_no_limit>]` - (DEPRECATED)-Object Store Metadata Percent**

This parameter is deprecated in ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose metadata space in use in the attached object store as a percentage of the license limit matches the specified value.

**`[-object-store-unreclaimed-space {<integer>[KB|MB|GB|TB|PB]}]` - (DEPRECATED)-Total Unreclaimed Space**

This parameter is deprecated in ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about the aggregates whose unreclaimed space in use in the attached object store matches the specified value.

**`[-object-store-unreclaimed-space-percent <percent_no_limit>]` - (DEPRECATED)-Object Store Unreclaimed Space Percentage**

This parameter is deprecated in ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose unreclaimed space in use in the attached object store as a percentage of the license limit matches the specified value.

**`[-object-store-size {<integer>[KB|MB|GB|TB|PB] } ] - Object Store Size`**

If this parameter is specified, the command displays information only about the aggregates whose attached object store size limit matches the specified value.

**`[-object-store-sis-space-saved {<integer>[KB|MB|GB|TB|PB] } ] - Object Store Space Saved by Storage Efficiency`**

If this parameter is specified, the command displays information only about the aggregates whose amount of space saved by storage efficiency matches the specified value.

**`[-object-store-sis-space-saved-percent <percent_no_limit>] - Object Store Space Saved by Storage Efficiency Percentage`**

If this parameter is specified, the command displays information only about the aggregates whose percentage of space saved by storage efficiency matches the specified value.

**`[-object-store-logical-used {<integer>[KB|MB|GB|TB|PB] } ] - Total Object Store Logical Used Size`**

If this parameter is specified, the command displays information only about the aggregates whose logical space use in the attached object store matches the specified value.

**`[-object-store-logical-used-percent <percent_no_limit>] - Object Store Logical Used Percentage`**

If this parameter is specified, the command displays information only about aggregates whose logical space in use in the attached object store as a percentage of the license limit matches the specified value.

**`[-object-store-logical-unreferenced-capacity {<integer>[KB|MB|GB|TB|PB] } ] - Object Store Logical Unreferenced Capacity`**

If this parameter is specified, the command displays information only about the aggregates whose logical unreferenced capacity in use in the attached object store matches the specified value.

**`[-object-store-logical-unreferenced-capacity-percent <percent_no_limit>] - Object Store Logical Unreferenced Percentage`**

This parameter is deprecated in ONTAP 9.10.1 and later. If this parameter is specified, the command displays information only about aggregates whose logical unreferenced capacity in use in the attached object store as a percentage of the license limit matches the specified value.

## Examples

The following example displays information about all aggregates:

```

cluster1::> storage aggregate show-space
Aggregate : aggr0
Feature                                     Used      Used%
-----
Volume Footprints                         5.75GB      91%
Aggregate Metadata                        380KB        0%
Snapshot Reserve                         325.3MB      5%
Total Used                               6.07GB      96%
Total Physical Used                       221.9MB      3%
Aggregate : aggr1
Feature                                     Used      Used%
-----
Volume Footprints                         2.03GB      33%
Aggregate Metadata                        304KB        0%
Total Used                               2.03GB      33%
Total Physical Used                       2.23MB      0%

2 entries were displayed.

```

The following example displays information about all the aggregates in a system including the ones that have an object store attached to them.

```
cluster-1::> storage aggregate show-space
Aggregate : aggr0
Feature                                         Used      Used%
-----
Volume Footprints                             2.87GB      90%
Aggregate Metadata                           328KB        0%
Snapshot Reserve                             162.6MB      5%
Total Used                                   3.03GB      95%
Total Physical Used                           2.08GB      65%
Aggregate : aggr1
Performance Tier
Feature                                         Used      Used%
-----
Volume Footprints                             1.25GB      13%

## storage aggregate show-spare-disks

### Display spare disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The command `storage aggregate show-spare-disks` displays information about spare disks. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all spare disks in the cluster.

### Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

## **| [-partition-info ] (privilege: advanced)**

Displays the following information about root-data and root-data1-data2 partitioned spares.

- Disk
- Type
- Class
- RPM
- Checksum
- Local Data Usable
- Local Data1 Usable
- Local Data2 Usable
- Local Root Usable
- Physical Size
- Status

## **| [-instance ] }**

If this parameter is specified, the command displays detailed information about each spare disk.

### **[-original-owner <text>] - Original Owner**

Selects the spare disks that match this parameter value.

### **[-disk <disk path name>] - Disk Name**

Selects the spare disks that match this parameter value.

### **[-checksum-style {advanced\_zoned | block | none}] - Checksum Style**

Selects the spare disks that match this parameter value. Possible values are:

- block — Supports block checksum
- advanced\_zoned — Supports advanced zone checksum
- none — No checksum support

### **[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects the spare disks that match this parameter value.

### **[-effective-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Effective Disk Type**

Selects the spare disks that match this parameter value.

Hard disk drives with the same `effective-disk-type` value may be mixed together in the same aggregate depending upon the system's `raid.mix.hdd.disktype.capacity` and `raid.mix.hdd.disktype.performance` option settings. Solid state drives with the same `effective-disk-type` value may be mixed together in the same aggregate depending upon the system's `raid.mix.disktype.solid_state` option setting.

**[-standard-disk-type {SATA | FC | NL-SAS | LUN | SAS | SCSI | SSD | VM-DISK | NVMe-SSD | SSD-CAP | SSD-ZNS | VM-LUN | VM-LUN-SSDS}] - Standard Disk Type**

Selects the spare disks that match this parameter value.

**[-disk-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

Selects the spare disks that match this parameter value. Possible values are:

- capacity — Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance — Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive — Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state — Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- array — Logical storage devices backed by storage arrays and used by ONTAP as disks. Includes disk type LUN.
- virtual — Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Disks with the same `disk-class` value are compatible for use in the same aggregate.

**[-disk-rpm <integer>] - Disk RPM**

Selects the spare disks that match this parameter value.

**[-effective-disk-rpm <integer>] - Effective Disk RPM**

Selects the spare disks that match this parameter value.

Hard disk drives with the same `effective-disk-rpm` value may be mixed together in the same aggregate depending upon the system's `raid.mix.hdd.rpm.capacity` and `raid.mix.hdd.rpm.performance` option settings.

**[-syncmirror-pool <text>] - Pool Number**

Selects the spare disks that match this parameter value.

**[-owner-name {<nodename>|local}] - Current Owner**

Selects the spare disks that match this parameter value.

**[-home-owner-name {<nodename>|local}] - Home Owner**

Selects the spare disks that match this parameter value.

**[-dr-owner-name {<nodename>|local}] - DR Home Owner**

Selects the spare disks that match this parameter value.

**[-usable-size-blks <integer>] - Disk Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

**[-local-usable-data-size-blks <integer>] - Local Node Data Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in 4KB blocks.

**`[-local-usable-root-size-blks <integer>]` - Local Node Root Usable Size in 4K blocks**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in 4KB blocks.

**`[-usable-size {<integer>[KB|MB|GB|TB|PB]}]` - Disk Usable Size**

Selects the spare disks that match this parameter value.

**`[-total-size {<integer>[KB|MB|GB|TB|PB]}]` - Total Size**

Selects the spare disks that match this parameter value.

**`[-local-usable-data-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Data Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data partition size (of root-data partitioned disk) or the combined data1 + data2 partition size (of root-data1-data2 partitioned disk) in auto-scaled units.

**`[-local-usable-root-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Root Usable Size**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the root partition size in auto-scaled units.

**`[-is-disk-zeroed {true|false}]` - Is Disk Zeroed?**

Selects the spare disks that match this parameter value.

When disks are zeroed, they can be provisioned directly into aggregates which avoids a lengthy zeroing process.

**`[-is-disk-zeroing {true|false}]` - Is Disk Zeroing?**

Selects the spare disks that match this parameter value.

**`[-zeroing-percent <percent>]` - Zeroing Percentage Completed**

Selects the spare disks that match this parameter value.

**`[-is-sparecore {true|false}]` - Sparecore Disk?**

Selects the spare disks that match this parameter value.

**`[-sparecore-status <Spare core status>] - Sparecore Status`**

Selects the spare disks that match this parameter value.

**`[-sparecore-percent <percent>] - Sparecore Percentage Completed`**

Selects the spare disks that match this parameter value.

**`[-is-disk-shared {true|false}] - Is Disk Shared?`**

Selects the spare disks that match this parameter value.

Shared disks have partitions that allow them to be used in multiple aggregates and between nodes in an HA pair. When set to *true*, this parameter selects shared disks in which the root partition and/or the data partition is a spare. When set to *false* only spare disks without partitions are displayed. When this parameter is not used, all spare disks are displayed.

**`[-is-disk-offline {true|false}] - Is Disk Offline?`**

Selects the spare disks that match this parameter value.

Disk offline events are typically temporary events which allow ONTAP to perform background error recovery activity.

**`[-is-disk-sick {true|false}] - Is Disk Sick?`**

Selects the spare disks that match this parameter value.

A sick disk triggers Rapid RAID Recovery to copy data to a spare drive. At the end of the process the sick disk is marked as *broken*.

**`[-is-disk-left-behind {true|false}] - Is Disk Left Behind Spare?`**

Selects the spare disks that match this parameter value.

Disks are left behind if they are not responding during a giveback or switchback event.

**`[-local-usable-data1-size-blks <integer>] - Local Node Data1 Usable Size in 4K blocks`  
(privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

**`[-local-usable-data2-size-blks <integer>] - Local Node Data2 Usable Size in 4K blocks`  
(privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

**`[-local-usable-data1-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Data1 Usable Size (privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

**`[-local-usable-data2-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Data2 Usable Size (privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

## Examples

Display spare disks owned by node *node-b*.

```
cluster1::> storage aggregate show-spare-disks -owner-name node-b
```

Original Owner: node-b

Pool0

Spare Pool

Usable Physical

| Disk | Type | Class | RPM | Checksum | Size |
|------|------|-------|-----|----------|------|
|------|------|-------|-----|----------|------|

| Size | Status |  |  |  |  |
|------|--------|--|--|--|--|
|------|--------|--|--|--|--|

|         |        |          |      |       |         |
|---------|--------|----------|------|-------|---------|
| 1.1.13  | BSAS   | capacity | 7200 | block | 827.7GB |
| 828.0GB | zeroed |          |      |       |         |

## storage aggregate show-status

### Display aggregate configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-status` command displays the RAID layout and disk configuration of aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all aggregates in the cluster.

This command does not use pagination. To reduce the output, parameter-based filtering can be used.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

This parameter currently has no effect.

**[-aggregate <text>] - Aggregate Name**

Selects the aggregates that match this parameter value.

**[-node <nodename>] - Node**

Selects the aggregates that match this parameter value.

## **[-aggregate-uuid <UUID>] - Aggregate UUID**

Selects the aggregates that match this parameter value.

### **Examples**

Display the RAID layout of a Flash Pool aggregate.

```
cluster1::> storage aggregate show-status -aggregate nodeB_flashpool_1
```

Owner Node: node-b

Aggregate: nodeB\_flashpool\_1 (online, raid\_dp, hybrid) (block checksums)

Plex: /nodeB\_flashpool\_1/plex0 (online, normal, active, pool0)

RAID Group /nodeB\_flashpool\_1/plex0/rg0 (normal, block checksums)

Usable

## storage aggregate show

Display a list of aggregates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show` command displays information about aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate name
- Size
- Available size
- Percentage used
- State
- Number of volumes
- Node on which the aggregate is located
- RAID status

To display detailed information about a single aggregate, use the `-aggregate` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-checksum ]**

If this parameter is specified, the command displays information about the checksum for all aggregates in the cluster:

- Aggregate name
- Checksum status (active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, upgrading\_phase2)
- Checksum style (none, advanced\_zoned, block, mixed, WAFL, or unknown)

**| [-disk ]**

If this parameter is specified, the command displays disk names for all aggregates in the cluster:

- Aggregate name
- Number and names of disks in the aggregate

**| [-raid-info ]**

If this parameter is specified, the command displays information about RAID groups, RAID type, maximum RAID size, checksum state, checksum style and whether the RAID status is inconsistent.

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all aggregates in the cluster.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays detailed information about the specified aggregate.

**[-storage-type {hdd | hybrid | lun | ssd | vmdisk}] - Storage Type**

If this parameter is specified, the command displays information only about the aggregates with the specified storage type. The possible values are hdd, hybrid, lun, ssd and vmdisk.

**[-checksumstyle <aggrChecksumStyle>] - Checksum Style**

If this parameter is specified, the command displays information only about the aggregates that use the specified checksum style.

**[-diskcount <integer>] - Number Of Disks**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of disks.

**[-m, -mirror <true>] - Is Mirrored**

If this parameter is specified, the command displays information only about the aggregates that have the specified mirrored value.

**[-d, -disklist <disk path name>,...] - Disks for First Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks.

**[-mirror-disklist <disk path name>,...] - Disks for Mirrored Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks present in the mirrored plex.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information only about the aggregates that are located on the specified node.

**[-free-space-realloc {on|off}] - Free Space Reallocation**

If this parameter is specified, the command displays whether free space reallocation is enabled on the specified aggregate.

**[-ha-policy {sfo|cfo}] - HA Policy**

This optionally specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support representative.

**[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the aggregates that have the specified space reserved for snapshots.

**[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified nearly full threshold percent.

**[`-space-full-threshold-percent` <percent>] - Aggregate Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified full threshold percent.

**[`-hybrid-enabled` {`true`|`false`}] - Hybrid Enabled**

If this parameter is specified, the command displays information only about the aggregates that are eligible to contain both SSD and non-SSD RAID groups.

**[`-availsize` {<integer>[`KB`|`MB`|`GB`|`TB`|`PB`]}] - Available Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified available size.

**[`-checksumenabled` {`true`|`false`}] - Checksum Enabled**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum setting.

**[`-checksumstatus` <text>] - Checksum Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum status. The possible values for checksum status include the following: active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, and upgrading\_phase2.

**[`-cluster` <text>] - Cluster**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the specified cluster. By default, only local cluster aggregates are displayed.

**[`-cluster-id` <UUID>] - Home Cluster ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the cluster specified by the cluster UUID. By default, only local cluster aggregates are displayed.

**[`-dr-home-id` <integer>] - DR Home ID**

If this parameter is specified, the command displays information only about the aggregates whose Disaster Recovery home node has the specified system ID.

**[`-dr-home-name` <text>] - DR Home Name**

If this parameter is specified, the command displays information only about the aggregates whose Disaster Recovery home is the specified node.

**[`-inofile-version` <integer>] - Inofile Version (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates whose inode files are at the specified version.

**[`-has-mroot` {`true`|`false`}] - Has Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain their owning node's management root directory.

**[`-has-partner-mroot` {`true`|`false`}] - Has Partner Node Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain the management root directory of their owning node's failover partner.

**[-home-id <integer>] - Home ID**

If this parameter is specified, the command displays information only about the aggregates whose home node has the specified system ID.

**[-home-name <text>] - Home Name**

If this parameter is specified, the command displays information only about the aggregates whose home node is the specified node.

**[-hybrid-cache-size-total {<integer>[KB|MB|GB|TB|PB]}] - Total Hybrid Cache Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified total cache size in a Flash Pool.

**[-hybrid {true|false}] - Hybrid**

If this parameter is specified, the command displays information only about the aggregates that currently contain both SSD and non-SSD RAID groups.

**[-inconsistent {true|false}] - Inconsistent**

If this parameter is specified, the command displays information only about the aggregates that have the specified consistency.

**[-is-home {true|false}] - Is Aggregate Home**

If this parameter is specified, the command displays information only about the aggregates whose home node and owner node have the same system ID.

**[-s, -maxraidsize <integer>] - Max RAID Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified maximum number of disks for RAID groups.

For Flash Pool aggregates, this option controls the maximum size of the HDD RAID groups.

**[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size**

If this parameter is specified, the command displays information about the maximum RAID group size for the SSD tier for Flash Pool aggregates.

This parameter is applicable only for Flash Pool aggregates.

**[-owner-id <integer>] - Owner ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by the node with the specified system ID.

**[-owner-name <text>] - Owner Name**

If this parameter is specified, the command displays information only about the aggregates that are owned by the specified node.

**[-percent-used <percent>] - Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size, as a percentage.

**[-plexes <text>,...] - Plexes**

If this parameter is specified, the command displays information only about the aggregates that have the specified plex or plexes.

**[-raidgroups <text>,...] - RAID Groups**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID group or groups.

**[-raidstatus <text>] - RAID Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID status. The possible values for RAID status are normal, copying, ironing, degraded, mirror degraded, growing, initializing, invalid, needs check, partial, reconstruct, raid4, raid0, raid\_dp, raid\_tec, redirect, and waf1 inconsistent. You can specify multiple values (for example, reconstruct and growing).

**[-t, -raidtype {raid\_tec|raid\_dp|raid4|raid\_ep}] - RAID Type**

If this parameter is specified, the command displays information only about the aggregates that use the specified RAID type. The possible values are *raid0* for RAID 0, *raid4* for RAID4, *raid\_dp* for RAID-DP, *raid\_tec* for RAID-TEC, and *mixed\_raid\_type* for aggregates that include a mix of RAID types.

**[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes**

If this parameter is specified, the command displays information only about the aggregates whose SyncMirror Resynchronization Snapshot Frequency is the specified value.

**[-root {true|false}] - Is Root**

If this parameter is specified, the command displays information about only the root aggregates in the cluster.

**[-sis-metadata-space-used {<integer>[KB|MB|GB|TB|PB]}] - Space Used by Metadata for Volume Efficiency**

If this parameter is specified, the command displays information about only the aggregates with the specified space used by A-SIS metafiles for volume efficiency. This parameter is deprecated in ONTAP 8.2 and later. Use the volume-footprint-list-info API for details related to space usage by deduplication metadata.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified size. The size of the aggregate is reported as the size available for use by WAFL, excluding WAFL reserve and aggregate snapshot reserve capacity. Use the [storage aggregate show-space](#) command to see the details of space utilization within an aggregate.

**[-state <aggregate state>] - State**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-usedsize {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size.

**[-uses-shared-disks {true|false}] - Uses Shared Disks**

Selects the aggregates that match this parameter value. This parameter is used to list all the aggregates that use shared HDDs or shared SSDs.

**[-uuid <text>] - UUID String (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate that has the specified UUID. This parameter is available only at the advanced privilege level and higher.

**[-volcount <integer>] - Number Of Volumes**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of volumes.

**[-autobalance-state <Auto Balance Aggregate state>] - State of the aggregate being balanced (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used size. This differs from *total-used* space by the space that is guaranteed for future writes. The value includes blocks in use by snapshots.

**[-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used percent.

**[-autobalance-state-change-counter <integer>] - State Change Counter for Auto Balancer (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of state change caused by the Auto Balance Aggregate feature.

**[-L, -snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays information only about the aggregates that have the specified snaplock-type.

**[-is-nve-capable {true|false}] - Is NVE Capable**

This parameter indicates whether or not the aggregate is capable of supporting NVE (NetApp volume encryption).

**[-is-cft-precommit {true|false}] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)**

Selects the aggregates that are set with this parameter value. This parameter lists all the aggregates that are in the precommit phase of a Copy-Free Transition workflow.

**[-is-transition-out-of-space {true|false}] - Is a 7-Mode transitioning aggregate that is not yet committed in clustered Data ONTAP and is currently out of space (privilege: advanced)**

Selects the aggregates that match this parameter value. This parameter is used to list all the 7-mode transitioning aggregates that are not yet committed in ONTAP, and are currently out of space.

**[-autobalance-unbalanced-threshold-percent <integer>] - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified unbalanced threshold percentage.

**`[-autobalance-available-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified available threshold percentage.

**`[-resync-priority {high(fixed)|high|medium|low}]` - Resynchronization Priority**

This parameter indicates the relative priority that is used to decide whether a mirrored aggregate can start a resynchronization operation or not. This field is not set for unmirrored aggregates.

Use the [storage aggregate resynchronization modify](#) command to modify this field for mirrored aggregates.

The valid values for this field are:

- `high(fixed)`: This value is reserved for ONTAP system aggregates, which cannot have any other value for this field. It cannot be explicitly set on a data aggregate. These aggregates always start their resynchronization operation at the first available opportunity.
- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- `low`: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

**`[-data-compaction-space-saved {<integer>[KB|MB|GB|TB|PB]}]` - Space Saved by Data Compaction**

This parameter indicates the amount of the space saved by Data Compaction in bytes.

**`[-data-compaction-space-saved-percent <percent>]` - Percentage Saved by Data Compaction**

This parameter indicates the percentage of space saved in the aggregate by Data Compaction.

**`[-data-compacted-count {<integer>[KB|MB|GB|TB|PB]}]` - Amount of compacted data**

This parameter indicates the number of bytes occupied by compacted data inside this aggregate.

**`[-creation-timestamp <MM/DD/YYYY HH:MM:SS>]` - Timestamp of Aggregate Creation**

This parameter indicates the date and time the aggregate was created.

**`[-single-instance-data-logging {off|on}]` - Enable SIDL**

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified aggregate.

**`[-composite {true|false}]` - Composite**

If this parameter is specified, the command displays information only about aggregates whose classification as a FabricPool matches the specified value. A FabricPool has an external capacity tier attached to it.

**`[-is-fabricpool-mirrored {true|false}]` - Is FabricPool Mirrored**

If this parameter is specified, the command displays information only about FabricPools whose classification as mirrored matches the specified value. A mirrored FabricPool has a second external capacity tier attached to it.

**[`-composite-capacity-tier-used` {<integer>[KB|MB|GB|TB|PB]}] - Capacity Tier Used Size**

If this parameter is specified, the command displays the amount of space in use in the attached external capacity tier.

**[`-sis-space-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Storage Efficiency**

This parameter indicates the total amount of space saved by storage efficiency in bytes.

**[`-sis-space-saved-percent` <percent>] - Percentage of Space Saved by Storage Efficiency**

This parameter indicates the percentage of space saved by storage efficiency.

**[`-sis-shared-count` {<integer>[KB|MB|GB|TB|PB]}] - Amount of Shared bytes count by Storage Efficiency**

This parameter indicates the number of bytes shared by storage efficiency.

**[`-is-inactive-data-reporting-enabled` {true|false}] - Inactive Data Reporting Enabled**

If this parameter is specified, the command displays whether reporting of inactive user data is enabled. This parameter is not allowed on FabricPools

**[`-inactive-data-reporting-start-timestamp` <MM/DD/YYYY HH:MM:SS>] - Timestamp when Inactive Data Reporting was Enabled**

If this parameter is specified, the command displays the timestamp at which inactive data reporting was enabled on the aggregate. This parameter is not allowed on FabricPools.

**[`-encrypt-with-aggr-key` {true|false}] - Enable Aggregate level Encryption**

Selects the aggregates that are encrypted with aggregate keys.

**[`-drive-protection-enabled` {true|false}] - Aggregate uses data protected SEDs**

If this parameter is specified, the command displays whether this aggregate is entirely composed of self-encrypting drives that have data protection enabled.

**[`-azcs-read-optimization` {on|off}] - azcs read optimization**

If this parameter is specified, the command displays whether azcs-with-compression feature is enabled.

**[`-space-required-for-revert` {<integer>[KB|MB|GB|TB|PB]}] - Metadata Reserve Space Required For Revert (privilege: advanced)**

If this parameter is specified, the command displays the additional amount of free space needed for metadata reserve in the aggregate if the system is required to revert to an ONTAP release earlier than 9.11.1x.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster1::> storage aggregate show
```

| Aggregate<br>Status                | Size    | Available | Used% | State  | #Vols | Nodes       | RAID   |
|------------------------------------|---------|-----------|-------|--------|-------|-------------|--------|
| aggr0<br>raid_dp,                  | 6.21TB  | 1.78TB    | 71%   | online | 49    | cluster1-01 | normal |
| aggr1<br>raid_dp,<br><br>mirrored, | 56.04MB | 55.89MB   | 0%    | online | 0     | cluster1-02 | normal |
| aggr2<br>raid_dp,                  | 1.77TB  | 1.63TB    | 8%    | online | 1     | cluster1-01 | normal |
| aggr3<br>raid_dp,                  | 1.77TB  | 1.73TB    | 2%    | online | 2     | cluster1-02 | normal |

4 entries were displayed.

The following example displays information about an aggregate name aggr1:

```
cluster1::> storage aggregate show -aggregate aggr1
```

```

Aggregate: aggr1
Checksum Style: block
Number Of Disks: 6
Mirror: true
Nodes: cluster1-02
Disks for First Plex: 1.1.2,
                      1.1.10,

## storage aggregate verify

### Verify an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate verify` command verifies the two plexes of an aggregate. It compares the data in the two plexes to ensure that the plexes are identical. It can be used whenever the administrator needs to ensure that the two plexes are completely synchronized with each other. To view any discrepancies, use the following command:

```
event log show -message-name raid.mirror.verify.mismatch
```

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be verified. If no aggregate is specified then the action specified by the parameter `-action` will be taken on all the aggregates.

#### **-action {start|stop|resume|suspend|status} - Action**

This parameter specifies the action to be taken. The possible actions are:

- `start` - Starts a verify.
- `stop` - Permanently stops a verify. A stopped verify cannot be resumed.
- `resume` - Resumes a suspended verify.
- `suspend` - Suspends a verify.
- `status` - Displays the current status of a verify.

#### **[-plex-to-fix <text>] - Plex to be Corrected in Case of Mismatches**

This parameter specifies the name of a plex to fix in case the two plexes of the aggregate do not match. The default behavior is to log any discrepancies instead of fixing them.

This parameter is only applicable when the command is used to start a verify.

### Examples

The following example starts a verify on an aggregate named `aggr1`.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action start
```

The following example queries the status of a verify on an aggregate named aggr1.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action status
Aggregate:aggr1, Is Suspended:false, Percentage Completed:19.03%
```

The following example starts a verify on all the aggregates.

```
cluster1::> storage aggregate verify -action start
```

## storage aggregate efficiency show

### Display aggregate storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage aggregate efficiency show` command displays information about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

- Aggregate
- Node
- Cross-vol-background-dedupe State (Enabled, Disabled)
- Cross-vol-inline-dedupe State (Enabled, Disabled)

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-cross-volume-background-dedupe {true|false}] - Cross Volume Background Deduplication**

Displays whether the cross volume background deduplication is enabled/disabled in the aggregate.

### **`[-cross-volume-inline-dedupe {true|false}]` - Cross Volume Inline Deduplication**

Displays whether the cross volume inline deduplication is enabled/disabled in the aggregate.

### **`[-cross-volume-dedupe-savings {true|false}]` - Has Cross Volume Deduplication Savings**

Displays whether the aggregate may have savings from cross volume deduplication.

### **`[-auto-adaptive-compression-savings {true|false}]` - Has Auto Adaptive Compression Savings**

Displays whether the aggregate may have auto adaptive compression savings.

## **Examples**

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency show

Aggregate: aggr0
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:           false
Cross Volume Background Deduplication:            false
Cross Volume Inline Deduplication:                 false

Aggregate: aggr1
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:           true
Cross Volume Background Deduplication:            true
Cross Volume Inline Deduplication:                 true
2 entries were displayed.
```

## **storage aggregate efficiency stat**

Display aggregate storage efficiency statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage aggregate efficiency stat` command displays storage efficiency statistics.

### **Parameters**

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays storage efficiency statistics for the specified aggregate.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays storage efficiency statistics for the aggregates that are located on the specified node.

**[-total-blocks-recompressed <integer>] - Total Number of Blocks Recompressed**

This field represents the total number of blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

**[-active-blocks-recompressed <integer>] - Number of Active Blocks Recompressed**

This field represents the total number of hot blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

**[-inactive-blocks-recompressed <integer>] - Number of Inactive Blocks Recompressed**

This field represents the total number of cold blocks recompressed. If this parameter is specified, the command displays storage efficiency statistics that match the specified block count.

## Examples

The following example displays storage efficiency statistics for all the aggregates that are owned by nodes in the local cluster:

```
cluster1::> storage aggregate efficiency stat
Aggregate: aggr1
                                         Node: node1
    Total Number of Blocks Recompressed: 512
      Number of Active Blocks Recompressed: 120
      Number of Inactive Blocks Recompressed: 392
Aggregate: aggr2
                                         Node: node1
    Total Number of Blocks Recompressed: 0
      Number of Active Blocks Recompressed: 0
      Number of Inactive Blocks Recompressed: 0

2 entries were displayed.
```

## storage aggregate efficiency cross-volume-dedupe revert-to

Reverts the cross volume deduplication savings on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate cross-volume-dedupe revert-to` command is used to revert cross volume deduplication savings on an aggregate.

## Parameters

### **-aggregate <aggregate name> - Aggregate (privilege: advanced)**

This specifies the aggregate on which cross volume deduplication savings should be reverted. If no aggregate is specified then it will revert the savings on all aggregates

### **[-c, -clean-up {true|false}] - Delete Previously Downgraded Metafiles (privilege: advanced)**

This specifies whether downgrade metafile needs to be removed so that other efficiency operations can start on that aggregate.

## Examples

The following example displays information for reverting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to
-aggregate aggr1
The revert operation started on aggregate "aggr1".

cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to
-aggregate aggr1 -clean-up true
The revert operation started on aggregate "aggr1".
```

## storage aggregate efficiency cross-volume-dedupe show

Display aggregate cross volume deduplication efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate efficiency cross-volume-dedupe show` command displays information in detail about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-background-progress <text>] - Progress**

Displays the information for the aggregates that match the specified progress.

**[-background-op-status <text>] - Operation Status**

Displays the information for the aggregates that match the specified operation status.

**[-background-last-op-state <text>] - Last Operation State**

Displays the information for the aggregates that match the specified last operation state.

**[-background-last-success-op-begin <Date>] - Last Success Operation Begin Time**

Displays the information for the aggregates that match the specified last successful operation begin time.

**[-background-last-success-op-end <Date>] - Last Success Operation End Time**

Displays the information for the aggregates that match the specified last successful operation end time.

**[-background-last-op-begin <Date>] - Last Operation Begin Time**

Displays the information for the aggregates that match the specified last operation begin time.

**[-background-last-op-end <Date>] - Last Operation End Time**

Displays the information for the aggregates that match the specified last operation end time.

**[-background-last-op-error <text>] - Last Operation Error**

Displays the information for the aggregates that match the specified last operation error.

**[-background-stage <text>] - Stage**

Displays the information for the aggregates that match the specified stage.

**[-background-checkpoint-time <Date>] - Checkpoint Time**

Displays the information for the aggregates that match the specified checkpoint time.

**[-background-checkpoint-op-type <text>] - Checkpoint Operation Type**

Displays the information for the aggregates that match the specified checkpoint operation type.

**[-background-checkpoint-stage <text>] - Checkpoint Stage**

Displays the information for the aggregates that match the specified checkpoint stage.

**[-background-dedupe {true|false}] - Background State**

Displays the information for the aggregates that match the specified cross volume background dedupe state.

### **`[-inline-dedupe {true|false}] - Inline State`**

Displays the information for the aggregates that match the specified cross volume inline dedupe state.

### **`[-dedupe-savings {true|false}] - Has Cross Volume Deduplication Savings`**

Displays the information for the aggregates that has some savings from cross volume deduplication.

## **Examples**

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency cross-volume-dedupe show

Aggregate: aggr0
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:                                false

-----:Cross Volume Background Deduplication Status:-----

## storage aggregate efficiency cross-volume-dedupe start

Starts the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate efficiency cross-volume-dedupe start` command is used to start cross volume background deduplication on an aggregate.

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This specifies the aggregate on which cross volume background deduplication should be started. If no aggregate is specified then it will start on all aggregates

#### **[-s, -scan-old-data <true>] - Scan Old Data**

This option processes all the existing data on all volumes on the aggregate. It prompts for user confirmation before proceeding. Default value is `false`.

### Examples

The following example displays information for starting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe start
-aggregate aggr1
The efficiency operation on aggregate "aggr1" has started.

cluster:::> storage aggregate efficiency cross-volume-dedupe start
-aggregate aggr1 -scan-old-data true
The efficiency operation on aggregate "aggr1" has started.
```

## storage aggregate efficiency cross-volume-dedupe stop

Stops the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate cross-volume-dedupe stop` command is used to stop cross volume background deduplication on an aggregate.

### Parameters

**-aggregate <aggregate name> - Aggregate (privilege: advanced)**

This specifies the aggregate on which cross volume background deduplication should be stopped. If no aggregate is specified then it will stop on all aggregates

### Examples

The following example displays information for stopping cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe stop
-aggregate aggr1
The efficiency operation on aggregate "aggr1" is being stopped.
```

## storage aggregate encryption show-key-id

Display encrypted aggregate information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate encryption show-key-id` command displays the key IDs of all NAE (NetApp Aggregate Encryption) aggregates.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate**

If this parameter is specified, the command displays information only about the specific NAE (NetApp Aggregate Encryption) aggregate.

**[-aggrID <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays the key ID of the specified NAE (NetApp Aggregate Encryption) aggregate ID.

**[-keyid-index-zero <text>,...] - 0th Index Keyid**

If this parameter is specified, the command displays the 0th index key ID of NAE (NetApp Aggregate Encryption) aggregates.

## storage aggregate flexaggr show

Display the list of aggregates and their defunct state

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate flexaggr show` command displays information about FlexAggrs. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate name
- State
- Nodes
- Is Root Aggregate
- Flexible Aggregate ID
- Flexible Aggregate State
- Is Home Node Unavailable
- Is Defunct

To display detailed information about a single aggregate, use the `-aggregate` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays information only about the aggregate that has the specified name.

**[-flexaggr-id <integer>] - FlexAggr ID**

If this parameter is specified, the command displays information only about the aggregates that have the specified Flexible Aggregate ID.

**[-state <aggregate state>] - State**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-nodes {<nodename>|local}] - Node**

If this parameter is specified, the command displays information only about the aggregates from the specified node.

**Examples**

The following example displays information about all Flexible Aggregates:

```
cluster1::> aggr flexaggr show
Aggregate          State   Node           Root  FA Id  FA State  HomeUn
Dfnct
-----
dataFA_2_p0_i1     online  node-vs1m1     false    2  completed  false
false
dataFA_4_p0_i1     online  node-vs1m1     false    4  completed  false
true
rootFA_1_p0_i1     online  node-vs1m1     true     1  completed  -
false
rootFA_3_p0_i1     online  node-vs1m1     true     3  completed  false
true
4 entries were displayed.
```

**storage aggregate inode-upgrade resume**

Resume suspended inode upgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate inode-upgrade resume` command resumes a suspended inode upgrade process. The inode upgrade process might have been suspended earlier due to performance reasons.

## Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

If this parameter is specified, the command resumes the upgrade process of an aggregate that is located on the specified node.

**-aggregate <aggregate name> - Aggregate Name (privilege: advanced)**

This specifies the aggregate for which the inode upgrade process is to be resumed.

## Examples

The following example resumes an aggregate upgrade process:

```
cluster1::> storage aggregate inode-upgrade resume -aggregate aggr1
```

## storage aggregate inode-upgrade show

Display inode upgrade progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate inode-upgrade show` command displays information about aggregates undergoing the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all aggregates undergoing the inode upgrade process. The default fields are:

- aggregate
- status
- scan-percent
- remaining-time
- space-needed
- scanner-progress

## Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-aggregate <text>] - Aggregate Name (privilege: advanced)**

If this parameter is specified with the `-node` parameter, the command displays detailed information about the specified aggregate. If only this parameter is specified, the command displays information about all aggregates that match the specified name.

### **[-node <nodename>] - Node Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that are located on the specified node.

### **[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade status.

### **[-scan-percent <percent>] - Upgrade Scan Percent Complete (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade progress percentage.

### **[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the space needed to complete the upgrade process matches the specified size.

### **[-remaining-time [<integer>d][<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the remaining time to complete the inode upgrade process matches the specified time.

### **[-scanner-progress <text>] - Scanner Progress (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the progress of the inode upgrade process matches the input.

## **Examples**

The following example displays information about all aggregates undergoing the inode upgrade process:

```
cluster1::> storage aggregate inode-upgrade show
Aggregate Status      %Complete Time Remaining Space Needed Inode Progress
-----
aggr0      pending      0%         -                20.36MB      Public : Inode 0
out of 65562
aggr1      pending      0%         -                19.84MB      Public : Inode 0
out of 63714
```

## **storage aggregate object-store attach**

Attach an object store to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store attach` command attaches an object store to an aggregate to create a FabricPool. This command requires two parameters to create a FabricPool - an aggregate and a configuration to attach an object-store to the aggregate. This command verifies whether the object store is accessible through the intercluster LIF both from the node on which the aggregate is present as well as its High Availability (HA) partner node. The command fails if the object store is not accessible.

Once an object store is attached to an aggregate, it cannot be detached.

## Parameters

### **-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate to which the object store must be attached to create a FabricPool.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store to be attached. The object store configuration has information about object store server name, port, access credentials, and provider type.

### **[-allow-flexgroup {true|false}] - Allow Existing FlexGroup Constituents in the Aggregate on Attach**

This optional parameter allows attaching object store to an aggregate already containing FlexGroup constituents. The default value is false. Mixing FabricPools and non-FabricPools within a FlexGroup is not recommended. All aggregates hosting constituents of a FlexGroup should be attached to the object store.

## Examples

The following example attaches an object store to aggregate `aggr1`:

```
cluster1::>storage aggregate object-store attach -aggregate aggr1 -object
-store-name my-store
```

## storage aggregate object-store mirror

Attaches a second object store to a FabricPool aggregate to create a mirror

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store mirror` command attaches a second object store to a FabricPool aggregate to create a mirror. This command verifies whether the object store is accessible through the intercluster LIF from both the node on which the aggregate is present and from its high-availability (HA) partner node. The command fails if the object store is not accessible.

## Parameters

### **-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate to which the object store must be attached in order to create a mirror.

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name of the new object store configuration to be attached to the aggregate. The object store configuration has information about the object store server name, port, access credentials, and provider type.

## Examples

The following example shows how to create a mirror to aggregate aggr1:

```
cluster1::>storage aggregate object-store mirror -aggregate aggr1 -object
-store-name my-store-2
```

## storage aggregate object-store modify

Modify attributes of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store modify` command is used to update one or more object store parameters.

## Parameters

### **-aggregate <text> - Aggregate Name**

This parameter identifies the aggregate to which the object store to be modified is attached.

### **-object-store-name <text> - ONTAP Name for this Object Store Config**

This parameter identifies the configuration name of the object store to be modified.

### **[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space (privilege: advanced)**

This optional parameter specifies the usage threshold below which ONTAP reclaims unused space from objects in the object store. When ONTAP writes data to the object store, it packages multiple file system blocks into one object. Over time, blocks stored in an object can be freed, leaving part of the object unused. When the percentage of used blocks in an object falls below this threshold, a background task moves the blocks which are still used to a new object. Afterwards, ONTAP frees the original object to reclaim the unused space. Valid values are between 0% and 99%. The default value depends on the object store's provider type. It is 20% for *AWS\_S3*, 25% for *Azure\_Cloud*, 40% for *SGWS*, 20% for *IBM\_COS*, 20% for *AliCloud*, 20% for *GoogleCloud* and 40% for *ONTAP\_S3*. Consult the FabricPool best practices guidelines for more information.

**[`-tiering-fullness-threshold <percent>`] - Aggregate Fullness Threshold Required for Tiering (privilege: advanced)**

This optional parameter specifies the percentage of space in the performance tier which must be used before data is tiered out to the capacity tier.

**[`-mirror-type {primary|mirror}`] - Object Store Mirror Type**

This parameter specifies the object store mirror type. Valid mirror types are *primary* or *mirror*.

**[`-force-tiering-on-metrocluster {true|false}`] - Force Tiering with no Mirror in a MetroCluster Configuration**

This parameter specifies force tiering option enabled or not on primary object stores for aggregates in a MetroCluster configuration.

**[`-migrate-threshold <percent>`] - Minimum Aggregate Space Threshold (privilege: advanced)**

This optional parameter specifies the minimum percentage of performance tier free space that must exist in order for migration of data from the capacity tier to performance tier to be allowed.

## Examples

The following example modifies the unreclaimed space threshold of an object store attached to an aggregate named `aggr1`:

```
cluster1::> storage aggregate object-store modify -aggregate aggr1 -object
-store-name my-store -unreclaimed-space-threshold 20%
```

## storage aggregate object-store show-freeing-status

Show status of background object freeing work after aggregate delete

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate object-store show-freeing-status` command displays status information about the background work that frees an aggregate's objects from an object store after a [storage aggregate delete](#).

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance`] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-bin-uuid <UUID>`] - UUID of the Bin (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate attached to the specified bin UUID.

**[`-config-id <integer>`] - Object Store Config ID (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate attached to the object- store with specified config ID.

**[`-object-store-name <text>`] - Object Store Configuration Name (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[`-aggregate-name <aggregate name>`] - Aggregate (privilege: advanced)**

If this parameter is specified, the command displays information only about the specified aggregates that were deleted.

**[`-request-state {queued|running|cleaning-up|finishing}`] - Request State (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified object freeing request state.

**[`-num-objects-freed <integer>`] - Num Objects Freed (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified number of objects that have been freed.

**[`-last-error <text>`] - The Last Error Encountered (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified last error encountered.

## Related Links

- [storage aggregate delete](#)

## storage aggregate object-store show-resync-status

Display object store mirror resync progress

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store show-resync-status` command displays information about the resync progress for mirror object stores attached to a FabricPool.

## Parameters

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-aggregate <aggregate name>`] - Aggregate**

If this parameter is specified, the command displays information only about the specified aggregates.

### **[`-primary-object-store-name <text>`] - Primary Object Store Name**

If this parameter is specified, the command displays information only about aggregates whose primary object store configuration name matches the specified names.

### **[`-mirror-object-store-name <text>`] - Mirror Object Store Name**

If this parameter is specified, the command displays information only about aggregates whose mirror object store configuration name matches the specified names.

### **[`-percent-complete <percent>`] - Resync Complete Percentage**

If this parameter is specified, the command displays information only about aggregates whose mirror object store resync progress percentage matches the specified value.

## **Examples**

The following example displays resync progress for all aggregates with mirror object stores which are not in sync:

```
cluster1::>storage aggregate object-store show-resync-status
```

## **storage aggregate object-store show-space**

Display space utilization of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The ``storage aggregate object-store show-space`` command displays information about the amount of space used in the object store for each of the aggregates in FabricPool. The used space is displayed in both absolute size as well as a percentage of the FabricPool license limit.

## **Parameters**

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-aggregate <text>`] - Aggregate Name**

If this parameter is specified, the command displays space information only about object stores that are attached to the specified aggregates.

### **[`-object-store-name <text>`] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays space information only about object stores whose

configuration name matches the specified names.

**[-object-store-availability <object store availability>] - Availability of the Object Store**

If this parameter is specified, the command displays space information about the object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

**[-object-store-unavailable-reason <text>] - Reason why Object Store is Unavailable**

If this parameter is specified, the command displays information only about object stores whose unavailability reason matches the specified reason.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays space information only about object stores whose space used by the associated aggregate as a percentage of the license limit matches the specified value. If the object store does not require a license, then this field is not set.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose performance tier fullness threshold for tiering matches the specified value.

**[-mirror-type {primary|mirror}] - Object Store Mirror Type**

If this parameter is specified, the command displays information about object stores with a mirror-type that matches the specified value.

**[-is-mirror-degraded {true|false}] - This object store is in mirror degraded mode**

If this parameter is specified, the command displays information only about mirror object stores which have the specified mirror degraded state.

**[-force-tiering-on-metrocluster {true|false}] - Force Tiering with no Mirror in a MetroCluster Configuration**

If this parameter is specified, the command displays information only about primary object stores for which force tiering is toggled on for aggregates in a MetroCluster configuration.

**[-cluster <Cluster name>] - The name of the Cluster to which the bin belongs**

If this parameter is specified, the command displays information only about object stores for which cluster matches the specified value.

**[-migrate-threshold <percent>] - Minimum Aggregate Space Threshold (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose performance tier migrate threshold matches the specified value.

## Examples

The following example displays space information about all object stores:

```
cluster1::>storage aggregate object-store show-space
```

## storage aggregate object-store show

Display the details of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store show` command displays information about all the object stores in the system.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified, the command displays information only about the object stores that are attached to the specified aggregates.

**[-object-store-name <text>] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[-object-store-availability <object Store Availability>] - Availability of the Object Store**

If this parameter is specified, the command displays information only about object stores whose availability status matches the specified value. Supported values with this parameter are - *available* and *unavailable*.

**[-object-store-unavailable-reason <text>] - Reason why Object Store is Unavailable**

If this parameter is specified, the command displays information only about object stores whose unavailability reason matches the specified reason.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays information only about object stores whose space used

by the aggregate as a percentage of the license limit matches the specified value.

**`[-unreclaimed-space-threshold <percent>]` - Threshold for Reclaiming Unreferenced Space (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**`[-tiering-fullness-threshold <percent>]` - Aggregate Fullness Threshold Required for Tiering (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose performance tier fullness threshold for tiering matches the specified value.

**`[-mirror-type {primary|mirror}]` - Object Store Mirror Type**

If this parameter is specified, the command displays information about object stores with a mirror-type that matches the specified value.

**`[-is-mirror-degraded {true|false}]` - This object store is in mirror degraded mode**

If this parameter is specified, the command displays information only about mirror object stores which have the specified mirror degraded state. When a mirror object store is attached to a FabricPool, it is initially degraded because it does not contain a copy of all the data in the primary object store. While the mirror is degraded, all reads are served from the primary object store, and the mirror cannot be promoted to become the primary. After the resync process copies all data from the primary object store to the mirror, the mirror is no longer degraded. From that point on the mirror is always kept in sync with the primary and never becomes degraded again.

**`[-force-tiering-on-metrocluster {true|false}]` - Force Tiering with no Mirror in a MetroCluster Configuration**

If this parameter is specified, the command displays information only about primary object stores for which force tiering is toggled on for aggregates in a MetroCluster configuration.

**`[-cluster <Cluster name>]` - The name of the Cluster to which the bin belongs**

If this parameter is specified, the command displays information only about object stores for which cluster matches the specified value.

**`[-migrate-threshold <percent>]` - Minimum Aggregate Space Threshold (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose performance tier migrate threshold matches the specified value.

## Examples

The following example displays all information about all object stores:

```
cluster1::>storage aggregate object-store show
```

## storage aggregate object-store unmirror

Remove the second object store from a mirrored FabricPool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store unmirror` command detaches a second object store from a mirrored FabricPool. This command verifies whether the primary object store is accessible through the intercluster LIF from both the node on which the aggregate is present and from its high-availability (HA) partner node. The command fails if the primary object store is not available.

## Parameters

### **-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate from which the mirrored object store must be removed.

## Examples

The following example shows how to unmirror a mirrored FabricPool `aggr1`:

```
cluster1::>storage aggregate object-store unmirror -aggregate aggr1
```

## storage aggregate object-store config create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store config create` command is used by a cluster administrator to tell ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store configuration in ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The ONTAP node must be able to connect to the object store. This includes
- Fast, reliable connectivity to the object store.
- An inter-cluster LIF (Logical Interface) must be configured on the cluster. ONTAP will verify connectivity prior to saving this configuration information.
- If SSL/TLS authentication is required, then valid certificates must be installed.
- FabricPool license (required for Amazon S3 and Azure object stores).

An object-store configuration once created must not be reassociated with a different object-store or container. See [storage aggregate object-store config modify](#) command for more information. If neither the `access-key` nor the `secret-password` are provided while setting up a configuration for `AWS_S3` object store in Cloud Volumes ONTAP, then the access key (access key ID), the secret password (secret access key), and the session token will be retrieved from EC2 instance metadata for the AWS Identity and Access Management (IAM) role associated with the EC2 instance. If ONTAP is unable to create a object store configuration, then the command will fail explaining the reason for failure.

## Parameters

### **-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: "", "-", A-Z, a-z, and 0-9. *The first character must be one of the following: "", A-Z, or a-z.*

### **-provider-type <providerType> - Type of the Object Store Provider**

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: `AWS_S3` (Amazon S3 storage), `Azure_Cloud` (Microsoft Azure Cloud), `SGWS` (StorageGrid WebScale), `IBM_COS` (IBM Cloud Object Storage), `AliCloud` (Alibaba Cloud Object Storage Service), `GoogleCloud` (Google Cloud Storage) and `ONTAP_S3`.

### **[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (`AWS_S3` or not). The `keys` value is always applicable, and if selected means that the `access-key` and `secret-password` are provided by the system administrator. In Cloud Volumes ONTAP, the `EC2-IAM` value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the `access-key`, `secret-password` and session token are retrieved from EC2 instance metadata for this IAM role. Note that `-use-iam-role` and `-auth-type` are mutually exclusive, `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`. In Cloud Volumes ONTAP, the `GCP-SA` value may also be applicable. It means that a session token is retrieved from the GCP instance metadata for the Service Account associated with the GCP instance. Similarly, `Azure-MSI` means that a session token is retrieved from the Azure instance metadata for the Managed Service Identity (MSI) associated with the Azure instance. For the `AWS_S3` provider, the `CAP` (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the `CAP` value is specified, then the `-cap-url` must be specified. See `cap-url`.

### **[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when `-auth-type` is `CAP`. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (`access-key`, `secret-pasword` and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mymission=myrole>

### **-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server**

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a `"blob.core.windows.net"` or a `"blob.core.usgovcloudapi.net"`, then a value of `-azure-account` followed by a period will be added in front of the server.

### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is `true`.

### **[-port <integer>] - Port Number of the Object Store**

This parameter specifies the port number on the remote server that ONTAP will use while establishing connection to the object store.

### **-container-name <text> - Data Bucket/Container Name**

This parameter specifies the data bucket or container that will be used for read and write operations.

This name cannot be modified once a configuration is created.

### **{ [-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. For an Azure object store see `-azure-account`.

### **[-secret-password <text>] - Secret Access Key for S3 Compatible Provider Types**

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3, SGWS, IBM COS object stores and ONTAP\_S3. If the `-access-key` is specified but the `-secret-password` is not, then one will be asked to enter the `-secret-password` without echoing the input. For an Azure object store see `-azure-private-key`.

### **| [-azure-account <text>] - Azure Account**

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see `access-key`.

The value of this field cannot be modified once a configuration is created.

### **[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this parameter is true then one will be asked to enter `-azure-private-key` without echoing the input. Default value: `true`.

### **[-azure-private-key <text>] - Azure Access Key }**

This parameter specifies the access key required to authenticate requests to the Azure object store. See also `ask-azure-private-key`. For other object store providers see `-secret-password`.

### **[-azure-sas-token <text>] - Azure Account Shared Access Signature token (privilege: advanced) }**

This parameter specifies the shared access signature token to authenticate requests and provide limited access to storage resources in the Azure object store.

### **[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies the IPspace to use to connect to the object store. Default value: `Default`.

### **[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. The default value is `true`. It is recommended to use the default value to make sure that ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

### **[-use-http-proxy {true|false}] - Use HTTP Proxy**

This optional parameter indicates whether an HTTP proxy will be used for connecting to an object store.

Note that an HTTP proxy is configured using the `vserver http-proxy` commands at the `diagnostic`

privilege level. Default value: *false* .

### **[`-cluster <Cluster name>`] - The Name of the Cluster to which the Configuration Belongs**

This optional parameter should only be specified in MetroCluster switched-over mode and specifies the name of the cluster for which the configuration must be created. By default the configuration is created for the local cluster.

### **[`-server-side-encryption {none | SSE-S3}`] - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on provider-type. *none* encryption (no encryption required) is supported by all types of S3 (non-Azure) object store servers. *SSE-S3* encryption is supported by and is a default for all types of S3 (non-Azure) object store servers except *ONTAP\_S3*. *SSE-KMS* data at rest are encrypted by the object store server with data keys managed by the object store server using AWS managed CMK or customer managed CMK. *DSSE-KMS* data at rest are dual encrypted by the object store server with data keys managed by the object store server using AWS managed CMK or customer managed CMK. In most cases it is best not to change default value of "SSE-S3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level.

### **[`-url-style {path-style | virtual-hosted-style}`] - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on provider-type.

### **[`-azure-msi-token <text>`] - Azure MSI Token for Authentication**

This optional parameter specifies the Managed Service Identity (MSI) token required to authenticate to the Azure object store. This form of authentication is only supported on Azure NetApp Files.

## **Examples**

The following example creates an object store configuration in ONTAP:

```
cluster1::>storage aggregate object-store config create -object-store-name
    my_aws_store -provider-type AWS_S3 -server s3.amazonaws.com
    -container-name my-aws-bucket -access-key DXJRXHPXHYXA9X31X3JX
```

## **Related Links**

- [storage aggregate object-store config modify](#)

## **storage aggregate object-store config delete**

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `storage aggregate object-store config delete` command removes an existing object store configuration in ONTAP. The configuration cannot be deleted if it is used by any aggregates or if the system is

still freeing objects from the object store from a previously executed [storage aggregate delete](#) command. The command [storage aggregate object-store show](#) can be used to view the aggregates attached to the object store before issuing the delete command.

The [storage aggregate object-store show](#) command will not display aggregates that have been previously deleted but still has objects in the object store.

## Parameters

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration to be deleted.

## Examples

The following example deletes an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config delete -object-store-name  
my-store
```

## Related Links

- [storage aggregate delete](#)
- [storage aggregate object-store show](#)

## storage aggregate object-store config modify

### Modify object store configuration attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store config modify` command is used to update one or more of object store configuration parameters. This command must not be used to reassociate an existing valid object-store configuration to a new object-store or container. The modifiable parameters include object store name, server name, port, access\_key, secret-password, ipspace and is-ssl-enabled.

## Parameters

**-object-store-name <text> - Object Store Configuration Name**

This parameter identifies the configuration to be modified.

**[-new-object-store-name <text>] - Object Store Configuration New Name**

This optional parameter specifies the new name for the object store configuration.

**[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This optional parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (AWS\_S3 or not). The *keys* value is always applicable, and if selected means that the *access-key* and *secret-*

password are provided by the system administrator. In Cloud Volumes ONTAP, the `EC2-IAM` value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the `access-key`, `secret-password` and session token are retrieved from EC2 instance metadata for this IAM role. Note that `-use-iam-role` and `-auth-type` are mutually exclusive, `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`. In Cloud Volumes ONTAP, the `GCP-SA` value may also be applicable. It means that a session token is retrieved from the GCP instance metadata for the Service Account associated with the GCP instance. Similarly, `Azure-MSI` means that a session token is retrieved from the Azure instance metadata for the Managed Service Identity (MSI) associated with the Azure instance. For the `AWS_S3` provider, the `CAP` (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the `CAP` value is specified, then the `-cap-url` must be specified. See `cap-url`.

**`[-cap-url <text>]` - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when `-auth-type` is `CAP`. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (`access-key`, `secret-pasword` and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mymission=myrole>

**`[-server <Remote InetAddress>]` - Fully Qualified Domain Name of the Object Store Server**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a `"blob.core.windows.net"` or a `"blob.core.usgovcloudapi.net"`, then the value of `azure-account` in the configuration followed by a period will be added in front of the server. Note that the value of `azure-account` cannot be modified.

**`[-is-ssl-enabled {true|false}]` - Is SSL/TLS Enabled**

This optional parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store.

**`[-port <integer>]` - Port Number of the Object Store**

This optional parameter specifies a new port number to connect to the object store server indicated in the `-server` parameter.

**`[-access-key <text>]` - Access Key ID for S3 Compatible Provider Types**

This optional parameter specifies a new access key (access key ID) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3.

**`[-secret-password <text>]` - Secret Access Key for S3 Compatible Provider Types**

This optional parameter specifies a new password (secret access key) for the AWS S3, SGWS, IBM COS object stores and ONTAP S3. For an Azure object store see `-azure-private-key`. If the `-access-key` is specified but the `-secret-password` is not then one will be asked to enter the `-secret-password` without echoing the input.

**`[-ask-azure-private-key {true|false}]` - Ask to Enter the Azure Access Key without Echoing**

If this optional parameter is true then one will be asked to enter the `-azure-private-key` without echoing the input.

### **`[-azure-private-key <text>]` - Azure Access Key**

This optional parameter specifies a new access key for Azure object store. For other object store providers see `secret-password`. See also `ask-azure-private-key`.

### **`[-azure-sas-token <text>]` - Azure Account Shared Access Signature token (privilege: advanced)**

This parameter specifies the shared access signature token to authenticate requests and provide limited access to storage resources in the Azure object store. Any previously stored token will be overwritten by the token specified in this parameter. Pass an empty string in single quotes to clear any previously stored token.

### **`[-ipspace <IPspace>]` - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies new ipspace values for the configuration.

### **`[-is-certificate-validation-enabled {true|false}]` - Is SSL/TLS Certificate Validation Enabled**

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. It is recommended to keep the default value which is `true` to make sure that ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

### **`[-use-http-proxy {true|false}]` - Use HTTP Proxy**

This optional parameter indicates whether an HTTP proxy will be used for connecting to an object store. Note that an HTTP proxy is configured using the `vserver http-proxy` commands at the `diagnostic` privilege level.

### **`[-server-side-encryption {none | SSE-S3}]` - Encryption of Data at Rest by the Object Store Server**

This parameter specifies if AWS or other S3 compatible object store server must encrypt data at rest. The available choices depend on `provider-type`. `none` encryption (no encryption required) is supported by all S3 (non-Azure) object store servers. `SSE-S3` encryption is supported by all S3 (non-Azure) object store servers except `ONTAP_S3`. In most cases it is best not to change default value of "SSE-S3" for object store servers which support SSE-S3 encryption. The encryption is in addition to any encryption done by ONTAP at a volume or at an aggregate level. Note that changing this option does not change encryption of data which already exist in the object store.

### **`[-url-style {path-style | virtual-hosted-style}]` - URL Style Used to Access S3 Bucket**

This parameter specifies the URL style used to access S3 bucket. This option is only available for non-Azure object store providers. The available choices and default value depend on `provider-type`.

### **`[-azure-msi-token <text>]` - Azure MSI Token for Authentication**

This optional parameter specifies the new Managed Service Identity (MSI) token required to authenticate to the Azure object store. This form of authentication is only supported on Azure NetApp Files.

## **Examples**

The following example modifies two parameters (port number and `is-ssl-enabled`) of an object store configuration named `my-store`:

```
cluster1::>storage aggregate object-store config modify -object-store-name
my-store -port 1235 -is-ssl-enabled true
```

## storage aggregate object-store config rename

Rename an existing object store configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The ``storage aggregate object-store config rename`` command is used to rename an exiting object store configuration.

### Parameters

**-object-store-name <text> - Object Store Configuration Name**

This parameter identifies an existing object store configuration.

**-new-object-store-name <text> - Object Store Configuration New Name**

This parameter specifies the new object store configuration name.

### Examples

The following example renames an object store configuration from my-store to ms1:

```
cluster1::>storage aggregate object-store config rename -object-store-name
my-store -new-object-store-name ms1
```

## storage aggregate object-store config show

Display a list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store config show` command displays information about all existing object store configurations in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-object-store-name <text>] - Object Store Configuration Name**

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

**[-object-store-uuid <UUID>] - UUID of the Object Store Configuration**

If this parameter is specified, the command displays information only about object store configurations whose UUID matches the specified UUID values.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose authentication type matches the specified value.

**[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

If this parameter is specified, the command displays information only about object store configurations whose CAP URL matches the specified value.

**[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

**[-port <integer>] - Port Number of the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

**[-container-name <text>] - Data Bucket/Container Name**

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. ONTAP uses this container name or object store data bucket while accessing data from the object store.

**[-access-key <text>] - Access Key ID for S3 Compatible Provider Types**

If this parameter is specified, the command displays information only about AWS S3, SGWS, IBM COS object store configurations and ONTAP S3 whose access key matches the specified value. ONTAP requires the access key for authorized access to the object store.

**[-azure-account <text>] - Azure Account**

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. ONTAP requires the Azure account for authorized access to the Azure object store.

### **`[-ipspace <IPspace>]` - IPspace to Use in Order to Reach the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. ONTAP uses the IPspace value to connect to the object store.

### **`[-iam-role <text>]` - IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM (Identity and Access Management) role matches the specified value.

### **`[-is-certificate-validation-enabled {true|false}]` - Is SSL/TLS Certificate Validation Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the validation of SSL/TLS certificate matches the specified value.

### **`[-use-http-proxy {true|false}]` - Use HTTP Proxy**

If this parameter is specified, the command displays information only about object store configurations for which usage of HTTP proxy matches the specified value.

### **`[-cluster <Cluster name>]` - The Name of the Cluster to which the Configuration Belongs**

If this parameter is specified, the command displays information only about object store configurations for which cluster matches the specified value.

### **`[-server-side-encryption {none | SSE-S3}]` - Encryption of Data at Rest by the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server-side encryption matches the specified value.

### **`[-url-style {path-style | virtual-hosted-style}]` - URL Style Used to Access S3 Bucket**

If this parameter is specified, the command displays information only about object store configurations whose URL style matches the specified value.

## **Examples**

The following example displays all available object store configuration in the cluster:

```
cluster1::>storage aggregate object-store config show
```

## **storage aggregate object-store profiler abort**

### **Abort object store profiler**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `storage aggregate object-store profiler abort` command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

## Parameters

**-node {<nodename>|local} - Node on Which the Profiler Should Run (privilege: advanced)**

This parameter specifies the node on which the object store profiler is running.

**-object-store-name <text> - Object Store Configuration Name (privilege: advanced)**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

## Examples

The following example aborts the object store profiler :

```
cluster1::>storage aggregate object-store profiler abort -object-store
-name my-store -node my-node
```

## storage aggregate object-store profiler show

Show object store profiler status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate object-store profiler show` command is used to monitor progress and results of the [storage aggregate object-store profiler start](#) command.

## Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[-object-store-name <text>] - ONTAP Name for this Object Store Configuration (privilege: advanced)**

If this parameter is specified, the command only displays information about the objects which are placed on the specified object store.

**[-object-name-prefix <UUID>] - Bin UUID (privilege: advanced)**

If this parameter is specified, the command displays information about all the objects whose object names are prefixed with the specified object name prefix. Objects from two different object stores will not have the same object name prefix.

**[`-object-prefix <text>`] - Prefix Added to Each Object (privilege: advanced)**

If this parameter is specified, the command only displays information about the objects which have the specified prefix. Objects belonging to two different object stores can have the same object prefix.

**[`-profiler-status <text>`] - Profiler Status (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[`-start-time <MM/DD/YYYY HH:MM:SS>`] - Profiler Start Time (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified start time of the profiler run.

**[`-op-name <text>`] - Operation Name - PUT/GET (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified operation name. Possible values are PUT or GET.

**[`-op-size {<integer>[KB|MB|GB|TB|PB]}`] - Size of Operation (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified size of the operation.

**[`-op-count <integer>`] - Number of Operations Performed (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[`-op-failed <integer>`] - Number of Operations Failed (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified node.

**[`-op-latency-minimum <integer>`] - Minimum Latency for Operation in Milliseconds (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified minimum latency for the operation. The values are in milliseconds.

**[`-op-latency-maximum <integer>`] - Maximum Latency for Operation in Milliseconds (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified maximum latency for the operation. The values are in milliseconds.

**[`-op-latency-average <integer>`] - Average Latency for Operation in Milliseconds (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified average latency for the operation. The values are in milliseconds.

**[`-op-throughput {<integer>[KB|MB|GB|TB|PB]}`] - Throughput per Second for the operation (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified throughput for the operation.

**[`-op-errors <text>,...`] - Error Reasons and Count (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the count and specified reason for error.

### **[`-op-latency-histogram <text>,...`] - Latency Histogram (privilege: advanced)**

If this parameter is specified, the command only displays information corresponding to the specified latency histogram for the operation.

## **Examples**

The following example displays the results of `storage aggregate object-store profiler start` :

```
cluster1::>storage aggregate object-store profiler show
```

## **Related Links**

- [storage aggregate object-store profiler start](#)

## **storage aggregate object-store profiler start**

Start the object store profiler to measure latency and throughput

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

The `storage aggregate object-store profiler start` command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command when the system is under 50% CPU utilization.

## **Parameters**

### **`-node {<nodename>|local}` - Node on Which the Profiler Should Run (privilege: advanced)**

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

### **`-object-store-name <text>` - Object Store Configuration Name (privilege: advanced)**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

### **`[-object-prefix <text>]` - Prefix Added to Each Object (privilege: advanced)**

This parameter specifies the prefix attached to each object. There is a prefix length restriction of 80 characters. In addition to this restriction, follow any specific prefix length or character restrictions that are imposed by the cloud store they plan to run this command. Refer to the respective cloud store documentation for details.

## Examples

The following example starts the object store profiler :

```
cluster1::>storage aggregate object-store profiler start -object-store  
-name my-store -node my-node
```

## storage aggregate object-store put-rate-limit modify

Modify the maximum, per node, FabricPool put rate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate object-store put-rate-limit modify` command enables the modification of values that can be used to limit the FabricPool put rate or to allow it to run more aggressively. Use the [storage aggregate object-store put-rate-limit show](#) command to display the current maximum put rate, if any, in effect.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

This parameter specifies the Node name.

**[-default {true|false}] - Set Default Values (privilege: advanced)**

Setting this field to true will reset all unset fields to the the system default.

**[-put-rate-bytes-limit {<integer>[KB|MB|GB|TB|PB]}] - Limit Max (B/s) Allowed (privilege: advanced)**

This field is the maximum put rate in bytes per second. The field can be used to reduce the put rate to an object store.

**[-put-latency-limit <integer>] - Latency (ms) At Which Parallel Puts Are Reduced (privilege: advanced)**

This field is the maximum put latency, in milliseconds, at which point the number of parallel put operations are decreased. The field can be used to reduce the put rate to an object store based on average latency. Setting this field to zero will disable the limit.

### Related Links

- [storage aggregate object-store put-rate-limit show](#)

## storage aggregate object-store put-rate-limit show

Display the per node FabricPool Put Rate Limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The storage aggregate object-store put-rate-limit show command displays the maximum put rate for FabricPool.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

This parameter specifies the Node name.

**`[-put-rate-bytes-limit {<integer>[KB|MB|GB|TB|PB] } ] - Put Rate Limit (B/s) (privilege: advanced)`**

This field represents an upper boundary on the allowed put rate. The put rate will not be allowed to exceed this value but can be throttled to values less than it to accommodate client operations and a high average system CPU. Some platforms are intentionally configured with a lower maximum put rate in an effort to reduce the impact of the FabricPool put subsystem on the overall system health. A limit in effect, lower than the default, may keep cold data in the performance tier for a long period of time and may require an increase in space requirements. A value of -1 indicates no upper bound is in effect.

**`[-put-rate {<integer>[KB|MB|GB|TB|PB] } ] - Estimated Put Rate (B/s) (privilege: advanced)`**

The put-rate displays the maximum computed bytes per second the put subsystem assumes is possible. This put rate is measured in real-time and is in relation to the node for all attached object stores which have put traffic to them.

**`[-max-put-rate-in-effect {<integer>[KB|MB|GB|TB|PB] } ] - Current Maximum Put Rate In Effect (B/s) (privilege: advanced)`**

This field displays the maximum allowed put rate. If it is less than the max-throughput then it indicates that throttling is in effect. The throttling is the outcome of either staying at put-rates-byte-limit or an effort to accommodate client operations on a system with high CPU.

**`[-max-throughput {<integer>[KB|MB|GB|TB|PB] } ] - Estimated Maximum Throughput (B/s) (privilege: advanced)`**

This field displays the maximum put throughput rate in bytes per second that the put subsystem will throttle down from or up to. It's the greater of the put-rate and the node default value.

**`[-put-latency <integer>] - Average PUT Op Latency (ms) (privilege: advanced)`**

This field displays the average put latency in milliseconds over the last several seconds to all object stores to which there is put traffic.

**`[-put-latency-limit <integer>] - Latency at which Parallel Puts are Reduced (ms) (privilege: advanced)`**

This field displays the put latency threshold in milliseconds at which point the number of parallel put operations to all object stores is decreased. The average put latency is displayed in the put-latency field.

## storage aggregate plex delete

Delete a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex delete` command deletes the specified plex. The aggregate specified with then `-aggregate` will be unmirrored and contain the remaining plex. The disks in the deleted plex become spare disks.

### Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

### Examples

The following example deletes plex0 of aggregate aggr1:

```
cluster1::> storage aggregate plex delete -aggregate aggr1 -plex plex0
```

## storage aggregate plex offline

Offline a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex offline` command takes the specified plex offline. The aggregate specified with the `-aggregate` parameter must be a mirrored aggregate and both plexes must be online. Prior to taking a plex offline, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.

### Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

## Examples

The following example takes plex0 of aggregate aggr1 offline:

```
cluster1::> storage aggregate plex offline -aggregate aggr1 -plex plex0
```

## storage aggregate plex online

Online a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex online` command brings the specified plex online. The aggregate specified with the `-aggregate` parameter must be an online mirrored aggregate. The system will initiate resynchronization of the plex as part of online processing.

### Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

## Examples

The following example brings plex0 of aggregate aggr1 online:

```
cluster1::> storage aggregate plex online -aggregate aggr1 -plex plex0
```

## storage aggregate plex show

Show plex details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex show` command displays information for the specified plex. By default, the command displays the following information about all plexes:

- Aggregate Name
- Plex Name
- Is Online
- Is Resyncing

- Resyncing Percentage
- Plex Status

To display detailed information about a single plex, use the `-aggregate` and `-plex` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**[-plex <text>] - Plex Name**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

**[-status <text>] - Status**

Displays plex status. Possible values are:

- *normal*
- *failed*
- *empty*
- *invalid*
- *uninitialized*
- *failed assimilation*
- *limbo*
- *active*
- *inactive*
- *resyncing*

These values may appear by themselves or in combination separated by commas, for example, *"normal,active"*.

**[-is-online {true|false}] - Is Online**

Selects the plexes that match this parameter value.

**[-in-progress {true|false}] - Resync is in Progress**

Selects the plexes that match this parameter value.

### **`[-resyncing-percent <percent>]` - Resyncing Percentage**

Selects the plexes that match this parameter value.

### **`[-resync-level <integer>]` - Resync Level**

Selects the plexes that match this parameter value.

### **`[-pool <integer>]` - Pool**

Selects the plexes that match this parameter value.

## **Examples**

The following example displays information about all the plexes for all the aggregates:

```
cluster1::> storage aggregate plex show
```

| Aggregate | Plex  | Is Online | Is Resyncing | Resyncing Percent | Status        |
|-----------|-------|-----------|--------------|-------------------|---------------|
| aggr0     | plex0 | true      | false        | -                 | normal,active |
| aggr1     | plex0 | true      | false        | -                 | normal,active |
| aggr1     | plex1 | true      | false        | -                 | normal,active |
| aggr2     | plex0 | true      | false        | -                 | normal,active |
| aggr2     | plex2 | true      | false        | -                 | normal,active |

5 entries were displayed.

The following example displays information about plex1 of aggregate aggr1:

```
cluster1::> storage aggregate plex show -aggregate aggr1 -plex plex1
```

Aggregate: aggr1

    Plex Name: plex1

        Status: normal,active

    Is Online: true

Resync is in Progress: false

    Resyncing Percentage: -

        Resync Level: -

        Pool: 1

## **storage aggregate reallocation quiesce**

### **Quiesce reallocate job on aggregate**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [storage aggregate reallocation restart](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced (paused) state.

## Parameters

### **-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to temporarily pause the job.

## Examples

```
cluster1::> storage aggregate reallocation quiesce
             -aggregate aggr0
```

Temporarily stops (pauses) any reallocation job running on aggregate aggr0.

## Related Links

- [storage aggregate reallocation restart](#)

## storage aggregate reallocation restart

Restart reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Starts a reallocation job. Use this command to restart a quiesced (temporarily stopped) job or a scheduled scan that is idle for the aggregate.

## Parameters

### **-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to restart reallocation scans.

### **[-i, -ignore-checkpoint <true>] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it was stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

## Examples

```
cluster1::> storage aggregate reallocation restart
             -aggregate aggr0 -ignore-checkpoint true
```

Restarts reallocation job on aggregate aggr0 from the beginning.

## storage aggregate reallocation schedule

Modify schedule of reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [storage aggregate reallocation start](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [storage aggregate reallocation start](#) command.

### Parameters

#### **-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to schedule reallocation jobs.

#### **[-d, -del <true>] - Delete**

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

#### **[-s, -cron <text>] - Cron Schedule**

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

- day of week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

### Examples

```
cluster1::> storage aggregate reallocation schedule -aggregate aggr0 -cron  
"0 23 6 *"
```

Schedules a reallocation job to run at 11:00 p.m. every Saturday on aggr0.

## Related Links

- [storage aggregate reallocation start](#)

## storage aggregate reallocation show

Show reallocate job status for improving free space layout

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays the status of a reallocation scan, including the state, schedule, aggregate and scan id. If you do not specify the *id* for a particular reallocation scan, the command displays information about all the existing reallocation scans.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the value of relevant field that you specify for the reallocation scans that are present.

**| [-v ]**

Specify this parameter to display the output in a verbose format.

**| [-instance ] }**

Displays information about reallocation scans on aggregates in a list format.

**[-id <integer>] - Job ID**

Specify this parameter to display the reallocation scan that matches the reallocation job ID that you specify.

**[-aggregate <aggregate name>] - Aggregate Name**

Specify this parameter to display the reallocation scan that matches the aggregate that you specify.

**[-description <text>] - Job Description**

Specify this parameter to display reallocation scans that match the text description that you specify.

**[-state**

**{ Initial | Queued | Running | Waiting | Pausing | Paused | Quitting | Success | Failure | Reschedule | Error | Quit | Dead | Unknown | Restart | Dormant } ] - Job State**

Specify this parameter to display reallocation jobs that match the state that you specify.

**[-progress <text>] - Execution Progress**

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all the jobs that are starting.

**[-schedule <job\_schedule>] - Schedule Name**

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the [job schedule show](#) command.

## **[-global-status <text>] - Global State of Scans**

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

## **Examples**

```
cluster1::> storage aggregate reallocation show
```

| Job ID | Aggregate | Schedule            | State  |
|--------|-----------|---------------------|--------|
| -----  | -----     | -----               | -----  |
| 23     | aggr0     | reallocate_0 23 * 6 | Queued |

Displays the job ID, aggregate, schedule, and state for the reallocation scans.

## **Related Links**

- [job schedule show](#)

## **storage aggregate reallocation start**

Start reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

Begins a reallocation scan on a specified aggregate.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the aggregate.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [storage aggregate reallocation schedule](#) command to schedule reallocation jobs.

## **Parameters**

### **-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to start a reallocation scan.

### **{ [-i, -interval <text>] - Interval Schedule**

Specified the schedule in a single string with four fields:

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of the month, reallocation scans will not run in any of the months with fewer than 31 days.

- day of the week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

#### | [-o, -once <true>] - Once }

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

### Examples

```
cluster1:> storage aggregate reallocation start -aggregate aggr0
-interval "0 23 * 6"
```

Starts a reallocation job on aggregate aggr0 at 11:00 p.m. every Saturday.

### Related Links

- [storage aggregate reallocation schedule](#)

## storage aggregate reallocation stop

Stop reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Stops and deletes any reallocation scan running on the specified aggregate. This command stops and deletes in-progress, scheduled, and quiesced scans.

### Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to stop and delete a reallocation scan.

### Examples

```
cluster1:> storage aggregate reallocation stop -aggregate aggr0
```

Stops and deletes the reallocation scan on aggregate aggr0.

# storage aggregate relocation show

Display relocation status of an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate relocation show` command displays status of aggregates which were relocated in the last instance of relocation operation.

## Parameters

`{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-node {<nodename>|local}] - Node`

Selects aggregates from the specified source node.

`[-aggregate <text>] - Aggregate Name`

Selects the aggregates that match this parameter value.

`[-relocation-status <text>] - Aggregates Relocation Status`

Selects the aggregates whose relocation status matches this parameter value.

`[-destination <text>] - Destination for Relocation`

Selects the aggregates that are designated for relocation on the specified destination node.

## Examples

The following example displays the relocation status of aggregates on all nodes in the cluster:

```
cluster1::> storage aggregate relocation show
Source          Aggregate  Destination  Relocation Status
-----
node0
                -          -          Not attempted yet
node1
                aggr1      node0      Done
                aggr2      node0      In progress
                aggr3      node0      Not attempted yet
4 entries were displayed.
```

## storage aggregate relocation start

Relocate aggregates to the specified destination

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate relocation start` command initiates the relocation of the aggregates from one node to the partner node in a high-availability (HA) pair.

### Parameters

**-node {<nodename>|local} - Name of the Node that currently owns the aggregate**

This specifies the source node where the aggregates to be relocated reside.

**-destination {<nodename>|local} - Destination node**

This specifies the destination node where aggregates are to be relocated.

**-aggregate-list <aggregate name>,... - List of Aggregates to be relocated**

This specifies the list of aggregate names to be relocated from source node to destination node.

**[-override-vetoes {true|false}] - Override Vetoes**

This specifies whether to override the veto checks for relocation operation. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. The default value is false.

**[-relocate-to-higher-version {true|false}] - Relocate To Higher Version**

This specifies if the aggregates are to be relocated to a node which is running on a higher version of ONTAP than the source node. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher ONTAP version. This option is not required if the destination node is running on higher minor version, but the same major version. The default value is false.

**[-override-destination-checks {true|false}] - Override Destination Checks**

This specifies if the relocation operation should override the check done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive. The default value is false.

**[-ndo-controller-upgrade {true|false}] - Relocate Aggregates for NDO Controller Upgrade (privilege: advanced)**

This specifies if the relocation operation is being done as a part of non-disruptive controller upgrade process. Aggregate relocation will not change the home ownerships of the aggregates while relocating as part of controller upgrade. The default value is false.

### Examples

The following example relocates aggregates name `aggr1` and `aggr2` from source node `node0` to destination node `node1`:

```
cluster1::> storage aggregate relocation start -node node0 -destination
node1 -aggregate-list aggr1, aggr2
```

## storage aggregate resynchronization modify

### Modify aggregate resynchronization priorities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage aggregate resynchronization modify` command can be used to modify the resynchronization priority of an aggregate.

When the number of aggregates pending resynchronization is higher than the maximum number of concurrent resynchronization operations allowed on a node, the aggregates get resynchronized in the order of their "resync-priority" values.

For example, let the `max-concurrent-resync` under the `storage aggregate resynchronization options` directory for a node be set to two. If there are three aggregates waiting to be resynchronized, where their respective `resync-priority` values are `high`, `medium`, and `low`, then the third aggregate is not allowed to start resynchronization until one of the first two aggregates has completed resynchronizing.

#### Parameters

##### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate that is to be modified.

##### **[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority**

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or ONTAP system aggregates.

Possible values for this parameter are:

- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- `low`: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

#### Examples

The following example changes the `resync-priority` of a specified aggregate to `medium`:

```
cluster1::> storage aggregate resynchronization modify -aggregate aggr1
-resync-priority medium
```

## storage aggregate resynchronization show

Display aggregate resynchronization priorities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate resynchronization show` command displays the relative resynchronization priority for each aggregate in the cluster. When a particular node restricts how many resync operations can be active concurrently, these priorities are used to prioritize the operations. The maximum concurrent resync operations for a node is displayed in the [storage aggregate resynchronization options show](#) command. If no parameters are specified, the command displays the following information about all the aggregates in the cluster:

- Aggregate name
- Node that owns the aggregate
- Resync priority for the aggregate

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays the resynchronization priority only for the specified aggregate.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays the resynchronization priority only for the aggregates owned by the specified node.

**[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority**

If this parameter is specified, the command displays only the resynchronization priority that matches the specified value. Possible values for this parameter are:

- `high(fixed)`: This value is reserved for ONTAP system aggregates, which cannot have any other value for this field. These aggregates always start their resynchronization operation at the first available opportunity. This value cannot be assigned to a data aggregate.
- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- `low`: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

When the number of aggregates waiting for resynchronization is higher than the maximum number of

resynchronization operations allowed on a node, then the `resync-priority` field is used to determine which aggregate starts resynchronization first. This field is not set for unmirrored aggregates.

### Examples

The following command displays the resynchronization priorities for all the aggregates in the cluster:

```
cluster1::> storage aggregate resynchronization show
Aggregate Node           Resync Priority
-----
aggr0_n1 cluster1-01      high(fixed)
aggr0_n2 cluster1-02      high(fixed)
aggr1    cluster1-01      low
aggr2    cluster1-01      high
aggr3    cluster1-01      medium
4 entries were displayed.
```

### Related Links

- [storage aggregate resynchronization options show](#)

## storage aggregate resynchronization options modify

Modify node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate resynchronization options modify` command can be used to modify the options that govern the resynchronization of aggregates on a given cluster node.

Modifying the `max-concurrent-resyncs` option changes the number of aggregates that are allowed to resynchronize concurrently. When the number of aggregates waiting for resynchronization is higher than this value, the aggregates are resynchronized in the order of their "`resync-priority``". This value can be modified using the [storage aggregate resynchronization modify](#) command while specifying the `-resync-priority` parameter.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node for which the option is to be modified.

**[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**

This parameter specifies the new value for the maximum number of concurrent resync operations allowed on a node. This option must be specified along with the `-node` parameter. When a node has active resync operations, setting this parameter to a value that is lower than the number of currently resyncing aggregates will trigger a user confirmation.

## Examples

The following example changes the maximum concurrent resync operations for the specified node to `ten` :

```
cluster1::> storage aggregate resynchronization options modify -node node1
-max-concurrent-resyncs 10
```

## Related Links

- [storage aggregate resynchronization modify](#)

## storage aggregate resynchronization options show

Display node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate resynchronization options show` command displays all the options that govern the resynchronization of aggregates on a given cluster node. If no parameters are specified, the command displays the following information about all nodes:

- Node for which the information is being displayed
- Maximum number of concurrent resynchronizing aggregates allowed

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays resynchronization options only for the specified node.

**[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**

If this parameter is specified, the command displays only the resynchronization option that matches the specified value.

## Examples

The following example displays the maximum number of concurrent resyncs allowed for each node in the cluster:

```
cluster1::> storage aggregate resynchronization options show
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
cluster1-02     4
2 entries were displayed.
```

The following example displays the maximum number of concurrent resyncs allowed for a specified node:

```
cluster1::> storage aggregate resynchronization options show -node node1
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

The following example displays all the nodes that allow more than five concurrent resync operations:

```
cluster1::> storage aggregate resynchronization options show -max
-concurrent-resyncs >5
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

## storage array commands

### storage array modify

Make changes to an array's profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage array modify` command lets the user change several array parameters.

#### Parameters

##### **-name <text>** - Name

Storage array name, either generated by ONTAP or assigned by the user.

##### **[-prefix <text>]** - Prefix

Abbreviation for the named array.

##### **[-vendor <text>]** - Vendor

Array manufacturer.

**[`-model <text>`] - Model**

Array model number.

**[`-options <text>`] - options**

Vendor specific array settings.

**[`-max-queue-depth <integer>`] - Target Port Queue Depth (privilege: advanced)**

The target port queue depth for all target ports on this array.

**[`-lun-queue-depth <integer>`] - LUN Queue Depth (privilege: advanced)**

The queue depth assigned to array LUNs from this array.

**{ [`-is-upgrade-pending {true|false}`] - Upgrade Pending (privilege: advanced)**

Set this parameter to *true* if the array requires additional ONTAP resilience for a pending firmware upgrade. Keep this parameter *false* during normal array operation. This value can not be set to *true* if `-path-failover-time` is greater than zero.

**[`-path-failover-time <integer>`] - Path Failover Time (sec)**

The time delay (in secs) before switching the I/O path when the path is deleted. The maximum time delay is 30 sec. The default is 0. This value can not be greater than zero if `-is-upgrade-pending` is *true*.

**[`-all-path-fail-delay <integer>`] - Extend All Path Failure Event (secs)**

Use this parameter to increase the delay before ONTAP declares an "all path failure" event for an array. Delaying the "all path failure" event allows ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes back online within the specified duration. A valid delay is any value between 30 and 90 seconds. A value of 0 will reset the delay, resulting in default actions being taken whenever an "all path failure" event is detected.

## Examples

This command changes the model to FastT.

```
cluster1::> storage array modify -name IBM_1722_1 -model FastT
```

## storage array remove

Remove a storage array record from the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array remove` command discards array profile records for a particular storage array from the cluster database. The command fails if a storage array is still connected to the cluster. Use the [storage array config show](#) command to view the array connectivity status. The array target port can be removed using the [storage array port remove](#) command.

## Parameters

### **-name <text> - Name**

Name of the storage array you want to remove from the database.

## Examples

```
cluster1::> storage array remove IBM_1722_1
```

## Related Links

- [storage array config show](#)
- [storage array port remove](#)

## storage array rename

Change the name of a storage array in the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array rename` command permits substitution of the array profile name which ONTAP assigned during device discovery. By default, the name that ONTAP assigned to the storage array during discovery is shown in ONTAP displays and command output.

## Parameters

### **-name <text> - Name**

Storage array name either generated by ONTAP or assigned by the user.

### **-new-name <text> - The new name to assign to this array profile. (28 chars max)**

New name to assign to the storage array.

## Examples

```
cluster1::> storage array rename -name HITACHI_DF600F_1 -new-name MyArray
```

## storage array show

Display information about SAN-attached storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array show` command displays information about arrays visible to the cluster. If no parameters are specified, the command displays the following information about all storage arrays:

- Prefix
- Name
- Vendor
- Model
- Options

To display detailed information about a single array, use the ``-name`` parameter. The detailed view adds the following information:

- Serial Number
- Optimization Policy
- Affinity
- Errors
- Path Failover Time
- Extend All Path Failure Event

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

Selects the arrays that match this parameter value.

**[-prefix <text>] - Prefix**

Abbreviation for the named array.

**[-vendor <text>] - Vendor**

Array manufacturer.

**[-model <text>] - Model**

Array model number.

**[-options <text>] - options**

Vendor specific array settings.

**[-serial-number <text>] - Serial Number**

Array product identifier.

**[`-max-queue-depth <integer>`] - Target Port Queue Depth (privilege: advanced)**

Selects the arrays that match this parameter value.

**[`-lun-queue-depth <integer>`] - LUN Queue Depth (privilege: advanced)**

Selects the arrays that match this parameter value.

**[`-optimization-policy {iALUA|eALUA|symmetric|proprietary|mixed|unknown}`] - Optimization Policy**

Selects the arrays that match this parameter value.

**[`-affinity {none|aaa|ap|mixed|unknown}`] - Affinity**

Selects the arrays that match this parameter value.

**[`-error-text <text>,...`] - Error Text**

Selects the arrays that match this parameter value.

**[`-is-upgrade-pending {true|false}`] - Upgrade Pending (privilege: advanced)**

Selects the arrays that match this parameter value.

**[`-path-failover-time <integer>`] - Path Failover Time (sec)**

Use this parameter to list arrays that have path failover time set to the value you specify.

**[`-all-path-fail-delay <integer>`] - Extend All Path Failure Event (secs)**

Use this parameter to list arrays that have the all path failure event delay set to the value you specify.

## Examples

The following example displays information about all arrays.

```
cluster1::> storage array show
Prefix                               Name      Vendor      Model Options
-----
                                HITACHI_DF600F_1  HITACHI      DF600F
                                IBM_1722_1        IBM          1722
2 entries were displayed.
```

The following example displays detailed information about a specific array:

```

cluster1::> storage array show -name HITACHI_DF600F_1
Name: HITACHI_DF600F_1
                                Prefix: abc
                                Vendor: HITACHI
                                Model: DF600F
                                options:
                                Serial Number: 4291000000000000
                                Optimization Policy: iALUA
                                Affinity: aaa
                                Error Text:
                                Path Failover Timeout (sec): 30
                                Extend All Path Failure Event (secs): 50

```

## storage array config show

Display connectivity to back-end storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array config show` command displays information about how the storage arrays connect to the cluster, LUN groups, number of LUNS, and more. Use this command to validate the configuration and to assist in troubleshooting.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-switch ]**

If you specify this parameter, switch port information is shown.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller Name**

Selects the arrays that match this parameter value.

**[-group <integer>] - LUN Group**

Selects the arrays that match this parameter value. A LUN group is a set of LUNs that shares the same path set.

**[-target-wwpn <text>] - Array Target Ports**

Selects the arrays that match this parameter value (the World Wide Port Name of a storage array port).

**[-initiator <text>] - Initiator**

Selects the arrays that match this parameter value (the host bus adapter that the clustered node uses to connect to storage arrays).

**[-array-name <array name>] - Array Name**

Selects the arrays that match this parameter value.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Selects the arrays that match this parameter value.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Selects the arrays that match this parameter value.

**[-lun-count <integer>] - Number of array LUNs**

Selects the arrays that match this parameter value.

**[-ownership {all|assigned|unassigned}] - Ownership**

Selects the arrays that match this parameter value.

**Examples**

```
cluster1::> storage array config show
```

| Node             | LUN Group | LUN Count | Array Name     | Array Target |
|------------------|-----------|-----------|----------------|--------------|
| Port Initiator   |           |           |                |              |
| vnv3070f19a      | 0         | 20        | DGC_RAID5_1    |              |

## storage array disk paths show

Display a list of LUNs on the given array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array disk paths show` command displays information about disks and array LUNs. Where it appears in the remainder of this document, "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks:

- Disk Unique Identifier
- Controller name
- Initiator Port
- LUN ID
- Failover optimization type
- The Use State of the LUN on this path
- Target Port
- Target IQN
- TPGN
- Port speeds
- Kbytes/sec on Disk (Rolling Average)
- Number IOPS per second on disk (Rolling Average)

To display detailed information about a single disk, use the `-disk` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all disks, in column style output.

**| [-switch ]**

Displays the switch port information for all disks, in column style output.

**| [-instance ] }**

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

**[-uid <text>] - Disk Unique Identifier**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`

**[-disk <disk path name>] - Disk Name**

Displays detailed information about the specified disks.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-diskpathnames <disk path name>,...] - Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-nodelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks visible to an initiator that is connected to the specified switch port.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-port-speed <text>,...] - Port Speed**

Selects information about disks served by a Host Bus Adapter that is running at the specified port speed.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks visible on target ports that have the specified access state.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks visible on target ports that have reached the specified I/O throughput.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks visible on target ports that have performed the specified number of IOPs.

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link errors.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[`-preferred-target-port {true|false}`] - Whether or not target port group is preferred**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[`-vmdisk-device-id <integer>,...`] - Virtual disk device ID**

Selects information about disks that have the specified virtual disk device ID.

**[`-host-adapter <text>`] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[`-primary-port <text>`] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[`-secondary-name <disk path name>`] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[`-secondary-port <text>`] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

## Examples

The following example displays information about all disks:

```
cluster1::> storage array disk paths show

## storage array port modify

Make changes to a target port record.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array port modify` command lets the user change array target port parameters.

### Parameters

**-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by ONTAP or assigned by the user.

**-wwnn <text> - WWNN**

Selects the array ports that match this parameter value.

**-wwpn <text> - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

The target port queue depth for this target port.

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used in automatically adjusting the queue depth of the target port based on its utilization.

### Examples

This command changes the maximum queue depth for this target port to 32.

```
cluster1::> storage array port modify -name HITACHI_DF600F_1 -wwnn  
50060e80004291c0 -wwpn 50060e80004291c0 -max-queue-depth 32
```

## storage array port remove

Remove a port record from an array profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array port remove` command removes a port from the array database. You might want to remove ports that are no longer connected to the clustered node. Port information can change after hardware replacement, rezoning, or similar configuration activities. The database retains the records about previous ports unless you remove the information.

## Parameters

### **-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by ONTAP or assigned by the user.

### **{ [-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

### **[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

### **| [-target-qn <text>] - Target IQN**

Selects the array ports that match this parameter value.

### **[-tpgt <integer>] - TPGT }**

Selects the array ports that match this parameter value.

## Examples

This command removes a port record from the array profiles database.

```
cluster1::> storage array port remove -name HITACHI_DF600F_1 -wwnn  
50060e80004291c0 -wwpn 50060e80004291c0
```

## storage array port show

Display information about a storage array's target ports.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array port show` command displays all the target ports known to the cluster for a given storage array (if an array name is specified) or for all storage arrays if no storage array name is specified. Target ports remain in the database as part of an array profile unless you explicitly remove them from the database.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-name <text>] - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by

ONTAP or assigned by the user.

**[-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

**[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

Selects the array ports that match this parameter value.

**[-node {<nodename>|local}] - Controller Name**

Selects the array ports that match this parameter value.

**[-initiator-port <text>,...] - Initiator Port**

Selects the array ports that match this parameter value.

**[-average-dynamic-queue-depth <integer>,...] - Average Dynamic Queue Depth (privilege: advanced)**

The average value of the dynamic target port queue depth.

**[-average-latency-per-iop <integer>,...] - Average Latency Per IOP**

Selects the array ports that match this parameter value (average latency per I/O performed in microseconds).

**[-average-pending <integer>,...] - Average Pending (privilege: advanced)**

Selects the array ports that match this parameter value (average over time of how many commands are on the outstanding queue).

**[-average-waiting <integer>,...] - Average Waiting (privilege: advanced)**

Selects the array ports that match this parameter value (average over time of how many commands are on the waiting queue).

**[-connection-type {direct|fabric|ISCSI}] - Connection Type**

Selects the array ports that match this parameter value (type of connection between the controller and the back end storage).

**[-dynamic-queue-depth <integer>,...] - Dynamic Queue Depth (privilege: advanced)**

Current dynamic target port queue depth, the maximum number of commands allowed outstanding.

**[-max-pending <integer>,...] - Max Pending (privilege: advanced)**

Selects the array ports that match this parameter value (largest number of commands observed on the outstanding queue).

**[-max-waiting <integer>,...] - Max Waiting (privilege: advanced)**

Selects the array ports that match this parameter value (largest number of commands observed on the waiting queue).

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects the array ports that match this parameter value.

**[-percent-busy <integer>,...] - Percent Busy**

Selects the array ports that match this parameter value (percentage of time I/Os are outstanding on the port).

**[-percent-waiting <integer>,...] - Percent Waiting**

Selects the array ports that match this parameter value (percentage of time there are I/Os waiting on the throttle list on the target port).

**[-switch-port <text>] - Switch Port**

Selects the array ports that match this parameter value (for fabric attached connections, the switch port the array target port is connected to; N/A for direct attached).

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-lun-in-use-count <integer>,...] - Target LUN In Use Count**

Selects the array ports that match this parameter value (number of IN-USE disks on this target port).

**[-target-port-speed <text>] - Target Port Speed**

Selects the array ports that match this parameter value (speed that the target port has negotiated with its connected switch port, or initiator port if direct attached).

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used when sending I/O to an array target port when it reaches maximum queue depth. Possible values are:

- normal - This policy aggressively competes for target port resources, in effect competing with other hosts. (default)
- defer - This policy does not aggressively compete for target port resources, in effect deferring to other hosts.

## Examples

The example below displays the port information for a single port.

```
cluster1::> storage array port show -wwpn 50060e80004291c0
Array Name: HITACHI_DF600F_1
WWNN: 50060e80004291c0
WWPN: 50060e80004291c0
Connection Type: fabric
Switch Port: vgbr300s89:9
Link Speed: 4 GB/s
Max Queue Depth: 1024
Utilization Policy: normal
```

| LUN                  |             |       |       |       |       |          |

## storage automated-working-set-analyzer commands

### storage automated-working-set-analyzer show

Display running instances

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The automated-working-set-analyzer show command displays the Automated Working-set Analyzer running instances.

#### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate-uuid <UUID>] - Uuid of the Aggregate (privilege: advanced)**

This parameter indicates the aggregate uuid that the AWA instance runs on.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[-working-set-size {true|false}] - Working Set Size (privilege: advanced)**

This parameter indicates whether the AWA instance is configured to find the working set size.

**[-start-time <Date>] - Starting Time (privilege: advanced)**

This parameter indicates the time when the AWA instance was started.

**[-total-intervals <integer>] - Total Interval Count (privilege: advanced)**

This parameter indicates the total number of intervals that the AWA instance has covered.

**[-read-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Read Throughput (privilege: advanced)**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks.

**[-write-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Write Throughput (privilege: advanced)**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks

**[-cacheable-read <percent>] - Cacheable Read (privilege: advanced)**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

**[-cacheable-write <percent>] - Cacheable Write (privilege: advanced)**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

**[-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}] - Max Projected Cache Size (privilege: advanced)**

This parameter indicates the projected Flash Pool cache usage.

**[-projected-read-hit <percent>] - Projected Read Hit (privilege: advanced)**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs.

**[-projected-write-hit <percent>] - Projected Write Hit (privilege: advanced)**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs.

**[`-referenced-interval-id` <integer>] - Referenced Interval ID (privilege: advanced)**

This parameter indicates the interval in which the cache size effect information is derived from.

**[`-referenced-interval-time` <Date>] - Referenced Interval Time (privilege: advanced)**

This parameter indicates the time when the referenced interval for the cache size effect information is derived from.

**[`-referenced-interval-cache-size` {<integer>[KB|MB|GB|TB|PB]}] - Referenced Interval Cache Size (privilege: advanced)**

This parameter indicates the cache size at the end of the referenced interval from which the cache size effect information is based on.

**[`-read-hit-20` <percent>] - 20% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 20% of the referenced cache size.

**[`-read-hit-40` <percent>] - 40% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 40% of the referenced cache size.

**[`-read-hit-60` <percent>] - 60% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 60% of the referenced cache size.

**[`-read-hit-80` <percent>] - 80% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 80% of the referenced cache size.

**[`-read-hit-100` <percent>] - 100% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 100% of the referenced cache size.

**[`-write-hit-20` <percent>] - 20% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 20% of the referenced cache size.

**[`-write-hit-40` <percent>] - 40% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted writehit rate when the cache size is 40% of the referenced cache size.

**[`-write-hit-60` <percent>] - 60% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 60% of the referenced cache size.

**[`-write-hit-80` <percent>] - 80% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 80% of the referenced cache size.

**[`-write-hit-100` <percent>] - 100% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 100% of the referenced cache

size.

**[`-num-intervals-show <integer>`] - Number of intervals to show (privilege: advanced)**

This parameter indicates the number of intervals to the past this command is showing.

## Examples

The following example shows a running instance of `automated-working-set-analyzer` on node `node1` for aggregate `aggr0`.

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer show
Node           FC      Aggregate  wss      Intervals Start Time
-----
node1          false aggr0      false      125 Wed Jul 22 13:58:17
2015
```

## storage automated-working-set-analyzer start

Command to start Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `automated-working-set-analyzer start` command enables the Automated Workload Analyzer that is capable of doing the following:

- Flash Pool modeling for an aggregate
- Flash Cache modeling for a node - can not specify an aggregate.
- Working set size estimation
- Workload monitoring

## Parameters

**`-node <nodename>` - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[`-flash-cache {true|false}`] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[`-aggregate <aggregate name>`] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[`-working-set-size {true|false}`] - Working Set Size (privilege: advanced)**

This parameter indicates whether the AWA instance is configured to find the working set size.

## Examples

```
cluster1::> storage automated-working-set-analyzer start -node vsim1
-aggregate aggr0
```

## storage automated-working-set-analyzer stop

Command to stop Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The storage automated-working-set-analyzer stop command terminates one or multiple Automated Workload Analyzer running instances.

### Parameters

**-node <nodename> - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash cache node-wide modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

## Examples

```
cluster1::> storage automated-working-set-analyzer stop -node vsim1
-aggregate aggr1
```

## storage automated-working-set-analyzer volume show

Displays the Automated Working Set Analyzer volume table

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The automated-working-set-analyzer volume show command displays the volume statistics reported by the corresponding Automated Working-set Analyzer running instances.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node <nodename>`] - Node (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[`-flash-cache {true|false}`] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[`-vol-uuid <UUID>`] - Uuid of the Volume (privilege: advanced)**

This parameter indicates the volume uuid that this command is issued on.

**[`-aggregate <aggregate name>`] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[`-volume <volume name>`] - Volume (privilege: advanced)**

This parameter indicates the volume name that this command is issued on.

**[`-rank <integer>`] - Cache Benefit Rank (privilege: advanced)**

This parameter indicates the rank of this volume among all volumes that would be most benefited by the modeled cache technology based on the AWA prediction.

**[`-read-throughput {<integer>[Bps|KBps|MBps|GBps] }`] - Read Throughput (privilege: advanced)**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks for this volume.

**[`-write-throughput {<integer>[Bps|KBps|MBps|GBps] }`] - Write Throughput (privilege: advanced)**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks for this volume.

**[`-cacheable-read <percent>`] - Cacheable Read (privilege: advanced)**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed for this volume. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

**[`-cacheable-write <percent>`] - Cacheable Write (privilege: advanced)**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

**[`-projected-cache-size {<integer>[KB|MB|GB|TB|PB] }`] - Max Projected Cache Size (privilege: advanced)**

This parameter indicates the projected Flash Pool cache usage by this volume.

**[`-projected-read-hit <percent>`] - Projected Read Hit (privilege: advanced)**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs for this volume.

### **[`-projected-write-hit <percent>`] - Projected Write Hit (privilege: advanced)**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs for this volume.

### **[`-num-intervals-show <integer>`] - Number of intervals to show (privilege: advanced)**

This parameter indicates the number of intervals to the past this command is showing.

## **Examples**

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer volume
show
Node          FC      Aggregate  Volume      Rank  Read Thrupt Write
Thrupt
-----
vsim1         false aggr0      vol0         1     230.47KBps
580.09KBps
```

# **storage disk commands**

## **storage disk assign**

Assign ownership of a disk to a system

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage disk assign` command is used to assign ownership of an unowned disk or array LUN to a specific node. You can also use this command to change the ownership of a disk or an array LUN to another node. You can designate disk ownership by specifying disk names, array LUN names, wildcards, or all (for all disks or array LUNs visible to the node). For disks, you can also set up disk ownership autoassignment. You can also assign disks to a particular pool. You can also assign disks by copying ownership from another disk.

### **Parameters**

#### **{ [`-disk <disk path name>`] - Disk Path**

This specifies the disk or array LUN that is to be assigned. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where `prefix` is the storage array's prefix and `number` is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance,

disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.

- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

A subset of disks or array LUNs can be assigned using the wildcard character (\*) in the `-disk` parameter. Either the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter must be specified with the `-disk` parameter. Do not use the `-node` parameter with the `-disk` parameter.

#### **| -disklist <disk path name>,... - Disk list**

This specifies the List of disks to be assigned.

#### **| -all <true> - Assign All Disks**

This optional parameter causes assignment of all visible unowned disks or array LUNs to the node specified in the `-node` parameter. The `-node` parameter must be specified with the `-all` parameter. When the `-copy-ownership-from` parameter is specified with the `-node` parameter, it assigns disk ownership based on the `-copy-ownership-from` parameter; otherwise it assigns ownership of the disks based on the `-node` parameter. Do not use the `-owner` or the `-sysid` parameter with the `-all` parameter.

#### **[ -T, -type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Storage Type**

This optional parameter assigns ownership of a specific type of disk or array LUN (or a set of disks/array LUNs) to a node. The `-count` parameter must be specified with the `-type` parameter.

#### **-n, -count <integer> - Disk Count**

This optional parameter assigns ownership of a number of disks or array LUNs specified in the `-count` parameter, to a node.

#### **| -auto <true> - Auto Assign }**

This optional parameter causes all visible disks eligible for autoassignment to be immediately assigned to the node specified in the `-node` parameter. Only unowned disks on loops or stacks owned wholly by that system and which have the same pool information will be assigned. The `-node` parameter must be specified with the `-auto` parameter. Do not use the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter with the `-auto` parameter. When possible, use the `-auto` parameter rather than the `-all` parameter to conform to disk ownership best practices. The `-auto` parameter is ignored for array LUNs.

#### **[ -p, -pool <integer>] - Pool**

This optional parameter specifies the pool to which a disk must be assigned. It can take values of "0" or "1".

#### **{ [-o, -owner <nodename>] - Owner Name**

This optional parameter specifies the node to which the disk or array LUN has to be assigned.

**`[-s, -sysid <nvramid>] - New Owner ID`**

This optional parameter specifies the serial number (NVRAM ID) of the node to which the disk or array LUN has to be assigned.

**`| [-copy-ownership-from <disk path name>] - Disk Name to Copy Ownership }`**

This optional parameter specifies the disk name from where the node needs to copy disk ownership information. You can use this parameter for disks to have the same ownership as the provided input disk.

**`[-c, -checksum {block|zoned|advanced_zoned}] - Checksum Compatibility`**

This optional parameter is used to set the checksum type for a disk or an array LUN. The possible values are *block*, *zoned*, and *advanced\_zoned*. This operation will fail if the specified disk is incompatible with the specified checksum type. A newly created aggregate with zoned checksum array LUNs is assigned advanced zoned checksum (AZCS) checksum type. AZCS checksum type provides more functionality than the "version 1" zoned checksum type which has been supported in previous ONTAP releases. Zoned checksum spare array LUNs added to an existing zoned checksum aggregate continue to be zoned checksum. Zoned checksum spare array LUNs added to an AZCS checksum type aggregate use the AZCS checksum scheme for managing checksums. For some disks (e.g. FCAL, SSD, SAS disks), the checksum type cannot be modified. For more information on modifying the checksum type, refer to the "Physical Storage Management Guide".

**`[-f, -force <true>] - Force Flag`**

This optional parameter forces the assignment of ownership of an already owned disk to a node. This parameter could also be used to assign an array LUN with a redundancy error, for example, if the array LUN is available on only one path. For a disk which is part of a live aggregate, even specification of the `-force` parameter would not force the assignment, since it would be catastrophic.

**`[-N, -node <nodename>] - Node Name (For Auto Assign)`**

This optional parameter is used with either the `-auto` or the `-all` parameter. If used with the `-auto` parameter, all disks which are visible to the node specified in the `-node` parameter and which are eligible for autoassignment would be assigned to it. If used with the `-all` parameter, all unowned disks or array LUNs visible to the node would be assigned to it.

**`{ [-root <true>] - Root Partition of Root-Data or Root-Data1-Data2 Partitioned Disk (privilege: advanced)`**

This optional parameter assigns the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

**`| [-data <true>] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)`**

This optional parameter assigns the data partition of a root-data partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

**`| [-data1 <true>] - Data1 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced)`**

This optional parameter assigns the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

**`| [-data2 <true>] - Data2 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced) }`**

This optional parameter assigns the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

## Examples

The following example assigns ownership of an unowned disk named ``\_1\_`` . ``\_1\_`` . ``\_16\_`` to a node named ``\_node1\_`` :

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
```

The following example assigns all unowned disks or array LUNs visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -all -node node1
```

The following example autoassigns all unowned disks (eligible for autoassignment) visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -auto -node node1
```

The following two examples show the working of the `-force` parameter with a spare disk that is already owned by another system:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
Error: command failed: Failed to assign disks. Reason: Disk 1.1.16 is
already owned.
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -force
Success.
```

The following example assigns ownership of the set of unowned disks on *<stack> 1* , to a node named *node1* :

```
cluster1::> storage disk assign -disk 1.* -owner node1
```

The following example assigns ownership of unowned disk *1.1.16* by copying ownership from disk *1.1.18* :

```
cluster1::> storage disk assign -disk 1.1.16
-copy-ownership-from 1.1.18
```

The following example assigns all unowned disks visible to a node named ``\_node1\_`` by copying ownership from disk ``\_1\_`` . ``\_1\_`` . ``\_18\_`` :

```
cluster1::> storage disk assign -all -node node1
          -copy-ownership-from 1.1.18
```

The following example assigns the root partition of disk *1.1.16* to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -root true
          -force true
```

The following example assigns the data partition of root-data partitioned disk *1.1.16* to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -data true
          -force true
```

The following example assigns the data1 partition of root-data1-data2 partitioned disk *1.1.24* to node1.

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data1 true
          -force true
```

The following example assigns the data2 partition of root-data1-data2 partitioned disk *1.1.24* to node1.z33

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data2 true
          -force true
```

## storage disk fail

### Fail the file system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk fail` command can be used to manually force a file system disk to fail. It is used to remove a file system disk that may be logging excessive errors and requires replacement. To unfail a disk, use the [storage disk unfail](#) command.

### Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the disk to be failed.

### **[-i, -immediate <true>] - Fail immediately**

This parameter optionally specifies whether the disk is to be failed immediately. It is used to avoid Rapid RAID Recovery and remove the disk from the RAID configuration immediately. Note that when a file system disk has been removed in this manner, the RAID group to which the disk belongs enters degraded mode (meaning a disk is missing from the RAID group). If a suitable spare disk is available, the contents of the disk being removed are reconstructed onto that spare disk.

## **Examples**

The following example fails a disk named 1.1.16 immediately:

```
cluster1::> storage disk fail -disk 1.1.16 -i true
WARNING: The system will not prefail the disk and its contents will not be
copied to a replacement disk before being failed out. Do you want to
fail out the disk immediately? {y|n}: y
```

## **Related Links**

- [storage disk unfail](#)

## **storage disk reassign**

(DEPRECATED)-Change the default owner of all disks from one node to another

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

The `storage disk reassign` is deprecated and may be removed in a future release of ONTAP. Disk reassignment is no longer required as part of a controller replacement procedure. For further information, see the latest controller or NVRAM FRU replacement flyer for your system. This command changes the ownership of all disks on a node to the ownership of another node. Use this command only when a node has a complete failure (for instance, a motherboard failure) and is replaced by another node. If the node's disks have already been taken over by its storage failover partner, use the `-force` parameter.

## **Parameters**

### **-s, -homeid <nvrleid> - Current Home ID (privilege: advanced)**

This specifies the serial number of the failed node.

### **-d, -newhomeid <nvrleid> - New Home ID (privilege: advanced)**

This specifies the serial number of the node that is to take ownership of the failed node's disks.

### **[-f, -force <true>] - Force (privilege: advanced)**

This optionally specifies whether to force the reassignment operation. The default setting is `false`.

## Examples

In the following example, a node named node0 and having serial number 12345678 has failed. Its disks have not been taken over by its storage failover partner. A replacement node with serial number 23456789 was installed and connected to node0's disk shelves. To assign node0's disks to the new node, start the new node and run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and
1.1.24
were reassigned to new owner with serial number 23456789.
```

In the following example, a similar failure has occurred, except that node0's disks have been taken over by its storage failover partner, node1. A new node with serial number 23456789 has been installed and configured. To assign the disks that previously belonged to node0 to this new node, run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
-force true
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and
1.1.24
were reassigned to new owner with serial number 23456789.
```

## storage disk refresh-ownership

### Refresh the disk ownership information on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command updates the disk ownership information for all the disks attached to a node to the latest view for all the nodes in the cluster. During normal operations, disk ownership is kept up to date automatically. In certain circumstances, however, disk ownership must be updated manually. If this is required, EMS messages will indicate that this command should be run. If the *-node* parameter is provided, the disk ownership information is updated only on the node specified.

### Parameters

**[*-node* {<nodename>|local}] - Node (privilege: advanced)**

If this parameter is provided, the disk ownership information is updated only on the node specified.

## Examples

The following example refreshes the disk ownership information for all the nodes in the cluster:

```
cluster1::> storage disk refresh-ownership
```

## storage disk remove-reservation

Removes reservation from an array LUN marked as foreign.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk remove-reservation` command removes persistent reservation from a specified foreign array LUN.

### Parameters

**-disk <disk path name> - Disk Name (privilege: advanced)**

This specifies the disk from which persistent reservation is to be removed.

### Examples

The following example removes the persistent reservation from a disk named node1:switch01:port.126L1.

```
cluster1:> storage disk remove-reservation -disk  
node1:switch01:port.126L1
```

## storage disk remove

Remove a spare disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk remove` command removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete.

This command does not remove disk ownership information from the disk. Therefore, if you plan to reuse the disk in a different storage system, you should use the [storage disk removeowner](#) command instead. See the "Physical Storage Management Guide" for the complete procedure.

For systems with multi-disk carriers, it is important to ensure that none of the disks in the carrier are filesystem disks before attempting removal. To convert a filesystem disk to a spare disk, see [storage disk replace](#) .

### Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the disk to be removed.

### Examples

The following example removes a spare disk named 1.1.16:

```
cluster1::> storage disk remove -disk 1.1.16
```

## Related Links

- [storage disk removeowner](#)
- [storage disk replace](#)

## storage disk removeowner

### Remove disk ownership

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk removeowner` command removes ownership from a specified disk. Then disk can then be reassigned to a new owner.

### Parameters

**-disk <disk path name> - Disk Name**

This specifies the disk whose ownership is to be removed.

### Examples

The following example removes the ownership from a disk named 1.1.27.

```
cluster1::> storage disk removeowner -disk 1.1.27
```

## storage disk replace

### Initiate or stop replacing a file-system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk replace` command starts or stops the replacement of a file system disk with spare disk. When you start a replacement, Rapid RAID Recovery begins copying data from the specified file system disk to a spare disk. When the process is complete, the spare disk becomes the active file system disk and the file system disk becomes a spare disk. If you stop a replacement, the data copy is halted, and the file system disk and spare disk retain their initial roles.

### Parameters

**-disk <disk path name> - Disk Name**

This specifies the file system disk that is to be replaced. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

#### **-action {start | stop} - Action**

This specifies whether to start or stop the replacement process.

#### **[-replacement <disk path name>] - Replacement**

This specifies the spare disk that is to replace the file system disk.

#### **[-allow-same-carrier <true>] - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you replace a disk in an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can replace a disk in an aggregate with a disk that causes this situation, but when an alternate disk becomes available, ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, ensure that disks housed in the same carrier are in different RAID groups.

This parameter affects only the disk replace operation. It is not a persistent attribute of the aggregate.

#### **[-m, -allow-mixing <true>] - Allow Mixing of Disks of Different RPM or Pool**

This optional parameter specifies whether the disk can be replaced with another disk of different RPM or from different Pool. This parameter affects only the current disk replacement operation.

## **Examples**

The following example begins replacing a file system disk named `1.0.16` with a spare disk named `1.1.14`.

```
cluster1::> storage disk replace -disk 1.0.16 -replacement 1.1.14 -action
start
```

## storage disk sanitize-spare

Sanitize a spare disk (non-cryptographically)

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk sanitize-spare` command sanitizes the specified spare disk (non-cryptographically).

### Parameters

**-disk <disk path name> - Disk Name (privilege: advanced)**

This parameter specifies the spare disk to be sanitized (non-cryptographically).

### Examples

The following example sanitizes a spare disk named 1.1.16 (non-cryptographically):

```
cluster1::> storage disk sanitize-spare -disk 1.1.16
```

## storage disk set-foreign-lun

Sets or Unsets an array LUN as foreign

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk set-foreign-lun` command sets or unsets a specified array LUN as foreign. This command will enable/disable the feature of importing the data from foreign LUN.

### Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the array LUN which is to be set or unset as foreign.

**-is-foreign-lun <true> - Is Foreign LUN**

If the parameter value specified is *true* then array LUN is set as foreign. If the parameter value specified is *false* then array LUN foreignness is cleared.

### Examples

The following example shows how to set an array LUN as foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun
true
```

The following example shows how to mark an array LUN as not foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun
false
```

## storage disk set-led

Identify disks by turning on their LEDs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk set-led` command controls the LED of a specified disk.

You can turn an LED on or off, cause it to blink or stop blinking, or test it.

This command is useful for locating a disk in its shelf.

### Parameters

**-action {on|off|blink|blinkoff|testall|resetall} - Action**

This parameter specifies the state to which the LED is to be set. Possible values include the following:

- on - The LED is lit steadily
- off - The LED is not lit
- blink - The LED blinks
- blinkoff - The LED stops blinking and is not lit
- testall - This tests the operation of every disk enclosure's hardware and drivers per node. Do not use this value in normal operation.
- resetall - This resets the LED of every disk on the node and lights up the LED of disks with faults.

**{ [-disk <disk path name>] - Disk Name**

This specifies the disk whose LED is to be set. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`

. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.

- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

#### **| [-adapter <text>] - Adapter Name**

The name of the adapter to which the shelves of disks of interest are attached to.

#### **[-node {<nodename>|local}] - Node Name }**

The node for which action is to be taken.

#### **[-duration <integer>] - Duration (minutes)**

This specifies the duration, in minutes, that the LED is to remain in the specified state. Only actions "on" and "blink" are supported.

#### **[-iteration <integer>] - Test iterations**

This specifies the number of iterations to run the action for. Only action "test-all" is supported.

### **Examples**

The following example causes the LEDs on all disks whose names match the pattern 1.0.\* to turn on for 5 minutes:

```
Cluster1::> storage disk set-led -disk 1.0.* -action on -duration 5
```

The following example causes the LEDs on disks 1.0.0 and 1.0.1 to turn on for 2 minutes:

```
Cluster1::> storage disk set-led -disk 1.0.0,1.0.1 -action on -duration 2
```

The following example causes the LEDs on all disks attached to adapter 0b on Node2 to turn on for 1 minute:

```
Cluster1::> storage disk set-led -node Node2 -adapter 0b -action on  
-duration 1
```

The following example resets the LEDs on all disks on the local node and causes the LEDs of disks with faults to turn on:

```
Cluster1::> storage disk set-led -action resetall
```

The following example tests the LEDs on all disks owned by the local node for 3 iterations:

```
Cluster1::> storage disk set-led -action testall -iteration 3
```

## storage disk show

Display a list of disk drives and array LUNs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk show` command displays information about disks and array LUNs. Where it appears in the remainder of this document "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks in column style output:

- Disk name
- Usable space on the disk, in human readable units
- Shelf number
- Bay number
- Container type (aggregate, broken, foreign, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, volume, or unsupported)
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Container name
- Owning node name

To display detailed information about a single disk, use the `-disk` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all disks, in column style output.

**| [-broken ]**

Displays the following RAID-related information about broken disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage reason
- Host bus adapter
- Shelf number

- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

#### | **[-errors ]**

Displays the following disk information about the disks which have errors.

- Disk Name
- Error Type
- Error Description and corresponding corrective action

#### | **[-foreign ] (privilege: advanced)**

Displays the following foreign LUN import related information about foreign disks:

- Disk name
- Array name
- Capacity in sectors
- Capacity in mb
- Serial Number

#### | **[-longop ]**

Displays the following information about long-running disk operations, in column style output:

- Disk name
- Whether the disk is marked as prefailed
- Whether the disk is being replaced
- Whether the disk is zeroed
- Copy destination
- Percentage of copy complete
- Percentage of zeroing complete
- Percentage of reconstruction complete

#### | **[-maintenance ]**

Displays the following RAID-related information about disks in the maintenance center:

- Original owning node name
- Checksum compatibility
- Disk name

- Outage Reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

#### | **[-ownership ]**

Displays the following ownership-related information:

- Disk name
- Aggregate name
- Home node name
- Owning node name
- Disaster recovery home node name
- Home node system id
- Owning node system id
- Disaster recovery home node system id
- Reservation node system id
- SyncMirror pool

#### | **[-partition-ownership ]**

Displays the following ownership-related information for partitioned disks:

- Disk name
- Aggregate name
- Owner of root partition on a partitioned disk
- Owner system id of root partition on a partitioned disk
- Owner of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner system id of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner of data2 partition on a root-data1-data2 partitioned disk
- Owner system id of data2 partition on a root-data1-data2 partitioned disk
- Owner of the disk which is partitioned
- Owner system id of the disk which is partitioned

### | **[-physical ]**

Displays the following information about the disk's physical attributes, in column style output:

- Disk name
- Disk type
- Disk vendor
- Disk model
- Firmware revision level
- RPM (Revolutions per minute)
- BPS (Bytes per sector)

### | **[-physical-location ] (privilege: advanced)**

Displays the following information about disks:

- Disk name
- Container type
- Primary path
- Location
- Home node name
- Physical size in human readable units

### | **[-port ]**

Displays the following path-related information:

- Disk name and disk port associated with disk primary path
- Disk name and disk port associated with the disk secondary path, for a multipath configuration
- Type, shelf, and bay information for the disks

### | **[-primary-paths ] (privilege: advanced)**

Displays the following information about disks:

- Disk Name
- Shelf
- Bay
- Container Type
- Primary Path

### | **[-raid ]**

Displays the following RAID-related information:

- Disk name
- Container type (aggregate, broken, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, or volume)
- Outage reason

- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- RAID group name
- Aggregate name

#### | **[-raid-info-for-aggregate ]**

Displays the following RAID-related information about the disks used in an aggregate:

- Owning node name
- Aggregate name
- Plex name
- RAID group name
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units

When this parameter is specified, RAID groups that use shared disks are not included. Use [storage aggregate show-status](#) to show information for all RAID groups and aggregates.

#### | **[-spare ]**

Displays the following RAID-related information about available spare disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- Disk class
- RPM (Revolutions per minute)
- Usable size in human readable units

- Physical size in human readable units
- Current owner node

## | **[-ssd-wear ]**

Displays the following wear life related information about solid state disks:

- **Rated Life Used** : An estimate of the percentage of device life that has been used, based on the actual device usage and the manufacturer's prediction of device life. A value greater than 99 indicates that the estimated endurance has been used, but this does not necessarily indicate a device failure. Omitted if value is unknown.
- **Spare Blocks Consumed Limit** : Spare blocks consumed percentage limit reported by the device. When the Spare Blocks Consumed percentage for the device reaches this read-only value, ONTAP initiates a disk copy operation to prepare to remove the device from service. Omitted if value is unknown.
- **Spare Blocks Consumed** : Percentage of device spare blocks that have been used. Each device has a number of spare blocks that will be used when a data block can no longer be used to store data. This value reports what percentage of the spares have already been consumed. Omitted if value is unknown.

## | **[-virtual-machine-disk-info ]**

Displays information about ONTAP virtual disks, their mapped datastores and their specific backing device attributes, such as: disk or LUN, adapter and initiator details (if applicable).

- Disk name.
- Name of the node.
- ONTAP-supplied serial number of the system disk.
- Size of the system disk.
- Name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- File name of the virtual disk used by the hypervisor. Each ONTAP disk is mapped to a unique VM disk file.
- Type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- Size of the disk backing store.
- Full path to the backing store for network-attached storage. This field is valid only for NAS connections.
- Backing adapter PCI device ID for the virtual disk, for example "50:00.0".
- Backing adapter device name, for example "vmhba32".
- Backing adapter model type, for example "LSI1064E".
- Backing adapter driver name of the initiator.
- The iSCSI name of the disk backing target. This field is valid only for iSCSI connections.
- The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections.
- SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1".
- Hypervisor-assigned unique ID of the backing device (disk or LUN).
- Backing disk partition number where the corresponding VM disk file resides.
- Size of the backing device (disk or LUN).

- Backing device manufacturer, for example "FUJITSU" or "IBM".
- Backing device model, for example "MBE2073RC" or "LUN".
- Storage account associated with the VM Disk.
- Container associated with the VM Disk.
- Page blob associated with the VM Disk.
- Error (if any) while retrieving virtual disk details.

#### | [-vmdisk-backing-info ]

Displays information about the backing disks on certain ONTAP-v models:

- Disk name
- Backing disk vendor
- Backing disk model
- Backing disk serial number
- Backing disk device id

#### | [-instance ] }

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

#### [-disk <disk path name>] - Disk Name

Displays detailed information about the specified disks. Disk names take one of the following forms:

- Disks are named in the form *<stack-id>.<shelf>.<bay>*
- Disks on multi-disk carriers are named in the form *<stack-id>.<shelf>.<bay>.<lun>*
- Virtual disks are named in the form *<prefix>.<number>*, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to ONTAP 8.3:

- Disks that are not attached to a switch are named in the form *<node>:<host\_adapter>.<loop\_ID>*. For disks with a LUN, the form is *<node>:<host\_adapter>.<loop\_ID>L<LUN>*. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form *<node>:<switch\_name>:<switch\_port>.<loop\_ID>*. For disks with a LUN, the form is *<node>:<switch\_name>:<switch\_port>.<loop\_ID>L<LUN>*. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

**[-owner {<nodename>|local}] - Owner**

Selects information about disks that are owned by the specified node.

**[-owner-id <nvramid>] - Owner System ID**

Selects the disks that are owned by the node with the specified system ID.

**[-is-foreign {true|false}] - Foreign LUN (privilege: advanced)**

Selects information about array LUNs that have been declared to be foreign LUNs.

**[-uid <text>] - Disk Unique ID**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`

**[-aggregate <aggregate name>] - Aggregate**

Selects information about disks that belong to the specified aggregate.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-average-latency <integer>] - Average I/O Latency Across All Active Paths**

Selects information about disks that have the specified average latency.

**[-bay <integer>] - Bay**

Selects information about disks that are located in the carrier within the specified shelf bay.

**[-bps <integer>] - Bytes Per Sector**

Selects information about disks that have the specified number of bytes per sector. Possible settings are 512, 520, 4096, and 4160.

**[-carrier-id <text>] - Carrier ID**

Selects information about disks that are located within the specified multi-disk carrier.

**[-checksum-compatibility {advanced\_zoned | block | none}] - Checksum Compatibility**

Selects information about disks that have the specified checksum compatibility.

**[-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

Selects information about disks that have the specified disk class.

- capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD, SSD-CAP and SSD-NVM.
- array = Logical storage devices backed by storage arrays and used by ONTAP as disks. Includes disk type LUN.
- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

**`[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type`**

Selects information about disks that have the specified container type.

- Aggregate = Disk is used as a physical disk in an aggregate.
- Broken = Disk is in broken pool.
- Foreign = Array LUN has been marked foreign.
- Labelmaint = Disk is in online label maintenance list.
- Maintenance = Disk is in maintenance center.
- Mediator = A mediator disk is a disk used on non-shared HA systems hosted by an external node which is used to communicate the viability of the storage failover between non-shared HA nodes.
- Remote = Disk belongs to the remote cluster.
- Shared = Disk is partitioned or in a storage pool.
- Spare = Disk is a spare disk.
- Unassigned = Disk ownership has not been assigned.
- Unknown = Container is currently unknown. This is the default setting.
- Unsupported = Disk is not supported.

**`[-container-name <text>] - Container Name`**

Selects information about disks that have the specified container name. + If a disk is in an aggregate or storage pool, the container name is the name of the aggregate or storage pool. + Spare disks show the SyncMirror Pool to which they belong. + Partitioned disks could return multiple aggregate names.

**`[-copy-destination <disk path name>] - Copy Destination Name`**

Selects information about disks whose contents are being copied (due to either Rapid RAID Recovery or disk replacement) to the specified spare disk.

**`[-copy-percent <integer>] - Percentage of Copy Complete`**

Selects information about disks that are involved as either a source or destination of a copy operation, (due to either disk replacement or Rapid RAID Recovery) and that have the specified percentage of the copy operation completed.

**`[-data-owner {<nodename>|local}] - Owner of Data Partition of Root-Data Partitioned Disk`**

Selects information about disks that have the specified data partition owner name. Used with root-data partitioned disks.

**`[-data1-owner {<nodename>|local}] - Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk`**

Selects information about disks that have the specified data1 partition owner name. Used with root-data1-data2 partitioned disks.

**`[-data2-owner {<nodename>|local}] - Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk`**

Selects information about disks that have the specified data2 partition owner name. Used with root-data1-data2 partitioned disks.

**[-data-home {<nodename>|local}] - Home Owner of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner name. Used with root-data partitioned disks.

**[-data1-home {<nodename>|local}] - Home Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data2-home {<nodename>|local}] - Home Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data-owner-id <nvramid>] - Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition owner system ID. Used with root-data partitioned disks.

**[-data1-owner-id <nvramid>] - Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data2-owner-id <nvramid>] - Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data-home-id <nvramid>] - Home Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner system ID. Used with root-data partitioned disks.

**[-data1-home-id <nvramid>] - Home Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner system ID. Used with root-data1-data2 partitioned disks.

**[-data2-home-id <nvramid>] - Home Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner system ID. Used with root-data1-data2 partitioned disks.

**[-disk-io-kbps-total <integer>] - Total Disk Throughput in KBPS Across All Active Paths**

Selects information about disks that have attained the specified I/O throughput on all connected paths.

**[-disk-iops-total <integer>] - Total Disk IOPs Across All Active Paths**

Selects information about disks that have achieved the specified number of IOPs per second on all connected paths.

**[-diskpathnames <disk path name>,...] - List of Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-effective-rpm <integer>] - Effective RPM**

Selects information about disks with the specified effective rotational speed.

**[-dr-home {<nodename>|local}] - Disaster Recovery Home**

Selects information about disks that have the specified Disaster home node.

**[-dr-home-id <nvramid>] - Disaster Recovery Home System ID**

Selects information about disks whose Disaster home node has the specified system id.

**[-drawer <integer>] - Drawer**

Selects information about disks that are located in the specified drawer.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Selects information about disks that have the specified error types.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of ONTAP.
- netapp = A SAN front-end LUN from one ONTAP system that is presented as external storage to another ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

**[-firmware-revision <text>] - Firmware Revision**

Selects information about disks that have the specified firmware revision level.

**[-home {<nodename>|local}] - Home**

Selects information about disks that have the specified home node.

**[-home-id <nvramid>] - Home System ID**

Selects information about disks whose home node has the specified system ID.

**[-host-adapter <text>] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[-import-in-progress {true|false}] - Foreign LUN import in progress**

Selects information about the array LUNs that are currently being imported

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks that are visible to an initiator that has executed the specified number of IOPs.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks that are visible to an initiator connected to the specified switch port.

**[-is-multidisk-carrier {true|false}] - Multi Disk Carrier?**

Selects information about disks that are located within a multi-disk carrier.

**[-is-local-attach {true|false}] - Indicates If the Disk Is Local to This Cluster**

Selects information about disks attached to the local(true) or remote(false) MetroCluster site.

**[-location {<nodename>|local}] - Physical Location**

Selects information about disks attached to the specified node.

**[-location-id <nvramid>] - The system ID of the node where the disk is attached**

Selects information about disks attached to the node with the specified system ID.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-model <text>] - Model**

Selects information about disks of the specified model.

**[-nodelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-outage-reason <text>] - Outage Reason**

Selects information about disks that are not in service for the specified reason. Possible values are: admin failed, admin removed, admin testing, evacuated, bad label, bypassed, failed, init failed, label version, labeled broken, labelmaint, LUN resized, missing, not responding, predict failure, rawsize shrank, recovering, sanitizing, sanitized, SnapLock Disk, testing, unassigned, unknown.

**[-path-error-count <integer>] - Path Error Count**

Selects information about disks that are visible on a path that has incurred the specified number of errors.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link errors.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-physical-size-mb <integer>] - Physical Size (MB)**

Selects information about disks that have the specified physical capacity, in megabytes.

**[-physical-size {<integer>[KB|MB|GB|TB|PB]}] - Physical Size**

Selects information about disks that have the specified physical capacity, in human readable units.

**[-physical-size-512b <integer>] - Physical Size in Units of 512 Bytes**

Selects information about disks that have the specified physical capacity, in 512-byte chunks. This parameter is present only for backwards compatibility with ONTAP 8.0.

**[-plex <text>] - Plex Name**

Selects information about disks that belong to the specified RAID plex.

**[-pool <text>] - Assigned Pool**

Selects information about disks that belong to the specified SyncMirror pool (pool0 or pool1).

**[-port-speed <text>,...] - Port Speed**

Selects information about disks that are served by a Host Bus Adapter that is running at the specified port speed.

**[-position <diskPositionType>] - Disk Position**

Selects information about disks that have the specified position within their disk container.

**[-power-on-hours <integer>] - Hours Powered On**

Selects information about disks that have the specified number of hours being powered up.

**[-prefailed {true|false}] - Marked for Rapid RAID Recovery?**

Selects information about disks that match the specified parameter value indicating whether the disk is either awaiting or is in process of Rapid RAID Recovery.

**[-preferred-target-port {true|false}] - Whether or not target port group is preferred  
(privilege: advanced)**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[-primary-port <text>] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[-raid-group <text>] - Raid Group Name**

Selects information about disks that belong to the specified RAID group.

**[-reconstruction-percent <integer>] - Percentage of Reconstruction Complete**

Selects information about disks that are being reconstructed and that have the specified percentage of the reconstruction operation completed.

**[-replacing {true|false}] - Being Replaced?**

Selects information about disks that match the specified boolean value indicating whether the disk is either awaiting or in process of disk replacement.

**[-reservation-key <text>] - Reservation Key**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation key.

**[-reservation-type {rs|we|re|ea|sa|wero|earo|wear|eaa|none}] - Reservation Type**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation type. Possible values are: rs, we, re, ea, sa, wero, earo, wear, eaa, or none.

**[-reserver-id <integer>] - Reservation System ID**

Selects information about disks that are reserved by the node with the specified system ID.

**[-root-owner {<nodename>|local}] - Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-owner-id <nvramid>] - Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home {<nodename>|local}] - Home Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home-id <nvramid>] - Home Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-rpm <integer>] - Revolutions Per Minute**

Selects information about disks that have the specified rotational speed.

**[-secondary-name <disk path name>] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[-secondary-port <text>] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

**[-serial-number <text>] - Serial Number**

Selects information about the disk that has the specified serial number.

**[-storage-pool <text>] - Storage Pool Name**

Selects information about disks that belong to the specified SSD storage pool.

**[-shelf <integer>] - Shelf**

Selects information about disks that are located within the specified shelf.

**[-shelf-uid <text>] - Shelf UID**

Selects information about disks that are located within a shelf with the specified Shelf UID.

**[-slot <integer>] - Slot**

Selects information about disks that are located in a drawer with the specified slot.

**[-stack-id <integer>] - Stack ID**

A cluster unique id for a collection of one or more interconnected shelves.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have performed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have reached the specified I/O throughput.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks that are visible on target ports that have the specified access state.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects information about disks that have the specified disk type.

**[-usable-size-mb <integer>] - Usable Size (MB)**

Selects information about disks that have the specified usable space, in megabytes.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Usable Size**

Selects information about disks that have the specified usable space, in human readable units.

**[-vendor <text>] - Vendor Name**

Selects information about disks that have the specified vendor.

**[-vmdisk-device-id <integer>,...] - Virtual Disk Device ID**

Selects information about disks that have the specified virtual disk device ID.

**[-zeroed {true|false}] - Zeroed?**

Selects information about disks that have (true) or have not (false) been fully pre-zeroed.

**[-zeroing-percent <integer>] - Percentage of Zeroing Complete**

Selects information about disks that are zeroing and have the specified percentage complete.

**[-carrier-serialno <text>] - Carrier Serial Number**

Selects information about disks that are located within the multi-disk carrier specified by the serial number.

**[`-vmdisk-target-address <text>`] - Target Address of the VM Disk**

Displays the VM Disk's target address either in the form of bus target lun or bus unit.

**[`-path-count <integer>`] - Number of Paths to Disk**

Selects information about disks that have the specified number of paths.

**[`-hw-minimum-os <ClusterVersion>`] - Hardware Minimum Supported ONTAP Version (x.y.z)**

Selects information about disks that have the specified hardware minimum supported ONTAP version in x.y.z format, for example "9.8.0" or "9.9.1".

**[`-bridge-serialno <text>`] - Bridge Serial Number**

Selects information about disks that are specified by the bridge serial number.

**[`-mailbox-disk-type <text>`] - Mailbox Disk Type**

The type of mediator mailbox disk.

- disk = disks from mediator node
- database = cloud database table

## Examples

The following example displays information about all disks:

```
cluster1::> storage disk show
```

| Disk<br>Owner   | Usable<br>Size | Shelf | Bay | Container<br>Type | Position | Aggregate   |
|-----------------|----------------|-------|-----|-------------------|----------|-------------|
| -----           | -----          | ----- | --- | -----             | -----    | -----       |
| 1.1.1<br>node1  | 10GB           | 1     | 1   | spare             | present  | -           |
| 1.1.4<br>node1  | 78.59GB        | 1     | 4   | spare             | present  | -           |

- [storage aggregate show-status](#)

## storage disk unfail

Unfail a broken disk

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage disk unfail` command can be used to unfail a broken disk.

If the attempt to unfail the disk is unsuccessful, the disk remains in the broken state.

The disk unfail command prompts for confirmation unless you specify the `"-quiet"` parameter.

## Parameters

**`-disk <disk path name>` - Disk Name (privilege: advanced)**

This parameter specifies the disk to be unfailed.

**`[-s, -spare <true>]` - Make the Disk Spare (privilege: advanced)**

This parameter specifies whether the unfailed disk will be made a spare disk. The disk is forced to become a spare disk if this parameter is specified.

If this parameter is not specified, the disk is brought back into its parent aggregate. Setting this parameter might result in the aggregate coming back online if it is not complete or online. The default value is false.

**`[-q, -quiet <true>]` - Confirmations off (privilege: advanced)**

You can set this parameter to true to suppress the confirmation messages. However, before proceeding with the command, you should be aware that the confirmation message contains important information about the effect of unfailling a disk. This command cannot be reversed once it is invoked. The default value is false.

## Examples

The following example unfails a disk named 1.1.16:

```
cluster1::*> storage disk unfail -disk 1.1.16
```

Warning: Failed disk "1.1.16" may have aggregate labels and file system data present. In that case, this command will attempt to bring this disk back into the aggregate with which this disk had formerly been associated and preserve file system data. Are you sure you want to continue with disk unfail? {y|n}:

## storage disk updatefirmware

(DEPRECATED) - Update disk firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of ONTAP. Use the `"storage disk firmware update"` command.

The `storage disk updatefirmware` command updates the firmware on one or more disks.

You can download the latest firmware by using the [storage firmware download](#) command.

You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter, or you can update the firmware on all local disks by omitting the `-disk` parameter.

## Parameters

### **[`-disk <disk path name>,...`] - Disk**

This specifies the disk or disks whose firmware is to be updated.

If you do not specify this option, all local disks' firmware is updated.

## Examples

The following example updates the firmware on all disks:

```
cluster1::> storage disk updatefirmware
```

## Related Links

- [storage disk firmware update](#)
- [storage firmware download](#)

## storage disk zerospares

### Zero non-zeroed spare disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage disk zerospares` command zeroes all non-zeroed spare disks in all nodes or a specified node in the cluster. A node must be online to zero disks. This operation must be done before a disk can be reused in another aggregate. This version of ONTAP uses fast zeroing, which converts a spare disk from non-zeroed to zeroed without the long wait times required when physically zeroing a disk.

## Parameters

### **[`-owner {<nodename>|local}`] - Owner**

If this parameter is specified, only non-zeroed spares assigned to the specified node will be zeroed. Otherwise, all non-zeroed spares in the cluster will be zeroed.

## Examples

The following example zeroes all non-zeroed spares owned by a node named `node4`, using fast zeroing:

```
cluster1::> storage disk zerospares -owner node4
```

## storage disk error show

Display disk component and array LUN configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk error show` command displays disk component and array LUN configuration errors.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Displays the error information of the disk whose unique ID matches the value you specify. A disk unique identifier has the form:

```
`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000:00000000`
```

**[-array-name <array name>] - Array Name**

Displays the errors of the storage array whose name you specified.

**[-node {<nodename>|local}] - Controller Name**

Displays the error information for the disks on the clustered node whose name you specified.

**[-disk <disk path name>] - Disk**

Displays detailed error information about the disk you specified.

**[-serial-number <text>] - Serial Number**

Displays the error information for the disk whose serial number you specified.

**[-error-id <integer>,...] - Error ID**

Displays the error information for the disks whose Error IDs match IDs you specified.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Displays all disk errors of the error types you specified, grouped by type.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.

- **foreign** = The array LUN is marked as foreign and has some external SCSI reservations other than those from ONTAP.
- **toobig** = The array LUN exceeds the maximum array LUN size that ONTAP supports.
- **toosmall** = The array LUN is less than the minimum array LUN size that ONTAP supports.
- **invalidblocksize** = The array LUN is not a valid block size.
- **targetasymmap** = The array LUN is presented more than once on a single target port.
- **deviceasymmap** = The array LUN is presented with multiple IDs.
- **failovermisconfig** = The array LUN is configured with inconsistent failover methods.
- **unknown** = The array LUN from a storage array that is not supported by this version of ONTAP.
- **netapp** = A SAN front-end LUN from one ONTAP system that is presented as external storage to another ONTAP system.
- **fwdownrev** = The disk firmware is a down version.
- **qualfail** = The disk is not supported.
- **diskfail** = The disk is in a failed state.
- **notallflashdisk** = The disk does not match the All-Flash Optimized personality of the system.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage disk error show
Disk           Error Type           Error Text
-----
1.02.0         qualfail           This disk failed dynamic disk
qualification. Update the Disk Qualification Package.
```

## storage disk firmware revert

### Revert disk firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk firmware revert` command reverts firmware on all disks or a specified list of disks on a node.

You can specify a list of one or more disks whose firmware is to be reverted by using the `-disk` parameter.

You can revert the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware revert` command. This is particularly true for CIFS sessions that might be terminated when this

command is executed.

If you need to view the current firmware versions, use the [storage disk show](#)-fields *firmware-revision* command. The following example displays partial output from the [storage disk show](#)-fields *firmware-revision* command, where the firmware version for the disks is NA02:

```
cluster1::> storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA02
1.0.1     NA02
1.0.2     NA02
1.0.3     NA02
1.0.4     NA02
1.0.5     NA02
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225\_ST336704FC and the firmware version is NA01, the file name is X225\_ST336704FC.NA01.LOD. If the node in this example contains disks with firmware version NA02, the `/mroot/etc/disk_fw/X225_ST336704FC.NA01.LOD` file is downloaded to every disk when you execute this command.

#### How to Revert the Firmware for an HA Pair in a Cluster

Use the following procedure to perform a revert on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both nodes by using the [storage firmware download](#) command.
- Revert the disk firmware on Node A's disks by entering the `storage disk firmware revert-node node-A`` command.
- Wait until the `storage disk firmware revert` command completes on Node A, and then revert the firmware on Node B's disks by entering the `storage disk firmware revert-node node-B`` command.

#### Parameters

**{ -disk <disk path name>, ... - Disk Name (privilege: advanced) }**

Specifies the disk or disks whose firmware is to be reverted.

**| -node {<nodename>|local} - Node Name (privilege: advanced) }**

Specifies the node name. The disk firmware will be reverted on all the disks owned by the node specified by this parameter.

#### Examples

- The following example reverts the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware revert -node cluster-node-01
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware revert process is complete.

Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware reverts? {y|n}: y

Info: Reverting disk firmware for disks on cluster-node-01.

- The following example reverts the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware revert -disk 1.5.0
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware revert process is complete.

Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware reverts? {y|n}: y

Info: Reverting disk firmware for disks on cluster-node-04.

## storage disk firmware show-update-status

Display disk firmware update status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk firmware show-update-status` command displays the state of the background disk firmware update process.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node <nodename>] - Node (privilege: advanced)`**

Selects the node that matches this parameter value.

**`[-num-waiting-download <integer>] - The Number of Disks Waiting to Download (privilege: advanced)`**

Selects the nodes whose number of disks waiting to download by the BDFU process matches this parameter value.

**`[-total-completion-estimate <integer>] - Estimated Duration to Completion (mins) (privilege: advanced)`**

Selects the nodes whose Background Disk Firmware Update (BDFU) completion time estimate matches this parameter value. This indicates the amount of estimated time required for BDFU to complete the firmware update cycle.

**`[-average-duration-per-disk <integer>] - Average Firmware Update Duration per Disk (secs) (privilege: advanced)`**

Selects the nodes whose BDFU reports the average time required to update a single disk matches this parameter value. This indicates the average amount of time required by each disk drive.

**`[-unable-to-update <disk path name>,...] - List of Disks with a Failed Update (privilege: advanced)`**

Selects the nodes whose unable to update disk list matches this parameter value. This is a list of disks that failed to update the firmware.

**[*-update-status* {*off*|*running*|*idle*}] - Background Disk Firmware Update Status (privilege: *advanced*)**

Selects the nodes whose BDFU process status matches this parameter value. Possible values are:

- *off* - The BDFU process is off.
- *running* - The BDFU process is on and currently running.
- *idle* - The BDFU process is on and is currently idle.

**Examples**

```
cluster1::*> storage disk firmware show-update-status
```

|        |         | Number   | Average     | Total      |
|--------|---------|----------|-------------|------------|
|        | Update  | Waiting  | Duration    | Completion |
| Node   | State   | Download | /Disk (Sec) | Est. (Min) |
| Update |         |          |             | Unable to  |
| node1  | running | 2        | 120         | 4 1.3.3    |
| node2  | idle    | 0        | 120         | 0 -        |
| node3  | off     | 0        | 120         | 0 -        |

**storage disk firmware update**

**Update disk firmware**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

Use the `storage disk firmware update` command to manually update firmware on all disks or a specified list of disks on a node. However, the recommended way to update disk firmware in a cluster is to enable automatic background firmware update by enabling the `-bkg-firmware-update` parameter for all of the nodes in the cluster. You can do this by entering the `storage disk option modify-node *-bkg-firmware -update on` command.

You can download the latest firmware on the node by using the `storage firmware download` command.

You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter.

You can update the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware update` command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

The firmware is automatically downloaded to disks, which report previous versions of the firmware. For information on automatic firmware update downloads, see "Automatic versus Manual Firmware Download".

If you need to view the current firmware versions, use the `storage disk show -fields firmware-revision` command. The following example displays partial output from the `storage disk show -fields firmware-revision` command, where the firmware version for the disks is NA01:

```
cluster1:> storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA01
1.0.1     NA01
1.0.2     NA01
1.0.3     NA01
1.0.4     NA01
1.0.5     NA01
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225\_ST336704FC and the firmware version is NA02, the filename is X225\_ST336704FC.NA02.LOD. The revision part of the file name is the number against which the node compares each disk's current firmware version. If the node in this example contains disks with firmware version NA01, the `/mroot/etc/disk_fw/X225_ST336704FC.NA02.LOD` file is used to update every eligible disk when you execute this command.

#### Automatic versus Manual Firmware Download

The firmware is automatically downloaded to those disks that report previous versions of firmware following a system boot or disk insertion. Note that:

- A manual download is a disruptive operation that makes disks inaccessible for up to five minutes after the download is started. Network sessions that use the node must be terminated before running the `storage disk firmware update` command.
- The firmware is not automatically downloaded to the node's partner node in an HA pair.
- The firmware is not automatically downloaded to unowned disks on nodes configured to use software-based disk ownership.
- The `bkg-firmware-update` parameter controls how the automatic firmware download feature works:
  - If the `bkg-firmware-update` parameter is set to off, then the `storage disk firmware update` will update the firmware on the drives in parallel.
  - If the `bkg-firmware-update` parameter is set to on, then the `storage disk firmware update` will update spares and filesystem disks in a nondisruptive manner in the background after boot. Firmware downloads for these disks will be done sequentially by temporarily taking them offline one at a time for the duration of the download. After the firmware is updated, the disk will be brought back online and restored to its normal operation.

During an automatic download to an HA environment, the firmware is not downloaded to the disks owned by the HA partner.

When you use the `storage disk firmware update` command, the firmware is:

- Updated on every disk regardless of whether it is on the A-loop, the B-loop, or in an HA environment.

- If the node is configured in a software-based disk ownership system, only disks owned by this node are updated.

During an automatic firmware download in a MetroCluster™ environment, the firmware is not downloaded to the disks owned by the partner cluster. During both manual and automatic firmware download in a MetroCluster-over-IP environment, the firmware is not downloaded to any remote disks located at the partner cluster while Disaster Recovery is in progress.

Follow the instructions in "How to Update the Firmware for an HA Pair in a Cluster" to ensure that the updating process is successful. ONTAP supports redundant path configurations for disks in a non-HA configuration. The firmware is automatically downloaded to disks on the A-loop or B-loop of redundant configurations that are not configured in an HA pair and are not configured to use software-based disk ownership.

### Automatic Background Firmware Update

The firmware can be updated in the background so that the firmware update process does not impact the clients. This functionality is controlled with the `bkg-firmware-update` parameter. You can modify the parameter by using the CLI [storage disk option modify](#)-node `node_name`-bkg-firmware-update *on|off* command. The default value for this parameter is "on".

When disabled or set to "off", `storage disk firmware update` will update the firmware in automated mode. This means that all disks which had older firmware revision will be updated regardless of whether they are spare or filesystem disks.

When enabled or set to "on", the background `storage disk firmware update` will update firmware in automated mode only on disks that can be successfully taken offline from active filesystem RAID groups and from the spare pool. To ensure a faster boot process, the firmware is not downloaded to spares and filesystem disks at boot time.

This provides the highest degree of safety available, without the cost of copying data from each disk in the system twice. Disks are taken offline one at a time and then the firmware is updated on them. The disk is brought online after the firmware update and a mini/optimized reconstruct happens for any writes, which occurred while the disk was offline. Background disk firmware update will not occur for a disk if its containing RAID group or the volume is not in a normal state (for example, if the volume/plex is offline or the RAID group is degraded). However, due to the continuous polling nature of background disk firmware update, firmware updates will resume after the RAID group/plex/volume is restored to a normal mode. Similarly, background disk firmware updates are suspended for the duration of any reconstruction within the system.

### How to Update the Firmware for an HA Pair in a Cluster

The best way to update the firmware in a cluster with HA pairs is to use automatic background firmware update by enabling the option `bkg-firmware-update` parameter for each node. Enable the `-bkg-firmware-update` parameter on all the nodes by entering the [storage disk option modify](#)-node `node_name`-bkg-firmware-update *on* command. Alternatively, use the following procedure to successfully perform a manual update on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both the nodes by using the [storage firmware download](#) command.
- Install the new disk firmware on Node A's disks by entering the `storage disk firmware update -node node-A``` command.
- Wait until the `storage disk firmware update` command completes on Node A, and then install the new disk firmware on Node B's disks by entering the `storage disk firmware update-node node-B``` command.

## Parameters

**{ -disk <disk path name>, ... - Disk (privilege: advanced) }**

Specifies the disk or disks whose firmware is to be updated.

**| -node {<nodename>|local} - node (privilege: advanced) }**

Specifies the node name. The disk firmware will be updated on all the disks owned by the node specified by this parameter.

## Examples

- The following example updates the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware update -node cluster-node-01
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware update process is complete.

Disk firmware updates should only be done one node at a time.

Disk

firmware updates can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware updates? {y|n}: y

Info: Updating disk firmware for disks on cluster-node-01.

- The following example updates the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware update -disk 1.5.0
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware update process is complete.

Disk firmware updates should only be done one node at a time.

Disk firmware updates can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware updates? {y|n}: y

Info: Updating disk firmware for disks on cluster-node-04.

## storage disk option modify

### Modify disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk option modify` command modifies the background firmware update setting, automatic copy setting, controls automatic disk assignment of all disks assigned to a specified node, or modifies the policy of automatic disk assignment of unowned disks.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node that owns the disks whose options are to be modified.

**[-bkg-firmware-update {on|off}] - Background Firmware Update**

This parameter specifies whether firmware updates run as a background process. The default setting is `on`, which specifies that firmware updates to spare disks and file system disks is performed nondisruptively via

a background process. If the option is turned off, automatic firmware updates will not occur until it is turned back on.

**[`-autocopy {on|off}`] - Auto Copy**

This parameter specifies whether data is to be automatically copied from a failing disk to a spare disk in the event of a predictive failure. The default setting is `on`. It is sometimes possible to predict a disk failure based on a pattern of recovered errors that have occurred. In such cases, the disk reports a predictive failure. If this option is set to `on`, the system initiates Rapid RAID Recovery to copy data from the failing disk to an available spare disk. When data is copied, the disk is marked as failed and placed in the pool of broken disks. If a spare is not available, the node continues to use the disk until it fails. If the option is set to `off`, the disk is immediately marked as failed and placed in the pool of broken disks. A spare is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

**[`-autoassign {on|off}`] - Auto Assign**

This parameter specifies whether automatic assignment of unowned disks is enabled or disabled. The default setting is `on`. This parameter is used to set both a node-specific and a cluster-wide disk option.

**[`-autoassign-policy {default|bay|shelf|stack}`] - Auto Assignment Policy**

This parameter defines the granularity at which auto assign should work. This option is ignored if the `-autoassign` option is off. Auto assignment can be done at the stack/loop, shelf, or bay level. The possible values for the option are `default`, `stack`, `shelf`, and `bay`. The default value is platform dependent. It is `stack` for all non-entry platforms and single-node systems, whereas it is `bay` for entry-level platforms.

**Examples**

The following example sets the background firmware update setting to `on` for all disks belonging to a node named `node0`:

```
cluster1::> storage disk option modify -node node0 -bkg-firmware-update on
```

The following example shows how to enable auto assignment for the disks on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign on
cluster1::> storage disk option show
```

| Node  | BKg. FW. Upd. | Auto Copy | Auto Assign | Auto Assign Policy |
|-------|---------------|-----------|-------------|--------------------|
| node1 | on            | on        | on          | default            |
| node2 | on            | on        | off         | default            |

```
2 entries were displayed.
```

The following example shows how to modify the auto assignment policy on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign-policy bay
cluster1::> storage disk option show
```

| Node  | BKg. FW. Upd. | Auto Copy | Auto Assign | Auto Assign Policy |
|-------|---------------|-----------|-------------|--------------------|
| node1 | on            | on        | on          | bay                |
| node2 | on            | on        | off         | default            |

2 entries were displayed.

## storage disk option show

Display a list of disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk option show` command displays the settings of the following disk options:

- Background firmware update
- Automatic copying of data to a spare disk in the event of a predictive failure
- Automatic assignment of disks
- Policy that governs automatic assignment of unowned disks

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the node that owns the disks. If this parameter is not specified, the command displays information about the disk options on all the nodes.

**[-bkg-firmware-update {on|off}] - Background Firmware Update**

Selects the disks that match this parameter value.

**[-autocopy {on|off}] - Auto Copy**

Selects the disks that match this parameter value.

**[-autoassign {on|off}] - Auto Assign**

Displays the auto assignment status of unowned disks. The default value is `on` .

## **[`-autoassign-policy {default|bay|shelf|stack}`]] - Auto Assignment Policy**

Selects the disks that match the automatic assignment policy value:

- Default
- Stack/loop
- Shelf
- Bay

### **Examples**

The following example displays disk-option settings for disks owned by all nodes in the cluster:

```
cluster1::> storage disk option show
Node          BKg. FW. Upd.  Auto Copy      Auto Assign    Auto Assign
Policy
-----
node0          on              on              on             default
node1          on              on              on             stack
node2          on              on              on             bay
node3          on              on              on             bay
4 entries were displayed.
```

## **storage dqp commands**

### **storage dqp show**

Display Disk Qualification Package details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

The `storage dqp show` command displays information about the Disk Qualification Package (DQP). The command displays the following information:

- Node Name
- Package Date
- File Version
- File Name
- Drive Record Count
- Drive Alias Record Count
- Device Class Record Count
- System Class Record Count

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays DQP information on the specified node.

**[-package-date <text>] - Package Date**

Selects DQP information with the specified package date.

**[-file-version <text>] - File Version**

Selects DQP information with the specified file version.

**[-filename <text>] - File Name**

Selects DQP information with the specified file name.

**[-drive-records <integer>] - Drive Record Count**

Selects DQP information with the specified drive record count.

**[-alias-records <integer>] - Alias Record Count**

Selects DQP information with the specified drive alias record count.

**[-device-records <integer>] - Device Record Count**

Selects DQP information with the specified device class record count.

**[-system-records <integer>] - System Record Count**

Selects DQP information with the specified system class record count.

## Examples

The following example displays the brief version of Disk Qualification Package details:

```
cluster1::> storage dqp show
Node                Package Date      Version
-----
cluster1-01        20180907         3.17
cluster1-02        20180907         3.17
2 entries were displayed.
```

The following example displays the `-instance` version of Disk Qualification Package details:

```
cluster1::> storage dqp show -instance
Node: cluster1-01
    Package Date: 20180907
    Version: 3.17
    File Name: qual_devices_v3
    Drive Record Count: 626
    Alias Record Count: 196
    Device Record Count: 28
    System Record Count: 3
Node: cluster1-02
    Package Date: 20180907
    Version: 3.17
    File Name: qual_devices_v3
    Drive Record Count: 626
    Alias Record Count: 196
    Device Record Count: 28
    System Record Count: 3
2 entries were displayed.
```

## storage encryption commands

### storage encryption disk destroy

Cryptographically destroy a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage encryption disk destroy` command cryptographically destroys a self-encrypting disk (SED), making it incapable of performing I/O operations. This command performs the following operations:

- Employs the inherent erase capability of SEDs to cryptographically sanitize the disk
- Permanently locks the disk to prevent further data access
- Changes the data and FIPS authentication keys to random values that are not recorded except within the SED.

Use this command with extreme care. The only mechanism to restore the disk to usability (albeit without the data) is the [storage encryption disk revert-to-original-state](#) operation that is available only on disks that have the physical secure ID (PSID) printed on the disk label.

The destroy command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

Upon command completion, remove the destroyed SED from the system.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the disk you want to cryptographically destroy. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **[-force-all-states <true>] - Destroy All Matching Disks**

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the `storage disk show` command. When you specify this parameter as *true*, it allows you to cryptographically destroy all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick destroy of all system disks if you use the `-disk` parameter with the asterisk wildcard (\*). If you destroy active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command cryptographically destroys the disk 1.10.20:

```
cluster1::> storage encryption disk destroy 1.10.20
```

```
Warning: This operation will cryptographically destroy 1 spare or broken
self-encrypting disks on 1 node.
```

```
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
```

```
To continue, enter
```

```
destroy disk
```

```
:destroy disk
```

```
Info: Starting destroy on 1 disk.
```

```
View the status of the operation by using the
"storage encryption disk show-status" command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk destroy 1.10.2*
```

Warning: This operation will cryptographically destroy 5 spare or broken self-encrypting disks on 1 node.

You cannot reuse destroyed disks unless you revert them to their original state using the PSID value.

To continue, enter

destroy disk

:yes

No disks destroyed.

```
cluster1::>
```

The following command quickly cryptographically destroys all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk destroy -force-all-states -disk *
```

Warning: This operation will cryptographically destroy 96 self-encrypting disks on 4 nodes.

To continue, enter

destroy disk

:destroy disk

Info: Starting destroy on 96 disks.

View the status of the operation by using the

xref:{relative\_path}storage-encryption-disk-show-status.html[storage encryption disk show-status] command.

```
cluster1::>
```

## storage encryption disk modify

Modify self-encrypting disk parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk modify` command changes the data protection parameters of self-encrypting disks (SEDs) and FIPS-certified SEDs (FIPS SEDs); it also modifies the FIPS-compliance AK (FIPS AK) of FIPS SEDs. The current data AK and FIPS AK of the device are required to effect changes to the respective AKs and FIPS compliance. The current and new AKs must be available from the key servers or onboard key management.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

To properly protect data at rest on a FIPS SED and place it into compliance with its FIPS certification requirements, set both the Data and FIPS AKs to a value other than the device's default key; depending on the device type, the default may be manufacture secure ID (MSID), indicated by a key ID with the special value `0x0`, or a null key represented by a blank key ID. Verify the key IDs by using the [storage encryption disk show](#) and [storage encryption disk show -fips](#) commands.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SED or FIPS SED that you want to modify.

### **{ [-data-key-id <text>] - Key ID of the New Data Authentication Key**

This parameter specifies the key ID associated with the data AK that you want the SED to use for future authentications. When the provided key ID is the MSID, data at rest on the SED is not protected from unauthorized access. Setting this parameter to a non-MSID value automatically engages the power-on-lock protections of the device, so that when the device is power-cycled, the system must authenticate with the device using the AK to reenable I/O operations. You cannot specify the null default key; use MSID instead.

### **| [-fips-key-id <text>] - Key ID of the New Authentication Key for FIPS Compliance }**

This parameter specifies the key ID associated with the FIPS AK that you want the FIPS SED to apply to SED credentials other than the one that protects the data. When the value is not the MSID, these credentials are changed to the indicated AK, and other security-related items are set to conform to the FIPS certification requirements ("FIPS compliance mode") of the device. You may set the `-fips-key-id` to any one of the key IDs known to the system. The FIPS key ID may, but does not have to, be the same as the data key ID parameter. Setting `-fips-key-id` to the MSID key ID value disables FIPS compliance mode and restores the FIPS-related authorities and other components as required (other than data) to their default settings. A nonMSID FIPS-compliance key may be applied only to a FIPS SED.

## Examples

The following command changes both the AK and the power-cycle protection to values that protect the data at rest on the disk. Note that the `-data-key-id` and `-fips-key-id` parameters require one of the key IDs that appear in the output of the `security key-manager query` command.

```
cluster1::> storage encryption disk modify -data-key-id
6A1E21D800000000010000000000000F5A1EB48EF26FD6A8E76549C019F2350 -disk
2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the  
storage encryption disk show-status command.

The following command changes the FIPS AK and sets the device into FIPS-compliance mode. Note that the `-fips-key-id` parameter requires one of the key IDs that appear in the output of the `security key-manager query` command.

```
cluster1::> storage encryption disk modify -fips-key-id
6A1E21D8000000000100000000000005A1FB4EE8F62FD6D8AE6754C9019F35A 2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the  
storage encryption disk show-status command.

## storage encryption disk revert-to-original-state

Revert a self-encrypting disk to its original, as-manufactured state

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Some self-encrypting disks (SEDs) are capable of an operation that restores them as much as possible to their as-manufactured state. The `storage encryption disk revert-to-original-state` command invokes this special operation that is available only in SEDs that have the physical secure ID (PSID) printed on their labels.

The PSID is unique to each SED, meaning the command can revert only one SED at a time. The disk must be in a "broken" or "spare" state as shown by the output of the [storage disk show](#) command.

The operation in the SED accomplishes the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) and FIPS AK to the default values
- Resets the data locking controls
- Resets the power-on lock state to *false*

- Initializes other vendor-unique encryption-related parameters

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfail](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

The name of the SED to be reverted to its as-manufactured state. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **-psid <text> - Physical Secure ID**

The PSID printed on the SED label.

## Examples

The following command shows a SED being returned to its as-manufactured state:

```
cluster1::> storage encryption disk revert-to-original-state -disk 01.10.0
-psid AC65PYF8CG45YZABUQJKM98WV2VZGRLD
```

## storage encryption disk sanitize

Cryptographically sanitize a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk sanitize` command cryptographically sanitizes one or more self-encrypting disks (SEDs), making the existing data on the SED impossible to retrieve. This operation employs the inherent erase capability of SEDs to perform all of the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) to the default AK (manufacture secure ID/MSID or null, depending on the device type)
- Unlocks the data band

- Resets the power-on lock state to *false*

There is no method to restore the disk encryption key to its previous value, meaning that you cannot recover the data on the SED. Use this command with extreme care.

The sanitize command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfail](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SEDs you want to cryptographically sanitize. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **[-force-all-states <true>] - Sanitize All Matching Disks**

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [storage disk show](#) command. When you specify this parameter as *true*, it allows you to cryptographically sanitize all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick erasure of all system data if you use the `-disk` parameter with the asterisk wildcard (\*). If you sanitize active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command sanitizes the disk 1.10.20:

```
cluster1::> storage encryption disk sanitize 1.10.20
```

```
Warning: This operation will cryptographically sanitize 1 spare or broken
self-encrypting disk on 1 node.
```

```
To continue, enter
```

```
sanitize disk
```

```
:sanitize disk
```

```
Info: Starting sanitize on 1 disk.
```

```
View the status of the operation using the
```

```
xref:{relative_path}storage-encryption-disk-show-status.html [storage
encryption disk show-status] command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk sanitize 1.10.2*
```

```
Warning: This operation will cryptographically sanitize 5 spare or broken  
self-encrypting disks on 1 node.
```

```
To continue, enter
```

```
    sanitize disk
```

```
    :yes
```

```
No disks sanitized.
```

```
cluster1::>
```

The following command quickly cryptographically sanitizes all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk sanitize -force-all-states -disk *
```

```
Warning: This operation will cryptographically sanitize 96  
self-encrypting disks on 4 nodes.
```

```
To continue, enter
```

```
    sanitize disk
```

```
    :sanitize disk
```

```
Info: Starting sanitize on 96 disks.
```

```
View the status of the operation by using the
```

```
    xref:{relative_path}storage-encryption-disk-show-status.html[storage  
encryption disk show-status] command.
```

```
cluster1::>
```

## storage encryption disk show-status

Display status of disk encryption operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk show-status` command displays the results of the latest destroy ,

modify, or sanitize operation of the storage encryption disk command family. Use this command to view the progress of these operations on self-encrypting disks (SEDs).

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter.

**[-is-fips-support {true|false}] - Node Supports FIPS Disks**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter (*true* means the node supports FIPS-certified self-encrypting drives).

**[-latest-op <Storage Disk Encryption Operation>] - Latest Operation Requested**

If you specify this parameter, the command displays disk encryption status for the nodes with a most recent storage encryption disk operation that matches this parameter (one of `destroy`, `modify`, `revert-to-original-state`, `sanitize`, or `unknown`).

**[-op-start-time <MM/DD/YYYY HH:MM:SS>] - Operation Start Time**

Selects the nodes with operation start times that match this parameter.

**[-op-execute-time <integer>] - Execution Time in Seconds**

If you specify this parameter, the command displays disk encryption status for the nodes with operation execution time that matches this parameter. The operation may be partial or completed.

**[-disk-start-count <integer>] - Number of Disks Started**

If you specify this parameter, the command displays disk encryption status for the nodes that started this number of SEDs in their latest operation.

**[-disk-done-count <integer>] - Number of Disks Done**

Selects the nodes that report this number of SEDs having completed the latest operation, successfully or not.

**[-disk-success-count <integer>] - Number of Disks Successful**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that successfully completed the latest operation. When the operation is finished, if the success count is not the same as the started count, some additional detail is available using the `-instance` or `-node` parameters.

**[-disk-no-key-id-count <integer>] - Number of Disks with Key ID Not Found**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because ONTAP could not find the Key IDs associated with the required authentication key of the SED.

**[-disk-no-authent-count <integer>] - Number of Disks Not Authenticated**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because the identified Authentication Key could not authenticate with the SED.

**[-op-sequence-count <integer>] - Sequence Count of Latest Operation**

If you specify this parameter, the command displays disk encryption status for that nodes that match the value list.

## Examples

When no operation has been requested since node boot, the status for that node is empty. If you enter a node name, the output is in the same format as for the `-instance` parameter.

```
cluster1::> storage encryption disk show-status -node node
Node Name: node
Node Supports FIPS-certified Self-Encrypting Disks: true
Latest Operation Requested: unknown
Operation Start Time: -
Execution Time in Seconds: -
Number of Disks Started: -
Number of Disks Done: -
Number of Disks Successful: -
Number of Disks with Key ID Not Found: -
Number of Disks Not Authenticated: -
```

Once an operation begins, the status is dynamic until all devices have completed. When disks are modified, sanitized, or destroyed, sequential executions of `storage encryption disk show-status` appear as in this example that shows the progress of a modify operation on three SEDs on each node of a two-node cluster:

```
cluster1::> storage encryption disk show-status
```

|            | SED     | Latest  | Start              | Execution  | Disks | Disks |
|------------|---------|---------|--------------------|------------|-------|-------|
| Disk       |         |         |                    |            |       |       |
| Node       | Support | Request | Timestamp          | Time (sec) | Begun | Done  |
| Successful |         |         |                    |            |       |       |
| node0      | true    | modify  | 9/22/2014 13:58:53 | 4          | 3     | 0     |
| node10     | true    | modify  | 9/22/2014 13:58:53 | 4          | 3     | 0     |

  

```
cluster1::> storage encryption disk show-status
```

|            | SED     | Latest  | Start              | Execution  | Disks | Disks |
|------------|---------|---------|--------------------|------------|-------|-------|
| Disk       |         |         |                    |            |       |       |
| Node       | Support | Request | Timestamp          | Time (sec) | Begun | Done  |
| Successful |         |         |                    |            |       |       |
| node3      | true    | modify  | 9/22/2014 13:58:53 | 7          | 3     | 3     |
| node13     | true    | modify  | 9/22/2014 13:58:53 | 7          | 3     | 3     |

## storage encryption disk show

### Display self-encrypting disk attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage encryption disk show` command displays information about encrypting drives. When no parameters are specified, the command displays the following information about all encrypting drives:

- Disk name
- The protection mode of the device
- The key ID associated with the data authentication key ("data AK")

In MetroCluster systems, the information is valid from the cluster that owns the drive, or from the DR cluster when in switchover mode. If information is not available, perform the `show` command from the cluster partner.

You can use the following parameters together with the `-disk` parameter to narrow the selection of displayed drives or the information displayed about them.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-fips ]**

If you specify this parameter, the command displays the key ID associated with the FIPS-compliance authentication key ("FIPS AK") instead of the data key ID.

**| [-instance ] }**

If you specify this parameter, the command displays detailed disk information about all disks, or only those specified by a `-disk` parameter.

**[-disk <disk path name>] - Disk Name**

If you specify this parameter, the command displays information about the specified disks. If you specify a single disk path name, the output is the same as when you use the `-instance` parameter. See the man page for the `storage disk modify` command for information about disk-naming conventions. Default is all self-encrypting disks.

**[-container-name <text>] - Container Name**

This parameter specifies the container name associated with an encrypting drive. If you specify an aggregate name or other container name, only the encrypting drives in that container are displayed. See the man page for the [storage disk show](#) command for a description of the container name. Use the [storage aggregate show-status](#) and [storage disk show](#) commands to determine which aggregates the drives are in.

**[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type**

This parameter specifies the container type associated with an encrypting drive. If you specify a container type, only the drives with that container type are displayed. See the man page for the [storage disk show](#) command for a description of the container type.

**[-data-key-id <text>] - Key ID of the Current Data Authentication Key**

This parameter specifies the key ID associated with the data AK that the encrypting drive requires for authentication with its data-protection authorities. The special key ID `0x0` indicates that the current data AK of the drive is the default manufacture secure ID (MSID) that is not secret. Some devices employ an initial null default AK that appears as a blank data-key-id; you cannot specify a null data-key-id value. To properly protect data at rest on the device, modify the data AK using a key ID that is not a default value (MSID or null). When you modify the data AK with a non-MSID key ID, the system automatically sets the device's power-on lock enable control so that authentication with the data AK is required after a device power-cycle. Use [storage encryption disk modify](#) `-data-key-id key-id` to protect the data. Use [storage encryption disk modify](#) `-fips-key-id key-id` to place the drives into FIPS-compliance mode.

**[-fips-key-id <text>] - Key ID of the Current FIPS Authentication Key**

This parameter specifies the key ID associated with the FIPS authentication key ("FIPS AK") that the system must use to authenticate with FIPS-compliance authorities in FIPS-certified drives. This parameter may not be set to a non-MSID value in drives that are not FIPS-certified.

**[-is-power-on-lock-enabled {true|false}] - Is Power-On Lock Protection Enabled?**

This parameter specifies the state of the control that determines whether the encrypting drive requires

authentication with the data AK after a power-cycle. The system enables this control parameter automatically when you use the [storage encryption disk modify](#)-data-key-id command to set the data AK to a value other than the default AK. Data is protected only when this parameter is *true* and the data AK is not a default. Compare with the values of the -protection-mode parameter below.

### **[-protection-mode <text>] - Mode of SED Data and FIPS-Compliance Protection**

The protection mode that the drive is in:

- open - data is unprotected; drive is not in FIPS-compliance mode
- data - data is protected; drive is not in FIPS-compliance mode
- part - data is unprotected; drive is otherwise in FIPS-compliance mode
- full - data is protected; drive is in FIPS-compliance mode
- miss - protection mode information is not available

### **[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

This parameter selects the drive type to include in the output.

### **[-control-standard <text>] - Control Standard**

This parameter specifies the industry standard for control of encrypting drives that the drive implements.

### **[-compliance-standard <text>] - Compliance Standard**

This parameter specifies the industry compliance standard, if any, that the drive is certified as adhering to.

### **[-overall-security <text>] - Overall Security**

This parameter specifies the drive's certified security level as defined in the compliance-standard, if the drive is certified to a compliance standard.

### **[-range-start <integer>] - TCG Data Range Start Sector**

This parameter specifies the TCG data range locking start sector.

### **[-range-length <integer>] - TCG Data Range Length in Sectors**

This parameter specifies the TCG data range locking length in sectors.

### **[-rdwr-lock-enabled <text>] - TCG Read/Write Lock Enabled**

This parameter indicates whether the drive will lock if it is power-cycled when lock is enabled for read/write.

### **[-rdwr-locked <text>] - TCG Read/Write Locked**

This parameter specifies if the drive is locked for read/write.

### **[-active-key <text>] - TCG Active Key Type**

This parameter shows the TCG active media encryption key type used to encrypt and decrypt the data.

## **Examples**

The following command displays information about all encrypting drives:

```
cluster1::> storage encryption disk show
Disk      Mode Data Key ID
-----
-----
0.0.0     open 0x0
0.0.1     part 0x0
0.0.2     data
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.0    open
0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1    part
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2    full
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note in the example that only disk 1.10.2 is fully protected with FIPS mode, power-on-lock enable, and an AK that is not the default MSID or a null key.

The following command displays information about the protection mode and FIPS key ID for all encrypting drives:

```
cluster1::> storage encryption disk show -fips
Disk      Mode FIPS-Compliance Key ID
-----
-----
0.0.0     open 0x0
0.0.1     part
0A53ED2A000000000100000000000000C1B27AD3F0DB8891375AED2F34D0BBED
0.0.2     data 0x0
1.10.0    open
0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1    part
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2    full
0A9C9CFC000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
[...]
```

Note again that only disk 1.10.2 is fully protected with FIPS-compliance mode set, power-on-lock enabled, and a data AK that is not the default MSID or a null key.

The following command displays the individual fields for disk 1.10.2:

```

cluster1::> storage encryption disk show -disk 1.10.2
Disk Name: 1.10.2
                                Container Name: aggr0
                                Container Type: shared
                                Is Drive FIPS-certified?: true
Key ID of the Current Data Authentication Key:
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
Key ID of the Current FIPS Authentication Key:
0A9C9CFC000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
    Is Power-On Lock Protection Enabled?: true
    Mode of Data and FIPS-Compliance Protection: full
                                Drive Type: SSD
                                Control Standard: TCG Enterprise
                                Compliance Standard: FIPS 140-2
                                Overall Security: Level 2

```

# storage errors commands

## storage errors show

Display storage configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage errors show` command displays configuration errors with back end storage arrays.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Selects the disks that match this parameter value.

**[`-array-name <array name>`] - Array Name**

Selects the disks that have the specified name for the storage array that is connected to the cluster.

**[`-node {<nodename>|local}`] - Controller Name**

Selects the disks that match this parameter value.

**[`-disk <disk path name>`] - Disk**

Selects the disks that match this parameter value.

**[`-serial-number <text>`] - Serial Number**

Selects the disks that match this parameter value.

**[`-error-id <integer>,...`] - Error ID**

Selects the disks with error-id values that match this parameter value.

**[`-error-type`**

**{`onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk`}] - Error Type**

Selects the disks with error types values that match this parameter value.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1:> storage errors show
Disk: vnv3070f20b:vnci9124s54:1-24.126L23
-----
vnci9124s54:1-24.126L23 (600a0b800019e999000036b24bac3983): This array LUN
reports an invalid block size and is not usable. Only a block size of 512
is supported.
```

## storage failover commands

### storage failover check-takeover

Display status for all takeover options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage failover check-takeover` command displays information about whether takeover is possible based on verification checks triggered by the `-check-only` parameter used with the [storage failover takeover](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Name of node command is run from

**[-operation {takeover|giveback}] - Operation**

Failover Operation Type

**[-option <takeover option>] - Takeover Option**

Takeover Option

**[-operation-status {true|false}] - Operation Status**

Status of whether defined operation would succeed or not

**[-reason <text>,...] - Reasons for Failure**

Reason for pre-takeover failure

## Examples

The following is an example of the `storage failover check-takeover` command:

```
cluster1::*> storage failover check-takeover
Node           Operation   Option      Operation-Status Reasons for
Failure
-----
Node 1         Takeover    normal      false              Takeover request
failed due to giveback in progress
```

## Related Links

- [storage failover takeover](#)

## storage failover giveback

Return failed-over storage to its home node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover giveback` command returns storage that has failed over to a node's partner back to the home node. This operation fails if other resource-intensive operations (for instance, system dumps) are running and make the giveback operation potentially dangerous or disruptive. It could take anywhere from a few seconds to a couple of minutes to relocate an SFO aggregate. The time includes both client outage and non-outage portions. Some options are available only at the advanced privilege level and higher. Run the [storage failover show-giveback](#) command to check the status of giveback operations.

### NOTE:

- If the system ID of the partner has changed while the node is in takeover mode, the `storage failover giveback` command updates the ownership of the partner's disks to the new system ID while giving back.
- If the giveback operation fails due to the operation being vetoed by a subsystem, check the syslog or EMS output for a subsystem-specific reason for the abort. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `override-vetoes` option in the `storage failover giveback` command to force the giveback.
- If the giveback operation fails because the node cannot communicate with its partner, check the EMS output for the corrective action. Follow the corrective action and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `-require-partner-waiting false` parameter in the `storage failover giveback` command to force the giveback. This parameter is available only at the advanced privilege level and higher.
- If the node does not receive notification that the partner has brought online the given-back aggregate and its volumes, the [storage failover show-giveback](#) command displays the giveback status for the aggregate as failed. A possible reason for this failure is that the partner is overloaded and slow in bringing the aggregate online. Run the [storage aggregate show](#) command to verify that the aggregate and its volumes are online on the partner node. The node will not attempt the giveback operation for remaining aggregates. To force the giveback, use the `-require-partner-waiting false` parameter in the `storage failover giveback` command. This parameter is available only at the advanced privilege level and higher.

## Parameters

### **{ -ofnode {<nodename>|local} - Node to which Control is Givenback**

Specifies the node whose storage is currently taken over by its partner and will be given back by the giveback operation.

### **[ -fromnode {<nodename>|local} ] - Node Initiating Giveback }**

Specifies the node that currently holds the storage that is to be returned to the partner node.

### **[ -require-partner-waiting {true|false} ] - Require Partner in Waiting (privilege: advanced)**

If this optional parameter is used and set to false, the storage is given back regardless of whether the partner node is available to take back the storage or not. If this parameter is used and set to true, the storage will not be given back if the partner node is not available to take back the storage. If this parameter is not used, the behavior defaults to the setting of the `-check-partner` option set with the [storage failover modify](#) command.

### **[ -override-vetoes <true> ] - Override All Vetoes**

If this optional parameter is used, the system overrides veto votes during a giveback operation. If this

parameter is not used, the system does not proceed with a giveback if it is vetoed. This parameter, if used, can only be set to true.

### **[`-only-cfo-aggregates <true>`] - Giveback Only CFO Aggregates**

If this optional parameter is used, giveback of only the CFO aggregates (root aggregate) will be attempted. If this parameter is not used, giveback of all the aggregates (root and data aggregates) will be attempted. This parameter, if used, can only be set to true.

## **Examples**

The following example gives back storage that is currently held by a node named node1. The partner must be available for the giveback operation to occur.

```
node::> storage failover giveback -fromnode node1
```

The following example gives back only the CFO aggregates to a node named node2 (the aggregates are currently held by a node named node1). The partner must be available for the giveback operation to occur, and the veto-giveback process is overridden.

```
node::> storage failover giveback -ofnode node2  
-override-vetoes true -only-cfo-aggregates true
```

## **storage failover modify**

Modify storage failover attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage failover modify` command changes the storage-failover options for a node. Some options are available only at the advanced privilege level and higher.

### **Parameters**

**-node {<nodename>|local} - Node**

This specifies the node whose storage-failover options are to be modified.

**{ [`-enabled {true|false}`] - Takeover Enabled**

This optionally specifies whether storage failover is enabled. The default setting is `true`.

### **[`-mode {ha|non_ha}`] - HA Mode }**

This specifies whether the node is set up in high-availability mode or stand-alone mode. If the node is a member of a high-availability configuration, set the value to *ha* . If the node is stand-alone, set the value to *non\_ha* . Before setting the HA mode, you must complete the platform dependent steps to set up the system in a stand-alone or HA configuration as shown in the documentation for your platform. Setting the value of this field to *non\_ha* is not supported on the ASA r2 platform.

### **[`-auto-giveback {true|false}`] - Auto Giveback Enabled**

This optionally specifies whether automatic giveback operations are enabled. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation. The default setting is *true* . This parameter is not applicable if takeover was because of a disruption in the partner's operation. For those cases, use the `-auto-giveback-after-panic` parameter, instead.

### **[`-detection-time <integer>`] - Takeover Detection Time (secs)**

This optionally specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Possible values range from 10 to 180 seconds. The default setting is 15 seconds.

### **[`-onfailure {true|false}`] - Takeover on Failure Enabled**

This optionally specifies whether the node automatically takes over for its partner node if the partner node fails. The default setting is *true* . This parameter is available only at the advanced privilege level and higher.

### **[`-onpanic {true|false}`] - Takeover on Panic Enabled**

This optionally specifies whether the node automatically takes over for its partner node if the partner node panics. The default setting is *true* . Changing this parameter on one node automatically makes the same change on its partner node.

### **[`-onshort-uptime {true|false}`] - Takeover on Short Uptime Enabled (privilege: advanced)**

This optionally specifies whether the node takes over for its partner node if the partner node fails within 60 seconds of starting up; the time period is modifiable by using the `-short-uptime` parameter. The default setting is *true* . This parameter is available only at the advanced privilege level and higher.

### **[`-short-uptime <integer>`] - Short Uptime (secs) (privilege: advanced)**

This optionally specifies the time period used by the `-onshort-uptime` parameter. The default setting is 60 seconds. This parameter is available only at the advanced privilege level and higher.

### **[`-attempts <integer>`] - Number of Giveback Attempts (privilege: advanced)**

This optionally specifies the number of times the node attempts an automatic giveback operation within 60 minutes; the time period is modifiable by using the `-attempts-time` parameter. The default setting is 2 attempts. This parameter is available only at the advanced privilege level and higher.

### **[`-attempts-time <integer>`] - Giveback Attempts Period (minutes) (privilege: advanced)**

This optionally specifies the time period used by the `-attempts` parameter. The default setting is 60 minutes. This parameter is available only at the advanced privilege level and higher.

### **[`-propagate {true|false}`] - Propagate Status via Mailbox (privilege: advanced)**

This optionally specifies whether storage-failover status is communicated via mailbox disks. The default

setting is `true` . This parameter is available only at the advanced privilege level and higher.

**`[-read-interval <integer>]` - Node Status Read Interval (secs) (privilege: advanced)**

This optionally specifies, in seconds, how frequently the node reads its partner node's status from the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**`[-write-interval <integer>]` - Node Status Write Interval (secs) (privilege: advanced)**

This optionally specifies, in seconds, how frequently the node writes its status to the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**`[-onreboot {true|false}]` - Takeover on Reboot Enabled**

This optionally specifies whether the node automatically takes over for its partner if the partner reboots. The default setting is `true` . Takeover can occur if the partner exceeds the expected time to reboot even when this option is set to `false`. The expected time to reboot is different for different platforms. The minimum expected time to reboot is 180 seconds. The `-inhibit-takeover` option of the [system node reboot](#) command overrides this option: if a node is rebooted with `-inhibit-takeover` set to `true` then takeover does not occur, even if the `takeover on reboot` option is `true`. If a node does takeover due to the partner rebooting, then it will automatically giveback after the reboot, even if the `-auto-giveback` option is set to `false` . This is non-persistent behavior: if the node does takeover due to partner reboot and then itself reboots (prior to giveback) then it will not automatically giveback if the `-auto-giveback` option is set to `false` .

**`[-delay-seconds <integer>]` - Delay Before Auto Giveback (secs)**

This optionally specifies the minimum time that a node will stay in takeover state prior to performing an automatic giveback. If the taken over node recovers quickly (for example, if the takeover was due to a reboot), by delaying the giveback for a few minutes the outage during the takeover and giveback can be reduced to two short outages instead of one longer one. The allowed range is 0 to 600, inclusive. The default setting is 600 seconds. This option affects all types of auto-giveback. This parameter is available only at the advanced privilege level and higher.

This delay does not affect manual giveback.

**`[-hwassist {true|false}]` - Hardware Assist Enabled**

This optionally specifies whether the hardware assist feature is enabled. If set to `true` this feature helps in fast takeover detection times in certain cases.

**`[-hwassist-partner-ip <IP Address>]` - Partner's Hwassist IP**

This optionally specifies the Ip address on which the partner node receives hardware assist alerts. For the hardware assist feature to be active, the value of this option should be equal to partner's node management Ip address.

**`[-hwassist-partner-port <integer>]` - Partner's Hwassist Port**

This optionally specifies the port number on which partner node listens to hardware assist alerts. It is recommended to have this value to be between 4000-4500. The default value is 4444.

**`[-hwassist-health-check-interval <integer>]` - Hwassist Health Check Interval (secs)**

This optionally specifies, in seconds, how frequently the hardware assist hardware on a node sends a heartbeat to its partner. The default value is 180.

### **[`-hwassist-retry-count <integer>`] - Hwassist Retry Count**

This optionally specifies the number of times we repeat sending an hardware assist alert. The default value is 2.

Modification of hardware assist parameters such as hardware assist IP, port is allowed only on certain platforms. Refer to Knowledge Base article [How to change hardware assist IP address?](#)

### **[`-auto-giveback-after-panic {true|false}`] - Auto Giveback After Takeover On Panic**

This optionally specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation automatically. The default setting is *true*.

This parameter is independent of the `-auto-giveback` parameter. If this parameter is enabled and the takeover is due to disruption in the partner's operation, giveback will be initiated even if `-auto-giveback` parameter is *false*.

### **[`-aggregate-migration-timeout <integer>`] - Aggregate Migration Timeout (secs) (privilege: advanced)**

This optionally specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 120 seconds.

## **Examples**

The following example enables the storage-failover service on a node named node0:

```
node::> storage failover modify -node node0 -enabled true
```

The following examples enable storage-failover takeover on a short uptime of 30 seconds on a node named node0:

```
node::*> storage failover modify -node node0 -onshort-uptime true -short-uptime 30
```

## **Related Links**

- [system node reboot](#)

## **storage failover show-giveback**

Display giveback status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover show-giveback` command displays information about the giveback status of aggregates. The command displays the following information when no parameters are specified:

- Node name
- Partner aggregate name
- Giveback Status

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular aggregate, run the command with the `-aggregate aggregate_name` parameter.`

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is used, the command displays information about the giveback status of the aggregates belonging to the HA partner of the specified node.

**[-aggregate <text>] - Aggregate**

If this parameter is used, the command displays information about the giveback status of the specified aggregate.

**[-giveback-status <text>,...] - Aggregates Giveback State**

If this parameter is used, the command displays information about the aggregates with the specified giveback status.

**[-destination <text>] - Destination for Giveback**

If this parameter is used, the command displays information about the giveback status of the aggregates whose destination after the giveback is the specified node.

## Examples

The following example displays information about giveback status on all nodes:

```
node::> storage failover show-giveback
```

| Node  | Partner<br>Aggregate | Giveback Status            |
|-------|----------------------|----------------------------|
| node0 | -                    | No aggregates to give back |
| node1 | -                    | No aggregates to give back |
| node2 | -                    | No aggregates to give back |
| node3 | -                    | No aggregates to give back |

4 entries were displayed.

## storage failover show-takeover

### Display takeover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover show-takeover` command displays information about the takeover status of nodes in a cluster. The command also displays the takeover status of aggregates being taken over. During each phase of takeover, the takeover node and the node being taken over display their takeover status and the status of the aggregates being taken over. The command displays the following information when no parameters are specified:

- Node name
- Node takeover status - This contains a descriptive information about the phase of takeover.
- Aggregate
- Aggregate takeover status - This contains the following information:
  - Takeover status of the aggregate, such as "Done", "Failed", "In progress" and "Not attempted yet".
  - Reason for an aggregate takeover failure.
  - Corrective action, in case of an aggregate takeover failure.

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular node, run the command with the ``-node`  
``_node_name_``` parameter.

Parameters

{ [-fields <fieldname>,...]

If this parameter is specified, the command displays the specified fields for all nodes, in column style output.

| [-instance ] }

If this parameter is specified, the command displays the same detailed information as for the -node parameter, but for all nodes.

[-node {<nodename>|local}] - Node Name

If this parameter is specified, the command displays information about the takeover status of the specified node, and the takeover status of the aggregates being taken over.

[-node-takeover-status <text>] - Node's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the nodes with the specified node-takeover-status. The command also displays the takeover status of the aggregates belonging to the node being taken over.

[-aggregate <text>] - Aggregate Being Taken Over

If this parameter is specified, the command displays information about the takeover status of the specified aggregate, and the takeover status of the nodes containing the specified aggregate.

[-aggregate-takeover-status <text>] - Aggregate's Takeover Status

If this parameter is specified, the command displays information about the takeover status of the aggregates with the specified aggregate takeover status, and the takeover status of the nodes containing those aggregates.

Examples

The following example shows the takeover status of two nodes, nodeA and nodeB, in an High Availability (HA) pair, when both are in normal mode; neither node has taken over its HA partner. In this case, there is no takeover status for the aggregates.

```
cluster1::> storage failover show-takeover
Node           Node Status           Aggregate           Takeover Status
-----
nodeA           Takeover not
                  attempted.
                  -
nodeB           Takeover not
                  attempted.
                  -
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA is in the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
```

| Node  | Node Status                                                                                                                                                                                                    | Aggregate                    | Takeover Status |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-----------------|
| ----- |                                                                                                                                                                                                                |                              |                 |
| nodeA | Optimized takeover of partner in progress. Partner, ("nodeB"), is relocating its SFO aggregates. Run the command "storage failover show-takeover -node nodeB" to display the relocation status of the partner. |                              |                 |
|       | -                                                                                                                                                                                                              | -                            |                 |
| nodeB | Being taken over.                                                                                                                                                                                              |                              |                 |
|       | aggr1                                                                                                                                                                                                          | In progress, Module: backup. |                 |
|       | aggr2                                                                                                                                                                                                          | Not attempted yet            |                 |
|       | CFO aggregates                                                                                                                                                                                                 | Not attempted yet.           |                 |

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO phase of an optimized takeover of nodeB (but has not completed the CFO phase of the optimized takeover). In this case, nodeA has information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
```

| ode   | Node Status                                                       | Aggregate          | Takeover Status |
|-------|-------------------------------------------------------------------|--------------------|-----------------|
| ----- |                                                                   |                    |                 |
| odeA  | Partner has relocated its aggregates. Takeover in progress.       |                    |                 |
|       | aggr1                                                             | Done               |                 |
|       | aggr2                                                             | Done               |                 |
|       | CFO aggregates                                                    | In progress.       |                 |
| odeB  | Relocated aggregates to partner. Waiting for partner to takeover. |                    |                 |
|       | aggr1                                                             | Done               |                 |
|       | aggr2                                                             | Done               |                 |
|       | CFO aggregates                                                    | Not attempted yet. |                 |

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO and CFO phases of an optimized takeover of nodeB. In this case, nodeA has information about the takeover status of nodeB's aggregates. Since nodeB is not operational, an Remote Procedure Call(RPC) error is indicated in the command output.

```
cluster1::> storage failover show-takeover
ode      Node Status      Aggregate      Takeover Status
-----
odeA      Partner has
           relocated its
           aggregates. In
           takeover.
           aggr1          Done
           aggr2          Done
           CFO aggregates Done.
Warning: Unable to list entries on node nodeB. RPC: Port mapper failure -
RPC:
           Timed out
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has aborted the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```

cluster1::> storage failover show-takeover
ode          Node Status          Aggregate          Takeover Status
-----
odeA          Optimized takeover
              of partner aborted.
              Run the command
              "storage failover
              show-takeover -node
              nodeB" to display the
              relocation status of
              the partner.
              -
odeB          Optimized takeover
              by partner aborted.
              aggr1          Failed: Destination node did
                              not online the aggregate on
                              time. To takeover the
                              remaining aggregates, run the
                              "storage failover takeover
                              -ofnode nodeB
                              -bypass-optimization true"
                              command. To giveback the
                              relocated aggregates, run the
                              "storage failover giveback
                              -ofnode nodeB" command.
              aggr2          Not attempted yet
              CFO aggregates Not attempted yet.

```

## storage failover show

### Display storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover show` command displays information about storage-failover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether storage failover is possible.
- The current state of storage failover. If the takeover is disabled the appropriate reason would be displayed.

To display detailed information about storage failover on a specific node, run the command with the `-node`

parameter. The detailed view adds the following information:

- Node NVRAM ID.
- Partner NVRAM ID.
- Whether storage failover is enabled.
- Whether the storage-failover interconnect is available.
- Status of individual storage-failover interconnect links.
- Type and vendor of the storage-failover interconnect.
- Partner State
- Status codes from the takeover-by-partner process. Possible values include:
  - NVRAM\_DOWN
  - OPERATOR\_DISABLE\_NVRAM
  - PARTNER\_RESET
  - FM\_TAKEOVER
  - NVRAM\_MISMATCH
  - OPERATOR\_DENY
  - CLUSTER\_DISABLE
  - VERSION
  - SHELF\_HOT
  - REVERT\_IN\_PROGRESS
  - HALT\_NOTKOVER
  - TAKEOVER\_ON\_PANIC
- Reasons why takeover is not possible, if applicable. Possible values include:
  - NOT\_INIT
  - DISABLED
  - DEGRADED
  - MBX\_UNKNOWN
  - FM\_VERSION
  - PARTNER\_DISABLED
  - OPERATOR\_DENY
  - NVRAM\_MISMATCH
  - VERSION
  - IC\_ERROR
  - BOOTING
  - SHELF\_HOT
  - PARTNER\_REVERT\_IN\_PROGRESS
  - LOCAL\_REVERT\_IN\_PROGRESS
  - PARTNER\_TAKEOVER

- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER
- Time until takeover, in seconds.
- Time until auto giveback, in seconds.
- Delay for auto giveback, in seconds.
- List of local mailbox disks.
- List of partner mailbox disks.
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover.

You can specify additional parameters to select the displayed information. For example, to display information only about storage-failover configurations whose interconnect is down, run the command with ``-interconnect-up false``.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-advanced ] (privilege: advanced)**

Displays the following information:

- Node name
- Whether kill messages are issued during a takeover operation
- Whether the node controls its partner's storage aggregates
- The time when firmware notification was received
- The time when booting notification was received
- The time at which the last takeover or giveback operation occurred, in microseconds
- The number of times the failover log was unsynchronized

**| [-iotime ] (privilege: advanced)**

Displays the following information:

- Node name
- Primary normal I/O time

- Primary transition I/O time
- Backup normal I/O time
- Backup transition I/O time

#### | [**-mailbox-status**] (privilege: advanced)

Displays the following information:

- Node name
- Primary mailbox status
- Backup mailbox status

#### | [**-more-options**] (privilege: advanced)

Displays the following information:

- Node name
- Whether takeover on short uptime is enabled
- Short uptime, in seconds
- Number of giveback attempts
- Interval of giveback attempts, in minutes
- Whether the primary mailbox is online
- Mailbox status read interval, in seconds
- Mailbox status write interval, in seconds

#### | [**-options**]

Displays the following information:

- Node name
- Whether automatic giveback operations are enabled
- Whether long-running operations are terminated when an automatic giveback operation is initiated
- Whether the node checks its partner's readiness before initiating a giveback operation
- The time, in seconds, that the node remains unresponsive before its partner initiates a takeover operation
- Whether the node automatically takes over for its partner if the partner fails
- Whether the node automatically takes over for its partner if the partner panics
- Whether the node automatically takes over for its partner if the partner reboots
- whether Hardware Assisted Takeover is enabled
- Ip address on which the partner node listens to the Hardware Assist alerts
- Port number on which the partner node listens to the Hardware Assist alerts
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover

If this parameter is specified when the privilege level is set to advanced or higher, the command displays the information in the previous list and the following additional information:

- Whether the node takes over for its partner if its partner fails after a period of time, which is listed in the following field
- The number of seconds before the node takes over for its partner
- The number of times the node attempts an automatic giveback operation within a period of time
- The number of minutes in which the automatic giveback attempts can occur
- Whether storage-failover status is communicated via mailbox disks
- The interval at which the node reads its partner node's status from the mailbox disks
- The interval at which the node writes its status to the mailbox disks
- '
  - The interval at which Hardware assist h/w sends a heartbeat
  - The number of times the Hardware assist alert is sent

#### | **`-progress`** ] (privilege: advanced)

Displays the following information:

- Node name
- Maximum resource-table index number
- Current resource-table index number
- Current resource-table entry

#### | **`-takeover-status`** ]

Displays the following information:

- Node name
- Partner name
- Takeover enabled
- Takeover possible
- Interconnect up
- State
- Node NVRAM ID
- Partner NVRAM ID
- Reason Takeover Not Possible By Partner
- Reason Takeover Not Possible
- Time Until Takeover

#### | **`-timeout`** ] (privilege: advanced)

Displays the following information:

- Node name
- Fast timeout
- Slow timeout
- Mailbox timeout

- Connection timeout
- Operator timeout
- Firmware timeout
- Dump-core timeout
- Booting timeout
- Reboot timeout

**| [-transit ] (privilege: advanced)**

Displays the following information:

- Node name
- Transit Timer Enabled
- Transit Timeout

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes whose name matches this parameter value.

**[-partner-name <text>] - Partner Name**

Selects the nodes that have the specified partner-name setting.

**[-nvramid <integer>] - Node NVRAM ID**

Selects the nodes that have the specified NVRAM ID setting.

**[-partner-nvramid <integer>] - Partner NVRAM ID**

Selects the nodes that have the specified partner NVRAM ID setting.

**[-enabled {true|false}] - Takeover Enabled**

Selects the nodes that have the specified enabled setting.

**[-mode {ha|non\_ha}] - HA Mode**

Selects the nodes that have the specified HA-mode setting. If the value is set to `ha` then the node is a member of a storage-failover configuration. If it is set to `non-ha` then it is in a stand alone configuration.

**[-possible {true|false}] - Takeover Possible**

Selects the nodes that have the specified failover-possible setting.

**[-reason <text>,...] - Reason Takeover not Possible**

Selects the nodes that have the specified reason-not-possible setting. Possible values include:

- NOT\_INIT
- DISABLED
- DEGRADED
- MBX\_UNKNOWN

- FM\_VERSION
- PARTNER\_DISABLED
- OPERATOR\_DENY
- NVRAM\_MISMATCH
- VERSION
- IC\_ERROR
- BOOTING
- SHELF\_HOT
- PARTNER\_REVERT\_IN\_PROGRESS
- LOCAL\_REVERT\_IN\_PROGRESS
- PARTNER\_TAKEOVER
- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER

**[-interconnect-up {true|false}] - Interconnect Up**

Selects the nodes that have the specified interconnect-up setting.

**[-interconnect-links <text>] - Interconnect Links**

Selects the nodes that have the specified interconnect-links setting.

**[-interconnect-type <text>] - Interconnect Type**

Selects the nodes that have the specified interconnect-type setting.

**[-state-description <text>] - State Description**

Selects the nodes that have the specified state-description setting.

**[-partner-state <text>] - Partner State**

Selects the nodes that have the specified partner-state setting. Possible values include:

- OPERATOR COMPLETED
- DEBUGGUER COMPLETED
- PROGRESS COUNTER
- I/O ERROR
- BAD CHECKSUM

- RESERVED
- UNKNOWN
- INITIALIZING
- IN POWER-ON SELF TEST
- BOOTING
- BOOT FAILED
- WAITING
- KERNEL LOADED
- UP
- IN DEBUGGER
- WAITING FOR OPERATOR INPUT
- DUMPING CORE
- HALTED
- REBOOTING
- WAITING FOR GIVEBACK (DISK RESERVATIONS)
- WAITING FOR GIVEBACK (HA MAILBOXES)
- DUMPING SPARECORE
- MULTI-DISK PANIC
- IN TAKEOVER

**`[-time-until-takeover <integer>]` - Time Until Takeover**

Selects the nodes that have the specified time-until-takeover setting.

**`[-partner-reason <text>,...]` - Reason Takeover not Possible by Partner**

Selects the nodes that have the specified partner-reason text setting.

**`[-killpackets {true|false}]` - Issue Kill Packets (privilege: advanced)**

Selects the nodes that have the specified kill packets setting.

**`[-partner-aggregates {true|false}]` - Control Partner Aggregates (privilege: advanced)**

Selects the nodes that have the specified partner aggregates setting.

**`[-current-index <integer>]` - Current Progress Index (privilege: advanced)**

Selects the nodes that have the specified current-progress index setting.

**`[-current-entry <text>]` - Current Progress Entry (privilege: advanced)**

Selects the nodes that have the specified current-progress entry setting.

**`[-maximum-index <integer>]` - Maximum Progress Index (privilege: advanced)**

Selects the nodes that have the specified maximum-progress index setting.

**`[-pmbx-status <text>,...]` - Primary Mailbox Status (privilege: advanced)**

Selects the nodes that have the specified primary mailbox status setting. Possible values include:

- MBX\_STATUS\_NODISKS
- MBX\_STATUS\_UNCERTAIN
- MBX\_STATUS\_STALE
- MBX\_STATUS\_CONFLICTED
- MBX\_STATUS\_OLD\_VERSION
- MBX\_STATUS\_NOT\_FOUND
- MBX\_STATUS\_WRONG\_STATE
- MBX\_STATUS\_BACKUP

**[-bmbx-status <text>,...] - Backup Mailbox Status (privilege: advanced)**

Selects the nodes that have the specified backup-mailbox status setting. See the description of the `-pmbx-status` parameter for a list of possible values.

**[-major-seq-num-local <integer>] - Local Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the local node.

**[-minor-seq-num-local <integer>] - Local Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the local node.

**[-major-seq-num-partner <integer>] - Partner Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the partner node.

**[-minor-seq-num-partner <integer>] - Partner Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the partner node.

**[-local-mbx-node-status <Mailbox Status>] - Local Mailbox Node Status (privilege: advanced)**

Selects the nodes that have the specified local mailbox node status. Possible values include:

- MBX\_UNKNOWN - Local node is up, mailbox uninitialized
- MBX\_TAKEOVER\_DISABLED - Local node is up but takeover is disallowed
- MBX\_TAKEOVER\_ENABLED - Local node is up and takeover is allowed
- MBX\_TAKEOVER\_ACTIVE - Partner node has taken over
- MBX\_GIVEBACK\_DONE - Giveback completed, but local node has not yet restarted

**[-mbx-abs-time-local <integer>] - Local Mailbox Absolute Time (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-mbx-sk-time-local <integer>] - Local Mailbox Kernel Time (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel Kernel Time.

**[-mbx-sk-cycles-local <integer>] - Local Mailbox CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel CPU Cycle count.

**[-ic-abs-time-local <integer>] - Local IC Absolute Time (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-local <integer>] - Local IC Kernel Time (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel Kernel Time.

**[-ic-sk-cycles-local <integer>] - Local IC CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel CPU Cycle count.

**[-partner-mbx-node-status <Mailbox Status>] - Partner Mailbox Node Status (privilege: advanced)**

Selects the nodes that have the specified partner mailbox node status. Possible values include:

- MBX\_UNKNOWN
- MBX\_TAKEOVER\_DISABLED
- MBX\_TAKEOVER\_ENABLED
- MBX\_TAKEOVER\_ACTIVE
- MBX\_GIVEBACK\_DONE

**[-mbx-abs-time-partner <integer>] - Partner Mailbox Absolute Time (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-mbx-sk-time-partner <integer>] - Partner Mailbox Kernel Time (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel Kernel Time.

**[-mbx-sk-cycles-partner <integer>] - Partner Mailbox CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel CPU Cycle count.

**[-mbx-major-seq-num-partner <integer>] - Partner Mailbox Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel major sequence number.

**[-mbx-minor-seq-num-partner <integer>] - Partner Mailbox Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel minor sequence number.

**[-ic-abs-time-partner <integer>] - Partner IC Absolute Time (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-partner <integer>] - Partner IC Kernel Time (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel Kernel Time.

**[-ic-sk-cycles-partner <integer>] - Partner IC CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel CPU Cycle count.

**[-ic-major-seq-num-partner <integer>] - Partner IC Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel major sequence number.

**[-ic-minor-seq-num-partner <integer>] - Partner IC Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel minor sequence number.

**[-local-takeover-info <text>] - Local Takeover Info (privilege: advanced)**

Selects the nodes that have the specified local node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled
- NOTKOVER\_VERSION - Version mismatch
- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Enable takeover on reboot
- TKOVER\_ON\_PANIC - Enabled takeover on panic
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

**[-partner-takeover-info <text>] - Partner Takeover Info (privilege: advanced)**

Selects the nodes that have the specified partner node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled

- NOTKOVER\_VERSION - Version mismatch
- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Takeover on reboot is enabled
- TKOVER\_ON\_PANIC - Takeover on panic is enabled
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

**[-local-headswap-state <Headswap State>] - Local Head Swap State (privilege: advanced)**

Selects the nodes that have the specified local node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started
- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-partner-headswap-state <Headswap State>] - Partner Head Swap State (privilege: advanced)**

Selects the nodes that have the specified partner node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started
- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-fast-timeout <integer>] - Fast Timeout (privilege: advanced)**

Selects the nodes that have the specified fast-timeout configuration setting.

**[-slow-timeout <integer>] - Slow Timeout (privilege: advanced)**

Selects the nodes that have the specified slow-timeout setting.

**[-mailbox-timeout <integer>] - Mailbox Timeout (privilege: advanced)**

Selects the nodes that have the specified mailbox-timeout setting.

**[-connect-timeout <integer>] - Connect Timeout (privilege: advanced)**

Selects the nodes that have the specified connect-timeout setting.

**[-operator-timeout <integer>] - Operator Timeout (privilege: advanced)**

Selects the nodes that have the specified operator-timeout setting.

**[-firmware-timeout <integer>] - Firmware Timeout (privilege: advanced)**  
Selects the nodes that have the specified firmware-timeout setting.

**[-dumpcore-timeout <integer>] - Dumpcore Timeout (privilege: advanced)**  
Selects the nodes that have the specified dump-core timeout setting.

**[-booting-timeout <integer>] - Booting Timeout (privilege: advanced)**  
Selects the nodes that have the specified booting-timeout setting.

**[-transit-timer {true|false}] - Transit Timer Enabled (privilege: advanced)**  
Selects the nodes that have the specified transit-timer setting.

**[-transit-timeout <integer>] - Transit Timeout (privilege: advanced)**  
Selects the nodes that have the specified transit timeout.

**[-firmware-received <integer>] - Firmware Received (privilege: advanced)**  
Selects the nodes that have the specified firmware-reception time.

**[-firmware-received-cycles <integer>] - Firmware Received in CPU Cycles (privilege: advanced)**  
Selects the nodes that have the specified firmware-reception time in CPU Cycles.

**[-booting-received <integer>] - Booting Received (privilege: advanced)**  
Selects the nodes that have the specified booting-reception time.

**[-transit-time <integer>] - Transit Event Time (privilege: advanced)**  
Selects the nodes whose last failover event occurred at the specified time.

**[-pnormal <integer>] - Primary Normal IO Time (privilege: advanced)**  
Selects the nodes that have the specified normal primary-mailbox I/O time.

**[-ptransition <integer>] - Primary Transition IO Time (privilege: advanced)**  
Selects the nodes that have the specified transitional primary-mailbox I/O time.

**[-bnormal <integer>] - Backup Normal IO Time (privilege: advanced)**  
Selects the nodes that have the specified normal backup-mailbox I/O time.

**[-btransition <integer>] - Backup Transition IO Time (privilege: advanced)**  
Selects the nodes that have the specified transitional backup-mailbox I/O time.

**[-logs-unsyned <integer>] - Logs Unsyned Count (privilege: advanced)**  
Selects the nodes that have the specified count of unsynchronized logs.

**[-auto-giveback {true|false}] - Auto Giveback Enabled**  
Selects the nodes that have the specified auto-giveback setting.

**[-detection-time <integer>] - Takeover Detection Time (secs)**  
Selects the nodes that have the specified detection-time setting.

**[-onfailure {true|false}] - Takeover on Failure Enabled**

Selects the nodes that have the specified takeover-on-failure setting.

**[-onpanic {true|false}] - Takeover on Panic Enabled**

Selects the nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**

Selects the storage-failover configurations that match this parameter value.

**[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)**

Selects the nodes that have the specified short-uptime value.

**[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)**

Selects the nodes that have the specified number of giveback attempts.

**[-attempts-time <integer>] - Giveback Attempts Period (minutes) (privilege: advanced)**

Selects the nodes that have the specified time setting for giveback attempts.

**[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)**

Selects the nodes that have the specified propagate-status-via-mailbox setting.

**[-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)**

Selects the nodes that have the specified read interval.

**[-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)**

Selects the nodes that have the specified write interval.

**[-onreboot {true|false}] - Takeover on Reboot Enabled**

Selects the nodes that have the specified takeover-on-reboot setting.

**[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**

Selects the nodes that have the specified delay (in seconds) for the auto giveback.

**[-hwassist {true|false}] - Hardware Assist Enabled**

Selects the nodes that have the specified hwassist setting.

**[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP**

Selects the nodes that have the specified hwassist-partner-ip setting.

**[-hwassist-partner-port <integer>] - Partner's Hwassist Port**

Selects the nodes that have the specified hwassist-partner-port setting.

**[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**

Selects the nodes that have the specified hwassist health check interval, in seconds.

**[-hwassist-retry-count <integer>] - Hwassist Retry Count**

Selects the nodes that have the specified hwassist retry count, in seconds.

**`[-hwassist-status <text>]` - Hwassist Status**

Selects the nodes that have the specified hwassist-status setting.

**`[-time-until-autogiveback <integer>]` - Time Until Auto Giveback (secs)**

Selects the nodes that have the specified time(in seconds) until auto giveback.

**`[-local-mailbox-disks <text>]` - Local Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the local node.

**`[-partner-mailbox-disks <text>]` - Partner Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the partner node.

**`[-local-firmware-state <text>]` - Local Firmware State (privilege: advanced)**

Selects the nodes that have the specified firmware state on the local node.

**`[-local-firmware-progress <integer>]` - Local Firmware Progress Counter (privilege: advanced)**

Selects the nodes that have the specified firmware progress counter for the local node.

**`[-partner-firmware-state <text>]` - Partner Firmware State (privilege: advanced)**

Selects the nodes that have the specified firmware state of the partner node.

**`[-partner-firmware-progress <integer>]` - Partner Firmware Progress Counter (privilege: advanced)**

Selects the nodes that have the specified firmware progress counter for the partner node.

**`[-local-missing-disks <text>]` - Missing Disks on Local Node**

Selects the nodes that have the specified missing disks on the local node.

**`[-partner-missing-disks <text>]` - Missing Disks on Partner Node**

Selects the nodes that have the specified missing disks on the partner node.

**`[-reboot-timeout <integer>]` - Reboot Timeout (privilege: advanced)**

Selects the nodes that have the specified reboot timeout.

**`[-time-since-takeover <text>]` - Time Since Takeover**

Selects the nodes that have been in takeover mode for the specified amount of time.

**`[-auto-giveback-after-panic {true|false}]` - Auto Giveback After Takeover On Panic**

Selects the nodes that have the specified auto-giveback-after-panic setting. If *true* then an automatic giveback operation is invoked when the failover node of an HA pair is repaired and rebooted. The takeover node of the HA pair detects this and initiates a giveback operation automatically.

**`[-is-giveback-requested {true|false}]` - Giveback Requested (privilege: advanced)**

Selects the nodes that have the specified is-giveback-requested setting. If *true*, a deferred giveback request has been made by the local node.

**`[-auto-giveback-last-veto-check <integer>]` - Auto Giveback Last Veto Check (privilege: advanced)**

Selects the nodes that have the specified auto-giveback-last-veto-check time. This setting indicates the

time, in milliseconds, when the local node made the most recent giveback veto check.

**`[-is-auto-giveback-attempts-exceeded {true|false}] - Auto Giveback Attempts Exceeded (privilege: advanced)`**

Selects the nodes that have the specified is-auto-giveback-attempts-exceeded setting. If *true*, the local node has exceeded the maximum number of allowed auto giveback attempts.

**`[-was-auto-giveback-done {true|false}] - Was Auto Giveback Done (privilege: advanced)`**

Selects the nodes that have the specified was-auto-giveback-done setting. If *true*, the last giveback was automatic (as opposed to a manual giveback).

**`[-is-cifs-auto-giveback-stopping {true|false}] - Is CIFS Auto Giveback Stopping (privilege: advanced)`**

Selects the nodes that have the specified is-cifs-auto-giveback-stopping setting. If *true*, the local node has initiated CIFS termination as part of an automatic giveback.

**`[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs) (privilege: advanced)`**

Selects the nodes that have the specified aggregate migration timeout.

**`[-is-mirror-enabled {true|false}] - Is NVRAM Mirroring Enabled (privilege: advanced)`**

Selects the nodes that have the specified is-mirror-enabled setting. If *true*, then NVRAM mirroring is enabled.

**`[-is-mirror-consistency-required {true|false}] - Is Mirror Consistency Required (privilege: advanced)`**

Selects the nodes that have the specified is-mirror-consistency-required setting. If *true*, then NVRAM mirror consistency is required.

**`[-is-memory-insufficient {true|false}] - Is Memory Insufficient To Takeover (privilege: advanced)`**

Selects the nodes that have the specified is-memory-insufficient setting. If *true*, the local node does not have enough memory to perform a takeover.

**`[-memio-state <memio status>] - Current State of Memio Link (privilege: advanced)`**

Selects the nodes that have the specified memio layer link current state. Possible values are:

- UNINIT - Uninitialized
- CLOSED - Closed
- HB\_LISTEN - Listening for connect
- SYN\_SENT - Sent generation information
- ESTABLISHED - Connection established

**`[-is-degraded {true|false}] - Are Partner Mailbox Disks Not Known (privilege: advanced)`**

Selects the nodes that have the specified is-degraded setting. If *true*, takeovers are deferred because partner mailbox disks are not known.

**`[-reserve-policy <reserve policy>] - FM Reservation Policy (privilege: advanced)`**

Selects the nodes that have the specified disk reservation policy. Possible values are:

- `RESERVE_NO_DISKS` - no disk reservations made during takeover, nor are disk reservations released during giveback
- `RESERVE_ALWAYS_AFTER_TAKEOVER` - reservations are issued at takeover. When disks are subsequently added, they are also reserved. All disks are released at giveback

**`[-reset-disks {true|false}]` - Issue Disk Resets during Failover (privilege: advanced)**

Selects the nodes that have the specified reset-disks setting. If `true`, disks are reset during takeover/giveback.

**`[-total-system-uptime <integer>]` - Total System Uptime (privilege: advanced)**

Selects the nodes that have the specified total system uptime, in milliseconds.

**`[-current-time <integer>]` - Current System Time (privilege: advanced)**

Selects the nodes that have the specified current time on the node.

**`[-fm-takeover-state <FM Takeover/Giveback Transition>]` - FM Takeover State (privilege: advanced)**

Selects the nodes that have the specified takeover state. Possible values are:

- `FT_NONE` - Not in takeover
- `FT_TAKEOVER_STARTED` - Local node has initiated takeover
- `FT_TAKEOVER_COMMITTED` - Takeover has been committed
- `FT_TAKEOVER_DONE_OK` - Local node successfully completed takeover
- `FT_TAKEOVER_DONE_FAILED` - Takeover failed

**`[-fm-giveback-state <FM Takeover/Giveback Transition>]` - FM Giveback State (privilege: advanced)**

Selects the nodes that have the specified giveback state. Possible values are:

- `FT_NONE` - Not in giveback
- `FT_GIVEBACK_READY` - Partner node is ready for giveback
- `FT_GIVEBACK_STARTED` - Local node has initiated giveback
- `FT_GIVEBACK_COMMITTED` - Giveback has been committed
- `FT_GIVEBACK_DONE_OK` - Giveback completed successfully

**`[-takeover-reason <FM Takeover Reason>]` - Reason why takeover triggered (privilege: advanced)**

Selects the nodes that have the specified takeover reason. Possible values are:

- `TAKEOVER_NONE` - Not in takeover
- `TAKEOVER_IMMEDIATE` - Operator initiated forced takeover
- `TAKEOVER_NDU` - Takeover initiated as part of NDU
- `TAKEOVER_FORCED` - Operator initiated forced takeover, possible data loss
- `TAKEOVER_EARLY` - Takeover occurred during the boot process
- `TAKEOVER_OPERATOR_EXP` - Takeover occurred after the operator timeout expired
- `TAKEOVER_POST_FAILED` - Takeover occurred on POST failure

- TAKEOVER\_PANIC - Takeover on panic
- TAKEOVER\_SHORTUPTIME - Takeover after rapid toggling between up and down states
- TAKEOVER\_SPARECORE\_EXP - Takeover on panic timeout expiration
- TAKEOVER\_REBOOT\_EXP - Takeover on reboot timer expiration
- TAKEOVER\_BOOTING\_EXP - Takeover on booting timer expiration
- TAKEOVER\_FIRMWARE\_EXP - Takeover on firmware timer expiration
- TAKEOVER\_NFO\_SHUTDOWN - Takeover on negotiated failover shutdown
- TAKEOVER\_NFO\_TIMER - Takeover on negotiated failover timer expiration
- TAKEOVER\_MDP - Takeover on multi-disk panic
- TAKEOVER\_REBOOT - Takeover on reboot
- TAKEOVER\_HALT - Takeover on halt
- TAKEOVER\_CLAM - CLAM-triggered takeover
- TAKEOVER\_HWASSIST - Hardware-assisted takeover
- TAKEOVER\_NORMAL - Operator initiated takeover

#### **[`-ha-type {none|shared_storage|non_shared_storage}`] - HA Type**

If this parameter is specified, the command selects the nodes that have the specified HA-type setting. If the value is set to *shared\_storage*, then the node is in a storage-failover configuration using the shared storage. If it is set to *non\_shared\_storage*, then the node is in a storage-failover configuration using the unshared storage. If it is set to *none*, then the node is not part of a storage-failover configuration.

### **Examples**

The following example displays information about all storage-failover configurations:

```
cluster1::> storage failover show
```

| Node  | Partner | Takeover<br>Possible | State              |
|-------|---------|----------------------|--------------------|
| node0 | node1   | true                 | Connected to node1 |
| node2 | node3   | true                 | Connected to node3 |
| node1 | node0   | true                 | Connected to node0 |
| node3 | node2   | true                 | Connected to node2 |

4 entries were displayed.

## **storage failover takeover**

Take over the storage of a node's partner

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage failover takeover` command initiates a takeover of the partner node's storage.

## Parameters

### **{ -ofnode {<nodename>|local} - Node to Takeover**

This specifies the node that is taken over. It is shut down and its partner takes over its storage.

### **[ -bynode {<nodename>|local} ] - Node Initiating Takeover }**

This specifies the node that is to take over its partner's storage.

### **[ -option <takeover option> ] - Takeover Option**

This optionally specifies the style of takeover operation. Possible values include the following:

- normal - Specifies a normal takeover operation; that is, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. This is the default value.
- immediate - Specifies an immediate takeover. In an immediate takeover, the takeover operation is initiated before the partner is given the time to close its storage resources gracefully. The use of this option results in an immediate takeover which does not do a clean shutdown. In case of NDU this can result in a NDU failure.

If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` option is set to false.

If this option is specified, migration of data LIFs from the partner will be delayed even if the `-skip-lif-migration-before-takeover` option is not specified. If possible, migrate the data LIFs to another node prior to specifying this option.

- allow-version-mismatch - If this value is specified, the takeover operation is initiated even if the partner is running a version of software that is incompatible with the version running on the node. In this case, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. However, the takeover operation will not be allowed if the partner has higher WAFL or RAID label versions. Use this value as part of a nondisruptive upgrade or downgrade procedure. For virtual ONTAP platforms, the partner's default image version should be greater or equal to the local node's current image version to proceed with a version mismatch.
- force - If this value is specified, the takeover operation is initiated even if the node detects an error that normally prevents a takeover operation from occurring. This value is available only at the advanced privilege level and higher.

If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` option is set to false.

The use of this option can potentially result in data loss. If the HA interconnect is detached or inactive, or the contents of the failover partner's NVRAM cards are unsynchronized, takeover is normally disabled. Using the `-force` option enables a node to take over its partner's storage despite the unsynchronized NVRAM, which can contain client data that can be lost upon storage takeover.

### **[ -bypass-optimization {true|false} ] - Bypass Takeover Optimization (privilege: advanced)**

If this is an operator-initiated planned takeover, this parameter specifies whether the takeover optimization is bypassed. This parameter defaults to false.

This parameter is ignored and negotiated takeover optimization automatically bypassed if the `-immediate` option, the `-force` option, or the `-allow-disk-inventory-mismatch` parameter is specified as part of the same `storage failover takeover` command.

#### **`[-allow-disk-inventory-mismatch {true|false}] - Disk inventory`**

If this parameter is specified, the takeover operation is initiated even if the local node cannot see the partner's filesystem disks.

If this parameter is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` parameter is set to `false`.

The use of this parameter can potentially result in client outage.

#### **`[-skip-lif-migration-before-takeover <true>] - Skip Migrating LIFs Away from Node Prior to Takeover`**

This parameter specifies that LIF migration prior to takeover is skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the takeover has occurred. Without this parameter, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to its takeover. If the migration fails or times out, the takeover is aborted.

#### **`[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Takeover`**

If this parameter is specified, quorum checks will be skipped prior to the takeover. The operation will continue even if there is a possible data outage due to a quorum issue.

#### **`[-override-vetoes <true>] - Override Vetoes`**

If this is an operator-initiated planned takeover, this parameter specifies whether the veto should be overridden. If this parameter is not specified, its value is set to `false`.

If this parameter is specified, negotiated takeover will override any vetoes to continue with takeover.

The use of this parameter might result in the takeover proceeding even if the node detects issues that can potentially make the takeover dangerous or disruptive.

#### **`[-halt <true>] - Halt the Node That Is Taken Over`**

This parameter specifies whether the node being taken over should be halted. If the value is `true`, then the node being taken over is halted. If the value is `false`, then the node being taken over is shutdown and might be rebooted if `AUTOBOOT` is set to `true`. This parameter defaults to `false`.

#### **`[-check-only <true>] - Only Run Pre-Takeover Checks`**

This parameter initiates a verification check of a possible future planned takeover. The check operation records any failures or issues that would prevent a takeover. Use the [storage failover check-takeover](#) command to view the result of the check. This parameter defaults to `false`.

This is a best effort operation. All checks passed does not guarantee a successful planned takeover as failures may occur during runtime.

## Examples

The following example causes a node named node0 to initiate a negotiated optimized takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0
```

The following example causes a node named node0 to initiate an immediate takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0 -option immediate
```

## storage failover hwassist show

Display hardware-assisted storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist show` command displays information about the hardware-assisted storage failover status on each node. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether hardware-assisted failover is enabled.
- IP address on which the local node receives hardware-assisted failover alerts.
- Port on which the local node receives hardware-assisted failover alerts.
- Hardware-assisted failover status.
- If the monitor is inactive, the reason it is inactive.
- If the monitor is inactive, the corrective action to make it active.
- Status of keep-alive alerts on the local node.

Hardware-assisted failover establishes a notification channel from each respective node's service processor to the other (HA partner) node. If a node becomes unresponsive, its service processor notifies the HA partner of this condition, accelerating storage failover. By default, hwassist is enabled and configured automatically to use each node's node-mgmt LIF. To modify or show the hardware-assisted storage failover configuration, use the [storage failover modify](#) and [storage failover show](#) commands.

## Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about hwassist on the specified nodes.

**[-partner-name {<nodename>|local}] - Name of the Partner Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified partner node.

**[-enabled {true|false}] - Local Hardware Assist Enabled**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified enabled state.

**[-local-status <text>] - Local Node's Hwassist Status**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local status (*active* or *inactive*).

**[-local-ip <text>] - IP Address on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local IP address.

**[-local-port <integer>] - Port on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local UDP port.

**[-local-inactive <text>] - Local Node's Hwassist Inactive Status Reason**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified inactive reason.

**[-local-action <text>] - Corrective Action on Local Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified corrective action.

## Examples

The following example displays the hardware-assisted failover information for node cluster1-01 and its HA partner node cluster1-02:

```

cluster1::> storage failover hwassist show
Node
-----
cluster1-01
                Partner: cluster1-02
        Hwassist Enabled: true
                Hwassist IP: 10.225.248.19
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
        Keep-Alive Status: healthy

cluster1-02
                Partner: cluster1-01
        Hwassist Enabled: true
                Hwassist IP: 10.225.248.21
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
        Keep-Alive Status: healthy

```

## storage failover hwassist test

Test the hwassist functionality

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist test` command tests the Hardware Assist h/w connectivity between the two nodes in a HA pair. The test result can be one of the following.

- Hardware Assist is not initialized.
- HW assist is not supported.
- Partner is throttling alerts.
- Resource is busy.
- Hardware Assist h/w returned an error.
- No response from partner.Timed out.
- Unexpected abort.

- Partner has taken over.
- Interconnect is down between nodes.
- Partner is not booted up yet.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node from which a test alert is initiated.

## Examples

The following command issues a test alert from the node cluster1-01:

```
cluster1::> storage failover hwassist test -node cluster1-01
Info: Operation successful.
```

## storage failover hwassist stats clear

Clear the hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats clear` command clears the statistics information maintained by Hardware Assist functionality.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which the statistics are to be cleared.

## Examples

The following example clears the hwassist statistics on the node cluster1-01:

```
cluster1::> storage failover hwassist stats clear -node cluster1-01
```

## storage failover hwassist stats show

Display hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats show` command displays statistics about the hardware assist alerts processed by a node. The command displays the following information for each alert:

- Locally enabled.
- Partner Inactive Reason.
- Alert type.
- Event that triggered the alert.
- The number of times the alert has been received.
- Whether takeover was possible on receiving the alert.
- The last time at which the alert was received.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the hwassist statistics for the specified node.

**[-enabled {true|false}] - Local Hardware Assist Enabled**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified enabled state.

**[-local-inactive <text>] - Local Node's Hwassist Inactive Status Reason**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified inactive reason.

**[-power-loss <text>] - Power Loss Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified power-loss event.

**[-watchdog-reset <text>] - Watchdog Reset Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified watchdog-reset event.

**[-power-off-via-rlm <text>] - Power Off by Using RLM**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified power off event via Remote LAN Manager.

**[-power-cycle-via-rlm <text>] - Power Cycle by Using RLM**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified power cycle event via Remote LAN Manager.

**[-reset-via-rlm <text>] - System Reset by Using RLM**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified reset event via Remote LAN Manager.

**[-power-off-via-sp <text>] - Power Off by Using SP**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified power off event via Service Processor.

**[-power-cycle-via-sp <text>] - Power Cycle by Using SP**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified power cycle event via Service Processor.

**[-reset-via-sp <text>] - System Reset by Using SP**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified reset event via Service Processor.

**[-dimm-uecc-error <text>] - DIMM UECC Fatal Error Detected by Storage OS**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified DIMM error event.

**[-post-error <text>] - POST Error Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified post error event.

**[-abnormal-reboot <text>] - Abnormal Reboot Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified abnormal reboot event.

**[-loss-of-heartbeat <text>] - Loss of Heartbeat Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified loss of heartbeat event.

**[-keep-alive <text>] - Periodic Message Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified keep alive event.

**[-test <text>] - Test Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified test event.

**[-bad-nvram-id <text>] - Bad NVRAM ID Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified bad NVRAM ID event.

**[-ss-mismatch <text>] - Shared Secret Key Mismatch Alert**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified shared secret mismatch event.

**[-unknown-alerts <text>] - Unknown Alerts**

If you specify this parameter, the command displays information only about hwassist statistics on nodes with the specified unknown alerts event.

**[-times-throttled <text>] - Number of Throttled Alerts**

If you specify this parameter, the command displays information only about hwassist statistics on nodes

with the specified times throttled event.

## Examples

The following example displays the hwassist statistics for the node ha1:

```
cluster1:> storage failover hwassist stats show -node ha1
Node: ha1

          Local Enabled: true
    Partner Inactive Reason: -
Alert Type  Alert Event                Count Takeover  Last Received
-----
-----
system_down power_loss                0 Yes          ---
system_down l2_watchdog_reset          0 Yes          ---
system_down power_off_via_rlm           0 Yes          ---
system_down power_cycle_via_rlm         0 Yes          ---
system_down reset_via_rlm               0 Yes          ---
system_down power_off_via_sp            0 Yes          ---
system_down power_cycle_via_sp          0 Yes          ---
system_down reset_via_sp                0 Yes          ---
system_down dimm_uecc_error             0 Yes          ---
system_down post_error                  0 No           ---
system_down abnormal_reboot             0 No           ---
system_down loss_of_heartbeat           0 No           ---
keep_alive  periodic_message           10 No          Wed Mar  9 13:41:28
EST 2016
test        test                       0 No           ---
ID_mismatch ---                       0 ---          ---
Key_mismatch ---                       0 ---          ---

```

## storage failover internal-options show

Display the internal options for storage failover

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage failover internal-options show` command displays the following information about the storage failover configuration:

- Node name
- Whether automatic giveback is enabled
- Whether partner checking is enabled
- Takeover detection time, in seconds
- Whether takeover on failover is enabled
- Whether takeover on panic is enabled
- Whether takeover on reboot is enabled
- Whether hardware-assisted takeover is enabled
- IP address on which the partner node listens to the hardware-assisted takeover alerts
- Port on which the partner node listens to the hardware-assisted takeover alerts
- Whether takeover on short uptime is enabled (detailed view only)
- Short uptime interval, in seconds (detailed view only)
- Number of giveback attempts (detailed view only)
- Giveback attempt interval, in minutes (detailed view only)
- Whether status is propagated through SFO mailboxes (detailed view only)
- Status read interval, in seconds (detailed view only)
- Status write interval, in seconds (detailed view only)
- Hardware-assisted takeover retry count (detailed view only)
- Hardware-assisted takeover heartbeat period (detailed view only)
- Whether operator-initiated planned takeover is optimized

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-more ] (privilege: advanced)`**

This parameter displays the following additional information: :

- Node name
- Whether takeover on short uptime is enabled

- Short uptime interval, in seconds
- Number of giveback attempts
- Giveback attempt interval, in minutes
- Whether status is propagated through SFO mailboxes
- Status read interval, in seconds
- Status write interval, in seconds
- Hardware-assisted takeover retry count
- Hardware-assisted takeover heartbeat period

**| [-instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects configuration information for the specified node.

**[-auto-giveback {true|false}] - Auto Giveback Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified automatic giveback setting.

**[-check-partner {true|false}] - Check Partner Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified partner-checking setting.

**[-detection-time <integer>] - Takeover Detection Time (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover detection time setting.

**[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-failure setting.

**[-onpanic {true|false}] - Takeover on Panic Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-short-uptime setting.

**[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-short-uptime time setting.

**[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)**

Selects configuration information for nodes that have the specified number of giveback attempts setting.

**[-attempts-time <integer>] - Giveback Attempts Minutes (privilege: advanced)**

Selects configuration information for nodes that have the specified giveback attempt time setting.

**[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)**

Selects configuration information for nodes that have the specified setting for propagation of status through Storage Failover mailboxes.

**`[-read-interval <integer>]` - Node Status Read Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified status read interval setting.

**`[-write-interval <integer>]` - Node Status Write Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified status write interval setting.

**`[-onreboot {true|false}]` - Takeover on Reboot Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-reboot setting.

**`[-delay-seconds <integer>]` - Delay Before Auto Giveback (secs) (privilege: advanced)**

If this parameter is specified, the command displays information only about the node or nodes that have the specified delay for auto giveback.

**`[-hwassist {true|false}]` - Hwassist Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified hardware-assisted takeover setting.

**`[-hwassist-partner-ip <text>]` - Partner's Hwassist IP (privilege: advanced)**

Selects configuration information for nodes that have the specified partner IP setting for hardware-assisted takeovers.

**`[-hwassist-partner-port <integer>]` - Partner's Hwassist Port (privilege: advanced)**

Selects configuration information for nodes that have the specified partner port setting for hardware-assisted takeovers.

**`[-hwassist-health-check-interval <integer>]` - Hwassist Health Check Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified health check interval setting for hardware-assisted takeovers

**`[-hwassist-retry-count <integer>]` - Hwassist Retry Count (privilege: advanced)**

Selects configuration information for nodes that have the specified retry count (in seconds) for hardware-assisted takeovers.

**`[-mode {ha|non_ha}]` - HA Mode (privilege: advanced)**

If this parameter is specified, the command displays information only about the node or nodes that have the specified HA mode.

**`[-bypass-takeover-optimization {true|false}]` - Bypass Takeover Optimization Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified setting for bypass takeover optimization ( `_ true _` means that optimized operator-initiated planned takeover is bypassed, *false* means that it is enabled). Operator-initiated planned takeover is optimized when SFO aggregates are relocated serially to the partner prior to takeover. This reduces client outage.

## Examples

The following example displays detailed information about the internal options for storage failover on a node named node2:

```

cluster1::*> storage failover internal-options show -node node2
Node: node2

Auto Giveback Enabled: false
Check Partner Enabled: true
Takeover Detection Time (secs): 15
Takeover On Failure Enabled: true
Takeover On Panic Enabled: false
Takeover On Short Uptime Enabled: true
Short Uptime (secs): -
Number of Giveback Attempts: 3
Giveback Attempts Minutes: 10
Propagate Status Via Mailbox: true
Node Status Read Interval (secs): 5
Node Status Write Interval (secs): 5
Failover the Storage when Cluster Ports Are Down: -
Failover Interval when Cluster Ports Are Down (secs): -
Takeover on Reboot Enabled: true
Delay Before Auto Giveback (secs): 300
Hardware Assist Enabled: true
Partner's Hw-assist IP:
Partner's Hw-assist Port: 4444
Hw-assist Health Check Interval (secs): 180
Hw-assist Retry count: 2
HA mode: ha
Bypass Takeover Optimization Enabled: true

```

## storage failover mailbox-disk show

Display information about storage failover mailbox disks

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage failover mailbox-disk show` command lists the mailbox disks that are used by storage failover. The command displays the following information:

- Node name
- Whether the mailbox disk is owned by the local node or by its partner
- Disk name
- Disk universal unique identifier (UUID)

This command is available only at the advanced privilege level and higher.

## Parameters

**[*-fields* <fieldname>,...]**

If *-fields* <fieldname>,... is used, the command displays only the specified fields.

**[*-instance* ] (privilege: advanced) }**

If this parameter is used, the command displays detailed information about all entries.

**[*-node* {<nodename>|local}] - Node (privilege: advanced)**

Selects the mailbox disks that are associated with the specified node.

**[*-location* {local|partner|tertiary}] - Mailbox Owner (privilege: advanced)**

Selects the mailbox disks that have the specified relationship to the node.

**[*-diskindex* <integer>] - Mailbox Disk Index (privilege: advanced)**

Selects the mailbox disk that has the specified index number.

**[*-diskname* <text>] - Mailbox Disk Name (privilege: advanced)**

Selects the mailbox disks that match the specified disk name.

**[*-diskuuid* <text>] - Mailbox Disk UUID (privilege: advanced)**

Selects the mailbox disks that match the specified UUID.

**[*-physical-location* {local|partner|mediator}] - Mailbox Disk Physical Location (privilege: advanced)**

Selects the mailbox disks that match the specified physical location.

**[*-location-id* <nvr amid>] - System ID of the Node where the Disk is Attached (privilege: advanced)**

Selects the mailbox disks that match the specified location-id.

**[*-location-name* <text>] - Mailbox Disk Location (privilege: advanced)**

Selects the mailbox disks that match the specified location-name.

## Examples

The following example displays information about the mailbox disks on a node named node1:

```
cluster1::*> storage failover mailbox-disk show -node node1
Node      Location  Index Disk Name      Physical Location  Disk UUID
-----
node1
      local      0 1.0.4      local      20000000:8777E9D6:[...]
      local      1 1.0.6      partner     20000000:8777E9DE:[...]
      partner     0 1.0.1      local      20000000:877BA634:[...]
partner   1 1.0.2      partner     20000000:8777C1F2:[...]
```

## storage failover progress-table show

Display status information about storage failover operations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage failover progress-table show` displays status information about storage-failover operations. This information is organized in a resource table. The command displays the following information:

- Node name
- Resource-entry index number
- Resource-entry name
- Resource-entry state
- Resource-entry failure code
- Resource-entry time delta

This command is available only at the advanced privilege level and higher.

### Parameters

**[`-fields <fieldname>,...`]**

If `-fields <fieldname>, ...` is used, the command will only displays only the specified fields.

**[`-instance ] (privilege: advanced) }`**

If this parameter is used, the command displays detailed information about all entries.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Selects the status information for the specified node.

**[`-index <integer>`] - Resource Table Index (privilege: advanced)**

Selects the status information for the specified index number.

**[`-entryname <text>`] - Resource Table Entry Name (privilege: advanced)**

Selects the status information for the specified entry name.

**[`-state <text>`] - Resource Table Entry State (privilege: advanced)**

Selects the status information for the specified state. Possible values include UP, START\_RUNNING, START\_DONE, START\_FAILED, STOP\_RUNNING, STOP\_FAILED, TAKEOVER\_BARRIER, and ONLY\_WHEN\_INITD.

**[`-failurecode <text>`] - Entry Failure Code (privilege: advanced)**

Selects the status information for the specified failure code. Possible values include OK, FAIL, FAIL\_ALWAYS, HANG, PANIC, and VETO.

**[`-timedelta <integer>`] - Entry Time Delta (privilege: advanced)**

Selects the status information for the specified time delta.

## Examples

The following example displays the entire storage-failover resource table:

```
cluster1::*> storage failover progress-table show
```

| Node                                                                  | Entry Name                          | State      | Time Delta |
|-----------------------------------------------------------------------|-------------------------------------|------------|------------|
| -----                                                                 |                                     |            |            |
| node0                                                                 |                                     |            |            |
|                                                                       | Pre-rsrctbl: fmdisk_resumePartnerDi | start_done | 6          |
|                                                                       | Pre-rsrctbl: coredump_get_busy_spar | start_done | 107        |
|                                                                       | Pre-rsrctbl: raid_preread_labels_be | start_done | 1          |
|                                                                       | Pre-rsrctbl: fmdisk_reserve_all     | start_done | 84         |
|                                                                       | rsrctbl: fmrsrc_giveback_done       | start_done | 0          |
|                                                                       | rsrctbl: fmic                       | start_done | 0          |
|                                                                       | rsrctbl: fmdisk_reserve             | start_done | 171        |
|                                                                       | rsrctbl: fm_partnerSlowTimeout      | start_done | 1          |
|                                                                       | rsrctbl: fmdisk_inventory           | start_done | 0          |
|                                                                       | rsrctbl: fmfsn_reserve              | start_done | 0          |
| Press <space> to page down, <return> for next line, or 'q' to quit... |                                     |            |            |
| Node                                                                  | Entry Name                          | State      | Time Delta |
| -----                                                                 |                                     |            |            |
| node0                                                                 |                                     |            |            |
|                                                                       | rsrctbl: rdb-ha                     | start_done | 36         |
|                                                                       | rsrctbl: giveback_cleanup_wait      | start_done | 0          |
|                                                                       | rsrctbl: priority_ha                | start_done | 0          |
|                                                                       | rsrctbl: raid                       | start_done | 113        |
|                                                                       | rsrctbl: raid_disaster_early        | start_done | 0          |
|                                                                       | rsrctbl: wafl_nvram_replay          | start_done | 0          |
|                                                                       | rsrctbl: takeover_test_1            | start_done | 0          |

## storage firmware commands

### storage firmware download

Download disk, ACP processor and shelf firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage firmware download` command downloads the ACP processor, disk, and shelf module firmware to a specified node. This command can also be used to download the disk qualification package (DQP).

Use the [storage disk firmware update](#) command to install downloaded disk firmware.

Use the [storage shelf firmware update](#) command to install downloaded shelf module firmware.

Use the [system node run`](#) local storage download acp` command to install downloaded ACP processor firmware.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node to which the firmware is to be downloaded.

### **-package-url <text> - Package URL (privilege: advanced)**

This specifies the path to the firmware package.

The packaged ACP processor, disk, and shelf firmware files need to have ".AFW", ".LOD", and ".SFW" file extensions, respectively.

The following URL protocols are supported: ftp, http, tftp and file. The file URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>*. The package must be present in the root directory of the USB mass storage device.

## Examples

The following example downloads a disk firmware package with the path *ftp://example.com/fw/disk-fw-1.2.LOD.zip* to a node named *node1*:

```
cluster1::> storage firmware download -node node1 -package-url
ftp://example.com/fw/disk-fw-1.2.LOD.zip
```

## storage firmware acp delete

Delete an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware acp delete` command deletes the specified ACP processor firmware file from all nodes that are currently part of the cluster.

## Parameters

### **-filename <text> - Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

## Examples

The following example deletes the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF on each node:

```
cluster1::*> storage firmware acp delete -filename ACP-IOM3.0150.AFW.FVF
```

## storage firmware acp rename

Rename an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware acp rename` command renames the specified ACP processor firmware file on each node.

### Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF to ACP-IOM3.AFW.FVF on each node:

```
cluster1::*> storage firmware acp rename -oldname ACP-IOM3.0150.AFW.FVF  
-newname ACP-IOM3.AFW.FVF
```

## storage firmware acp show

Display the list of ACP firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage firmware acp show` command displays the ACP processor firmware files present on each node.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the ACP processor firmware files on each node:

```
cluster1::> storage firmware acp show
Node: Node1
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
Node: Node2
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
8 entries were displayed.
```

## storage firmware disk delete

Delete a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware disk delete` command deletes the specified disk firmware file on each node.

### Parameters

**-filename <text> - Storage Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

### Examples

The following example deletes the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD on each node:

```
cluster1::*> storage firmware disk delete -filename
X262_SMOOST25SSX.NA06.LOD
```

## storage firmware disk rename

Rename a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware disk rename` command renames the specified disk firmware file on each node.

### Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

### Examples

The following example renames the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD to X262\_SMOOST25SSX.LOD on each node:

```
cluster1::*> storage firmware disk rename -oldname
X262_SMOOST25SSX.NA06.LOD -newname X262_SMOOST25SSX.LOD
```

## storage firmware disk show

Display the list of disk firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage firmware disk show` command displays the disk firmware files present on each node.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the disk firmware files on each node:

```
cluster1::> storage firmware disk show
Node: Node1
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
Node: Node2
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

## storage firmware hba show

Display the list of HBA firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage firmware hba show` command displays the HBA firmware files present on each node. For MCC configs, run the command on each DR group.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the HBA firmware files on each node:

```
cluster1::> storage firmware hba show
Node: Node1
HBA Firmware Files
-----
PM8072.03080900.HFW
SAS3008.13000000.HFW
SAS3616W.12030003.HFW
PM8072.03080900.HFW
Node: Node2
HBA Firmware Files
-----
PM8072.03080900.HFW
SAS3008.13000000.HFW
SAS3616W.12030003.HFW
PM8072.03080900.HFW
8 entries were displayed.
```

## storage firmware shelf delete

### Delete a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware shelf delete` command deletes the specified shelf firmware file from all nodes that are currently part of the cluster.

## Parameters

**-filename <text> - Storage Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

## Examples

The following example deletes the shelf firmware file with the name IOM12.0210.SFW on each node:

```
cluster1::*> storage firmware shelf delete -filename IOM12.0210.SFW
```

## storage firmware shelf rename

Rename a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware shelf rename` command renames the specified shelf firmware file on each node.

## Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the shelf firmware file with the name IOM12.0210.SFW to IOM12.000.SFW on each node:

```
cluster1::*> storage firmware shelf rename -oldname IOM12.0210.SFW  
-newname IOM12.000.SFW
```

## storage firmware shelf show

Display the list of shelf firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage firmware shelf show` command displays the shelf firmware files present on each node.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the shelf firmware files on each node:

```
cluster1::> storage firmware shelf show
Node: Node1
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
Node: Node2
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
8 entries were displayed.
```

# storage iscsi-initiator commands

## storage iscsi-initiator add-target

Add an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator add-target` command adds an iSCSI target to a node's list of targets.

This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the ONTAP node to which the iSCSI target will be added.

### **-label <text> - User Defined Identifier (privilege: advanced)**

Specifies a label for the target to be added.

### **-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner} - Target Type (privilege: advanced)**

Specifies the type of the target. It is used by the node to determine how to use the LUNs. There are five target types:

- partner - The partner target should belong to the node's HA partner. This allows the node to access its partner's disks.
- mailbox - A mailbox target's LUNs are used exclusively as HA mailboxes.
- external - External targets' LUNs can be used by the node but do not play a role in HA.
- dr\_auxiliary - The DR auxiliary target for MetroCluster over IP. Not a valid target type for the add-target command.
- dr\_partner - The DR partner target for MetroCluster over IP. Not a valid target type for the add-target command.

### **-target-portal <text> - Target Portal (privilege: advanced)**

Specifies the target's IP address and listening TCP port. The port is not required if it is the default iSCSI port (3260). Examples of correct target portals are `10.0.0.2` and `10.0.0.2:860`.

### **-target-name <text> - iSCSI Name (privilege: advanced)**

Specifies the iSCSI target name such as an IQN (iSCSI qualified name).

### **[-status-admin {down|up}] - Administrative Status (default: up) (privilege: advanced)**

Use to specify whether the initial administrative status of the connection is up or down. The default setting is `up`.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator add-target -node node1
               -label target1 -target-type external
               -target-portal 10.0.0.2:860
               -target-name iqn.2012-06.com.bsdctl:target0
```

## storage iscsi-initiator connect

Connect to an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator connect` command connects a node to the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the ONTAP node to which the iSCSI target will be connected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to connect to.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator connect -node node1
                    -label target1
```

## storage iscsi-initiator disconnect

Disconnect from an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator disconnect` command disconnects a node from the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the ONTAP node from which the iSCSI target will be disconnected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to disconnect from.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator disconnect -node node1
                    -label target1
```

## storage iscsi-initiator remove-target

Remove an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage iscsi-initiator remove-target` command removes an iSCSI target from a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the ONTAP node from which the iSCSI target will be removed.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to be removed.

## Examples

The following example adds and connects to an iSCSI target from the specified *node*.

```
cluster1::*> storage iscsi-initiator remove-target -node node1
                    -label target1
```

## storage iscsi-initiator show

Display the iSCSI targets

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage iscsi-initiator show` displays the list of iSCSI targets configured for each ONTAP node in the cluster. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**`[-target-type {external|mailbox|partner|partner2|dr_auxiliary|dr_partner}] - Target Type (privilege: advanced)`**

Selects targets with the specified target type.

**`[-label <text>] - User Defined Identifier (privilege: advanced)`**

Selects targets with the specified label.

**`[-target-portal <text>] - Target Portal (privilege: advanced)`**

Selects targets with the specified portal.

**`[-target-name <text>] - iSCSI Name (privilege: advanced)`**

Selects targets with the specified target name.

**`[-status-admin {down|up}] - Administrative Status (privilege: advanced)`**

Selects targets with the specified administrative status.

**`[-status-oper {down|up}] - Operational Status (privilege: advanced)`**

Selects targets with the specified operational status.

**`[-failure-reason <text>] - Failure Reason (privilege: advanced)`**

Selects targets with the specified failure reason.

## Examples

The following example displays the list of iSCSI targets for each node in the cluster.

```
cluster1::*> storage iscsi-initiator show

Status
Node Type Label      Target Portal      Target Name
Admin/Op
-----

## storage path commands

### storage path quiesce

Quiesce I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage path quiesce` command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the [storage path resume](#) command is issued to continue I/O.

#### Parameters

**-node {<nodename>|local} - Node name**

The name of the clustered node for which information is being displayed.

**-initiator <initiator name> - Initiator Port**

Initiator port that the clustered node uses.

**-target-wwpn <wwpn name> - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**{ [-lun-number <integer>] - LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, ONTAP resumes the entire path to an array.

**| [-path-failure-threshold <integer>] - Max Number of Path Failures Acceptable During wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

**[-wait-duration <integer>] - Wait Duration in minutes }**

The time duration(minutes) in which path is monitored for path failures.

**Examples**

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

**Related Links**

- [storage path resume](#)

**storage path resume**

Resume I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path resume` command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the `storage path quiesce-path-failure-threshold count` command.

## Parameters

**-node {<nodename>|local} - Node name**

The name of the clustered node for which information is being displayed.

**-initiator <initiator name> - Initiator Port**

Initiator port that the clustered node uses.

**-target-wwpn <wwpn name> - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-lun-number <integer>] - LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, ONTAP resumes the entire path to an array.

## Examples

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

## storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path show-by-initiator` command displays path based statistics. The output is similar to the `storage path show` command but the output is listed by initiator.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the array.

**[-array-name <array name>] - Array Name**

Name of the storage array that is connected to the cluster.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

## **[`-target-iops <integer>`] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

### **Examples**

### **Related Links**

- [storage path show](#)

## **storage path show**

Display a list of paths to attached arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage path show` command displays path based statistics. The default command shows:

- Node name
- Initiator port
- Target port
- Target IQN
- TPGN
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-array ]**

Using this option displays:

- Array name
- Target port
- Target IQN
- Target I/O in Kbytes/sec
- Target side switch port
- Path I/O in Kbytes/sec
- Initiator side switch port
- Initiator I/O in Kbytes/sec
- Initiator port

**| [-by-target ]**

Using this option displays the same information as the array option, but grouped by target port.

**| [-detail ]**

Using this option displays the same information as the array and by-target options, but adds the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

**| [-switch ]**

Using this option adds switch port information to the default display.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-array-name <array name>] - Array Name**

Name of the storage array that is connected to the cluster.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the array.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

**[-vmdisk-device-id <integer>] - Virtual disk device ID**

Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.

**[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

**[-wait-duration <integer>] - Wait Duration in minutes**

The time duration(minutes) in which path is monitored for path failures.

## Examples

The following example shows the default display.

```
vbv3170f2a::> storage path show
```

| Path I/O      |       | Initiator | Array Target     | Port  | TPGN  | Speed  |

## storage pool commands

### storage pool add

Add disks to a storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage pool add` command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache capacity of that aggregate is increased automatically.

For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the [storage pool create](#) command.

Storage pools are not supported in all-flash aggregates.

#### Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool to which disks are to be added.

**{ [-disk-count <integer>] - Number of Disks to Add in Storage Pool**

This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

**[-nodes {<nodename>|local}] - Nodes From Which Spares Should be Selected**

This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.

**[-disk-list <disk path name>,...] - List of Spare Disks }**

This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

**{ [-quiet <true>] - Confirmations off (privilege: advanced)**

When set to *true* , this parameter specifies the operation should be executed without pausing for confirmation.

**[-simulate <true>] - Simulate Storage Pool Addition**

When set to *true* , this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

**Examples**

In this example, the user requests a report detailing the changes that would occur if a new disk is added to the storage pool *SP1* . In this case, 186.2 GB of cache is added to the Flash Pool aggregates *nodeA\_flashpool\_1* and *nodeB\_flashpool\_1*. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

| Container<br>Name    | Capacity<br>To Be Added | Current<br>Size | New<br>Size |
|----------------------|-------------------------|-----------------|-------------|
| nodeA_flashpool_1    | 186.2GB                 | 558.7GB         | 744.9GB     |
| nodeB_flashpool_1    | 186.2GB                 | 558.7GB         | 744.9GB     |
| (Available Capacity) | 372.5GB                 | 1.09TB          | 1.45TB      |

The following example adds one disk to a storage pool named *SP1* . The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1

Info: The following disks will be added to storage pool "SP1":
Disk                Size  Type  Owner
-----
1.0.12              744.9GB SSD    cluster-1-01
New Allocation Unit Size: 744.8GB
Capacity will be allocated in the following way:
Container            Capacity  Current      New
Name                To Be Added      Size      Size
-----
nodeA_flashpool_1    186.2GB    558.7GB    744.9GB
nodeB_flashpool_1    186.2GB    558.7GB    744.9GB
(Available Capacity) 372.5GB    1.09TB     1.45TB
Are you sure you want to continue with this operation?

- [storage pool create](#)

## storage pool create

Create a new storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool create` command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the [storage pool reassign](#) command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool aggregates using the [storage aggregate add-disks](#) command and the `-storage-pool` parameter.

Storage pools are not supported in All-Flash aggregates.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.

### **{ [-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either the node or its partner or both from where command is run.

### **-disk-count <integer> - Number of Disks in Storage Pool**

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the storage pool first, unless you specify the `-disk-size` parameter.

### **[-disk-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Size**

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable size between 95% and 105% of the specified size are selected.

### **[-disk-list <disk path name>,... - Disk List for Storage Pool Creation }**

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks and can be owned by either node in an HA pair.

### **[-simulate <true>] - Simulate Storage Pool Creation**

This option simulates the storage pool creation and prints the allocation unit size that would be used for the storage pool.

## **Examples**

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the spare disks selected are from either local node, or its partner or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected are from either node0, or its partner node1 or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes  
node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13,  
1.0.15, 1.0.17, 1.0.19
```

# storage pool delete

Delete an existing storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool delete` command deletes an existing SSD storage pool. At the end of the operation, the SSDs are converted back to spare disks.

## Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

## Examples

Verify that storage pool *SP3* is ready for deletion by confirming it has four available allocation units and then delete it.

```
cluster1::> storage pool show-available-capacity -storage-pool SP3
```

| Node   | Storage Pool | Storage Type | SyncMirror Pool | Allocation Unit size | Unit Count | Total Usable Size |
|--------|--------------|--------------|-----------------|----------------------|------------|-------------------|
| node-a | SP3          | SSD          | Pool0           | 372.5GB              | 2          | 744.9GB           |
| node-b | SP3          | SSD          | Pool0           | 372.5GB              | 2          | 744.9GB           |

```
2 entries were displayed.
```

```
cluster1::> storage pool delete -storage-pool SP3
```

```
Warning: Are you sure you want to delete storage pool "SP3"? {y|n}: y
[Job 313] Job succeeded: storage pool delete job for "SP3" completed
successfully
```

# storage pool reassign

Reassign capacity from one node to another node in storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool reassign` command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

### **-from-node {<nodename>|local} - Reassign Available Capacity from This Node**

This parameter specifies the name of the node that currently owns the allocation units.

### **-to-node {<nodename>|local} - Reassign Available Capacity to This Node**

This parameter specifies the name of the node that will now own the allocation units.

### **-allocation-units <integer> - Allocation Units**

This parameter specifies the number of allocation units to be reassigned.

## Examples

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

| Node   | Storage Pool | Storage Type | SyncMirror Pool | Allocation Unit size | Unit Count | Total Usable Size |
|--------|--------------|--------------|-----------------|----------------------|------------|-------------------|
| node-a | SP2          | SSD          | Pool0           | 744.9GB              | 2          | 1.45TB            |
| node-b | SP2          | SSD          | Pool0           | 744.9GB              | 1          | 744.9GB           |

2 entries were displayed.

```
cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to
-node node-a -allocation-units 1
[Job 310] Job succeeded: storage pool reassign job for "SP2" completed
successfully
```

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

| Node   | Storage Pool | Storage Type | SyncMirror Pool | Allocation Unit size | Unit Count | Total Usable Size |
|--------|--------------|--------------|-----------------|----------------------|------------|-------------------|
| node-a | SP2          | SSD          | Pool0           | 744.9GB              | 3          | 2.18TB            |
| node-b | SP2          | SSD          | Pool0           | 744.9GB              | 0          | 0B                |

2 entries were displayed.

## storage pool rename

### Rename storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool rename` command changes the name of the storage pool.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool name.

### **-new-name <storage pool name> - New Name of the Storage Pool**

This parameter specifies the new name of the storage pool.

## Examples

Renaming storage pool "sp1" to "sp2"

```
cluster-1::> storage pool show
Storage
Storage Pool      Type      #Disks  Nodes      Total Size
-----
sp1                SSD          4 node-a,
                    node-b      10.44GB

cluster-1::> storage pool rename -storage-pool sp1 -new-name sp2

cluster-1::> storage pool show
Storage
Storage Pool      Type      #Disks  Nodes      Total Size
-----
sp2                SSD          4 node-a,
                    node-b      10.44GB
```

## storage pool show-aggregate

Display aggregates provisioned from storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool show-aggregate` command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[-aggregate <aggregate name>] - Aggregate**

Selects the storage pools that match this parameter value.

**[-capacity {<integer>[KB|MB|GB|TB|PB]}] - Capacity**

Selects the storage pools that match this parameter value.

Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool.

**[-allocated-unit-count <integer>] - Number of AU's Assigned to This Aggregate**

Selects the storage pools that match this parameter value.

**[-original-owner <text>] - Original Owner Name**

Selects the storage pools that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the storage pools that match this parameter value.

## Examples

Display information about the aggregate or aggregates using a storage pool called *SP2* :

```
cluster1::> storage pool show-aggregate -storage-pool SP2 -instance
Name of Storage Pool: SP2
                        Aggregate: node2_flashpool_1
                        Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
                        Original Owner Name: node2
                        Node: node2
```

## storage pool show-available-capacity

Display available capacity of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool show-available-capacity` command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool. Allocation units might be provisioned into aggregates using the [storage aggregate add-disks](#) command and the `-storage-pool` parameter.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the available capacities that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the available capacities that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

**[-storage-type <SSD>] - Type of Storage Pool**

Selects the available capacities that match this parameter value. Only the `SSD` type is supported for this version of ONTAP.

**[-allocation-unit-count <integer>] - Number of Allocation Units Available**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates. Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as `allocation-unit-size`.

**[-syncmirror-pool <text>] - SyncMirror Pool**

Selects the available capacities that match this parameter value.

The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.

Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

**[*-available-size* {<integer>[KB|MB|GB|TB|PB]}] - Total Usable Available Size**

Selects the available capacities that match this parameter value.

The *available-size* is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of *available-size* that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

**Examples**

In this example, two nodes of an HA pair share available capacity from two storage pools, *SP1* and *SP2* . There are a total of 5 allocation units that have not yet been provisioned.

```
cluster1::> storage pool show-available-capacity
```

|        |              | Storage | SyncMirror | Allocation | Unit  | Total       |
|--------|--------------|---------|------------|------------|-------|-------------|
| Node   | Storage Pool | Type    | Pool       | Unit size  | Count | Usable Size |
| node-a | SP1          | SSD     | Pool0      | 558.7GB    | 1     | 558.7GB     |
| node-b | SP1          | SSD     | Pool0      | 558.7GB    | 1     | 558.7GB     |
| node-a | SP2          | SSD     | Pool0      | 744.9GB    | 2     | 1.45TB      |
| node-b | SP2          | SSD     | Pool0      | 744.9GB    | 1     | 744.9GB     |

**Related Links**

- [storage aggregate add-disks](#)

**storage pool show-disks**

Display disks in storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage pool show-disks` command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

**Parameters**

**{ [*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[-disk <disk path name>] - Name of the disk**

Selects the storage pools with the disks that match this parameter value.

**[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM | SSD-CAP | SSD-ZNS | VMLUN | VMLUN-SSD}] - Disk Type**

Selects the storage pools with the disks that match this parameter value. Only the `SSD` type is supported for this version of ONTAP.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Usable Size**

Selects the storage pools with the disks that match this parameter value.

In this command, `usable-size` refers to the sum of the capacities of all of the partitions on the disk.

**[-total-size {<integer>[KB|MB|GB|TB|PB]}] - Total Size**

Selects the storage pools with the disks that match this parameter value.

**[-node-list <nodename>,...] - List of Nodes**

Selects the storage pools with the disks that are visible to all of the specified nodes.

## Examples

Show information about SSDs in a storage pool called `SP2`.

```
cluster1::> storage pool show-disks -storage-pool SP2
```

Storage Pool Name: SP2

Storage

| Disk   | Type  | Usable Size | Total Size |
|--------|-------|-------------|------------|
| -----  | ----- | -----       | -----      |
| 1.0.16 | SSD   | 745.0GB     | 745.2GB    |
| 1.0.18 | SSD   | 745.0GB     | 745.2GB    |
| 1.0.20 | SSD   | 745.0GB     | 745.2GB    |
| 1.0.22 | SSD   | 745.0GB     | 745.2GB    |

## storage pool show

Display details of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool show` command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Storage Pool Name**

Selects the storage pools that match this parameter value.

**[-storage-pool-uuid <UUID>] - UUID of Storage Pool**

Selects the storage pools that match this parameter value.

**[-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

**[-disk-count <integer>] - Number of Disks in Storage Pool**

Selects the storage pools that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

**[-allocation-unit-data-size-raid4 {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID4 and RAID-EP**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid4`.

**[-allocation-unit-data-size-raid-dp {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-DP**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_dp`.

**[-allocation-unit-data-size-raid-tec {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-TEC**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_tec`.

### **[`-storage-type <SSD>`] - Storage Type**

Selects the storage pools that match this parameter value.

Only the `SSD` type is supported for this version of ONTAP.

### **[`-pool-usable-size {<integer>[KB|MB|GB|TB|PB]}`] - Storage Pool Usable Size**

Selects the storage pools that match this parameter value.

The `pool-usable-size` is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of `pool-usable-size` that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

### **[`-pool-total-size {<integer>[KB|MB|GB|TB|PB]}`] - Storage Pool Total Size**

Selects the storage pools that match this parameter value.

The `pool-total-size` is the sum of the capacities of allocation units belonging to this storage pool.

### **[`-is-healthy {true|false}`] - Is Pool Healthy?**

Selects the storage pools that match this parameter value.

For storage pools with `is-healthy false`, the `unhealthy-reason` parameter provides more information.

`is-healthy` must be `true` to provision allocation units from a storage pool into an aggregate.

### **[`-pool-state <State of the Storage Pool>`] - State of the Storage Pool**

Selects the storage pools that match this parameter value. Possible states are:

- `normal` - the storage pool is operating normally.
- `degraded` - the storage pool has one or more failed disks.
- `creating` - the storage pool is being created.
- `deleting` - the storage pool is being deleted.
- `reassigning` - allocation units are being reassigned from one node to another.
- `growing` - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

### **[`-unhealthy-reason <text>`] - Reason for Storage Pool Being Unhealthy**

Selects the storage pools that match this parameter value.

The message provided gives additional details about why the storage pool is unhealthy.

### **[`-current-operation-job-id <integer>`] - Job ID of the Currently Running Operation**

Selects the storage pools that match this parameter value.

Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.

## Examples

Display the storage pools in the cluster.

```
cluster1::> storage pool show
Storage Pool      Type  #Disks  Nodes              Total Size
-----
LargeSP           SSD    10  noda-a,node-b      7.27TB
SmallSP           SSD     2  noda-a,node-b      1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).

```
cluster1::> storage pool show -storage-pool SmallSP
Storage Pool Name: SmallSP
                UUID of Storage Pool: 60f2f1b9-e60f-11e3-a5e7-
00a0981899a2
        Nodes Sharing the Storage Pool: node-a, node-b
    Number of Disks in Storage Pool: 2
        Allocation Unit Size: 372.5GB
                Storage Type: SSD
        Storage Pool Usable Size: 1.09TB
        Storage Pool Total Size: 1.45TB
                Is Pool Healthy?: true
        State of the Storage Pool: normal
    Reason for storage pool being unhealthy: -
    Job ID of the Currently Running Operation: -
```

## storage port commands

### storage port disable

Disable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage port disable` command disables a specified storage port.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

### **-port <text> - Port**

Use this parameter to specify the port that needs to be disabled.

### **[-force <true>] - Force (privilege: advanced)**

Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that doing so might cause multiple device failures.

## **Examples**

The following example disables port 0a on node node1:

```
cluster1::> storage port disable -node node1 -port 0a
```

## **storage port enable**

Enable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage port enable` command enables a specified storage port.

### **Parameters**

#### **-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

#### **-port <text> - Port**

Use this parameter to specify the port that needs to be enabled.

## **Examples**

The following example enables port 0a on node node1:

```
cluster1::> storage port enable -node node1 -port 0a
```

## **storage port modify**

Modify a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage port modify` command modifies the attributes of a storage port.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the name of the node.

### **-port <text> - Port**

This parameter specifies the name of the port.

### **[-mode {storage|network}] - Mode**

This parameter specifies the usage mode for an Ethernet port - storage or network use. The mode parameter only applies to Ethernet ports that are not dedicated to storage connectivity.

### **[-force <true>] - Force (privilege: advanced)**

This parameter allows the operation to override warnings.

## Examples

The following example places a nondedicated Ethernet port in storage mode:

```

cluster1::> storage port show
Speed
Node          Port Type  Mode    VLAN      State   Status      ID
              (Gb/s)
-----
cluster1-01
    e0b  ENET  network    - -        -        -
    e0c  ENET  -          100 enabled online      30
    e0e  ENET  storage    0 enabled offline    30
    e0f  ENET  -          100 enabled online      30
cluster1-02
    e0b  ENET  storage    0 enabled offline    30
    e0c  ENET  -          100 enabled online      30
    e0e  ENET  storage    0 enabled offline    30
    e0f  ENET  -          100 enabled online      30
8 entries were displayed.

cluster1::> storage port modify -node cluster1-01 -port e0b -mode storage

cluster1::> storage port show
Speed
Node          Port Type  Mode    VLAN      State   Status      ID
              (Gb/s)
-----
cluster1-01
    e0b  ENET  storage    0 enabled offline    30
    e0c  ENET  -          100 enabled online      30
    e0e  ENET  storage    0 enabled offline    30
    e0f  ENET  -          100 enabled online      30
cluster1-02
    e0b  ENET  storage    0 enabled offline    30
    e0c  ENET  -          100 enabled online      30
    e0e  ENET  storage    0 enabled offline    30
    e0f  ENET  -          100 enabled online      30
8 entries were displayed.

```

## storage port rescan

### Rescan a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage port rescan` command rescans a specified storage port. This command is not supported on Ethernet storage ports (type = ENET).

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port that needs to be rescanned.

## Examples

The following example rescans port 0a on node node1:

```
cluster1::> storage port rescan -node node1 -port 0a
```

## storage port reset-device

Reset a device behind a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage port reset-device` command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device. This command is not supported on Ethernet storage ports (type = ENET).

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port used to reset the device.

**{ -shelf-name <text> - Shelf Name (privilege: advanced)**

Use this parameter to specify the shelf where the device resides.

**-bay-id <integer> - Bay ID (privilege: advanced)**

Use this parameter to specify the bay where the device resides.

**| -loop-id <integer> - Loop ID (privilege: advanced) }**

Use this parameter to specify the loop ID of the device.

## Examples

The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0  
-bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

## storage port reset

### Reset a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage port reset` command resets a specified storage port. This command is not supported on Ethernet storage ports (type = ENET).

#### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port that needs to be reset.

## Examples

The following example resets port 0a on node node1:

```
cluster1::> storage port reset -node node1 -port 0a
```

## storage port show

### Show storage port information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage port show` command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type
- Speed
- State
- Status

To display detailed profile information about a single storage port, use the `-node` and `-port` parameters.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage ports, in column style output.

**| [-errors ]**

Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

**| [-instance ] }**

Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.

**[-node {<nodename>|local}] - Node**

Displays detailed information about the storage ports on the specified node.

**[-port <text>] - Port**

Selects the ports with the specified port name.

**[-port-type {Unknown|SAS|FC|ENET}] - Port Type**

Selects the ports of the specified type.

**[-port-speed {0|1|1.5|2|2.5|3|4|5|6|8|10|12|14|16|25|32|40|64|100}] - Port Speed**

Selects the ports with the specified speed.

**[-state {enabled|disabled|enable-pending|disable-pending}] - Port State**

Selects the ports with the specified state.

**[-status {unknown|online|online-degraded|offline|link-down|transient-mode}] - Port Status**

Selects the ports with the specified operational status.

**[-description <text>] - Description**

Selects the ports with the specified description.

**[-firmware-rev <text>] - Firmware Revision**

Selects the ports with the specified firmware revision.

**[-serial-number <text>] - Serial Number**

Selects the ports with the specified serial number.

**[-is-dedicated {true|false}] - Is Dedicated Storage Port?**

Selects the ports that match the specified value for storage-only ports. This value is always true for FC and SAS ports, as well as for ENET ports that are dedicated to storage.

**[-part-number <text>] - Part Number**

Selects the ports with the specified part number.

**[-connection-mode {Unknown|Loop|Point-to-point}] - Connection Mode**

Selects the ports with the specified connection mode.

**[-wwnn <FC WWN>] - World Wide Node Name**

Selects the ports with the specified World Wide Node Name.

**[-wwpn <FC WWN>] - World Wide Port Name**

Selects the ports with the specified World Wide Port Name.

**[-board-name <text>] - Board Name**

Selects the ports with the specified board name.

**[-connector-capabilities <integer>,...] - Connector Capabilities**

Selects the ports with the specified list of connector capabilities.

**[-wwn <FC WWN>] - Base World Wide Name**

Selects the ports with the specified World Wide Name.

**[-mfg-part-number <text>] - MFG Part Number**

Selects the ports with the specified manufacturer part number.

**[-nvdata-rev <text>] - NVDATA Revision**

Selects the ports with the specified NVDATA revision.

**[-date-code <text>] - Date Code**

Selects the ports with the specified date code.

**[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology**

Selects the ports with the specified connector technology.

**[-phy-id <integer>,...] - Phy ID**

Selects the ports that have phys with the specified phy ID.

**[-phy-state {enabled|disabled}] - Phy State**

Selects the ports that have phys with the specified state.

**[`-phy-status` {`unknown`|`online`|`offline`|`speed-negotiation-failed`|`sata-oob-failed`}] - Phy Status**

Selects the ports that have phys with the specified status.

**[`-phy-speed` {`0`|`1`|`1.5`|`2`|`2.5`|`3`|`4`|`5`|`6`|`8`|`10`|`12`|`14`|`16`|`25`|`32`|`40`|`64`|`100`}] - Phy Speed**

Selects the ports that have phys with the specified speed.

**[`-mac-address` <text>] - MAC Address**

Selects ports that match the specified MAC address.

**[`-mode` {`storage`|`network`}] - Mode**

Selects the ports with the specified mode.

**[`-vlan-id` <integer>] - VLAN ID**

Selects the ports with the specified VLAN ID.

**[`-vendor-id` <text>] - (DEPRECATED) Vendor ID**

This parameter has been deprecated and may be removed in a future version of ONTAP.

Selects the ports with the specified vendor ID.

**[`-vendor-part-id` <text>] - (DEPRECATED) Vendor part ID**

This parameter has been deprecated and may be removed in a future version of ONTAP.

Selects the ports with the specified vendor part ID.

**[`-device-type` <text>] - Device type**

Selects ports that match the specified device type.

**[`-hw-rev` <text>] - Hardware Revision**

Selects the ports with the specified hardware revision.

**[`-error-type` {`unknown`|`online`|`online-degraded`|`offline`|`link-down`|`transient-mode`}] - Error Type**

Selects the ports with the specified error type.

**[`-error-severity` {`unknown`|`notice`|`warning`|`error`|`critical`}] - Error Severity**

Selects the ports with the specified error severity.

**[`-error-text` <text>] - Error Text**

Selects the ports with the specified error text.

**[`-corrective-action` <text>] - Corrective Action**

Selects the ports with the specified corrective action.

**[-cable-length <text>] - Cable Length**

Selects the ports with the specified cable length.

**[-cable-identifier <text>] - Cable Identifier**

Selects the ports with the specified cable identifier.

**[-cable-end-id {end\_0|end\_1}] - Cable End Identifier**

Selects the ports with the specified cable end identifier.

**[-connector-type {QSFP|QSFP+|QSFP28|Mini-SAS HD|SFP}] - Connector Type**

Selects the ports with the specified connector type.

**[-connector-vendor <text>] - Connector Vendor**

Selects the ports with the specified connector vendor.

**[-connector-part-number <text>] - Connector Part Number**

Selects the ports with the specified connector part number.

**[-connector-serial-number <text>] - Connector Serial Number**

Selects the ports with the specified connector serial number.

**[-is-redundant {true|false}] - Is Redundant?**

Selects the ports that are redundant (true) or not redundant (false). A port is redundant if all attached devices have a second path through another port.

**[-in-use {true|false}] - In Use?**

Selects the ports that are in use (true) or not in use (false). A port is in use if any devices are connected using this port.

## Examples

The following example displays information about all storage ports in the cluster:

```

cluster1::> storage port show
Speed
Node          Port Type  Mode  (Gb/s) State  Status  ID
-----
cluster1-01
    4a    SAS   -      0 enabled offline  -
    4b    SAS   -      0 enabled offline  -
    4c    SAS   -      0 enabled offline  -
    4d    SAS   -      0 enabled offline  -
    e3a   ENET  network - - - - -
    e3b   ENET  storage 100 enabled online   30
    e5a   ENET  storage 100 enabled online   30
    e5b   ENET  network - - - - -
cluster1-02
    4a    SAS   -      0 enabled offline  -
    4b    SAS   -      0 enabled offline  -
    4c    SAS   -      0 enabled offline  -
    4d    SAS   -      0 enabled offline  -
    e3a   ENET  network - - - - -
    e3b   ENET  storage 100 enabled online   30
    e5a   ENET  storage 100 enabled online   30
    e5b   ENET  network - - - - -
16 entries were displayed.

```

The following example displays detailed information about port e5a on node node1:

```

cluster1::> storage port show -node cluster1-01 -port e5a
Node: cluster1-01
    Port: e5a
    Port Type: ENET
    Mode: storage
    Description: 40G/100G Ethernet Controller CX5
    Firmware Revision: 16.23.1020
    MAC Address: ec:0d:9a:65:e4:44
    Is Dedicated: false
    Serial Number: MT1730X00227
    Connector Vendor: Molex Inc.
    Connector Part Number: 112-00322
    Connector Serial Number: 532120266
    Port Speed: 100 Gb/s
    Port State: enabled
    Port Status: online

```

# storage raid-options commands

## storage raid-options modify

Modify a RAID option

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage raid-options modify` command is used to modify the available RAID options for each node in a cluster. The options are described in the `storage raid-options` manual page.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the RAID option is to be modified.

**-name <text> - Option Name**

This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the [storage raid-options show](#) command.

**[-value <text>] - Option Value**

This parameter specifies the value of the selected RAID option.

### Related Links

- [storage raid-options show](#)

## storage raid-options show

Display RAID options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage raid-options show` command displays information about all the RAID options in a cluster. The options are described in the `storage raid-options` manual page.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-node <nodename>|local`]] - Node**

Selects information about all the RAID options on the specified node.

### **[`-name <text>`] - Option Name**

Selects information about the RAID options that have the specified name.

### **[`-value <text>`] - Option Value**

Selects information about all the RAID options that have the specified value.

### **[`-recommended-value <text>`] - Recommended Value**

Selects information about all the RAID options that have the specified recommended value.

### **[`-constraint <text>`] - Option Constraint**

Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:

- *none* - no constraint on the value of this RAID option; nodes can have different values
- *same\_preferred* - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- *same\_required* - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- *only\_one* - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- *unknown* - no information about constraints for this RAID option

## **Examples**

The following example shows the RAID scrub settings for a node named node1:

```
cluster1::> storage raid-options show -node node1 -name raid.scrub*

Node      Option                               Current   Recommended
Constraint                               Value     Value
-----
node1     raid.scrub.perf_impact                 low       low
only_one
node1     raid.scrub.enable                      on        off
none
2 entries were displayed.
```

## **storage raidlm commands**

## storage raidlm policy modify

Enable/Disable the policy

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage raidlm policy modify` command is used to modify the available Raid Layout Manager policy.

### Parameters

**-node <nodename> - Node names (privilege: advanced)**

This parameter specifies the node on which this Raid Layout Manager policy is enabled.

**-policy-name <text> - Policy name for Raid-lm (privilege: advanced)**

This parameter specifies the Raid Layout Manager policy name.

**-policy-type <text> - Policy type for Raid-lm (privilege: advanced)**

This parameter specifies the Raid Layout Manager policy type.

**[-is-enabled {true|false}] - Is Policy Enabled? (privilege: advanced)**

This parameter specifies the value of the Raid Layout Manager policy to be modified. To see the list of Raid Layout Manager policy that can be modified, use the [storage raidlm policy show](#) command.

### Related Links

- [storage raidlm policy show](#)

## storage raidlm policy show

Display the policies

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage raidlm policy show` command displays information about Raid Layout Manager policies and its value. Raid Layout Manager is a user space process which polls system configuration, detect conflict if it deviates from NetApp recommended best practices, and resolve conflict.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[*-node* <nodename>] - Node names (privilege: advanced)**

This parameter specifies the node on which this Raid Layout Manager policy is enabled.

**[*-policy-name* <text>] - Policy name for Raid-lm (privilege: advanced)**

All the Raid Layout Manager policy.

**[*-policy-type* <text>] - Policy type for Raid-lm (privilege: advanced)**

Policy type of the Raid Layout Manager policy.

**[*-is-enabled* {true|false}] - Is Policy Enabled? (privilege: advanced)**

Value of the Raid Layout Manager policy that have the specified name.

## Examples

The following example shows the RAID-LM policy settings for node1 and node2:

```
cluster1::> storage raidlm policy show -node node* -policy-name
auto_unpartition_on_spares_low
Node              Policy Type  Policy Name                                Is Enabled
-----
node1
      Shared-Disk  auto_unpartition_on_spares_low true
node2
      Shared-Disk  auto_unpartition_on_spares_low true
2 entries were displayed.
```

## storage shelf commands

### storage shelf show

Display a list of storage shelves

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage shelf show` command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID
- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the `-shelf` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage shelves, in column style output.

**| [-bay ]**

Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

**| [-connectivity ]**

Displays the following details about the connectivity from the node to the storage shelf:

- Node name
- Initiator side switch port
- Target side switch port
- World-wide port name
- Target Port Group Number (TPGN)

**| [-cooling ]**

Displays the following details about the cooling elements and temperature sensors of the storage shelf:

- Element ID of the cooling fan
- The current speed of the cooling fan in revolutions per minute (rpm)
- Operational status of the cooling fan
- Sensor ID of the temperature sensor element
- Temperature at the sensor in degrees Celsius
- Whether the current temperature at the sensor is the ambient temperature
- Low critical threshold value for the temperature sensor
- Low warning threshold value for the temperature sensor
- High critical threshold value for the temperature sensor
- High warning threshold value for the temperature sensor
- Operational status for the temperature sensor

**| [-errors ]**

Displays the following error status information about the storage shelves that have errors:

- Error type
- Error description

### | [-module ]

Displays the following details about the I/O modules attached to the storage shelf:

- Module ID
- Module part number
- Serial number of the Enclosure Services Controller Electronics element
- Whether monitoring is enabled on this module
- Whether this module is the SAS expander master module
- Whether this module is the element reporting
- Version of the firmware installed on the module
- Latest firmware revision
- Number of times, since the last boot, that this module has been swapped
- Operational status of the module

### | [-port ]

Displays the following details about the storage shelf ports:

- Expander phy element identifier
- SAS shelf port type
- World-wide Port Name of the SAS port
- Operational physical link rate of the SAS port in Gb/s
- Negotiated physical link rate of the SAS port in Gb/s
- Power status of the SAS port
- Status of the SAS port
- Fibre Channel shelf port ID
- Fibre Channel shelf port type
- Fibre Channel shelf port status

### | [-power ]

Displays the following details about the power supplies, voltage sensors, and current sensors of the storage shelf:

- Power Supply Unit (PSU) number
- PSU type
- PSU part number
- PSU serial number
- PSU power rating in watts
- PSU crest factor
- Power drawn from the PSU in watts
- Whether the PSU can be reset via software control
- Whether the auto power reset of the PSU is enabled

- PSU firmware revision
- Operational status of the PSU
- Voltage sensor number
- Voltage detected by the voltage sensor, in volts (V)
- Operational status of the voltage sensor
- Current sensor number
- Current detected by the current sensor, in milliamps (mA)
- Operational status of the current sensor

**[ -instance ]**

Displays expanded information about all the storage shelves in the system.

**[ -shelf <text> ] - Shelf Name**

Displays information only about the storage shelves that match the names you specify.

**[ -node {<nodename>|local} ] - Node**

Displays information only about the storage shelves that are attached to the node you specify.

**[ -shelf-uid <text> ] - Shelf UID**

Displays information only about the storage shelf that matches the shelf UID you specify. Example:

`50:05:0c:c0:02:10:64:26`

**[ -stack-id {<integer>|-} ] - Stack ID**

Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify

**[ -shelf-id <text> ] - Shelf ID**

Displays information only about the storage shelves that match the shelf ID you specify.

**[ -module-type**

**{unknown|atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12f|nsm100|nsm8e|psm3e|iom12b|iom12g|nsm16e|iom12c|nsm100b} ] - Shelf Module Type**

Displays information only about the storage shelves that match the module-type you specify.

**[ -connection-type {unknown|fc|sas|nvme} ] - Shelf Connection Type**

Displays information only about the storage shelves that match the connection type you specify. Example: FC or SAS.

**[ -is-local-attach {true|false} ] - Is the Shelf Local to This Cluster?**

Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

**[ -vendor <text> ] - Shelf Vendor**

Displays information only about the storage shelves that match the vendor you specify.

**[ -product-id <text> ] - Shelf Product Identification**

Displays information only about the storage shelves that match the product ID you specify.

**[-serial-number <text>] - Shelf Serial Number**

Displays information only about the storage shelf that matches the serial number you specify.

**[-disk-count {<integer>|-}] - Disk Count**

Displays information only about the storage shelves that have the disk count you specify.

**[-raw-capacity <integer>] - Raw Capacity**

Displays the raw capacity of the disks in the storage shelf in 4k blocks.

**[-state {unknown|no-status|init-required|online|offline|missing}] - Shelf State**

Displays information only about the storage shelves that are in the state you specify.

**[-op-status {unknown|normal|warning|error|critical|standby-power}] - Shelf Operational Status**

Displays information only about the storage shelves that are currently operating under the status condition you specify.

**[-bay-id {<integer>|-}] - Bay ID**

Displays information only about the storage shelves that have bays that match the bay ID you specify.

**[-bay-type {unknown|single-disk|multi-lun}] - Bay Type**

Displays information only about the storage shelves that have bays that match the type of bay you specify.

**[-bay-has-disk {true|false}] - Bay Has Disk**

Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

**[-bay-op-status {unknown|normal|error}] - Bay Operational Status**

Displays information only about the storage shelves that have bays that match the operational state you specify.

**[-controller {<nodename>|local}] - Controller Name**

Displays information only about the storage shelves that are connected to the node you specify.

**[-controller-uuid <text>,...] - Controller UUID**

Displays information only about the storage shelves that are connected to the node UUID you specify.

**[-initiator <text>,...] - Initiator**

Displays information only about the storage shelves that are visible to the initiator you specify.

**[-initiator-wwpn <text>,...] - Initiator WWPN**

Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

**[-target-port <text>,...] - Target Port**

Displays information only about the storage shelves visible on the specified target ports identified by their World-Wide Port Name (WWPN).

**[-tpgn {<integer>|-}] - Target Port Group Number**

Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

**[-port-speed {<integer>|-}] - Port Speed**

Displays information only about the storage shelves with ports that match the port speed you specify.

**[-io-kbps {<integer>|-}] - Kbytes/sec on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

**[-iops {<integer>|-}] - Number IOPS per Second on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

**[-current-sensor-id {<integer>|-}] - Current Sensor ID**

Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

**[-current-sensor-location <text>,...] - Current Sensor Location**

Displays information only about the storage shelves with current sensors installed at the location you specify.

**[-current-sensor-reading {<integer>|-}] - Current Sensor Reading**

Displays information only about the storage shelves with current sensors that match the current reading you specify.

**[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with current sensors that match the operational status you specify.

**[-fan-id {<integer>|-}] - Fan ID**

Displays information only about the storage shelves with cooling fans that match the fan IDs you specify.

**[-fan-location <text>,...] - Fan Location**

Displays information only about the storage shelves with cooling fans installed.

**[-fan-rpm {<integer>|-}] - Fan Rotation Per Minute**

Displays information only about the storage shelves with cooling fans that match the rpm rate you specify.

**[-fan-op-status {unknown|normal|off|error|not-supported|not-installed}] - Fan Operational Status**

Displays information only about the storage shelves with cooling fans that match the operational status you specify.

**[-module-id <text>,...] - Module ID**

Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

**[-module-location <text>,...] - Module Location**

Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

**[-module-part-number <text>,...] - Module Part Number**

Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

**[-is-sas-master-module {true|false}] - Is SAS Expander Master Module?**

Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

**[-is-monitor-active {true|false}] - Is Monitor Active?**

Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

**[-enclosure-type <text>,...] - Module Enclosure Type**

Displays information only about the storage shelves that match the enclosure types you specify.

**[-es-serial-number <text>,...] - ES Electronics Element Serial Number**

Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

**[-module-fru-id <text>,...] - Field Replaceable Unit ID**

Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

**[-module-is-reporting-element {true|false}] - Is Reporting Element?**

Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

**[-module-fw-revision <text>,...] - Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

**[-module-latest-fw-revision <text>,...] - Latest Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.

**[-module-fw-progress {not-available|ready|in-progress|failed}] - Module Firmware Progress**

Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

**[-module-swap-count {<integer>|-}] - Module Swap Count**

Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

**[`-module-op-status {unknown|normal|warning|error|not-installed}`] - Module Operational Status**

Displays information only about the storage shelves with I/O modules that match the operational status you specify.

**[`-sas-port-id <text>,...`] - Port ID**

Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

**[`-sas-port-type {unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi_ho|a_to_b|b_to_a}`] - Port Type**

Displays information only about the storage shelves with SAS Ports that match the SAS port type you specify.

**[`-sas-port-wwpn <text>,...`] - Port World Wide Port Name**

Displays information only about the storage shelves with SAS Ports that match the World-Wide Port Names you specify.

**[`-sas-port-speed <text>,...`] - Port Speed**

Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

**[`-sas-negotiated-port-speed <text>,...`] - Negotiated Port Speed**

Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

**[`-sas-port-power-status <text>,...`] - Port Power Status**

Displays information only about the storage shelves with SAS Ports that match the power status you specify.

**[`-sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp_clk_thr|byp_comma_los|byp_crc_brst_thr|byp_data_timeout|byp_drv_fault|byp_drv_pcycle|byp_drv_pwr|byp_drv_self|byp_gen|byp_init|byp_lip_brst_thr|byp_lip_f8|byp_lip_rate_thr|byp_lipf7|byp_ltb|byp_man|byp_no_drive|byp_osc|byp_other_thr|byp_rec_los|byp_rport|byp_stall_thr|byp_wrd_brst_thr|byp_wrd_rate_thr|byp_xmit_fault|diag_transmit|inserted|loopback|status_unknown|warn_high_clk_delta|warn_high_crc_rate|warn_high_lip|warn_high_wrd_rate|term|phy_dis_clk_fault|phy_dis_crc_err|phy_dis_crc_err_burst|phy_dis_disparity|phy_dis_disparity_burst|phy_dis_emulate_reserve|phy_dis_inval_dword|phy_dis_inval_dword_burst|phy_dis_loss_dword|phy_dis_loss_dword_burst|phy_dis_man_smp|phy_dis_manual|phy_dis_mirrored|empty|phy_dis_phy_change|phy_dis_phy_change_burst|phy_dis_phy_reset|phy_dis_phy_reset_burst|phy_dis_phy_unused|phy_ena|phy_ena_not_attach|phy_ena_unknown|phy_unknown|phy_dis_illegal}`] - Port Operational Status**

Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

**[`-sas-port-module-id {A|B}`] - Port Module ID**

Displays information only about the storage shelves with SAS Ports that match the module ID you specify.

**[`-fc-port-id <text>,...`] - Fibre Channel Port ID**

Displays information only about the storage shelves with FC Ports that match the port IDs you specify.

**[-fc-port-mode**

{unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi\_ho|a\_to\_b|b\_to\_a}} - **Fibre Channel Port Mode**

Displays information only about the storage shelves with FC Ports that match the port modes you specify.

**[-fc-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-**

recovery|byp\_clk\_thr|byp\_comma\_los|byp\_crc\_brst\_thr|byp\_data\_timeout|byp\_drv\_fault|byp\_drv\_pcycle|byp\_drv\_pwr|byp\_drv\_self|byp\_gen|byp\_init|byp\_lip\_brst\_thr|byp\_lip\_f8|byp\_lip\_rate\_thr|byp\_lipf7|byp\_ltbi|byp\_man|byp\_no\_drive|byp\_osc|byp\_other\_thr|byp\_rec\_los|byp\_rport|byp\_stall\_thr|byp\_wrd\_brst\_thr|byp\_wrd\_rate\_thr|byp\_xmit\_fault|diag\_transmit|inserted|loopback|status\_unknown|warn\_high\_clk\_delta|warn\_high\_crc\_rate|warn\_high\_lip|warn\_high\_wrd\_rate|term|phy\_dis\_clk\_fault|phy\_dis\_crc\_err|phy\_dis\_crc\_err\_burst|phy\_dis\_disparity|phy\_dis\_disparity\_burst|phy\_dis\_emulate\_reserve|phy\_dis\_inval\_dword|phy\_dis\_inval\_dword\_burst|phy\_dis\_loss\_dword|phy\_dis\_loss\_dword\_burst|phy\_dis\_man\_smp|phy\_dis\_manual|phy\_dis\_mirrored|empty|phy\_dis\_phy\_change|phy\_dis\_phy\_change\_burst|phy\_dis\_phy\_reset|phy\_dis\_phy\_reset\_burst|phy\_dis\_phy\_unused|phy\_ena|phy\_ena\_not\_attach|phy\_ena\_unknown|phy\_unknown|phy\_dis\_illegal}}] - **Fibre Channel Port Operational Status**

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

**[-psu-id {<integer>|-}] - Power Supply Unit ID**

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

**[-psu-location <text>,...] - Power Supply Unit Location**

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

**[-psu-type <text>,...] - Power Supply Unit Type**

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

**[-psu-part-number <text>,...] - Power Supply Unit Part Number**

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

**[-psu-serial-number <text>,...] - Power Supply Unit Serial Number**

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

**[-psu-reset-capable {true|false}] - Power Supply Unit Reset Capability**

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

**[-psu-is-enabled {true|false}] - Power Supply Unit Enable/Disable Status**

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

**[-psu-fw-version <text>,...] - Power Supply Unit Firmware Version**

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

**[-psu-op-status {unknown|normal|error|dc-over-voltage|dc-under-voltage|dc-over-current|over-temperature-error|failed|off|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with PSUs that match the operational status you specify.

**[-psu-power-rating {<integer>|-}] - Power Supply Power Ratings In Watts**

Displays information only about the storage shelves with PSUs that match the power rating you specify.

**[-psu-crest-factor {<integer>|-}] - Power Supply Crest Factor**

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

**[-psu-power-drawn {<integer>|-}] - Power Drawn From PSU In Watts**

Displays information only about the storage shelves with PSUs that match the drawn power you specify.

**[-temp-sensor-id {<integer>|-}] - Sensor Name**

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.

**[-temp-sensor-location <text>,...] - Sensor Location**

Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

**[-temp-sensor-reading {<integer>|-}] - Temperature Reading**

Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.

**[-temp-is-ambient {true|false}] - Temperature Reading at Ambient Value**

Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

**[-temp-high-critical-threshold {<integer>|-}] - High Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

**[-temp-high-warning-threshold {<integer>|-}] - High Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

**[-temp-low-warning-threshold {<integer>|-}] - Low Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

**[-temp-low-critical-threshold {<integer>|-}] - Low Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the low critical threshold you specify.

**[-temp-op-status {unknown|normal|under-temperature|over-temperature|error|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

**[-voltage-sensor-id {<integer>|-}] - Voltage Sensor ID**

Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

**[-voltage-sensor-location <text>,...] - Voltage Sensor Location**

Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

**[-voltage-sensor-reading <text>,...] - Voltage Current Reading**

Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

**[-voltage-op-status {unknown|normal|over-voltage-critical|under-voltage-critical|not-supported|not-installed|not-recoverable}] - Operational Status**

Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

**[-nsm-port-module-id {A|B}] - Port Module ID**

Displays information only about the storage shelves with PCIe Ports from the specified module.

**[-nsm-port-id <integer>,...] - Port ID**

Displays information only about the storage shelves with PCIe Ports that match the specified ID.

**[-nsm-port-type {cpu|disk|cx5|ethernet}] - Port Type**

Displays information only about the storage shelves with PCIe Ports that match the specified type.

**[-nsm-port-state {ok|off-link-disabled|off-dll-link|link-down|no-drive}] - Port State**

Displays information only about the storage shelves with PCIe Ports that match the specified state.

**[-nsm-port-bay <integer>,...] - Port Bay**

Displays information only about the storage shelves with PCIe Ports that match the specified bay.

**[-nsm-port-disk-id <integer>,...] - Port Disk ID**

Displays information only about the storage shelves with PCIe Ports that match the specified disk ID.

**[-nsm-port-is-installed {true|false}] - Port Is Disk Installed**

Displays information only about the storage shelves with PCIe Ports that have a disk installed.

**[-nsm-port-is-error {true|false}] - Port Has Error**

Displays information only about the storage shelves with PCIe Ports that have errors.

**[-nsm-port-speed {2.5|5.0|8.0|16.0|32.0}] - Port Speed**

Displays information only about the storage shelves with PCIe Ports that match the specified speed.

**[-nsm-port-speed-max {2.5|5.0|8.0|16.0|32.0}] - Max Port Speed**

Displays information only about the storage shelves with PCIe Ports that match the specified maximum speed.

**[-nsm-port-lane-width <integer>,...] - Port Lane Width**

Displays information only about the storage shelves with PCIe Ports that match the specified lane width.

**[-nsm-port-lane-width-max <integer>,...] - Max Port Lane Width**

Displays information only about the storage shelves with PCIe Ports that match the specified maximum lane width.

**[-dimm-module-id {A|B}] - DIMM Module ID**

Displays information only about the storage shelves with DIMMs from the specified module.

**[-dimm-id <integer>,...] - DIMM ID**

Displays information only about the storage shelves with DIMMs that match the specified ID.

**[-dimm-serial-number <text>,...] - DIMM Serial Number**

Displays information only about the storage shelves with DIMMs that match the specified serial number.

**[-dimm-part-number <text>,...] - DIMM Part Number**

Displays information only about the storage shelves with DIMMs that match the specified part number.

**[-dimm-vendor <text>,...] - DIMM Vendor**

Displays information only about the storage shelves with DIMMs that match the specified vendor.

**[-dimm-type <text>,...] - DIMM Type**

Displays information only about the storage shelves with DIMMs that match the specified type.

**[-dimm-size <text>,...] - DIMM Size**

Displays information only about the storage shelves with DIMMs that match the specified size.

**[-dimm-speed <text>,...] - DIMM Speed**

Displays information only about the storage shelves with DIMMs that match the specified speed.

**[-dimm-location <text>,...] - DIMM Location**

Displays information only about the storage shelves with DIMMs that match the specified location.

**[-dimm-op-status {unknown|normal|error|not-supported|not-installed}] - DIMM Operational Status**

Displays information only about the storage shelves with DIMMs that match the specified operational status.

**[-boot-device-module-id {A|B}] - Boot Device Module ID**

Displays information only about the storage shelves with boot devices from the specified module.

**[-boot-device-id <integer>,...] - Boot Device ID**

Displays information only about the storage shelves with boot devices that match the specified ID.

**[-boot-device-serial-number <text>,...] - Boot Device Serial Number**

Displays information only about the storage shelves with boot devices that match the specified serial number.

**[-boot-device-part-number <text>,...] - Boot Device Part Number**

Displays information only about the storage shelves with boot devices that match the specified part number.

**[-boot-device-vendor <text>,...] - Boot Device Vendor**

Displays information only about the storage shelves with boot devices that match the specified vendor.

**[-boot-device-type <text>,...] - Boot Device Type**

Displays information only about the storage shelves with boot devices that match the specified type.

**[-boot-device-size <text>,...] - Boot Device Size**

Displays information only about the storage shelves with boot devices that match the specified size.

**[-boot-device-op-status {unknown|normal|error|not-supported|not-installed}] - Boot Device Operational Status**

Displays information only about the storage shelves with boot devices that match the specified operational status.

**[-coin-battery-module-id {A|B}] - Coin Battery Module ID**

Displays information only about the storage shelves with coin batteries from the specified module.

**[-coin-battery-id <integer>,...] - Coin Battery ID**

Displays information only about the storage shelves with coin batteries that match the specified ID.

**[-coin-battery-voltage <integer>,...] - Coin Battery Voltage (mV)**

Displays information only about the storage shelves with coin batteries that match the specified voltage.

**[-coin-battery-op-status {unknown|normal|error|low|high|not-supported|not-installed}] - Coin Battery Operational Status**

Displays information only about the storage shelves with coin batteries that match the specified operational status.

**[-error-type**

**{Unknown|ACPP|Bootdevice|Coinbattery|Configuration|Current|Dimm|Expander|Fan|Module|PCM|Power|Temperature|Voltage}] - Error Type**

Displays information only about the storage shelves with errors that match the error type you specify.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Displays information only about the storage shelves with errors that match the error severity you specify.

## Examples

The following example displays information about all storage shelves:

```

cluster1::> storage shelf show
Module Operational
      Shelf Name  Shelf ID  Serial Number  Model  Type
Status
-----
Critical          1.1         1  6000832415    DS2246  IOM6
Normal            1.2         2  6000647652    DS2246  IOM6
Normal            1.3         3  6000003844    DS2246  IOM6
Normal            1.4         4  SHJ000000013A9E  DS4246  IOM6
Normal            1.5         5  SHJ000000013A84  DS4246  IOM6
Normal            1.6         6  6000005555    DS2246  IOM6

6 entries were displayed.

Errors:

-----

Critical condition is detected in storage shelf power supply unit "1".  
The unit might fail.

Critical over temperature failure for temperature sensor "1". Current  
temperature: "75" C ("167" F).

cluster1::>

```

The following example displays error information about the storage shelves that have errors:

```
cluster1::> storage shelf show -errors
Shelf Name: 1.1
    Shelf UID: 50:0a:09:80:01:cb:d6:84
    Serial Number: 6000832415
Error Type      Description
-----
Power           Critical condition is detected in storage shelf
power supply unit "1". The unit might fail.
Temperature     Critical over temperature failure for temperature
sensor "1". Current temperature: "75" C ("167" F).
```

## storage shelf acp configure

### Configure alternate control path (ACP)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Configure the ACP connectivity on the cluster. Enabling ACP connectivity is non-disruptive to the cluster.

#### Parameters

##### **-is-enabled {true|false} - Is Enabled?**

Configures the connectivity to the specified state.

##### **[-subnet <IP Address>] - Subnet**

Configures the connectivity to the specified subnet.

##### **[-netmask <IP Address>] - Netmask**

Configures the connectivity to the specified netmask.

##### **[-channel {out-of-band|in-band}] - Channel**

Configures the connectivity to the specified channel.

#### Examples

The following example configures out-of-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel out-of-
band -subnet 192.168.0.1 -netmask 255.255.255.0
```

The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

## storage shelf acp show

Show connectivity information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays information about the ACP connectivity on each node

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <field-name> ", ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-errors ]**

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

**[-is-enabled {true|false}] - Is Enabled?**

Selects the nodes that are enabled or disabled.

**[-port <text>] - Port**

Selects the nodes that match the specified port on which ACP is configured.

**[-address <IP Address>] - IP Address**

Selects the nodes with the specified IP address.

**[-subnet <IP Address>] - Subnet**

Selects the nodes with the specified subnet.

**[-netmask <IP Address>] - Netmask**

Selects the nodes with the specified netmask.

**[-connection-status {no-connectivity|partial-connectivity|full-connectivity|additional-connectivity|unknown-connectivity|not-available|connection-disabled}] - Connection Status**

Selects the nodes with the specified connection status.

**[-error-id <integer>] - Error ID**

Selects the node with the specified error ID.

**[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

The error type, in case of a connection error.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

The error severity, in case of a connection error.

**[-error-text <text>] - Error Text**

Selects the node with the specified error text.

**[-corrective-action <text>] - Corrective Action**

Selects the node with the specified corrective action.

**[-channel {unknown|out-of-band|in-band}] - Channel**

Selects the nodes that has channel configured out-of-band or in-band.

## Examples

The following example displays ACP connectivity on each node (in-band):

```
fas2750-2n-rtp-1::> storage shelf acp show
Node                               Channel                               Connectivity
-----
fas2750-rtp-1a                    in-band                               active
fas2750-rtp-1b                    in-band                               active
2 entries were displayed.
```

The following example displays ACP connectivity on each node (out of band):

```
fas2750-2n-rtp-1::> storage shelf acp show
Node                               Channel                               Connectivity
-----
fas2750-rtp-1a                    out-of-band                          full-connectivity
fas2750-rtp-1b                    out-of-band                          full-connectivity
2 entries were displayed.
```

The following example displays the -instance output of the storage acp show (in-band) command. Use this command to display details on connectivity and configuration.

```
fas2750-2n-rtp-1::> storage shelf acp show -instance
Node: fas2750-rtp-1a
Channel: in-band
Enable Status: true
Connection Status: active
Node: fas2750-rtp-1b
Channel: in-band
Enable Status: true
Connection Status: active
2 entries were displayed.
```

The following example displays the `-instance` output of the `storage acp show (out-of-band)` command. Use this command to display details on connectivity and configuration.

```
fas2750-2n-rtp-1::> storage shelf acp show -instance
Node: fas2750-rtp-1a
Channel: out-of-band
Enable Status: true
Port: e0P
IP Address: 192.168.1.74
Subnet: 192.168.0.1
Netmask: 255.255.252.0
Connection Status: full-connectivity
Node: fas2750-rtp-1b
Channel: out-of-band
Enable Status: true
Port: e0P
IP Address: 192.168.1.75
Subnet: 192.168.0.1
Netmask: 255.255.252.0
Connection Status: full-connectivity
2 entries were displayed.
```

## storage shelf acp module show

Show modules connected to the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays information about the modules connected to each node

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <field-name>", ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify

**| [-errors ]**

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the modules that match this parameter value.

**[-mac-address <text>] - MAC Address**

Selects the module that match the specified MAC address.

**[-module-name <text>] - Module name**

Selects the module that match the specified module name.

**[-module-address <IP Address>] - IP Address**

Selects the module that match the specified IP address.

**[-protocol-version <text>] - Protocol Version**

Selects the modules that match the specified protocol version.

**[-firmware-version <text>] - Firmware Version**

Selects the modules that match the specified firmware version.

**[-acpa-id <integer>] - ACPA assigner ID**

Selects the modules that match the specified ACPA ID.

**[-shelf-serial-number <text>] - Shelf Serial Number**

Selects the modules that match the specified shelf serial number.

**[-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e|iom12f|iom12b|iom12g|iom12c}] - IOM Type**

Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

**[-last-contact <integer>] - Last Contact (secs)**

Selects the modules that match the specified last contact.

**[-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off}] - Local Node State**

Selects the modules that match the specified state.

**[-stack-id {<integer>|-}] - Stack ID**

Selects the modules that match the specified stack ID.

**[-shelf-id <text>] - Shelf ID**

Selects the modules that match the specified shelf ID.

**[-adapter-name <text>] - Adapter Name**

Selects the modules that match the specified adapter name.

**[-error-id <integer>,...] - Error ID**

Selects the modules that match the specified error ID.

**[-error-text <text>,...] - Error Text**

The error text, in case of a module error.

**[-corrective-action <text>,...] - Corrective Action**

The corrective action, in case of a module error.

**[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

Selects the modules that match the specified error type.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Selects the modules that match the specified error severity.

**[-power-cycle-count <integer>] - Power Cycle count**

Number of times a shelf power cycle has been performed on a shelf

**[-power-off-count <integer>] - Power Off count**

Number of times a shelf power off has been performed on a shelf

**[-power-on-count <integer>] - Power On count**

Number of times a shelf power on has been performed on a shelf

**[-expander-reset-count <integer>] - Expander reset count**

Number of times an expander reset has been performed on a module

**[-expander-power-cycle-count <integer>] - Expander power cycle count**

Number of times an expander power cycle has been performed on a module

## Examples

The following example displays the ACP modules connected to each node:

```
cluster1::> storage shelf acp module show
```

| Node             | Module Name | State  |
|------------------|-------------|--------|
| stor-v4-1a-1b-01 | 1.10.A      | Active |
|                  | 1.10.B      | Active |
|                  | 1.254.B     | Active |
|                  | 1.254.A     | Active |
| stor-v4-1a-1b-02 | 1.10.A      | Active |
|                  | 1.10.B      | Active |
|                  | 1.254.B     | Active |
|                  | 1.254.A     | Active |

8 entries were displayed.

The following example displays the -instance output of the storage shelf acp module show. More details on each module can be seen [here](#).

```
cluster1::> storage shelf acp module show -instance
```

## storage shelf drawer show-phy

Display a list of PHYs per drawer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage shelf drawer show-phy` command displays information for drawer PHYs in the storage system. If no parameters are specified, the default command displays the following information about PHYs:

- Shelf Name
- Drawer Number
- PHY Number
- Type
- SAS Address
- State

To display detailed information about a single PHY, use the `-shelf`, `-drawer`, and `-phy` parameters.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all drawer PHYs, in column style output.

**| [-instance ]**

Displays expanded information for all drawer PHYs in the system. If a shelf, drawer, and PHY are specified, then this parameter displays the same detailed information for the PHY you specify as does the `-shelf`, `-drawer`, and `-phy` parameters.

**[-shelf <text>] - Shelf Name**

Displays the PHYs in the storage shelf that matches the specified shelf name.

**[-drawer <integer>] - Drawer Number**

Displays the PHYs in the drawers that match the specified drawer number.

**[-phy <integer>] - PHY Number**

Displays the PHYs that match the specified PHY number.

**[-node {<nodename>|local}] - Node Name**

Displays the PHYs that are present for the specified node.

**[-type {unknown|disk|virtual|input}] - Type**

Displays the PHYs with the specified type.

**[-physical-id <integer>] - Physical ID**

Displays the PHYs that match the specified physical-id.

**[-sas-address <text>] - Attached SAS Address**

Displays the PHYs with the specified attached sas address.

**[-state-a {unknown|enabled|disabled}] - State Module A**

Displays the PHYs for which module A has the specified state.

**[-state-b {unknown|enabled|disabled}] - State Module B**

Displays the PHYs for which module B has the specified state.

**[-status-a <Drawer PHY Status>] - Status Module A**

Displays the PHYs with module A currently operating under the specified status.

**[-status-b <Drawer PHY Status>] - Status Module B**

Displays the PHYs with module B currently operating under the specified status.

## Examples

The following example displays information about all drawer PHYs:

```
cluster1::> storage shelf drawer show-phy
```

| Shelf | Drawer | PHY # | Type    | SAS Address      | PHY State A/B   |
|-------|--------|-------|---------|------------------|-----------------|
| 2.5   | 1      | 0     | disk    | 00c5005079183f85 | enabled/enabled |
|       |        | 1     | disk    | -                | enabled/enabled |
|       |        | 2     | disk    | -                | enabled/enabled |
|       |        | 3     | disk    | 00c50050e1183f85 | enabled/enabled |

# storage shelf drawer show-slot

Display a map between bay number and drawer/slot number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage shelf drawer show-slot` command maps each drawer and slot number to the corresponding bay number.

## Parameters

`{ [-fields <fieldname>,...]`

Displays the specified fields in column style output.

`| [-instance ]`

Displays all slot information.

`[-shelf <text>] - Shelf Name`

Displays the slots in the shelf that matches the specified shelf name.

`[-bay <integer>] - Bay Number`

Displays the slots that have the specified bay number.

`[-node {<nodename>|local}] - Node Name`

Displays the slots that are present for the specified node.

`[-drawer <integer>] - Drawer Number`

Displays the slots in the drawers that match the specified drawer number.

`[-slot <integer>] - Slot Number`

Displays the slots that match the specified slot number.

`[-is-installed {yes|no}] - Is Disk Installed`

Displays the slots that have a disk installed.

## Examples

The following example displays the mapping from drawer and slot number to bay number:

```
cluster1:> storage shelf drawer show-slot
Shelf  Drawer  Slot  Bay  Installed?
-----
2.5
      1
      0    0  yes
      1    1  no
      2    2  no
```

|   |    |    |     |
|---|----|----|-----|
|   | 3  | 3  | yes |
|   | 4  | 4  | no  |
|   | 5  | 5  | no  |
|   | 6  | 6  | yes |
|   | 7  | 7  | no  |
|   | 8  | 8  | no  |
|   | 9  | 9  | yes |
|   | 10 | 10 | no  |
|   | 11 | 11 | no  |
| 2 |    |    |     |
|   | 0  | 12 | yes |
|   | 1  | 13 | no  |
|   | 2  | 14 | no  |
|   | 3  | 15 | yes |
|   | 4  | 16 | no  |
|   | 5  | 17 | no  |
|   | 6  | 18 | yes |
|   | 7  | 19 | no  |
|   | 8  | 20 | no  |
|   | 9  | 21 | yes |
|   | 10 | 22 | no  |
|   | 11 | 23 | no  |
| 3 |    |    |     |
|   | 0  | 24 | yes |
|   | 1  | 25 | no  |
|   | 2  | 26 | no  |
|   | 3  | 27 | yes |
|   | 4  | 28 | no  |
|   | 5  | 29 | no  |

## storage shelf drawer show

Display a list of drawers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage shelf drawer show` command displays information for storage shelf drawers in the storage system. If no parameters are specified, the default command displays the following information for the drawers:

- Shelf Name
- Drawer Number
- Status
- Closed/Open
- Disk Count
- Firmware

To display detailed information for a single drawer, use the `-shelf` and `-drawer` parameters.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all drawers, in column style output.

**| [-errors ]**

Displays the following error status information about the drawers that have errors:

- Status

- Error Description

**[`-instance`] -**

Displays expanded information for all drawers in the system. If a shelf and drawer are specified, then this parameter displays the same detailed information for the specified drawer as does the `-shelf` and `-drawer` parameters.

**[`-shelf <text>`] - Shelf Name**

Displays the drawers in the storage shelf that matches the specified shelf name.

**[`-drawer <integer>`] - Drawer Number**

Displays the drawers that match the specified drawer number.

**[`-node {<nodename>|local}`] - Node Name**

Displays the drawers that are present for the specified node.

**[`-disk-count <integer>`] - Drawer Disk Count**

Displays the drawers that have the specified disk count.

**[`-part-number <text>`] - Part Number**

Displays the drawers that have the specified part number.

**[`-serial-number <text>`] - Serial Number**

Displays the drawer that matches the specified serial number.

**[`-is-closed {open|closed}`] - Drawer is Closed?**

Displays the drawers that are closed or open.

**[`-firmware-a <text>`] - Firmware A**

Displays the drawers for which module A has the specified firmware version.

**[`-firmware-b <text>`] - Firmware B**

Displays the drawers for which module B has the specified firmware version.

**[`-path-a {unknown|ok|degraded|none}`] - Path A**

Displays the drawers for which module A has the specified path status.

**[`-path-b {unknown|ok|degraded|none}`] - Path B**

Displays about drawers for which module B has the specified path status.

**[`-is-supported {yes|no}`] - Drawer is Supported?**

Displays the drawers that are supported (TRUE) or not supported (FALSE).

**[`-vendor <text>`] - Vendor Name**

Displays the drawers that match the specified vendor.

**[`-mfg-date <text>`] - Mfg. Date**

Displays the drawers that match the specified manufactured date.

### **[-fru-type <text>] - FRU Type**

Displays the drawers that match the specified FRU type.

### **[-status-a {unknown|normal|warning|error|critical}] - Status A**

Displays the drawers with module A currently operating under the specified status.

### **[-status-b {unknown|normal|warning|error|critical}] - Status B**

Displays the drawers with module B currently operating under the specified status.

### **[-error <text>] - Error**

Displays the drawers that match the specified error description.

## **Examples**

The following example displays information about all drawers:

```
cluster1::> storage shelf drawer show
Drawer  Disk
Shelf Drawer  Status A/B  Closed? Count  Firmware A/B
-----
2.5
      1  normal/normal  closed      4  00000634/00000634
      2  normal/normal  closed      4  00000634/00000634
      3  normal/normal  closed      4  00000634/00000634
      4  normal/normal  closed      5  00000634/00000634
      5  normal/normal  closed      4  00000634/00000634
5 entries were displayed.
cluster1::>
```

The following example displays expanded information about drawer 1 in shelf 2.5:

```

cluster1::> storage shelf drawer show -shelf 2.5 -drawer 1
Shelf: 2.5
        Drawer ID: 1
        Part Numer: 111-03071
        Serial Number: 021604008153
Drawer is Closed?: closed
        Disk Count: 4
        Firmware A: 00000634
        Firmware B: 00000634
        Path A: ok
        Path B: ok
        Status A: normal
        Status B: normal
Drawer is Supported?: yes
        Vendor Name: NETAPP
        Mfg. Date: 02/2016
        FRU Type: SASDRWR
Error Description: -
cluster1::>

```

The following example displays error information about the drawers that have errors:

```

cluster1::> storage shelf drawer show -errors
Shelf Drawer      Status A/B      Error Description
-----
2.5
        2  warning/warning  Drawer open.
cluster1::>

```

## storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage shelf firmware show-update-status` command displays the state of the Shelf Firmware Update process.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

#### **[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### **[ -node <nodename>] - Node (privilege: advanced)**

Selects the node that matches this parameter value.

#### **[ -update-status {running|idle}] - Disk Shelf Firmware Update Status (privilege: advanced)**

Selects the nodes whose SFU process status matches this parameter value. Possible values are:

- running - Disk shelf firmware update is in progress.
- idle - Disk shelf firmware update is not in progress.

#### **[ -in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated (privilege: advanced)**

Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

### **Examples**

```
cluster1::*> storage shelf firmware show-update-status
```

| Node       | Update Status | In-Progress Count |
|------------|---------------|-------------------|
| cluster-n1 | running       | 10                |
| cluster-n2 | idle          | -                 |
| cluster-n3 | running       | 7                 |

## **storage shelf firmware update**

### **Update Shelf Firmware**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `storage shelf firmware update` command updates the firmware on one or more shelves. You can download the latest firmware by using the [storage firmware download](#) command. You can specify a shelf whose firmware is to be updated by using the `-shelf` parameter. You can update the firmware on all the shelves by not providing the `-shelf` parameter. All the shelves of a specific module type can be updated by providing a value to the `-module-type` parameter.

### **Parameters**

#### **{ [-shelf <text>] - Shelf Name (privilege: advanced)**

This specifies the name of the shelf whose firmware is to be updated.

```
| [-module-type  
{atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12b|nsm100|nsm8e|iom12g|nsm16e|iom12c  
|nsm100b|nsm100c}] - Shelf Module Type (privilege: advanced) }
```

Update the firmware on the shelves that match the module-type you specify.

**[-refresh <true>] - Refresh (privilege: advanced)**

Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

## Examples

The following example updates the firmware on all the shelves in the cluster:

```
cluster1::*> storage shelf firmware update
```

The following example updates the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -module-type IOM6
```

The following example updates the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -shelf 1.2
```

The following example refreshes the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -refresh -module-type IOM6
```

The following example refreshes the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -refresh -shelf 1.2
```

## storage shelf location-led modify

Modify the state of the shelf Location LED

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage shelf location-led modify` command modifies the on/off state of the shelf location LED.

## Parameters

**| -shelf-name <text> - Shelf Name }**

This parameter specifies the shelf whose LED is to be turned on or turned off.

**[-led-status {on|off}] - Location LED**

This parameter specifies whether the shelf location LED needs to be turned on or turned off.

## Examples

The following example turns on the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -shelf-name 1.0 -led-status  
on
```

```
Info: Shelf locate request successful for shelf "1.0".
```

The following example turns off the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -shelf-name 1.0 -led-status  
off
```

```
Info: Shelf locate request successful for shelf "1.0".
```

## storage shelf location-led show

Display the Location LED status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage shelf location-led show` command displays the state of shelf location LED.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-shelf-name <text>] - Shelf Name**

Selects the shelves whose shelf-name matches this parameter value.

**[`-node {<nodename>|local}`}] - Node Name**

Selects the nodes that match this parameter value.

**[`-stack-id <integer>`] - Stack ID**

Selects the shelves whose stack-id matches this parameter value.

**[`-shelf-id <integer>`] - Shelf ID**

Selects the shelves whose shelf-id matches this parameter value.

**[`-led-status {on|off}`] - Location LED**

Shows the state of the shelf location LED.

**Examples**

The following example shows the state of the shelf location LED for each shelf.

```
cluster1::> storage shelf location-led show
Shelf Name Stack ID Shelf ID LED Status
-----
      8.2         8         2 off
      8.3         8         3 off
      6.0         6         0 unsupported
      8.1         8         1 off
4 entries were displayed.
```

**storage shelf port show**

Display storage shelf ports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage shelf port show` command displays information for storage shelf ports in the storage system. If no parameters are specified, the default command displays the following information for the ports:

- Shelf Name
- ID
- Module
- State
- Internal?

To display detailed information for a single port, use the `-shelf` and `-id` parameters.

**Parameters**

**{ [-fields <fieldname>,...]**

Displays output in column style about the specified fields for all shelf ports.

**| [-cables ]**

Displays information about all cables connected to the shelf ports.

**| [-instance ]**

Displays expanded information for all shelf ports in the system. If a shelf and ID are specified, then this parameter displays the same detailed information for the specified port as does the -shelf and -id parameters.

**[-shelf <text>] - Shelf Name**

Displays the ports in the storage shelf that matches the specified shelf name.

**[-id <integer>] - Port ID**

Displays the ports that match the specified ID.

**[-node {<nodename>|local}] - Node Name**

Displays the ports that are present for the specified node.

**[-module-id {A|B}] - Module ID**

Displays the ports from the specified shelf module ID.

**[-is-internal {true|false}] - Is Port Internal?**

Displays the ports that are internal.

**[-location <text>] - Location**

Displays the ports with the specified location.

**[-is-cable-connected {true|false}] - Is Cable Connected?**

Displays the ports that have cables connected to them.

**[-is-error {true|false}] - Any Errors?**

Displays the ports for which errors have been logged.

**[-connector-state {connected|disconnected|error}] - Connector State**

Displays the ports with the specified connector state.

**[-connector-serial-number <text>] - Connector Serial Number**

Displays the ports with the specified connector serial number.

**[-connector-type {QSFP|QSFP+|QSFP28|Mini-SAS-HD}] - Connector Type**

Displays the ports with the specified connector type.

**[-cable-vendor <text>] - Cable Vendor**

Displays the ports that are connected to a cable from the specified vendor.

**[-cable-part-number <text>] - Cable Part Number**

Displays the ports that are connected to a cable with the specified part number.

**[-cable-technology {active-copper|passive-copper|optical}] - Cable Technology**

Displays the ports that are connected to a cable with the specified technology.

**[-cable-length <text>] - Cable Length**

Displays the ports that are connected to a cable with the specified length.

**[-cable-id <text>] - Cable ID**

Displays the ports that are connected to a cable with the specified ID.

**[-cable-end {end\_0|end\_1}] - Cable End**

Displays the ports that are connected to a cable with the specified cable end.

**[-designator <text>] - Designator**

Displays the ports with the specified designator.

**[-wwn <text>] - Local Device WWN**

Displays the ports with the specified WorldWide Name (WWN).

**[-remote-wwn <text>] - Remote Device WWN**

Displays the ports connected to the specified remote WorldWide Name (WWN).

**[-remote-phy <text>] - Remote Phy**

Displays the ports connected to the specified remote PHY.

**[-swap-count <integer>] - Swap Count**

Displays the ports with the specified swap count.

**[-mac <MAC Address>] - Local MAC Address**

Displays the ports with the specified MAC address.

**[-remote-mac <MAC Address>] - Remote MAC Address**

Displays the ports connected to the specified MAC address.

**[-remote-port <text>] - Remote Port**

Displays the ports connected to the specified port.

**[-remote-chassis <text>] - Remote Chassis**

Displays the ports connected to the specified chassis.

**[-remote-device <text>] - Remote Device**

Displays the ports connected to the specified device.

**[-vlan-id <integer>] - VLAN ID**

Displays the ports with the specified Virtual LAN (VLAN) ID.

**[-link-state {unknown|online|offline}] - Link State**

Displays the ports with the specified link state.

### **[-speed <integer>] - Speed**

Displays the Ethernet port speed.

### **Examples**

The following example displays information about all shelf ports:

```
cluster1::> storage shelf port show

Shelf ID Module State          Internal?
----- --  -
1.4
    0 A      connected      false
    1 A      connected      false
    2 B      connected      false
    3 B      connected      false
4 entries were displayed.
```

The following example displays expanded information about port 0 in shelf 1.4:

```
cluster1::> storage shelf port show -shelf 1.4 -id 0
Shelf Name: 1.4
    Port ID: 0
    Module ID: A
    Is Port Internal?: false
    Location: rear of the shelf at the top left, on shelf
module A
    Is Cable Connected?: true
    Any Errors?: false
    Connector State: connected
Connector Serial Number: 616930439
    Connector Type: qsfp+
    Cable Vendor: Molex Inc.
Cable Part Number: 112-00431+A0
    Cable Technology: passive-copper
    Cable Length: 5m
    Cable ID: 500a0980000b6c3f-50000d1703544b80
    Cable End: end_1
    Designator: sqr
    Local Device WWN: 500A0980000B6C3F
    Remote Device WWN: 50000D1703544B80
    Remote Phy: 12
    Swap Count: 0
```

The following example displays information about the cables:

```
cluster1::> storage shelf port show -cables
```

```
Shelf: 1.4
```

| ID Number | Vendor     | Part Number  | Technology     | Length | Type  | Serial    |
|-----------|------------|--------------|----------------|--------|-------|-----------|
| 0         | Molex Inc. | 112-00431+A0 | passive-copper | 5m     | qsfp+ | 616930439 |
| 1         | Molex Inc. | 112-00431+A0 | passive-copper | 5m     | qsfp+ | 616930364 |
| 2         | Molex Inc. | 112-00431+A0 | passive-copper | 5m     | qsfp+ | 616930452 |
| 3         | Molex Inc. | 112-00431+A0 | passive-copper | 5m     | qsfp+ | 616930474 |

4 entries were displayed.

## storage stackmon commands

### storage stackmon modify

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage stackmon modify` command modifies stackmon.

#### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node on which to modify stackmon.

**[-paused {true|false}] - Paused (privilege: advanced)**

This parameter specifies whether stackmon is paused. If set to true, stackmon will not respond to any topology changes.

**[-reset-timer <true>] - Reset Stackmon Timer (privilege: advanced)**

This parameter resets stackmon's timer, which will trigger it to check for and resolve any stack ID conflicts.

**[-refresh-shelf-table <true>] - Refresh Shelf Table (privilege: advanced)**

This parameter refreshes the table used by `storage shelf` commands.

#### Examples

The following example pauses stackmon on all nodes.

```
cluster1::> storage stackmon modify -node * -paused true
```

The following example triggers stackmon on all nodes.

```
cluster1::> storage stackmon modify -node * -reset-timer true -paused  
false
```

## storage stackmon show

### Display stackmon information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage stackmon show` command displays information for stackmon on all nodes. If no parameters are specified, the default command displays the following information:

- Node
- State
- Paused

To display detailed information, use the `-node` parameter.

#### Parameters

**[`-fields <fieldname>,...`]**

Displays output in column style about the specified fields.

**[`-instance` ] (privilege: advanced) }**

Displays expanded information for stackmon on all nodes. If a node is specified, then this parameter displays the same detailed information for the specified port as does the `-node` parameter.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Displays the stackmon information for the the specified node.

**[`-state {init|processing|stable|failed-reconcile}`] - State (privilege: advanced)**

Displays the stackmon information that matches the specified state.

**[`-paused {true|false}`] - Paused (privilege: advanced)**

Displays the stackmon information that matches the specified value.

**[`-timer-delay <integer>`] - Timer Delay (privilege: advanced)**

Displays the stackmon information that matches the specified timer-delay value.

#### Examples

The following example displays stackmon information for all nodes:

```
cluster1::> storage stackmon show
```

| Node  | State  | Paused |
|-------|--------|--------|
| node1 | stable | false  |
| node2 | stable | false  |
| node3 | stable | false  |
| node4 | stable | false  |

4 entries were displayed.

## storage stackmon repair run

### Repair stackmon

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage stackmon repair run` command diagnoses stackmon reconciliation failures and attempts to repair the stack IDs.

#### Parameters

**[`-skip-check-stackmon-state <true>`] - Skip Check for Stackmon State (privilege: advanced)**

This parameter allows the command to be executed when stackmon is still running.

#### Examples

The following example diagnoses and repairs the stack IDs following a stackmon reconciliation failure.

```
cluster1::*> storage stackmon repair run
```

## storage stackmon repair show

Display repairs that will be made to stackmon if `"storage stackmon repair run"` is executed

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage stackmon repair show` command diagnoses stackmon reconciliation failures and displays the repairs that will be made if [storage stackmon repair run](#) is executed:

#### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ](`privilege: advanced`)**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-shelf-uid <integer>`] - Shelf UID (`privilege: advanced`)**

Displays the stackmon repairs for the specified shelf. Use [storage shelf show -fields shelf-uuid](#) to find the shelf-uid.

**[`-old-stack-id <integer>`] - Old Stack ID (`privilege: advanced`)**

Displays the stackmon repairs with the specified current stack-id.

**[`-new-stack-id <integer>`] - New Stack ID (`privilege: advanced`)**

Displays the stackmon repairs with the specified new stack-id.

**[`-skip-check-stackmon-state <true>`] - Skip Check for Stackmon State (`privilege: advanced`)**

This parameter allows the command to be executed when stackmon is still running.

## Examples

The following example displays the stackmon repairs:

```
cluster 1::*> storage stackmon repair show
```

| Shelf                | Old Stack | New Stack |
|----------------------|-----------|-----------|
| 123370712932616784   | 1         | 1         |
| 292812051842665040   | 3         | 1         |
| 4342319975102154064  | 2         | 2         |
| 4558492757215937872  | 2         | 2         |
| 5350844816656434512  | 1         | 1         |
| 9274403680772754000  | 1         | 1         |
| 9346461274810681936  | 2         | 2         |
| 10786768730639108688 | 2         | 2         |

8 entries were displayed.

## Related Links

- [storage stackmon repair run](#)

## storage stackmon topology show

Display stackmon topology

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage stackmon topology show` command displays the shelf topology reported by stackmon, SES, and the disk driver on all nodes. Note: all node/shelf pairs are shown, even if the node is not connected to the shelf. The `chain-handle`, `ses-channels`, and `disk-channels` fields will be empty ("-") when the node is not connected to the shelf.

## Parameters

**`[-fields <fieldname>,...]`**

Displays output in column style about the specified fields.

**`[-instance ] (privilege: advanced) }`**

Displays expanded information for stackmon topology on all nodes. If a node and shelf-uid are specified, then this parameter displays the same detailed information for the specified port as does the `-node` and `-shelf-uid` parameters.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Displays the topology information for the specified node.

**`[-shelf-uid <integer>] - Shelf UID (privilege: advanced)`**

Displays the topology information for the specified shelf. Use [storage shelf show-fields shelf-uid](#) to find the shelf-uid.

**`[-stack-id <integer>] - Stack ID (privilege: advanced)`**

Displays the topology information for shelves with the specified stack-id.

**`[-chain-handle <integer>] - Stackmon Chain Handle (privilege: advanced)`**

Displays the topology information for shelves with the specified chain-handle.

**`[-reconcile-state {processing|succeeded|failed}] - Reconcile State (privilege: advanced)`**

Displays the topology information for shelves with the specified reconcile-state.

**`[-ses-channels <text>,...] - SES Channels (privilege: advanced)`**

Displays the topology information for shelves with the specified SES channels.

**`[-disk-channels <text>,...] - Disk Channels (privilege: advanced)`**

Displays the topology information for shelves with the specified disk channels.

**`[-ses-disk-match {true|false}] - SES Matches Disk Topology (privilege: advanced)`**

Displays the topology information for shelves that are seen on the same channels by SES and the disk driver.

## Examples

The following example displays topology information for all shelves:

```
cluster1::*> storage stackmon topology show
```

Failed

| Node Shelf           | Chain Handle        | Stack | Reconcile |

# storage tape commands

## storage tape offline

Take a tape drive offline

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command takes the specified tape drive offline.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device `-name` name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**| -device-id <text> - Tape Drive Device ID }**

Use this parameter to specify the device ID of the tape drive that needs to be taken offline.

### Examples

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

## storage tape online

Bring a tape drive online

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command brings a specified tape drive online.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -device-id <text> - Tape Drive Device ID**

Use this parameter to specify the device ID of the tape drive that needs to be brought online.

**| -name <text> - Tape Drive Device Name }**

Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of the device `-name` name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**Examples**

The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

```
cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4
```

**storage tape position****Modify a tape drive cartridge position**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command changes the tape drive cartridge position.

**Parameters****-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**-name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed. The format of the device `-name` includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom} - Tape Position Operation**

Use this parameter to specify the tape positioning operation. The possible values for `-operation` are:

- weof - Write end-of-file marks

- fsf - Forward space end-of-file marks
- bsf - Backward space end-of-file marks
- fsr - Forward space records
- bsr - Backward space records
- rewind - Rewind the tape
- erase - Erase then entire tape media from current position
- eom - Position the tape at end of data (end of media if full)

### **[-count <integer>] - Count for Positioning**

Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

### **Examples**

The following example specifies a rewind operation on a tape device. Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m
-operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the -count parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst1a
-operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation
eom
```

## **storage tape reset**

### **Reset a tape drive**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

This command resets a specified tape drive.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node to which the tape drive is attached.

### **-device-id <text> - Tape Drive Device ID (privilege: advanced)**

Use this parameter to specify the device ID of the tape drive is to be reset.

## Examples

The following example resets the tape drive with device ID sw4:2.126L3 attached to the node, cluster1-01.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```

## storage tape show-errors

### Display tape drive errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape show-errors` command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device(tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

### **[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-device-type <text>] - Device Type**

Selects the devices with the specified type of tape drive.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive with the specified serial number.

**[-error <text>] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives with the specified initiator port.

**Examples**

The following example shows error information for all tape drives attached to cluster1.

```
cluster1::> storage tape show-errors
      Node: node1
      Device ID: 0d.125
      Device Type: tape drive
      Description: Hewlett-Packard LTO-5
      Alias: st0
Errors: hardware error; repair or replace tape drive
Node: node1
      Device ID: 2d.0
      Device Type: tape drive
      Description: IBM LTO-6 ULT3580
      Alias: st2
Errors: -
```

The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

```
cluster1::> storage tape show-errors -device-id sw4:2.126L1 -node node1
Node: node1
  Device ID: sw4:2.126L1
  Device Type: tape drive
  Description: Hewlett-Packard LTO-3
    Alias: st3
Errors: -
```

## storage tape show-media-changer

Display information about media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This `storage tape show-media-changer` command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached
- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the media changer with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about media changers on the specified node.

**[-description <text>] - Description**

Selects the media changers with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the media changer with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

>Selects the media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the media changer with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the media changers with the specified operational state.

**[-error <text>] - Media Changer Error Description**

Selects the media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the media changers with the specified initiator port.

## Examples

The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer
```

```
Media Changer: sw4:10.11L1
```

```
Description: PX70-TL
```

```
WWNN: 2:00a:000e11:10b919
```

```
WWPN: 2:00b:000e11:10b919
```

```
Serial Number: 00FRU7800000_LL1
```

```
Errors: -
```

```
Paths:
```

| Node        | Initiator | Alias | Device State |
|-------------|-----------|-------|--------------|
| cluster1-01 | 2b        | mc0   | in-use       |

```
Media Changer: sw4:12.4L1
```

```
Description: NEO-TL
```

```
WWNN: 2:001:000e11:10b919
```

```
WWPN: 2:002:000e11:10b919
```

```
Serial Number: 00FRU7800000_LL0
```

```
Errors: -
```

```
Paths:
```

| Node        | Initiator | Alias | Device State |
|-------------|-----------|-------|--------------|
| cluster1-01 | 5a        | mc1   | available    |

## storage tape show-supported-status

Displays the qualification and supported status of tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the supported and qualification status of all tape drives recognized by ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the NetApp Support Site to the storage system.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the tape drives that match this parameter value.

**[-tape-drive <text>] - Tape Drive Name**

Selects the tape drives that match this parameter value.

**[-is-supported {true|false}] - Tape Drive Supported**

Selects the tape drives that match this parameter value.

**[-status <text>] - Supported Status**

Selects the tape drives that match this parameter value.

## Examples

The following example displays support and qualification status of tape drives recognized by ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
```

```
Node: Node1
```

| Tape Drive                | Is Supported | Support Status          |
|---------------------------|--------------|-------------------------|
| sw4:2.126L6               | false        | Nonqualified tape drive |
| Hewlett-Packard C1533A    | true         | Qualified               |
| Hewlett-Packard C1553A    | true         | Qualified               |
| Hewlett-Packard Ultrium 1 | true         | Qualified               |
| Sony SDX-300C             | true         | Qualified               |
| Sony SDX-500C             | true         | Qualified               |
| StorageTek T9840C         | true         | Dynamically Qualified   |
| StorageTek T9840D         | true         | Dynamically Qualified   |
| Tandberg LTO-2 HH         | true         | Dynamically Qualified   |

The following example displays support and qualification status of tape drives selected by `□tape-drive`. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
```

```
Node: Node1
```

| Tape Drives   | Is Supported | Support Status |
|---------------|--------------|----------------|
| Sony SDX-300C | true         | Qualified      |

## storage tape show-tape-drive

Display information about tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This `storage tape show-tape-drive` command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached

- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the tape drives with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives with the specified operational state.

**[-error <text>] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives with the specified initiator port.

## **[*-resv-type* {*off*|*persistent*|*scsi*}] - Reservation type for device**

Selects the tape drives with the specified type.

### **Examples**

The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
Tape Drive: sw4:11.126
  Description: StorageTek T10000C
    WWNN: 5:001:04f000:b39ec8

```

## **storage tape show**

Display information about tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage tape show` command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a

media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-alias ]**

Displays the tape drive/media changer alias with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Alias name of the tape drive/media changer
- Alias mapping for tape drive/media changer

**| [-connectivity ]**

Displays the connectivity from the node to the tape drive/media changer with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Type of device: tape drive or media changer
- Interface type for the tape drive/media changer
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Tape drive/media changer errors
- Initiator port which hosts the tape drive/media changer
- Alias name of the tape drive/media changer
- Operational state of tape drive/media changer
- Functional status of tape drive/media changer

**| [-device-names ]**

Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Device Names that include Rewind, no Rewind, Unload/Reload

#### | [-status ]

Displays the status of tape drive/media changer with the following details:

- Device ID of the tape drive/media changer
- Tape drive/media changer description
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Alias name of the tape drive/media changer
- Format used for tape cartridge mounted by tape drive
- Tape drive/media changer errors
- Node to which tape drive/media changer is attached
- Operational state of tape drive/media changer
- File number following last tape drive I/O operation
- Block number following last tape drive I/O operation
- Residual count following last tape drive I/O operation

#### | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### [-device-id <text>] - Device ID

Selects the tape drive/media changer with the specified device ID.

#### [-node {<nodename>|local}] - Node

Displays detailed information about tape drives or media changers on the specified node.

#### [-device-type <text>] - Device Type

Selects the devices with the specified type of tape drive or media changer.

#### [-description <text>] - Description

Selects the tape drives/media changers with the specified description.

#### [-alias-name <text>] - Alias Name

Selects the tape drive/media changer with the specified alias name.

#### [-alias-mapping <text>] - Alias Mapping

Selects the tape drive/media changer with the specified alias mapping.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives/media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive/media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive/media changer with the specified serial number.

**[-functional-status {unknown|normal|error}] - Functional Status**

Selects the tape drives/media changers with the specified functional status of the device.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type**

Selects the tape drives/media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives/media changers with the specified operational state.

**[-format <text>,...] - Tape Cartridge Format**

Selects the tape drives with the specified tape format.

**[-error <text>] - Tape Error**

Selects the tape drives/media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives/media changers with the specified initiator port.

**[-file-number <integer>] - File Number**

Selects the tape drives/media changers with the specified file number. The file number is the number of file marks between the beginning of media and current logical position. File number gets modified on write file mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape media or tape not loaded in the tape drive.

**[-block-number <integer>] - Block Number**

Selects the tape drives/media changers with the specified block number. The block number is the number of logical blocks between the beginning of tape media or the prior file mark and the current logical position on the tape media. Block number gets modified on writes, reads, and forward or backward space over records (blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

**[-residual-count <integer>] - Residual Count of Last I/O Operation**

Selects the tape drives with the specified residual count.

**[-device-name-r <text>,...] - Device Name for Rewind**

Selects the tape drives with the specified device name for rewind.

**[-device-name-nr <text>,...] - Device Name for No Rewind**

Selects the tape drives with the specified device name for no rewind.

**[-device-name-ur <text>,...] - Device Name for Unload Reload**

Selects the tape drives with the specified device name for unload/reload.

**[-resv-type {off|persistent|scsi}] - Reservation Type for device**

Selects the tape drives with the specified type.

**[-aliases-name <text>,...] - Alias Names**

Selects the tape drive/media changer with the specified alias name.

**[-aliases-mapping <text>,...] - Alias Mappings**

Selects the tape drive/media changer with the specified alias mapping.

## Examples

The following example displays information about all tape drives and media changers attached to the cluster:

```
cluster1::> storage tape show
```

```
Node: cluster1-01
```

| Device ID | Device Type | Description |
|-----------|-------------|-------------|
|-----------|-------------|-------------|

| Status |  |  |
|--------|--|--|
|--------|--|--|

## storage tape trace

### Enable/disable tape trace operations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

**[-is-trace-enabled {true|false}] - Tape Trace Enabled or Disabled**

Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

#### Examples

The following example enables tape trace operation on the node, cluster1-01.

```
cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

## storage tape alias clear

### Clear alias names

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command clears alias names for a tape drive or media changer.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

### **{ -name <text> - Alias Name That Is to Be Cleared**

Use this parameter to specify the alias name that is to be cleared. You can use the 'storage tape show -alias' command to find more information about alias names of tape drives and media changers attached to a node. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-name` parameter, a single alias name is cleared.

### **| -clear-scope {tape|media-changer|all} - Scope of Alias Clear Operation }**

Use this parameter to specify the scope of the alias clear operation. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-clear-scope` parameter, multiple aliases are cleared depending upon the value of the parameter.

The possible values for `-clear-scope` are as follows:

- tape - Clear all tape drive aliases
- media-changer - Clear all media-changer aliases
- all - Clear both tape drive and media-changer aliases

## Examples

The following example clears an alias name 'st3' attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -name st3
```

The following example clears all tape drive alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```

## storage tape alias set

Set an alias name for tape drive or media changer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command sets an alias name for a tape drive or media changer.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**-name <text> - Alias Name for Tape Drive or Media Changer**

Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

**-mapping <text> - Mapping for Alias Name**

Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number>]' where the <serial-number> is from 2 to 124 characters long and includes the following characters: 0-9, a-z, and A-Z.

## Examples

The following example sets an alias name 'st3' for a tape drive with serial number SN[123456]L4 attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name st3 -mapping  
SN[123456]L4.
```

The following example sets an alias name 'mc1' for a media changer with serial number SN[65432] attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name mc1 -mapping  
SN[65432].
```

## storage tape alias show

Displays aliases of all tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays aliases of all tape drives and media changers attached to every node in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays the tape drive and media changer aliases on the specified node.

**[-alias-list <text>,...] - List of Aliases**

Displays the node with the specified list of tape drive and media changer aliases.

**Examples**

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show

Node: node1

Alias                                     Mapping
-----
mc0                                       SN[00FRU7800000_LL0]L1
mc1                                       SN[00FRU7800000_LL1]L1
mc2                                       SN[aa6a64c69360a0980248c8]
mc3                                       SN[c940abe8b0c3a0980248c8]
mc4                                       SN[fba082e6b335a0980248c8]L5
st0                                       SN[HU19487T7N]
st1                                       SN[1068000230]
st10                                      SN[fba0c508b335a0980248c8]L7

Node: node2

Alias                                     Mapping
-----
mc1                                       SN[c940982fc48c8]

```

## storage tape config-file delete

Delete a tape config file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage tape config-file delete` command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

### Parameters

**-filename <text> - Config File Filename (privilege: advanced)**

This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

### Examples

The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:

```
cluster1:> storage tape config-file delete -filename XYZ_LTO-6.TCF
```

## storage tape config-file get

Get a tape drive configuration file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape config-file get` command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

### Parameters

**-url <text> - Config File URL**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.

### Examples

The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1:> storage tape config-file get -url  
http://example.com/~tapeconfigfile/XYZ_LTO-6.TCF
```

## storage tape config-file show

Display the list of tape drive configuration files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape config-file show` command lists the tape drive configuration files loaded onto each node in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about tape drive configuration files for the specified node.

**[-config-file <text>] - Tape Config File**

Selects information about the tape drive configuration file specified.

### Examples

The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show
```

```
Node: node1
```

```
Tape Config Files
```

## storage tape library config show

Display connectivity to back-end storage tape libraries.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-switch ]**

If you specify this parameter, switch port information is shown.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller Name**

The name of the clustered node for which information is being displayed.

**[*-group* <integer>] - LUN Group**

A LUN group is a set of LUNs that shares the same path set.

**[*-target-wwpn* <text>] - Library Target Ports**

The World Wide Port Name of a storage tape library port.

**[*-initiator* <text>] - Initiator**

The host bus adapter that the clustered node uses to connect to storage tape libraries.

**[*-array-name* <array name>] - Library Name**

Name of the storage tape library that is connected to the clustered node.

**[*-target-side-switch-port* <text>] - Target Side Switch Port**

This identifies the switch port that connects to the tape library's target port.

**[*-initiator-side-switch-port* <text>] - Initiator Side Switch Port**

This identifies the switch port that connects to the node's initiator port.

**[*-lun-count* <integer>] - Number of LUNS**

This is a command-line switch (*-lun-count*) used to restrict what LUN groups are displayed in the output.

**Examples**

The following example displays the storage tape library configuration information.

```
cluster1::> storage tape library config show
      LUN    LUN
Node      Group Count      Library Name      Library Target
Port Initiator
-----
cluster1-01
          0      2      TAPE_LIB_1
50050763124b4d6f      3d

cluster1::>
```

**storage tape library path show-by-initiator**

Display a list of LUNs on the given tape library

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

## Parameters

**{ [-fields <fieldname>,...]**

fields used to be used in this display

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage tape library that is being used.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the cluster.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the library path.

**[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the library path.

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)**

>Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

## **[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

### **Examples**

The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
Node: cluster1-01
      Initiator I/O      Initiator Side      Path I/O      Target
Side      Target I/O
Initiator      (KB/s)      Switch Port      (KB/s)      Switch
Port      (KB/s)      Target Port Library Name
-----
0b      0 sw_tape:6      0
sw_tape:0      0 510a09800000412d TAPE_LIB_1
sw_tape:1      0 510a09820000412d TAPE_LIB_1
3d      0 N/A      0
N/A      0 50050763124b4d6f TAPE_LIB_2
3 entries were displayed.
```

## **storage tape library path show**

Display a list of Tape Libraries on the given path

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays path information for a tape library and has the following parameters by default:

- Node name
- Initiator port
- Target port
- TPGN (Target Port Group Number)
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

### **Parameters**

**{ [-fields <fieldname>,...]**

fields used to be used in this display

## | [-detail ]

Using this option displays the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

## | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## [-node {<nodename>|local}] - Controller name

The name of the clustered node for which information is being displayed.

## [-array-name <array name>] - Library Name

Name of the storage tape library that is connected to the cluster.

## [-target-wwpn <text>] - Target Port

Target World Wide Port Name. Port on the storage tape library that is being used.

## [-initiator <text>] - Initiator Port

Initiator port that the clustered node uses.

## [-initiator-side-switch-port <text>] - Initiator Side Switch Port

Switch port connected to the clustered node.

## [-tpgn <integer>] - Target Port Group Number

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

## [-port-speed <text>] - Port Speed

Port Speed of the specified port.

## [-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)

Rolling average of Kbytes of I/O per second on the library path.

## [-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)

Rolling average of I/O per second on the library path.

## [-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)**

>Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

## Examples

The following example displays the path information for a storage tape library

```
cluster1::> storage tape library path show
Node                               Initiator  Target Port          TPGN    Speed
(KB/s)          IOPs
-----
cluster1-01
0                0          3d          50050763124b4d6f      61    4 Gb/S
cluster1-01
0                0          0b          510a09800000412d      35    4 Gb/S
cluster1-01
0                0          0b          510a09820000412d      1    4 Gb/S
3 entries were displayed.
```

## storage tape load-balance modify

Modify the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape load-balance modify` command modifies the tape load balance setting for a specified node in the cluster.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the tape load balance setting is to be modified.

**[-is-enabled {true|false}] - Is Tape Load Balance Enabled**

This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

### Examples

The following example modifies the tape load balance setting on node1 in the cluster:

```
cluster1::> storage tape load-balance modify -node node1 -is-enabled true
```

## storage tape load-balance show

Displays the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape load-balance show` command displays tape load balance settings for each node in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about tape load balancing for the specified node.

## **`[-is-enabled {true|false}] - Is Tape Load Balance Enabled`**

Selects information about load balance configuration as specified by enabled or disabled setting.

### **Examples**

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show
```

| Node  | Enabled |
|-------|---------|
| ----- | -----   |
| node1 | false   |
| node2 | false   |

2 entries were displayed.

# system commands

## system bridge commands

### system bridge add

Add a bridge for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system bridge add` command enables you to add FC-to-SAS bridges for in-band monitoring in a MetroCluster configuration.

#### Parameters

**-name <text> - Bridge Name**

This parameter identifies the bridge being added for in-band monitoring.

#### Examples

The following command adds a bridge with name `ATTO_FibreBridge7600N_1` for monitoring:

```
cluster1::> system bridge add -name ATTO_FibreBridge7600N_1
cluster1::> system bridge show
```

| Bridge                             | Symbolic Name           | Is Monitored | Monitor Status | Managed By | Vendor |
|------------------------------------|-------------------------|--------------|----------------|------------|--------|
| Model                              | Bridge WWN              |              |                |            |        |
| ATTO_2000001086a183c0              | bridge1                 | true         | ok             | in-band    | Atto   |
| FibreBridge 7600N 2000001086a183c0 | ATTO_FibreBridge7600N_2 | false        | -              | none       | Atto   |
| 2000001086a18340                   | ATTO_FibreBridge7600N_3 | false        | -              | none       | Atto   |
| 2000001086a1ee40                   | ATTO_FibreBridge7600N_4 | false        | -              | none       | Atto   |
| 2000001086700a30                   |                         |              |                |            |        |

4 entries were displayed.

```
cluster1::>
```

## system bridge modify

Modify a bridge's configuration information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system bridge modify` enables you to modify certain parameters for identifying and accessing the FC-to-SAS bridges added for monitoring in a MetroCluster configuration.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge.

**[-node-visible-list <text>,...] - Nodes Bridge is Visible To**

This parameter specifies nodes that are visible to the bridge.

### Examples

The following command modifies 'ATTO\_2000001086b0' bridge node-visible-list to 'nodeA,nodeB'

```
cluster1::> system bridge modify -name ATTO_2000001086b0 -node-visible  
-list nodeA,nodeB  
cluster1::>
```

## system bridge refresh

Refresh bridge info

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system bridge refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. There is no action if the refresh is already in progress. For systems running ONTAP 9.7 or earlier, the FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the `system switch fiber-channel add` and [system bridge add](#) commands respectively. For systems running ONTAP 9.8 or later, the `system bridge refresh` command performs the additional task of automatically adding any bridges that have recently been added to the environment (assuming the automatic option is set).

### Examples

The following command triggers a refresh for the SNMP data:

```
cluster1::*> system bridge refresh  
cluster1::*>
```

## Related Links

- [system bridge add](#)

## system bridge remove

Remove a bridge from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system bridge remove` enables you to remove FC-to-SAS bridges that were previously added for SNMP monitoring.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge added for monitoring.

### Examples

The following command removes 'ATTO\_10.226.197.16' bridge from monitoring:

```

cluster1::> system bridge remove -name ATTO_10.226.197.16
cluster1::> system bridge show

```

| Monitor                 | Bridge           | Symbolic Name | Vendor            | Model            | Bridge WWN | Is Monitored |
|-------------------------|------------------|---------------|-------------------|------------------|------------|--------------|
| ATTO_FibreBridge6500N_1 | Bridge Number 16 | Atto          | FibreBridge 6500N | 2000001086603824 | false      |              |
| ATTO_FibreBridge6500N_2 | Not Set          | Atto          | FibreBridge 6500N | 20000010866037e8 | false      |              |
| ATTO_FibreBridge6500N_3 | Not Set          | Atto          | FibreBridge 6500N | 2000001086609e0e | false      |              |
| ATTO_FibreBridge6500N_4 | Not Set          | Atto          | FibreBridge 6500N | 2000001086609c06 | false      |              |

4 entries were displayed.

## system bridge run-cli

Execute a CLI command on a bridge

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system bridge run-cli` command enables you to execute an ATTO bridge command.

### Parameters

#### **-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the command is to be executed on.

#### **-command <text> - CLI command to execute**

This parameter specifies the command to be executed on the named bridge.

## Examples

The following example executes a command on a bridge

```
sti8040mcc-201_siteA::> system bridge run-cli -name  
ATTO_FibreBridge7500N_1 -command "Help"
```

## system bridge show

Display bridge information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system bridge show` command displays information about all the storage bridges in the MetroCluster configuration. The bridges must have been previously added for monitoring using the [system bridge add](#) command. If no parameters are specified, the default command displays the following information about the bridges:

- Bridge
- Symbolic Name
- Vendor
- Model
- Bridge WWN
- Is Monitored
- Is Bridge Secure
- Managed By
- Monitor Status

To display detailed profile information about a single bridge, use the `-name` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the bridges, in column style output.

**| [-connectivity ]**

Displays the following details about the connectivity from different entities to the bridge:

- Node
- Initiator
- Initiator Side Switch Port
- Target Side Switch Port
- Target Port WWN

- Target Port Number

#### | **[-cooling ]**

Displays the following details about the chassis temperature sensor(s) on the bridge:

- Sensor Name
- Reading in degree Celsius ©
- Fan operational status
- Minimum Safe Operating Temperature in degree Celsius ©
- Maximum Safe Operating Temperature in degree Celsius ©
- Sensor Status

#### | **[-error ]**

Displays the errors related to the bridge.

#### | **[-ports ]**

Displays the following details about the bridge FC ports:

- Port number
- Port administrative status
- Port operational status
- Port operating mode
- Port negotiated speed
- Peer world wide name

Displays the following details about the bridge SAS ports:

- Port number
- Port negotiated data rate
- Port data rate capability
- Port PHY1 operational status
- Port PHY2 operational status
- Port PHY3 operational status
- Port PHY4 operational status
- Port administrative status
- Port operational status
- Peer world wide name

#### | **[-power ]**

Displays the status of the replaceable power supplies for the FibreBridge 7500N only:

- Power supply name
- Power supply status

## | [-sfp ]

Displays the following details about the bridge FC ports Small Form-factor Pluggable (SFP):

- Port number
- SFP vendor
- SFP serial number
- SFP part number
- SFP speed capability

Displays the following details about the bridge SAS ports Quad Small Form-factor Pluggable (QSFP):

- Port number
- QSFP vendor
- QSFP serial number
- QSFP type
- QSFP part number

Displays the following details about the bridge SAS ports Mini-SAS HD:

- Port number
- Mini-SAS HD vendor
- Mini-SAS HD serial number
- Mini-SAS HD type
- Mini-SAS HD part number

## | [-stats ]

Displays the following details about the bridge FC ports:

- Port number
- Port operational status
- Port operational mode
- Port negotiated speed
- Port link failure count
- Port synchronization loss count
- Port CRC error count
- Port operational mode
- Port received word count (Rx)
- Port transmitted word count (Tx)

Displays the following details about the bridge SAS ports:

- Port number
- PHY port number

- Port negotiated speed
- Port speed capability
- Port invalid DWORD count
- Port disparity error count
- Port synchronization loss count
- Port PHY reset count
- Port link changed count
- Port CRC error count

**[ -instance ] }**

Displays expanded information about all the bridges in the system. If a bridge is specified, then this parameter displays the same detailed information for the bridge you specify as does the -name parameter.

**[ -name <text> ] - Bridge Name**

Displays information only about the bridges that match the name you specify.

**[ -wwn <text> ] - Bridge World Wide Name**

Displays information only about the bridges that match the bridge WWN you specify.

**[ -model <text> ] - Bridge Model**

Displays information only about the bridges that match the bridge model you specify.

**[ -vendor {unknown|Atto} ] - Bridge Vendor**

Displays information only about the bridges that match the bridge vendor you specify.

**[ -fw-version <text> ] - Bridge Firmware Version**

Displays information only about the bridges that match the bridge firmware version you specify.

**[ -serial-number <text> ] - Bridge Serial Number**

Displays information only about the bridges that match the bridge serial number you specify.

**[ -address <IP Address> ] - Bridge IP Address**

Displays information only about the bridges that match the bridge IP address you specify.

**[ -is-monitoring-enabled {true|false} ] - Is Monitoring Enabled for Bridge?**

Displays information only about the bridges that match the bridge monitoring value you specify.

**[ -status {unknown|ok|error} ] - Bridge Status**

Displays information only about the bridges that match the bridge monitoring status you specify.

**[ -profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]} ] - Bridge Profile Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the profile data last successful refresh timestamp you specify.

**[ -symbolic-name <text> ] - Bridge Symbolic Name**

Displays information only about the bridges that match the symbolic name you specify.

**[-snmp-community <text>] - SNMP Community Set on the Bridge**

Displays information only about the bridges that match the bridge SNMP community you specify.

**[-managed-by {SNMP|in-band|none}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge 7500N may use either.

**[-is-bridge-secure {true|false}] - Is Security Enabled For Bridge?**

Displays information only about the bridges that match the bridge security value you specify.

**[-node-visible-list <text>,...] - Nodes Bridge is Visible To**

Displays information only about the bridges that are available to the node.

**[-error-text-list <text>,...] - Bridge Error Description List**

Displays information only about the bridges that have the errors you specify.

**[-temp-sensor-name <text>] - Temperature Sensor Name**

Displays information only about the bridges that have the temperature sensor with the name you specify.

**[-min-safe-oper-temp <integer>] - Minimum Safe Operating Temperature in Degree Celsius**

Displays information only about the bridges that have the temperature sensor with the minimum safe operating temperature you specify.

**[-max-safe-oper-temp <integer>] - Maximum Safe Operating Temperature in Degree Celsius**

Displays information only about the bridges that have the temperature sensor with the maximum safe operating temperature you specify.

**[-temp-reading <integer>] - Chassis Temperature Sensor Reading in Degree Celsius**

Displays information only about the bridges that have the temperature sensors with the reading you specify.

**[-temp-sensor-status {normal|warning|critical}] - Chassis Temperature Sensor Status**

Displays information only about the bridges that have the temperature sensor with the status you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Chassis Temperature Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the temperature sensor data last successful refresh timestamp you specify.

**[-fc-port-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the bridges that have the ports with the indexes you specify.

**[-fc-port-oper-state-list {unknown|online|offline}] - Bridge FC Port Operational State List**

Displays information only about the bridges that have the ports with the operational states you specify.

**[-fc-port-admin-state-list {unknown|disabled|enabled}] - Bridge FC Port Admin State List**

Displays information only about the bridges that have the ports with the administrative states you specify.

**`[-fc-port-negotiated-data-rate-list {unknown|2|4|8|16}] - Bridge FC Port Negotiated Data Rate List`**

Displays information only about the bridges that have the ports with the negotiated data rates you specify.

**`[-fc-port-negotiated-conn-mode-list {unknown|loop|n-port}] - Bridge FC Port Negotiated Connection Mode List`**

Displays information only about the bridges that have the ports with the negotiated connection modes you specify.

**`[-fc-port-wwn-list <text>,...] - Bridge FC Port WWN List`**

Displays information only about the bridges that have the ports with the world-wide names you specify.

**`[-fc-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port Data Last Successful Refresh Timestamp`**

Displays information only about the bridges that match the FC ports data last successful refresh timestamp you specify.

**`[-fc-port-stats-index-list <integer>,...] - Bridge FC Port Index List`**

Displays information only about the bridges that have the ports with the indexes you specify.

**`[-fc-port-tx-words-list <integer>,...] - Bridge FC Port Transmitted Word Count List`**

Displays information only about the bridges that have the ports with the number of transmitted words you specify.

**`[-fc-port-rx-words-list <integer>,...] - Bridge FC Port Received Word Count List`**

Displays information only about the bridges that have the ports with the number of received words you specify.

**`[-fc-port-link-failures-list <integer>,...] - Bridge FC Port Link Failure Count List`**

Displays information only about the bridges that have the ports with the number of link failures you specify.

**`[-fc-port-sync-losses-list <integer>,...] - Bridge FC Port Sync Loss Count List`**

Displays information only about the bridges that have the ports with the number of synchronization losses you specify.

**`[-fc-port-invalid-crc-list <integer>,...] - Bridge FC Port Invalid CRC Count List`**

Displays information only about the bridges that have the ports with the number of invalid CRCs you specify.

**`[-fc-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port Stats Last Successful Refresh Timestamp`**

Displays information only about the bridges that match the FC port stats data last successful refresh timestamp you specify.

**`[-sas-port-index-list <integer>,...] - Bridge SAS Port Index List`**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**`[-sas-port-oper-state-list {unknown|online|offline|degraded}] - Bridge SAS Port Operational State List`**

Displays information only about the bridges that have the SAS ports with the operational states you specify.

**`[-sas-port-phy1-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY1 Operational State List`**

Displays information only about the bridges that have the SAS ports with the PHY1 operational states you specify.

**`[-sas-port-phy2-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY2 Operational State List`**

Displays information only about the bridges that have the SAS ports with the PHY2 operational states you specify.

**`[-sas-port-phy3-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY3 Operational State List`**

Displays information only about the bridges that have the SAS ports with the PHY3 operational states you specify.

**`[-sas-port-phy4-oper-state-list {unknown|online|offline}] - Bridge SAS Port PHY4 Operational State List`**

Displays information only about the bridges that have the SAS ports with the PHY4 operational states you specify.

**`[-sas-port-admin-state-list {unknown|disabled|enabled}] - Bridge SAS Port Administrative State List`**

Displays information only about the bridges that have the SAS ports with the administrative states you specify.

**`[-sas-port-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Data Rate Capability List`**

Displays information only about the bridges that have the SAS ports with the data rate capabilities you specify.

**`[-sas-port-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Negotiated Data Rate List`**

Displays information only about the bridges that have the SAS ports with the negotiated data rates you specify.

**`[-sas-port-wwn-list <text>,...] - Bridge SAS Port WWN List`**

Displays information only about the bridges that have the SAS ports with the world-wide names you specify.

**`[-sas-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port DB Data Last Successful Refresh Timestamp`**

Displays information only about the bridges that match the SAS ports data last successful refresh timestamp you specify.

**`[-sas-port-stats-phy-index-list <integer>,...] - Bridge SAS Port PHY Index List`**

Displays information only about the bridges that have the SAS ports with the PHY indexes you specify.

**`[-sas-port-link-changed-list <integer>,...] - Bridge SAS Port Link Changed Count List`**

Displays information only about the bridges that have the SAS ports with the link changed count you specify.

**[-sas-port-invalid-crc-list <integer>,...] - Bridge SAS Port Invalid CRC Count List**

Displays information only about the bridges that have the SAS ports with the invalid CRCs you specify.

**[-sas-port-phy-reset-list <integer>,...] - Bridge SAS Port PHY Reset Count List**

Displays information only about the bridges that have the SAS ports with the PHY reset count you specify.

**[-sas-port-sync-losses-list <integer>,...] - Bridge SAS Port Sync Loss Count List**

Displays information only about the bridges that have the SAS ports with the synchronization losses you specify.

**[-sas-port-disparity-count-list <integer>,...] - Bridge SAS Port Disparity Count List**

Displays information only about the bridges that have the SAS ports with the disparity count you specify.

**[-sas-port-invalid-dword-list <integer>,...] - Bridge SAS Port Invalid DWORD Count List**

Displays information only about the bridges that have the SAS ports with the invalid DWORD count you specify.

**[-sas-port-stats-index-list <integer>,...] - Bridge SAS Port Index List**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**[-sas-port-stats-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Data Rate Capability List**

Displays information only about the bridges that have the SAS ports with the data rate capabilities you specify.

**[-sas-port-stats-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Negotiated Data Rate List**

Displays information only about the bridges that have the SAS ports with the negotiated data rates you specify.

**[-sas-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port Statistics Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS port stats data last successful refresh timestamp you specify.

**[-fc-sfp-port-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the bridges that have the FC ports with the indexes you specify.

**[-fc-port-sfp-vendor-list <text>,...] - Bridge FC Port SFP Vendor List**

Displays information only about the bridges that have the FC ports with the SFP vendors you specify.

**[-fc-port-sfp-serial-number-list <text>,...] - Bridge FC Port SFP Serial Number List**

Displays information only about the bridges that have the FC ports with the SFP serial numbers you specify.

**[-fc-port-sfp-part-number-list <text>,...] - Bridge FC Port SFP Part Number List**

Displays information only about the bridges that have the FC ports with the SFP part numbers you specify.

**[-fc-port-sfp-data-rate-capability-list {2Gb|4Gb|8Gb|16Gb|32Gb}] - Bridge FC Port SFP Data Rate Capability List**

Displays information only about the bridges that have the FC ports with the SFP data rate capabilities you

specify.

**`[-fc-port-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] }]` - Bridge FC Port SFP Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the FC ports SFP data last successful refresh timestamp you specify.

**`[-sas-qsfp-port-index-list <integer>,...]` - Bridge SAS Port Index List**

Displays information only about the bridges that have the SAS ports with the indexes you specify.

**`[-sas-port-qsfp-vendor-list <text>,...]` - Bridge SAS Port QSFP Vendor List**

Displays information only about the bridges that have the SAS ports with the QSFP vendors you specify.

**`[-sas-port-qsfp-serial-number-list <text>,...]` - Bridge SAS Port QSFP Serial Number List**

Displays information only about the bridges that have the SAS ports with the QSFP serial numbers you specify.

**`[-sas-port-qsfp-type-list {unknown|optical|active-copper|passive-copper}]` - Bridge SAS Port QSFP Type List**

Displays information only about the bridges that have the SAS ports with the QSFP types you specify.

**`[-sas-port-qsfp-part-number-list <text>,...]` - Bridge SAS Port QSFP Part Number List**

Displays information only about the bridges that have the SAS ports with the QSFP part numbers you specify.

**`[-sas-port-qsfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] }]` - Bridge SAS Port QSFP Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS ports QSFP data last successful refresh timestamp you specify.

**`[-mini-sas-hd-index-list <integer>,...]` - Bridge Mini-SAS HD Index List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD indexes that you specify.

**`[-mini-sas-hd-vendor-list <text>,...]` - Bridge Mini-SAS HD Vendor List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD vendors that you specify.

**`[-mini-sas-hd-serial-number-list <text>,...]` - Bridge Mini-SAS HD Serial Number List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD serial numbers that you specify.

**`[-mini-sas-hd-type-list <text>,...]` - Bridge Mini-SAS HD Type List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD types that you specify.

**`[-mini-sas-hd-part-number-list <text>,...]` - Bridge Mini-SAS HD Part Number List**

Displays information only about the bridges that have SAS ports with the Mini-SAS HD part numbers that you specify.

**`[-mini-sas-hd-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] }]` - Bridge Mini-SAS HD Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the SAS ports Mini-SAS HD data with the last successful refresh timestamp that you specify.

**`[-power-supply-index-list <integer>,...]` - Bridge Power Supply Index List**

Displays information only about the bridges that have power supplies with the indexes that you specify.

**`[-power-supply-name-list <text>,...]` - Bridge Power Supply Name List**

Displays information only about the bridges that have power supplies with the name that you specify.

**`[-power-supply-status-list {unknown|down|up}]` - Bridge Power Supply Status List**

Displays information only about the bridges that have power supplies with the status that you specify.

**`[-power-supply-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] }]` - Bridge Power Supply Data Last Successful Refresh Timestamp**

Displays information only about the bridges that match the power supply last data with the last successful refresh timestamp that you specify.

**`[-node-list {<nodename>|local}]` - Node Name List**

Displays information only about the bridges that are connected to the nodes you specify.

**`[-initiator-list <text>,...]` - Initiator List**

Displays information only about the bridges that are connected to the nodes hosting the initiators you specify.

**`[-initiator-side-switch-port-name-list <text>,...]` - Initiator Side Switch Port Name List**

Displays information only about the bridges that are connected to the initiator-side switch ports you specify.

**`[-target-side-switch-port-name-list <text>,...]` - Target Side Switch Port Name List**

Displays information only about the bridges that are connected to the target-side switch ports you specify.

**`[-target-port-wwn-list <text>,...]` - Target Port WWN List**

Displays information only about the bridges that match the target ports with world-wide names you specify.

**`[-target-port-index-list <integer>,...]` - Target Port Index List**

Displays information only about the bridges that match the target ports with indexes you specify.

## Examples

The following example displays information about all bridges:

```

cluster1::> system bridge show

Monitor

## system bridge config-dump collect

Retrieve and save bridge dumpconfiguration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge config-dump collect` command retrieves a dumpconfiguration file from a system bridge.

## Parameters

### **-bridge <text> - Bridge Name (privilege: advanced)**

Use this parameter to retrieve a dumpconfiguration file from the specified bridge.

## Examples

The following example retrieves a dumpconfiguration file from bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::*> system bridge config-dump collect -bridge
ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the dumpconfiguration file from bridge
"ATTO_FibreBridge7500N_1".

cluster1::*>
```

## system bridge config-dump delete

Delete a dumpconfiguration file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system bridge config-dump delete` command deletes dumpconfiguration files previously retrieved with the [system bridge config-dump collect](#) command.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to delete a dumpconfiguration file stored on the specified node.

### **-file <text> - Config File (privilege: advanced)**

Use this parameter to delete the dumpconfiguration file with the specified file name.

## Examples

The following example deletes `dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt` from node1:

```
cluster1::*> system bridge config-dump delete -node node1 -file
dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt

cluster1::*>
```

## system bridge config-dump show

Display a list of bridge dumpconfiguration files

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system bridge config-dump show` command displays information about all the dumpconfiguration files previously retrieved with the `system bridge config-dump collect` command. If no parameters are specified, the default command displays the following information about the dumpconfiguration files:

- Node
- File Name
- Timestamp
- Bridge
- Bridge Serial Number

To display detailed information about a single dumpconfiguration file, use the `-node` and `-file` parameters.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Displays information about the dumpconfiguration files stored on the node that matches the specified node name.

**[`-file <text>`] - Config File (privilege: advanced)**

Displays information about the dumpconfiguration files that match the specified file name.

**[`-bridge <text>`] - Bridge Name (privilege: advanced)**

Displays information about the dumpconfiguration files from the bridge that matches the specified bridge name.

**[`-serial-number <text>`] - Serial Number of Bridge (privilege: advanced)**

Displays information about the dumpconfiguration files from the bridge that matches the specified serial number.

**[`-timestamp <MM/DD/YYYY HH:MM:SS>`] - Time of Collection (privilege: advanced)**

Displays information about the dumpconfiguration files that were collected at the specified time.

## Examples

The following example displays information about all dumpconfiguration files:

```
cluster1::*> system bridge config-dump show

Bridge: ATTO_FibreBridge7500N_1

Node   File Name                                                    Timestamp
-----

## system bridge coredump collect

Retrieve and save coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system bridge coredump collect` command retrieves a core file from a bridge.

## Parameters

### **-name <text> - Bridge Name**

This parameter specifies the bridge name from which the coredump file is to be collected.

## Examples

The following example retrieves a coredump from bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::> system bridge coredump collect -bridge ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the coredump from bridge
"ATTO_FibreBridge7500N_1".

cluster1::>
```

## system bridge coredump delete

Delete a saved coredump file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system bridge coredump delete` command deletes a coredump file previously retrieved with the [system bridge coredump collect](#) command.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the coredump file belongs to.

**-corename <text> - Coredump Filename**

This parameter specifies the name of the coredump file to be deleted.

### Examples

The following example deletes coredump file `core.FB7500N100018.1970-01-05.17_50_30.mem` collected from bridge `ATTO_FibreBridge7500N_1`:

```
cluster1::> system bridge coredump delete -name ATTO_FibreBridge7500N_1
-corename core.FB7500N100018.1970-01-05.17_50_30.mem

cluster1::>
```

## system bridge coredump show

Display a list of bridge coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system bridge coredump show` command displays information about all the coredump files previously retrieved with the [system bridge coredump collect](#) command. If no parameters are specified, the default command displays the following information about the coredump files:

- Bridge Name
- Bridge Serial Number
- Coredump Filename
- Located on Node
- Panic Timestamp
- Panic String

To display detailed information about a single coredump file, use the `-node` and `-corename` parameters.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-serial-number <text>] - Bridge Serial Number**

Use this parameter to select the coredump files from the bridge that matches the specified bridge serial number.

**[-corename <text>] - Coredump Filename**

Use this parameter to select the coredump files that matches the specified file name.

**[-name <text>] - Bridge Name**

Use this parameter to select the coredump files from the bridge that matches the specified bridge name.

**[-node <nodename>] - Located on Node**

Use this parameter to select the coredump the coredump files that are located on the specified node.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Panic Timestamp**

Use this parameter to select the coredump files that were collected at the specified time.

**[-panic-string <text>] - Panic String**

Use this parameter to select the coredump files that matches the specified panic string.

## Examples

The following example displays information about all coredump files:

```
cluster1::> system bridge coredump show
Bridge Name: ATTO_FibreBridge7500N_1
Bridge Serial Number: FB7500N100018
  Coredump Filename: core.FB7500N100018.1970-01-05.17_50_30.mem
  Located on Node: stg-8020-6a
  Panic Timestamp: 7/6/2017 11:03:37
  Panic String: CoreDumpGenerate CLI Command

cluster1::>
```

## system bridge firmware update

Download firmware onto the bridge so it can be updated

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system bridge firmware update` command downloads the firmware onto the bridge. The bridge needs to be rebooted for the firmware update to occur. The firmware file to be used is specified by the `-uri` parameter.

### Parameters

**-bridge <text> - Bridge Name (privilege: advanced)**

This specifies the bridge whose firmware needs to be updated.

**-uri <text> - URI (privilege: advanced)**

This parameter specifies the URI from which the firmware file is downloaded onto the bridge.

**[-skip <>true>] - Skip Checking for Port Path = 2 (privilege: advanced)**

Use this optional parameter to skip the bridge path checking allowing a firmware file to be downloaded onto the bridge. Note that doing so might cause multiple device failures.

**[-username <text>] - Username for the URI (privilege: advanced)**

Use this optional parameter to provide a username for the URI.

### Examples

The following example updates the firmware on bridge `ATTO_FibreBridge7500N_1` when credentials are not required.

```
cluster1::> system bridge firmware update -bridge ATTO_FibreBridge7500N_1
-uri http://0.0.0.0/firmware.zbd
[Job 72] Job is queued: System bridge firmware update job.
```

The following example updates the firmware on bridge ATTO\_FibreBridge7500N\_1 when credentials are required

```
cluster1::> system bridge firmware update -bridge ATTO_FibreBridge7500N_1
-uri http://0.0.0.0/firmware.zbd -username user1
Enter the password:
[Job 72] Job is queued: System bridge firmware update job.
```

## system bridge options modify

Enable or disable configurable options for all bridges

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system bridge options modify` command alters the value of configurable options which affect all the ATTO FibreBridges in the cluster configuration.

### Parameters

**-option-name <text> - Option Name (privilege: advanced)**

The options supported are:

- enable.automatic.addition

Allowable values: {true, false}

The enable.automatic.addition option controls whether or not ATTO FibreBridge 7500N and FibreBridge 7600N bridges are automatically added for in-band monitoring by the Fabric Health Monitor.

If set to true, the feature is enabled and all ATTO FibreBridge 7500N and FibreBridge 7600N bridges in the cluster will automatically be added for in-band monitoring by the Fabric Health Monitor. This is the preferred and default value.

If set to false, the feature is disabled and ATTO bridges will not automatically be added for monitoring. This value should only be used if you do not want to monitor the bridges at all, or if you want them to be monitored via SNMP.

The ATTO FibreBridge 6500N does not have the capability to be monitored by in-band management, so this option does not apply to the 6500N.

Note that this command is cluster-specific. To affect both clusters of a MetroCluster system, the command must be executed once on each cluster of the MetroCluster system.

### **[*-option-value* <text>] - Option Value (privilege: advanced)**

This parameter provides the value for each option. Allowable values for each option are specified in the option description above.

### **Examples**

The following example sets the `enable.automatic.addition` option to `true`:

```
siteA::*> system bridge options modify -option-name
enable.automatic.addition -option-value true
siteA::*>
```

## **system bridge options show**

Show state of configurable options for all bridges

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system bridge options show` command displays the value of configurable options which apply to all ATTO FibreBridges in the cluster configuration. If the user specifies the command without parameters, the output displays the current value of all the configurable options supported by the cluster.

### **Parameters**

#### **[*-fields* <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

#### **[*-instance* ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[*-option-name* <text>] - Option Name (privilege: advanced)**

The options supported are:

- `enable.automatic.addition`

Allowable values {true, false}.

This option controls whether or not bridges are automatically added for in-band monitoring by the Fabric Health Monitor.

If set to `true`, the feature is enabled and all ATTO 7500N and 7600N bridges will automatically be added for in-band monitoring by the Fabric Health Monitor.

If set to `false`, the feature is disabled and ATTO FibreBridges will not be automatically added for monitoring. They can be left unmonitored, or manually added for SNMP monitoring.

Note that this command is cluster-specific. To determine the option setting on both clusters of a

MetroCluster system, the command must be executed once on each cluster of the MetroCluster system.

### **[`-option-value <text>`] - Option Value (privilege: advanced)**

The option-value parameter specifies the value of the option. Allowable values are described for each option supported in the list above.

## **Examples**

The following example displays the current setting of the bridge options:

```
siteA::*> system bridge options show
  Option Name                Option Value      Option Hint
  -----
enable.automatic.addition    true             {true,false} - enable
auto-add
siteA::*>
```

# **system chassis commands**

## **system chassis show**

Display all the chassis in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system chassis show` command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `-instance` parameter.

## **Parameters**

**{ [`-fields <fieldname>`,...]**

Selects the fields that you specify.

**| [`-instance` ] }**

Displays detailed information about all the chassis in the cluster.

**[`-chassis-id <text>`] - Chassis ID**

Selects information about the specified chassis.

### **[`-member-nodes {<nodename>|local}`]] - List of Nodes in the Chassis**

Selects information about the chassis with the specified member node list.

### **[`-num-nodes <integer>`]] - Number of Nodes in the Chassis**

Selects information about the chassis with the specified number of nodes.

### **[`-status {ok|ok-with-suppressed|degraded|unreachable|unknown}`]] - Status**

Selects information about the chassis with the specified status.

## **Examples**

The following example displays information about all the chassis in the cluster:

```
cluster1::> system chassis show
```

| Chassis ID | Status | List of Nodes |
|------------|--------|---------------|
| 4591227214 | ok     | node1,node2   |
| 4591227000 | ok     | node1,node2   |

The following example displays detailed information about a specific chassis:

```
cluster1::> system chassis show -chassis-id 4591227214 -instance
```

Chassis ID: 4591227214  
List of Nodes in the Chassis: node1,node2  
Number of Nodes in the Chassis: 2  
Status: ok

## **system chassis fru show**

Display the FRUs in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system chassis fru show` command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state

- Nodes sharing the FRU

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that you specify.

**[-instance ] }**

Displays detailed information about FRUs.

**[-node {<nodename>|local}] - Node**

Specifies the primary node name in the cluster on which Chassis health monitor is running.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about all the FRUs with the specified FRU type.

**[-name <text>] - FRU ID**

Selects information about the FRU with the specified FRU unique name.

**[-state <text>] - FRU State**

Selects information about all the FRUs with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about all the FRUs with the specified status.

**[-display-name <text>] - Display Name for the FRU**

Selects information about all the FRUs with the specified FRU display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Monitor Name**

Selects information about all the FRUs with the specified monitor name.

**[-model <text>] - Model Type**

Selects information about all the FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the FRUs in the specified chassis.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the FRUs with the specified additional information.

**[-connected-nodes {<nodename>|local}] - List of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified node list.

**[-num-nodes <integer>] - Number of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified number of connected nodes.

**Examples**

The following example displays information about all major chassis specific FRUs in the cluster:

```
cluster1::> system chassis fru show
```

| Chassis ID | FRU      | Type       | State | Nodes Sharing the FRU |
|------------|----------|------------|-------|-----------------------|
| 4591227214 | node1    | controller | ok    | node1                 |
| 4591227214 | node2    | controller | ok    | node2                 |
| 4591227214 | PSU1 FRU | psu        | GOOD  | node1,node2           |
| 4591227214 | PSU2 FRU | psu        | GOOD  | node1,node2           |

The following example displays detailed information about a specific FRU:

```

cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
Node: node1
        FRU Serial Number: XXT122737891
        FRU Name: PSU1 FRU
        FRU Type: psu
        FRU Name: XXT122737891
        FRU State: GOOD
        Status: ok
        Display Name for the FRU: PSU1 FRU
        Monitor Name: chassis
        Model Type: none
        Shared Resource: shared
        Chassis ID: 4591227214
Additional Information About the FRU: Part Number: 114-00065+A0
Revision: 020F
Manufacturer: NetApp
FRU Name: PSU
        List of Nodes Sharing the FRU: node1,node2
        Number of Nodes Sharing the FRU: 2

```

## system configuration commands

### system configuration backup copy

#### Copy a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system configuration backup copy` command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the [system configuration backup show](#) command to display configuration backups to copy.

#### Parameters

**-from-node {<nodename>|local} - Source Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to copy.

**-to-node {<nodename>|local} - Destination Node (privilege: advanced)**

Use this parameter to specify the name of the destination node where the configuration backup copy is created.

## Examples

The following example copies the configuration backup file `node1.special.7z` from the node `node1` to the node `node2`.

```
cluster1::*> system configuration backup copy -from-node node1 -backup
node1.special.7z -to-node node2
[Job 295] Job is queued: Copy backup job.
```

## Related Links

- [system configuration backup show](#)

## system configuration backup create

Create a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup create` command creates a new configuration backup file.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which to create the backup file.

**[-backup-name <text>] - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: `* ? /`

**[-backup-type {node|cluster}] - Backup Type (privilege: advanced)**

Use this parameter to specify the type of backup file to create.

## Examples

The following example creates a new cluster configuration backup file called `node1.special.7z` on the node `node1`.

```
cluster1::*> system configuration backup create -node node1 -backup-name
node1.special.7z -backup-type cluster
[Job 194] Job is queued: Cluster Backup OnDemand Job.
```

## system configuration backup delete

Delete a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup delete` command deletes a saved configuration backup.

Use the [system configuration backup show](#) command to display saved configuration backups.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to delete.

## Examples

The following example shows how to delete the configuration backup file `node1.special.7z` from the node `node1`.

```
cluster1::*> system configuration backup delete -node node1 -backup
node1.special.7z
```

## Related Links

- [system configuration backup show](#)

## system configuration backup download

### Download a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup download` command copies a configuration backup from a source URL to a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the node to which the configuration backup is downloaded.

**-source <text> - Source URL (privilege: advanced)**

Use this parameter to specify the source URL of the configuration backup to download.

**[-backup-name <text>] - Backup Name (privilege: advanced)**

Use this parameter to specify a new local file name for the downloaded configuration backup.

## **`[-validate-certificate {true|false}]` - Validate Digital Certificate (privilege: advanced)**

Use this parameter with the value `true` to validate the digital certificate of the remote server.

### **Examples**

The following example shows how to download a configuration backup file from a URL to a file named `exampleconfig.download.7z` on the node `node2`.

```
cluster1::*> system configuration backup download -node node2 -source
http://www.example.com/config/download/nodeconfig.7z -backup-name
exampleconfig.download.7z
```

## **system configuration backup rename**

### **Rename a configuration backup**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system configuration backup rename` command changes the file name of a configuration backup file.

Use the [system configuration backup show](#) command to display configuration backups to rename.

### **Parameters**

#### **`-node {<nodename>|local}` - Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

#### **`-backup <text>` - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to rename.

#### **`-new-name <text>` - New Name (privilege: advanced)**

Use this parameter to specify a new name for the configuration backup file.

### **Examples**

The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```
cluster1::*> system configuration backup rename -node node1 -backup
download.config.7z -new-name test.config.7z
```

- [system configuration backup show](#)

## system configuration backup show

Show configuration backup information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup show` command displays information about saved configuration backups.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Selects configuration backups that are saved on the node you specify.

**`[-backup <text>] - Backup Name (privilege: advanced)`**

Selects configuration backups that have the backup name you specify.

**`[-backup-type {node|cluster}] - Backup Type (privilege: advanced)`**

Selects configuration backups of the type you specify.

**`[-time <MM/DD HH:MM:SS>] - Backup Creation Time (privilege: advanced)`**

Selects configuration backups that were saved on the date and time you specify.

**`[-cluster-name <text>] - Cluster Name (privilege: advanced)`**

Selects configuration backups that were saved in the cluster that has the name you specify.

**`[-cluster-uuid <UUID>] - Cluster UUID (privilege: advanced)`**

Selects configuration backups that were saved in the cluster that has the UUID you specify.

**`[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Backup (privilege: advanced)`**

Selects configuration backups that have the file size you specify.

**`[-nodes-in-backup {<nodename>|local}] - Nodes In Backup (privilege: advanced)`**

Selects configuration backups that include the configuration of the nodes you specify.

**`[-version <text>] - Software Version (privilege: advanced)`**

Selects configuration backups that have the software version you specify.

**`[-is-auto {true|false}] - Backup Created from Schedule (true or false) (privilege: advanced)`**

A value of `true` selects configuration backups that were created from a schedule. A value of `false` selects configuration backups that were created manually.

### **[*-schedule* <text>] - Name of Backup Schedule (privilege: advanced)**

Selects configuration backups that were created by the schedule you specify.

### **Examples**

The following example shows typical output for this command.

```
cluster1::*> system configuration backup show
Node      Backup Tarball                               Time
Size
-----
node1      cluster1.8hour.2011-02-22.18_15_00.7z         02/22 18:15:00
7.78MB
node1      cluster1.8hour.2011-02-23.02_15_00.7z         02/23 02:15:00

node1      cluster1.daily.2011-02-23.00_10_00.7z         02/23 00:10:00
7.99MB
Press <space> to page down, <return> for next line, or 'q' to quit... q
5 entries were displayed.
```

## **system configuration backup upload**

### **Upload a configuration backup**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system configuration backup upload` command copies a configuration backup from a node in the cluster to a remote URL.

the web server to which you are uploading the configuration backup file must have PUT operations enabled for HTTP and POST operations enabled for HTTPS. Some web servers may require the installation of an additional module. For more information, see your web server's documentation.

### **Parameters**

#### ***-node* {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the node from which the configuration backup is uploaded.

**-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the file name of the configuration backup to upload.

**-destination <text> - Destination URL (privilege: advanced)**

Use this parameter to specify the destination URL of the configuration backup.

**[-validate-certificate {true|false}] - Validate Digital Certificate (privilege: advanced)**

Use this parameter with the value *true* to validate the digital certificate of the remote server.

**[-rest-method {POST|PUT}] - REST Method (privilege: advanced)**

Use this parameter to specify the http method to use in order to upload the configuration backup.

## Examples

The following example show how to upload the configuration backup file `testconfig.7z` from the node `node2` to a remote URL.

```
cluster1::*> system configuration backup upload -node node2 -backup
testconfig.7z -destination
ftp://www.example.com/config/uploads/testconfig.7z
```

## system configuration backup settings clear-password

### Clear password for destination URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``system configuration backup settings clear-password`` command clears the password used for uploads of configuration backups. Enter the command without parameters.

Use the [system configuration backup settings show](#) command to display the destination URL for configuration backups. Use the [system configuration backup settings modify](#) command to change the destination URL and remote username for configuration backups.

### Parameters

### Examples

The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings clear-password

Do you want to clear the password? {y|n}:
```

## Related Links

- [system configuration backup settings show](#)
- [system configuration backup settings modify](#)

## system configuration backup settings modify

### Modify configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup settings modify` command changes settings for configuration backup.

### Parameters

**`[-destination <text>]` - Backup Destination URL (privilege: advanced)**

Use this parameter to specify the destination URL for uploads of configuration backups. Use the value "" to remove the destination URL. Only FTP, HTTP, HTTPS, FTPS protocols are supported.

**`[-username <text>]` - Username for Destination (privilege: advanced)**

Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the [system configuration backup settings set-password](#) command to change the password used with this user name.

**`[-validate-certificate {true|false}]` - Validate Digital Certificate (privilege: advanced)**

Use this parameter with the value `true` to validate the digital certificate of the remote server. Digital certificate validation is disabled by default.

**`[-numbackups1 <integer>]` - Number of Backups to Keep for Schedule 1 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup job schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 1 is pre-programmed to be '8hour'.

**`[-numbackups2 <integer>]` - Number of Backups to Keep for Schedule 2 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup job schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 2 is pre-programmed to be 'daily'.

**`[-numbackups3 <integer>]` - Number of Backups to Keep for Schedule 3 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup job schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed. Schedule 3 is pre-programmed to be 'weekly'.

### Examples

The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1::*> system configuration backup settings modify -destination  
ftp://www.example.com/config/uploads/ -username admin
```

## Related Links

- [system configuration backup settings set-password](#)

## system configuration backup settings set-password

Modify password for destination URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup settings set-password` command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the [system configuration backup settings modify](#) command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the [system configuration backup settings show](#) command to display the destination URL for configuration backups. Use the [system configuration backup settings modify](#) command to change the destination URL and remote username for configuration backups.

## Parameters

## Examples

The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings set-password  
  
Enter the password:  
Confirm the password:
```

## Related Links

- [system configuration backup settings modify](#)
- [system configuration backup settings show](#)

## system configuration backup settings show

Show configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup settings show` command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the [system configuration backup settings set-password](#) command to change the password used with the user name on the destination. Use the [system configuration backup settings modify](#) command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

## Parameters

### **`[-instance ]` (privilege: advanced)**

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

## Examples

The following example displays basic backup settings information.

```
cluster1::*> system configuration backup settings show
Backup Destination URL                               Username
-----
ftp://www.example.com/config/uploads/                jdoe
```

The following example shows detailed output using the `-instance` parameter.

```
cluster1::*> system configuration backup settings show -instance
Backup Destination URL:
ftp://www.example.com/config/uploads/
Username for Destination: admin
Validate Digital Certificate: true
Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

- [system configuration backup settings modify](#)

## system configuration recovery cluster modify

### Modify cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system configuration recovery cluster modify` command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

#### Parameters

**`[-recovery-status {complete|in-progress|not-in-recovery}]` - Cluster Recovery Status (privilege: advanced)**

Use this parameter with the value `complete` to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The `in-progress` and `not-in-recovery` values are not applicable to this command.

#### Examples

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status
complete
```

## system configuration recovery cluster recreate

### Recreate cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system configuration recovery cluster recreate` command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the [system configuration recovery cluster rejoin](#) command.

#### Parameters

**`-from {node|backup}` - From Node or Backup (privilege: advanced)**

Use this parameter with the value `node` to re-create the cluster using the current node as a configuration template. Use this parameter with the value `backup` to re-create the cluster using a configuration backup as a configuration template.

**`[-backup <text>]` - Backup Name (privilege: advanced)**

Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the `-from` parameter with the value `backup`, you must use this parameter and specify a backup name. Use the [system configuration backup show](#) command to view available configuration backup files.

## Examples

The following example shows how to re-create a cluster using the node `node1` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from node
```

The following example shows how to re-create a cluster using the configuration backup `siteconfig.backup.7z` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from backup  
-backup siteconfig.backup.7z
```

## Related Links

- [system configuration recovery cluster rejoin](#)
- [system configuration backup show](#)

## system configuration recovery cluster rejoin

Rejoin a cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration recovery cluster rejoin` command rejoins a node to a new cluster created earlier using the [system configuration recovery cluster recreate](#) command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

### Parameters

**-node {<nodename>|local} - Node to Rejoin (privilege: advanced)**

Use this parameter to specify the node to rejoin to the cluster.

## Examples

This example shows how to rejoin the node `node2` to the cluster.

```
cluster1::*> system configuration recovery cluster rejoin -node node2

Warning: This command will rejoin node "node2" into the local cluster,
        potentially overwriting critical cluster configuration files.
This
        command should only be used to recover from a disaster. Do not
perform
        any other recovery operations while this operation is in
progress.
        This command will cause node "node2" to reboot.
Do you want to continue? {y|n}: y
```

## Related Links

- [system configuration recovery cluster recreate](#)

## system configuration recovery cluster show

Show cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster show` command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the [system configuration recovery cluster recreate](#) command with the *-from backup* parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the [system configuration recovery cluster rejoin](#) command to recover other nodes in the cluster.

## Examples

The following example displays the cluster recovery status.

```
source:::> system configuration recovery cluster show
        Recovery Status: in-progress
Is Recovery Status Persisted: true
```

## Related Links

- [system configuration recovery cluster recreate](#)
- [system configuration recovery cluster rejoin](#)

## system configuration recovery cluster sync

Sync a node with cluster configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster sync` command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

## Parameters

**-node {<nodename>|local} - Node to Synchronize (privilege: advanced)**

Use this parameter to specify the name of the node to synchronize with the cluster.

## Examples

The following example shows the synchronization of the node `node2` to the cluster configuration.

```
cluster1::*> system configuration recovery cluster sync -node node2

Warning: This command will synchronize node "node2" with the cluster
configuration, potentially overwriting critical cluster
configuration
files on the node. This feature should only be used to recover
from a
disaster. Do not perform any other recovery operations while this
operation is in progress. This command will cause all the cluster
applications on node "node2" to restart, interrupting
administrative
CLI and Web interface on that node.
Do you want to continue? {y|n}: y
All cluster applications on node "node2" will be restarted. Verify that
the cluster applications go online.
```

## system configuration recovery node restore

### Restore node configuration from a backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery node restore` command restores the configuration of the local node from a configuration backup file.

Use the [system configuration backup show](#) command to view available configuration backup files.

## Parameters

### **-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of a configuration backup file to use as the configuration template.

### **[-nodename-in-backup <text>] - Use Backup Identified by this Nodename (privilege: advanced)**

Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.

### **[-force <true>] - Force Restore Operation (privilege: advanced)**

Use this parameter with the value `true` to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

Use this parameter with the value `false` to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is `false`.

## Examples

The following example shows how to restore the configuration of the local node from the configuration backup of `node3` that is stored in the configuration backup file `example.backup.7z`.

```
cluster1::*> system configuration recovery node restore -backup
example.backup.7z
Warning: This command overwrites local configuration files with files
contained
        in the specified backup file. Use this command only to recover
from a
        disaster that resulted in the loss of the local configuration
files.
        The node will reboot after restoring the local configuration.
Do you want to continue? {y|n}: y
```

# system controller commands

## system controller show

Display the controller information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller show` command displays information about all the controllers in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-system-id <text>] - System ID**

Selects information about the controller with the specified System ID.

**[-model <text>] - Model Name**

Selects information about the controllers with the specified model name.

**[-part-number <text>] - Part Number**

Selects information about the controllers with the specified part number.

**[-revision <text>] - Revision**

Selects information about the controllers with the specified revision.

**[-serial-number <text>] - Serial Number**

Selects information about the controller with the specified system serial number.

**[-controller-type <text>] - Controller Type**

Selects information about the controllers with the specified controller type.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the controllers with the specified health monitor status.

**[-chassis-id <text>] - Chassis ID**

Selects information about the controllers with the specified chassis ID.

## Examples

The below example displays information about all controllers in the cluster.

```
cluster1::> system controller show
      Controller Name      System ID      Serial Number      Model
Status
-----
node1      140733730268652  700001456939      FAS2520
ok
node2      140733730268667  700001456941      FAS2520
ok
2 entries were displayed.
```

The example below displays detailed information about specified controller in the cluster.

```
cluster1::> system controller show -instance -node node1
      Node: node1
      System ID: 140733730268652
      Model Name: FAS2520
      Part Number: 111-01316
      Revision: 21
      Serial Number: 700001456939
      Controller Type: none
      Status: ok
      Chassis ID: 4591227214
```

## system controller bezel-led modify

Modify the state of the bezel LED log (lit or unlit)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller bezel-led modify` command controls the illumination state of the LED logo on the chassis bezel (lit or unlit) of a node. On platforms where two controllers in a high-availability (HA) configuration share the same chassis, any changes to the LED logo's illumination state are kept synchronized on both nodes.

### Parameters

**-node {<nodename>|local} - Node**

The node whose bezel LED logo illumination state is being modified.

### **[*-state* {*off*|*on*|*disconnected*|*bezel-switch*|*unknown*}] - Bezel LED Logo State**

The bezel LED logo illumination state of the node. The possible values are: on (lit), off (unlit),bezel-switch or disconnected. The default state is on .

### **Examples**

The following example turns on the bezel LED logo:

```
cluster1::> system controller bezel-led modify -node node1 -state on
```

The following example turns off the bezel LED logo:

```
cluster1::> system controller bezel-led modify -node node1 -state off
```

The following example lets the bezel switch control the bezel LED:

```
cluster1::> system controller bezel-led modify -node node1 -state bezel-switch
```

## **system controller bezel-led show**

Display the state of the bezel LED logo (lit or unlit)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller bezel-led show` command shows the current illumination state of the bezel LED logo (lit or unlit).

### **Parameters**

**{ [*-fields* <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**| [*-instance* ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[*-node* {<nodename>|*local*}] - Node**

The node whose bezel LED logo illumination state is being shown.

**[*-state* {*off*|*on*|*disconnected*|*bezel-switch*|*unknown*}] - Bezel LED Logo State**

The bezel LED logo illumination state of the node.

## Examples

The following example lists the current illumination state of the bezel LED logo:

```
cluster1::> system controller bezel-led show
Node                Bezel LED Logo State
-----
node1               off
node2               off
```

## system controller bootmedia show-percentage-used

Show the utilization percentage of the NVMe boot media

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller bootmedia show-percentage-used` command displays the Boot Media Device percentage used. These commands are available for NVMe bootmedia systems. By default, the command displays the following information about the NVMe bootmedia:

- Node
- Display Name
- Is NVMe
- NVMe Percentage Used
- NVMe Available Spare
- NVMe Spare Threshold

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the boot media devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**`[-device-id <Hex Integer>] - Device ID`**

Selects the bootmedia devices with the specified device ID.

**`[-display-name <text>] - Display Name`**

Selects the bootmedia devices with the specified display name.

**`[-unique-name <text>] - Unique Name`**

Selects the bootmedia device with the specified unique name.

**`[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name`**

Selects the bootmedia devices with the specified health monitor.

**`[-usbmon-status {present|not-present}] - Bootmedia Health Monitor`**

Selects the bootmedia devices with the specified USBMON status.

**`[-device-state {good|warn|bad}] - Bootmedia State`**

Selects the bootmedia devices with the specified device state.

**`[-size <integer>] - Max Memory Size (MB)`**

Selects the bootmedia devices with the specified memory size.

**`[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status`**

Selects the bootmedia devices with the specified health monitor status.

**`[-is-nvme {true|false}] - Is NVMe Boot Media`**

Selects the boot media technology. If the value is "true", the boot media uses NVMe technology.

**`[-nvme-percent-used <integer>] - NVMe Percentage Used`**

Selects the NVMe boot media with the specified percentage of rated life used by the solid-state device (SSD). When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

**`[-nvme-available-spare <integer>] - NVMe Available Spare`**

Selects the NVMe boot media with the specified percentage of available spare blocks. When all spare blocks are consumed on the SSD, i.e. when this parameter reaches 0%, the system can no longer write data to the solid-state device (SSD).

**`[-nvme-spare-threshold <integer>] - NVMe Spare Threshold`**

Selects the NVMe boot media with the specified "low spare blocks" threshold percentage. System health monitor alerts are generated when the available spare blocks on the SSD cross below this threshold.

## Examples

The following example displays the information of the boot media devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-percentage-used
```

|           |                      | NVMe Used | NVMe Spare | NVMe      |
|-----------|----------------------|-----------|------------|-----------|
| +Node     | Display Name         | Is NVMe   | Percentage | Available |
| Threshold |                      |           |            |           |
| localhost | BootMedia/           | true      | 0          | 100       |
| 10        | 0X331511900503A0SAM0 |           |            |           |
|           | 00PM9A30002T00025000 |           |            |           |

The following example displays the detailed information about the boot media present in a node:

```
cluster1::> system controller bootmedia show-percentage-used -instance
-node node1
Node: localhost
    Serial Number: S668NE0RC00442
    Vendor ID: 144d
    Device ID: a80a
    Display Name:
BootMedia/0X331511900503A0SAM000PM9A30002T00025000
    Unique Name: 0X331511900503A0SAM000PM9A30002T00025000
    Health Monitor Name: controller
Bootmedia Health Monitor: present
    Bootmedia State: good
    Max Memory Size (MB): 1831420
    Status: ok
    Is NVME Boot Media: true
    NVME Percentage Used: 0
    NVME Available Spare: 100
    NVME Spare Threshold: 10
```

## system controller bootmedia show-serial-number

Display the Boot Media Device serial number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller bootmedia show-serial-number` command displays the Boot Media Device serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not

supported. By default, the command displays the following information about the bootmedia:

- Node
- Display Name
- Serial Number
- Size
- Bootmedia State
- Status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the bootmedia devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[-usbmon-status {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[-device-state {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

**[-size <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

**[-is-nvme {true|false}] - Is NVMe Boot Media**

Selects the boot media technology. If the value is "true", the boot media uses NVMe technology.

**[-nvme-percent-used <integer>] - NVMe Percentage Used**

Selects the NVMe boot media with the specified percentage of rated life used by the solid-state device (SSD). When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

**[-nvme-available-spare <integer>] - NVMe Available Spare**

Selects the NVMe boot media with the specified percentage of available spare blocks. When all spare blocks are consumed on the SSD, i.e. when this parameter reaches 0%, the system can no longer write data to the solid-state device (SSD).

**[-nvme-spare-threshold <integer>] - NVMe Spare Threshold**

Selects the NVMe boot media with the specified "low spare blocks" threshold percentage. System health monitor alerts are generated when the available spare blocks on the SSD cross below this threshold.

**Examples**

The following example displays the information of the boot media present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-serial-number
```

| Node<br>Status | Display Name        | Serial Number  | (MB)   | State |
|----------------|---------------------|----------------|--------|-------|
| or-12-01       | BootMedia/SAMSUNG   | S2J4NXAGA08186 | 122104 | good  |
| ok             | MZVLV128HCGR-00000  |                |        |       |
|                | BootMedia-2/SAMSUNG | S2J4NXAGA08198 | 122104 | good  |
| ok             | MZVLV128HCGR-00000  |                |        |       |

2 entries were displayed.

The following example displays the detailed information about the boot media present in a node:

```
cluster1::> system controller bootmedia show-serial-number -instance -node
node1
Node: node1
        Vendor ID: 8086
        Device ID: 8d02
        Display Name: TOSHIBA THNSNJ060GMCU
        Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
        Health Monitor Name: controller
Bootmedia Health Monitor: present
        Bootmedia State: good
        Max memory size(in MB): 16367
                Status: ok
        Serial number: Y4IS104FTNEW
                Is NVMe: true
        NVMe Percentage Used: 0
        NVMe Available Spare: 100
        NVMe Spare Threshole: 10
```

## system controller bootmedia show

### Display the Boot Media Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller bootmedia show` command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the `-instance` parameter.

#### Parameters

```
{ [-fields <fieldname>,...]
```

Selects the fields that you specify.

**[`-instance` ] }**

Displays detailed information for all the bootmedia devices.

**[`-node` {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[`-serial-num` <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[`-vendor-id` <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[`-device-id` <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[`-display-name` <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[`-unique-name` <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[`-monitor` {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[`-usbmon-status` {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[`-device-state` {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

**[`-size` <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

**[`-health` {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

**[`-is-nvme` {true|false}] - Is NVMe Boot Media**

Selects the boot media technology. If the value is "true", the boot media uses NVMe technology.

**[`-nvme-percent-used` <integer>] - NVMe Percentage Used**

Selects the NVMe boot media with the specified percentage of rated life used by the solid-state device (SSD). When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

**[`-nvme-available-spare` <integer>] - NVMe Available Spare**

Selects the NVMe boot media with the specified percentage of available spare blocks. When all spare blocks are consumed on the SSD, i.e. when this parameter reaches 0%, the system can no longer write data to the solid-state device (SSD).

## **[*-nvme-spare-threshold* <integer>] - NVMe Spare Threshold**

Selects the NVMe boot media with the specified "low spare blocks" threshold percentage. System health monitor alerts are generated when the available spare blocks on the SSD cross below this threshold.

### **Examples**

The following example displays the information of the boot media present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show
Size Bootmedia
Node          Display Name          Vendor ID Device ID    (MB) State
Status
-----
node1         Micron Technology      634      655      1929 good
ok
              0x655
node2         Micron Technology      634      655      1929 good
ok
              0x655
```

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia show -instance -node node1
Node: node1
      Vendor ID: 634
      Device ID: 655
      Display Name: Micron Technology 0x655
      Unique Name: Micron Technology 0x655 (ad.0)
      Health Monitor Name: controller
      USBMON Health Monitor: present
      Bootmedia State: good
Max memory size(in MB): 1929
      Status: ok
      Is NVMe: true
      NVMe Percentage Used: 0
      NVMe Available Spare: 100
      NVMe Spare Threshold: 10
```

## **system controller clus-flap-threshold show**

Display the controller cluster port flap threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller clus-flap-threshold show` command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

## system controller config show-errors

Display configuration errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller config show-errors` displays configuration errors.

- node
- description

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the PCI devices.

**[-node {<nodename>|local}] - Node**

Displays configuration errors on the specified node.

**[-verbose <true>] - Verbose Output?**

The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

**[-description <text>] - Error Description**

Displays the node with the specified configuration error.

## Examples

The example below displays configuration errors on all the nodes in the cluster.

```

cluster1::> system controller config show-errors

Configuration Info and Errors for Node: cluster1-01
-----
-----
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on
model FAS3210

Configuration Info and Errors for Node: cluster1-02
-----
-----
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not
supported on model FAS3210

cluster1::>

cluster1::> system controller config show-errors -verbose

Configuration Info and Errors for Node: cluster1-01
-----
-----
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067: Proprietary embedded SAS HBA

cluster1::>

```

## system controller config show

### Display System Configuration Information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller config show` command displays system configuration information for the devices present in the controller. To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

**[-device <text>] - Device**

Selects the configuration information that matches the specified device.

**[-subslot <integer>] - Subslot Number**

Selects the configuration information that matches the specified subslot.

**[-info <text>] - Device Info**

Selects the configuration information that matches the specified device information.

**[-slot <text>] - Slot**

Selects the configuration information that matches the specified slot.

## Examples

The following example displays configuration information for slot 1 of the controller:

```
cluster1::> system controller config show -slot 1

Node: node1
Sub- Device/
Slot slot Information
----
-----
1      - NVRAM10 HSL
        Device Name:      Interconnect HBA: Generic OFED Provider
        Port Name:        ib1a
        Default GID:      fe80:0000:0000:0000:0000:0000:0000:0104
        Base LID:         0x104
        Active MTU:       8192
        Data Rate:        0 Gb/s (8X)
        Link State:       DOWN
        QSFP Vendor:      Amphenol
        QSFP Part Number: 112-00436+A0
        QSFP Type:        Passive Copper 1m ID:00
        QSFP Serial Number: APF16130066875
        QSFP Vendor:      Amphenol
        QSFP Part Number: 112-00436+A0
        QSFP Type:        Passive Copper 1m ID:00
        QSFP Serial Number: APF16130066857

cluster1::>
```

## system controller config pci show-add-on-devices

Display PCI devices in expansion slots

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller config pci show-add-on-devices` command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node
- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-model <text>] - Model String**

Selects the PCI devices that are present on the system with the specified model name.

**[-type <integer>] - Device Type**

Selects the PCI devices with the specified device type.

**[-slot-and-sub <text>] - PCI Slot Number**

Selects the PCI devices present in the specified slot or slot-subslot combination.

**[-device <text>] - Device**

Selects the PCI devices with the specified device ID.

**[-vendor <text>] - Vendor Number**

Selects the PCI devices with the specified vendor ID.

**`[-sub-device-id <integer>]` - Sub Device ID**

Selects the PCI devices with the specified sub-device ID.

**Examples**

The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
```

| Node<br>ID | Model | Slot | Type | Device | Vendor | Sub-Device |
|------------|-------|------|------|--------|--------|------------|
|------------|-------|------|------|--------|--------|------------|

|       |  |  |  |  |  |  |
|-------|--|--|--|--|--|--|
| ----- |  |  |  |  |  |  |
| ----- |  |  |  |  |  |  |

|             |         |    |   |        |        |  |
|-------------|---------|----|---|--------|--------|--|

## system controller config pci show-hierarchy

### Display PCI hierarchy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller config pci show-hierarchy` command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- Node
- Level
- Device
- Link Capability
- Link Status

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for PCI devices.

**[-node {<nodename>|local}] - Node**

Displays the PCI hierarchy of the specified node.

**[-level <integer>] - PCI Device Level**

Displays the PCI devices that match the specified level within the PCI hierarchy.

**[-pci-device <text>] - PCI Device**

Displays the PCI devices that match the specified device description.

**[-link-cap <text>] - Link Capability**

Displays the PCI devices that match the specified link capability.

**[-link-status <text>] - Link Status**

Displays the PCI devices that match the specified link status.

### Examples

The example below displays the PCI hierarchy for all of the nodes in the cluster.

```
cluster1::> system controller config pci show-hierarchy
PCI Hierarchy
```

Node: cluster1-01

| Level | Device                                                      | Link                                    |

## system controller coredump-device show-serial-number

Display the coredump device serial number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller coredump-device show-serial-number` command displays the serial number of coredump devices. This command is only applicable to AFF A700 systems. By default, the command displays the following information about the coredump device:

- Node name
- Display name

- Serial number
- Size
- Device state
- Status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for the coredump device.

**[-node {<nodename>|local}] - Node**

Selects the coredump device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the coredump device with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the coredump device with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the coredump device with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the coredump device with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the coredump device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the coredump device with the specified health monitor.

**[-health-status {present|not-present}] - Health Status**

Selects the coredump device with the specified health status.

**[-device-state {good|warn|bad}] - Device State**

Selects the coredump device with the specified device state.

**[-size <integer>] - Max Memory Size (GB)**

Selects the coredump device with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the coredump device with the specified health monitor status.

## **[*-shelf-status* {*present*|*not-present*}] - Shelf Connected Status**

Selects the coredump device with the specified shelf connected status.

### **Examples**

The following example displays the information of the coredump device present in all the nodes in a cluster:

```
cluster1::> system controller coredump-device show-serial-number
Size Device
Node      FRU/Display Name      Serial Number      (GB) State
Status
-----
cluster1-01
          Coredump/X9170A      A22P5061550000644      1024 good
ok
cluster1-02
          Coredump/X9170A      A22P5061550000137      1024 good
ok
2 entries were displayed.
```

The following example displays the detailed information about the coredump device present in a node:

```
cluster1::> system controller coredump-device show-serial-number -instance
-node cluster1-01
Node: cluster1-01
      Serial Number: A22P5061550000644
      Vendor ID: 1b85
      Device ID: 4018
      Display Name: Coredump/X9170A
      Unique Name: 0X91701190020741OCZ000Z63000001T0003500
Health Monitor Name: controller
      Health Status: present
      Device State: good
Max Memory Size (GB): 1024
      Status: ok
Shelf Connected Status: present
```

## **system controller coredump-device show**

Display the coredump device health status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller coredump-device show` command displays details of the coredump devices present in all the nodes in a cluster. This command is only applicable to AFF A700 systems. By default, the command displays the following information about the coredump device:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Device state
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for the coredump device.

**[-node {<nodename>|local}] - Node**

Selects the coredump device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the coredump device with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the coredump device with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the coredump device with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the coredump device with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the coredump device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the coredump device with the specified health monitor.

**[-health-status {present|not-present}] - Health Status**

Selects the coredump device with the specified health status.

**[-device-state {good|warn|bad}] - Device State**

Selects the coredump device with the specified device state.

**[-size <integer>] - Max Memory Size (GB)**

Selects the coredump device with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the coredump device with the specified health monitor status.

**[-shelf-status {present|not-present}] - Shelf Connected Status**

Selects the coredump device with the specific shelf connected status.

**Examples**

The following example displays the information of the coredump devices present in all the nodes in a cluster:

```
cluster1::> system controller coredump-device show
Size Device
Node      FRU/Display Name      Vendor ID Device ID      (GB) State
Status
-----
cluster1-01
ok        Coredump/X9170A      1b85      4018      1024 good
cluster1-02
ok        Coredump/X9170A      1b85      4018      1024 good
2 entries were displayed.
```

The example below displays the detailed information about the coredump device present in a node.

```

cluster1::> system controller coredump-device show -instance -node
cluster1-01
Node: cluster1-01
    Serial Number: A22P5061550000644
        Vendor ID: 1b85
        Device ID: 4018
    Display Name: Coredump/X9170A
    Unique Name: 0X91701190020741OCZ000Z63000001T0003500
Health Monitor Name: controller
    Health Status: present
        Device State: good
Max Memory Size (GB): 1024
    Status: ok
Shelf Connected Status: present

```

## system controller environment show

Display the FRUs in the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller environment show` displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name
- FRU state

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the environment FRUs.

**[-node {<nodename>|local}] - Node**

Selects information about all the environment FRUs that the specified node owns.

**[-serial-number <text>] - FRU Serial Number**

Selects information about all the environment FRUs with the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects information about the environment FRU with the specified FRU name.

**[-type {controller|psu|fan|dimmb|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about all the environment FRUs with the specified FRU type.

**[-name <text>] - Name**

Selects information about all the environment FRUs with the specified unique name.

**[-state <text>] - FRU State**

Selects information about all the environment FRUs with the specified FRU state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about all the environment FRUs with the specified health monitor status.

**[-display-name <text>] - Display Name for the FRU**

Selects information about all the environment FRUs with the specified display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Monitor Name**

Selects information about all the environment FRUs with the specified monitor.

**[-model <text>] - Model Type**

Selects information about all the environment FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the environment FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the environment FRUs in the specified chassis.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the environment FRU with specified additional information.

**[-seq-state-cnt <integer>] - Count of Same State**

Selects information about all the environment FRU with specified sequential state count.

## Examples

The following example displays information about all major environment FRUs in the cluster:

```
cluster1::> system controller environment show
```

| Node  | FRU Name | State |
|-------|----------|-------|
| node1 | PSU1 FRU | GOOD  |
| node1 | PSU2 FRU | GOOD  |
| node2 | PSU1 FRU | GOOD  |
| node2 | PSU2 FRU | GOOD  |

The following example displays detailed information about a specific environment FRU:

```
cluster1::> system controller environment show -node node1 -fru-name "PSU1  
FRU" -instance
```

```
Node: node1
```

```
FRU Serial Number: XXT122737891
```

```
FRU Name: PSU1 FRU
```

```
FRU Type: psu
```

```
Name: XXT122737891
```

```
FRU State: GOOD
```

```
Status: ok
```

```
Display Name for the FRU: PSU1 FRU
```

```
Monitor Name: controller
```

```
Model Type: none
```

```
Shared Resource: shared
```

```
Chassis ID: 4591227214
```

```
Additional Information About the FRU: Part Number: 114-00065+A0
```

```
Revision: 020F
```

```
Manufacturer: NetApp
```

```
FRU Name: PSU
```

## system controller flash-cache show

Display the Flash Cache device status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller flash-cache show` command displays the current Flash Cache device information.

### Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

If this parameter is specified, only status information for the matching node is displayed.

**[`-device-id <integer>`] - Device ID**

If this parameter is specified, only status information for the matching device-id is displayed.

**[`-slot <integer>`] - Slot**

If this parameter is specified, only status information for the matching slot is displayed. Slot can have a format of slot, slot-subslot, or domain:bus:slot.

**[`-subslot <integer>`] - Subslot**

If this parameter is specified, only status information for the matching subslot is displayed.

**[`-domain <integer>`] - Domain**

If this parameter is specified, only status information for the matching PCI domain is displayed.

**[`-bus <integer>`] - Bus**

If this parameter is specified, only status information for the matching PCI bus is displayed.

**[`-slot-string <text>`] - Slot String**

If this parameter is specified, only status information for the matching slot is displayed. Format can be slot or slot-subslot.

**[`-device-state`**

**{`ok|erasing|erased|failed|removed|online|offline_failed|degraded|offline_threshold`}] - Device State**

If this parameter is specified, only status information for the matching device-state is displayed.

**[`-model-number <text>`] - Model Number**

If this parameter is specified, only status information for the matching model-number is displayed.

**[`-part-number <text>`] - Part Number**

If this parameter is specified, only status information for the matching part-number is displayed.

**[`-serial-number <text>`] - Serial Number**

If this parameter is specified, only status information for the matching serial-number is displayed.

**[`-firmware-version <text>`] - Firmware Version**

If this parameter is specified, only status information for the matching firmware-version is displayed.

**[`-firmware-file <text>`] - Firmware Filename**

If this parameter is specified, firmware-file is the base name of the firmware file located in disk\_fw to update the device firmware.

**[`-hardware-revision <text>`] - Hardware Revision**

If this parameter is specified, only status information for the matching hardware-revision is displayed.

**[-capacity <integer>] - Capacity**

If this parameter is specified, only status information for the matching capacity is displayed.

**[-last-change-time <integer>] - Time Last State Change**

If this parameter is specified, only status information for the matching last-change-time is displayed.

**[-service-time <integer>] - Service Time**

If this parameter is specified, only status information for the matching service-time is displayed.

**[-percent-online <integer>] - Percent Online**

If this parameter is specified, only status information for the matching percent-online is displayed.

**[-average-erase-cycle-count <integer>] - Avg Erase Cycle Count**

If this parameter is specified, only status information for the matching average-erase-cycle-count is displayed.

**[-threshold-profile <text>] - Threshold Profile**

If this parameter is specified, only status information for the matching threshold-profile is displayed.

**Examples**

The following example displays the current state of all Flash Cache devices:

```
cluster1::> system controller flash-cache show
```

|          | Device | Model | Part   | Serial                      | Firmware |
|----------|--------|-------|--------|-----------------------------|----------|
| Capacity | Device |       |        |                             |          |
| Node     | ID     | Slot  | Number | Number                      | Version  |
| (GB)     | State  |       |        |                             |          |
| -----    |        |       |        |                             |          |
| node1    |        |       |        |                             |          |
| 4096     | ok     | 0 6-1 | X9172A | 119-00209 A22P7061550000004 | NA00     |
| 1024     | ok     | 1 6-2 | X9170A | 119-00207 A22P5061550000135 | NA00     |
| node2    |        |       |        |                             |          |
| 4096     | ok     | 0 6-1 | X9172A | 119-00209 A22P7061550000007 | NA00     |
| 1024     | ok     | 1 6-2 | X9170A | 119-00207 A22P5061550000091 | NA00     |

4 entries were displayed.

**system controller flash-cache secure-erase run**

Perform a secure-erase operation on the targeted devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache secure-erase run` command securely erases the given Flash Cache device.

## Parameters

**-node {<nodename>|local} - Node**

Selects the node of the specified Flash Cache devices.

**-device-id <integer> - Device Id**

Selects the device-id of the specified Flash Cache devices.

## Examples

The following example securely erases the selected Flash Cache device:

```
cluster1::> system controller flash-cache secure-erase -node node1 -device
-id 0
```

## system controller flash-cache secure-erase show

Display the Flash Cache card status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache secure-erase show` command displays the current Flash Cache device secure-erase status.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, only status information for the matching node is displayed.

**[-device-id <integer>] - Device Id**

If this parameter is specified, only status information for the matching device-id is displayed.

**[-device-state {ok|erasing|erased|failed|removed|unsupported}] - Device State**

If this parameter is specified, only status information for the matching device-state is displayed.

## Examples

The following example displays the current state of all the Flash Cache devices:

```
cluster1::> system controller flash-cache secure-erase show
Node          Device ID Slot Device State
-----
node1
              0 6-1  ok
              1 6-2  erasing
node2
              0 6-1  erased
              1 6-2  ok
4 entries were displayed.
```

## system controller fru show-manufacturing-info

Display manufacturing information of FRUs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller fru show-manufacturing-info` command displays manufacturing information for field replaceable units (FRUs) installed in the system. The information includes FRU-description, serial number, part number, and revision number. To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays detailed information about the installed FRUs in the system.

**[-node {<nodename>|local}] - Node**

Selects a specific node's installed FRUs.

**[-system-sn <text>] - System Serial Number**

Selects information about installed FRUs with the specified system serial number.

**[-model-name <text>] - Model Name**

Selects information about installed FRUs with the specified model name.

**[-system-id <text>] - System ID**

Selects information about installed FRUs with the specified system ID.

**[-kernel-version <text>] - Kernel Version**

Selects information about installed FRUs with the specified kernel version.

**[-firmware-release <text>] - Firmware Release**

Selects information about installed FRUs with the specified firmware release.

**[-description <text>] - FRU Description**

Selects information about installed FRUs with the specified FRU description.

**[-vendor-id <text>] - FRU Vendor ID**

Selects information about the FRU with the vendor identification.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-part-number <text>] - FRU Part Number**

Selects information about the FRU with the specified part number.

**[-revision <text>] - FRU Revision of Part Number**

Selects information about the FRU with the specified revision.

**[-manufacturer <text>] - FRU Manufacturer**

Selects information about the FRU with the specified manufacturer.

**[-manufacture-date <text>] - FRU Manufacturing Date**

Selects information about the FRU with the specified manufacture date.

**[-product-id <text>] - FRU Product Identifier**

Selects information about the FRU with the specified product ID.

**[-firmware-version <text>] - FRU Firmware Version**

Selects information about the FRU with the specified firmware version.

**Examples**

The following example displays all installed FRUs in the system:

```

cluster1::> system controller fru show-manufacturing-info
Node: platsw-lodi-1-01
System Serial Number: 791541000047
      Model Name: FAS9040
      System ID: 0537024373
Firmware release: 10.0X18
      Kernel Version: NetApp Release sysMman_3887886_1608151712: Mon Aug
15
                        15:54:00 PDT 2016
FRU Description          FRU Serial Number          FRU Part Number          FRU

## system controller fru show

### Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller fru show` command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem
- Health monitor status

To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the controller specific FRUs in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the FRUs in the specified node.

**[-subsystem <Subsystem>] - Subsystem**

Selects information about the FRUs of the specified subsystem.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - Name of the FRU**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdim}] - FRU Type**

Selects information about the FRU with the specified FRU type.

**[-name <text>] - FRU Name**

Selects information about the FRU with the specified unique name.

**[-state <text>] - FRU State**

Selects information about the FRU with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the FRU with the specified health monitor status.

**[-display-name <text>] - Display Name for the Fru**

Selects information about the FRU with the specified display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Monitor Name**

Selects information about the FRU with the specified health monitor type.

**[-model <text>] - Model Type**

Selects information about the FRU with the specified model.

**[-chassis-id <text>] - Chassis ID**

Selects information about the FRU with the specified chassis ID.

**[-location <text>] - Location of the FRU**

Selects information about the FRU with the specified FRU location.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about the FRU with the specified additional information.

## Examples

The example below displays information about all controller specific FRUs in the cluster.

```

cluster1::> system controller fru show
      Node          FRU Name          Subsystem
Status -----
-----
ok      node1          PSU1 FRU          Environment
ok      node1          PSU2 FRU          Environment
ok      node1          DIMM-NV1          Memory
ok      node1          DIMM-1          Memory
ok      node1          Micron Technology 0x655 (ad.0) Motherboard
ok
node2      PSU1 FRU          Environment      ok
      node2          PSU2 FRU          Environment
ok      node2          DIMM-NV1          Memory
ok      node2          DIMM-1          Memory
ok      node2          Micron Technology 0x655 (ad.0) Motherboard
ok
      10 entries were displayed.

```

The example below displays information about the specific FRU.

```

cluster1::> system controller fru show -instance -serial-number AD-01-1306-2EA01E9A
      Node: node1
      Subsystem: Memory
      FRU Serial Number: AD-01-1306-2EA01E9A
      Name of the FRU: DIMM-1
      FRU Type: dimm
      FRU Name: DIMM-1
      FRU State: ok
      Status: ok
      Display Name for the Fru: DIMM-1
      Monitor Name: controller
      Model Type: none
      Chassis ID: 4591227214
      Location of the FRU: Memory Slot: 1
      Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9

```

## system controller fru led disable-all

Turn off all the LEDs Data Ontap has lit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller fru led disable-all` command turns off all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

### Examples

Turn off all FRU fault LEDs.

```
cluster1::*> system controller fru led disable-all
14 entries were modified.
```

## system controller fru led enable-all

Light all the LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller fru led enable-all` command turns on all the controller and IOXM FRU fault

LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Examples

Turn on all FRU fault LEDs.

```
cluster1::*> system controller fru led enable-all
14 entries were modified.
```

## system controller fru led modify

Modify the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller fru led modify` command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs

are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Selects FRU fault LEDs on the specified nodes.

**-fru-id <FRU LED key> - FRU ID (privilege: advanced)**

Selects the FRU fault LEDs that match the specified FRU type.

**-fru-slot <integer> - FRU Slot (privilege: advanced)**

Selects the FRU fault LEDs that match the specified slot.

**[-fru-state {on|off|unknown}] - FRU State (privilege: advanced)**

Specifies the target state for the FRU fault LED.

## Examples

Turn off DIMM 3's FRU fault LED.

```
cluster1::*> system controller fru led modify -node node1 -fru-id dimm
-fru-slot 3 -fru-state off
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1::*> system controller fru led modify -node node1 -fru-id pci -fru
-slot * -fru-state on
```

## system controller fru led show

Display the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller fru led show` command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Selects FRU fault LEDs on the specified nodes.

**`[-fru-id <FRU LED key>] - FRU ID (privilege: advanced)`**

Selects the FRU fault LEDs that match the specified FRU type.

**`[-fru-slot <integer>] - FRU Slot (privilege: advanced)`**

Selects the FRU fault LEDs that match the specified slot.

**`[-fru-bay <text>] - FRU Bay (privilege: advanced)`**

Selects the FRU fault LEDs that match the specified bay.

**`[-fru-state {on|off|unknown}] - FRU State (privilege: advanced)`**

Selects the FRU fault LEDs that match the specified status.

**`[-lit-by <text>] - Lit By (privilege: advanced)`**

Selects the FRU fault LEDs that were lit by the specified source.

## Examples

List the current state of all FRU fault LEDs.

```
cluster1::*> system controller fru led show
```

| Node  | FRU Type   | Bay | Slot | State | Lit By |
|-------|------------|-----|------|-------|--------|
| host1 | controller | A   | 1    | on    | SP     |
|       | ioxm       | B   | 1    | off   | -      |
|       | pci        | -   | 1    | off   | -      |
|       | pci        | -   | 2    | off   | -      |
|       | pci        | -   | 3    | off   | -      |
|       | pci        | -   | 4    | off   | -      |
|       | pci        | -   | 5    | off   | -      |
|       | pci        | -   | 6    | off   | -      |
|       | dimmm-nv   | -   | 1    | off   | -      |
|       | dimmm-nv   | -   | 2    | off   | -      |
|       | dimmm      | -   | 1    | off   | -      |
|       | dimmm      | -   | 2    | off   | -      |
|       | dimmm      | -   | 3    | off   | -      |
|       | dimmm      | -   | 4    | off   | -      |
|       | identify   | -   | 1    | off   | -      |

5 entries were displayed.

The example below displays the status of only a specific FRU.

```
cluster1::*> system controller fru led show -node host1 -fru-id controller -fru-slot 1
```

| Node  | FRU Type   | Bay | Slot | State | Lit By |
|-------|------------|-----|------|-------|--------|
| host1 | controller | A   | 1    | off   | -      |

## system controller ioxm show

Displays IOXM Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller ioxm show` command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the IOXMs.

**[-node {<nodename>|local}] - Node**

Selects the IOXM that is connected to the specified node.

**[-chassis-config {c-i|c-c|c-b}] - Controller-IOXM or Controller-Controller or Controller-Blank**

Selects the IOXMs with the specified chassis configuration.

**[-is-present {present|not-present}] - IOXM Presence**

Selects the IOXMs that are connected and detected (`present` ) or connected but not detected (`not-present` ).

**[-power {good|bad}] - Power to IOXM**

Selects the IOXMs with the specified power state.

**[-display-name <text>] - Display Name**

Selects the IOXMs with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the IOXM with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the IOXMs with the specified health monitor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - IOXM Health**

Selects the IOXMs with the specified health monitor status.

## Examples

The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show
```

| Node  | Display Name | Is-Present? | Power | Status |
|-------|--------------|-------------|-------|--------|
| node1 | IOXM         | present     | good  | ok     |
| node2 | IOXM         | present     | good  | ok     |

The example below displays detailed information of an IOXM that is connected to a node.

```
cluster1::> system controller ioxm show -instance -node node1
Node: node1
Controller-IOXM or Controller-Controller or Controller-Blank: c-i
  IOXM Presence: present
  Power to IOXM: good
  Display Name: node1/IOXM
  Unique Name: 8006459930
Health Monitor Name: controller
  IOXM Health: ok
```

## system controller location-led modify

Modify the location LED state of a controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller location-led modify` command modifies the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

### Parameters

**-node {<nodename>|local} - Node**

Selects the location LED on the specified filers.

**[-state {on|off}] - LED State**

Modifies the state of the location LED on the filer.

### Examples

The following example turns on the location LED:

```
cluster1::*> system controller location-led modify -node node1 -state on
```

Turn off Location LED.

```
cluster1::*> system controller location-led modify -node node1 -state off
```

## system controller location-led show

Display the location LED state on controllers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller location-led show` command shows the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the location LED on the specified filers.

**[-state {on|off}] - LED State**

Displays the location LED's status.

### Examples

The following example lists the current state of the location LED:

```
cluster1::*> system controller location-led show
Node                Location LED State
-----
node1               Off
node2               Off
```

## system controller memory dimm show

### Display the Memory DIMM Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller memory dimm show` command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CECC Alert Method
- CPU socket
- Channel
- Slot number
- Health monitor status
- Failure reason

To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the DIMMs in all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the DIMMs in the specified node.

**[-pds-id <integer>] - DIMM ID**

Selects information about the DIMMs with the specified DIMM ID.

**[-slotname <text>] - Slot Name**

Selects information about the DIMMs with the specified slot name.

**[-socket <integer>] - CPU Socket**

Selects information about the DIMMs with the specified socket ID.

**[-channel <integer>] - Channel**

Selects information about the DIMMs with the specified channel number.

**[-slot-no <integer>] - Slot Number on a Channel**

Selects information about the DIMMs with the specified slot number.

**[-serial <text>] - Serial Number**

Selects information about the DIMMs with the specified serial number.

**[-part-no <text>] - Part Number**

Selects information about the DIMMs with the specified part number.

**[-cecc-count <integer>] - Correctable ECC Error Count**

Selects information about the DIMMs with the specified correctable ECC error count.

**[-uecc-count <integer>] - Uncorrectable ECC Error Count**

Selects information about the DIMMs with the specified uncorrectable ECC error count.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects information about the DIMMs with the specified health monitor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the DIMMs with the specified health monitor status.

**[-name <text>] - Unique Name of DIMM**

Selects information about the DIMMs with the specified unique name.

**[-display-name <text>] - Display Name for the DIMM**

Selects information about the DIMMs with the specified display name.

**[-alt-cecc-method <text>] - CECC Alert Method**

Selects information about the DIMMs with the specified CECC error alert method.

**[-alt-cecc-dimm {true|false}] - Replace DIMM**

Selects information about the DIMMs with the specified replace DIMM value.

**[-failure-reason <text>] - Failure Reason**

Selects information about the DIMMs with the specified failure reason.

## Examples

The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show
```

| Slot   | Node    | DIMM Failure | UECC Count | CECC Count | Alert Method | CPU Socket | Channel |
|--------|---------|--------------|------------|------------|--------------|------------|---------|
| Number | Status  | Name Reason  |            |            |              |            |         |
| 0      | unknown | disabled     |            |            |              |            |         |
| 1      | ok      |              |            |            |              |            |         |
| 0      | ok      |              |            |            |              |            |         |
| 1      | ok      |              |            |            |              |            |         |

4 entries were displayed.

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds
-id 1
```

```

Node: node1
DIMM ID: 1
Slot Name: DIMM-1
CPU Socket: 0
Channel: 0
Slot Number on a Channel: 0
Serial Number: AD-01-1306-2EA01E9A
Part Number: HMT82GV7MMR4A-H9
Correctable ECC Error Count: 0
Uncorrectable ECC Error Count: 0
Health Monitor Name: controller
Status: unknown
Unique Name of DIMM: DIMM-1
Display Name for the DIMM: DIMM-1
CECC Alert Method: bucket
Replace DIMM: false
Failure Reason: disabled

```

## system controller nvram-bb-threshold show

Display the controller NVRAM bad block threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller nvram-bb-threshold show` command displays the threshold for the NVRAM bad block counts for a node.

## system controller pci show

### Display the PCI Device Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller pci show` command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

- Node name
- Display name
- Correctable error count
- Functional link width
- Functional link speed
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all of the PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-bus-number <integer>] - Bus Number**

Selects the PCI devices with the specified bus number.

**[-device-number <integer>] - Device Number**

Selects the PCI devices with the specified device number.

**[-function-number <integer>] - Function Number**

Selects the PCI devices with the specified function number.

**[-slot-number <integer>] - Slot Info**

Selects the PCI devices with the specified slot number.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the PCI devices monitored by the specified health monitor.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the PCI devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the PCI devices with the specified device ID.

**[-physical-link-width <integer>] - Physical Link Width**

Selects the PCI devices with the specified physical link width.

**[-functional-link-width <integer>] - Functional Link Width**

Selects the PCI devices with the specified functional link width.

**[-physical-link-speed <text>] - Physical Link Speed(GT/s)**

Selects the PCI devices with the specified physical link speed.

**[-functional-link-speed <text>] - Functional Link Speed(GT/s)**

Selects the PCI devices with the specified functional link speed.

**[-unique-name <text>] - Unique Name**

Selects the PCI devices with the specified unique name.

**[-corr-err-count <integer>] - Correctable Error Count**

Selects the PCI devices with the specified correctable error count.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the PCI devices with the specified health monitor status.

**[-display-name <text>] - Display Name**

Selects the PCI devices with the specified display name.

**[-cerr-diff <integer>] - Correctable Error Difference**

Selects the PCI devices with the specified difference in correctable error count.

## Examples

The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show
```

| Node        | Display Name       | Correctable Error Count | Functional Link Width | Functional Link Speed |
|-------------|--------------------|-------------------------|-----------------------|-----------------------|
| cluster1-01 | Ontap PCI Device 0 | 0                       | 4                     | 5GT/s                 |
| ok          |                    |                         |                       |                       |
| cluster1-02 | Ontap PCI Device 4 | 0                       | 4                     | 5GT/s                 |
| ok          |                    |                         |                       |                       |

The example below displays detailed information about a PCIe device in a node.

```
cluster1::> system controller pcie show -instance -node cluster1-01 -bus
-number 1
Node: cluster1-01
    Bus Number: 1
    Device Number: 0
    Function Number: 0
    Slot Info: 0
    Health Monitor Name: controller
    Vendor ID: 11f8
    Device ID: 8001
    Physical Link Width: 4
    Functional Link Width: 4
    Physical Link Speed(GT/s): 5GT/s
    Functional Link Speed(GT/s): 5GT/s
    Unique Name: ontap0@pci0:1:0:0
    Correctable Error Count: 0
    Status: ok
    Display Name: Ontap PCI Device 0
    Correctable Error Difference: 0
```

## system controller pcicerr threshold modify

### Modify the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller pcicerr threshold modify` command modifies node-wide PCIe correctable error threshold counts in the cluster.

## Parameters

### **[-pcie-cerr-threshold <integer>] - Corr. Error Limit**

The PCIe error threshold count that would trigger an alert if exceeded.

### **[-nvram-bb-threshold <integer>] - NVRAM Bad Block limit**

The NVRAM bad block threshold count that would trigger an alert if exceeded.

## Examples

The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller threshold modify -pcie-cerr-threshold 100
```

## **system controller pcicerr threshold show**

Display the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller pcicerr threshold show` command displays information about node-wide PCIe correctable error threshold counts in the cluster.

## Examples

The example below displays the information about node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller pcicerr threshold show

PCIe Error Threshold
-----
                        200
```

## **system controller platform-capability show**

Display platform capabilities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller platform-capability show` command displays information about all platform capabilities for each controller in the cluster. By default, the command displays the following information about all controllers in the cluster:

- Controller Name

- Capability ID
- Capability Supported?
- Capability Name

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays detailed information about all controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-capability-id <integer>] - Capability ID**

Selects the desired capability ID.

**[-supported <text>] - Supported?**

Selects the desired capability support state (true or false).

**[-name <text>] - Capability Name**

Selects the desired capability name.

## Examples

The following example displays platform capability information for the controller:

```
cluster1::> system controller platform-capability show
Node          Capability ID Supported? Capability Name
-----
or-099-diag-01
              0          false    CAP_CMCI_ENABLED
              1          false    CAP_HA_CONFIG_ONLY
              2          true     CAP_SUPPORT_CARD_FRU
              3          true     CAP_SCORPIO_EN
              4          false    CAP_NVD_EN
              5          false    CAP_ENABLE_HPET
              6          false    CAP_VERIFY_ACPI_TABLE
7 entries were displayed.
```

## system controller replace cancel

Cancel ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace cancel` command is used to cancel a controller replacement that is in a paused state (paused-on-request, paused-on-error or paused-for-intervention). The update cannot be canceled if it is not in a paused state.

## Examples

The following example displays a cancel operation:

```
cluster1::> system controller replace cancel
Warning: The controller replacement will be canceled and any changes will
have to be reverted manually.
Do you want to continue? {y|n}: y
Controller replacement canceled successfully.
```

## system controller replace pause

### Pause ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace pause` command is used to pause a currently running replacement. The operation pauses at the next predefined update stage (for example, after finishing the current task it will pause the next restartable task) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-on-request state.

## Examples

The following example displays pause operation:

```
cluster1::> system controller replace pause

A pause requested for Controller Replacement operation.
The current task will continue and the next restartable task will be
paused.
```

## system controller replace resume

### Resume paused controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace resume` command is used to resume an update that is currently in one

of paused-on-request, paused-on-error or paused-for-intervention states. If the update is not paused then an error is returned.

## Examples

The following example shows a resume operation:

```
cluster1::> system controller replace resume

Controller replacement resumed successfully.
```

## system controller replace show-details

Display detailed status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace show-details` command displays detailed information about the currently running and previously run non-disruptive controller replacement operations. The command displays the following information:

- Phase
- Node
- Task name
- Task status
- Error message

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-operation-identifier {None|Controller-replacement}] - Operation Identifier (privilege: advanced)`**

Specifies the NDO operation identifier.

**`[-task-identifier <integer>] - Task Identifier (privilege: advanced)`**

Specifies the identification number of the task.

**`[-node <nodename>] - Node That Performs Operation (privilege: advanced)`**

Specifies the node that is to be replaced.

**[-task-phase {None|Initialization|Precheck|Commit|Collect-info|Preop|Resource-release|Verification|Resource-regain|Postop|Uncommit|Postcheck|Cleanup}] - Task Phase (privilege: advanced)**

Specifies the phase of the operation.

**[-task-name <text>] - Name of the Task (privilege: advanced)**

Specifies the name of the task.

**[-task-status {None|Ready-to-start|In-progress|Waiting|Paused-on-error| | Paused-for-intervention|Paused-on-request|Completed-on-first-node|Completed|Failed|Pause\_req|Canceled}] - Status of the Task (privilege: advanced)**

Specifies the status of the task.

**[-task-error <text>] - Error During the Task Execution (privilege: advanced)**

Specifies the error occurred.

**[-task-recovery-action <text>] - Action to Recover from Error (privilege: advanced)**

Specifies the action to be taken in case of error.

## Examples

The following example displays detailed information about the non-disruptive replacement operation:

```
cluster1::*> system controller replace show-details
```

| Task Phase                 | Node  | Task Name             | Operation-State |
|----------------------------|-------|-----------------------|-----------------|
| -----                      | ----- | -----                 | -----           |
| Precheck                   | node1 | Cluster Health Check  | Completed       |
|                            |       | MCC Cluster Check     | Completed       |
|                            |       | Aggr Relocation       | Completed       |
|                            |       | Status Check          |                 |
|                            |       | Model Name Check      | Completed       |
|                            |       | Cluster Quorum Check  | Completed       |
|                            |       | Image Version Check   | Completed       |
|                            |       | HA Status Check       | Completed       |
|                            |       | Aggregate Status      | Completed       |
|                            |       | Check                 |                 |
|                            |       | Disk Status Check     | Completed       |
|                            |       | Data LIF Status Check | Completed       |
|                            |       | Cluster LIF Status    | Completed       |
|                            |       | Check                 |                 |
|                            |       | ASUP Status Check     | Completed       |
|                            |       | CPU Utilization Check | Completed       |
|                            |       | Aggr Reconstruction   | Completed       |
|                            |       | Check                 |                 |
|                            |       | Node Affinity Job     | Completed       |
|                            |       | Check                 |                 |

## system controller replace show

Display status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace show` command displays overall information about the currently running, or previously run controller replacement operation. The command displays the following information:

- Operation Status
- Error message
- Recommended action

## Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

## Examples

The following example displays information about automated nondisruptive operation:

```
cluster1::*> system controller replace show
Node           Status           Error-Action
-----
node1          Paused-for-intervention  Follow the instructions given
in
node2          None
Step Details:
-----
Controller replacement operation has been paused for user intervention.
Collect the following info from the current node:
  1. vserver services name-service dns show
  2. service-processor show -node * -instance
  3. network port ifgrp show
  4. network port vlan show
  5. network interface failover-groups show
  6. storage array config show -switch switchname
  7. storage encryption disk show
2 entries were displayed.
```

## system controller replace start

### Start controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace start` command is used to initiate a controller-replacement operation. The update is preceded by a validation of the HA pair to ensure that any issues that might affect the update are identified.

There are predefined points in the update when the update can be paused (either requested by the user or by the operation in case of an error or for manual intervention).

## Parameters

**[`-nodes <nodename>,...`] - Nodes for Controller Replacement (privilege: advanced)**

Specifies the nodes that are to be replaced.

**[`-simulate <true>`] - Simulate Controller Replacement (privilege: advanced)**

Dry run the operation. Checks for all validations.

**[`-skip-metrocluster-check {true|false}`] - Skip Metrocluster Check before Replacement (privilege: advanced)**

Skips the DR mirror offline check when performing MetroCluster validation. In 4-node MetroCluster configuration, if controller replacement is already complete one one site, then the partner site should replace its controllers by setting this parameter to `true` . The default value is `false`.

**[`-nso {true|false}`] - Select NSO Procedure (privilege: advanced)**

Follow the negotiated switchover switchback based controller replacement procedure for 4 node MCC FC system. To select ARL based procedure for 4 node MCC FC , this parameter needs to be set to `false` . This parameter is only honored in MCC configuration. Therefore, setting or unsetting of this parameter has no effect in HA configuration. The default value is `true` for MCC FC.

## Examples

The following example shows the replacement operation:

```
cluster1::> system controller replace start -nodes node1,node2 -simulate
true
```

Warning: 1. Current version of node is 9.4.0

Before starting controller replacement, please ensure that the new controllers are in the version 9.4.0

2. Verify that NVMEM or NVRAM batteries of the new nodes are charged, and charge them if they are not. You need to physically check the new nodes to see if

the NVMEM or NVRAM batteries are charged. You can check the battery status either by connecting to a console or using SSH, logging into the Service Processor

(SP) for your system, and use the system sensors to see if the battery has a sufficient charge.

Attention: Do not try to clear the NVRAM contents. If there is a need to clear the contents of NVRAM, contact NetApp technical support.

3. If you are replacing the controllers with an used one, please ensure to run wipeconfig before controller replacement

4. Current model name is FAS8040

Before starting the operation, please ensure that the new controller model is supported for controller replacement.

Do you want to continue? {y|n}: y

Controller replacement: Prechecks in progress.....

Controller replacement has been paused for user intervention.

Please collect the following info from the current node:

vserver services name-service dns show

network interface show -curr-node node -role cluster,intercluster,node-mgmt,cluster-mgmt

network port show -node node -type physical

service-processor show -node \* -instance

network fcp adapter show -node node

network port ifgrp show

network port vlan show

system node show -instance -node node

run -node node sysconfig

storage aggregate show -node node

volume show -node node

network interface failover-groups show

storage array config show -switch switchname

system license show -owner node

storage encryption disk show

# system controller service-event delete

Manually clear a selected service event

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller service-event delete` command removes the service event from the list and extinguishes all related FRU attention LEDs.

In some cases, where the underlying fault condition remains, the service event might be reported again, causing it to reappear in the list. In such cases, it is necessary to remedy the underlying fault condition in order to clear the service event.

## Parameters

**-node {<nodename>|local} - Node**

Selects service events on the specified nodes.

**-event-id <integer> - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row to delete. Use the [system controller service-event show](#) command to find the event identifier for the service event to delete.

## Examples

The following example lists the currently active service events. Then, using the listed Service Event ID, the service event is deleted:

```
cluster1::> system controller service-event show
```

| Node      | ID | Event Location                 | Event Description |
|-----------|----|--------------------------------|-------------------|
| plata4-1a | 1  | DIMM in slot 1 on Controller A | Uncorrectable ECC |

```
cluster1::> system controller service-event delete -event-id 1
```

# system controller service-event show

Display the active service events causing attention LEDs to be lit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller service-event show` command displays one or more events that have been detected by the system for which a physical service action might be required. Physical service actions sometimes involve replacing or re-seating misbehaving FRUs. In such cases FRU attention LEDs will be illuminated to assist in physically locating the FRU in need of attention. When the FRU in question is contained within another FRU, both the inner and outer FRU attention LEDs will be lit. It creates a path of LEDs that starts at the chassis level and leads to the FRU in question. For example, if a DIMM is missing from the controller motherboard, the storage OS will detect this and log a service event whose location is the DIMM slot on the controller. The DIMM slot LED, controller LED and chassis LED will all be lit to create a path of LEDs to follow.

FRU Attention LEDs that are not visible from outside of the system (e.g. those on the controller motherboard such as DIMMs, boot device etc.) will remain on for a few minutes, even after power is removed from the containing FRU. As such, when the controller is removed from the chassis, a DIMM slot FRU attention LED will remain on, helping to locate the FRU in need of attention.

Generally, service events are cleared automatically when the issue is resolved. The corresponding FRU attention LEDs are extinguished accordingly. In cases where the service event request is caused by an environmental issue, it might be necessary to manually remove the service event from the list. This can be done using the [system controller service-event delete](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects service events on the specified nodes.

**[-event-id <integer>] - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row for use with the [system controller service-event delete](#) command

**[-event-loc <text>] - Location**

Selects the service events that match the specified event location.

**[-event-desc <text>] - Description**

Selects the service events that match the specified event description.

**[-event-timestamp <text>] - Timestamp**

The time that the event occurred, recorded by the Service Processor

## Examples

The following example lists the currently active service events.

```
cluster1::> system controller service-event show
```

| Node      | ID | Event Location                 | Event Description |
|-----------|----|--------------------------------|-------------------|
| plata4-1a | 1  | DIMM in slot 1 on Controller A | Uncorrectable ECC |

## system controller slot module insert

Add a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller slot module insert` command adds a module on the controller.

## Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

## Examples

The following example adds a module in the local node:

```
p2i030::> system controller slot module insert -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
powered
        on and initialized.
Do you want to continue? {y|n}:y
The module has been successfully powered on, initialized and placed into
service.

p2i030::>
```

## system controller slot module remove

Remove a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller slot module remove` command removes a module on the controller.

### Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

### Examples

The following example removes a module in the local node:

```
p2i030::> system controller slot module remove -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
        powered off for removal.
Do you want to continue? {y|n}: y
The module has been successfully removed from service and powered off. It
can now be safely removed.

p2i030::>
```

## system controller slot module replace

Power off a module on the controller for replacement

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller slot module replace` command powers off a module on the controller for replacement.

### Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

### **-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

### **Examples**

The following example powers off a module in the local node:

```
p2i030::> system controller slot module replace -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
powered
        off for replacement.
Do you want to continue? {y|n}: y
The module has been successfully powered off. It can now be safely
replaced. After the replacement module is inserted, use the "system
controller slot module insert" command to place the module into service.

p2i030::>
```

## **system controller slot module show**

Display hotplug status of a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller slot module show` command displays hotplug status of a module on the controller. The command displays the following information about the PCIe modules:

- Node
- Slot
- Module
- Status

To display more details, use the `-instance` parameter.

### **Parameters**

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node` {<nodename>|local}] - Node**

Selects the PCIe modules that are present in the specified node.

**[`-slot` <text>] - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

**[`-status` <text>] - Module Status**

Selects hotplug status for PCIe modules.

**[`-card` <text>] - Module Name**

Selects module name for PCIe modules.

**Examples**

The following example displays hotplug status of PCI modules found in the local node:

```
::> system controller slot module show -node local
```

| Node      | Slot | Module                     | Status       |
|-----------|------|----------------------------|--------------|
| localhost | 1    | IO_CARRIER_NIANTIC_NIC     | powered-on   |
| localhost | 2    | IO_4X_10GBT_INTL_NIC       | powered-on   |
| localhost | 3    | IO_4X_12Gb_PMC_SAS         | powered-on   |
| localhost | 4    | IO_4X_10GBE_16GFC_QLGC_CNA | powered-on   |
| localhost | 5    | IO_4X_12Gb_PMC_SAS         | powered-on   |
| localhost | 6    | NVRAM10                    | hotplug-not- |
| supported |      |                            |              |
| localhost | 6-1  |                            | empty        |
| localhost | 6-2  |                            | empty        |
| localhost | 7    | IO_4X_12Gb_PMC_SAS         | powered-on   |
| localhost | 8    | IO_4X_10GBT_INTL_NIC       | powered-on   |
| localhost | 9    | IO_4X_12Gb_PMC_SAS         | powered-on   |
| localhost | 10   | IO_4X_12Gb_PMC_SAS         | powered-on   |
| localhost | 11   | IO_4X_12Gb_PMC_SAS         | powered-on   |

13 entries were displayed.

```

**system controller sp config show**

Display the Service Processor Config Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller sp config show` command displays the following configuration information of

the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

## Parameters

**{ [-fields <fieldname>, ...]**

Selects the field that you specify.

**| [-instance ] }**

Displays detailed configuration information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the service processor configuration of the specific node.

**[-version <text>] - Firmware Version**

Selects the service processor configuration with the specified firmware version.

**[-boot-version {primary|backup}] - Booted Version**

Selects the service processor configuration with the specified version of the currently booted partition.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the service processor configuration with the specified monitor name.

**[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - SP Status**

Selects the service processor configuration with the specified status of service processor.

**[-sp-config {true|false}] - Auto Update Configured**

Selects information about the service processor with the specified configuration status of the service processor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the service processor configuration information with the specified service processor status.

**[-link-status {up|down|disabled|unknown}] - Public Link Status**

Selects the service processor configuration with the specified physical Ethernet link status.

### **[*-name <text>*] - Display Name**

Selects the service processor configuration with the specified unique name.

### **Examples**

The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show
```

| Node  | Firmware Version | Booted Version | Auto Update Configured | SP Status | Link Status | Status |
|-------|------------------|----------------|------------------------|-----------|-------------|--------|
| node1 | 2.2.2            | primary        | true                   | online    | up          | ok     |
| node2 | 2.2.2            | primary        | true                   | online    | up          | ok     |

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1
```

Node: node1  
Firmware Version: 2.2.2  
Booted Version: primary  
Health Monitor Name: controller  
SP Status: online  
Auto Update Configured: true  
Status: ok  
Public Link Status: up  
Display Name: SP Config

## **system controller sp upgrade show**

### **Display the Service Processor Upgrade Table**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller sp upgrade show` command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed upgrade information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the upgrade information of the service processor on the specified node.

**[-new-fw-avail {true|false}] - New Firmware Available**

Selects the information of the service processors which have new firmware available.

**[-new-fw-version <text>] - New Firmware Version**

Selects the information about service processors with the specified firmware version.

**[-auto-update {true|false}] - Auto Update**

Selects the information about service processors with the specified state.

**[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status**

Selects the information about service processors with the specified auto update status.

**[-auto-update-sttime <MM/DD/YYYY HH:MM:SS>] - Auto Update Start Time**

Selects the information about service processors with the specified start time.

**[-auto-update-entime <MM/DD/YYYY HH:MM:SS>] - Auto Update End Time**

Selects the information about service processors with the specified end time.

**[-auto-update-per <integer>] - Auto Update Percent Done**

Selects the information about service processors with the specified auto update percentage completed.

**[-auto-update-maxret <integer>] - Auto Update Maximum Retries**

Selects the information about service processors with the specified maximum number of retries.

**[-auto-update-curret <integer>] - Auto Update Current Retries**

Selects the information about service processors with the specified number of current retries.

**[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status**

Selects the information about service processors with the specified automatic update status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor Name**

Selects the information about service processors with the specified monitor name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the information about service processors with the specified health monitor status.

### **[-name <text>] - Display Name**

Selects the information about service processors with the specified display name.

### **Examples**

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New    Firmware      Auto Update   Auto Update
Node   Available         Feature      Status        Status
----  -
node1  false             true         installed      ok

```

The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1
Node: node1
    New Firmware Available: false
    New Firmware Version: Not Applicable
    Auto Update: true
    Auto Update Status: installed
    Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
    Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
    Auto Update Percent Done: 0
    Auto Update Maximum Retries: 5
    Auto Update Current Retries: 0
    Previous AutoUpdate Status: passed
    Health Monitor Name: controller
    Status: ok
    Display Name: SP Upgrade
```

## **system feature-usage commands**

### **system feature-usage show-history**

#### **Display Feature Usage History**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

Display feature usage information in the cluster on a per-node and per-week basis.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays feature usage information for the specified node name.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays feature usage information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays feature usage information for the specified feature name.

**[-week-number <Sequence Number>] - Week Number**

Displays feature usage information for the specified week number.

**[-usage-status {not-used|configured|in-use|not-available}] - Usage Status**

Displays feature usage information that matches the specified usage status.

**[-date-collected <MM/DD/YYYY HH:MM:SS>] - Collection Date**

Displays feature usage information that is collected on the day matching the specified date.

**[-owner <text>] - Owner**

Displays feature usage information for the specified owner name.

**[-feature-message <text>] - Feature Message**

Displays feature usage information that contains the specified feature message.

## Examples

The following example displays a usage output filtered by the serial number and feature name:

```
cluster1::> system feature-usage show-history -serial-number 1-81-
00000000000000001122334455 -feature-name NFS
Node Serial Number: 1-81-00000000000000001122334455
Feature Name: NFS
Owner: node1
Week # Usage Status          Date Collected          Feature Message
-----
      4 in-use              01/22/13 10:00:00
      3 in-use              01/15/13 10:00:00
      2 not-used            01/08/13 10:00:00
      1 configured          01/01/13 10:00:00

4 entries were displayed.
```

## system feature-usage show-summary

### Display Feature Usage Summary

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the *-instance* parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the *-fields <fieldname>, ...* parameter, the command output also includes the specified field or fields. You can use *'-fields ?'* to display the fields to specify.

**| [-instance ] }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays usage summary information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays usage summary information for the specified feature name.

**[-weeks-in-use <integer>] - Weeks In-Use**

Displays usage summary information for features matching the number of weeks in use.

**[-last-used <MM/DD/YYYY HH:MM:SS>] - Date last used**

Displays usage summary information for features last used on the specified date.

**[-owner <text>] - Owner**

Displays usage summary information for the specified owner name.

**[-weeks-not-used <integer>] - Weeks Not Used**

Displays usage summary information for features matching the number of weeks not in use.

**[-weeks-configured <integer>] - Weeks Configured**

Displays usage summary information for features matching the number of weeks that the feature was in configuration.

**[-weeks-not-available <integer>] - Weeks Data Not Available**

Displays usage summary information for features matching the number of weeks when usage data was not available.

**Examples**

The following example displays a usage summary output for a cluster of two nodes:

```
cluster1::> system feature-usage show-summary
Node Serial Number: 1-81-0000000000000001122334455
Owner: node1
Feature Name  Weeks In Use      Date Last Used
-----
CIFS          10 1/1/2013 23:27:49
NFS           15 1/8/2013 23:48:03

Node Serial Number: 1-81-0000000000000001122334466
Owner: node2
Feature Name  Weeks In Use      Date Last Used
-----
CIFS          10 1/1/2013 23:26:38
NFS           20 1/8/2013 23:46:48
4 entries were displayed.
```

## system fru-check commands

### system fru-check show

#### Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system fru-check show` command checks and displays the results of quick diagnostic tests done for certain FRUs of each controller in the cluster. The tests are not intended to be exhaustive, but simply to do a quick check of certain FRUs especially after replacement.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-instance ] }**

Selects detailed information (if available) for all the FRUs.

**[-node {<nodename>|local}] - Node**

Selects the FRUs that belong to the node that has the specified name.

**[-serial-number <text>] - FRU Serial Number**

Selects the FRU matching the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects the FRU matching the specified fru-name.

**[-fru-type {controller|dimm|bootmedia|nvram|nvdim}] - FRU Type**

Selects the FRUs of the specified type.

**[-fru-status {pass|fail|unknown}] - Status**

Selects the FRUs whose FRU check status matches that specified. "pass" indicates the FRU is operational. "fail" indicates the FRU is not operating correctly. "unknown" indicates a failure to obtain FRU information during the check.

**[-display-name <text>] - Display Name**

Selects the FRU matching the specified display name.

**[-location <text>] - Location**

Selects the FRUs whose location matches that specified. Example: Memory Slot: 1

**[-additional-info <text>] - Additional Info**

Selects the FRUs whose additional information matches that specified. Example: Part No: 69003140-I00-NTA-T

**[-reason <text>] - Details**

Selects the FRUs whose failure reason matches that specified.

## system ha commands

### system ha interconnect config show

Display the high-availability interconnect configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system ha interconnect config show` command displays the high-availability interconnect device basic configuration information.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display all the fields from all nodes in cluster.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Use this parameter to display all the fields from the specified node in the cluster.

**`[-transport <text>] - Interconnect Type (privilege: advanced)`**

Selects the nodes that match this HA interconnect transport type.

**`[-local-sysid <integer>] - Local System ID (privilege: advanced)`**

Selects the nodes that match this local system unique identifier.

**`[-partner-sysid <integer>] - Partner System ID (privilege: advanced)`**

Selects the nodes that match this partner system unique identifier.

**`[-initiator {local|partner}] - Connection Initiator (privilege: advanced)`**

Selects the nodes that match this parameter value. The value is the initiator of the connection request.

**`[-port-name <text>,...] - Port (privilege: advanced)`**

Selects the nodes that match this port name.

**`[-ipaddress <text>,...] - IP Address (privilege: advanced)`**

Selects the nodes that match this IP address.

**`[-interface {backplane|external}] - Interface (privilege: advanced)`**

Selects the nodes that match this parameter value. *external* means the HA interconnect links between partner nodes are connected externally. *backplane* means the HA interconnect links between partner nodes are connected over the backplane.

## Examples

The following example displays the HA interconnect configuration information on FAS8000 series nodes in the cluster:

```

cluster1::*> system ha interconnect config show
Node: ic-f8040-01
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875713
    Partner System ID: 536875678
    Connection Initiator: local
    Interface: backplane

Port    IP Address      Flags
----    -
ib0a    192.0.3.236      0x0
ib0b    192.0.3.237      0x0
Node: ic-f8040-02
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875678
    Partner System ID: 536875713
    Connection Initiator: partner
    Interface: backplane

Port    IP Address      Flags
----    -
ib0a    192.0.3.96       0x0
ib0b    192.0.3.97       0x0

2 entries were displayed.

```

The following example displays the HA interconnect configuration information on FAS2500 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
Node: ic-f2554-03
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1781036608
    Partner System ID: 1780360209
    Connection Initiator: local
    Interface: backplane
```

| Port | IP Address | Flags |
|------|------------|-------|
| ib0a | ib0a       | -     |

```
Node: ic-f2554-04
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1780360209
    Partner System ID: 1781036608
    Connection Initiator: partner
    Interface: backplane
```

| Port | IP Address | Flags |
|------|------------|-------|
| ib0a | ib0a       | -     |

2 entries were displayed.

## system ha interconnect link off

Turn off the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect link off` command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

### Parameters

#### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.

#### **-link {0|1} - Link (privilege: advanced)**

This mandatory parameter specifies the interconnect link number (0-based) to turn off.

## Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

Error: command failed: Invalid link value 0. Specify 1.

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

## system ha interconnect link on

Turn on the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect link on` command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.

**-link {0|1} - Link (privilege: advanced)**

This mandatory parameter specifies the interconnect link number (0-based) to turn on.

## Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0

Error: command failed: Invalid link value 0. Specify 1.

cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0

cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

## system ha interconnect ood clear-error-statistics

### Clear error statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect ood clear-error-statistics` command enables you to clear all the error statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the error statistics cleared. The value "local" specifies the current node.

### Examples

```
cluster1::*> system ha interconnect ood clear-error-statistics -node ic-
f2554-03
```

## system ha interconnect ood clear-performance-statistics

### Clear performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect ood clear-performance-statistics` command enables you to clear all the performance statistics collected for the out-of-order delivery-capable high-availability interconnect

device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the performance statistics cleared. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood clear-performance-statistics -node  
ic-f2554-03
```

## **system ha interconnect ood disable-optimization**

Disable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood disable-optimization` command disables the optimization capability on the high-availability interconnect device. The command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the optimization disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-optimization -node ic-  
f2554-03
```

## **system ha interconnect ood disable-statistics**

Disable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood disable-statistics` command disables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the statistics collection disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-statistics -node ic-f2554-03
```

## **system ha interconnect ood enable-optimization**

Enable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood enable-optimization` command enables you to turn on optimization (coalescing out-of-order delivery requests) on the high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the optimization enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-optimization -node ic-f2554-03
```

## **system ha interconnect ood enable-statistics**

Enable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood enable-statistics` command enables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the statistics collection enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-statistics -node ic-f2554-03
```

## **system ha interconnect ood send-diagnostic-buffer**

Send diagnostic buffer to partner

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood send-diagnostic-buffer` command enables you to run a short out-of-order delivery diagnostic test. The command sends a buffer to the partner controller over the high-availability interconnect. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will send the diagnostic buffer to its partner. The value "local" specifies the current node.

## Examples

The following example demonstrates how to use this command to send a diagnostic buffer to the partner:

```
cluster1::*> system ha interconnect ood send-diagnostic-buffer -node ic-f2554-03
```

## **system ha interconnect ood status show**

Display the high-availability interconnect device out-of-order delivery (OOD) information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood status show` command displays configuration information of the out-of-order delivery-capable high-availability interconnect devices. This command is supported only on FAS2500 series nodes in the cluster.

## Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>,... parameter, the command displays only the fields that you specify.

**[*-instance* ] (privilege: advanced) }**

Use this parameter to display all the fields from all nodes in cluster.

**[*-node* {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[*-is-ood-enabled* {true|false}] - Is OOD Enabled (privilege: advanced)**

Selects the nodes that match this parameter value.

**[*-is-coalescing-enabled* {true|false}] - Is Coalescing Enabled (privilege: advanced)**

Selects the nodes that match this parameter value.

## Examples

The following example displays the HA interconnect device out-of-order delivery configuration information on FAS2500 series nodes in the cluster.

```
cluster1::*> system ha interconnect ood status show
Node: ic-f2554-03
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
Node: ic-f2554-04
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
2 entries were displayed.
```

## system ha interconnect port show

Display the high-availability interconnect device port information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect port show` command displays the high-availability interconnect device port physical layer and link layer status information.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**`| [-instance ] (privilege: advanced) }`**

Use this parameter to display all the fields from all nodes in the cluster.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Use this parameter to display all the fields from the specified node in the cluster.

**`[-link-monitor {on|off}] - Link Monitor Detection (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-port <integer>,...] - Port Number (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-phy-layer-state {invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved}] - Physical Layer State (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-link-layer-state {invalid|down|initialize|armed|active|reserved}] - Link Layer State (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-phy-link-up-count <integer>,...] - Physical Link Up Count (privilege: advanced)`**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.

**`[-phy-link-down-count <integer>,...] - Physical Link Down Count (privilege: advanced)`**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

**`[-is-active-link {true|false}] - Is the Link Active (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

## Examples

The following example displays the HA interconnect device port information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect port show
```

|             | Link    |      | Physical Layer | Link Layer | Physical | Physical  |
|-------------|---------|------|----------------|------------|----------|-----------|
| Active      |         |      |                |            |          |           |
| Node        | Monitor | Port | State          | State      | Link Up  | Link Down |
| Link        |         |      |                |            |          |           |
| -----       | -----   | ---- | -----          | -----      | -----    | -----     |
| -----       |         |      |                |            |          |           |
| ic-f8040-01 | on      |      |                |            |          |           |
|             |         | 0    | linkup         | active     | 1        | 0         |
| true        |         | 1    | linkup         | active     | 1        | 0         |
| false       |         |      |                |            |          |           |
| ic-f8040-02 | on      |      |                |            |          |           |
|             |         | 0    | linkup         | active     | 1        | 0         |
| true        |         | 1    | linkup         | active     | 1        | 0         |
| false       |         |      |                |            |          |           |

2 entries were displayed.

## system ha interconnect port sharing modify

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect port sharing modify` command sets the state of port sharing for the specified node. This command is used to allow a Cluster/HA port-sharing platform to continue using the normally-shared ports for HA only, while using other ports for Cluster-only. An example of when this would be needed is if the Cluster/HA ports are 100G, but the node is being connected to a 10G switch in an existing cluster. In order to use a separate 10G Cluster port, this command stops using the 100G port for Cluster and only uses it for HA.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

This parameter specifies the node on which to modify port sharing.

**[-enabled {true|false}] - Enabled (privilege: advanced)**

Set this parameter to enable/disable port sharing.

### Examples

The following example modifies the HA interconnect device port sharing to enabled:

```
cluster1::*> system ha interconnect port sharing modify -node node1
-enabled true

cluster1::*> system ha interconnect port sharing show
Node           Enabled
-----
node1          true
node2          false
```

## system ha interconnect port sharing show

Display the high-availability interconnect device port sharing information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect port sharing show` command displays the high-availability interconnect device port sharing status information.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[`-instance` ](`privilege: advanced`) }**

Use this parameter to display all the fields for each node.

**[`-node <nodename>`] - Node (`privilege: advanced`)**

Use this parameter to display information from the specified node in the cluster.

**[`-enabled {true|false}`] - Enabled (`privilege: advanced`)**

Selects the nodes that match this parameter value.

### Examples

The following example displays the HA interconnect device port sharing information:

```
cluster1::*> system ha interconnect port sharing show
Node           Enabled
-----
node1          true

## system ha interconnect statistics clear-port-symbol-error

Clear the high-availability interconnect port symbol errors

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics clear-port-symbol-error` command clears the high-availability interconnect device port symbol errors. This command is supported only on FAS2500 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics show -object ic\\_hw\\_port\\_stats](#) command.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

Selects the nodes that match this parameter value.

### Examples

```
cluster1::*> system ha interconnect statistics clear-port-symbol-error  
-node ic-f2554-03
```

### Related Links

- [statistics show](#)

## system ha interconnect statistics clear-port

Clear the high-availability interconnect port counters

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics clear-port` command clears the high-availability interconnect device port statistics. This command is supported only on FAS2500 series and FAS8000 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics show -object ic\\_hw\\_port\\_stats](#) command.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

Selects the nodes that match this parameter value.

## Examples

```
cluster1::*> system ha interconnect statistics clear-port -node ic-f8040-01
```

## Related Links

- [statistics show](#)

## system ha interconnect statistics show-scatter-gather-list

Display the high-availability interconnect scatter-gather list entry statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[`-instance` ](**privilege: advanced**) }**

Use this parameter to display all the fields from all nodes in cluster.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[`-sge <integer>,...`] - Scatter-Gather Entry (privilege: advanced)**

Selects the nodes that match this scatter-gather element index value.

**[`-total-count <integer>,...`] - Total Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.

**[`-total-size <integer>,...`] - Total Size (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.

## Examples

```
cluster1::*> system ha interconnect statistics show-scatter-gather-list
Node: ic-f8040-01
Entry          Count          Size
-----
1              410925          77344493
2               988           1246987
3               72           747325
4             93264          1527155579
8                9           294912
9                9           294912

Node: ic-f8040-02
Entry          Count          Size
-----
1             1544405          310004390
2              6217           16779908
3              1222           12003411
4             338606          5543436659
6                2           41980
7                2           46136
8               18           589824
9               18           589824

## system ha interconnect statistics performance show

Display the high-availability interconnect device performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics performance show` command displays the high-availability interconnect device performance statistics.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[`-instance` ](privilege: advanced) }**

Use this parameter to display all the fields from all nodes in cluster.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[`-elapsed <integer>`] - Elapsed Time (secs) (privilege: advanced)**

Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.

**[`-qmax-wait <integer>`] - Maximum Queue Wait Count (privilege: advanced)**

Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

**[`-qmax-wait-time <integer>`] - Average Queue Wait Time (usecs) (privilege: advanced)**

Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

**[`-qmax-timeout <integer>`] - Maximum Queue Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

**[`-preempt-timeout <integer>`] - Preempt Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

**[`-nonpreempt-timeout <integer>`] - Non-Preempt Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

**[`-notify-timeout <integer>`] - Notify Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

**[`-avg-rnv-msgs-time <integer>`] - Remote NV Messages Average Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

**[`-rnv-transfers <integer>`] - Total Remote NV Transfers (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

**[`-avg-rnv-transfer-size <integer>`] - Remote NV Average Transfer Size (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

**[`-avg-rnv-transfer-time <integer>`] - Remote NV Transfers Average Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

**[-ic-waits <integer>] - Total Count of IC waits for Given ID (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

**[-ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.

**[-ic-isdone <integer>] - Total IC isdone Checks (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

**[-ic-isdone-pass <integer>] - Total IC isdone Checks Success (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

**[-ic-isdone-fail <integer>] - Total IC isdone Checks Failed (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.

**[-ic-small-writes <integer>] - IC Small Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

**[-ic-4k-writes <integer>] - IC 4K Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

**[-ic-8k-writes <integer>] - IC 8K Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

**[-ic-16k-writes <integer>] - IC 16K+ Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

**[-ic-xorder-writes <integer>] - IC XORDER Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

**[-ic-xorder-reads <integer>] - IC XORDER Reads (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

**[-rdma-read <integer>] - RDMA Reads Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

**[-rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

**[-avg-mbytes-second <text>] - Average MegaBytes Transferred per second (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

**[-avg-bytes-transfer <integer>] - Average Bytes per Transfer (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

**[-total-transfers <integer>] - Total Transfers (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

**[-avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.

**[-max-nvlog-sync-time <integer>] - Maximum Time for NVLOG Sync (msecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

**[-max-sgl-length <integer>] - Maximum Scatter-Gather Elements in a List (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

**[-ic-recq-waits <integer>] - Total Receive Queue Waits to Post Buffer (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.

**[-avg-recq-wait-time <integer>] - Average Time Receive Queue Waited (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

## Examples

The following example displays the HA interconnect device performance statistics for FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect statistics performance show

## system ha interconnect status show

Display the high-availability interconnect connection status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect status show` command displays the high-availability interconnect connection status. Connection status information displayed by this command varies by controller model. For nodes with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?

- Is the link on second port active?
- Interconnect RDMA status

For nodes with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the `-instance` or `-node` parameter displays detailed information about the interconnect device and its ports.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**`| [-instance ] (privilege: advanced) }`**

Use this parameter to display all the fields for the specified node or all the nodes.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Use this parameter to display all the fields for the specified node.

**`[-link-status {up|down}] - Link Status (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-link0-status {up|down}] - Link 0 Status (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-link1-status {up|down}] - Link 1 Status (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-ic-rdma {up|down}] - IC RDMA Connection (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means active interconnect connection with its partner.

**`[-is-link0-active {true|false}] - Is Link 0 Active (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

**`[-is-link1-active {true|false}] - Is Link 1 Active (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

**`[-slot <integer>] - Slot Number (privilege: advanced)`**

Selects the nodes that match this PCI slot number.

**[-driver-name <text>] - Driver Name (privilege: advanced)**  
Selects the nodes that match this interconnect device driver name.

**[-firmware <text>] - Firmware Revision (privilege: advanced)**  
Selects the nodes that match this firmware version.

**[-version <text>] - Version Number (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-device-type <text>] - Device Type (privilege: advanced)**  
Selects the nodes that match this interconnect device type.

**[-serial-number <text>] - Serial Number (privilege: advanced)**  
Selects the nodes that match this interconnect device serial number.

**[-debug-firmware {yes|no}] - Debug Firmware (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-command-revision <integer>] - Command Revision (privilege: advanced)**  
Selects the nodes that match this interconnect device command revision.

**[-hardware-revision <integer>] - Hardware Revision (privilege: advanced)**  
Selects the nodes that match this interconnect device hardware revision.

**[-port1 <integer>] - Port Number 1 (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-port1-port-name <text>] - Port Name (privilege: advanced)**  
Selects the nodes that match this port name.

**[-port1-gid <text>] - Global Identifier (privilege: advanced)**  
Selects the nodes that match this global identifier value.

**[-port1-base-lid <text>] - Base Local Identifier (privilege: advanced)**  
Selects the nodes that match this base local identifier value.

**[-port1-rm-lid <text>] - Remote Local Identifier (privilege: advanced)**  
Selects the nodes that match this remote local identifier value.

**[-port1-mtu <integer>] - Maximum Transmission Unit (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-port1-data-rate <text>] - Data Rate (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-port1-link-info <text>] - Link Information (privilege: advanced)**  
Selects the nodes that match this parameter value.

**[-port1-qsfp-vendor <text>] - QSFP Vendor (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[-port1-qsfp-part-number <text>] - QSFP Part Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

**[-port1-qsfp-type <text>] - QSFP Type (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[-port1-qsfp-serial-number <text>] - QSFP Serial Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

**[-port2 <integer>] - Port Number 2 (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port2-port-name <text>] - Port Name (privilege: advanced)**

Selects the nodes that match this port name.

**[-port2-gid <text>] - Global Identifier (privilege: advanced)**

Selects the nodes that match this global identifier value.

**[-port2-base-lid <text>] - Base Local Identifier (privilege: advanced)**

Selects the nodes that match this base local identifier value.

**[-port2-rm-lid <text>] - Remote Local Identifier (privilege: advanced)**

Selects the nodes that match this remote local identifier value.

**[-port2-mtu <integer>] - Maximum Transmission Unit (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port2-data-rate <text>] - Data Rate (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port2-link-info <text>] - Link Information (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port2-qsfp-vendor <text>] - QSFP Vendor (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[-port2-qsfp-part-number <text>] - QSFP Part Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

**[-port2-qsfp-type <text>] - QSFP Type (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[-port2-qsfp-serial-number <text>] - QSFP Serial Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

## Examples

The following example displays status information about the HA interconnect connection on FAS8000 series nodes with two HA interconnect links in the cluster:

```
cluster1::*> system ha interconnect status show
Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
Node: ic-f8040-02
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays status information about the HA interconnect connection on FAS2500 series nodes with a single HA interconnect link in the cluster:

```
cluster1::*> system ha interconnect status show
Node: ic-f2554-01
    Link Status: up
    IC RDMA Connection: up
Node: ic-f2554-02
    Link Status: up
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays detailed information about the HA interconnect link when parameters like `-instance` , `-node` are used with the ``system ha interconnect status show`` command

```

cluster1::*> system ha interconnect status show -instance -node ic-f8040-01

## system health commands

### system health alert delete

Delete system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system health alert delete` command deletes all the alerts on the cluster with the specified input parameters.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to delete alerts generated on a cluster only on the node you specify.

**-monitor <hm\_type> - Monitor**

Use this parameter to delete alerts generated on a cluster only on the monitor you specify.

**-alert-id <text> - Alert ID**

Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

## Examples

This example shows how to delete an alert with the specified alert-id:

```
cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert
-alerting-resource *
```

## system health alert modify

### Modify system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health alert modify` command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to change the state.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name on which you want to change the state.

**-alert-id <text> - Alert ID**

Use this parameter to specify the alert ID on which you want to change the state.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to specify the alerting resource name on which you want to change the state.

**[-acknowledge {true|false}] - Acknowledge**

Use this parameter to set the acknowledgement state to true or false.

### **`[-suppress {true|false}] - Suppress`**

Use this parameter to set the suppress state to true or false.

### **`[-acknowledger <text>] - Acknowledger`**

Use this parameter to set the acknowledger as the filter for setting state.

### **`[-suppressor <text>] - Suppressor`**

Use this parameter to set the suppressor as the filter for setting state.

## **Examples**

This example modifies the alert field states on the cluster:

```
cluster1::> system health alert modify -node * -alert-id  
DualPathToDiskShelf_Alert -suppress true
```

## **system health alert show**

### **View system health alerts**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system health alert show` command displays information about all the alerts generated on the system. Using `-instance` will add detailed information.

### **Parameters**

**`{ [-fields <fieldname>, ...]`**

Selects the fields that you specify.

**`| [-instance ] }`**

Displays the following additional information about each alert:

- Node name
- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
- Probable cause for the alert
- Possible effect due to the alert
- Recommended corrective actions to follow

**[-node {<nodename>|local}] - Node**

Selects the alerts generated for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alerts with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Selects the alerts with the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Selects the alerts with the specified alerting resource name.

**[-subsystem <hm\_subsystem>] - Subsystem**

Selects the alerts generated on the monitoring subsystem.

**[-indication-time <Date>] - Indication Time**

Selects the alerts with the specified indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Selects the alerts with the perceived severity level.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alerts that contain the specified probable cause.

**[-probable-cause-description <text>] - Description**

Selects the alerts containing the specified probable cause description.

**[-corrective-actions <text>] - Corrective Actions**

Selects the alerts with the specified recommended corrective action.

**[-possible-effect <text>] - Possible Effect**

Selects the alerts with the specified possible effect.

**[-acknowledge {true|false}] - Acknowledge**

Selects the alerts with the specified acknowledgement status.

**[-suppress {true|false}] - Suppress**

Selects the alerts with the specified suppressor field status of true or false.

**[-policy <text>] - Policy**

Selects the alerts with the specified policy name.

**[-acknowledger <text>] - Acknowledger**

Selects the alerts with the specified acknowledger field.

**[-suppressor <text>] - Suppressor**

Selects the alerts with the specified suppressor field.

**[-additional-info <text>,...] - Additional Information**

Selects the alerts with the specified additional information.

**[-alerting-resource-name <text>] - Alerting Resource Name**

Selects the alerts with the specified alerting resource name.

**[-tags <hm\_alert\_type>,...] - Additional Alert Tags**

Selects the alerts with the specified keywords.

## Examples

The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show
Node: node1
    Alert ID: DualPathToDiskShelf_Alert
    Resource: Shelf ID 2
    Severity: Major
    Suppress: false
    Acknowledge: false
    Tags: quality-of-service, nondisruptive-upgrade
    Probable Cause: Disk shelf 2 does not have two paths to controller
                    node1.
    Possible Effect: Access to disk shelf 2 via controller node1 will be
                    lost with a single hardware component failure (e.g.
                    cable, HBA, or IOM failure).
    Corrective Actions: 1. Halt controller node1 and all controllers attached
to disk shelf 2.
                      2. Connect disk shelf 2 to controller node1 via two
paths following the rules in the Universal SAS and ACP Cabling Guide.
                      3. Reboot the halted controllers.
                      4. Contact support personnel if the alert persists.
```

The example below displays additional information about a specific alert generated in the cluster:

```

cluster1::> system health alert show -monitor node-connect -alert-id
DualPathToDiskShelf_Alert -instance
Node: node1
    Monitor: node-connect
    Alert ID: DualPathToDiskShelf_Alert
    Alerting Resource: 50:05:0c:c1:02:00:0f:02
    Subsystem: SAS-connect
    Indication Time: Mon Mar 21 10:26:38 2011
    Perceived Severity: Major
    Probable Cause: Connection_establishment_error
    Description: Disk shelf 2 does not have two paths to controller
node1.
    Corrective Actions: 1. Halt controller node1 and all controllers
attached to disk shelf 2.
                        2. Connect disk shelf 2 to controller node1 via
two paths following the rules in the Universal SAS and ACP Cabling Guide.
                        3. Reboot the halted controllers.
                        4. Contact support personnel if the alert
persists.
    Possible Effect: Access to disk shelf 2 via controller node1 will
be lost with a single hardware component failure (e.g. cable, HBA, or IOM
failure).
    Acknowledge: false
    Suppress: false
    Policy: DualPathToDiskShelf_Policy
    Acknowledger: -
    Suppressor: -
    Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
                        Shelf id: 2
                        Shelf Name: 4d.shelf2
                        Number of Paths: 1
                        Number of Disks: 6
                        Adapter connected to IOMA:
                        Adapter connected to IOMB: 4d
    Alerting Resource Name: Shelf ID 2
    Additional Alert Tags: quality-of-service, nondisruptive-upgrade

```

## system health alert definition show

Display system health alert definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system health alert definition show` command displays information about the various alerts defined in the system health monitor policy file. Using `-instance` will display additional details.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Use this parameter to display additional information on each alert definition.

- Node name
- Monitor name
- Subsystem identifier
- Alert ID
- Severity of the alert
- Probable cause
- Probable cause description
- Possible effect due the error state
- Recommended corrective actions to be followed
- Any additional information
- Additional alert tags

**[-node {<nodename>|local}] - Node**

Selects the alert definitions for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alert definitions with the specified monitor name.

**[-alert-id <text>] - Class of Alert**

Selects the alert definitions with the specified alert identifier.

**[-perceived-severity <hm\_perceived\_sev>] - Severity of Alert**

Selects the alert definitions with the specified perceived severity.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alert definitions with the specified probable cause of the alert.

**[-probable-cause-description <text>] - Probable Cause Description**

Selects the alert definitions with the specified probable cause description.

**[-possible-effect <text>] - Possible Effect**

Selects the alert definitions with the specified possible effect.

### **[-corrective-actions <text>] - Corrective Actions**

Selects the alert definitions with the specified corrective action.

### **[-subsystem <hm\_subsystem>] - Subsystem Name**

Selects the alert definitions with the specified subsystem.

### **[-additional-information <text>] - Additional Relevant Data**

Selects the alert definitions with the specified additional information.

### **[-tags <hm\_alert\_type>,...] - Additional Alert Tags**

Selects the alert definitions with the specified keywords.

## **Examples**

The example below displays information about all the definitions in the alert definition file:

```
cluster1::> system health alert definition show
Node           Monitor           Subsystem           Alert ID
-----
node-01        system-connect        SAS-connect
DualControllerNonHa_

Alert
Severity: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected
to
two controllers
$(sschm_shelf_info.connected-nodes)) that are
not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id)
may
be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to
disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id)
to both HA controllers following the rules in the Universal SAS and ACP
Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert
persists.
Additional Info: -
Tags: quality_of_service, nondisruptive-upgrade
```

The example below displays detailed information about the definitions in the alert definition file:

```

cluster1::> system health alert definition show -instance
Node: krivC-01
        Monitor: system-connect
        Class of Alert: DualControllerNonHa_Alert
        Severity of Alert: Major
        Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected
to two controllers ($(sschm_shelf_info.connected-nodes)) that are not an
HA pair.
        Possible Effect: Access to disk shelf $(sschm_shelf_info.id)
may be lost with a single controller failure.
        Corrective Actions: 1. Halt all controllers that are connected to
disk shelf $(sschm_shelf_info.id).
        2. Connect disk shelf $(sschm_shelf_info.id) to both HA
controllers following the rules in the Universal SAS and ACP Cabling
Guide.
        3. Reboot the halted controllers.
        4. Contact support personnel if the alert persists.
        Subsystem Name: SAS-connect
Additional Relevant Data: -
        Additional Alert Tags: quality_of_service, nondisruptive-upgrade

```

## system health autosupport trigger history show

### View system health alert history

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health autosupport trigger history show` command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

### Parameters

```
{ [-fields <fieldname>,...]
```

Use this parameter to display only the fields you specify.

**| [-instance ] }**

Use this parameter to display additional information about all of the alerts that were generated.

**[-node {<nodename>|local}] - Node**

Use this parameter to display AutoSupport trigger history on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display AutoSupport trigger history with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.

**[-subsystem <hm\_subsystem>] - Subsystem**

Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.

**[-indication-time <Date>] - Indication Time**

Use this parameter to display the AutoSupport message that was triggered at the indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.

**[-autosupport-triggered {true|false}] - AutoSupport Triggered**

Use this parameter to display the alerts that generated AutoSupport messages.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Use this parameter to display the alerts that were generated with the specified probable cause.

**[-corrective-actions <text>] - Corrective Actions**

Use this parameter to display the AutoSupport alerts with the specified corrective actions.

**[-asup-enable {true|false}] - Enable Asup for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

**[-alert-clear-time <Date>] - Alert Clear Time**

Use this parameter to display the alerts that were cleared at a given time.

## Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
Node           Monitor           Subsystem           Alert ID
-----
node1          node-connect        SAS-connect
DualPathToDiskShelf_
Alert
Resource: 50:05:0c:c1:02:00:0f:02
Severity: Major
AutoSupport sent: true
```

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Thu Mar 17 11:59:09 2011
Perceived Severity: Major
AutoSupport Triggered: true
Probable Cause: Connection_establishment_error
Corrective Actions: 1. Halt controller node1 and all controllers
attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the
rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Enable asup for this alert: true
Alert Clear Time: Wed May 29 16:10:13 2013
```

## system health config show

Display system health configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health config show` command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the health monitors present on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display the health monitors with the specified monitor name.

**[-subsystem <hm\_subsystem>,...] - Subsystem**

Selects the health monitors with the specified subsystems.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects the health monitors with the specified health status.

**[-mon-version <text>] - Monitor Version**

Selects the health monitors with the specified monitor version.

**[-pol-version <text>] - Policy File Version**

Selects the health monitors with the specified health monitor policy version.

**[-context {Node |Cluster}] - Context**

Selects the health monitors with the specified running context.

**[-aggregator <hm\_type>] - Aggregator**

Selects the health monitors with the specified aggregator.

**[-resources <text>,...] - Resource**

Selects the health monitors with the specified resource name.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Subsystem Initialization Status**

Selects the health monitors with the specified subsystem initialization state.

**[-sub-pol-versions <text>] - Subordinate Policy Versions**

Selects the health monitors with the specified subordinate policy version.

## Examples

The example below displays information about health monitor configuration:

```
cluster1::> system health config show
```

| Node  | Monitor        | Subsystem   | Health   |
|-------|----------------|-------------|----------|
| node1 | node-connect   | SAS-connect | degraded |
| node1 | system-connect | SAS-connect | degraded |
| node1 | system         | SAS-connect | degraded |

The example below displays detailed information about health monitor configuration:

```
cluster1::> system health config show -instance
Node: node1
Monitor: node-connect
Subsystem: SAS-connect
Health: degraded
Monitor Version: 1.0
Policy File Version: 1.0
Context: node_context
Aggregator: system-connect
Resource: SasAdapter, SasDisk, SasShelf
Subsystem Initialization Status: initialized
Subordinate Policy Versions: 1.0 SAS, 1.0 SAS multiple adapters
```

## system health policy definition modify

### Modify system health policy definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system health policy definition modify` enables or disables health monitoring policies based on input parameters the user provides.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to enable or disable the policy.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

**-policy-id <text> - Policy**

Use this parameter to specify the policy identifier that you want to enable or disable.

### **[`-enable {true|false}`] - Policy Status**

Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

### **[`-asup-enable {true|false}`] - Enable AutoSupport for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

## **Examples**

This example modifies policy state on the cluster:

```
cluster1::> system health policy definition modify -node node1
               -policy-id ControllerToShelfIomA_Policy -enable false -monitor *
```

## **system health policy definition show**

Display system health policy definitions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system health policy definition show` command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:

- Node name
- Monitor name
- Policy name
- Policy rule expression
- Expression for joining two tables
- Policy status
- Alert identifier
- Responsible resource name

### **Parameters**

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

Selects policy definitions for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects policy definitions with the specified monitor name.

**[-policy-id <text>] - Policy**

Selects policy definitions with the specified policy identifier.

**[-rule-expression <ArithExpr>] - Rule Expression**

Selects policy definitions with the specified rule of expression.

**[-where <ArithExpr>] - Variable Equivalence**

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

**[-enable {true|false}] - Policy Status**

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

**[-alert-id <text>] - Alert ID**

Selects all policy definitions of the specified alert identifier.

**[-responsible-resource-info <text>] - Table and ID of Resource at Fault**

Selects all policy definitions with the specified responsible resource.

**[-asup-enable {true|false}] - Enable AutoSupport for This Alert**

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

**Examples**

The example below displays information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show
Node           Monitor           Policy
-----
node1          node-connect        ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2
                        nschm_shelf_info.iomb-adapter == NULL
                        Where: -
                        Enable: true
                        Alert ID: ControllerToShelfIomA_Alert
                        Number of Alerts: -
                        Responsible Resource: nschm_shelf_info.name
```

The example below displays detailed information about all the policy definitions present in the cluster:

```

cluster1::> system health policy definition show -instance
Node: node1
        Monitor: node-connect
        Policy: ControllerToShelfIomA_Policy
        Rule Expression: nschm_shelf_info.num-paths == 2
        nschm_shelf_info.iomb-adapter == NULL
        Variable Equivalence: -
        Policy Status: true
        Alert ID: ControllerToShelfIomA_Alert
        Table and ID of Resource at Fault: nschm_shelf_info.name

```

## system health status show

Display system health monitoring status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

### Examples

This example displays information about health monitoring status:

```

cluster1::> system health status show
Status
-----
degraded

```

## system health subsystem show

Display the health of subsystems

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health subsystem show` command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use

the [system health alert show](#) command to display information about generated alerts.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-subsystem <hm\_subsystem>] - Subsystem**

Selects the specified subsystem.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects subsystems that have the specified health status.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Initialization State**

Selects subsystems that have the specified initialization state.

**[-outstanding-alert-count <integer>] - Number of Outstanding Alerts**

Selects subsystems that have the specified number of outstanding alerts.

**[-suppressed-alert-count <integer>] - Number of Suppressed Alerts**

Selects subsystems that have the specified number of suppressed alerts.

**[-node {<nodename>|local}] - Node**

Selects subsystems for the specified node.

**[-refresh-interval <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>,...] - Subsystem Refresh Interval**

The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

## Examples

The example below displays the health status of each subsystem:

```
cluster1:> system health subsystem show
Subsystem      Health
-----
SAS-connect    degraded
Switch-Health  OK
CIFS-NDO       OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance

Subsystem: SAS-connect
Health: degraded
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1,node2
Subsystem Refresh Interval: 30m, 30m
Subsystem: Switch-Health
Health: ok
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1
Subsystem Refresh Interval: 5m
Subsystem: CIFS-NDO
Health: OK
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1
Subsystem Refresh Interval: 5m
```

# system license commands

## system license add

Add one or more licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

## Parameters

**-license-code <License Code V2>,... - License Code V2**

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

## | [-use-license-file {true|false}] - Use License File (privilege: advanced) }

If this parameter is set to true, licenses from the local node /mroot/etc/lic\_file license file will be installed if the file exists at this location.

### Examples

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB to the cluster

```
cluster1::> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA,  
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
```

The following example installs the licenses from the local node "/mroot/etc/lic\_file"

```
cluster1::> system license add -use-license-file true
```

## system license clean-up

### Remove unnecessary licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command. Licenses that cannot be deleted are displayed with reasons for the non-deletion.

### Parameters

#### [-unused <true>] - Remove unused licenses

If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

#### [-expired <true>] - Remove expired licenses

If you use this parameter, the command removes licenses in the cluster that have expired.

#### [-n, -simulate <true>] - Simulate Only

If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

### Examples

The following example simulates and displays the licenses that can be cleaned up:

```
cluster-1::> system license clean-up -expired -unused
```

The following licenses were safely deleted:

Serial number: 1-80-000011

Owner: cdancluster-1

| Package | Reason |
|---------|--------|
|---------|--------|

-----

|      |                     |
|------|---------------------|
| CIFS | License has expired |
|------|---------------------|

Serial number: 4067154888

Owner: none

| Package | Reason |
|---------|--------|
|---------|--------|

-----

|       |                     |
|-------|---------------------|
| Cloud | License has expired |
|-------|---------------------|

Serial number: 1-81-00000000000000004067154999

Owner: none

| Package | Reason |
|---------|--------|
|---------|--------|

-----

|       |                                           |
|-------|-------------------------------------------|
| iSCSI | License unused by any node in the cluster |
|-------|-------------------------------------------|

The following licenses are either expired or unused but cannot be safely deleted:

Serial number: 4067154778

Owner: node1

| Package | Reason |
|---------|--------|
|---------|--------|

-----

|       |                                        |
|-------|----------------------------------------|
| Cloud | Feature would be impaired upon removal |
|-------|----------------------------------------|

Serial number: 4067154779

Owner: node2

| Package | Reason |
|---------|--------|
|---------|--------|

-----

|       |                          |
|-------|--------------------------|
| Cloud | System generated license |
|-------|--------------------------|

## system license delete

### Delete a license

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command deletes a license from a cluster.

## Parameters

### **-serial-number <text> - Serial Number**

This parameter specifies the serial number of the license that is to be deleted from the cluster. If this parameter is not provided, the default value is the serial number of the cluster.

### **-package <Licensable Package> - Package**

This parameter specifies the name of the package that is to be deleted from the cluster.

## Examples

The following example deletes a license named CIFS and serial number 1-81-0000000000000000000123456 from the cluster:

```
cluster1::> system license delete -serial-number 1-81-  
0000000000000000000123456 -package CIFS
```

The following example deletes from the cluster all of the licenses under the installed-license Core Bundle for serial number 123456789:

```
cluster1::> system license delete { -serial-number 123456789 -installed  
-license "Core Bundle" }
```

## system license show-aggregates

Display status of aggregates leases and license used.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the status of all ONTAP aggregates.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you use this parameter, the command displays information only about aggregates that match the given node.

**[-aggr-name <text>] - Aggregate Name**

If you use this parameter, the command displays information only about aggregate that match the given aggregate.

**[-aggr-size {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Size**

If you use this parameter, the command displays information only about aggregates that match the given physical size of an aggregate.

**[-licensed-size {<integer>[KB|MB|GB|TB|PB]}] - Licensed Size**

If you use this parameter, the command displays information only about aggregates that match the given licensed-size.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Lease Expiration**

If you use this parameter, the command displays information only about aggregates that match the given lease expiration.

**[-status <AggrLicStatus>] - Aggregate Status**

If you use this parameter, the command displays information only about aggregates that match the given status.

**[-compliant {true|false}] - Is Aggregate Compliant**

If you use this parameter, the command displays information only about aggregates that match the given state of compliance.

**[-aggr-uuid <UUID>] - Aggregate UUID**

If you use this parameter, the command displays information only about aggregate that match the given aggregate uuid.

**Examples**

The following example displays the license status of the cluster:

```
cluster1::> system license show-aggregates
Licensed Physical
Node      Aggregate                Size      Size Lease Expiration  Status

missing

```

## system license show-serial-numbers

### Display History of Serial Numbers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command displays the history of changes to the support and node serial numbers. The node serial number and the support serial number of an ONTAP system are generally the same and do not change over time. However, when capacity pools licensing is used, the support serial number is that of the capacity pool license serial number and the node serial number is generated by the license manager. Also, when a cluster is upgraded or converted from capacity tiers licensing to capacity pools licensing, its support serial numbers as well as its node serial numbers change.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**
