If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-seqnum <Sequence Number>] - Sequence number**

Event sequence number

**[-node {<nodename>|local}] - Node**

Selects the node names that match this parameter value.

**[-date <MM/DD/YYYY HH:MM:SS>] - Date**

Selects the dates of serial number changes that match this parameter value.

**[-reason <text>] - Reason for change**

Reasons for serial number changes.

**[-support-serial-number <text>] - Support Serial Number**

Selects the support serial numbers that match this parameter value.

**[-node-serial-number <text>] - Node Serial Number**

Selects the node serial number that match this parameter value.

#### Examples

The following example displays the serial number change history of a four node capacity pools cluster. Its two HA pairs were originally assigned to capacity pools 390000101 and 390000102, and then both were reassigned to another capacity pool 390000103:

```
cluster1::> system license show-serial-numbers
```

Change Date: 06/06/2019

Reason: Reassignments of capacity pools

| Node  | Support Serial | Node Serial          |
|-------|----------------|----------------------|
| node1 | 390000103      | 99939000010100000001 |
| node2 | 390000103      | 99939000010100000002 |
| node3 | 390000103      | 99939000010200000003 |
| node4 | 390000103      | 99939000010200000004 |

Change Date: 03/01/2019

Reason: Initial installation

| Node  | Support Serial | Node Serial          |
|-------|----------------|----------------------|
| node1 | 390000101      | 99939000010100000001 |
| node2 | 390000101      | 99939000010100000002 |
| node3 | 390000102      | 99939000010200000003 |
| node4 | 390000102      | 99939000010200000004 |

The following example displays the history of a four node cluster converted from capacity tiers licensing to capacity pools licensing:

```
cluster1::> system license show-serial-numbers
```

Change Date: 06/06/2019

Reason: Conversions from capacity tiers to pools

| Node  | Support Serial | Node Serial          |
|-------|----------------|----------------------|
| node1 | 390000103      | 99939000010300000011 |
| node2 | 390000103      | 99939000010300000012 |
| node3 | 390000103      | 99939000010300000013 |
| node4 | 390000103      | 99939000010300000014 |

Change Date: 03/01/2019

Reason: Initial installation

| Node  | Support Serial | Node Serial |
|-------|----------------|-------------|
| node1 | 310000101      | 310000101   |
| node2 | 310000102      | 310000102   |
| node3 | 310000103      | 310000103   |
| node4 | 310000104      | 310000104   |

The following example displays the history of an evaluation cluster that was upgraded to capacity pools licensing:

```
cluster1::> system license show-serial-numbers
```

Change Date: 06/06/2019

Reason: Conversions from capacity tiers evaluation to pools

| Node  | Support Serial | Node Serial          |
|-------|----------------|----------------------|
| node1 | 390000103      | 99939000010300000011 |
| node2 | 390000103      | 99939000010300000012 |
| node3 | 390000103      | 99939000010300000013 |
| node4 | 390000103      | 99939000010300000014 |

Change Date: 03/01/2019

Reason: Initial installation

| Node  | Support Serial | Node Serial          |
|-------|----------------|----------------------|
| node1 | evaluation     | 99887766554433221101 |
| node2 | evaluation     | 99887766554433221102 |
| node3 | evaluation     | 99887766554433221103 |
| node4 | evaluation     | 99887766554433221104 |

## system license show-status

### Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the status of all ONTAP licenses.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-status {not-compliant|eval|partially-installed|valid|not-installed|not-applicable|not-known}] - Current State**

If you use this parameter, the command displays information only about licenses that match the given status.

**[-license <Licensable Package>] - License**

If you use this parameter, the command displays information only about licenses that match the given license.

### **[-scope {site|cluster|node|pool}] - License Scope**

If you use this parameter, the command displays information only about licenses that match the given scope.

### **[-detailed-status <text>,...] - Detailed Status**

If you use this parameter, the command displays information only about licenses that match the given detailed-status.

## **Examples**

The following example displays the license status of the cluster:

```
cluster1::> system license show-status
Status      License                Scope      Detailed Status
-----
partially-installed
          CIFS                node      License missing on: Node2-
Cluster1.
          SnapRestore          node      License missing on: Node2-
Cluster1.
valid
          FCP                  node      -
          FabricPool           cluster  The system is using 1TB, and can
use up to 25TB.
not-installed
          NFS                  -        -
          iSCSI                -        -
          SnapMirror            -        -
          FlexClone             -        -
          SnapVault             -        -
          SnapLock              -        -
          SnapManagerSuite      -        -

## system license show

### Display licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system license show` command displays the information about licenses in the system.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-serial-number <text>] - Serial Number**

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

**[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the specified package.

**[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

**[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

**[-type {license|site|demo|subscr|capacity|capacity-per-term|enabled}] - Type**

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

**[-customer-id <text>] - Customer ID**

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.

**[-installed-license <text>] - Installed License Name**

If you use this parameter, the command displays information only about the licenses that match the installed license you specify.

### **[`-host-id <text>`] - Host Id**

If you use this parameter, the command displays information only about the license that have the host id you specify.

### **[`-capacity {<integer>[KB|MB|GB|TB|PB]}`] - License Capacity**

If you use this parameter, the command displays information only about the licenses that match the capacity you specify.

## **Examples**

The following example displays information about all licensed packages in the cluster:

```
cluster1::> system license show

Serial Number: 1-81-0000000000000001122334455
Owner: node2
Installed License: Legacy Key
Capacity: -
Package           Type      Description           Expiration
-----
NFS                license   NFS License          -
CIFS               license   CIFS License          -
iSCSI              license   iSCSI License         -
SnapRestore        license   SnapRestore License   -
FlexClone          license   FlexClone License     -
S3                 license   S3 License            -

Serial Number: 123456789
Owner: node1
Installed License: Core Bundle
Capacity: 10TB
Package           Type      Description           Expiration
-----
NFS                capacity  NFS License          -
CIFS               capacity  CIFS License          -
iSCSI              capacity  iSCSI License         -
SnapRestore        capacity  SnapRestore License   -
FlexClone          capacity  FlexClone License     -
S3                 capacity  S3 License            -
12 entries were displayed.
```

## **system license update-leases**

### **Begin lease reconciliation**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system license update-leases` command attempts to update (that is, renew) any capacity pool leases that have expired.

## Parameters

### `[-node {<nodename>|local}]` - Nodes to Attempt Renewal

This optional parameter directs the system to update leases for only the specified nodes.

### `[-force {true|false}]` - Force Renewal of Valid Leases

This optional parameter, if set with a value of "true", directs the system to update all leases for a node, not just those that have expired.

## Examples

The following example updates all leases on a node:

```
cluster1::*> system license update-leases -node node1 -force true
Number of Leases Updated: 3
Number of Leases Not Updated: 0 (error), 0 (already up-to-date)
```

## system license capacity show

(DEPRECATED)-Show license capacity status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of ONTAP. Use the `"system license show-status"` command.

The `system license capacity show` command displays the information about the licenses in the system that are specifically related to storage capacity limits.

## Parameters

### `{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

### `| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### `[-serial-number <Node Serial Number>]` - Serial Number

If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

**[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the package you specify.

**[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

**[-max-capacity {<integer>[KB|MB|GB|TB|PB]}] - Maximum Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.

**[-current-capacity {<integer>[KB|MB|GB|TB|PB]}] - Current Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

**[-reported-state {evaluation|warning|missing|enforcement|installed}] - Reported State**

If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

**[-node {<nodename>|local}] - Node Name**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

## Examples

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "-" (meaning "unlimited"). This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show
```

```
Node:          node1
Serial Number: 1-81-00000000000001234567890123456

                Max  Current
Package          Capacity Capacity Expiration
-----
Select          2TB   15.81GB 4/11/2016 00:00:00
Node:          node2
Serial Number: 1-81-000000000000000000000123456788

                Max  Current
Package          Capacity Capacity Expiration
-----
Select          -    10.40TB 4/11/2016 00:00:00
Node:          node3
Serial Number: 1-81-000000000000000000000123456789

                Max  Current
Package          Capacity Capacity Expiration
-----
Select          -    10.40TB 4/11/2016 00:00:00
Node:          node4
Serial Number: 1-81-00000000000001234567890123456

                Max  Current
Package          Capacity Capacity Expiration
-----
Select          2TB   15.81GB 4/11/2016 00:00:00
```

## system license entitlement-risk show

### Display Cluster License Entitlement Risk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays information about license entitlement risk of the cluster for each license package. The command displays license package name, entitlement risk, corrective action to reduce the entitlement risk for each package, and the names and serial numbers for the nodes that do not have a node-locked license for a given package. If command is used with the "-detail" parameter, the output displays the names and serial numbers for all nodes in the cluster instead of only the nodes missing a node-locked license. It also displays whether each node has a license and if the features corresponding to the package are used in the past week.

License entitlement risk does not apply to base license. If a node has a site or a valid demo license for the given package, the entitlement risk will be shown as "medium" and the nodes missing a node-locked license

will be displayed. The corrective action, if the cluster has a site license for the given package is, "Verify all controllers are entitled". If the entitlement risk is high, the corrective action is "Acquire node-locked license". For the low entitlement risk and if the cluster is unlicensed for a given package, the corrective action is "None". If the license entitlement risk cannot be computed because of infrastructure issues, the entitlement risk is shown as "unknown" and the corrective action is displayed as "Verify system health". For more information regarding license entitlement risk, see + <http://mysupport.netapp.com/licensing/ontapentitlementriskstatus>

## Parameters

**{ [-fields <fieldname>, ...]**

With this parameter, you can specify which fields should be displayed by the command. License package names and node serial numbers are always displayed.

**| [-detail ]**

If you use this parameter, the command displays the license package name, entitlement risk, corrective action, all nodes' names, their serial numbers, whether a node-locked license is present and whether a given license package has been in use in the past week for each node in the cluster.

**| [-instance ] }**

If this parameter is used, the command displays values for all fields for each license package and each node in the cluster individually.

**[-package <Licensable Package>] - Package Name**

If you use this parameter, the command displays information only for the specified license package.

**[-serial-number <text>] - Node Serial Number**

If you use this parameter, the command displays information only for the node with the specified serial number. The displayed entitlement risk and corrective action apply to the entire cluster.

**[-node-name <text>] - Node Name**

If you use this parameter, the command displays information only for the node with the specified name. The displayed entitlement risk and corrective action apply to the entire cluster.

**[-risk {high|medium|low|unlicensed|unknown}] - Entitlement Risk**

If you use this parameter, the command displays information only for the license packages that have the specified license entitlement risk.

**[-action <text>] - Corrective Action**

If you use this parameter, the command displays information only for the license packages which need the specified corrective action to reduce entitlement risk.

**[-is-licensed {true|false}] - Is Node-Locked License Present**

If you use this parameter, the command displays information only for the license packages for which at least one node in the cluster has a node-locked license. It also displays the nodes in the cluster which do not have a node-locked license.

**[-in-use {true|false}] - Usage Status**

If you use this parameter, the command displays information only for the license packages with corresponding features in use.

### **[-missing-serial-numbers <text>,...] - Serial Numbers Missing a Node-Locked License**

If you use this parameter, the command displays the packages for which the node with the specified serial number does not have a node-locked license.

### **[-missing-node-names <text>,...] - Node Names Missing a Node-Locked License**

If you use this parameter, the command displays all the packages for which the node with the specified name does not have a node-locked license.

### **[-action-code {acquire-license|adjust-capacity|verify-entitlement|verify-system-health|none}] - Corrective Action Code**

If you use this parameter, the command displays information only for the license packages which need specified corrective action code to reduce entitlement risk. This parameter is same as the parameter "action".

## **Examples**

The following example displays the information for license package NFS. NFS is unlicensed in the cluster and no action is necessary to reduce the entitlement risk. The nodes, cluster1-01 and cluster-02, are missing a node-locked license. The serial numbers for both nodes are also displayed.

```
cluster1::> system license entitlement-risk show
Package                Entitlement Risk Corrective Action
-----
NFS                    unlicensed          None
Nodes Without a Node-Locked License
-----
cluster1-01            1-81-00000000000000004073806282
cluster1-02            1-81-00000000000000004073806283
```

The following example displays the information for license package CIFS. The cluster has high entitlement risk for CIFS. The command displays serial numbers for all nodes in the cluster. Both nodes are missing a node-locked CIFS license. Node with serial number 1-81-00000000000000004073806282 has used CIFS feature in the past week, and the node with serial number 1-81-00000000000000004073806283 has not used this feature in the past week.

```
cluster1::> system license entitlement-risk show -detail
Package                Entitlement Risk Corrective Action
-----
CIFS                    high              Acquire a node-locked license
Serial Numbers          Licensed Usage
-----
1-81-00000000000000004073806282 false      true
1-81-00000000000000004073806283 false      false
```

## **system license license-manager check**

Display license manager status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``system license license-manager check`` checks the connectivity status of a node to the License Manager that the node was configured to use. The status of a node might indicate that the License Manager is inaccessible. If so, the status message contains additional text in parentheses. The text options and descriptions are as follows:

- `license_expired` : The License Manager has a license, but it is expired.
- `network_error` : The node is unable to establish basic network connectivity.
- `no_valid_license` : The License Manager does not have a valid capacity pool license.

All other values indicate an internal error.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

This parameter directs the system to display results for the License Manager configured for the specified node.

**`[-status <text>] - Status (privilege: advanced)`**

This parameter directs the system to display results for the given status message.

## Examples

The following examples check the status of the configured License Manager, before and after its license has expired:

```
cluster1::*> system license license-manager check -node node1
Node: node1
LM status: License Manager (1.2.3.4:5678) is accessible.
```

```
cluster1::*> system license license-manager check
```

| Node  | Status                                        |
|-------|-----------------------------------------------|
| node1 | License Manager (1.2.3.4:5678) is accessible. |
| node2 | License Manager (1.2.3.4:5678) is accessible. |

2 entries were displayed.

```
cluster1::*> system license license-manager check -node node1
Node: node1
LM status: License Manager (1.2.3.4:5678) is inaccessible
(license_expired).
```

```
cluster1::*> system license license-manager check
```

| Node  | Status                                                               |
|-------|----------------------------------------------------------------------|
| node1 | License Manager (1.2.3.4:5678) is inaccessible<br>(license_expired). |
| node2 | License Manager (1.2.3.4:5678) is inaccessible<br>(license_expired). |

2 entries were displayed.

## system license license-manager modify

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system license license-manager modify`` command modifies the configuration information for the License Manager the system is using.

### Parameters

**[-host <text>] - License Manager Host (privilege: advanced)**

Sets the specified host, which can either be a fully qualified domain name (FQDN) or an IP address.

### Examples

The following example modifies information about the License Manager configuration:

```
cluster1::*> system license license-manager modify -host  
myhost.mycompany.com
```

## system license license-manager show

### Display license manager information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system license license-manager show` command displays the information about the current License Manager configuration.

#### Examples

The following example displays information about current License Manager configuration:

```
cluster1::*> system license license-manager show  
  
License Manager Host: 1.2.3.4
```

## system license status show

### (DEPRECATED)-Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command is deprecated and may be removed in a future release of ONTAP. Use the `"system license show-status"` command.

This command displays the list of licensable packages in the system and their current licensing status.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-package <Licensable Package>] - Package Name**

If you use this parameter, the command displays information only about the specified package.

**[-method {none|license|site|demo|subscr|capacity|enabled}] - Licensed Method**

If you use this parameter, the command displays information only about the packages with the specified licensed method.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

**[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that match the description you specify.

**[-status-details <text>] - Additional Information About Status**

This option displays additional information regarding the cluster-level license status for license methods.

## Examples

The following example displays the license status of the cluster:

```
cluster1::> system license status show
```

| Package               | Licensed Method | Expiration          | Status Details  |
|-----------------------|-----------------|---------------------|-----------------|
| Base                  | site            | -                   | -               |
| NFS                   | site            | -                   | -               |
| CIFS                  | demo            | 12/7/2015 00:00:00  | Demo expires on |
| given date            |                 |                     |                 |
| iSCSI                 | none            | -                   | -               |
| FCP                   | none            | -                   | -               |
| SnapRestore           | none            | -                   | -               |
| SnapMirror            | none            | -                   | -               |
| FlexClone             | none            | -                   | -               |
| SnapVault             | none            | -                   | -               |
| SnapLock              | none            | -                   | -               |

# system limits commands

## system limits show

Displays the Maximum volume limit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command displays the Maximum volumes allowed in a node and maximum allowed size of a volume.

### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-node* <nodename>] - Node's filer ID (privilege: advanced)**

This parameter indicates the node name.

**[*-max-aggr-size* <integer>] - Maximum Aggregate Size in TB (privilege: advanced)**

This parameter indicates the Maximum aggregate size in TB

**[*-max-node-vvols* <integer>] - Maximum Number of Volumes (privilege: advanced)**

This parameter indicates the Maximum Number of Volumes

**[*-max-hya-ssd-limit* <integer>] - Maximum SSD on a Flash Pool Aggregate (privilege: advanced)**

This parameter indicates the Maximum hya ssd limit

**[*-is-200tb-vvol-size-allowed* {true|false}] - Is system allowed to create vvols upto 200TB (privilege: advanced)**

This parameter indicates the whether the volume of size 200TB is allowed

**[*-max-vol-size-old* <integer>] - Old Maximum Volume Size in TB (privilege: advanced)**

This parameter indicates Maximum Volume Size in TB prior to 9.12.1

**[*-max-vol-size-published* <integer>] - User Visible Maximum Volume Size in TB (privilege: advanced)**

This parameter indicates Maximum Volume Size in TB published in customer documentation.

## Examples

Example shows the output of system limits show

```
cluster1::> system limits show
```

| Node  | Max_volume_size | Max_volume_count |
|-------|-----------------|------------------|
| node1 | 300             | 500              |

## system node commands

### system node halt

Shut down a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system node halt` command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

#### Parameters

##### **-node {<nodename>|local} - Node**

Use this mandatory parameter to specify the node that you want to shut down. The value `local` specifies the current node.

##### **[-reason <text>] - Reason for Shutdown**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

##### **[-f, -inhibit-takeover <true>] - Disallow Storage Takeover by Partner**

This parameter optionally forces the shutdown and prevents storage failover. LIFs will migrate prior to shutdown even when `inhibit-takeover` is set to `true`. To prevent LIF migration, `skip-lif-migration-before-shutdown` should be set to `true`. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

If `-inhibit-takeover` is set to `true`, the default behavior of the `storage failover show`-fields onreboot`` command is ignored.

If you enter this command without using this parameter, its effective value is `false` and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to `true` and storage takeover is disabled during reboot.

##### **[-d, -dump <true>] - Create a Core Dump**

If this parameter is set to `true`, it forces a dump of the kernel core when halting the node.

### **`[-skip-lif-migration-before-shutdown <true>]` - Skip Migrating LIFs Away from Node Prior to Shutdown**

If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

### **`[-ignore-quorum-warnings <true>]` - Skip Quorum Check Before Shutdown**

If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.

### **`[-ignore-strict-sync-warnings <true>]` - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous relationships with policy of type strict-sync-mirror will be skipped. The operation will continue even if there is a possible data outage due to not being able to fully sync data.

### **`[-power-off {true|false}]` - Power off the node after shutdown**

If this parameter is specified, the node will be powered off at the end of the halt operation. If set to false, the OS will reboot and then stop at the LOADER prompt. If set to true, when the node is powered back on, it will stop at the LOADER prompt.

## **Examples**

The following example shuts down the node named cluster1 for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

## **system node migrate-root**

Start the root aggregate migration on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

The `system node migrate-root` command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, set it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that owns the root aggregate that you want to migrate. The value *local* specifies the current node.

### **{ -disklist <disk path name>,... - List of Disks for New Root Aggregate (privilege: advanced)**

Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

### **-raid-type {raid\_tec|raid\_dp|raid4|raid\_ep} - RAID Type for the New Root Aggregate (privilege: advanced)**

Specifies the RAID type of the root aggregate. The default value is *raid-dp*.

### **| -resume <true> - Resume a Failed Migrate Operation (privilege: advanced) }**

Resumes a failed migrate-root operation if the new\_root aggregate is created and the old root aggregate is in the restricted state.

## Examples

The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist
1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -raid-type raid-dp
```

## system node modify

### Modify node attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node modify` command sets the attributes of a node.

The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type <text> may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the [system node show](#) command to display the field values that this command modifies.

## Parameters

### **-node {<nodename>|local} - Node**

This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.

### **[-owner <text>] - Owner**

This optional text string identifies the node's owner. Fill it in as needed for your organization.

### **[-location <text>] - Location**

Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

### **[-assettag <text>] - Asset Tag**

If your organization uses asset tags to track equipment, you can use this text string to store that tag's value.

### **[-eligibility {true|false}] - Eligibility (privilege: advanced)**

This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node's eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

### **[-epsilon {true|false}] - Epsilon (privilege: advanced)**

If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

### **[-skip-quorum-check-before-eligible <true>] - Skip Quorum Check Before Setting Node Eligible (privilege: advanced)**

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

### **[-skip-quorum-check-before-ineligible <true>] - Skip Quorum Check Before Setting Node Ineligible (privilege: advanced)**

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

### **[-is-diff-svcs {true|false}] - Differentiated Services**

If set to `true` this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is false.

## **Examples**

The following example modifies the attributes of a node named node0. The node's owner is set to "IT" and its location to "Data Center 2."

```
cluster1::> system node modify -node node0 -owner "IT" -location "Data  
Center 2"
```

## **Related Links**

- [system node show](#)

## system node reboot

### Reboot a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node reboot` command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

### Parameters

#### **-node {<nodename>|local} - Node**

Specifies the node that is to be restarted. The value "local" specifies the current node.

#### **[-f, -inhibit-takeover <true>] - Disallow Storage Takeover by Partner**

If set to `true`, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. LIFs will migrate prior to reboot even when `inhibit-takeover` is set to `true`. To prevent LIF migration, `skip-lif-migration-prior-to-reboot` should be set to `true`. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is `false` and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to `true` and storage takeover is disabled during reboot.

#### **[-reason <text>] - Reason for Reboot**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

#### **[-d, -dump <true>] - Create a Core Dump**

If you would like the node to create a core dump before restarting, specify the `true` value with this parameter. If you enter this command without using this parameter, its effective value is `false` and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to `true` and the node creates a core dump.

#### **[-skip-lif-migration-before-reboot <true>] - Skip Migrating LIFs Away from Node Prior to Reboot**

If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

#### **[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Reboot**

If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

#### **[-ignore-strict-sync-warnings <true>] - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous relationships with policy of type `strict-sync-mirror` will be skipped. The operation will continue even if there is a possible data

outage due to not being able to fully sync data.

## Examples

The command in the following example restarts the node named `cluster1` for a software upgrade:

```
cluster1::> system node reboot -node cluster1 -reason "software upgrade"
```

## system node rename

### Rename a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node rename` command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the `-node local` parameter.

Use the [system node show](#) command to display the names of all the nodes in the current cluster.

### Parameters

#### **-node {<nodename>|local} - Node**

This parameter specifies which node you are renaming. The value `local` specifies the current node.

#### **-newname <text> - New Name**

Use this parameter to specify the new name of the node.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "\_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

## Examples

The following example changes the name of the node named `node3` to `node4`.

```
cluster1::> system node rename -node node3 -newname node4
```

### Related Links

- [system node show](#)

## system node restore-backup

Restore the original backup configuration to the HA target node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node restore-backup` command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the `system node restore-backup` command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.

**-target-address <Remote InetAddress> - HA Partner IP Address (privilege: advanced)**

Specifies the IP address for the target node.

## system node revert-to

Revert a node to a previous release of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node revert-to` command reverts a node's cluster configuration to the given version. After the `system node revert-to` command has finished, the `revert_to` command must be run from the nodeshell. The `revert_to` command reverts the filesystem on individual nodes to the target release. Before running `revert-to` in the cluster shell, the target release must be installed on the node.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that is to be reverted. The value `local` specifies the current node.

**-version <revert version> - Data ONTAP Version (privilege: advanced)**

Specifies the version of ONTAP to which the node is to be reverted.

**[-check-only <true>] - Capability Check (privilege: advanced)**

If set to `true`, this parameter specifies that the cluster configuration revert should perform checks to verify

all of the preconditions necessary for revert-to to complete successfully. Setting the parameter to `true` does not run through the actual revert process. By default this option is set to `false`.

## Examples

The command in the following example reverts cluster configuration of a node named `node1` to ONTAP version 9.16

```
cluster1::*> system node revert-to -node node1 -version 9.16
```

## system node run-console

### Access the console of a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node's console over the serial channel. This command works even if ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose physical console you want to access.

## Examples

The following example accesses the console of `node2` in the same cluster.

```
cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might
open on top of this session.
Type Ctrl-D.
SP-login: admin
Password:
*****
* This is an SP console session. Output from the      *
* serial console is also mirrored on this session.   *
*****
node2::>
node2::> Connection to 192.168.1.202 closed.

cluster1::>
```

## system node run

Run interactive or non-interactive commands in the nodeshell

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use the `system node run` command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the `-node` parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type '?' at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the `man` command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the `exit` command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The `system node run` command is not available from the GUI interface.

An alternate way to invoke the `system node run` command is by typing the `run` as a single word.

### Parameters

#### **-node {<nodename>|local} - Node**

Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the `exit` command.

#### **{ [-command <text>, ...] - Command to Run**

This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type '?' at an interactive nodeshell prompt.

#### **| [-reset <true>] - Reset Existing Connection }**

If this parameter is specified with the `true` value, it terminates any existing interactive nodeshell session on the specified node. The default value is `false`.

### Examples

The following example runs the nodeshell command `sysconfig -V` on a node named `node1`:

```
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
    group 0: 3 disks
```

The following example starts a nodeshell session on a node named node2 and then runs the nodeshell `sysconfig -V` command. The system remains in the nodeshell after running the `sysconfig -V` command.

```
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
    group 0: 3 disks
node2>
```

The following example starts a nodeshell session on a node named node1 and then runs two nodeshell commands, `aggr status` first and `vol status` second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single `run` command.

```
cluster1::> run -node node1 -command "aggr status; vol status"

    Aggr State          Status          Options
    aggr0 online        raid_dp, aggr    root
                        parity uninit'd!
                        32-bit
    aggr1 online        raid_dp, aggr    parity uninit'd!
                        32-bit

    Volume State        Status          Options
    vol0 online         raid_dp, flex    root, nvfail=on
                        parity uninit'd!
    root_vs0 online     raid_dp, flex    create_ucose=on,
                        cluster          convert_ucose=on,
                        parity uninit'd! maxdirsiz=102400
```

## system node show-discovered

Display all nodes discovered on the local network

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node show-discovered` command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you want to view.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**[-instance ] }**

If the `-instance` parameter is specified, the command displays detailed information about each node.

**[-node <text>] - Node Name**

This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

**[-is-in-cluster {true|false}] - Is in a Cluster**

If this parameter is set to `false`, the command lists only nodes that do not belong to a cluster.

**[-cluster-uuid <UUID>] - Cluster UUID**

Displays information about nodes belonging to the cluster that has the UUID you specify.

**[-cluster-name <text>] - Cluster Name**

Displays information about nodes belonging to the cluster that has the name you specify.

**[-serial-number <text>] - Node Serial Number**

Displays information about the node that has the serial number you specify.

**[-addresses <IP Address>,...] - Cluster IP Addresses**

Displays information about the node that has the cluster IP addresses you specify.

**[-netmask <IP Address>] - Cluster Address Mask**

Displays information about the nodes that have the netmask address you specify.

**[-nvramid <nvramid>] - Node NVRAM ID**

Displays information about the node that has the NVRAM ID you specify.

**[-partner-nvramid <nvramid>] - Partner NVRAM ID**

Displays information about the node that has an HA partner with the NVRAM ID you specify.

**[-model <text>] - Model**

Displays the nodes that have the specified model number.

**[-version <text>] - Software Version**

Displays the nodes that have the specified version of ONTAP.

## Examples

The following example displays information about all discovered nodes in the cluster network:

```
cluster1::*> system node show-discovered
```

| Node         | Cluster  | Addresses       | NVRAM ID   | Partner NVRAM |
|--------------|----------|-----------------|------------|---------------|
| 4069114-60-0 | -        | 169.254.232.178 | 4069114600 | -             |
| 4069114-60-2 | -        | 169.254.79.38   | 4069114602 | -             |
| 4069114-60-3 | -        | 169.254.195.76  | 4069114603 | -             |
| cluster1-01  | cluster1 | 169.254.140.39  | 4069114628 | 4069114629    |
| cluster1-02  | cluster1 | 169.254.138.137 | 4069114629 | 4069114628    |

## system node show

Display the list of nodes in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node show` command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you want to view. Use the [system node modify](#) command to change some of the field values that this command displays.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-inventory ]**

Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

**| [-messages ]**

Use this parameter to display system messages for each node.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for node names that match this parameter value.

**[-owner <text>] - Owner**

Selects nodes that have owner values that match this parameter value.

**[-location <text>] - Location**

Selects nodes at specific physical locations that match this parameter value.

**[`-model <text>`] - Model**

Selects nodes that have model numbers that match this parameter value.

**[`-serialnumber <text>`] - Serial Number**

Selects nodes that have serial numbers that match this parameter value.

**[`-assettag <text>`] - Asset Tag**

Selects nodes that have asset tags that match this parameter value.

**[`-uptime {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}`] - Uptime**

Selects nodes that have uptimes that match this parameter value. This parameter is most useful when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

**[`-nvramid <nvrmaid>`] - NVRAM System ID**

Selects nodes that have NVRAM system IDs that match this parameter value.

**[`-systemid <text>`] - System ID**

Selects nodes that have system IDs that match this parameter value.

**[`-vendor <text>`] - Vendor**

Selects nodes that have vendor names that match this parameter value.

**[`-health {true|false}`] - Health**

Selects nodes that have health values that match this parameter value. Specify `true` to display healthy nodes, and `false` to display unhealthy nodes.

**[`-eligibility {true|false}`] - Eligibility**

Selects nodes that have voting eligibility values that match this parameter value.

**[`-epsilon {true|false}`] - Epsilon (privilege: advanced)**

Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify `true` to display the node holding epsilon, and `false` to display nodes not holding epsilon.

**[`-uuid <UUID>`] - UUID (privilege: advanced)**

Selects nodes that have the specified universal unique identifiers that match this parameter value.

**[`-is-diff-svcs {true|false}`] - Differentiated Services**

If `true`, the corresponding node is considered to be part of differentiated services storage infrastructure.

**[`-is-all-flash-optimized {true|false}`] - All-Flash Optimized**

Selects nodes that have "All-Flash Optimized" personality values that match this parameter value. Specify `true` to display nodes which support only SSD drives, and `false` to display nodes which support all kinds of drives.

### **`[-is-capacity-optimized {true|false}] - Capacity Optimized`**

Selects nodes that have "Capacity Optimized" personality values that match this parameter value. Specify *true* to display nodes which support only SSD drives with Capacity Optimized personality enabled and set *false* otherwise.

### **`[-is-qlc-optimized {true|false}] - FAS QLC Optimized`**

Selects nodes that have "QLC Optimized" personality values that match this parameter value. Specify *true* to display nodes which support only SSD drives with QLC Optimized personality enabled and set *false* otherwise.

### **`[-is-all-flash-select-optimized {true|false}] - All-Flash Select Optimized`**

Selects nodes that have "All-Flash Select Optimized" personality values that match this parameter value. Specify *true* to display nodes which support only SSD drives, and *false* to display nodes which support all kinds of drives.

### **`[-sas2-sas3-mixed-stack-support {all|direct-attached|bridge-attached|none}] - SAS2/SAS3 Mixed Stack Support`**

Selects nodes that have "SAS2/SAS3 Mixed Stack Support" values that match this parameter value. The possible values are:

- *all* : SAS2/SAS3 mixing supported on all stacks
- *direct-attached* : SAS2/SAS3 mixing supported on direct-attached stacks
- *bridge-attached* : SAS2/SAS3 mixing supported on bridge-attached stacks
- *none* : SAS2/SAS3 mixing not supported

### **`[-is-disaggregated {true|false}] - Disaggregated Storage`**

If true, the corresponding node is considered part of the disaggregated storage infrastructure.

### **`[-personality <text>] - Personality`**

Selects nodes that have the ONTAP personality that match this parameter value.

## **Examples**

The following example displays information about all nodes in the cluster:

```
cluster1::> system node show
Node      Health Eligibility Uptime           Model      Personality Location
-----
node0     true   true      89 days 23:47 MODELXX   Unified    Data Center
2
node1     true   true     15 days 22:37 MODELXX   Unified    Data Center
2
node2     true   true     15 days 23:00 MODELXX   Unified    Data Center
2
node3     true   true     15 days 22:37 MODELXX   Unified    Data Center
2
4 entries were displayed.
```

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
node      location model
-----
node5     Lab 1    MODELXX
node7     Lab 3    MODELXX
node9     Lab 5    MODELXX
```

## system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke-core-upload` command sends two AutoSupport messages. The first AutoSupport message contains the content relevant to this core upload. This AutoSupport message has subject line with prefix "CORE INFO:". The second Autosupport message contains the core file specified by the "-core-filename" option. This AutoSupport message has subject line with prefix "CORE UPLOAD:". The command requires that the specified file be present while the AutoSupport message is being transmitted.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "https" protocol is supported. If this parameter is omitted, the message is sent to all the recipients defined by the [system node autosupport modify](#) command.

### **[-force <>true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-case-number <text>] - Case Number for This Core Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **-core-filename <text> - The Existing Core Filename to Upload**

Use this parameter to specify the core file to be included in the AutoSupport message. Use the [system node coredump show](#) command to list the core files by name.

## **Examples**

Use this command to list the core files from a node:

```
cluster1::> system node coredump show -node local
Node:Type Core Name                               Saved Panic Time
-----
node:kernel
      core.4073000068.2013-09-11.15_05_01.nz      true  9/11/2013
15:05:01
```

Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11.15\_05\_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename
core.4073000068.2013-09-11.15_05_01.nz -node local
```

## **system node autosupport invoke-diagnostic**

Generate and send an AutoSupport message with diagnostic content from specified subsystems.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node autosupport invoke-diagnostic` command sends an AutoSupport message from a node containing basic content from all subsystems along with troubleshooting and diagnostic content from specified subsystems.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node from which the AutoSupport message is sent.

**[-message-subject <text>] - Message Included in the AutoSupport Subject (privilege: advanced)**

Use this parameter to specify text sent in the subject line of the AutoSupport message.

**[-uri <text>] - Alternate Destination for This AutoSupport (privilege: advanced)**

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto" and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

**[-force <true>] - Generate and Send Even if Disabled (privilege: advanced)**

This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0", then obey the normal "state", "support" and "diagnostic-content-state" flags. If this is "1", then ignore the "state", "support" and "diagnostic-content-state".

**-subsystems <subsys1,subsys2,...>,... - Subsystems to Collect Basic, Troubleshooting & Diagnostic Content (privilege: advanced)**

Use this mandatory parameter to include basic, troubleshooting, and diagnostic configuration content from the subsystems you specify. Content is collected from the "mandatory" subsystem and the subsystems you specify. You can specify up to four subsystems.

## Examples

The following example sends a diagnostic AutoSupport message from a node named myNode containing information from the "mandatory" subsystem and basic, troubleshooting and diagnostic contents from "raid", "wafl" and "ha" subsystems:

```
cluster1::> system node autosupport invoke-diagnostic -node myNode
-subsystems raid,wafl,ha
```

## system node autosupport invoke-performance-archive

Generate and send an AutoSupport message with performance archives.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke-performance-archive` command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

Performance archive upload is not supported when the `-remove-private-data` parameter is enabled. To disable this parameter, use the `system node autosupport modify -remove-private -data false` command.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "file" and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the `system node autosupport modify` command.

### **[-force <true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-case-number <text>] - Case Number for This Performance Archive Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **-start-date <MM/DD/YYYY HH:MM:SS> - Start Date for Performance Archive Dataset**

Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

### **{ -end-date <MM/DD/YYYY HH:MM:SS> - End Date for Performance Archive Dataset**

Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

### **[-duration <[<integer>h] [<integer>m] [<integer>s]> - Duration of Performance Archive Dataset }**

Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.

## Examples

Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

```
cluster1::> system node autosupport invoke-performance-archive -node local
-start-date 9/12/2013 19:37:24 -end-date 9/12/2013 22:37:24
cluster1::> system node autosupport invoke-performance-archive -node local
-start-date 11/21/2013 13:42:09 -duration 6h
```

## system node autosupport invoke-spllog

Generate and send an AutoSupport message with collected service-processor log files

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke-spllog` command sends an AutoSupport message with the Service Processor (SP) or baseboard management controller (BMC) log files from a specified node in the cluster.

## Parameters

### **-remote-node {<nodename>|local} - Node**

Use this parameter to specify the node from which Service Processor log files are to be collected.

### **[-log-sequence <integer>] - Log File Sequence Number**

Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "file" and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

### **[-force <true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-full <true>] - Full Log Collection**

Use this parameter to collect full logs from the SP or BMC.

### **[-show-full-progress <true>] - Full Log Collection Progress Status**

Use this parameter to find the status of a full log collection from a SP or BMC.

## Examples

Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

```
cluster1::> system node autosupport invoke-splog -remote-node cluster1-02
[Job 777] Job succeeded: Log files from the service processor have been
transferred to "/mroot/etc/log/sp/ondemand" on node cluster1-01, and
AutoSupport message has been triggered.

cluster1::>
```

## system node autosupport invoke

Generate and send an AutoSupport message

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport invoke` command sends an AutoSupport message from a node.

### Parameters

#### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

#### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the `-type` parameter is set to performance.

#### **-type {test|performance|all} - Type of AutoSupport Collection to Issue**

Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a `-type`.

- test - The message contains basic information about the node. When the AutoSupport message is received by technical support, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by technical support.
- all - The message contains all collected information about the node.
- performance - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the `-perf` parameter of the [system node autosupport modify](#) command.

#### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto" and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

### **[`-force <true>`] - Generate and Send Even if Disabled**

Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

### **Examples**

The following example sends a test AutoSupport message from a node named `node0` with the text "Testing ASUP":

```
cluster1::> system node autosupport invoke -node node0 -type test -message
"Testing ASUP"
```

### **Related Links**

- [system node autosupport modify](#)

## **system node autosupport modify**

Modify AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system node autosupport modify` command modifies the AutoSupport configuration of all the nodes in the cluster.

### **Parameters**

#### **`-node {<nodename>|local}` - Node**

The AutoSupport configuration will be modified on all nodes in the cluster, even if this parameter is specified.

This parameter is ignored, but retained for CLI backward compatibility.

#### **[`-state {enable|disable}`] - State**

Use this parameter to specify whether AutoSupport is enabled or disabled. The default setting is `enable`. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's technical support, your internal support organization, or partners.

#### **[`-mail-hosts <text>,...`] - SMTP Mail Hosts**

Use this parameter to specify up to five SMTP mail hosts through which AutoSupport messages are sent out. This parameter is required if you specify e-mail addresses in the `-to`, `-noteto`, or `-partner-address` parameters or if you specify `smtp` in the `-transport` parameter. Separate multiple mail hosts with commas and do not use spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, `mymailhost.example.com:5678`). The default port value is `587` if `-smtp-encryption` is set to `start_tls`. Otherwise, the default is `25`.

Also, you can optionally specify a user name and password combination for authentication to each mail server. The format when specifying a username is `user1@mymailhost.example.com`. User will be prompted for the password. The username and password can be specified on none, all, or some of the mail hosts.

If the user name itself includes the "@" symbol and domain information, the format to be used is `user%40domain.com@mymailhost.example.com`. User will be prompted for the password.

The default value for this parameter is `mailhost`.

#### **`[-from <mail address>]` - From Address**

Use this parameter to specify the e-mail address from which all the nodes in the cluster send AutoSupport messages. The default is Postmaster. If you require node-specific "from" addresses, enable the node-specific-from (privilege: advanced) parameter.

#### **`[-to <mail address>,...]` - List of To Addresses**

Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-to` parameter of the [system node autosupport trigger modify](#) command. By default, no list is defined.

#### **`[-noteto <mail address>,...]` - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification destination create](#) command to create an email destination and the [event notification create](#) command to map the `important-events` system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the [event filter rule add](#) command. This newly created filter has to be mapped to the event destination.

Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-noteto` parameter of the [system node autosupport trigger modify](#) command. By default, no list is defined.

#### **`[-partner-address <mail address>,...]` - List of Partner Addresses**

Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. By default, no list is defined.

#### **`[-support {enable|disable}]` - Send AutoSupport Messages to Vendor Support**

Use this parameter to specify whether to send all AutoSupport messages to your vendor's technical support. (Destination information is pre-defined and does not require configuration.) When `-state` is enabled and `-support` is disabled, messages are sent to the addresses specified in the `-to`, `-noteto`, or `-partner-address` parameters but are not sent to your vendor's technical support. The default is `enable`.

## **[-transport {smtp|https}] - Protocol to Contact Support**

*http* transport is no longer supported by AutoSupport servers.

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's technical support. This parameter applies only when the `-support` parameter is set to enable. If you specify `https` and your network uses a proxy, you must also set the `-proxy-url` parameter. If you specify `smtp`, you must also configure the `-mail-hosts` parameter.

## **[-proxy-url <text>] - Support Proxy URL**

Use this parameter to specify an HTTP/S proxy if the `-transport` parameter is set to `HTTPS` and your organization uses a proxy. Enter the URL with an `http://` or `https://` prefix. If a scheme is not specified with the URL, it is assumed to be `http://`. If authentication is required, use the format "`[username]@[host][:[port]]`". You will be prompted for the password. If using an `HTTPS` proxy, you also need to install the correct Root CA certificates in ONTAP. The default is an empty string. To specify a proxy that contains a question mark, press `ESC` followed by the `"?"`. This field can be cleared by setting the value to an empty string using two double quotes (`""`).

## **[-hostname-subj {true|false}] - Hostname Subject**

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is `false`. This parameter applies only if the `-remove-private-data` parameter is `true`.

## **[-perf {true|false}] - Performance Data Enable**

Use this parameter to specify whether performance data is sent to technical support and addresses specified in the `-partner-address` parameter. The default is `true`.

## **[-retry-interval [<integer>h [<integer>m [<integer>s]]] - Retry Interval**

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with `"s"`, `"m"`, or `"h"` to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

## **[-retry-count <integer>] - Retry Count**

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

## **[-reminder {true|false}] - Reminder Enable**

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to technical support. This reminder is logged as an EMS event called `"autosupport.general.reminder"` every 24 hours. The default is `true`.

## **[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTPS Size**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for `HTTPS` transfers. This parameter applies only to messages sent to technical support and only if the `-transport` parameter is set to `HTTPS`. Setting the value to 0 disables the delivery size budget. The default is 50 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the `"system node autosupport manifest show"` command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the `"system node autosupport trigger show"` command with the `-instance`

parameter.

### **[`-max-smtp-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in the `-to`, `-noteto`, and `-partner-address` parameters. If the `-transport` parameter is set to `smtp`, this parameter also applies to messages sent to the vendor's technical support. Setting the value to 0 disables the delivery size budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the `-instance` parameter.

### **[`-remove-private-data` {true|false}] - Remove Sensitive Data**

Use this parameter with the value `true` to remove, encode, or mask sensitive data from AutoSupport attachments and headers. Use this feature to eliminate private data from all AutoSupport messages. The default is `false`.

Eliminated data can include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy names, user IDs, group IDs, LUNs, NVMe namespaces and qtree names.

Unstructured log files (such as the EMS event log) are also no longer collected by AutoSupport to ensure sensitive data is not included. As a result, log files will need to be manually collected and provided to technical support for troubleshooting purposes.

Changing this value from `false` to `true` deletes the AutoSupport history and all files associated with it.

### **[`-validate-digital-certificate` {true|false}] - Validate Digital Certificate Received (privilege: advanced)**

Use this parameter with the value `true` to force each node to validate digital certificates that it receives. The default is `true`. When this value is true, the certificate might be validated by OCSP. The OCSP validation for these certificates is controlled by [security config ocsd enable -app autosupport](#) and [security config ocsd disable -app autosupport](#).

### **[`-ondemand-state` {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)**

Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled. The default is `enable`. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport OnDemand requests from support personnel.

### **[`-ondemand-remote-diagnostics-state` {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)**

Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or disabled. The default is `enable`. When AutoSupport OnDemand Remote Diagnostics is enabled, support personnel can remotely trigger new AutoSupport messages on this node to gather information during troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-

send existing AutoSupport messages that may not have been transmitted correctly.

**`[-compress-spool-dir {true|false}]` - Compress AutoSupport Spool Dir (privilege: advanced)**

Use this parameter with the value `true` to compress the AutoSupport spool directory once the AutoSupport is in a terminal state. The default is `true`.

**`[-node-specific-from {enable|disable}]` - Node-Specific From Address (privilege: advanced)**

Use this parameter to specify whether the "from" e-mail address needs to be node-specific. If enabled, the node-specific "from" e-mail address is generated by prepending the node name and "-" to the configured "from" address. For example, if the node name is "cluster-01" and the "from" parameter is "[prod@company.com](mailto:prod@company.com)", the generated "from" e-mail address is "[cluster-01-prod@company.com](mailto:cluster-01-prod@company.com)".

**`[-validate-smtp-certificate {true|false}]` - Validate Certificate of SMTP Server (privilege: advanced)**

Use this parameter with the value `true` to force each node to validate digital certificates that it receives from the SMTP server. The default is `true`. When this value is true, the certificate might be validated by OCSP. The OCSP validation for these certificates is controlled by [security config ocsp enable -app autosupport](#) and [security config ocsp disable -app autosupport](#).

**`[-smtp-encryption {none|start_tls}]` - SMTP Encryption**

Use this parameter to specify the encryption protocol used to deliver AutoSupport messages to the configured mail servers. When this parameter is set to `none`, the SMTP AutoSupport message is not encrypted. When this parameter is set to `start_tls`, the existing plaintext channel is upgraded to a TLS encrypted channel using the STARTTLS protocol. If the TLS connection fails, there is no fallback to plaintext transfer. The default is `none`.

**`[-force <true>]` - Bypass Interdependency Checks (privilege: advanced)**

Use this parameter to modify some of the AutoSupport configurations that are otherwise blocked when the automatic update feature is enabled. Without this parameter, an attempt to disable AutoSupport, modify the transport to SMTP, or disable the AutoSupport OnDemand feature fails if the automatic update feature is enabled.

## Examples

The following example enables AutoSupport on all nodes in the cluster with the following settings:

- SMTP mail host named `smtp.example.com`.
- E-mail "from" address of [alerts@example.com](mailto:alerts@example.com)
- E-mail "to" address of [support@example.com](mailto:support@example.com)
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- If sending fails, the system will wait 23 minutes before retrying.

```
cluster1::> system node autosupport modify -state enable -mail-hosts
smtp.example.com -from alerts@example.com -to support@example.com -support
enable -transport https -retry-interval 23m
```

The following examples show how to modify AutoSupport URLs when using IPv6 address literals. You will be

prompted for the password in the second example:

```
cluster1::> system node autosupport modify -mail-hosts  
[2620:10a:4002:6004::bbbb]:25
```

```
cluster1::> system node autosupport modify -proxy-url  
username@[2620:10a:4002:6004::bbbb]:8080
```

## system node autosupport show

### Display AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport show` command displays the AutoSupport configuration of one or more nodes.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-config ]**

Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

**| [-recent ]**

Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

**| [-support-http ]**

Use this parameter to display whether HTTP support is enabled in the cluster, and identify the transport protocol and the support proxy URL used.

## **| [-support-smtp ]**

Use this parameter to display whether SMTP (e-mail) support is enabled in the cluster, and identify the transport protocol and the "to" e-mail address used.

## **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## **[-node {<nodename>|local}] - Node**

The AutoSupport configuration is identical for all nodes in the cluster.

Use this parameter to display detailed information about the node you specify.

## **[-state {enable|disable}] - State**

Use this parameter to display information only about nodes that have the AutoSupport state you specify.

## **[-mail-hosts <text>,...] - SMTP Mail Hosts**

Use this parameter to display information only about nodes that use the mail hosts you specify.

The port number used is displayed with the mailhost after a ":". The default port value is `587` if `-smtp-encryption` is set to `start_tls`. Otherwise, the default is `25`.

## **[-from <mail address>] - From Address**

Use this parameter to display information only about nodes that have the "from" e-mail address you specify.

## **[-to <mail address>,...] - List of To Addresses**

Use this parameter to display information only about nodes that have the "to" e-mail addresses you specify.

## **[-noteto <mail address>,...] - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.

## **[-partner-address <mail address>,...] - List of Partner Addresses**

Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the "-to" addresses of AutoSupport triggers.

## **[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support**

Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's technical support. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's technical support.

## **[-transport {smtp|https}] - Protocol to Contact Support**

Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

### **[-url <text>] - Support URL for HTTPS**

Use this parameter to display information only about nodes that use the URL you specify to send messages through the HTTPS POST operations.

### **[-put-url <text>] - Support URL for HTTPS PUT**

Use this parameter to display information only about nodes that use the URL you specify to send messages through the HTTPS PUT operations.

### **[-proxy-url <text>] - Support Proxy URL**

Use this parameter to display information only about nodes that use the proxy URL you specify.

### **[-support-address <mail address>,...] - Support Address**

Use this parameter to display information only about nodes that use the external support address you specify.

### **[-hostname-subj {true|false}] - Hostname Subject**

Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is `false`, this parameter has no effect.

### **[-perf {true|false}] - Performance Data Enable**

Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

### **[-retry-interval <[<integer>h] [<integer>m] [<integer>s]>] - Retry Interval**

Use this parameter to display information only about nodes that use the retry interval you specify.

### **[-retry-count <integer>] - Retry Count**

Use this parameter to display information only about nodes that use the retry count you specify.

### **[-reminder {true|false}] - Reminder Enable**

Use this parameter with the value "true" to display information only about nodes that send messages reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the value "false" to display information only about nodes that do not send reminder messages.

### **[-last-subject <text>] - (DEPRECATED) Last Subject Sent**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message had the "Subject:" line you specify.

### **[-last-time <MM/DD/YYYY HH:MM:SS>] - (DEPRECATED) Last Time Sent**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message was sent at the date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

### **[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTPS Size**

Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to

the file size you specify.

**[`-max-smtp-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size**

Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail) transfers to the file size you specify.

**[`-remove-private-data` {true|false}] - Remove Sensitive Data**

Use this parameter with the value "true" to display information only about nodes that remove sensitive data from AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not remove sensitive data.

**[`-validate-digital-certificate` {true|false}] - Validate Digital Certificate Received (privilege: advanced)**

Use this parameter with the value "true" to display information only about nodes that validate digital certificates they receive. Use this parameter with the value "false" to display information only about nodes that do not validate digital certificates.

**[`-ondemand-state` {enable|disable}] - AutoSupport OnDemand State (privilege: advanced)**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you specify.

**[`-ondemand-remote-diagnostics-state` {enable|disable}] - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote Diagnostics state you specify.

**[`-ondemand-server-url` <text>] - AutoSupport OnDemand Server URL**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server URL you specify.

**[`-compress-spool-dir` {true|false}] - Compress AutoSupport Spool Dir (privilege: advanced)**

Use this parameter to display information only about nodes with the AutoSupport spool directory compression state you specify.

**[`-node-specific-from` {enable|disable}] - Node-Specific From Address (privilege: advanced)**

Use this parameter to display information that matches the specified value - enabled or disabled.

**[`-validate-smtp-certificate` {true|false}] - Validate Certificate of SMTP Server (privilege: advanced)**

Use this parameter with the value "true" to display information only about nodes that validate certificates they receive from the SMTP server. Use this parameter with the value "false" to display information only about nodes that do not validate certificates from the SMTP server.

**[`-smtp-encryption` {none|start\_tls}] - SMTP Encryption**

Use this parameter to display information only about nodes that use the encryption protocol you specify to send SMTP AutoSupport messages.

## Examples

The following example displays the AutoSupport configuration for a node named node3:

```

cluster1::> system node autosupport show -node node3
Node: node3
State: enable
SMTP Mail Hosts: smtp.example.com:25
From Address: alerts@example.com
List of To Addresses: support@example.com
List of Noteto Addresses: -
List of Partner Addresses: support@partner.com
Send AutoSupport Messages to Vendor Support: enable
Protocol to Contact Support: https
Support Proxy URL: support.proxy.example.com
Hostname Subject: true
Performance Data Enable: true
Retry Interval: 4m
Retry Count: 15
Reminder Enable: true
The Transmission Window: 1h
Last Subject Sent: WEEKLY
Last Time Sent: 3/1/2019 06:00:03
Maximum HTTP Size: 50MB
Maximum SMTP Size: 5MB
Remove Sensitive Data: false
Continue Local Collection while Disabled: true
SMTP Encryption: none

```

## system node autosupport check show-details

Display detailed status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport check show-details` command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node <nodename>`] - Node**

Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.

**[`-check-type <Type of AutoSupport Check>`] - AutoSupport Check Type**

Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.

**[`-status {ok|warning|failed|not-run}`] - Status of the Check**

Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check.

**[`-error-detail <text>`] - Detailed Description of Error**

Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.

**[`-corrective-action <text>`] - Corrective Action**

Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check

**Examples**

The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```
cluster1::> system node autosupport check show-details -node node2
```

```
Node: node2

Category: https
  Component: https-put-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/put".
  Component: https-post-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/post".

Category: smtp
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "mailhost.netapp.com".
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "sendmail.domain.com".
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "gmail.domain.com".

Category: on-demand
  Component: ondemand-server
    Status: ok
    Detail: Successfully connected to "support.netapp.com/aods".

Category: configuration
  Component: configuration
    Status: ok
    Detail: No configuration issues found.
```

## system node autosupport check show

Display overall status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

### Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node**

Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

**[-http-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport HTTPS Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTPS destination was established.

**[-aod-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport OnDemand Server**

Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

**[-smtp-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport SMTP Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.

**[-config-status {ok|warning|failed|not-run}] - Overall Status of AutoSupport Configuration**

Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

**[-warning-text <text>] - Conditional Warning Message**

Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

**Examples**

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```

|           |       |               |
|-----------|-------|---------------|
| On Demand |       |               |
| Server    | SMTP  | Configuration |
| -----     | ----- | -----         |
| ok        | ok    | ok            |

**system node autosupport destinations show**

Display a summary of the current AutoSupport destinations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport destinations show` command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

**[-destinations <text>,...] - Destinations**

Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

## Examples

This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTPS POST, HTTPS PUT, and e-mail notifications.

```
cluster1::> system node autosupport destinations show
Node
    Destinations
-----
node1
  https://asuppost.example.com/cgi-bin/asup.cgi
  https://asupput.example.com/cgi-bin/asup.cgi
  support@example.com

node2
  https://asuppost.example.com/cgi-bin/asup.cgi
  https://asupput.example.com/cgi-bin/asup.cgi
  support@example.com
```

## system node autosupport history cancel

Cancel an AutoSupport Transmission.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history cancel` command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the [system node autosupport history retransmit](#) command.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

### **[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

## Examples

Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10
```

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10  
-destination http
```

## Related Links

- [system node autosupport history retransmit](#)

## system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history retransmit` command retransmits a locally stored AutoSupport message.

Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the [system node autosupport history show](#) command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the [system node autosupport history show](#) command to display the 50 most recent AutoSupport messages, which are available for retransmission.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message to retransmit.

### **-uri <text> - Destination to Send this AutoSupport**

Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.

### **[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Transmit Size Limit for this AutoSupport.**

Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

## Examples

The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

```
cluster1::> system node autosupport history retransmit -node node1 -seq
-num 45 -uri mailto:support@example.com
```

## Related Links

- [system node autosupport history show](#)

## system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history show-upload-details` command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number

- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of Upload
- Time Remaining

**[-node {<nodename>|local}] - Node**

Use this parameter to display details of AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for this AutoSupport**

*http* destination indicates the HTTPS protocol was used to deliver the AutoSupport.

Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Autosupport Compressed Size**

Use this parameter to display details of AutoSupport messages of the compressed size you specify.

**[-percent-complete <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

**[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[*-time-remaining* <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

**Examples**

The following example shows the first three results output by the history show-upload-details command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show-upload-details -node
node1
```

| Node  | Seq<br>Num | Destination | Size    | Percent<br>Complete | Rate       | Time<br>Remaining |
|-------|------------|-------------|---------|---------------------|------------|-------------------|
| ----- |            |             |         |                     |            |                   |
| node1 | 13         | smtp        | 755.9KB | 100                 | 142.88KBps | 0s                |
|       |            | http        | 755.8KB | 80                  | 125.97KBps | 10s               |
|       |            | noteto      | -       | -                   | -          | -                 |
|       | 12         | smtp        | -       | -                   | -          | -                 |
|       |            | http        | 316.4KB | 100                 | 158.22KBps | 0s                |
|       |            | noteto      | 201B    | 100                 | 201Bps     | 0s                |
|       | 11         | smtp        | -       | -                   | -          | -                 |
|       |            | http        | 626.1MB | 100                 | 649.56KBps | 0s                |
|       |            | noteto      | -       | -                   | -          | -                 |

Press <space> to page down, <return>> for next line, or 'q' to quit... q  
9 entries were displayed.

**system node autosupport history show**

Display recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node autosupport history show` command displays information about the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport sequence number
- Destination type, such as smtp
- Status of delivery, such as sent-successful
- Attempt count

- Time of last update

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-delivery ]**

Use this parameter to display destination information about each AutoSupport message.

**| [-detail ]**

Use this parameter to display trigger and subject information about each AutoSupport message.

**| [-instance ] }**

Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

**[-node {<nodename>|local}] - Node**

Use this parameter to display only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

*http* destination indicates the HTTPS protocol was used to deliver the AutoSupport.

Use this parameter to display only AutoSupport messages that were sent to the destination type you specify.

**[-trigger <Message Name>] - Trigger Event**

Use this parameter to display only AutoSupport messages that match the trigger event you specify.

**[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update**

Use this parameter to display only AutoSupport messages that were updated most recently at the time you specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

### **[`-status` <AutoSupport general status>] - Status of Delivery**

Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:

- `initializing` - The AutoSupport message request is being processed.
- `collection-failed` - The AutoSupport collection failed. View the 'Last Error' field of this message for more information.
- `collection-in-progress` - The AutoSupport collection is in progress.
- `queued` - The AutoSupport message is queued for delivery.
- `transmitting` - The AutoSupport message transmission is in progress.
- `sent-successful` - The AutoSupport message was sent successfully.
- `ignore` - The AutoSupport message was processed successfully, but the trigger event is not configured for delivery to the current destination type.
- `re-queued` - The AutoSupport message transmission failed, has been re-queued, and will be retried.
- `transmission-failed` - The AutoSupport message transmission failed, and the retry limit was exceeded.
- `ondemand-ignore` - The AutoSupport message was processed successfully, but the AutoSupport On Demand server chose to ignore it.

### **[`-attempt-count` <integer>] - Delivery Attempts**

Use this parameter to display only AutoSupport messages that the system has attempted to send the number of times you specify. This parameter is most useful when given a range, such as ">5".

### **[`-subject` <text>] - AutoSupport Subject**

Use this parameter to display only AutoSupport messages of the type you specify.

### **[`-uri` <text>] - Delivery URI**

Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

### **[`-error` <text>] - Last Error**

Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you specify.

### **[`-generated-on` <MM/DD/YYYY HH:MM:SS>] - Time of Generation**

Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

### **[`-size` {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size**

Use this parameter to display only AutoSupport messages of the compressed size you specify.

### **[`-percent-complete` <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

### **[`-upload-rate` {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[-time-remaining <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time Remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

**[-decompressed-size {<integer>[KB|MB|GB|TB|PB] }] - AutoSupport Decompressed Size**

Use this parameter to display only AutoSupport messages of the decompressed size you specify.

**[-total-time <integer>] - Total Collection Time (ms)**

Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only shown when the collection has completed.

## Examples

The following example shows the first three results output by the history command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show -node node1
```

| Node     | Seq<br>Num | Destination | Status          | Attempt<br>Count | Last<br>Update |
|----------|------------|-------------|-----------------|------------------|----------------|
| -----    |            |             |                 |                  |                |
| node1    | 56         |             |                 |                  |                |
|          |            | smtp        | ignore          | 1                | 11/18/2010     |
| 01:10:01 |            | http        | re-queued       | 2                | 11/18/2010     |
| 02:50:07 |            | noteto      | transmitting    | 1                | 11/18/2010     |
| 01:10:01 | 55         |             |                 |                  |                |
|          |            | smtp        | ignore          | 1                | 11/18/2010     |
| 00:53:59 |            | http        | sent-successful | 3                | 11/18/2010     |
| 01:50:03 |            | noteto      | sent-successful | 1                | 11/18/2010     |
| 00:53:59 | 54         |             |                 |                  |                |
|          |            | smtp        | ignore          | 1                | 11/17/2010     |
| 12:18:58 |            | http        | sent-successful | 4                | 11/17/2010     |
| 16:07:22 |            | noteto      | sent-successful | 1                | 11/17/2010     |
| 12:18:58 |            |             |                 |                  |                |

Press <space> to page down, <return> for next line, or 'q' to quit... q  
9 entries were displayed.

## system node autosupport manifest show

Display AutoSupport content manifest

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport manifest show` command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-content ]**

Use this parameter to display detailed information about the content of the files contained in the report.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-prio-num <integer>] - Priority Order of Collection**

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

**[-subsys <subsys1,subsys2,...>] - Subsystem**

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

**[-cmd-tgt <Execution domain of AutoSupport content>] - Execution Domain for Command**

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

**[-body-file <text>] - The AutoSupport Content Filename for this Data**

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

### **[`-cmd <text>`] - Actual Data Being Collected**

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

### **[`-query <text>`] - Table Query for XML Collection**

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

### **[`-size-collected {<integer>[KB|MB|GB|TB|PB]}`] - Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.

### **[`-time-collected <integer>`] - Collection Time for this Data Item (ms)**

Use this parameter to display information about only AutoSupport message content collected in the amount of time you specify, in milliseconds.

### **[`-status <AutoSupport manifest collection status>`] - Status of this Data Item**

Use this parameter to display information about only AutoSupport message content with the collection status you specify. Possible statuses are:

- `requested` - The AutoSupport request has been added to the queue and is waiting processing by the collector.
- `working` - The AutoSupport collector is actively gathering the needed data.
- `file-not-found` - AutoSupport data collection failed because a necessary file is missing.
- `no-such-table` - The AutoSupport collector was unable to find the requested SMF table.
- `collection-truncated-size-limit` - AutoSupport data was truncated due to size limits, but partial data is available.
- `collection-truncated-file-size-limit` - AutoSupport data for a particular data item or file was truncated due to file size limits, but partial data is available.
- `collection-skipped-size-limit` - AutoSupport data was skipped due to size limits, and no data is available.
- `collection-truncated-time-limit` - AutoSupport data was truncated due to time limits, but partial data is available.
- `collection-skipped-time-limit` - AutoSupport data was skipped due to time limits, and no data is available.
- `delivery-skipped-size-limit` - AutoSupport data was skipped at delivery time due to size limits.
- `collection-truncated-age` - AutoSupport data for the particular data item or file was truncated due to age, but partial data is available.
- `general-error` - AutoSupport data collection failed. Additional information (if any) is in the Error String field.
- `completed` - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.
- `content-not-collected-precheck` - AutoSupport content was not collected due to pre-check function violation.
- `content-not-collected-privacy` - AutoSupport content was not collected because the operation

is disabled in privacy mode.

- `content-empty` - AutoSupport content was collected successfully, but the output was empty.
- `collection-aborted` - AutoSupport data collection was aborted.

#### **`[-error <text>]` - Textual Description of Error**

Use this parameter to display information about only AutoSupport message content with the error text you specify. If data collection has failed, the error text contains a description of the failure. If data collection completes successfully, this field is empty.

#### **`[-content-type <Type of AutoSupport content>]` - AutoSupport Content Type for this Data**

Use this parameter to display information about only AutoSupport message content of the type you specify. Types supported are:

- `basic` - Configuration data about this subsystem
- `troubleshooting` - Detailed diagnostic data about this subsystem

#### **`[-orig-size-collected {<integer>[KB|MB|GB|TB|PB]}]` - Initial Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

#### **`[-size-compressed {<integer>[KB|MB|GB|TB|PB]}]` - Compressed Size**

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

### **Examples**

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
```

| Node  | Sequence | AutoSupport<br>Body Filename      | Collected<br>Size | Status    | Error |
|-------|----------|-----------------------------------|-------------------|-----------|-------|
| node1 | 372      | SYSCONFIG-A.txt                   | 1.73KB            | completed |       |
|       |          | OPTIONS.txt                       | 29.44KB           | completed |       |
|       |          | software_image.xml                | 7.56KB            | completed |       |
|       |          | CLUSTER-INFO.xml                  | 3.64KB            | completed |       |
|       |          | autosupport.xml                   | 12.29KB           | completed |       |
|       |          | autosupport_budget.xml            |                   |           |       |
|       |          |                                   | 7.01KB            | completed |       |
|       |          | autosupport_history.xml           |                   |           |       |
|       |          |                                   | 46.52KB           | completed |       |
|       |          | X-HEADER-DATA.TXT                 | 717.00B           | completed |       |
|       |          | SYSTEM-SERIAL-NUMBER.TXT          |                   |           |       |
|       |          |                                   | 35.00B            | completed |       |
|       |          | cluster_licenses.xml              |                   |           |       |
|       |          |                                   | 3.29KB            | completed |       |
|       |          | cm_hourly_stats.gz                | 151.4KB           | completed |       |
|       |          | boottimes.xml                     | 56.86KB           | completed |       |
|       |          | rdb_txn_latency_stats_hrly.xml    |                   |           |       |
|       |          |                                   | 39.31KB           | completed |       |
|       |          | rdb_voting_latency_stats_hrly.xml |                   |           |       |
|       |          |                                   | 3.43KB            | completed |       |

```
14 entries were displayed.
```

This example shows how you can use parameters to limit output to specific fields of a specific AutoSupport message. This is helpful when troubleshooting.

```

```

## system node autosupport trigger modify

### Modify AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use the `system node autosupport trigger modify` command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

### **-autosupport-message <Autosupport Message> - EMS Message**

Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

### **[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses**

Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

### **[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification destination create](#) command to create an email destination and the [event notification create](#) command to map the `important-events` system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the [event filter rule add](#) command. This newly created filter has to be mapped to the event destination.

Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

### **[-basic-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Basic Info**

Use this parameter to include *basic* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

### **[-troubleshooting-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Troubleshooting Info**

Use this parameter to include *troubleshooting* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

### **[-suppress {true|false}] - Suppress all occurrences of this trigger**

Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

## Examples

The following example enables messages to the configured "to" addresses from the `battery.low` trigger on the node `node1`.

```
cluster1::> system node autosupport trigger modify -node node1
-autosupport-message battery.low -to enabled
```

## system node autosupport trigger show

### Display AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport trigger show` command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.

Use the [system node autosupport destinations show](#) command to view available destinations.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-basic ]**

Use this parameter to display which subsystem information is included as *basic* content when the AutoSupport message is triggered.

**| [-troubleshooting ]**

Use this parameter to display which subsystem information is included as *troubleshooting* content when the AutoSupport message is triggered.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display AutoSupport triggers only on the node you specify.

**[-autosupport-message <Autosupport Message>] - EMS Message**

Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command,

"callhome." is implied, does not need to be entered, and will not be displayed in command output.

### **[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses**

Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

### **[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP.

Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.

### **[-basic-default <subsys1,subsys2,...>,...] - Default Subsystems Reporting Basic Info**

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *basic* content from the subsystems you specify.

### **[-troubleshooting-default <subsys1,subsys2,...>,...] - Default Subsystems Reporting Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *troubleshooting* content from the subsystems you specify.

### **[-additional-content <Type of AutoSupport content>,...] - Additional Content Flag**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* or *troubleshooting* content.

### **[-basic-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Basic Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* content from the subsystems you specify.

### **[-troubleshooting-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *troubleshooting* content from the subsystems you specify.

### **[-suppress {true|false}] - Suppress all occurrences of this trigger**

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

## **Examples**

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```
cluster1::> system node autosupport trigger show
```

| Node  | AutoSupport<br>Message | To       | Note To  | Additional<br>Content |
|-------|------------------------|----------|----------|-----------------------|

## system node coredump delete-all

Delete all coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump delete-all` command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional `-saved` parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

### **-node <nodename> - Node That Owns the Coredump**

This specifies the node from which core files or core dumps are to be deleted.

### **[-type {unsaved-kernel|saved-kernel|kernel|application|all}] - Type of Core to delete**

This parameter specifies the type of core file to be deleted. If the type is unsaved, all unsaved core dumps will be deleted. If the type is saved, all saved core files will be deleted. If the type is kernel, all kernel core files and kernel core dumps will be deleted. If the type is application, all application core files will be deleted. If the type is all, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

## Examples

The following example deletes all unsaved kernel core dumps on a node named node0:

```
cluster1::> system node coredump delete-all -node node0
```

## system node coredump delete

### Delete a coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump delete` command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

### **-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node from which core files are to be deleted.

### **[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This specifies the type of core file to be deleted. If the type is kernel, the specified kernel core file will be deleted. If the type is application, the specified application core file will be deleted.

### **-corename <text> - Coredump Name**

This specifies the core file that is to be deleted.

## Examples

The following example deletes a core dump named `core.101268397.2010-05-30.19_37_31.nz` from a node named node0:

```
cluster1::> system node coredump delete -node node0 -corename
core.101268397.2010-05-30.19_37_31.nz
```

## system node coredump save-all

Save all unsaved kernel coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump save-all` saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the `-save-attempts` parameter, the command prompts you before continuing. The `save-attempts` parameter is set by invoking the command `system node coredump config modify`.

### Parameters

**-node <nodename> - Node That Owns the Coredump**

This specifies the node on which unsaved core dumps are to be saved.

### Examples

The following example saves all unsaved core dumps on a node named node0:

```
cluster1::> system node coredump save-all -node node0
```

## system node coredump save

Save an unsaved kernel coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump save` command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command [system node coredump config modify](#). A saved core dump can be uploaded to a remote site for support analysis; see the [system node coredump upload](#) command man page for more information.

### Parameters

**-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the core dump is located.

**-corename <text> - Coredump Name**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on a node named `node0`:

```
cluster1::> system node coredump save -node node0 -corename
core.101268397.2010-05-30.19_37_31.nz
```

## system node coredump show

Display a list of coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump show` command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with `-type kernel`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-system ]**

If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node That Owns the Coredump**

If you specify both this parameter and the `-corename` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays

information about the core files on the specified node.

### **[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This parameter specifies the type of core files to be displayed. If the type is kernel and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is kernel and the system does not support segmented core files, the command displays information about full core files. If the type is ancillary-kernel-segment, the command displays information about ancillary kernel core segment files. If the type is application, the command displays information about application core files. If no type is specified, the command displays information about core files of type kernel or application.

### **[-corename <text>] - Coredump Name**

If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files that match the specified name.

### **[-panic-node <text>] - Node That Generated Core**

If you specify this parameter with a node name, the command displays information only about the core files that were generated when the specified node panicked.

### **[-panic-systemid <integer>] - System ID of Node That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated when the node with the specified system ID panicked.

### **[-version <text>] - Data ONTAP Version of Core**

If you specify this parameter, the command displays information only about the core files that match the specified version.

### **[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS` `[- HH:MM]_` ``. You can use ``_[- HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+- HH:MM]` is relative to UTC.

### **[-panic-string <text>] - Panic String**

If you specify this parameter, the command displays information only about the core files that match the specified panic string.

### **[-is-saved {true|false}] - Saved Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not saved yet to a core file.

### **[-is-partial {true|false}] - Partial Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not partially saved.

### **[-save-attempts <integer>] - Number of Attempts to Save Core**

If you specify this parameter, the command displays information only about the core dumps that have the specified number of successful or failed save attempts.

**[-space-needed {<integer>[KB|MB|GB|TB|PB] }] - Space Needed To Save Core**

If you specify this parameter, the command displays information only about the core dumps that need the specified amount of disk space to save into a core file.

**[-size <text>] - Size of Core (bytes)**

If you specify this parameter, the command displays information only about the saved core files that are of the specified size.

**[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core**

If you specify this parameter, the command displays information only about the saved core files that have the specified MD5 checksum for compressed data of the core.

**[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments**

If you specify this parameter, the command displays information only about the saved core files that have the specified ancillary segment directory.

## Examples

The following examples display information about the core files:

```
cluster1::> system node coredump show
Node   Core Name                               Saved   Panic Time
-----
node0
  core.101182345.2010-02-01.14_19_08.nz      false   2/1/2010 09:19:08
  Partial Core: false
  Number of Attempts to Save Core: 2
  Space Needed To Save Core: 4.45GB
node1
  core.101268397.2010-05-30.19_37_31.nz      true    5/30/2010 15:37:31
node2
  core.101270930.2010-09-06.18_40_03.nz      true    9/6/2010 14:40:03
node3
  core.101271326.2010-09-06.19_06_18.nz      true    9/6/2010 15:06:18
  core.101271326.2010-09-06.19_09_49.nz      true    9/6/2010 15:09:49
4 entries were displayed.
```

```
cluster1::> system node coredump show -panic-time 9/6/2010 15:00:00+3:00
Node   Core Name                               Saved   Panic Time
-----
node3
      core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
      core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
2 entries were displayed.
```

## system node coredump status

### Display kernel coredump status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump status` command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter `-node local`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-disks ]**

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
- Number of disks used
- Number of disks with partial cores

**| [-spraycore ]**

If you specify this parameter, the command displays the following information:

- Node name
- Whether spray cores are supported
- Number of spray-core disks

- Number of spray-core blocks
- Number of disks needed for spray core
- Estimated number of blocks needed for spray core

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the following information:

- Node name
- State of the core-dump process
- Space available on the internal file system
- Name of the core being saved, if applicable
- Total number of blocks in the core being saved, if applicable
- Number of blocks currently saved, if applicable
- Type of core dump
- Number of unsaved complete cores on the node
- Number of unsaved partial cores on the node
- Whether spray cores are supported on the node
- Whether any spare disks are available on the node
- Number of disks that have cores
- Number of unsaved cores
- Number of disks that have partial cores
- Number of partial cores
- Number of unused spray-core disks
- Number of spray-core blocks
- Number of disks available for core dumps
- Estimated number of blocks needed for spray core
- Number of disks needed for spray core

**[-state <text>] - State**

If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: `nocore`, `idle`, `init`, `saving`, and `waitdump`.

**[-space-available {<integer>[KB|MB|GB|TB|PB] } ] - Space Available On Internal Filesystem**

If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

**[-corename <text>] - Name of Core Being Saved**

If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

**[`-total-blocks <integer>`] - Total Number of Blocks in Core Being Saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

**[`-blocks-saved <integer>`] - Number of Blocks saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

**[`-type <text>`] - Type of Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

**[`-spraycore-supported {true|false}`] - Spray Core Supported on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.

**[`-spares-available {true|false}`] - Spare Disk(s) Available on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

**[`-disks-used <integer>`] - Number of Disks with Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

**[`-unsaved-cores <integer>`] - Number of Unsaved Complete Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

**[`-partial-disks <integer>`] - Number of Disks with Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

**[`-partial-cores <integer>`] - Number of Unsaved Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

**[`-spraycore-disks <integer>`] - Number of Unused Spray Core Disks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

**[`-spraycore-blocks <integer>`] - Number of Spray Core Blocks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

**[`-numdisks <integer>`] - Total Number of Disks Available for Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.

**[`-blocks-needed <integer>`] - Estimated Number of Blocks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the

specified number of estimated blocks needed for the spray method of dumping core.

**[`-disks-needed <integer>`] - Number of Disks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

**[`-space-needed {<integer>[KB|MB|GB|TB|PB]}`] - Space Needed to Save All Unsaved Cores**

If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

**[`-min-free {<integer>[KB|MB|GB|TB|PB]}`] - Minimum Free Bytes on Root Filesystem**

If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

## Examples

The following example displays core dump information about the node named node0:

```
cluster1:> system node coredump status -node node0 -instance
Node: node0

                                State: idle
    Space Available On Internal Filesystem: 132.1GB
          Name of Core Being Saved: -
Total Number of Blocks in Core Being Saved: -
          Number of Blocks saved: -
              Type of core dump: spray
    Number of Unsaved Complete Cores: 0
    Number of Unsaved Partial Cores: 1
    Space Needed To Save All Unsaved Cores: 4.81GB
    Minimum Free Bytes On Internal Filesystem: 250MB
```

## system node coredump trigger

Make the node dump system core and reset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the `-dump` parameter of the `system node shutdown`, [system node halt](#), or [system node reboot](#) command in that this command uses a control flow through the Service Processor of the remote node, whereas the `-dump` parameter uses a communication channel between ONTAP running on the nodes. This command is helpful in cases where ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the [system node coredump show](#) command. This command works for a single node only and the full name of the node must be entered exactly.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node for which you want to trigger a coredump.

## Examples

The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command [system node coredump show](#) can be used to display the generated coredump.

```
cluster1::> set advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.

Do you want to continue? {y|n}: y

```
cluster1::*> system node coredump trigger -node node2
```

Warning: The Service Processor is about to perform an operation that will cause

a dirty shutdown of node "node2". This operation can cause data loss. Before using this command, ensure that the

cluster

will have enough remaining nodes to stay in quorum. To reboot or

halt

a node gracefully, use the "system node reboot" or "system node

halt"

command instead. Do you want to continue? {yes|no}: yes

Warning: This operation will reboot the current node. You will lose this login

session. Do you want to continue? {y|n}: y

```
cluster1::*>
```

```
cluster1::> system coredump show
```

| Node: | Type | Core Name | Saved | Panic Time |
|-------|------|-----------|-------|------------|
|-------|------|-----------|-------|------------|

|       |       |       |       |       |
|-------|-------|-------|-------|-------|
| ----- | ----- | ----- | ----- | ----- |
| ----- | ----- | ----- | ----- | ----- |

|        |        |  |  |  |
|--------|--------|--|--|--|
| node2: | kernel |  |  |  |
|--------|--------|--|--|--|

|  |                                        |       |           |  |
|--|----------------------------------------|-------|-----------|--|
|  | core.1786429481.2013-10-04.11_18_37.nz | false | 10/4/2013 |  |
|--|----------------------------------------|-------|-----------|--|

11:18:37

## system node coredump upload

(DEPRECATED)-Upload a coredump to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and might be removed in a future release of ONTAP. Use "[system node autosupport invoke-core-upload](#)" instead.

The `system node coredump upload` command uploads a saved core file to a specified URL. You should use this command only at the direction of technical support.

### Parameters

#### **-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the core file is located.

#### **[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This specifies the type of core files to be uploaded. If the type is kernel, kernel core files will be uploaded. If the type is application, application core file will be uploaded.

#### **-corename <text> - Coredump Name**

This specifies the name of the core file that is to be uploaded.

#### **[-location <text>] - URL for Coredump Upload Directory**

This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the `-upload-location` parameter of the [system node coredump config modify](#) command. The following protocols are supported: ftp and http. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

#### **[-casenum <integer>] - Case Number**

This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

### Examples

The following example uploads a core file named `core.07142005145732.2010-10-05.19_03_41.nz` on a node named `node0` to the default location. The support case number is 2001234567.

```
cluster1::> system node coredump upload -node node0 -corename
core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
```

- [system node coredump config modify](#)

## system node coredump config modify

### Modify coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump config modify` command modifies the cluster's core dump configuration.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose coredump configuration you want to modify.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays the number of bytes that need to be made available in the root file system after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays the maximum number of times the system will attempt to save a core dump. The default setting is 2.

**[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you set this parameter to true, the system will automatically start saving the core dump after reboot.

**[-upload-location <text>] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of ONTAP. Use the `-uri` parameter of the "`system node autosupport invoke-core-upload`" command instead.

If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is <ftp://ftp.netapp.com/to-ntap/>.)

### Examples

The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1::> system node coredump config modify -coredump-attempts 5 -save
-attempts 5
```

## system node coredump config show

### Display coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump config show` command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the coredump configuration information of the specified node.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you specify this parameter, the command displays only the coredump information that matches the specified sparse core setting. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays only the coredump information that matches the maximum number of times the system will attempt to save a core dump.

**[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you specify this parameter, the command displays only the coredump information that matches the

specified configuration of whether the system will automatically start saving the core dump after reboot.

### **[`-upload-location <text>`] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

### **Examples**

The following example displays information about the cluster's core dump configuration:

```
cluster1::> system node coredump config show
      Sparse      Min      Max      Max On
      Core      Free      Dump      Save Startup
Node  Enabled    Bytes Attempts Attempts Enabled Coredump Location
-----
node0
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node1
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node2
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node3
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
4 entries were displayed.
```

## **system node coredump external-device save**

Save a core dump to an external USB device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system node coredump external-device save` command saves a specified core dump to an external USB device plugged into the port specified by the `-device` parameter.

External USB device requirements:

- A device formatted with the FAT32 filesystem.
- A device formatted with the ext2 filesystem with the largefile flag set. + This can be done using the following command on a Linux host: `mkfs.ext2 -T largefile <device_name>`
- The command [system node coredump show](#) can be used to determine the size of the core dump.

## Parameters

**-node {<nodename>|local} - Node That Owns the Coredump (privilege: advanced)**

This specifies the node on which the core dump is located.

**-device {usb0|usb1} - Device (privilege: advanced)**

This specifies which external USB device connected to the node to save the core dump, for example: usb0. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

**-corename <text> - Coredump Name (privilege: advanced)**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on node1 to external USB device usb0:

```
cluster1::> system node coredump external-device save -node node1 -device
usb0 -corename core.101268397.2010-05-30.19_37_31.nz
```

## Related Links

- [system node coredump show](#)

## system node coredump external-device show

Display a list of files on an external USB device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node coredump external-device show` command displays basic information about files on an external USB device, such as the filename and size.

## Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ `-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`-node` {<nodename>|local} - Node That Owns the Coredump (privilege: advanced)**

This parameter selects the node that has files that are to be displayed on the external USB device.

**[ `-device` {usb0|usb1} ] - Device (privilege: advanced)**

This parameter specifies the name of the external USB device, for example: usb0. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

**[ `-corename` <text> ] - Coredump Name (privilege: advanced)**

This parameter specifies the core dump file for which the information is displayed.

**[ `-size` {<integer>[KB|MB|GB|TB|PB]} ] - Size of Core (privilege: advanced)**

If specified, the command displays information only about the core files that are of the specified size.

## Examples

The following example displays information about core files stored on external USB devices:

```
cluster1::> system node coredump external-device show
Node                               Device  Coredump Name
-----
node1                             usb0    core.537051938.2017-10-26.23_52_15.nz
                                     Size: 13074695581 bytes (12.18) GB
```

## system node coredump reports delete

Delete an application core report

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump reports delete` command deletes the specified application core report.

### Parameters

**`-node` {<nodename>|local} - Node That Owns the Coredump**

This specifies the node from which reports are to be deleted.

**`-reportname` <text> - Report Name**

This specifies the report that is to be deleted.

## Examples

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report`

is deleted from a node named node0:

```
cluster1::> system node coredump reports delete -node node0 -reportname
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report
```

## system node coredump reports show

Display a list of application core reports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump reports show` command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with `-node local`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node That Owns the Coredump**

Selects information about all the reports on the specified node. If you specify both this parameter and the `-reportname` parameter, the command displays detailed information about the specified report.

**[-reportname <text>] - Report Name**

Selects information about the reports that match the specified name. If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified report.

**[-panic-node <text>] - Node That Generated Core**

Selects information about the reports that were generated by the specified node.

**[-panic-systemid <integer>] - System ID of Node That Generated Core**

Selects information about the reports that were generated by the node with the specified system ID.

**[-version <text>] - Data ONTAP Version of Core**

Selects information about the reports that match the specified version.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS` `[- HH:MM]_``` . You can use ```_[- HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+- HH:MM]` is relative to UTC.

### **`[-panic-string <text>]` - Panic String**

Selects information about the reports that match the specified panic string.

### **Examples**

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
Node      Report Name                                     Panic Time
-----
node0     notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report  3/25/2011
09:59:43
```

## **system node coredump reports upload**

(DEPRECATED)-Upload an application core report to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command is deprecated and might be removed in a future release of ONTAP. See core report information in the SmartSoft tool.

The `system node coredump reports upload` command uploads an application report to a specified URL. You should use this command only at the direction of technical support.

### **Parameters**

#### **`-node {<nodename>|local}` - Node That Owns the Coredump**

This specifies the node on which the report is located.

#### **`-reportname <text>` - Report Name**

This specifies the name of the report that is to be uploaded.

#### **`[-location <text>]` - URL for Coredump Upload Directory**

This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

#### **`[-casenum <integer>]` - Case Number**

This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

### **Examples**

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2` is uploaded on a node named `node0` to the default location. The support case number is `2001234567`.

```
cluster1::> system node coredump reports upload -node node0 -corename
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

## system node coredump segment delete-all

Delete all core segments on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes all the core segments on a node.

### Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

### Examples

This deletes all the core segments for *node1* .

```
cluster1::> system node coredump segment delete-all -node node1
```

## system node coredump segment delete

Delete a core segment

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes a core segment.

### Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

**-segment <text> - Core Segment**

This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.

**[-owner-node <text>] - Node That Owns the Core Segment File**

This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

## Examples

This deletes all core segments in the directory, `core.151708240.2012-01-11.05_56_52`.

```
cluster1::> system node coredump segment delete -node node1 -segment
core.151708240.2012-01-11.05_56_52
```

## system node coredump segment show

Display a list of core segments

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment

**[-node {<nodename>|local}] - Node**

Selects information about the core segments on the specified node.

**[-segment <text>] - Core Segment**

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

**[-owner-node <text>] - Node That Owns the Core Segment File**

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

**[-panic-system-id <integer>] - System ID of Node That Generated Core**

Selects information about the core segments that were generated when the node with the specified system ID panicked.

**[-md5-data-chksum <text>] - Md5 Checksum of the Compressed Data of the Core Segment**

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

**[-segment-name <text>] - Name of the Core Segment**

Selects information about the core segments with the specified name.

**[-total-segment-count <integer>] - Number of Segments Generated**

Selects information about the core segments with the specified name.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the core segments that were generated by a panic at the specified time.

**[-size <text>] - Size of Core Segment (bytes)**

Selects information about the core segments that are of the specified size.

**[-panic-string <text>] - Panic String of Panic That Generated Core**

Selects information about the core segments that match the specified panic string.

## Examples

The example below displays the core segments on *node1*.

```
cluster1:> system node coredump segment show -node node1
Node: node1
Segment Directory: core.118049106.2012-01-05.17_11_11
                  Panic Time: 1/5/2012 12:11:11
                  Number of Segments: 2
                  Segment File Name:
                                core.118049106.2012-01-05.17_11_11.nvram.nz
                                core.118049106.2012-01-05.17_11_11.ontap.nz
2 entries were displayed.
```

The example below displays detailed information a specific core segment file on *node1*.

```

cluster1::> system node coredump segment show -node node1 -segment
core.118049106.2012-01-05.17_11_11.ontap.nz -instance
Node: node1
Core Segment: core.118049106.2012-
01-05.17_11_11.ontap.nz
Node That Owns the Core Segment File: node1
System ID of Node That Generated Core: 118049106
Md5 Checksum of the Compressed Data of the Core Segment:
1a936d805dcd4fd5f1180fa6464fdee4
Name of the Core Segment: ontap
Number of Segments Generated: 2
Time of Panic That Generated Core: 1/5/2012 12:11:11

```

## system node environment sensors show

Display the sensor table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node environment sensors show` command displays the following information:

- Node name
- Sensor name
- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about the sensors on the specified node. If this parameter is specified with the -name parameter, the command displays information only about the specified sensor.

**[-name <text>] - Sensor Name**

Selects information about the sensors that have the specified name. If this parameter is specified with the -node parameter, the command displays information only about the specified sensor.

**[-fru <text>] - FRU**

Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).

**[-type {fan|thermal|voltage|current|battery-life|discrete|fru|nvme|counter|minutes|percent|agent|unknown}] - Sensor Type**

Selects information about the sensors that have the specified sensor type. Possible values vary among platforms but may include *fan*, *temperature*, *thermal* and *voltage*.

**[-units <text>] - Value Units**

Selects information about the sensors that have readings displayed in the specified units of measure. Possible values vary among platforms but may include *RPM*, *C* and *mV*.

**[-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown|nonreadable}] - Sensor State**

Selects information about the sensors that have the specified state. Possible values vary among platforms but may include *normal*, *warn\_lo*, *warn\_hi*, *crit\_lo*, *crit\_hi* and *failed*.

**[-discrete-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown|nonreadable}] - Discrete Sensor State**

Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor has a set of possible discrete values rather than a range of possible values. For example, a presence sensor which has the discrete values PRESENT and NOT\_PRESENT is a discrete-valued sensor. Possible values vary among platforms but may include *normal* and *failed*.

**[-value <integer>] - Last Sensor Value**

Selects information about the sensors that have the specified sensor value.

**[-discrete-value <text>] - Discrete Sensor Value**

Selects information about the discrete-valued sensors that have the specified discrete value. Possible values vary among sensors but may include *PRESENT*, *NOT\_PRESENT*, *ON*, *OFF*, *OK* and *FAULT*.

**[-crit-low <integer>] - Critical Low Threshold**

Selects information about the sensors that have the specified critically low threshold.

**[-warn-low <integer>] - Warning Low Threshold**

Selects information about the sensors that have the specified warning-low threshold.

**[-warn-hi <integer>] - Warning Hi Threshold**

Selects information about the sensors that have the specified warning-high threshold.

### **[-crit-hi <integer>] - Critical Hi Threshold**

Selects information about the sensors that have the specified critically high threshold.

### **[-inactive {true|false}] - Show Inactive Sensors**

Specify *true* to include inactive sensors in the output. By default, only sensors with the value *false* are shown.

### **[-hidden {true|false}] - Show Hidden Sensors**

Specify *true* to include hidden sensors in the output. By default, only sensors with the value *false* are shown.

## **Examples**

The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show

system node external-cache modify

Modify external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node external-cache modify` command can be used to modify the following attributes of external-cache for a node:

- `is-enabled`
- `is-rewarm-enabled`
- `is-mbuf-inserts-enabled`
- `pcs-size`
- `is-hya-enabled`

## Parameters

### **`-node {<nodename>|local}` - Node**

This specifies the node on which the modifications need to be made.

### **`[-is-enabled {true|false}]` - Is Enabled?**

Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.

### **`[-is-rewarm-enabled {true|false}]` - Is Rewarm On?**

Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

### **`[-is-mbuf-inserts-enabled {true|false}]` - Is Mbuf Inserts On?**

Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by technical support. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

### **`[-pcs-size <integer>]` - PCS Size**

Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383 (GB). This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

### **`[-is-hya-enabled {true|false}]` - Is HyA Caching Enabled?**

Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

## Examples

```
cluster::> system node external-cache modify -node node1 -is-enabled true
```

The command enables the external-cache feature on `node1` .

## system node external-cache show

Display external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node external-cache show` command displays external-cache information for each of the nodes available.

### Parameters

**{ [-fields <fieldname>,...]**

Valid values for this option are {node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled} . Specifying the value will display all entries that correspond to it.

**| [-instance ] }**

This option does not need an input value. Specifying this option will display the information about all the entries.

**[-node {<nodename>|local}] - Node**

Specify this parameter to display external-cache parameters that match the specified node.

**[-is-enabled {true|false}] - Is Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-rewarm-enabled {true|false}] - Is Rewarm On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf Inserts On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-pcs-size <integer>] - PCS Size**

Valid values for this option are integers between 16 and 16383 (GB). Specifying the value will display all entries that correspond to it.

**[-is-hya-enabled {true|false}] - Is HyA Caching Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

### Examples

```
cluster1::> system node external-cache show -node node1
Node: node1
    Is Enabled: false
    Is rewarm on: false
    Is Mbuf inserts on: true
    PCS size: 256
    Is hya caching enabled: true
```

Displays the external-cache information about `node1` in a list format.

## system node firmware download

Download motherboard firmware and system diagnostics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node firmware download` command downloads new system firmware to the boot device. A reboot followed by the 'update\_flash' command at the firmware prompt is required for the firmware to take effect.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node or nodes on which the firmware is to be updated.

**-package <text> - Package URL (privilege: advanced)**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted. The FILE URL scheme can be used to specify location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device. The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

### Examples

The following example downloads firmware to node-01 from a web server:

```
cluster1::*> system node firmware download -node node-01 -package
http://example.com/serviceimage.zip
```

## system node firmware bootmedia show

Display the BIOS/LOADER firmware versions stored in the boot media and running on the system

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the BIOS and LOADER versions of system firmware installed on the boot media, as well as the versions currently running on the system.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-board-ID <text>] - Board Type**

Selects information about the controllers with the specified board type.

**[-modelName <text>] - Model Name**

Selects information about the controllers with the specified model name.

**[-bootmedia-bios-version <text>] - BIOS Firmware Version**

Selects information about the controllers with the specified BIOS firmware version installed on the boot media.

**[-bootmedia-loader-version <text>] - LOADER Firmware Version**

Selects information about the controllers with the specified LOADER firmware version installed on the boot media.

**[-running-bios-version <text>] - BIOS version**

Selects information about the controllers with the specified BIOS firmware version currently running on the system.

**[-running-loader-version <text>] - Loader version**

Selects information about the controllers with the specified LOADER firmware version currently running on the system.

## Examples

The following example displays the BIOS and LOADER versions installed on the bootmedia as well as the versions currently running on the system:

```
cluster1::> system node firmware bootmedia show
Node           Model Name      BIOS Version  LOADER Version
-----
node01
           FAS2820
Boot Media: 19.5           8.4.0
           Running: 19.4           8.3.0
node02
           FAS2820
Boot Media: 19.5           8.4.0
           Running: 19.4           8.3.0
```

## system node hardware nvram-encryption modify

### Configure NVRAM device encryption

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system node hardware nvram-encryption modify` command configures the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

This feature might be restricted in some countries due to local regulations concerning encrypted data.

#### Parameters

**-node {<nodename>|local} - Node**

Specifies the node containing the NVRAM or NVMEM subsystem.

**[-is-enabled {true|false}] - Is Encryption Enabled**

Specifies whether the NVRAM or NVMEM encryption is disabled or enabled.

#### Examples

The following commands enable or disable the NVRAM encryption:

```
cluster1::> system node hardware nvram-encryption modify -node node1 -is
-enabled false
           cluster1::> system node hardware nvram-encryption modify -node
node1 -is-enabled true
```

## system node hardware nvram-encryption show

### Show NVRAM device encryption information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node hardware nvram-encryption show` command displays the configuration of the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the NVRAM encryption configuration on the specified node.

**[-nvram-device-name <text>] - NVRAM Device Name**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the specified NVRAM device. Current platforms only support one device - NVRAM.0.

**[-is-supported {true|false}] - Is Encryption Support**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for platforms that support it.

**[-is-enabled {true|false}] - Is Encryption Enabled**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the NVRAM or NVMEM devices where the device has the specified enabled value.

**[-key-id <text>] - Key ID of the Encryption Key**

If this parameter is specified, the command displays information about the NVRAM encryption configuration with the specified encryption Key ID used to encrypt the NVRAM or NVMEM data on flash storage.

## Examples

The following example displays information about the NVRAM encryption configuration on all nodes of the cluster:

```
cluster1::> system node hardware nvram-encryption show
      Node: node1
NVRAM-Device: NVRAM.0
      Supported: true
      Enabled: true
      Key-ID:
0000000000000000000000000000000000000000000000000000000000000000
      Node: node2
NVRAM-Device: NVRAM.0
      Supported: true
      Enabled: true
      Key-ID:
0000000000000000000000000000000000000000000000000000000000000000
  2 entries are displayed.
```

## system node hardware tape drive show

Displays information about tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the following information about tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Description of the tape drive
- NDMP path of the tape drive

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-device-id <text>] - Device ID**

Selects information about the tape drive that has the specified device ID.

### **[-description <text>] - Description**

Selects information about the tape drive or drives that have the specified description.

### **[-wwn <text>] - World Wide Name**

Selects information about the tape drive that has the specified worldwide name.

### **[-serial-number <text>] - Serial Number**

Selects information about the tape drive that has the specified serial number.

### **[-ndmp-path <text>, ...] - NDMP Path**

Selects information about the tape drive or drives that have the specified NDMP path.

## **Examples**

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description      NDMP Path
-----
cluster1
      brocade-247-198:3.126L1      nrst0l nrst0m nrst0h nrst0a

      SONY SDX-400C                rst5l rst5m rst5h rst5a
      urst5l urst5m urst5h urst5a

5 entries were displayed.
```

## **system node hardware tape library show**

Display information about tape libraries

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library
- Description of the tape library
- NDMP path of the tape library

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape libraries on the specified node.

**[-device-id <text>] - Device ID**

Selects information about the tape library that has the specified device ID.

**[-description <text>] - Description**

Selects information about the tape library or libraries that have the specified description.

**[-wwn <text>] - World Wide Name**

Selects information about the tape library that has the specified worldwide name.

**[-serial-number <text>] - Serial Number**

Selects information about the tape library that has the specified serial number.

**[-ndmp-path <text>] - NDMP Path**

Selects information about the tape library or libraries that have the specified NDMP path.

## Examples

The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show

## system node hardware unified-connect modify

Modify the Fibre Channel and converged networking adapter configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node hardware unified-connect modify` command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form `Xy` where `X` is an integer and `y` is a letter. For example: `4a`

For a target adapter, use the [network fcp adapter modify](#) command to bring the adapter offline.

For an initiator adapter, use the `system node run local storage disable adapter` command to take the adapter offline.

The `-mode` parameter refers to the mode of the adapter and can be either *fc* or *cna*.

The `-type` parameter refers to the FC-4 type of the adapter and can be *initiator*, *target*, or *fcvi*.

The `-force` parameter suppresses confirmation prompts.

The adapter type *fcvi* is supported only on platforms with FCVI adapters.

### Parameters

**-node {<nodename>|local} - Node**

Specifies the node of the adapter.

**-adapter <text> - Adapter**

Specifies the adapter.

**[-m, -mode {fc|cna}] - Configured Mode**

Specifies the mode.

**[-t, -type {initiator|target|fcvi}] - Configured Type**

Specifies the FC-4 type.

**[-f, -force <true>] - Force**

Suppresses warnings and confirmation prompts.

### Examples

```
cluster1::> system node hardware unified-connect modify -node node1
-adapter 0d -mode cna
```

Configures the mode of adapter 0d on node1 to CNA.

## system node hardware unified-connect show

Displays information about Fibre Channel and converged networking adapters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-capability ]**

If this parameter is specified, the command displays the capabilities of the adapters.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

**[-adapter <text>] - Adapter**

If this parameter is specified, the command displays information about the specified adapter.

**[-current-mode {fc|cna}] - Current Mode**

If this parameter is specified, the command displays adapters configured to the specified mode.

**[-current-type {initiator|target|fcvi}] - Current Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4 type.

**[-pending-mode {fc|cna}] - Pending Mode**

If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.

**[-pending-type {initiator|target|fcvi}] - Pending Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

### **[-status-admin <text>] - Administrative Status**

If this parameter is specified, the command displays adapters with the specified status.

### **[-supported-modes {fc|cna}] - Supported Modes**

The list of modes that the adapter supports.

### **[-supported-fc-types {initiator|target|fcvi}] - Supported FC Types**

The list of FC-4 types the adapter supports when configured into fc mode.

### **[-supported-cna-types {initiator|target|fcvi}] - Supported CNA Types**

The list of FC-4 types the adapter supports when configured into cna mode.

## **Examples**

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

```
cluster1::> system node hardware unified-connect show
```

| Node  | Adapter | Current Mode | Current Type | Pending Mode | Pending Type | Admin Status |
|-------|---------|--------------|--------------|--------------|--------------|--------------|
| node1 | 0c      | fc           | initiator    | -            | -            | online       |
| node1 | 0d      | fc           | initiator    | -            | -            | online       |
| node1 | 3a      | fc           | target       | -            | -            | online       |
| node1 | 3b      | fc           | target       | -            | -            | online       |
| node1 | 4a      | cna          | target       | -            | -            | online       |
| node1 | 4b      | cna          | target       | -            | -            | online       |
| node1 | 6a      | fc           | target       | -            | -            | online       |
| node1 | 6b      | fc           | target       | -            | -            | online       |
| node2 | 0c      | fc           | initiator    | -            | -            | online       |
| node2 | 0d      | fc           | initiator    | -            | -            | online       |
| node2 | 3a      | fc           | target       | -            | -            | online       |
| node2 | 3b      | fc           | target       | -            | -            | online       |
| node2 | 4a      | cna          | target       | -            | -            | online       |
| node2 | 4b      | cna          | target       | -            | -            | online       |
| node2 | 6a      | cna          | target       | -            | -            | online       |
| node2 | 6b      | cna          | target       | -            | -            | online       |

16 entries were displayed.

## **system node image abort-operation**

Abort software image 'update' or 'get' operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node image abort-operation` command aborts software installation ("update") or download ("get") operation on the specified node.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node on which to abort the operation.

## Examples

The following example aborts the software installation operation on a node named `node1`.

```
cluster1::> system node image abort-operation -node node1
```

## system node image get

Fetch a file from a URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command fetches a file from the specified URL and stores it in the `/mroot/etc/software` directory.

## Parameters

**[-node {<nodename>|local}] - Node (privilege: advanced)**

This parameter specifies the node that fetches and stores the package.

**-package <text> - Package URL (privilege: advanced)**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted. The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device. The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command "security certificate install -type server-ca".

**[-replace-package <true>] - Replace the Local File (privilege: advanced)**

Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

**[-rename-package <text>] - Rename the File (privilege: advanced)**

Use this parameter to enter a package name that is different from the file name in the URL.

### **[`-background <true>`] - Run in the background (privilege: advanced)**

This parameter allows the operation to run in the background. The progress of the operation can be checked with the command `system image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

### **Examples**

```
system image get http://example.com/image.tgz -rename-package image2.tgz
-replace-package
```

## **system node image modify**

### **Modify software image configuration**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system node image modify` command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

### **Parameters**

#### **`-node {<nodename>|local}` - Node (privilege: advanced)**

This specifies the node on which the software image is located.

#### **`-image {image1|image2|remote}` - Image Name (privilege: advanced)**

This specifies the software image that is to be set or unset as the default.

#### **`[-isdefault {true|false}]` - Is Default Image (privilege: advanced)**

This optionally specifies whether the specified image is the default.

### **Examples**

The following example sets the software image named `image2` as the default image on a node named `node0`.

```
node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.
```

## **system node image show-update-progress**

### **Show progress information for a currently running update**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node image show-update-progress` command displays the progress of a software-image update initiated by using the [system node image update](#) command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This optionally specifies the name of a node whose image-update progress is to be displayed.

**[-follow <true>] - Follow the Progress in the Foreground (privilege: advanced)**

Do not use background processing for this command. If you do not use this parameter, the value is `true`.

## Examples

The following example displays image-update progress:

```
node::> system node image show-update-progress

ERROR: command failed: There is no update/install in progress
```

## Related Links

- [system node image update](#)

## system node image show

Display software image information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node image show` command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
- Whether the image is the current image
- Software version
- Installation date

To display detailed information about a specific software image, run the command with the `-node` and `-image` parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the `-iscurrent true` parameter.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node (privilege: advanced)`**

Selects information about the software images on the specified node. If this parameter and the `-image` parameter are both used, the command displays detailed information about the specified software image.

**`[-image {image1|image2|remote}] - Image Name (privilege: advanced)`**

Selects information about the software images that match the specified name. If this parameter and the `-node` parameter are specified, the command displays detailed information about the specified software image.

**`[-isdefault {true|false}] - Is Default Image (privilege: advanced)`**

Selects information about the software images with the specified default setting.

**`[-iscurrent {true|false}] - Is Current Image (privilege: advanced)`**

Selects information about the software images that have the specified currency value.

**`[-kernel-path <text>] - Kernel Image Path (privilege: advanced)`**

Selects information about the software images that have the specified kernel image path.

**`[-rootfs-path <text>] - Root Filesystem Image Path (privilege: advanced)`**

Selects information about the software images that have the specified root file system image path.

**`[-version <text>] - Software Version (privilege: advanced)`**

Selects information about the software images that have the specified root file system image path.

**`[-installdate <MM/DD/YYYY HH:MM:SS>] - Install Date (privilege: advanced)`**

Selects information about the software image that have the specified installation date. Specify the date in the format `MM/DD/YYYY HH:MM:SS` [`+- HH:MM`].

## Examples

The following example displays information about the software images on a node named `node1`:

```
cluster1::> system node image show -node node1
```

| Node  | Image  | Is Default | Is Current | Version | Install Date       |
|-------|--------|------------|------------|---------|--------------------|
| node1 | image1 | true       | true       | 8.0     | 8/20/2009 17:42:42 |
|       | image2 | false      | false      | 8.0     | 6/26/2009 17:44:50 |

2 entries were displayed.

## system node image update

### Perform software image upgrade/downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system node image update` command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the `"-validate-only"` parameter to validate the software image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

#### Parameters

##### **-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node on which the software image is located.

##### **-package <text> - Package URL (privilege: advanced)**

This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

- As an HTTP URL in the form `http://host_name[:port]/path_to_file`. For instance, `http://example.com/downloads/image.tgz`. The management utility prompts you for a user name and password before beginning the download.

If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an HTTPS URL in the form `https://host_name[:port]/path_to_file`. For instance, `https://example.com/downloads/image.tgz`.

The HTTPS URL scheme requires that you install the HTTPS server certificate on the system by using the command `"security certificate install -type server-ca"`.

- As an FTP URL in the form `ftp://host_name[:port]/path_to_file`. For instance, `ftp://example.com/downloads/image.tgz`. If required, the management utility prompts you for

a user name and password before beginning the download.

- As a filename of a package left behind by a previous installation, or a package fetched using [system node image get](#) . For example, *image.tgz* . Available packages can be displayed using [system node image package show](#) .
- As a path to a package in a mounted file system in the form *file://localhost/path\_to\_file* . For example, *file://localhost/mroot/etc/software/image.tgz* .
- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>* . Typically, the file name is *image.tgz* . The package must be present in the root directory of the USB mass storage device.

#### **[[-replace](#) {[image1](#)|[image2](#)}] - Image to Replace (privilege: advanced)**

This optionally specifies the image that is to be replaced when the node is booted from the network.

#### **[[-setdefault](#) <true>] - Set Newly Updated Image as Default (privilege: advanced)**

This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

#### **[[-replace-package](#) <true>] - Replace the Local File (privilege: advanced)**

Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

#### **[[-rename-package](#) <text>] - Rename the File (privilege: advanced)**

Use this parameter to enter a package name that is different from the file name in the URL.

#### **[[-background](#) <true>] - Run in the Background (privilege: advanced)**

This parameter will allow the operation to run in the background. The progress of the operation can be checked with the command [system node image show-update-progress](#) . If this command is entered without using this parameter, its effective value is false and the operation will run in the foreground. If this parameter is used without a value, it is set to true.

#### **[[-validate-only](#) <true>] - Validate the Package before Installation (privilege: advanced)**

Use this parameter to validate the package. Validation consists of verifying whether there is enough space on the system to install the package, verifying the checksum for each component within the package and so on. Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated only, not installed.

## **Examples**

The following example updates the software image on a node named node0 from a software package located at <ftp://ftp.example.com/downloads/image.tgz>:

```
node::> system node image update -node node0 -package
ftp://ftp.example.com/downloads/image.tgz -setdefault true
```

- [system node image show-update-progress](#)

## system node image package delete

Delete a software package

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The delete command will delete the specified software package.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The package will be deleted from the repository belonging to the node specified with this parameter. The local node is used as the default if this parameter is omitted.

**-package <text> - Package File Name (privilege: advanced)**

This parameter specifies the package to be deleted.

### Examples

```
::> system image package delete image.tgz
1 entry was deleted.
```

## system node image package show

Display software package information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The package show command displays details of the software packages residing on the storage controller.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

**[`-package <text>`] - Package File Name (privilege: advanced)**

This parameter specifies which package's information will be displayed.

## Examples

```
cluster1::> system image package show
      Package
Node Repository Package File Name
-----
node-01
      mroot
              image.tgz
1 entries were displayed.
```

## system node image package external-device delete

Delete file on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The delete command deletes the specified file on the external device.

### Parameters

**`-node {<nodename>|local}` - Node (privilege: advanced)**

The file is deleted from the external device of the node specified with this parameter. If this parameter is omitted, then the local node is used as the default node.

**`-package <text>` - File Name (privilege: advanced)**

This parameter specifies the file to be deleted.

**`-device {usb0|usb1}` - Device (privilege: advanced)**

This parameter specifies the name of the external device. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

## Examples

```
::> system image package external delete -package image.tgz
```

## system node image package external-device show

Display file listing on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The external-device show command displays files residing on the external storage device.

### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-node* {<nodename>|local}] - Node (privilege: advanced)**

This parameter selects the node that has files that are to be displayed on the external storage device. If this parameter is omitted, then the local node is the default node.

**[*-package* <text>] - File Name (privilege: advanced)**

This parameter specifies the file for which the information is displayed.

**[*-device* {usb0|usb1}] - Device (privilege: advanced)**

This parameter specifies the name of the external device. Currently, only usb0 is supported. + usb0 refers to the first external USB device connected to the node (regardless of port).

### Examples

```
cluster1::> system image package external-device show
Node                               Device           Package File Name
-----
node-01                           usb0            image.tgz
node-01                           usb0            netboot.tgz
2 entries were displayed.
```

## system node internal-switch show

Display onboard switch attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node internal-switch show` command is used to display the internal switch state information and the link status.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to specify the node the switch resides on.

**[-switch-id <integer>] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[-port-id <integer>] - Port**

Use this parameter to specify the port id. For example, 0.

**[-port-name <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.

**[-auto-admin <Auto-negotiation setting>] - Auto-Negotiation Administrative**

Use this parameter to show the auto-negotiation administrative setting. 'enable' or 'disable'.

**[-auto-op <Auto-negotiation setting>] - Auto-Negotiation Operational**

Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

**[-duplex-admin <Duplex>] - Duplex Mode Administrative**

Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

**[-duplex-op <Duplex>] - Duplex Mode Operational**

Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

**[-speed-admin <Link speed>] - Speed Administrative**

Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

**[-speed-op <Link speed>] - Speed Operational**

Use this parameter to show the speed operational setting. '10', '100' or '1000'.

**[-link <Link Status>] - Link State**

Use this parameter to show the link state, 'up' or 'down'.

**[-up-admin <Link Status>] - Up Administrative**

Use this parameter to show the up administrative setting, 'up' or 'down'.

**[-fc-op <Flow control>] - Flow Control Operational**

Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

Examples

The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
```

| Port                      | Role             | Link | Auto-Negot<br>Admin/Oper | Duplex<br>Admin/Oper | Speed (Mbps)<br>Admin/Oper |

system node internal-switch dump stat

Display onboard switch port statistics counter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system node internal-switch dump stat` command is used to display the counter information of the internal switch ports.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node <nodename>] - Node`

Use this parameter to specify the node the switch resides on.

`[-switch-id <integer>] - Switch`

Use this parameter to specify the switch id. For example, 1.

`[-port-id <integer>] - Port`

Use this parameter to specify the port id. For example, 0.

**[*-stat-id* <text>] - Counter Name**

Use this parameter to specify the counter name.

**[*-valued* <integer>] - Counter Value**

Use this parameter to show the value of specified counter.

**[*-port-name* <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.

**Examples**

The following example shows partial counter information of the internal switch 0 on Node1

```
cluster1::> system node internal-switch dump stat -node Node1 -switch-id 0
Port  Port Name          Counter              Value
----  -
Node: Node1          , Switch: 0
0      sw-wrench          1024ToMaxOctets      22480201
0      sw-wrench          128To255Octets       119552
0      sw-wrench          256To511Octets       345587
0      sw-wrench          512To1023Octets      1250437
0      sw-wrench          64Octets              803025
```

**system node nfs usage show**

Show NFS usage in the local node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The ``system node nfs usage show`` command displays the NFS usage information in the local node. The display output shows the number of RPC calls received per protocol on the local node. Usage is collected whenever there is any NFS traffic. These values are not persistent and will reset when the node reboots.

**Examples**

The following example displays the NFS usage information that does not have any NFS usage.

```
::*> system node nfs usage show
Node: node1
v3: 0
v4: 0
```

The following example displays the NFS usage information with v3 usage.

```
::*> system node nfs usage show
Node: node1
v3: 5
v4: 0
```

The following example displays the NFS usage information with v4 usage.

```
::*> system node nfs usage show
Node: node1
v3: 0
v4: 14
```

## system node power on

### Power nodes on

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node whose power you want to switch on.

### Examples

The following example switches on the power of node2.

```
cluster1::> set advanced

Warning: These advanced commands are potentially dangerous; use them only
when
        directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y

cluster1::*>
cluster1::*> system node power on -node node2

cluster1::*>
```

## system node power show

Display the current power status of the nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the power status of the main controller in each node across the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-status {on|off}] - Current Power Status**

If the `-status` parameter is specified, the command only lists information about the node with the power status value you enter.

### Examples

The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show
```

```
Node                Status
-----
node1               on
node2               on
2 entries were displayed.
```

```
cluster1::>
```

## system node root-mount create

Create a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node root-mount create` command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the [system node root-mount show](#) command to view the current status of root-mount or verify task completion.

**Parameters**

- node <nodename> - Owner of the Root-mount**  
The node name where the root-mount will be created.
- root-node <nodename> - Root-mount Destination Node**  
The node name that the root-mount will access.

**Examples**

The following example shows the creation of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the successful completion.

```
cluster1::> system node root-mount show
This table is currently empty.

cluster1::> system node root-mount create -node nodeA -root-node nodeB

cluster1::> system node root-mount show
Node           Root Node      State      Last Error
-----
nodeA          nodeB          ready
```

**Related Links**

- [system node root-mount show](#)

**system node root-mount delete**

Delete a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node root-mount delete` command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the [system node root-mount show](#) command to view the current status of root-mount or verify task completion.

**Parameters**

### **-node <nodename> - Owner of the Root-mount**

The node which has the mount.

### **-root-node <nodename> - Root-mount Destination Node**

The node accessed by the mount.

## **Examples**

This example shows the deletion of a root-mount from *cluster1::nodeA* to *cluster1::nodeB* and the verification of the command's successful completion.

```
cluster1::> system node root-mount show
Node           Root Node           State           Last Error
-----
nodeA           NodeB                           ready

cluster1::> system node root-mount delete -node nodeA -root-node nodeB

cluster1::> system node root-mount show
This table is currently empty.
```

## **Related Links**

- [system node root-mount show](#)

## **system node root-mount show**

Show the existing mounts from any node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system node root-mount show` command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

## **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-node <nodename>`] - Owner of the Root-mount**

Selects information about root-mounts that exist on the specified node.

### **[`-root-node <nodename>`] - Root-mount Destination Node**

Selects information about root-mounts that connect to the specified node.

### **[`-create-time <MM/DD/YYYY HH:MM:SS>`] - Mount Creation Time**

Selects information about root-mounts that were created at the specified time.

### **[`-state <Mount State>`] - State of the Root-Mount**

Selects information about root-mounts that have the specified state. The states are:

- *unknown*: The state of the root-mount is being determined.
- *initializing*: A root-mount was found and needs testing to determine the correct state.
- *mount-requested*: The root-mount has been requested, but is not ready.
- *mounting*: The root-mount is being created, but is not ready.
- *ready*: The root-mount is ready to be used.
- *not-responding*: The root-mount exists but is not responding.
- *does-not-exist*: No root-mount is possible to this node's root volume.
- *ha-busy*: The root-mount is busy pending completion of an HA event.
- *clean-up-requested*: The root-mount is being deleted.
- *cleaning-up*: The root-mount is being deleted.
- *create-error*: The root-mount could not be created.

### **[`-last-error <text>`] - Last Error**

Selects information about root-mounts that have the specified last-error value.

## **Examples**

+ The following example shows the default state of the root-mounts on a cluster that is not using root-node services:

```
cluster1:> system node root-mount show
This table is currently empty.
```

+ The following example displays the root-mounts that exist for a cluster that has ``\_nodeA\_`` mounted to ``\_nodeB\_``, and ``\_nodeB\_`` mounted to ``\_nodeA\_``:

```
cluster1::> system node root-mount show
Node           Root Node           State           Last Error
-----
nodeA           nodeB           ready
nodeB           nodeA           ready
2 entries were displayed.
```

## system node upgrade-revert show

Display upgrade/revert node status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node upgrade-revert show` command displays information about the status of upgrades or reversions. In case of upgrade to a patch release, for example from "9.12.1P1" to "9.12.1P2", there are no upgrade tasks to run, and therefore this command will not return any output. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

**[`-upgrade-version <integer>`] - Cluster Upgrade Version (privilege: advanced)**

Selects status information about upgrades or reversions that are to the version number you specify.

**[`-startup-phase {pre-root|pre-apps|post-apps}`] - Startup Phase (privilege: advanced)**

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

- pre-root - Upgrade is applied before mroot is mounted
- pre-apps - Upgrade is applied before other cluster apps are started
- post-apps - Upgrade is applied after all RDB apps are online

**[`-status <Upgrade/Revert Execution Status>`] - Execution Status (privilege: advanced)**

Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:

- prepared - Ready to upgrade
- applied - Successful upgrade
- reverted - Successful reversion
- failed - Unsuccessful upgrade or reversion
- aborted - Unsuccessful upgrade or reversion
- skipped - Upgrade or reversion was skipped for that phase
- locked - Upgrading or reverting

**[`-status-msg <text>`] - Status Message (privilege: advanced)**

Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

**[`-direction {upgrade|revert}`] - Upgrade/Revert Direction (privilege: advanced)**

Use this parameter with the value `upgrade` to select status information about upgrades. Use this parameter with the value `revert` to select status information about reversions.

**[`-node-status {reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped}`] - Node Status (privilege: advanced)**

Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:

- aborted - Upgrade process aborted. Contact support personnel.
- failed - Upgrade process failed. Contact support personnel.
- stopped - Upgrade process stopped due to node or management application restart. Use the [system node upgrade-revert upgrade](#) command to complete the upgrade manually.
- complete - Upgrade process completed successfully.
- waiting - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using [cluster show](#) and [cluster ping-cluster](#) to ensure that all nodes are healthy and in communication.

**[`-node-status-msg <text>`] - Node Status Message (privilege: advanced)**

Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.

## Examples

The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
cluster1::*> system node upgrade-revert show
```

```
Node: node1                                     Status: complete
```

```
Status Message: The upgrade is complete.
```

```
Vers Phase      Status  Upgrade Phase Status Message
```

```
---- -
```

```
200 pre-root    applied  No upgrade is required for this phase.
```

```
200 pre-apps    applied  Upgrade successful.
```

```
200 post-apps   applied  Upgrade successful.
```

```
Node: node2                                     Status: complete
```

```
Status Message: The upgrade is complete.
```

```
Vers Phase      Status  Upgrade Phase Status Message
```

```
---- -
```

```
200 pre-root    applied  No upgrade is required for this phase.
```

```
200 pre-apps    applied  Upgrade successful.
```

```
200 post-apps   applied  Upgrade successful.
```

```
6 entries were displayed.
```

- [system node upgrade-revert upgrade](#)
- [cluster show](#)
- [cluster ping-cluster](#)

## system node upgrade-revert upgrade

Run the upgrade at a specific phase.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node upgrade-revert upgrade` command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that is to be upgraded. The value `local` specifies the current node.

## Examples

This example shows command output of a node named `node0` if node configuration is current.

```
cluster1::*> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

## system node usb-ports modify

Modify the state of the external USB ports on the next boot

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node usb-ports modify` command allows the user to change the state of the external USB ports on the next boot.

### Parameters

**-node {<nodename>|local} - Node That Owns the External USB Ports (privilege: advanced)**

This parameter specifies which node the external USB state will be modified.

**[-is-disabled-next-boot {true|false}] - State of the External USB Ports on the Next Boot (privilege: advanced)**

If set to `true` the external USB ports on the specified node will be disabled on the next boot.

## Examples

The following example disables the external USB ports for `node1` on the next boot:

```
cluster1:::> system node usb-ports modify -node node1 -is-disabled-next
-boot true
ALERT: A reboot is required for changes to take effect.
```

## system node usb-ports show

Display the state of the external USB ports

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node usb-ports show` command displays the status of the external USB ports on each node.

Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-node* {<nodename>|local}] - Node That Owns the External USB Ports (privilege: advanced)**

If this parameter is specified, the command displays information about the status of the external USB ports on the specified node.

**[*-is-disabled* {true|false}] - Current State of the External USB Ports (privilege: advanced)**

This parameter specifies the current state of the external USB ports.

**[*-is-disabled-next-boot* {true|false}] - State of the External USB Ports on the Next Boot (privilege: advanced)**

This parameter specifies the state of the external USB ports after the next boot.

**[*-is-feature-supported* {true|false}] - External USB Ports Supported? (privilege: advanced)**

This parameter specifies whether or not the node even supports external USB ports.

**[*-connected-ports* {true|false}] - Connected USB Devices (privilege: advanced)**

This parameter specifies whether or not the USB ports have a device connected to them.

Examples

The following example displays information about the state of the external USB ports:

```
cluster1::> system node usb-ports show
Node                Disabled?                Disabled on Next Boot?
Supported? Devices Connected to Ports
-----
node1                false                true                true
false
```

**system node virtual-machine show-network-load-balancer**

Display network load balancer information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The *system node virtual-machine show-network-load-balancer* displays the list of network load balancer probe ports for each ONTAP node in the cluster.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node <nodename>] - Node (privilege: advanced)`**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**`[-vserver-name <text>] - Vserver Name (privilege: advanced)`**

Vserver name.

**`[-lif-name <text>] - ONTAP LIF Name (privilege: advanced)`**

ONTAP logical interface name.

**`[-probe-port <integer>] - Probe Port (privilege: advanced)`**

A TCP port which is regularly probed by the network load balancer. When the TCP port is healthy and open, the network load balancer will continue sending traffic to an associated network route. When unhealthy, the network load balancer will redirect all traffic intended for this route to an alternate route.

**`[-last-probe-time <MM/DD/YYYY HH:MM:SS>] - Last Probe Time (privilege: advanced)`**

The timestamp of the most recent health probe request on this TCP port.

**`[-remove-listener {true|false}] - Remove listener for This LIF (privilege: advanced)`**

Whether or not ONTAP has programmatically told the network load balancer to stop listening on the health probe associated with this LIF.

**`[-active {true|false}] - Actively receiving Health Probes (privilege: advanced)`**

Whether or not the network load balancer has received a health probe request on this TCP port, within the expected timeframe.

## Examples

The following example displays probe ports for each node in the cluster.

```
cluster1::*> system node virtual-machine show-network-load-balancer
```

| Node     | Vserver  | Logical<br>Interface | Probe<br>Port | Last Probe<br>Time |
|----------|----------|----------------------|---------------|--------------------|
| node1    | vserver0 | data_lif1            | 63002         | 5/8/2018           |
| 19:22:47 | cluster1 | cluster_mgmt         | 63001         | 5/8/2018           |
| 19:22:43 | vserver0 | data_lif2            | 63003         | 5/8/2018           |
| 19:22:44 | vserver0 | svm_mgmt             | 63004         | 5/8/2018           |
| 19:22:50 |          |                      |               |                    |

```
4 entries were displayed.
```

## system node virtual-machine disk-object-store create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store create` command adds an object store container to a node's configuration. All objects within the container will be added as disks to the specified node.

### Parameters

**-node <nodename> - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node to which the object store container will be added.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**-server <text> - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

Specifies the object store server where the container is hosted.

**-port <integer> - Port Number of the Object Store (privilege: advanced)**

Specifies the port number to connect to the object store server.

**-container-name <text> - Container Name (privilege: advanced)**

Specifies the name of the container to be added.

**-azure-account <text> - Azure Storage Account (privilege: advanced)**

Specifies the Azure storage account.

**-azure-private-key <text> - Azure Storage Account Access Key (privilege: advanced)**

Specifies the access key required to authenticate requests to the Azure object store.

**[-update-partner <true>] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example adds a container to the specified node.

```
cluster1::*> system node virtual-machine disk-object-store create
               -node node1 -object-store-name objstore1 -server
storageaccount1.blob.core.windows.net
               -container-name container1 -azure-account storageaccount1
               -azure-private-key
XpSUcS/f1sl4sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDoWYnsf/8JBhlHImH/RP9IO6maKL
YqEXAMPLEKEY== -update-partner
```

## system node virtual-machine disk-object-store delete

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store delete` command removes an object store container from a node's configuration.

### Parameters

**-node <nodename> - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node from which the object store container will be removed.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**[-update-partner {true|false}] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example removes a container from the specified node.

```
cluster1::*> system node virtual-machine disk-object-store delete
               -node node1 -object-store-name objstore1 -update-partner
```

## system node virtual-machine disk-object-store modify

Modify the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store modify` command updates one or more object store configuration parameters.

### Parameters

**-node <nodename> - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node for which the object store configuration will be modified.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**[-server <text>] - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server.

**[-azure-private-key <text>] - Azure Storage Account Access Key (privilege: advanced)**

This optional parameter specifies a new access key for the storage account.

**[-update-partner <>true>] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

### Examples

The following example updates the stored private key for an Azure container on the specified node.

```
cluster1::*> system node virtual-machine disk-object-store modify
               -node node1 -object-store-name objstore1
               -azure-private-key
XpSUcS/f1sl4sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDoWYnsf/8JBhlHImH/RP9IO6maKL
YqEXAMPLEKEY== -update-partner
```

## system node virtual-machine disk-object-store show

Display the list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node virtual-machine disk-object-store show` command displays the list of object store containers that contain each node's disks.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node <nodename>`] - ONTAP Node Name (privilege: advanced)**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[`-object-store-name <object store name>`] - ONTAP Name for this Object Store Config (privilege: advanced)**

Selects object store configurations with the specified name.

**[`-server <text>`] - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

Selects containers on the specified server.

**[`-port <integer>`] - Port Number of the Object Store (privilege: advanced)**

Selects containers attached on the specified port.

**[`-container-name <text>`] - Container Name (privilege: advanced)**

Selects containers with the specified name.

**[`-azure-account <text>`] - Azure Storage Account (privilege: advanced)**

Selects containers in the specified Azure storage account.

**[`-alive {true|false}`] - Is Server Alive (privilege: advanced)**

Selects containers based on their aliveness state, as seen from the ONTAP node.

## Examples

The following example displays the list of containers for each node in the cluster.

```
cluster1::*> system node virtual-machine disk-object-store show
                        Object Store
Node      Name      Azure Storage Account  Container Name
Alive
-----
node1
      objstore1    storageaccount1        container1
true
node2
      objstore1    storageaccount1        container1
true
2 entries were displayed.
```

## system node virtual-machine hypervisor show

Display hypervisor information about Data ONTAP-v nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

The name of the ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

[-vm-uuid <UUID>] - UUID of the Virtual Machine

The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects information about the hypervisor on which the ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use `-node` to filter out the same information.

**[-vmhost-bios-release-date <text>] - Release Date for the Hypervisor BIOS**

The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

**[-vmhost-bios-version <text>] - Current BIOS Version of the Hypervisor Physical Chassis**

The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

**[-vmhost-boot-time <text>] - Time When Hypervisor was Last Booted**

The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

**[-vmhost-cpu-clock-rate <integer>] - Speed of the Hypervisor CPU Cores (MHz)**

The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

**[-vmhost-cpu-core-count <integer>] - Number of Physical CPU Cores on the Hypervisor**

The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the specified CPU cores.

**[-vmhost-cpu-socket-count <integer>] - Number of Physical CPU Packages on the Hypervisor**

The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package consists of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

**[-vmhost-cpu-thread-count <integer>] - Number of Physical CPU Threads on the Hypervisor**

The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

**[-vmhost-gateway <text>] - Default Gateway for the Hypervisor**

The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.

**[-vmhost-hardware-vendor <text>] - Hardware Vendor of the Hypervisor**

The name of hypervisor hardware manufacturer. This optional parameter selects information about the hypervisors with the specified hardware vendor.

**[-vmhost-hypervisor <text>] - Complete Product Name, including the Version Information for the Hypervisor**

The complete product name, including the version information for the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified hypervisor version.

**[-vmhost-ip-address <text>] - Primary IP Address Assigned to the Hypervisor**

The primary IP address assigned to the hypervisor. This optional parameter selects information about the hypervisors with the specified IP address.

**[-vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)**

The physical memory size of the hypervisor in bytes. This optional parameter selects information about the hypervisors that are running with the specified physical memory.

**[`-vmhost-model <text>`] - Hypervisor Manufacturer-Supplied Hardware Model Name**

The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information about the hypervisors with the specified hardware model.

**[`-vmhost-name <text>`] - Hostname of the Hypervisor**

The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor with the specified host name.

**[`-vmhost-netmask <text>`] - Subnet Mask Address for the Hypervisor**

The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors with the specified netmask address.

**[`-vmhost-processor-id <text>`] - Processor ID of the Hypervisor**

The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the specified processor ID.

**[`-vmhost-processor-type <text>`] - CPU Model of the Hypervisor**

The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified processor type.

**[`-vmhost-software-vendor <text>`] - Name of the Virtual Machine Software Manufacturer**

The name of the virtual machine software manufacturer. This optional parameter selects information about the hypervisors with the specified software vendor.

**[`-vmhost-uuid <UUID>`] - UUID of the Hypervisor**

A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the specified UUID.

**[`-vmhost-error <text>`] - Error in case Hypervisor Info Retrieval Fails**

Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful when entered with wildcards.

**[`-vm-custom-max-capacity <integer>`] - Maximum Storage Capacity of the Virtual Machine (in TB)**

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects information about the node's storage capacity.

## Examples

The following example shows typical output from the `system node virtual-machine hypervisor show` command for the ONTAP virtual machines running in the cluster.

```

cluster1::> system node virtual-machine hypervisor show

## system node virtual-machine instance show-system-disks

Display information about virtual machine system disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The system node virtual-machine instance `show-system-disks` command displays information about the system disks (non-data disks) attached to the virtual machine. Data disk information is available using the command `storage disk show-virtual-machine-disk-info`.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name**

Selects disk information for nodes that match this parameter.

**[-vmdisk-purpose <text>] - Purpose of the System Disk**

Selects disk information for disks that match this parameter. Values include: *Boot* , *NVRAM* , and *Core* .

**[-vmdisk-type <text>] - Type of the System Disk**

Selects disk information for disks that match this parameter. Possible values are: *VMDISK* , *SSD* .

**[-vmdisk-name <text>] - System Disk Name**

Selects disk information for disks that match this parameter. The virtual machine ID of the system disk.

**[-vmdisk-capacity <text>] - Size of the System Disk (GB)**

Selects disk information for disks that match this parameter. The size of the system disk.

**[-vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor**

Selects disk information for disks that match this parameter. The virtual machine file name of the disk. Each system disk is mapped to a unique VM disk file.

## Examples

The following example shows typical output from the command.

```
cluster1::> system node virtual-machine instance show-system-disks
```

|       | Disk    | Disk   | Disk | Disk        |                     |
|-------|---------|--------|------|-------------|---------------------|
| Node  | Purpose | Type   | Name | Capacity GB | VM Disk File Name   |
| ----- |         |        |      |             |                     |
| node1 |         |        |      |             |                     |
|       | boot    | SSD    | da0  | 10          | node1-vm-disk-boot  |
|       | nvram   | SSD    | da1  | 500         | node1-vm-disk-nvram |
|       | core    | VMDISK | da2  | 216         | node1-vm-disk-core  |

## system node virtual-machine instance show

Display virtual machine instance information per node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node virtual-machine instance show` command displays virtual machine information. With this information you can determine the relationship between a ONTAP *node* and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter represents the name of the ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-instance-id <text>] - ID of This Instance**

Selects the nodes that match this parameter value. A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8fe4b19bc3b330c3.1".

**[-account-id <text>] - ID of This Account**

Selects the nodes that match this parameter value. The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

**`[-image-id <text>]` - ID Of the Image in Use on This Instance**

Selects the nodes that match this parameter value. The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run ONTAP in the cloud.

**`[-instance-type <text>]` - Specifies System Attributes and Use Cost**

Selects the nodes that match this parameter value. A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

**`[-region <text>]` - Set of Resources in the Same Geographic Area**

Selects the nodes that match this parameter value. A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

**`[-version <text>]` - Instance Metadata Version of This VM**

Selects the nodes that match this parameter value. The instance metadata version of this virtual machine instance.

**`[-availability-zone <text>]` - Distinct Location within a Region**

Selects the nodes that match this parameter value. A distinct location within a *region* that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

**`[-primary-ip <text>]` - Primary IP Address Assigned to this Instance**

Selects the nodes that match this parameter value. The primary IP address assigned to this virtual machine instance.

**`[-fault-domain <integer>]` - Fault Domain of This Instance**

Selects the nodes that match this parameter value. A cloud provider-assigned numerical fault domain ID for this virtual machine.

**`[-update-domain <integer>]` - Update Domain of This Instance**

Selects the nodes that match this parameter value. A cloud provider-assigned numerical update domain ID for this virtual machine.

**`[-provider <text>]` - Provider on which this instance is running.**

Selects the nodes that match this parameter value. The provider on which this instance is running.

**`[-offer <text>]` - Marketplace Offer for This Image**

Selects the nodes that match this parameter value. A Marketplace is an online store that offers applications and services either built on or designed to integrate with a particular cloud provider. A virtual machine offer corresponds to a class of product offering from a publisher. An offer is a collection of SKUs. Every offer appears as its own entity in the provider Marketplace.

**`[-sku <text>]` - Marketplace SKU for This Image**

Selects the nodes that match this parameter value. A SKU is the smallest purchasable unit of an offer. While within the same product class (offer), SKUs allow you to differentiate between different features supported, VM image types and billing models supported.

**[-sku-version <text>] - Marketplace Version of a SKU**

Selects the nodes that match this parameter value. The version for this virtual machine SKU.

**[-resource-group-name <text>] - Resource Group Name of This Instance**

Selects the nodes that match this parameter value. Resource group for the instance.

**[-cpu-platform <text>] - CPU Platform of the Instance**

Selects the nodes that match this parameter value. GCP only. CPU platform of the hypervisor host.

Example: *Intel Broadwell*.

**[-consumer <text>] - Consumer of this Instance**

Selects the nodes that match this parameter value. Consumer is based on the platform/infrastructure on which ONTAP is launched. Example: *Marketplace*.

**[-total-network-bandwidth-limit <integer>] - Total Network Bandwidth Limit in MB/s**

Selects the nodes that match this parameter value. Represents the total network bandwidth limit for the given VM in MBps. For IBM Cloud, the limit is calculated separately for ingress and egress. Example: *1024*.

**[-total-volume-bandwidth-limit <integer>] - Total Volume Bandwidth Limit in MB/s**

Selects the nodes that match this parameter value. Represents the total volume bandwidth limit for the given VM in MBps. For IBM Cloud, the limit is calculated separately for ingress and egress. Example: *1024*.

**[-az-id <text>] - Id of Availability Zone in which the instance is running**

Id of Availability Zone in which the instance is running

**[-storage-ontap-instance-id <text>] - Storage ontap instance ID for the deployment**

Storage ONTAP instance ID for the deployment

**[-vpc-partner-api-endpoint <text>] - VPC partner api endpoint for the deployment**

VPC partner api endpoint for the deployment

**[-self-setup {true|false}] - Deployed and configured without BlueXP**

Deployed and configured without BlueXP

## Examples

The following examples illustrate typical output from the `system node virtual-machine instance show` command for a virtual machine running in a cloud provider environment.

```
cluster1:> system node virtual-machine instance show
           Node:  node1
           Instance ID:  i-b9c42e97

## system script commands

### system script delete

Delete saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system script delete` command deletes files that contain CLI session records. Use the [system script show](#) command to display saved CLI sessions.

#### Parameters

**-username <text> - Log Owner Username**

Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username is that of the logged in user.

**-filename <text> - Log Filename**

Use this parameter to specify the names of CLI session record files to delete.

#### Examples

The following example shows how to delete the files named `sessionlog2` and `sessionlog3`.

```
cluster1::> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```
cluster1::> system script delete *
```

## system script show

Display saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system script show` command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the `-user` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-user ]**

Use this parameter to display all script files created by all users, along with the username associated with each file.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-username <text>] - Log Owner Username**

Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.

**[-filename <text>] - Log Filename**

Use this parameter to display information only about files that have the file name you specify.

**[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Logfile Size Limit**

Use this parameter to display information only about files that have the size limit you specify.

**[-state <State of CLI session log>] - Current State**

Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are `open-and-logging`, `file-full`, and `file-closed`.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Current Logfile Size**

Use this parameter to display information only about files that are the size you specify.

**[-mtime <MM/DD/YYYY HH:MM:SS>] - Last Modification Time**

Use this parameter to display information only about files that were last modified at the date and time you specify.

**[-this-session {yes|no}] - Session is Logging**

Use this parameter with the value `yes` to display information only about files that are recording the current CLI session. Use this parameter with the value `no` to display information only about files that are not

recording the current CLI session.

## Examples

The following example displays typical system script information.

```
cluster1::> system script show
          This
FileName  Sess State          Size    Last Mod Date
-----
sessionlog1    no  file-closed    435B    12/2/2008 10:51:12
sessionlog2    yes open-and-logging 193B    12/2/2008 10:51:29
2 entries were displayed.
```

## system script start

Start logging all CLI I/O to session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system script start` command starts creating a record of your CLI session. The record is stored in a file. Use the `system script show -this-sessionyes` command to display files that are recording the current CLI session. Use the `system script stop` command to stop recording the current CLI session.

### Parameters

#### **-filename <text> - Filename to Log To**

Use this parameter to specify the file name to which the CLI session record is saved.

#### **-size-limit {<integer>[KB|MB|GB|TB|PB] } - Logfile Size Limit Max:2GB**

Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is 1 MB . The maximum file size limit is 2 GB .

## Examples

The following example shows how to start creating a record of the CLI session in a file named `sessionlog3` . The size limit of this file is 20 MB .

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

## system script stop

Stops logging CLI I/O

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system script stop` command stops creating a record of your CLI session, if you started creating the record by using the `system script start` command. Use the `system script show -this-sessionyes` command to display files that are recording the current CLI session.

### Examples

The following example shows how to stop creating a record of your CLI session.

```
cluster1::> system script stop
```

## system script upload

Upload the selected CLI session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system script upload` command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the `system script show` command to display saved CLI sessions. Use the `system script start` command to record a CLI session and save it to a file.

### Parameters

#### **-username <text> - Username If Not Your Own**

Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

#### **-filename <text> - Filename to Log To**

Use this parameter to specify the name of a file to be uploaded.

#### **-destination {scheme://(hostname|IPv4 Address|'['IPv6 Address']')}...} - URI to Send File To**

Use this parameter to specify the FTP or HTTP destination of the file.

## Examples

The following example shows how to upload the file named `sessionlog3` to the destination `ftp://now.example.com/cli_sessions`.

```
cluster1::> system script upload -filename sessionlog3 -destination
ftp://now.example.com/cli_sessions
```

# system service-processor commands

## system service-processor reboot-sp

Reboot the Service Processor on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor reboot-sp` command reboots the Service Processor of the specified node.

## Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor is to be rebooted.

**[-image {primary|backup}] - Image to Boot with After Reboot**

This parameter specifies the image that the Service Processor uses after the reboot. By default, the `primary` image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact technical support before attempting to boot the SP from the backup image.

## Examples

The following command reboots the Service Processor of node "node1" into the `primary` image.

```
cluster1::> system service-processor reboot-sp -node node1 -image primary

NOTE : If your console connection is through the SP, it will be
disconnected.
      Do you want to reboot the SP ? {y|n}: y

cluster1::>
```

The following command reboots the Service Processors of all nodes. Since `-image` is not specified, the Service Processors will boot into the primary image.

```
cluster1::> system service-processor reboot-sp -node *

NOTE : If your console connection is through the SP, it will be
disconnected.
      Do you want to reboot the SP ? {y|n}: y
2 entries were acted on.

cluster1::>
```

## system service-processor show

Display the Service Processor information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor show` command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for the Service Processor of the specified node.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects information for the Service Processors whose status matches the specified value.

**[-ip-configured {true|false}] - Is Network Configured**

Selects information for the Service Processors whose network is configured (`true`) or not configured (`false`).

**[-address <IP Address>, ...] - Public IP Address**

Selects information for the Service Processors that use the specified IP address or addresses.

**[-mac <MAC Address>] - MAC Address**

Selects information for the Service Processors that use the specified MAC address.

**[-fw-version <text>] - Firmware Version**

Selects information for the Service Processors that are running the specified firmware version.

**[-part-num <text>] - Part Number**

Selects information for the Service Processors that have the specified part number.

**[-serial-num <text>] - Serial Number**

Selects information for the Service Processors that have the specified serial number.

**[-dev-rev <text>] - Device Revision**

Selects information for the Service Processors that have the specified device revision.

**[-autoupdate-enabled {true|false}] - Is Firmware Autoupdate Enabled**

Selects information for the Service Processors that have the specified status for firmware automatic update.

## Examples

The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
```

| Node  | Type | Status | IP Configured | Firmware Version | IP Address    |
|-------|------|--------|---------------|------------------|---------------|
| node1 | SP   | online | true          | 2.2X5            | 192.168.1.201 |
| node2 | SP   | online | true          | 2.2X5            | 192.168.1.202 |

2 entries were displayed.

```
cluster1::>
```

The following example displays all available information for the Service Processors of all the nodes.

```

cluster1::> system service-processor show -instance
Node: node1
                Type of Device: SP
                  Status: online
Is Network Configured: true
    Public IP Address: 192.168.1.201
      MAC Address: ab:cd:ef:fe:ed:01
    Firmware Version: 2.2X5
      Part Number: Not Applicable
      Serial Number: Not Applicable
      Device Revision: Not Applicable
Is Firmware Autoupdate Enabled: true
Node: node2
                Type of Device: SP
                  Status: online
Is Network Configured: true
    Public IP Address: 192.168.1.202
      MAC Address: ab:cd:ef:fe:ed:02
    Firmware Version: 2.2X5
      Part Number: Not Applicable
      Serial Number: Not Applicable
      Device Revision: Not Applicable
Is Firmware Autoupdate Enabled: true
2 entries were displayed.

cluster1::>

```

The following example displays only the type, status and firmware version for the Service Processors of all the nodes.

```

cluster1::> system service-processor show -fields type,status,fw-version
node          type status fw-version
-----
node1         SP   online 2.2X5
node2         SP   online 2.2X5
2 entries were displayed.

cluster1::>

```

## system service-processor api-service check

Check API Service availability in SP/BMC

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system service-processor api-service check` checks the availability of the SP API and web service on Service Processors (SP) or Baseboard Management Controllers (BMC) in the cluster.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node to initiate the check operation. By default, all nodes check availability.

**[-port <integer>] - SP/BMC API Service Port (privilege: advanced)**

This parameter specifies the port number on the SP or BMC used for the API service. By default, port 50000 is used.

**[-target-node {<nodename>|local}] - Target Node (privilege: advanced)**

This parameter specifies the target node whose SP or BMC API and web service is to be checked. By default, all node SPs or BMCs are checked.

## Examples

The following example checks the availability of the API and web service on all node SPs or BMCs.

```

cluster1::~*> sp api-service check -node *

Date: Tue Oct 27 03:09:19 2020
Node: cluster1-01
Port: 50000
    Local Private IPv4: ok (192.0.2.82)
    Local Public IPv4: ok (10.233.4.22)
    Local Public IPv6: ok (2020::2023)

```

## system service-processor api-service disable-installed-certificates

Disable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command disables user-installed certificates for secure communication with the service processor API service. Default certificates are then auto-generated.

## Examples

The following example disables user-installed certificates for the service processor API service.

```
cluster1::> system service-processor api-service disable-installed-  
certificates
```

## system service-processor api-service enable-installed-certificates

Enable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command enables user-installed certificates for secure communication with the service processor. Use the [security certificate install](#) command to install client, server and CA certificates.

## Parameters

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver on which certificates are installed.

**-server-cert <text> - Name of the Server Certificate**

Use this parameter to specify the unique name of the server certificate.

**-client-cert <text> - Name of the Client Certificate**

Use this parameter to specify the unique name of the client certificate.

**-rootca-cert <text> - Names of the Root CA Certificates**

Use this parameter to specify the unique names of server-ca or client-ca certificate.

## Examples

The following example installs server, client and rootca certificates and then enables those certificates for secure communication with the service processor.

```

cluster1::> security certificate install -vserver cluster1 -type server
cluster1::> security certificate install -vserver cluster1 -type client
cluster1::> security certificate install -vserver cluster1 -type server-ca
cluster1::> security certificate show-user-installed
Vserver      Serial Number      Certificate Name      Type
-----
cluster1  1533F133482E800F
                                xxx-ca      server-
ca
    Certificate Authority: xxx-ca
    Expiration Date: Sat Jun 01 05:11:41 2019

## system service-processor api-service modify

Modify service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system service-processor api-service modify` command modifies the Service Processor (SP) or Baseboard Management Controller (BMC) API service and web service configuration. The SP API and web is a secure network API that enables ONTAP to communicate with the SP or BMC over the network.

### Parameters

**{ [-sp-api-enabled {true|false}] - Is SP API Service Enabled (privilege: advanced)**

This parameter enables or disables the SP API service of the SP or BMC. When the SP API service is

disabled, features like network-based firmware updates and network-based down node log collection will not be available, and the slower serial-interface will be used for firmware updates and down node log collection.

**`[-sp-api-port <integer>] - SP API Service Port (privilege: advanced)`**

This parameter specifies the port number on the SP or BMC used for the SP API service. By default, port 50000 is used.

**`[-sp-api-limit-access {true|false}] - Only Cluster Members Can Access the API Service (privilege: advanced)`**

This parameter restricts SP API service access to cluster members only. By default, it is enabled.

**`[-web-enabled {true|false}] - Is SP Web Service Enabled (privilege: advanced)`**

This parameter enables or disables the web service of the SP or BMC running on TCP port 443. When the web service is disabled, features like network-based firmware updates and network-based down node log collection will not be available, and the slower serial-interface will be used for firmware updates and down node log collection.

**`[-web-limit-access {true|false}] - Only Cluster Members Can Access the Web Service (privilege: advanced) }`**

This parameter restricts web service access to cluster members only. By default, it is enabled.

## Examples

The following example modifies the port number used for the SP API service and then disables the SP API service.

```
cluster1::*>system service-processor api-service modify -sp-api-enabled
true -sp-api-port 50001 -sp-api-limit-access true

cluster1::*>system service-processor api-service show
  Service Processor API service configuration
    SP API Enabled: true
    SP API Port: 50001
  SP API Limit Access: true
    Web Enabled: true
  Web Limit Access: true
  Server Certificate: -internal-
  Client Certificate: -internal-
    CA Certificate: -internal-
```

```
cluster1::*>system service-processor api-service modify -sp-api-enabled
false -sp-api-port 50001 -sp-api-limit-access true

cluster1::*>system service-processor api-service show
  Service Processor API service configuration
    SP API Enabled: false
      SP API Port: 50001
SP API Limit Access: true
    Web Enabled: true
    Web Limit Access: true
  Server Certificate: -internal-
  Client Certificate: -internal-
    CA Certificate: -internal-
```

The following example disables the SP Web service.

```
cluster1::*>system service-processor api-service modify -web-enabled false
-web-limit-access true

cluster1::*>system service-processor api-service show
  Service Processor API service configuration
    SP API Enabled: false
      SP API Port: 50001
SP API Limit Access: true
    Web Enabled: false
    Web Limit Access: true
  Server Certificate: -internal-
  Client Certificate: -internal-
    CA Certificate: -internal-
```

## system service-processor api-service regenerate-ssh-auth-key

### Regenerate SSH Auth Private and Public Key

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system service-processor api-service regenerate-ssh-auth-service` command regenerates public and private keys for SSH public key authentication between ONTAP nodes and their service processor (SP) or baseboard management controller (BMC).

#### Parameters

### **-key-type {ecdsa-256|ecdsa-384|rsa-2048|rsa-3076|rsa-4096} - SSH Key Type**

This parameter specifies the SSH authentication key type and key size that must be used when regenerating the keys. Examples: ecdsa-256, rsa-2048.

#### **Examples**

The following example regenerates keys based on key type ECDSA and key size 256.

```
cluster1::> system service-processor api-service regenerate-ssh-auth-key  
-key_type ecdsa-256
```

### **system service-processor api-service renew-internal-certificates**

Renew SSL and SSH certificates used for secure communication with the service processor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### **Description**

The `system service-processor api-service renew-internal-certificates` command generates the certificates used for secure communication with the service processor API service. This command is not allowed if user-installed certificates are enabled.

#### **Examples**

The following example generates new default host and root-ca certificates.

```
cluster1::*> system service-processor api-service renew-internal-  
certificates
```

### **system service-processor api-service show**

Display service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### **Description**

The `system service-processor api-service show` command displays the Service Processor (SP) or Baseboard Management Controller (BMC) API and web service configuration.

#### **Examples**

The following example displays the SP or BMC API and web service configuration:

```
cluster1::*> system service-processor api-service show
Service Processor API service configuration
  SP API Enabled: true
  SP API Port: 50000
SP API Limit Access: true
  Web Enabled: true
  Web Limit Access: true
Server Certificate: -internal-
Client Certificate: -internal-
CA Certificate: -internal-
```

## system service-processor image modify

### Enable/Disable automatic firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system service-processor image modify` command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

#### Parameters

##### **-node {<nodename>|local} - Node**

The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

##### **[-autoupdate {true|false}] - Firmware Autoupdate**

Setting this parameter to `true` enables automatic firmware update. Setting this parameter to `false` disables automatic firmware update. This is a mandatory parameter.

#### Examples

The following command enables automatic firmware update for the Service Processor on the local node.

```
cluster1::> system service-processor image modify -node local -autoupdate
true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

## system service-processor image show

Display the details of currently installed Service Processor firmware image

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor image show` command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects firmware image information for the Service Processor of the specified node.

**[-image {primary|backup}] - Image**

Selects firmware image information for the Service Processors that are running the primary or backup image as specified.

**[-type {SP|NONE|BMC}] - Type**

Selects firmware image information for the Service Processors of the specified type.

**[-status {installed|corrupt|updating|auto-updating|none}] - Image Status**

Selects firmware image information for the Service Processors whose image status matches the specified value.

**[-is-current {true|false}] - Is Image Current**

Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.

**[-version <text>] - Firmware Version**

Selects firmware image information for the Service Processors running the specified firmware version.

**[-autoupdate {true|false}] - Firmware Autoupdate**

Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.

**[-last-update-status {failed|passed}] - Last Update Status**

Selects firmware image information for the Service Processors whose last update is of the specified status.

Examples

The following command displays basic firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show
Is
Node          Type  Image  Status  Current Version
-----
node1          SP
               primary installed true    2.2X8
               backup  installed false   2.2X5
node2          SP
               primary installed true    2.2X8
               backup  installed false   2.2X5
4 entries were displayed.

cluster1::>
```

The following command displays all available firmware information for the Service Processors of all the nodes.

```

cluster1::> system service-processor image show -instance
Node: node1
    Image: primary
    Type: SP
    Image Status: installed
    Is Image Current: true
    Firmware Version: 2.2X8
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node1
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: primary
    Type: SP
    Image Status: installed
    Is Image Current: true
    Firmware Version: 2.2X8
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
4 entries were displayed.

cluster1::>

```

## system service-processor image update

### Update Service Processor firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image update` command installs a new firmware version on the Service Processor (SP) or Baseboard Management Controller (BMC) of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the SP or BMC and how.

You can use the command `system service-processor image update-progress show` to check the progress of the update.

The following parameter combinations are not supported for this command:

- `-baseline true` with `-package <text>`

## Parameters

### `-node {<nodename>|local}` - Node

This parameter specifies the node whose SP or BMC firmware is to be updated.

### `[-package <text>]` - Firmware Package

This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the `system node image package show` command. If you do not specify this parameter, the SP or BMC is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if `baseline` is `false` or omitted.

### `[-baseline {true|false}]` - Install Baseline

If you set this parameter to `true`, the command installs the SP or BMC firmware version that is bundled with the currently running release of ONTAP. This is a safety mechanism that allows you to revert the SP or BMC firmware to the version that was qualified and bundled with the currently running version of ONTAP on your system. If not specified, this parameter defaults to `false`.

### `[-pre-check {true|false}]` - Perform Pre-checks (privilege: advanced)

If you set this parameter to `false`, the command skips pre-requisite checks, such as target versions below baseline or compatibility tokens. The default value for this parameter is `true`.

## Examples

The following command reverts the firmware on the SP or BMC of the local node to the version that was packaged with the currently running release of ONTAP. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -baseline
true
```

```

cluster1::>

cluster1::> system service-processor image update-progress show

```

| Node  | In Progress | Start Time         | Percent Done | End Time |
|-------|-------------|--------------------|--------------|----------|
| node1 | yes         | 8/28/2012 20:00:34 | 99           | -        |
| node2 | no          | -                  | 0            | -        |

```

2 entries were displayed.

cluster1::>

```

## system service-processor image update-progress show

Display status for the latest Service Processor firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image update-progress show` command displays the progress information of firmware updates on the Service Processor (SP) or Baseboard Management Controller (BMC) of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP/BMC firmware update that is triggered from the SP CLI.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter displays the status of SP or BMC firmware update for the specified node.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update Start Timestamp**

This parameter displays the status of the SP or BMC whose firmware update start time matches the specified value.

### **[-percent-done <integer>] - Latest SP Firmware Update Percentage Done**

This parameter displays the status of the SP or BMC whose update completion percentage matches the specified value.

### **[-end-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update End Timestamp**

This parameter displays the status of the SP or BMC whose firmware update end time matches the specified value.

### **[-in-progress {yes|no}] - Is Update in Progress**

This parameter displays the update status of the SP or BMC that matches the specified in-progress status.

## **Examples**

The following example starts a firmware update on the local node and then uses the command `system service-processor image update-progress show` to display progress of firmware updates on SPs or BMCs of all nodes in the system.

```
cluster1::> system service-processor image update -node local -baseline true
```

```
cluster1::>
```

```

## **system service-processor log show-allocations**

Display the Service Processor log allocation map

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the `mroot` directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that the specified node has collected.

**[-remote-node <text>] - Remote Node**

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

**[-seqList <integer>,...] - Log File Sequence Numbers**

If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

## Examples

The following example displays the allocation map of the Service Processor log files in the cluster.

```
cluster1::> system service-processor log show-allocation
Node           From Which Node      Log File Sequence
-----
cluster1-01
                cluster1-01      10, 11, 12, 13, 15
                cluster1-02      14, 15, 16, 17
cluster1-02
                cluster1-01      14
                cluster1-02      11, 12, 13
4 entries were displayed.

```

## system service-processor network modify

Modify the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network modify` command modifies the network configuration of the Service Processor of specified node or nodes in a cluster.

If the SP automatic network configuration has been enabled, the `system service-processor network`

`modify` command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor's network configuration is to be modified.

### **-address-family {IPv4|IPv6} - Address Family**

This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.

### **[-enable {true|false}] - Interface Enabled**

This parameter enables or disables the underlying network interface for the specified `address-family`. This is a mandatory parameter.

### **[-dhcp {v4|none|v6}] - DHCP Status**

If this parameter is set to `v4`, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to `v4` or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.

### **[-ip-address <IP Address>] - IP Address**

This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the `-dhcp` parameter is not set to `v4`.

### **{ [-netmask <IP Address>] - Netmask**

This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not `v4` and the address family is IPv4.

### **[-prefix-length <integer>] - Prefix Length of Subnet Mask }**

This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to `v4` and when the address family is set to IPv6.

### **[-gateway <IP Address>] - Gateway IP Address**

This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to `v4`.

## Examples

The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

## system service-processor network show

### Display the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network show` command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects network configuration information for the Service Processor of the specified node.

**[-address-family {IPv4|IPv6}] - Address Family**

Selects network configuration information for the Service Processors that have the specified IP address family.

**[-enable {true|false}] - Interface Enabled**

Selects network configuration information for the Service Processors whose network interface for the given `address-family` is enabled or disabled as specified.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects network configuration information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects network configuration information for the Service Processors whose status matches the specified value.

**[-link-status {up|down|disabled|unknown}] - Link Status**

Selects network configuration information for the Service Processors whose link status matches the specified value.

**[-dhcp {v4|none|v6}] - DHCP Status**

Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

**[-ip-address <IP Address>] - IP Address**

Selects network configuration information for the Service Processors that use the specified IP address.

**[-mac <MAC Address>] - MAC Address**

Selects network configuration information for the Service Processors that use the specified MAC address.

**[-netmask <IP Address>] - Netmask**

This parameter displays information only for the Service Processors that use the specified netmask.

**[-prefix-length <integer>] - Prefix Length of Subnet Mask**

Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

**[-router-ip <IP Address>] - Router Assigned IP Address**

Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.

**[-link-local-ip <IP Address>] - Link Local IP Address**

Selects network configuration information for the Service Processors whose link local IP address matches the specified value.

**[-gateway <IP Address>] - Gateway IP Address**

Selects network configuration information for the Service Processors whose gateway IP address matches the specified value.

**[-time-last-updated <text>] - Time Last Updated**

Selects network information for the Service Processors that have the specified time stamp showing when configuration was last updated.

**[-subnet-name <text>] - Subnet Name**

Selects network information for the Service Processors that use the specified subnet-name for SP automatic configuration.

**[-is-ipv6-ra-enabled {true|false}] - Enable IPv6 Router Assigned Address**

Selects network information for the Service Processors that have the specified status for IPv6 router-assigned address.

**[-setup-status {not-setup|succeeded|in-progress|failed}] - SP Network Setup Status**

Selects network information for the Service Processors that have the specified status for network interface setup.

**[-setup-failure-reason {success|subnet-out-of-address|invalid-subnet|other-error}] - SP Network Setup Failure Reason**

Selects network information for the Service Processors that have the specified reason for network interface setup failure.

## Examples

The following example displays basic network configuration information for the Service Processors of all the nodes.

```

cluster1::> system service-processor network show

```

| Node                                    | Status | Type | Link State | IP Address    |
|-----------------------------------------|--------|------|------------|---------------|
| node1                                   | online | IPv4 | up         | 192.168.1.201 |
| DHCP: v4                                |        |      |            |               |
| MAC Address: ab:cd:ef:fe:ed:01          |        |      |            |               |
| Network Gateway: 192.168.1.1            |        |      |            |               |
| Network Mask (IPv4 only): 255.255.255.0 |        |      |            |               |
| Prefix Length (IPv6 only): -            |        |      |            |               |

## system service-processor network auto-configuration disable

### Disable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network auto-configuration disable` command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

Parameters

**-address-family {IPv4|IPv6} - Subnet Address Family**

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

Examples

The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```
cluster1::>system service-processor network show
      Address
Node      Status      Family      Link State      IP Address
-----
node1
      online      IPv4      up      192.168.1.2
      DHCP: none
      MAC Address: ab:cd:ef:fe:ed:01
      Network Gateway: 192.168.1.1
      Network Mask (IPv4 only): 255.255.255.0
      Prefix Length (IPv6 only): -
      IPv6 RA Enabled: -
      Subnet Name: ipv4_test
      SP Network Setup Status: succeeded
```

```
cluster1::>system service-processor network auto-configuration disable
-address-family Ipv4

cluster1::>system service-processor network auto-configuration show
Cluster Name      SP IPv4 Subnet Name      SP IPv6 Subnet Name
-----
cluster1      -
```

```

cluster1::>system service-processor network show
                                Address
Node           Status           Family    Link State  IP Address
-----
node1
online         IPv4       up         192.168.1.184
DHCP: v4
MAC Address: ab:cd:ef:fe:ed:01
Network Gateway: 192.168.1.1
Network Mask (IPv4 only): 255.255.255.0
Prefix Length (IPv6 only): -
IPv6 RA Enabled: -
Subnet Name: -
SP Network Setup Status: succeeded

```

## system service-processor network auto-configuration enable

### Enable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system service-processor network auto-configuration enable` command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

#### Parameters

##### **-address-family {IPv4|IPv6} - Subnet Address Family**

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

##### **-subnet-name <text> - Subnet Name**

This parameter specifies the network subnet that the SP will use for automatic network configuration.

#### Examples

The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::>system service-processor network show
```

| Node  | Status | Address<br>Family | Link State | IP Address    |
|-------|--------|-------------------|------------|---------------|
| ----- |        |                   |            |               |
| ----- |        |                   |            |               |
| node1 | online | IPv4              | up         | 192.168.1.201 |

DHCP: v4

MAC Address: ab:cd:ef:fe:ed:01  
Network Gateway: 192.168.1.1  
Network Mask (IPv4 only): 255.255.255.0  
Prefix Length (IPv6 only): -  
IPv6 RA Enabled: -  
Subnet Name: -  
SP Network Setup Status: succeeded

```
cluster1::> network subnet show
```

IPspace: Default

| Subnet<br>Name | Subnet         | Broadcast<br>Domain | Gateway     | Avail/<br>Total | Ranges                      |
|----------------|----------------|---------------------|-------------|-----------------|-----------------------------|
| -----          |                |                     |             |                 |                             |
| -----          |                |                     |             |                 |                             |
| ipv4_test      | 192.168.1.0/24 | Default             | 192.168.1.1 | 3/5             | 192.168.1.2-<br>192.168.1.6 |

```
cluster1::>system service-processor network auto-configuration enable
-address-family ipv4 -subnet-name ipv4_test
```

```
cluster1::system service-processor network> show
```

| Node  | Status | Address Family | Link State | IP Address  |
|-------|--------|----------------|------------|-------------|
| ----- |        |                |            |             |
| ----- |        |                |            |             |
| node1 | online | IPv4           | up         | 192.168.1.2 |

DHCP: none

MAC Address: ab:cd:ef:fe:ed:01

Network Gateway: 192.168.1.1

Network Mask (IPv4 only): 255.255.255.0

Prefix Length (IPv6 only): -

IPv6 RA Enabled: -

Subnet Name: ipv4\_test

SP Network Setup Status: succeeded

## system service-processor network auto-configuration show

### Display Service Processor Auto-Configuration Setup

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network auto-configuration show` command displays the names of the IPv4 and IPv6 network subnet objects configured in the cluster that the SP uses for automatic configuration.

### Examples

The following example shows that the SP is configured to use the "ipv4\_test" IPv4 subnet in the cluster for the SP automatic network configuration.

```
cluster1::>system service-processor network auto-configuration show
Cluster Name      SP IPv4 Subnet Name      SP IPv6 Subnet Name
-----
cluster1         ipv4_test                -
```

## system service-processor ssh add-allowed-addresses

### Add IP addresses to the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh add-allowed-addresses` command grants IP addresses access to the Service Processor.

## Parameters

### **-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses**

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

## Examples

The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh add-allowed-addresses -allowed
-addresses 192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be
replaced
      with your changes. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
  Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service
Processor.
cluster1::> system service-processor ssh add-allowed-addresses -allowed
-addresses 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh show
  Allowed Addresses: 0.0.0.0/0, ::/0
cluster1::>
```

## **system service-processor ssh remove-allowed-addresses**

Remove IP addresses from the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

## Parameters

### **-allowed-addresses <IP Address/Mask>,... - Public IP Addresses**

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

## Examples

The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh remove-allowed-addresses -allowed
-addresses 192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list,
all IP
        addresses will be denied access. To restore the "allow all"
default,
        use the "system service-processor ssh add-allowed-addresses
        -allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to
continue?
        {y|n}: y

cluster1::> system service-processor ssh show
  Allowed Addresses: -

cluster1::>
```

## system service-processor ssh show

Display SSH security information about the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

## Examples

The following example displays SSH security information about the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```

## system services commands

### system services firewall modify

Modify firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system services firewall modify` command modifies a node's firewall configuration.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to modify firewall configuration.

**[-enabled {true|false}] - Service Enabled**

Use this parameter to specify whether firewall protection is enabled ("*true*") or disabled ("*false*") for the node's network ports. The default setting is *true*.

## Examples

The following example enables firewall protection for a node named node1:

```
cluster1::> system services firewall modify -node node1 -enabled true
```

### system services firewall show

Show firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system services firewall show` command displays firewall configuration. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about the firewall settings on the node you specify.

**[-enabled {true|false}] - Service Enabled**

Selects information about the nodes with the firewall enabled ("*true*") or disabled ("*false*").

## Examples

The following example displays information about firewall configuration for all nodes in the cluster:

```
cluster1::> system services firewall show
Node           Enabled
-----
node0          true
node1          true
node2          true
node3          true
4 entries were displayed.
```

## system services firewall policy clone

(DEPRECATED)-Clone an existing firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy clone](#) instead.

The `system services firewall policy clone` command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

## Parameters

**-vserver <text> - Vserver owning the Policy**

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

### **-policy <text> - Firewall Policy to be Cloned**

Use this parameter to specify the name of the existing policy to copy.

### **[-destination-vserver <text>] - Vserver owning the New Firewall Policy**

Use this parameter to specify the name of the Vserver that will own the new policy to create.

### **-destination-policy <text> - Name of New Firewall Policy**

Use this parameter to specify the name of the new policy to create.

## **Examples**

This example creates a new firewall policy named "data2" on Vserver "vs0" from an existing firewall policy named "data" on Vserver "vs1".

```
cluster1::> system services firewall policy clone -vserver vs0 -policy
data -destination-vserver vs1 -destination-policy data2
```

## **Related Links**

- [network interface service-policy clone](#)

## **system services firewall policy create**

(DEPRECATED)-Create a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy create](#) or [network interface service-policy add-service](#) instead.

The `system services firewall policy create` command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, and to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the [network interface modify](#) command with the `-firewall-policy` parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

You can use this command to create an empty firewall policy by creating a single policy entry for the "none" firewall service. When used by a logical network interface (LIF), an empty firewall policy will block all services managed using firewall policies.

## **Parameters**

**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver on which the policy is to be created.

**-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy that is to be created.

**-service <service> - Service**

Use this parameter to specify the network service that is associated with the policy. Possible values include:

- dns - The DNS protocol server
- http - The HTTP protocol
- ndmp - The NDMP tape backup protocol
- ndmps - The NDMPs tape backup protocol
- none - No protocol (for creating an empty policy)
- ntp - The NTP protocol
- rsh - The RSH protocol
- snmp - The SNMP protocol
- telnet - The Telnet protocol

**-allow-list <IP Address/Mask>, ... - Allowed IPs**

Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

**Examples**

The following example creates a firewall policy named data that uses the NDMP protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service  
ndmp -allow-list 192.0.2.128/25
```

The following example adds an entry to the firewall policy named data, associating the DNS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service  
dns -allow-list 192.0.2.128/25
```

- [network interface modify](#)

## system services firewall policy delete

(DEPRECATED)-Remove a service from a firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy delete](#) or [network interface service-policy remove-service](#) instead.

The `system services firewall policy delete` command deletes a firewall policy. You cannot delete a policy that is being used by a logical interface. Use the [network interface modify](#) command with the `-firewall-policy` parameter to change a network interface's firewall policy.

### Parameters

**-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver of the policy to delete.

**-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy to delete.

**-service <service> - Service**

Use this parameter to specify the policy's network service to delete.

### Examples

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service  
telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster  
-service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service  
telnet
```

- [network interface modify](#)

## system services firewall policy modify

(DEPRECATED)-Modify a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy modify-service](#) instead.

The [system services firewall modify](#) command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

### Parameters

**-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver of the policy to modify.

**-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy to modify.

**-service <service> - Service**

Use this parameter to specify the policy's network service to modify.

**[-allow-list <IP Address/Mask>, ...] - Allowed IPs**

Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25".

Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

### Examples

The following example modifies the firewall policy named data that uses the NDMP protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service  
ndmp -allow-list 192.0.2.128/25
```

## system services firewall policy show

(DEPRECATED)-Show firewall policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future ONTAP release. Use [network interface service-policy show](#) instead.

The `system services firewall policy show` command displays information about firewall policies.

Some firewall policies contain a single entry for the "none" firewall service. You can consider these policies to be empty. When used by a logical network interface (LIF), an empty firewall policy will block all services managed using firewall policies.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**| [-instance ] }**

Use this parameter to display all the fields for the specified policies.

**[-vserver <vserver>] - Vserver Name**

Use this parameter to display information only about the Vserver you specify.

**[-policy <textpolicy\_name>] - Policy**

Use this parameter to display information about the policy you specify.

**[-service <service>] - Service**

Use this parameter to display information about the services you specify.

**[-allow-list <IP Address/Mask>,...] - Allowed IPs**

Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

**[-ipspace <text>] - IPspace**

Use this parameter to display information only about the IPspace you specify.

### Examples

The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
```

| Vserver Policy | Service | Allowed |
|----------------|---------|---------|
|----------------|---------|---------|

```
-----  
cluster1
```

```

## Related Links

- [network interface service-policy show](#)

## system services manager install show

Display a list of installed services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager install show` command displays information about installed services.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-service <text>] - Service**

Selects information about installed services that have the name you specify.

**[-version <service version>] - Version**

Selects information about installed services that have the version number you specify.

**[-constituent <text>] - Constituent**

Selects information about installed services that have the constituent process you specify.

**[-nodes {<nodename>|local}] - Nodes**

Selects information about services that are installed on the nodes you specify.

**[-description <text>] - Description**

Selects information about installed services that match the description you specify.

## Examples

The following example shows typical output from a two-node cluster.

```
cluster1::> system services manager install show
Service          Version Constituent Nodes
-----
diagnosis
                1.0      schmd      node1, node2
                1.0      shmd      node1, node2
2 entries were displayed.
```

## system services manager policy add

Add a new service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager policy add` command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

## Parameters

### **-service <text> - Service**

Use this parameter to specify the name of the service for which to add a policy.

### **-version <service version> - Version**

Use this parameter to specify the minimum version number of the service to run.

## Examples

This example adds a service manager policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy add -service diagnosis -version 1.0
```

## system services manager policy remove

Remove a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager policy remove` command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

## Parameters

### **-service <text> - Service**

Use this parameter to specify the name of the service from which to remove a policy.

### **-version <service version> - Version**

Use this parameter to specify the version number that is configured by the policy to remove.

## Examples

The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis -version 1.0
```

## system services manager policy setstate

Enable/disable a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager policy setstate` command enables or disables services manager policies. Use the [system services manager policy show](#) command to display information about configured policies.

## Parameters

### **-service <text> - Service**

Use this parameter to set the state of the policy you specify.

### **-version <service version> - Version**

Use this parameter to set the state of the policy with the version number you specify.

### **-state {on|off} - State**

Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

## Examples

The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis
-version 1.0 -state off
```

## system services manager policy show

Display service policies

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager policy show` command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the [system services manager status show](#) command to view information about services that are configured to run in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-service <text>] - Service**

Selects policies that apply to the service you specify.

**[-version <service version>] - Version**

Selects policies that have the version number you specify.

**[-constituent <text>] - Constituent**

Selects policies that have the constituent process you specify.

**[-state {on|off}] - State**

Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.

**[-num-active <integer>] - Number Active**

Selects policies that have the number of active (running) instances you specify.

**[-target-nodes <service affinity>,...] - Target Nodes**

Selects policies that are configured to run on the nodes you specify.

**[-tag <UUID>] - Tag (privilege: advanced)**

Selects policies that have the UUID you specify. Use this parameter with the `-fields` parameter to display a list of the UUIDs of configured services.

## Examples

The following example shows typical output for this command.

```
cluster1::> system services manager policy show
Service          Version State Constituent Number Target
                  Active Nodes
-----
diagnosis
                1.0    on    schmd      1      any
                1.0    on    shmd      1      any
2 entries were displayed.
```

## Related Links

- [system services manager status show](#)

## system services manager status show

Display the status of a service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager status show` command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the [system services manager policy show](#) command to view existing policies.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-service <text>] - Service**

Selects information about services that match the service name you specify.

**[-version <service version>] - Version**

Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the [system services manager policy show](#) command to view information about service policies.

**[-constituent <text>] - Constituent**

Selects information about services that have the constituent process you specify.

**[-actual-version <service version>] - Actual Version**

Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.

**[-node <nodename>] - Node**

Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.

**[-state <svc\_state>] - State**

Selects information about services that are in the state you specify.

**[-is-running {true|false}] - Is Running**

Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

## Examples

The example below shows typical output for a simple cluster.

```
cluster1::> system services manager status show
```

| Service   | Version | Constituent | Actual Version | Node        | State   |
|-----------|---------|-------------|----------------|-------------|---------|
| diagnosis | 1.0     | schmd       | 1.0            | cluster1-01 | running |
|           | 1.0     | shmd        | 1.0            | cluster1-01 | running |

2 entries were displayed.

## system services ndmp kill-all

Kill all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services ndmp kill-all` command is used to terminate all NDMP sessions on a particular node in the cluster.

### Parameters

**-node {<nodename>|local} - Node**

Node on which all NDMP sessions needs to be terminated.

### Examples

The following example shows how all NDMP sessions on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill-all -node node1
```

## system services ndmp kill

Kill the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster.

## Parameters

### <integer> - Session Identifier

Session ID of the NDMP session.

## Examples

The following example shows how a specific NDMP session on the node named `node1` can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

## system services ndmp modify

(DEPRECATED)-Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp modify](#)" command.

The `system services ndmp modify` command allows you to modify the NDMP configurations for a node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

## Parameters

### **-node {<nodename>|local}** - Node

This specifies the node whose NDMP configuration is to be modified.

### **[-enable {true|false}]** - NDMP Service Enabled

This optionally specifies whether NDMP is enabled on the node. The default setting is `true`.

### **[-clear-text {true|false}]** - Allow Clear Text Password

This optionally specifies whether the NDMP password can be sent in clear text. The default setting is `true`.

### **[-user-id <text>]** - NDMP User ID

This optionally specifies the ID of the NDMP user.

## Examples

The following example modifies the NDMP configuration on a node named `node1`. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named `ndmp`:

```
cluster1::> system services ndmp modify -node node1 -enable true
             -clear-text false -user-id ndmp
```

## Related Links

- [vserver services ndmp modify](#)

## system services ndmp off

(DEPRECATED)-Disable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp off](#)" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node on which NDMP service is to be disabled.

## Examples

The following example is used to turn off the NDMP service on node named node1:

```
cluster1::> system services ndmp off -node node1
```

## Related Links

- [vserver services ndmp off](#)

## system services ndmp on

(DEPRECATED)-Enable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp on](#)" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node on which the NDMP service is to be enabled.

## Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1::> system services ndmp on -node node1
```

## Related Links

- [vserver services ndmp on](#)

## system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp generate-password](#)" command.

The `system services ndmp password` command is used to change the NDMP password for a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node for which the password is to be changed.

## Examples

The following example is used to change the NDMP password for the node named node1:

```
cluster1::> system services ndmp password -node node1
```

```
Please enter password:
```

```
Confirm password:
```

## Related Links

- [vserver services ndmp generate-password](#)

## system services ndmp probe

Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services ndmp probe` command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset
- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address

- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

## Parameters

### **[`-node {<nodename>|local}`]} - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

### **[`-session-id <integer>`]} - Session Identifier**

If this parameter is specified, the command displays information only about the specified session.

### **[`-ndmp-version <integer>`]} - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

### **[`-session-authorized {true|false}`]} - Session Authorized**

This parameter indicates whether an NDMP session is authenticated or not.

### **[`-data-state <component state>`]} - Data State**

This parameter identifies the current state of the data server's state machine.

### **[`-data-operation <data operation>`]} - Data Operation**

This parameter identifies the data server's current operation.

### **[`-data-halt-reason <halt reason>`]} - Data Server Halt Reason**

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

### **[`-data-con-addr-type <address type>`]} - Data Server Connect Type**

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

### **[`-data-con-addr <text>`]} - Data Server Connect Address**

This parameter specifies the connection endpoint information for the data server's data connection.

**[-data-con-port <integer>] - Data Server Connect Port**

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

**[-data-bytes-processed <integer>] - Data Bytes Processed**

This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[-mover-state <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[-mover-mode <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This parameter identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This parameter represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This parameter represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[-mover-window-offset <integer>] - Mover Window Offset**

This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This parameter represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[`-mover-setrecordsize-flag {true|false}`] - Mover SetRecordSize Flag**

This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[`-mover-setwindow-flag {true|false}`] - Mover SetWindow Flag**

This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[`-mover-con-addr-type <address type>`] - Mover Connect Type**

This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[`-mover-con-addr <text>`] - Mover Connect Address**

This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[`-mover-con-port <integer>`] - Mover Connect Port**

This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

**[`-eff-host <host type>`] - Effective Host**

This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[`-client-addr <text>`] - NDMP Client Address**

This parameter specifies the client's IP address.

**[`-client-port <integer>`] - NDMP Client Port**

This parameter specifies the client's port number.

**[`-spt-device-id <text>`] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[`-spt-ha <integer>`] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[`-spt-scsi-id <integer>`] - SCSI Target ID**

This parameter specifies the SCSI target.

**[`-spt-scsi-lun <integer>`] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[`-tape-device <text>`] - Tape Device**

This parameter specifies the name to identify the tape device.

**[`-tape-mode <mover mode>`] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**`[-is-secure-control-connection {true|false}] - Is Secure Control Connection`**

This parameter specifies whether the control connection is secure or not.

**`[-data-backup-mode <text>] - Data Backup Mode`**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**`[-data-path <text>] - Data Path`**

This parameter specifies the path of data being backed up.

**`[-source-addr <text>] - NDMP Source Address`**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays diagnostic information about all the sessions in the cluster:

```
cluster1::> system services ndmp probe
Node: cluster1-01
    Session identifier: 4952
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
    Data server connect type: LOCAL
    ....
    ...

Node: cluster1-02
    Session identifier: 5289
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
    Data server connect type: LOCAL
    ....
    ...
```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```
cluster1::> system services ndmp probe -node cluster1-01
Node: cluster1-01
    Session identifier: 4952
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
    Data server connect type: LOCAL
    ....
    ...
```

## system services ndmp show

(DEPRECATED)-Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp show](#)" command.

The `system services ndmp show` command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

### Parameters

**{ [-fields <fieldname>,...]**

If this parameter is specified, the command displays only the fields that you specify.

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

Selects information about the specified node.

### **[`-enable {true|false}`] - NDMP Service Enabled**

Selects information about the nodes where NDMP is enabled/disabled.

### **[`-clear-text {true|false}`] - Allow Clear Text Password**

Selects information about the nodes whose clear-text setting matches the specified value.

### **[`-user-id <text>`] - NDMP User ID**

Selects information about the nodes that have the specified NDMP user ID.

## **Examples**

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node           Enabled   Clear Text  User ID
-----
node0          true     true        ndmp
node1          true     true        ndmp
node2          true     true        ndmp
node3          true     true        ndmp
4 entries were displayed.
```

## **system services ndmp status**

### Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system services ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following details about the active sessions:

- Node
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

## **Parameters**

**{ [`-fields <fieldname>`,...]**

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read
- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port
- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device
- tape-modes
- is-secure-control-connection
- data-backup-mode

- data-path
- source-addr

**[ -instance ] }**

If this parameter is specified, the command displays detailed information about all the active sessions.

**[ -node {<nodename>|local} ] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

**[ -session-id <integer> ] - Session Identifier**

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a number used to identify a particular NDMP session.

**[ -ndmp-version <integer> ] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

**[ -session-authorized {true|false} ] - Session Authorized**

This field indicates whether an NDMP session is authenticated or not.

**[ -data-state <component state> ] - Data State**

This field identifies the current state of the data server's state machine.

**[ -data-operation <data operation> ] - Data Operation**

This field identifies the data server's current operation.

**[ -data-halt-reason <halt reason> ] - Data Server Halt Reason**

This field identifies the event that caused the data server state machine to enter the HALTED state.

**[ -data-con-addr-type <address type> ] - Data Server Connect Type**

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[ -data-con-addr <text> ] - Data Server Connect Address**

This specifies the connection endpoint information for the data server's data connection.

**[ -data-con-port <integer> ] - Data Server Connect Port**

This specifies the TCP/IP port that the data server will use when establishing a data connection.

**[ -data-bytes-processed <integer> ] - Data Bytes Processed**

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[ -mover-state <component state> ] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[ -mover-mode <mover mode> ] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This integer field identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This field represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This field represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[-mover-window-offset <integer>] - Mover Window Offset**

This field represents the absolute offset of the first byte of the mover window within the overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This field represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag**

This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag**

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[-mover-con-addr-type <address type>] - Mover Connect Type**

This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[-mover-con-addr <text>] - Mover Connect Address**

This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status
```

| Session |       |
|---------|-------|
| Node    | Id    |
| -----   | ----- |
| node-01 | 17479 |
| node-01 | 19769 |
| node-02 | 21118 |

3 entries were displayed.

The following example shows how to display only the sessions running on node-01:

```
cluster1::> system services ndmp status -node node-01
```

| Session |       |
|---------|-------|
| Node    | Id    |
| -----   | ----- |
| node-01 | 17479 |
| node-01 | 19769 |

2 entries were displayed.

## system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp log start](#)" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP *server* session manages all NDMP tasks on the node. If you want to log information regarding the NDMP server, use *server* with the `-session-id` parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the `-session-id` parameter to enable logging.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node.

**-session-id {<integer>|server} - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify *server* to start logging on the NDMP server session.

### **-filter <text> - Level Filter (privilege: advanced)**

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow : *all* , *none* , *normal* , *backend* or "*filter-expression*". The default value for this is *none* .

- *all* turns on logging for all modules.
- *none* disables logging for all modules.
- *normal* is a short cut parameter that enables logging for all modules except *verbose* and *io\_loop* . The equivalent filter string is *all-verbose-io\_loop*
- *backend* is a short cut parameter that enables logging for all modules except *verbose* , *io\_loop* , *ndmps* and *ndmpd* . The equivalent filter string is *all-verbose-io\_loop-ndmps-ndmpp*
- (*filter-expression*) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
  - - to remove the given module from the list of specified modules in the filter string. For example the filter *all-ndmpp* will enable logging for all modules but not *ndmpp* .
  - ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter *ndmpp<sup>mover</sup>data* will enable logging for *ndmpp* , *mover* and *data* .

The possible module names and a brief description is given below:

| Modules    | Description                       |
|------------|-----------------------------------|
| verbose    | verbose message                   |
| io         | I/O process loop                  |
| io_loop    | I/O process loop verbose messages |
| ndmps      | NDMP service                      |
| ndmpp      | NDMP Protocol                     |
| rpc        | General RPC service               |
| fdc_rpc    | RPC to FC driver service          |
| auth       | Authentication                    |
| mover      | NDMP MOVER (tape I/O)             |
| data       | NDMP DATA (backup/restore)        |
| scsi       | NDMP SCSI (robot/tape ops)        |
| bkup_rpc   | RPC to Backup service client      |
| bkup_rpc_s | RPC to Backup service server      |
| cleaner    | Backup/Mover session cleaner      |
| conf       | Debug configure/reconfigure       |
| dblade     | Dblade specific messages          |
| timer      | NDMP server timeout messages      |
| vldb       | VLDB service                      |
| smf        | SMF Gateway messages              |
| vol        | VOL OPS service                   |
| sv         | SnapVault NDMP extension          |
| common     | NDMP common state                 |
| ext        | NDMP extensions messages          |
| sm         | SnapMirror NDMP extension         |
| ndmprpc    | NDMP Mhost RPC server             |

## Examples

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id
33522 -filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all
-node cluster1-01
```

## system services ndmp log stop

(DEPRECATED)-Stop logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "[vserver services ndmp log stop](#)" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP *server* session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use *server* with the `-session-id` parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the `-session-id` parameter to disable logging.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node.

**-session-id {<integer>|server} - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify *server* to stop logging on the NDMP server session.

### Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id 35512 -node  
cluster1-01
```

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id server -node  
cluster1-01
```

- [vserver services ndmp log stop](#)

## system services ndmp node-scope-mode off

### (DEPRECATED)-Disable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under `vserver services ndmp``.

#### Examples

The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

## system services ndmp node-scope-mode on

### (DEPRECATED)-Enable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to ONTAP 8.1 NDMP authentication scheme

#### Examples

The following example enables node-scope-mode of operation :

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

## system services ndmp node-scope-mode status

(DEPRECATED)-Status of NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of ONTAP. Use the Vserver-aware "`vserver services ndmp``" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
- NDMP node-scope-mode is enabled - NDMP server is node scoped

### Parameters

### Examples

The following example shows how to check the status of NDMP server in a cluster

```
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

## system services ndmp service modify

Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system services ndmp service modify` command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

- NDMP Common Sessions

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node whose NDMP configuration is to be modified.

**[-common-sessions <integer>] - NDMP Common Sessions (privilege: advanced)**

This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

Increasing this parameter can make the storage system unresponsive.

## Examples

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```
cluster1::> system services ndmp modify -node node1
           -common-sessions 16
```

## system services ndmp service show

### Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system services ndmp service show` command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

Selects information about the specified node.

**[`-common-sessions <integer>`] - NDMP Common Sessions (privilege: advanced)**

Selects information about the nodes that have the specified number of NDMP common sessions.

## Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp service show
Node          Common Sessions
-----
node0          16
node1          16
node2          16
node3          16
4 entries were displayed.
```

## system services ndmp service start

### Start the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system services ndmp service start` command starts the NDMP service daemon for a node. This is different from the [system services ndmp on](#) command. The [system services ndmp on](#) command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the [system services ndmp service stop](#) command.

#### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP service needs to be started.

#### Examples

```
cluster1::*> system services ndmp service start -node node0
```

Starts the NDMP service on node0.

#### Related Links

- [system services ndmp on](#)
- [system services ndmp service stop](#)

## system services ndmp service stop

### Stop the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service stop` command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the [system services ndmp off](#) command. The [system services ndmp off](#) command disables new NDMP connections on the node but does not stop the NDMP service daemon.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP service needs to be stopped.

## Examples

```
cluster1::*> system services ndmp service stop -node node0
```

Stops the NDMP service on node0.

## Related Links

- [system services ndmp off](#)

## system services ndmp service terminate

Terminate all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use [system services ndmp kill-all](#) for a clean termination of all active sessions on a node.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP sessions need to be terminated

## Examples

```
cluster1::*> system services ndmp service terminate -node node0
```

Terminates all active NDMP sessions on node0.

## Related Links

- [system services ndmp kill-all](#)

## system services web modify

Modify the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

### Parameters

#### **[-external {true|false}] - External Web Services**

Defines whether remote clients can access HTTP or HTTPS service content. Along with the `system services firewall` configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

#### **[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)**

Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

#### **[-http-enabled {true|false}] - HTTP Enabled (privilege: advanced)**

Defines whether HTTP is enabled. The default value for this parameter is *false*.

#### **[-csrf-protection-enabled {true|false}] - CSRF Protection Enabled (privilege: advanced)**

Defines whether CSRF protection is enabled. The default value is *true*.

#### **[-csrf-token-concurrent-limit <integer>] - Maximum Number of Concurrent CSRF Tokens (privilege: advanced)**

Defines how many concurrent CSRF tokens can exist at any given time. The default value is *500*.

#### **[-csrf-token-idle-timeout <integer>] - CSRF Token Idle Timeout (Seconds) (privilege: advanced)**

Defines how long (in seconds) an unused CSRF token will exist until it expires. The default value is *900* seconds (15 minutes).

#### **[-csrf-token-absolute-timeout <integer>] - CSRF Token Absolute Timeout (Seconds) (privilege: advanced)**

Defines how long (in seconds) a CSRF token can exist regardless of usage. The default value is *0/undefined*, which means that it will never time out.

#### **[-lif-service-policy-enforced {true|false}] - Enforce Network Interface Service-Policy (privilege: advanced)**

Defines whether to enforce the network interface service-policy for web services.

#### **[-hsts-enabled {true|false}] - HSTS Enabled (privilege: advanced)**

Defines whether HTTPS Strict Transport Security (HSTS) is enabled.

## **`[-hsts-max-age <integer>]` - HSTS Max Age (Seconds) (privilege: advanced)**

Defines HTTPS Strict Transport Security (HSTS) max-age value in seconds.

### **Examples**

The following command changes the maximum size of the wait queue:

```
cluster1::> system services web modify -wait-queue-capacity 256
```

## **system services web show**

Display the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the `External Web Services` and `Status` attributes, two features of web services' availability.

The `External Web Services` field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the `system services firewall` configuration, the `External Web Services` field indicates the visibility for client connections.

The `Status` field describes the aggregated operational state of cluster-level web services as retrieved from the `system services web node` command. The `Status` field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the [system services web node show](#) command. The following are the possible values for the `Status` in node configuration or availability:

- `online`, all web services are consistently configured and working correctly.
- `partial`, one or more nodes' web services are unavailable due to an error condition.
- `mixed`, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the `system services web node` command.
- `offline`, all of the nodes' web services are unavailable due to an error condition.
- `unclustered`, the current node is not part of an active cluster.

The `HTTP Enabled` field indicates whether HTTP is enabled.

The `per-address-limit` field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

### **Examples**

The following example displays the availability of web services for the cluster.

```
cluster1::> system services web show
External Web Services: true
                    Status: online
    HTTP Protocol Port: 80
    HTTPS Protocol Port: 443
        HTTP Enabled: true
```

- [system services web node show](#)

## system services web file-uploads cleanup-config modify

Update the configuration information for file uploads cleanup task

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services web file-uploads cleanup-config modify` command configures the periodic task to remove incomplete upload files.

### Parameters

#### **[-frequency <integer>] - Cleanup Frequency (in minutes)**

Defines the frequency of the recurring task in minutes. The default is 5 minutes.

#### **[-stale-age <integer>] - Age of stale files to be removed (in minutes)**

Defines the time in minutes after last modified time of a file to be considered stale. The default is 5 minutes.

## system services web file-uploads cleanup-config show

Show the configuration information for file uploads cleanup task

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command shows the configuration parameters of the periodic task to remove incomplete upload files.

The `Frequency` field indicates the frequency of the periodic task in minutes.

The `Stale Age` field indicates the time in minutes after the last modified time of a file to be considered stale.

## system services web node show

Display the status of the web servers at the node level

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the [system services web show](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

**[-external {true|false}] - External Web Services**

Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the `system services firewall` command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is `true`, which exports web protocols for remote access.

**[-http-port <integer>] - HTTP Port**

Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

**[-https-port <integer>] - HTTPS Port**

Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

**[-http-enabled {true|false}] - HTTP Enabled**

Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

**[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)**

Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

**[-status {offline|partial|mixed|online|unclustered}] - Protocol Status**

Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:

- `online`, indicates that web services are working correctly.
- `offline`, indicates that web services are unavailable due to an error condition.
- `unclustered`, indicates that the current node is not part of an active cluster.

**[-total-hits <integer>] - Total HTTP Requests**

Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the

web server.

**[*-total-bytes* <integer>] - Total Bytes Served**

Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

**[*-lif-service-policy-enforced* {true|false}] - Enforce Network Interface Service-Policy**

Selects the nodes that match this parameter value. Defines whether network interface service-policy is enforced.

**Examples**

The following example displays the status of web servers for nodes in the cluster.

```
cluster1::system services web node> show
```

| Node  | External | HTTP enabled | HTTP Port | HTTPS Port | Status | Total HTTP Requests | Total Bytes Served |
|-------|----------|--------------|-----------|------------|--------|---------------------|--------------------|
| node1 | true     | true         | 80        | 443        | online | 5                   |                    |
| node2 | true     | true         | 80        | 443        | online | 5                   |                    |

2 entries were displayed.

**system services web ontapi modify**

Unsuspend ONTAPI after auto suspend

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command allows users to un-suspend ONTAPI after it has been automatically suspended

**Parameters**

**[*-suspended* {true|false}] - ONTAPI suspended status**

Defines whether ONTAPI is currently suspended or not.

**Examples**

1. Example status of ONTAPI being suspended:

```
cluster1::> system services web ontapi show
ONTAPI Suspended
-----
true
```

1. The following example un-suspend ONTAPI:

```
cluster1::> system services web ontapi modify -suspended false
```

1. Attempting to manually set the suspend status to true will result in an error:

```
cluster1::> system services web ontapi modify -suspended true

Error: command failed: ONTAPI cannot be manually suspended. Use the
"vserver
    services web" CLI command to disable the ONTAPI service.
```

## system services web ontapi show

Display the current ONTAPI status (suspended/unsuspended)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays if ONTAPI is currently suspended.

### Examples

The following example displays the status of ONTAPI

```
cluster1::*> system services web ontapi show
ONTAPI Suspended
-----
true
```

## system smtape commands

### system smtape abort

Abort an active SMTape session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the [system smtape backup](#) or [system smtape restore](#) commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

## Parameters

### **-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for a backup or restore session.

## Examples

Abort the SMTape session with the session identifier *20*

```
cluster1::> system smtape abort -session 20
Abort posted to session 20.
```

## Related Links

- [system smtape backup](#)
- [system smtape restore](#)

## system smtape backup

Backup a volume to tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command `system hardware tape drive show` to view the list of tape devices in the cluster. You must specify a snapshot name to perform an SMTape backup operation. The snapshot name specified is used as the base snapshot. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command `system smtape status`. This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base snapshot created during this backup operation in order to use this snapshot to re-establish a SnapMirror relationship upon a restore.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

**-volume <volume name> - Volume Name**

Use this parameter to specify the name of the volume that needs to be backed up to tape.

**-backup-snapshot <snapshot name> - Snapshot Name**

Use this parameter to specify the name of the snapshot while performing an SMTape backup operation.

**-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

**[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

## Examples

The following example will start the backup of a volume *datavol* in a Vserver *vserver0* to a tape *rst0a*. Both the volume and tape reside on the same node *cluster1-01*. The snapshot to be backed up is *datavol\_snapshot* and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
             -backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a
             -tape-block-size 256
```

```
Session 21 created successfully
```

The following example will start the backup of a volume *datavol* in a Vserver *vserver0* to a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both the volume and tape reside on the same node *cluster1-01*. The snapshot to be backed up is *datavol\_snapshot* and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
             -backup-snapshot datavol_snapshot -tape /cluster1-01/nrst01
```

```
Session 22 created successfully
```

## system smtape break

Make a restored volume read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

### **-volume <volume name> - Volume Name**

Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

## Examples

Make the read-only volume *datavol* on Vserver *vserver0* writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

## system smtape continue

Continue SMTape session waiting at the end of tape

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned appropriately before issuing this command.

## Parameters

### **[-tape </node\_name/tape\_device>] - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is */node\_name /tape\_device*, where *node\_name* is the name of the cluster node owning the tape and *tape\_device* is the name of the tape device.

### **-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for the SMTape backup or restore operations.

## Examples

Continues an SMTape session having session ID *20* on tape device *rst0a* on the node *node1* in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session 40 on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

## system smtape restore

### Restore a volume from tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command performs restore of a backup image created using the command [system smtape backup](#) in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the status of the session can be monitored using the command `system smtape status`. It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore.

Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command [system smtape break](#) to get read/write permissions on the volume. Restore can be done to a non-root DP volume.

#### Parameters

**-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

**-volume <volume name> - Volume Name**

Use this parameter to specify the volume name on which the tape content will be restored.

**-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

**[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then `system smtape restore` will fail.

## Examples

The following example will start the restore to a volume *datavol* from a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both *vserver0* and *rst0a* reside on the same node *cluster1-01*.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a -tape-block-size 256
Session 2 created successfully
```

The following example will start the restore to a volume *datavol* from a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both *vserver0* and *rst0a* reside on the same node *cluster1-01*. The default tape record size of 240KB was used during backup.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a
Session 5 created successfully
```

## system smtape showheader

Display SMTape header

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the snapshot used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.

- Backup Version - the SMTape backup version.
- Backup Sequence No - the backup sequence number.
- Backup Mode - this field describes the backup mode.
- Time of Backup - the time at which the backup was performed.
- Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
- Volume Total Inodes - number of inodes of the backed up volume.
- Volume Used Inodes - number of used inodes of the backed up volume.
- Number of Snapshots - number of snapshots present in this backup.
- Snapshot ID - is the Snapshot ID of the backup Snapshot.
- Snapshot Time - time at which the backup snapshot was created.
- Snapshot Name - name of the snapshot which was backed up to tape.

## Parameters

### **-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

## Examples

The following example reads the image header from the tape `nrst01` residing on the node `cluster1-01` and displays relevant tape header information.

```

cluster1::> system smtape showheader -tape /cluster1-01/nrst01
-tape-block-size 240
Tape record size in KB: 240
    Tape Number: 1
    WAFL Version: 23577
    Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
    Source Storage System: cluster1-01
    Source Volume: /vs1/srcvol
    Source Volume Capacity: 400.00MB
    Source Volume Used Size: 0.00
    Source Snapshot: mysnap
    Volume Type: Flex
    Is SISVolume: no
    Backup Version: 1:3
    Backup Sequence No: 0
    Backup Mode: dw-data
    Time of Backup: 4/24/2012 15:16:38
    Time of Previous Backup: 0/0/0 00:00:00
    Volume Total Inodes: 12789
    Volume Used Inodes: 100
    Number of Snapshots: 1
    Snapshot ID: 1
    Snapshot Time: 4/24/2012 15:16:10
    Snapshot Name: mysnap

```

## system smtape status clear

### Clear SMTape sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command clears SMTape sessions which are completed, failed or Unknown state.

### Parameters

#### **[*-session* <Sequence Number>] - Session Identifier**

Use this parameter to clear the SMTape sessions with the specified session identifier.

#### **[*-node* {<nodename>|local}] - Node Name**

Use this parameter to clear the SMTape sessions related to the specified node.

#### **[*-type* {backup|restore}] - Operation Type**

Use this parameter to clear the SMTape sessions of the specified operation type. These can be either backup or restore sessions.

**[`-status` {`COMPLETED`|`FAILED`|`UNKNOWN`}] - Session Status**

Use this parameter to clear the SMTape sessions which have the status as specified in the parameter.

**[`-path` <text>] - Path Name**

Use this parameter to clear the SMTape sessions which have path as specified in the parameter.

**[`-device` <text>] - Device Name**

Use this parameter to clear the SMTape sessions on a specific tape device.

**[`-backup-snapshot` <snapshot name>] - Snapshot Name**

Use this parameter to clear the SMTape sessions using the snapshot name as specified in the parameter.

**[`-tape-block-size` <integer>] - Tape Block Size**

Use this parameter to clear the SMTape sessions with the tape block size as specified in the parameter.

**Examples**

The following example clears all the completed SMTape sessions in the cluster:

```
cluster1::> system smtape status clear
5 sessions are purged.
```

The SMTape sessions on the node *node1* in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1
3 sessions are purged.
```

**system smtape status show****Show status of SMTape sessions**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

## Parameters

**{ [-fields <fieldname>, ...]**

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status
- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

**| [-instance ] }**

Displays detailed information about the specified sessions.

**[-session <Sequence Number>] - Session Identifier**

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.

**[-node {<nodename>|local}] - Node Name**

Selects information about sessions related to the specified node.

**[-type {backup|restore}] - Operation Type**

Selects information about SMTape sessions of the specified operation type.

**[-status {COMPLETED|FAILED|ACTIVE|WAITING|ABORTING|UNKNOWN}] - Session Status**

Selects information about SMTape sessions having the specified status in the parameter.

**[-path <text>] - Path Name**

Selects information about SMTape sessions on a volume which is at the specified path name. This is the logical path of the volume and you must specify the path name in the following format: /vserver\_name /volume\_name .

**[-device <text>] - Device Name**

Selects information about the SMTape sessions on the specified tape device. You must specify the tape device name in the following format: /node\_name /tape\_device .

**[`-progress` <integer>[KB|MB|GB|TB|PB]] - Bytes Transferred**

Selects information about SMTape sessions in which the number of data bytes transferred in a particular session matches with the number specified in this parameter.

**[`-start-time` <MM/DD/YYYY HH:MM:SS>] - Start Time**

Selects information about SMTape sessions whose starting time matches the specified starting time.

**[`-end-time` <MM/DD/YYYY HH:MM:SS>] - End Time**

Selects information about SMTape sessions whose ending time matches the specified ending time.

**[`-backup-snapshot` <snapshot name>] - Snapshot Name**

Selects information about SMTape sessions that use a particular snapshot name which matches the specified snapshot name in the parameter in backup or restore operations.

**[`-tape-block-size` <integer>] - Tape Block Size**

Selects information about SMTape sessions that use a particular tape block size which matches the specified tape block size parameter in backup or restore operations.

**[`-error` <text>] - Error Description**

Selects information about SMTape sessions that have a particular error description which matches the specified error description in the parameter.

## Examples

Displays default entries about the five SMTape sessions.

```
cluster1::> system smtape status show
```

| Session | Type    | Status    | Progress | Path         | Device          | Node      |
|---------|---------|-----------|----------|--------------|-----------------|-----------|
| -----   | -----   | -----     | -----    | -----        | -----           | -----     |
| 5       | Backup  | COMPLETED | 50MB     | /vsrvr1/vol1 | /cls1-01/nrst01 | cluster1- |
| 01      |         |           |          |              |                 |           |
| 4       | Restore | FAILED    | 0B       | /vsrvr1/vol3 | /cls1-02/nrst21 | cluster1- |
| 02      |         |           |          |              |                 |           |
| 3       | Backup  | COMPLETED | 50MB     | /vsrvr1/vol3 | /cls1-01/nrst01 | cluster1- |
| 01      |         |           |          |              |                 |           |
| 2       | Backup  | COMPLETED | 50MB     | /vsrvr1/vol2 | /cls1-03/nrst0m | cluster1- |
| 03      |         |           |          |              |                 |           |
| 1       | Backup  | COMPLETED | 50KB     | /vsrvr1/vol5 | /cls1-01/nrst0n | cluster1- |
| 01      |         |           |          |              |                 |           |

5 entries were displayed.

The following example shows the output with the `-instance` argument.

```
cluster1::> system smtape status show -instance
```

```
Session Identifier: 1
    Node Name: node1
    Operation Type: Backup
        Status: COMPLETED
        Path Name: /vs1/vol1
        Device Name: /node1/rst0a
Bytes Transferred: 2048
    Start Time: 1/4/2012 14:26:24
    End Time: 1/4/2012 14:29:45
    Last updated: 1/4/2012 14:29:45
    Snapshot Name: vol1.snapshot
    Tape Block Size: 240
    Error Description: None
```

## system snmp commands

### system snmp authtrap

Enables or disables SNMP authentication traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Use this command to either enable or disable the standard SNMP authentication failure traps.

#### Parameters

##### **[-authtrap <integer>] - Enables SNMP Authentication Trap**

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

#### Examples

The following example demonstrates how to set the SNMP authtrap. +

```
cluster1::> system snmp authtrap -authtrap 1
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp contact

Displays or modifies contact details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Sets the contact name as the System.sysContact.0 MIB-II variable.

### Parameters

#### **[-contact <text>] - Contact**

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

### Examples

The following example sets the contact name for SNMP. +

```
cluster1::> system snmp contact -contact private
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp enable-snmpv3

Enables SNMPv3 cluster-wide

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system snmp enable-snmpv3` command enables SNMPv3 server on the entire cluster. When this command is run, SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

### Examples

The following command enables SNMPv3 server on the entire cluster, within a cluster named cluster1:

```
cluster1::> set -privilege advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.

Do you want to continue? {y|n}: y

```
cluster1::*> system snmp enable-snmpv3
```

Warning: If you enable SNMPv3 using this command, any SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

Do you want to continue? {y|n}: y

1 entry was modified.

```
cluster1::*>
```

## system snmp init

Enables or disables SNMP traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Initializes or disables sending of traps by the SNMP daemon from the cluster.

### Parameters

#### **[-init <integer>] - Initialize Traps**

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

### Examples

The following command initializes SNMP daemon to send traps. +

```
cluster1::> system snmp init -init 1
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
    - -
```

## system snmp location

Displays or modifies location information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Sets the location name as the System.sysLocation.0 MIB-II variable.

### Parameters

#### **[-location <text>] - Location**

Specifies the location details. If no value is specified, this command displays the current setting of location.

### Examples

This command sets the location name. +

```
cluster1::> system snmp location -location NB
cluster1::> system snmp show
  contact:
    private
  location:
    NB
  authtrap:
    1
  init:
    1
  traphosts:
    -
  community:
    - -
```

## system snmp prepare-to-downgrade

Change SNMP configuration to the default settings for releases earlier than Data ONTAP 9.3.0

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system snmp prepare-to-downgrade` command prepares the SNMP subsystem for a downgrade or a revert. More specifically, it prepares the SNMPv3 client feature for a downgrade or a revert. It deletes all storage switches that were explicitly added for monitoring and are using SNMPv3 as the underlying protocol. It also deletes any cluster switches that are using SNMPv3 for monitoring. Finally, it deletes any remote switch SNMPv3 users configured in ONTAP.

### Examples

The following command prepares the SNMP subsystem for a downgrade or a revert, within a cluster named `cluster1`:

```
cluster1::*> system snmp prepare-to-downgrade
```

## system snmp show

Displays SNMP settings

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Lists the current values of all the SNMP parameters.

## Examples

The example below shows a typical command display.

```
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    xxx.example.com (xxx.example.com) (192.168.xxx.xxx)
community:
    - -
```

## system snmp community add

Adds a new community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system snmp community add` command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

**-community-name <text> - Community**

This parameter specifies the name of the community.

**-type <ctype> - access type**

This parameter specifies 'ro' for read-only community.

## Examples

The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
             -community-name private
cluster1::> system snmp community show
             ro private
```

## system snmp community delete

Deletes community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system snmp community delete` command deletes communities with the specified access control type. Only read-only communities are supported.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you want to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.

**-community-name <text> - Community**

Specify the name of the community.

**-type <ctype> - access type**

Specify 'ro' for a read-only community.

### Examples

The following example deletes the read-only community 'private':

```
cluster1::> system snmp community delete -type ro
             -community-name private
cluster1::> system snmp community show
This table is currently empty.
```

## system snmp community show

Displays communities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays the current list of SNMP communities.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Selects the Vserver to which the SNMP community belongs

**[-community-name <text>] - Community**

Selects the SNMP v1/v2c community string

**[-access <ctype>] - access**

Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

## Examples

```
cluster1::> system snmp community show
cluster1
    ro private
```

## system snmp traphost add

### Add a new traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Adds the SNMP manager who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

## Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then the SNMPv3 traps are generated for this traphost using the associated USM user's authentication and privacy credentials. If no USM user is associated, then the SNMP v1/v2c traps are generated for this traphost. For the SNMP v1/v2c traps, the default community string is 'public', when no community is defined. When the community strings are defined, then the first community string is chosen for the SNMP v1/v2c traps.

**[-usm-username <text>] - USM User Name**

Specifies a predefined SNMPv3 USM user. The SNMPv3 traps are generated using this USM user's authentication and privacy credentials for the traphost identified by the `peer-address` parameter.

## Examples

In the following example, the command adds a hostname 'yyy.example.com' for the SNMPv3 traps: +

```
cluster1::> system snmp traphost add -peer-address yyy.example.com -usm
-username MyUsmUser
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com) (192.168.xxx.xxx)      USM
User: MyUsmUser
```

In the following example, the command adds a hostname 'xxx.example.com' for the SNMP v1/v2c traps: +

```
cluster1::> system snmp traphost add xxx.example.com
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com) (192.168.xxx.xxx)      USM
User: MyUsmUser
                xxx.example.com(xxx.example.com) (xxx.xxx.xxx.xxx)
Community: public
```

## system snmp traphost delete

### Delete a traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Deletes the SNMP manager, who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

### Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then specify the USM user to delete the traphost.

**[-usm-username <text>] - USM User Name**

Specifies the USM user associated with traphost.

## Examples

In the following example, the command deletes the SNMPv3 traphost 'yyy.example.com' associated with the USM user: +

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com -usm
-username MyUsmUser
```

In the following example, the command deletes the SNMP v1/v2c traphost 'xxx.example.com' associated with a community string: +

```
cluster1::> system snmp traphost delete -peer-address xxx.example.com
```

## system snmp traphost show

Displays traphosts

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays list of the SNMP v1/v2c and SNMP v3 managers, that receive trap PDUs.

### Examples

In the following example, the command displays all the host names or IP addresses that have been added until now: +

```
cluster1::> system snmp traphost show

## system switch commands

### system switch ethernet configure-health-monitor

Ethernet switch health monitor configuration file setup.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system switch ethernet configure-health-monitor` command downloads an Ethernet switch's health monitor configuration file in the ZIP format, which contains the XML file and a signed version file. After download, ONTAP will check the signed file. If valid, the Ethernet switch health monitor restarts to use the new Ethernet switch health monitor configuration file.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Node on which the download and signed file validation process occurs. The Ethernet switch health monitor process will be restarted on this node. The configuration file will be ingested and made available to all nodes in the cluster.

### **-package-url <text> - Package URL (privilege: advanced)**

URL that provides the location of the package to be downloaded. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted.

### **Examples**

The following example downloads Ethernet switch health monitor configuration file to node1 from a web server and enables Ethernet switch health monitor to process it:

```
cluster1::*> system switch ethernet configure-health-monitor -node node1
-package-url
http://example.com/hm_config.zip
```

## **system switch ethernet create**

Add information about an Ethernet switch (cluster or storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system switch ethernet create` command manually configures and enables the health monitoring of a specified Ethernet switch of type: cluster or storage. This command might be needed when ONTAP is unable to automatically discover and initiate monitoring of a switch through the Cisco Discovery Protocol (CDP) or the Link Layer Discovery Protocol (LLDP). If ONTAP has discovered a switch that is not in `system switch ethernet show`, such as if the switch was deleted using `system switch ethernet delete` with the `force` parameter, the `device`, `address`, and `type` parameters must match the discovered values. To identify which switches are currently monitored, use the `system switch ethernet show` command. If this switch was previously monitored within the past 7 days, hourly AutoSupport® log collection might automatically resume.

### **Parameters**

#### **-device <text> - Device Name**

Name of the switch intended for monitoring. ONTAP utilizes this device name to recognize the SNMP agent it needs to interact with.

#### **-address <IP Address> - IP Address**

IP address of the switch's management interface. This address is used as the destination of SNMP traffic and SSH connections for the purpose of monitoring and log collection, respectively.

#### **-snmp-version {SNMPv1|SNMPv2c|SNMPv3} - SNMP Version**

SNMP version that ONTAP employs for sending SNMP requests for monitoring purposes. By default, SNMPv2c is used, as established by the Reference Configuration File (RCF) applied to the switch.

#### **-community-or-username <text> - SNMPv2c Community String or SNMPv3 Username**

Community string used for SNMPv2 authentication, or the SNMPv3 username for SNMPv3 security. By default, the community string for SNMPv2 authentication is set to `cshml!`, as determined by the RCF that is applied to the switch. If SNMPv3 is used, the switch must be configured with the SNMPv3 username.

### **-model {OTHER|NX3132V|NX3232C} - Model Number**

Model of the switch. Use the OTHER option when adding a switch that requires an Ethernet switch health monitor XML configuration file, such as the BES-53248, MSN2100-CB2FC, MSN2100-CB2RC, N9K-C92300YC, and N9K-C9336C-FX2 switches. Be aware that the OTHER option selected during creation is different from the OTHER displayed by the [system switch ethernet show](#) command. In this show command, OTHER indicates that a switch is not supported for health monitoring.

### **-type {cluster-network|storage-network} - Switch Network**

Switch type: cluster-network or storage-network.

### **[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Monitoring status selected by the administrator, which is set to true by default when not specified. During maintenance periods, a switch not manually added might be repeatedly discovered and dropped, which could potentially generate unnecessary alerts if monitoring is enabled by default. In such cases, setting this parameter to false disables the monitoring process.

## **Examples**

Example 1: Initiates Ethernet switch health monitoring for a Cisco Nexus 3132Q-V cluster switch named SwitchA.

```
cluster1::> system switch ethernet create -device SwitchA -address 1.2.3.4
-snmpp-version SNMPv2c -community-or-username cshml! -model NX3132V -type
cluster-network
```

Example 2: Initiates Ethernet switch health monitoring for a NVIDIA SN2100 storage switch named SwitchB, with the SNMPv3 username snmpv3u1.

```
cluster1::> system switch ethernet create -device SwitchB -address 5.6.7.8
-snmpp-version SNMPv3 -community-or-username snmpv3u1 -model OTHER -type
storage-network
```

## **Related Links**

- [system switch ethernet show](#)
- [system switch ethernet delete](#)

## **system switch ethernet delete**

Delete information about an Ethernet switch (cluster or storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system switch ethernet delete` command is used to delete an Ethernet switch. This command is intended to be used to delete a switch that has been disconnected from the system, instead of waiting for it to be deleted automatically. If you want to stop monitoring the switch, use [system switch ethernet modify](#) to set

the *is-monitoring-enabled-admin* parameter to *false*. By default, this command only allows deletion of a switch if the *is-discovered* parameter is *false* (ONTAP isn't receiving Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) data for the switch). However, if the *force* parameter is used, the switch will be deleted regardless of *is-discovered*. If the switch is rediscovered, it will be re-added automatically.

## Parameters

### **-device <text> - Device Name**

Name of the Ethernet switch that you want to delete.

### **[-force <true>] - Force Delete (privilege: advanced)**

This parameter forces the delete operation. This allows deletion of a switch when *is-discovered* is *true*. Note: The switch may be re-added automatically.

## Examples

Example 1: Delete a removed switch named SwitchA.

```
cluster1::> system switch ethernet delete -device SwitchA
```

Example 2: Forcefully remove a discovered switch named SwitchB.

```
cluster1::*> system switch ethernet delete -device SwitchB -force
```

## Related Links

- [system switch ethernet modify](#)

## system switch ethernet modify

Modify information about an Ethernet switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet modify` command is used to modify the settings of an Ethernet switch for health monitoring purposes. This command allows you to adjust various parameters related to the switch, including its SNMP version, SNMPv2c community or SNMPv3 username, and monitoring status. If *is-discovered* is *false*, the IP address and type can also be changed.

## Parameters

### **-device <text> - Device Name**

Name of the Ethernet switch that you want to modify. ONTAP utilizes this device name to recognize the SNMP agent it needs to interact with.

**[`-address <IP Address>`] - IP Address**

IP address of the switch's management interface. This address is used as the destination of SNMP traffic and SSH connections for the purpose of monitoring and log collection, respectively.

**[`-snmp-version {SNMPv1|SNMPv2c|SNMPv3}`] - SNMP Version**

SNMP version that ONTAP employs for sending SNMP requests for monitoring purposes. By default, SNMPv2c is used, as established by the Reference Configuration File (RCF) applied to the switch.

**[`-community-or-username <text>`] - SNMPv2c Community String or SNMPv3 Username**

Community string used for SNMPv2 authentication, or the SNMPv3 username for SNMPv3 security. By default, the community string for SNMPv2 authentication is set to `csbm1!`, as determined by the RCF that is applied to the switch. If SNMPv3 is used, the switch must be configured with the SNMPv3 username.

**[`-type {cluster-network|storage-network}`] - Switch Network**

Switch type: `cluster-network` or `storage-network`.

**[`-is-monitoring-enabled-admin {true|false}`] - Enable Switch Monitoring**

Monitoring status selected by the administrator, which is set to `true` by default when not specified. During maintenance periods, unnecessary alerts may be generated if monitoring is left enabled. In such cases, setting this parameter to `false` disables the monitoring process.

**Examples**

Example 1: Modifies the IP address for the switch named SwitchA. All other settings of the switch are preserved.

```
cluster1::> system switch ethernet modify -device SwitchA -address 2.3.4.5
```

Example 2: Modifies the SNMP parameters for the switch named SwitchB. All other settings are preserved.

```
cluster1::> system switch ethernet modify -device SwitchB -snmp-version
SNMPv3 -community-or-username snmpv3u1
```

**system switch ethernet show-all**

(DEPRECATED)-Displays the list of switches

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

This command has been deprecated. It may be removed from a future release of ONTAP.

The `system switch ethernet show-all` command displays configuration details for cluster and storage Ethernet switches.

## Parameters

**[-fields <fieldname>,...]**

Selects the fields that have the specified name.

**[ -instance ] (privilege: advanced) }**

Selects detailed information for all the switches.

**[-device <text>] - Device Name (privilege: advanced)**

Selects the switches that match the specified device name.

**[-address <IP Address>] - IP Address (privilege: advanced)**

Selects the switches that match the specified IP address.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version (privilege: advanced)**

Selects the switches that match the specified SNMP version.

**[-community-or-username <text>] - SNMPv2c Community String or SNMPv3 Username (privilege: advanced)**

Selects the switches that match the specified community string or SNMPv3 username.

**[-discovered {true|false}] - Is Discovered (privilege: advanced)**

Selects the switches that match the specified discovery setting.

**[-type {cluster-network|storage-network}] - Switch Network (privilege: advanced)**

Selects the switches that match the specified switch type.

**[-sw-version <text>] - Software Version (privilege: advanced)**

Selects the switches that match the specified software version.

**[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status (privilege: advanced)**

Selects the switches that match the specified operational monitoring status.

**[-reason <text>] - Reason For Not Monitoring (privilege: advanced)**

Selects the switches that match the specified reason.

**[-version-source <text>] - Source Of Switch Version (privilege: advanced)**

Selects the switches that match the specified version source (for example, SNMP, CDP, ISDP, or LLDP).

**[-rcf-version <text>] - Reference Config File Version (privilege: advanced)**

Selects the switches that match the specified reference configuration file version.

**[-serial-number <text>] - Serial Number of the Device (privilege: advanced)**

Selects the switches that match the specified serial number.

**[-model <text>] - Model to display (privilege: advanced)**

Selects the switches that match the specified model number.

### **[-role <text>] - Configured Role (privilege: advanced)**

Selects the switches that match the specified role or combined role (different roles can be combined using '+').

### **Examples**

```
cluster1::> system switch ethernet show-all
Switch                                     Type                                     Address                                     Model
-----
SwitchA                                  cluster                                  1.2.3.4
Nexus5010
Is Monitored: yes
Reason:
Software Version: Cisco IOS 4.1N1
Version Source: CDP
```

The example above displays the configuration of all Ethernet switches (cluster and storage).

## **system switch ethernet show**

Display the configuration for Ethernet switches (cluster and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system switch ethernet show` command displays configuration details for cluster and storage Ethernet switches.

### **Parameters**

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-banner ]**

Displays the following information about a switch:

- Device Name
- Banner seen when accessing the switch through SSH.

**| [-snmp-config ]**

Displays the following information about a switch:

- Device Name
- SNMPv2c Community String or SNMPv3 Username
- SNMP Version

## | [-status ]

Displays the following status information about a switch:

- Is Discovered
- SNMPv2c Community String or SNMPv3 Username
- Model Number
- Switch Network
- Software Version
- Reason For Not Monitoring
- Source Of Switch Version
- Is Monitored ?

## | [-instance ] }

Selects detailed information for all the switches.

## [-device <text>] - Device Name

Selects the switches that match the specified device name.

## [-address <IP Address>] - IP Address

Selects the switches that match the specified IP address.

## [-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version

Selects the switches that match the specified SNMP version.

## [-is-discovered {true|false}] - Is Discovered

Selects the switches that match the specified discovery setting.

## [-community-or-username <text>] - SNMPv2c Community String or SNMPv3 Username

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

## [-model {OTHER|NX3132V|NX3232C}] - Model Number

Selects the switches that match the specified model number.

## [-type {cluster-network|storage-network}] - Switch Network

Selects the switches that match the specified switch type.

## [-sw-version <text>] - Software Version

Selects the switches that match the specified software version.

## [-reason <text>] - Reason For Not Monitoring

Selects the switches that match the specified reason.

## [-version-source <text>] - Source Of Switch Version

Selects the switches that match the specified version source (for example, SNMP, CDP, ISDP, or LLDP).

**`[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring`**

Selects the switches that match the specified admin monitoring status.

**`[-is-monitoring-enabled-operational {true|false}] - Is Monitored ?`**

Selects the switches that match the specified operational monitoring status.

**`[-serial-number <text>] - Serial Number of the Device`**

Selects the switches that match the specified serial number.

**`[-device-banner <text>] - Device Banner`**

Banner seen when accessing the switch through SSH.

**`[-rcf-version <text>] - Reference Config File Version`**

Selects the switches that match the specified reference configuration file version.

**`[-role <text>] - Configured Role`**

Selects the switches that match the specified role or combined role (different roles can be combined using '+'):

- cluster
- multicluster
- storage
- multistorage
- metrocluster

## Examples

```
cluster1::> system switch ethernet show
```

| Switch                                                                                                                                                                            | Type            | Address | Model |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|-------|
| SwitchA<br>C9336C-FX2                                                                                                                                                             | cluster-network | 1.2.3.4 | N9K-  |
| Serial Number: FFF123456V1<br>Is Monitored: true<br>Reason: None<br>Software Version: Cisco Nexus Operating System (NX-OS) Software, Version 10.3(4a)<br>Version Source: CDP/ISDP |                 |         |       |
| SwitchB<br>C9336C-FX2                                                                                                                                                             | cluster-network | 2.3.4.5 | N9K-  |
| Serial Number: FEE234567V2<br>Is Monitored: true<br>Reason: None<br>Software Version: Cisco Nexus Operating System (NX-OS) Software, Version 10.3(4a)<br>Version Source: CDP/ISDP |                 |         |       |

The example above displays the configuration of all Ethernet switches (cluster and storage).

```
cluster1::> system switch ethernet show -snmp-config
```

| Switch  | SNMPv2c Community<br>or SNMPv3 Username | SNMP Version |
|---------|-----------------------------------------|--------------|
| SwitchA | public                                  | SNMPv2c      |

The example above displays the SNMPv2c community string or SNMPv3 username and SNMP version for all Ethernet switches (cluster and storage).

```

cluster1::> system switch ethernet show -banner
Device: SwitchA
-----

*****
****
*
* NetApp Reference Configuration File (RCF)
* Switch      : SwitchModel
* Filename     : SwitchType-RCF-v1.8-Cluster
* Release Date : Apr-04-2022
* Version      : v1.8
*
*****
****

```

The example above shows the SSH banner for all the Ethernet switches (cluster and storage).

## system switch ethernet fan show

Display fan information for Ethernet switches (cluster and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet fan show` command displays the status of fans on the monitored Ethernet switches.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the specified fields.

**| [-instance ] }**

Displays detailed information for all fans on all switches.

**[-device <text>] - Switch Name**

Selects the fans that belong to the specified switch.

**[-fan-name <text>] - Fan or Fan Tray Name**

Selects the fans that match the specified fan name or fan tray name.

**[-index <integer>] - Sensor Index**

Selects the fans that match the specified sensor index.

**`[-fan-type {single|tray}] - Single Fan or Fan Tray`**

Selects the fans that match the specified fan type.

**`[-fan-status {operational|failed|not-operational|not-present|unknown}] - Fan Status`**

Selects the fans that match the specified operational status.

**`[-display-name <text>] - Fan Display Name`**

Selects the fans that match the specified display name.

**`[-unique-name <text>] - Fan Unique Name`**

Selects the fan that matches the specified unique name.

**`[-container-name <text>] - Fan Container Name`**

Selects the fans that match the specified container name.

**`[-is-psu-fan {yes|no}] - Is Power Supply Unit Fan`**

Selects the fans that are PSU fans (`yes`) or are not PSU fans (`no`).

**`[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor`**

Selects the fans that the specified health monitor continuously monitors.

**`[-error-description <text>] - Error Description`**

Selects the fans that match the specified error description.

**`[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Resource Status`**

Selects the fans that match the specified status.

**Examples**

```
cluster1::> system switch ethernet fan show
```

```
Switch: SwitchA
```

| Fan          | Type | Fan Status  | Container | Is PSU Fan | Error |
|--------------|------|-------------|-----------|------------|-------|
| Fan Module-1 | tray | operational | FanBay-1  | no         |       |
| Fan Module-2 | tray | operational | FanBay-2  | no         |       |

```
Switch: SwitchB
```

| Fan          | Type | Fan Status  | Container | Is PSU Fan | Error |
|--------------|------|-------------|-----------|------------|-------|
| Fan Module-1 | tray | operational | FanBay-1  | no         |       |
| Fan Module-2 | tray | operational | FanBay-2  | no         |       |

The above example displays the fans and their status on the switches names SwitchA and SwitchB.

## system switch ethernet interface show

Display interface information for Ethernet switches (cluster and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet interface show` command displays the status and configuration of network interfaces on the monitored switches.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-counters ]**

Displays the current status of the following network counters:

- in-octets
- in-errors
- in-discards

- out-octets
- out-errors
- out-discards

**[ -instance ] }**

Displays detailed interface configuration for all monitored Ethernet switches

**[ -device <text> ] - Switch Name**

Selects the interface ports that belong to the specified switch.

**[ -interface-name <text> ] - Interface Name**

Selects the interface ports that match the specified interface name.

**[ -index <integer> ] - Interface Index**

Selects the interface ports that match the specified interface index.

**[ -type <interface type> ] - Interface Type**

Selects the interface ports that match the specified interface type.

**[ -mtu <integer> ] - MTU**

Selects the interface ports that match the specified maximum transfer unit.

**[ -duplex-type {unknown|half-duplex|full-duplex} ] - Duplex Settings**

Selects the interface ports that match the specified duplex setting.

**[ -speed <integer> ] - Interface Speed(Mbps)**

Selects the interface ports that match the specified interface speed in bits per second.

**[ -admin-state {up|down|testing} ] - Administrative Status**

Selects the interface ports that match the specified administrative status of the switch interface.

**[ -oper-state {up|down|testing|unknown|dormant|not-present|lower-layer-down} ] - Operational Status**

Selects the interface ports that match the specified operational status.

**[ -is-isl {yes|no} ] - Is ISL**

Selects the interface ports that are Inter-Switch links (yes) or are not Inter-Switch links (no).

**[ -in-octets <Counter> ] - Input Octets**

Selects the interface ports that match the specified number of octets entering the interface.

**[ -in-errors <Counter> ] - Input Errors**

Selects the interface ports that match the specified number of input packets that were dropped due to errors.

**[ -in-discards <Counter> ] - Input Discards**

Selects the interface ports that match the specified number of input packets that were silently discarded (possibly due to buffer overflow).

**[-out-octets <Counter>] - Output Octets**

Selects the interface ports that match the specified number of octets that exited the interface.

**[-out-errors <Counter>] - Output Errors**

Selects the interface ports that match the specified number of output packets that were dropped due to errors.

**[-out-discards <Counter>] - Output Discards**

Selects the interface ports that match the specified number of output packets that were silently discarded (possibly due to buffer overflow).

**[-timestamp <MM/DD/YYYY HH:MM:SS>] - Stats Retrieval Timestamp**

Selects the interface ports with statistics collected at the specified timestamp.

**[-interface-number <integer>] - Interface Number**

Selects the interface ports that match the specified interface number.

**[-unique-name <text>] - Interface Unique Name**

Selects the interface port that matches the specified unique name.

**[-display-name <text>] - Interface Display Name**

Selects the interface ports that match the specified display name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Port Config Status**

Selects the interface ports that match the specified status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the interface ports that the specified health monitor continuously monitors.

**[-switch-type {cluster-network|storage-network}] - Switch Network**

Selects the interface ports that match the specified switch type.

**[-remote-port-mtu <integer>,...] - MTU of Remote Port**

Selects the interface ports that match the specified remote port mtu.

**[-remote-port-name <text>] - Remote Port Name**

Selects the interface ports that match the specified remote port name.

**[-remote-device <text>] - Remote Device Name**

Selects the interface ports that match the specified remote device.

**[-model <text>] - Switch Model**

Selects the interface ports that match the specified model.

**[-mac-address <text>] - MAC Address**

Selects the interface ports that match the specified mac address.

**[-vlan-id <text>] - VLAN ID**

Selects the interface ports that match the specified vlan id.

**[-if-alias <text>] - Interface Alias**

Selects the interface ports that match the specified interface alias.

**[-is-vpc-peer-link {yes|no}] - Is vPC Peer Link Interface**

Selects the interface ports that are part of the vPC peer link (yes) or are not part of the vPC peer link (no).

**[-role <text>] - Role**

Selects the interface ports that are configured for the specified role.

**[-breakout-physical-port <text>] - Breakout Physical Port**

Selects the breakout interface ports with the specified physical interface name.

**[-breakout-number <integer>] - Breakout Number**

Selects the breakout interface ports with the specified sub-interface number.

**Examples**

```
cluster1::> system switch ethernet interface show
```

```
Switch: SwitchA
```

The example above displays the counters on switch network interfaces for all the Ethernet switches (cluster, management and storage).

## system switch ethernet log collect-support-log

Initiates the support log collection for the specified Ethernet switch.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet log collect-support-log` command initiates the support log collection for the specified Ethernet switch via SSH.

Log files are removed during takeover or giveback operations.

### Parameters

### **-device <text> - Switch Name**

Ethernet switch device for which the support log collection will be performed.

The device must be one of the devices listed as an Ethernet switch from the [system switch ethernet show](#) command. The full device name from the [system switch ethernet show](#) command must be used.

### **Examples**

```
cluster1::> system switch ethernet log collect-support-log -device  
cluster-sw1
```

Initiates support log collection for the specified Ethernet switches.

### **Related Links**

- [system switch ethernet show](#)

## **system switch ethernet log modify**

Modify the Ethernet switch log request.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system switch ethernet log modify` command modifies the the enablement and status of the hourly collection of periodic data and the status of the collection of detailed support logs.

### **Parameters**

#### **-device <text> - Switch Name**

Ethernet switch device for which the log request is being made.

The device must be one of the devices listed as an Ethernet switch from the [system switch ethernet show](#) command. The full device name from the [system switch ethernet show](#) command must be used.

#### **[-support-requested {true|false}] - Support Log Requested**

Request (true) or cancel (false) support log collection.

#### **[-periodic-enabled {true|false}] - Periodic Log Enabled**

Enable (true) or disable (false) periodic log collection.

### **Examples**

```
cluster1::> system switch ethernet log modify -device switch-  
name01(Switch---SN) -periodic-enabled true
```

Enables periodic log collection for the specified Ethernet switch.

### Related Links

- [system switch ethernet show](#)

## system switch ethernet log setup-password

Obtain Ethernet switch admin passwords.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet log setup-password` command allows the administrator to set up Ethernet switch health monitor access to certain Ethernet switches, so that switch logs can be collected.

### Examples

```
cluster1::> system switch ethernet log setup-password  
      Enter the switch name: (use full name from system switch  
ethernet show)  
      Enter the password: (Enter admin password of switch)  
      Enter the password again: (Enter admin password of switch)  
cluster1::>
```

Enables setup of switch log collection for the specified Ethernet switch.

## system switch ethernet log show

Display Ethernet switch log information.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch ethernet log show` command displays the enablement and status of the hourly collection of periodic data and the status of the collection of detailed support logs.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] }**

If this parameter is specified, the command displays information about all entries.

**[`-device <text>`] - Switch Name**

If this parameter is specified, the command only displays log collection details of the provided Ethernet switch(es).

**[`-support-requested {true|false}`] - Support Log Requested**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with support log collection requested (*true*) or not requested (*false*).

**[`-support-timestamp <MM/DD/YYYY HH:MM:SS>`] - Last Support Log Timestamp**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided timestamp for periodic log collection.

**[`-support-filename <text>`] - Support Log Filename**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided path for support log collection.

**[`-periodic-enabled {true|false}`] - Periodic Log Enabled**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with periodic log collection enabled (*true*) or disabled (*false*).

**[`-support-state {never-run|initiated|in-progress|completed|failed}`] - Support Log State**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided state; *never-run*, *initiated*, *in-progress*, *completed*, or *failed*.

**[`-support-status-msg <text>`] - Support Log Status**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided status message for support log collection.

**[`-periodic-state {never-run|scheduled|in-progress|halted|failed}`] - Periodic Log State**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided state; either *never-run*, *scheduled*, *in-progress*, *halted*, or *failed*.

**[`-periodic-status-msg <text>`] - Periodic Log Status**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided status message for periodic log collection.

**[`-periodic-timestamp <MM/DD/YYYY HH:MM:SS>`] - Last Periodic Log Timestamp**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided timestamp for periodic log collection.

**[`-periodic-filename <text>`] - Periodic Log Filename**

If this parameter is specified, the command only displays log collection details of the Ethernet switch(es) with the provided path for periodic log collection.

## Examples

```
cluster1::> system switch ethernet log show
Periodic      Periodic      Support
              Switch
State    Log State
-----
scheduled failed
switch-name01 (Switch---SN)      true
switch-name02 (Switch---SN)      false      failed
-
```

Displays the Ethernet switches, their periodic log collection enablement, their periodic log collection state, and their support log collection state.

## system switch ethernet polling-interval modify

Modify the polling interval for Ethernet switch health

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system switch ethernet polling-interval modify` command modifies the interval in which the Ethernet switch health monitor polls cluster, management and storage switches.

### Parameters

#### **[-polling-interval <integer>] - Polling Interval**

Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

## Examples

```
cluster1::> system switch ethernet polling-interval modify -polling
-interval 41
```

Modifies the polling interval of the switches.

## system switch ethernet polling-interval show

Display the polling interval for monitoring Ethernet switch health

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet polling-interval show` command displays the polling interval used by the Ethernet switch health monitor.

## Examples

```
cluster1::> system switch ethernet polling-interval show
Polling Interval (in minutes): 40
```

The example above displays the polling interval period for the switches.

## system switch ethernet power show

Display power information for Ethernet switches (cluster and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch ethernet power show` command displays the power supply status of the monitored Ethernet switches.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields with the names that you specify.

**| [-instance ] }**

Displays detailed power supply information for all the switches.

**[-device <text>] - Switch Name**

Selects the PSUs that belong to the specified switch.

**[-psu-name <text>] - Power Supply Name**

Selects the PSUs that match the specified power supply name.

**[-oper-status {operational|failed|not-operational|not-present|unknown}] - Operational Status**

Selects the PSUs that match the specified operational status.

**[-error-description <text>] - Error Description**

Selects the PSUs that match the specified error description.

**[-display-name <text>] - Power Supply Display Name**

Selects the PSUs that match the specified display name.

### **[-unique-name <text>] - Power Supply Unique Name**

Selects the PSU that matches the specified unique name.

### **[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Power Supply Resource Health**

Selects the PSUs that match the specified status.

### **[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the PSUs that match the specified monitor type.

### **[-admin-status {on|off|not-defined|unknown}] - Administrative Status**

Selects the PSUs that match the specified administrative status for the power supply.

## **Examples**

```
cluster1::> system switch ethernet power show
```

| Switch  | Power Supply  | Admin Status | Operational Status | Error |
|---------|---------------|--------------|--------------------|-------|
| SwitchA | PowerSupply-1 | on           | operational        |       |
| SwitchA | PowerSupply-2 | on           | operational        |       |

The example above displays the power-supply status for all Ethernet switches (cluster, management and storage).

## **system switch ethernet switch-count show**

Display the count of cluster-network and storage-network switches.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system switch ethernet switch-count show` command displays the Ethernet switch redundancy status of the cluster that the Ethernet switch health monitor is monitoring.

## **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed power supply information for all the switches.

### **[`-unique-name <text>`] - Cluster Unique Name**

Displays the cluster name whose Ethernet switch redundancy is monitored.

### **[`-clus-switch-count <integer>`] - Ethernet Switch Count**

Displays the count of cluster network switches in the cluster.

### **[`-mgmt-switch-count <integer>`] - (DEPRECATED)-Management Switch Count**

This parameter is deprecated and may be removed in a future release of ONTAP.

Displays the count of management network switches in the cluster.

### **[`-switchless-config {true|false}`] - 2-Node Switchless**

Displays whether the cluster is in switchless cluster configuration or not.

### **[`-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}`] - Health Monitor**

Displays the health monitor monitoring this cluster network switch redundancy information of the cluster.

### **[`-status {ok|ok-with-suppressed|degraded|unreachable|unknown}`] - Ethernet Switch Redundancy Status**

Displays the Ethernet switch redundancy status of the cluster.

### **[`-display-name <text>`] - Cluster Display Name**

Displays the cluster name whose Ethernet switch redundancy is monitored.

### **[`-stor-switch-count <integer>`] - Storage Switch Count**

Displays the count of storage network switches in the cluster.

## **Examples**

```
cluster1::*> system switch ethernet switch-count show
Cluster  Storage Switchless
Sw Count Sw Count Config
-----
          2          2 false
```

Shows the count of Ethernet switches (including cluster and storage networks) and the switchless configuration status of the cluster.

## **system switch ethernet temperature show**

Display temperature information for Ethernet switches (cluster and storage).

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system switch ethernet temperature show` command displays the temperature status of

switches monitored by the Ethernet switch health monitor.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-device <text>] - Switch Name**

Selects the temperature sensors that belong to the specified switch.

**[-sensor-name <text>] - Sensor Name**

Selects the temperature sensors that match the specified temperature sensor name.

**[-index <integer>] - Sensor Index**

Selects the temperature sensors that match the specified sensor index.

**[-temperature <integer>] - Temperature in Celsius**

Selects the temperature sensors whose readings match the specified temperature value.

**[-threshold-severity**

**{Unknown|Other|Information|Degraded|Minor|Major|Critical|Fatal}] - Threshold Severity**

Selects the temperature sensors that match the specified threshold severity.

**[-threshold-value <integer>,...] - Threshold Value**

Selects the temperature sensors that match the specified threshold value.

**[-sensor-status {normal|warning|alert|critical|not-present|not-operational|unknown}] - Temperature Status**

Selects the temperature sensors that match the specified operational status.

**[-display-name <text>] - Sensor Display Name**

Selects the temperature sensors that match the specified sensor display name.

**[-unique-name <text>] - Sensor Unique Name**

Selects the temperature sensor that matches the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example|ethernet-switch}] - Health Monitor**

Selects the temperature sensors that the specified health monitor continuously monitors.

**[-error-description <text>] - Error Description**

Selects the temperature sensors that match the specified fault error description.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Resource Status**

Selects the temperature sensors that match the specified status.

Examples

```
cluster1::> system switch ethernet temperature show
```

| Switch  | Sensor               | Reading | Severity     | Threshold Value | Threshold | Status | Error |
|---------|----------------------|---------|--------------|-----------------|-----------|--------|-------|
| SwitchA | "Module-1, Intake-1" | 24      | Minor, Major | 40, 50          |           | normal |       |
| SwitchA | "Module-1, Intake-2" | 23      | Minor, Major | 40, 50          |           | normal |       |

The example above displays temperature status for all Ethernet switches (cluster, management and storage).

system switch ethernet threshold show

Display the Ethernet switch health monitor alert thresholds

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system switch ethernet threshold show` command displays thresholds used by health monitor alerts.

Examples

```
cluster1::> system switch ethernet threshold show
```

Errors/Utilization Threshold is per 0.10% values: 1 = 0.10%, 5 = 0.50%

Entity-alert Threshold is the count needed to raise entity warning alert

| Errors              |                      | Bandwidth           |                      | Entity-alert           |
|---------------------|----------------------|---------------------|----------------------|------------------------|
| Threshold (0.1%) In | Threshold (0.1%) Out | Threshold (0.1%) In | Threshold (0.1%) Out | Entity-alert Threshold |
| 1                   | 1                    | 900                 | 900                  | 2                      |

Displays the inbound and outbound switch interface packet error thresholds which are set at 0.1%, and the inbound and outbound switch interface bandwidth utilization thresholds which are set at 90%. Also displays the threshold value for entity warning alerts. The node platform health monitor also shares the same thresholds for monitoring cluster port packet errors on the node.

system switch fibre-channel add

Add a back-end fibre-channel switch for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch fibre-channel add` command enables you to add fibre-channel (FC) switches for SNMP monitoring in a MetroCluster configuration. Front end switches should not be added for monitoring and will result in a Monitor Status Error condition.

## Parameters

### **-address <IP Address> - FC Switch Management IP Address**

This parameter specifies the IP address of the back-end FC switch that is added for monitoring.

### **[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - Supported SNMP Version**

This parameter specifies the SNMP version that ONTAP uses to communicate with the back-end FC switch that is added for monitoring. The default SNMP version is SNMPv2c.

### **[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

### **[-veto-backend-fabric-check {true|false}] - Veto Back-end Fabric Check? (privilege: advanced)**

If specified, the `system switch fibre-channel add` command will not check if the switch is present in the MetroCluster's back-end fabric. By default, it does not let you add switches that are not present.

### **[-blades <integer>,...] - Cisco Director Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the back-end switch that is added for monitoring. It is only applicable to director-class switches.

## Examples

The following command adds a back-end switch with IP Address 10.226.197.34 for monitoring:

```

cluster1::> system switch fibre-channel add -address 10.226.197.34 -snmp
-community-or-username public
cluster1::> system switch fibre-channel show

```

| Monitor             | Symbolic            | Is                       |
|---------------------|---------------------|--------------------------|
| Switch              | Name                | Vendor Model             |
| Status              | Switch WWN          | Monitored                |
| Cisco_10.226.197.34 | mcc-cisco-8Gb-fab-4 | Cisco DS-C9148-16P-K9    |
|                     |                     | 2000547fee78f088 true ok |
| mcc-cisco-8Gb-fab-1 | mcc-cisco-8Gb-fab-1 | Cisco -                  |
|                     |                     | - false -                |
| mcc-cisco-8Gb-fab-2 | mcc-cisco-8Gb-fab-2 | Cisco -                  |
|                     |                     | - false -                |
| mcc-cisco-8Gb-fab-3 | mcc-cisco-8Gb-fab-3 | Cisco -                  |
|                     |                     | - false -                |

```

4 entries were displayed.
cluster1::>

```

The following command adds a Cisco Director Class switch for monitoring. ONTAP uses SNMPv3 and 'snmpuser1' username to communicate with this switch.

```

cluster1::> system switch fibre-channel add -address 10.228.56.208 -snmp
-version SNMPv3 -snmp-community-or-username snmpuser1 -blades 3,4

```

## system switch fibre-channel modify

Modify information about a back-end fibre-channel switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch fibre-channel modify` command enables you to modify certain parameters for identifying and accessing the back-end fibre-channel (FC) end switches added for monitoring in a MetroCluster configuration.

### Parameters

**-switch-name <text> - FC Switch Name**

This parameter specifies the name of the switch.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

This parameter specifies the SNMP version that ONTAP uses to communicate with the switch.

**[-switch-ipaddress <IP Address>] - Switch IP Address**

This parameter specifies the IP address of the switch.

**[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

**[-blades <integer>,...] - Director-Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

## Examples

The following command modifies Cisco\_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> system switch fibre-channel modify -switch-name
Cisco_10.226.197.34 -switch-ipaddress 10.226.197.34 -snmp-community-or
-username public
cluster1::>
```

The following command modifies the blades monitored on a director-class switch:

```
cluster1::> system switch fibre-channel modify -switch-name
Cisco_10.228.56.208 -blades 3,4
cluster1::>
```

The following command modifies Brocade 6505 switch SNMP version to SNMPv3 and SNMPv3 username to 'snmpuser1':

```
cluster1::> system switch fibre-channel modify -switch-name Brocade6505
-switch-ipaddress 10.226.197.34 -snmp-version SNMPv3 -snmp-community-or
-username snmpuser1
cluster1::>
```

## system switch fibre-channel refresh

### Refresh back-end fibre-channel switch info

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system switch fibre-channel refresh` command triggers a refresh of the SNMP data for the MetroCluster fibre-channel (FC) switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [system switch fibre-channel add](#) and [system bridge add](#) commands, respectively.

## Examples

The following command triggers a refresh for the FC switch and FC-to-SAS bridge data:

```
cluster1::*> system switch fibre-channel refresh
cluster1::*>
```

## Related Links

- [system switch fibre-channel add](#)
- [system bridge add](#)

## system switch fibre-channel remove

Remove a back-end fibre-channel switch from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system switch fibre-channel remove` command enables you to remove back-end fibre-channel (FC) switches that were previously added for SNMP monitoring.

## Parameters

**-switch-name <text> - FC Switch Name**

This parameter specifies the name of the back-end FC switch added for monitoring.

## Examples

The following command removes 'Cisco\_10.226.197.34' switch from monitoring:

```

cluster1::> system switch fibre-channel show
Symbolic                                     Is

## system switch fibre-channel show

Display back-end fibre-channel switch information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system switch fibre-channel show` command displays information about all the back-end fibre-channel (FC) switches in the MetroCluster configuration. The back-end switches must have been previously added for monitoring using the [system switch fibre-channel add](#) command. If no parameters are specified, the default command displays the following information about the back-end FC switches:

- Switch
- Symbolic Name
- Vendor
- Model
- Switch WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single back-end FC switch, use the `-switch-name` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the back-end FC switches, in column-style output.

**| [-connectivity ]**

Displays the following details about the connectivity from the back-end FC switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
- Peer port world wide name
- Peer type
- Additional information about peer

Displays the following details about the connectivity from the node to the back-end FC switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

### | [**-cooling** ]

Displays the following details about the fans and temperature sensors on the back-end FC switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius °C
- Temperature sensor status

### | [**-error** ]

Displays the errors related to the back-end FC switch.

### | [**-port** ]

Displays the following details about the back-end FC switch ports:

- Port name
- Port world wide name
- Port administrative status
- Port operational status
- Port operating mode
- Whether SFP is present in the port
- Port speed in gigabits per second (Gbps)
- Port BB credit
- Peer port world wide name

### | [**-power** ]

Displays the following details about the back-end FC switch power supplies:

- Power supply name
- Power supply serial number
- Power supply operational status

### | [**-san-config** ]

Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the back-end FC switch:

- VSAN identifier
- VSAN name
- VSAN operational status
- Type of load balancing configured for the VSAN
- Whether in-order-delivery set for the VSAN
- Whether the auto power reset of the PSU is enabled

- VAN member switch name and port
- Zone name
- VSAN ID of the zone
- Zone member switch name and port
- Zone member port id
- Zone member port world wide name

#### | [-sfp ]

Displays the following details about the back-end FC switch ports small form-factor pluggable (SFP):

- Port name
- Type of SFP
- SFP transmitter type
- SFP vendor
- SFP part number
- SFP serial number

#### | [-stats ]

Displays the following details about the back-end FC switch ports:

- Port name
- Frames received through the port (Rx Frames)
- Frames transmitted through the port (Tx Frames)
- Octets received through the port (Rx Octets)
- Octets transmitted through the port (Tx Octets)
- Port error frames

#### | [-instance ] }

Displays expanded information about all the back-end FC switches in the system. If a back-end FC switch is specified, then this parameter displays the same detailed information for the back-end FC switch you specify as does the -switch-name parameter.

#### **[-switch-name <text>] - FC Switch Name**

Displays information only about the back-end FC switches that match the name you specify.

#### **[-switch-wwn <text>] - Switch World Wide Name**

Displays information only about the back-end FC switches that match the switch wwn you specify.

#### **[-switch-symbolic-name <text>] - Switch Symbolic Name**

Displays information only about the back-end FC switches that match the switch symbolic name you specify.

#### **[-switch-fabric-name <text>] - Fabric Name**

Displays information only about the back-end FC switches that match the switch fabric you specify.

**[-domain-id <integer>] - Switch Domain ID**

Displays information only about the back-end FC switches that match the switch domain id you specify.

**[-switch-role {unknown|primary|subordinate}] - Switch Role in Fabric**

Displays information only about the back-end FC switches that match the switch role you specify.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Displays information only about the back-end FC switches that match the switch SNMP version you specify.

**[-switch-model <text>] - Switch Model**

Displays information only about the back-end FC switches that match the switch model you specify.

**[-switch-vendor {unknown|Brocade|Cisco}] - Switch Vendor**

Displays information only about the back-end FC switches that match the switch vendor you specify.

**[-fw-version <text>] - Switch Firmware Version**

Displays information only about the back-end FC switches that match the switch firmware version you specify.

**[-serial-number <text>] - Switch Serial Number**

Displays information only about the back-end FC switches that match the switch serial number you specify.

**[-switch-ipaddress <IP Address>] - Switch IP Address**

Displays information only about the back-end FC switches that match the switch IP address you specify.

**[-switch-status {unknown|ok|error}] - Switch Status**

Displays information only about the back-end FC switches that match the switch status you specify.

**[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username**

Displays information only about the back-end FC switches that match the switch SNMPv2c community or SNMPv3 username you specify.

**[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Profile Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the profile data last successful refresh timestamp you specify.

**[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Switch**

Displays information only about the back-end FC switches that match the switch monitoring value you specify.

**[-blades <integer>,...] - Director-Class Switch Blades to Monitor**

Displays information only about the back-end FC switches that match the blade value you specify.

**[-engine-id <Hex String>] - Engine ID of SNMPv3 Capable Switch**

Displays information only about the back-end FC switches that match the SNMPv3 engine-id you specify.

**[-psu-name-list <text>,...] - Switch Power Supply Name List**

Displays information only about the back-end FC switches that have the power supply units with the names

you specify.

**[-psu-serial-number-list <text>,...] - Switch Power Supply Serial Number List**

Displays information only about the back-end FC switches that have the power supply units with the serial numbers you specify.

**[-psu-status-list {unknown|normal|warning|faulty|not-present}] - Switch Power Supply Status List**

Displays information only about the back-end FC switches that have the power supply units with the statuses you specify.

**[-psu-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Power Supply Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the power supply unit data last successful refresh timestamp you specify.

**[-temp-sensor-name-list <text>,...] - Switch Temperature Sensor Name List**

Displays information only about the back-end FC switches that have the temperature sensors with the names you specify.

**[-temp-sensor-reading-list <integer>,...] - Switch Temperature Sensor Reading © List**

Displays information only about the back-end FC switches that have the temperature sensors with the readings you specify.

**[-temp-sensor-status-list {unknown|normal|warning|critical}] - Switch Temperature Sensor Status List**

Displays information only about the back-end FC switches that have the temperature sensors with the statuses you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Temperature Sensor Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the temperature sensor data last successful refresh timestamp you specify.

**[-fan-name-list <text>,...] - Switch Fan Name List**

Displays information only about the back-end FC switches that match the fans with the names you specify.

**[-fan-rpm-list <integer>,...] - Switch Fan Speed (RPM) List**

Displays information only about the back-end FC switches that match the fans with the RPM speeds you specify.

**[-fan-status-list {unknown|operational|failed|not-operational|not-present}] - Switch Fan Operational Status List**

Displays information only about the back-end FC switches that match the fans with the statuses you specify.

**[-fan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Fan Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the fan data last successful refresh timestamp you specify.

**[-vsan-index-list <integer>,...] - Switch VSAN Index List**

Displays information only about the back-end FC switches that have the VSANs with the indexes you specify.

**[-vsan-name-list <text>,...] - Switch VSAN Name List**

Displays information only about the back-end FC switches that have the VSANs with the names you specify.

**[-vsan-oper-status-list {up|down}] - Switch VSAN Operational Status List**

Displays information only about the back-end FC switches that have the VSANs with the operational statuses you specify.

**[-vsan-load-balancing-type-list {src-id-dest-id|src-id-dest-id-ox-id}] - Switch VSAN Load balancing Type List**

Displays information only about the back-end FC switches that have the VSANs with the load balancing types you specify.

**[-is-vsan-iod-list {true|false}] - Is In-order Delivery Set for VSAN List**

Displays information only about the back-end FC switches that have the VSANs with the IOD setting you specify.

**[-vsan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch VSAN Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the VSAN data last successful refresh timestamp you specify.

**[-member-switch-name-list <text>,...] - Member Switch List**

Displays information only about the back-end FC switches that have the VSANs with the member switch names you specify.

**[-member-switch-port-name-list <text>,...] - Member Switch Port Name List**

Displays information only about the back-end FC switches that have the VSANs with the member switch port names you specify.

**[-vsan-id-list <integer>,...] - Zone VSAN ID List**

Displays information only about the back-end FC switches that have the VSANs with the IDs you specify.

**[-zone-name-list <text>,...] - Switch Zone Name List**

Displays information only about the back-end FC switches that have the zones with the names you specify.

**[-zone-member-sw-domain-id-list <integer>,...] - Zone Member Switch Port Domain ID List**

Displays information only about the back-end FC switches that have the zones with the member switch domain ids you specify.

**[-zone-member-port-name-list <text>,...] - Zone Member Port List**

Displays information only about the back-end FC switches that have the zones with the port names you specify.

**[-zone-member-port-wwn-list <text>,...] - Zone Member WWPN List**

Displays information only about the back-end FC switches that have the zones with the port WWNs you

specify.

**`[-zone-member-port-switch-name-list <text>,...] - Zone Member Switch WWN List`**

Displays information only about the back-end FC switches that have the zones with the member port hosting switch names you specify.

**`[-zone-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]`**

**`- Switch Zone Data Last Successful Refresh Timestamp`**

Displays information only about the back-end FC switches that match the zone data last successful refresh timestamp you specify.

**`[-zone-member-wwn-list <text>,...] - Zone Member WWN List`**

Displays information only about the back-end FC switches that have the zones with the member WWNs you specify.

**`[-zone-member-port-id-list <text>,...] - Zone Member Port ID List`**

Displays information only about the back-end FC switches that have the zones with the member port ids you specify.

**`[-port-wwn-list <text>,...] - Switch Port World Wide Name (WWPN) List`**

Displays information only about the back-end FC switches that have the ports with the WWNs you specify.

**`[-port-name-list <text>,...] - Switch Port Name List`**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**`[-port-admin-status-list {unknown|enabled|disabled}] - Switch Port Admin Status List`**

Displays information only about the back-end FC switches that have the ports with administrative statuses you specify.

**`[-port-oper-status-list {unknown|online|offline}] - Switch Port Operational Status List`**

Displays information only about the back-end FC switches that have the ports with operational statuses you specify.

**`[-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port|other|EX-port|D-port|SIM-port|VE-port|AE-port|AF-port}] - Switch Port Mode List`**

Displays information only about the back-end FC switches that have the ports with the operating modes you specify.

**`[-port-oper-speed-list <integer>,...] - Switch Port Current Speed (in Gbits/sec) List`**

Displays information only about the back-end FC switches that have the ports with the operational speeds you specify.

**`[-port-bb-credit-list <integer>,...] - Switch Port BB Credit List`**

Displays information only about the back-end FC switches that have the ports with the BB credits you specify.

**`[-port-sfp-present-list {true|false}] - Switch Port Is SFP Present List`**

Displays information only about the back-end FC switches that have the ports with the SFP present values you specify.

**[-port-peer-wwpn-list <text>,...] - Switch Port Peer WWPN List**

Displays information only about the back-end FC switches that have the ports with the peer port WWPNs you specify.

**[-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Data Last Successful Refresh Timestamp**

Displays information only about the back-end FC switches that match the port data last successful refresh timestamp you specify.

**[-port-stat-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-port-tx-frames-list <integer>,...] - Switch Port Transmitted Frame Count List**

Displays information only about the back-end FC switches that have the ports with the transmitted frames values you specify.

**[-port-rx-frames-list <integer>,...] - Switch Port Received Frame Count List**

Displays information only about the back-end FC switches that have the ports with the received frames values you specify.

**[-port-tx-octets-list <integer>,...] - Switch Port Total Transmitted Octets List**

Displays information only about the back-end FC switches that have the ports with the transmitted octets values you specify.

**[-port-rx-octets-list <integer>,...] - Switch Port Total Received Octets List**

Displays information only about the back-end FC switches that have the ports with the received octets values you specify.

**[-port-frame-error-list <integer>,...] - Switch Port Frame Error Count List**

Displays information only about the back-end FC switches that have the ports with the error frame values you specify.

**[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Stat Data Last Update Timestamp**

Displays information only about the back-end FC switches that match the port statistics data last successful refresh timestamp you specify.

**[-sfp-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**[-sfp-type-list {unknown|other|gbic|embedded|glm|gbic-with-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|xfp|x2-short|x2-medium|x2-tall|xpak-short|xpak-medium|xpak-tall|xenpak|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}] - Switch Port SFP Type List**

Displays information only about the back-end FC switches that have the ports with the SFP types you specify.

**[-sfp-tx-type-list {unknown|long-wave-laser|short-wave-laser|long-wave-laser-cost-reduced|electrical|ten-gig-base-sr|ten-gig-base-lr|ten-gig-base-er|ten-gig-base-lx4|ten-gig-base-sw|ten-gig-base-lw|ten-gig-base-ew}] - Switch Port SFP Transmitter Type List**

Displays information only about the back-end FC switches that have the ports with the SFP transmitter types you specify.

**`[-sfp-vendor-list <text>,...] - Switch Port SFP Vendor List`**

Displays information only about the back-end FC switches that have the ports with the SFP vendors you specify.

**`[-sfp-part-number-list <text>,...] - Switch Port SFP Part Number List`**

Displays information only about the back-end FC switches that have the ports with the SFP part numbers you specify.

**`[-sfp-serial-number-list <text>,...] - Switch Port SFP Serial Number List`**

Displays information only about the back-end FC switches that have the ports with the SFP serial numbers you specify.

**`[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port SFP Data Last Successful Refresh Timestamp`**

Displays information only about the back-end FC switches that match the port SFP data last successful refresh timestamp you specify.

**`[-switch-error-text-list <text>,...] - Switch Error Text List`**

Displays information only about the back-end FC switches that have the errors you specify.

**`[-conn-switch-port-name-list <text>,...] - Switch Port Name List`**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**`[-conn-switch-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port|other|EX-port|D-port|SIM-port|VE-port|AE-port|AF-port}] - Switch Port Operating Mode List`**

Displays information only about the back-end FC switches that have the ports with the operating modes you specify.

**`[-conn-switch-port-wwn-list <text>,...] - Switch Port WWN List`**

Displays information only about the back-end FC switches that have the ports with the WWNs you specify.

**`[-conn-switch-port-peer-port-wwn-list <text>,...] - Switch Port Peer Port WWN List`**

Displays information only about the back-end FC switches that have the ports with the peer port WWNs you specify.

**`[-conn-switch-port-peer-info-list <text>,...] - Switch Port Peer Host & Port Name List`**

Displays information only about the back-end FC switches that have the ports with the peer information values you specify.

**`[-conn-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Connectivity Data Last Successful Refresh Timestamp`**

Displays information only about the back-end FC switches that match the switch connectivity data last successful refresh timestamp you specify.

**`[-conn-switch-port-peer-type-list {unknown|bridge|switch|fcp-adapter|fcvi-adapter}] - Switch Port Peer Type List`**

Displays information only about the back-end FC switches that have the ports connected to the peer types

you specify.

**`[-switch-port-name-list <text>,...] - Switch Port Name List`**

Displays information only about the back-end FC switches that have the ports with the names you specify.

**`[-switch-port-speed-list <integer>,...] - Switch Port Speed (in Gbps) List`**

Displays information only about the back-end FC switches that have the ports with the speeds you specify.

**`[-node-name-list <nodename>,...] - Node Name List`**

Displays information only about the back-end FC switches that are connected to the nodes you specify.

**`[-adapter-name-list <text>,...] - Node Adapter Name List`**

Displays information only about the back-end FC switches that are connected to the adapters you specify.

**`[-adapter-port-name-list <text>,...] - Node Adapter Port Name List`**

Displays information only about the back-end FC switches that are connected to the adapter ports you specify.

**`[-adapter-type-list {unknown|FCP-Initiator|FC-VI|FCP-Target}] - Node Adapter Type List`**

Displays information only about the back-end FC switches that are connected to the types of adapters you specify.

**`[-path-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Path Data Last Successful Refresh Timestamp`**

Displays information only about the back-end FC switches that match the node to switch path data last successful refresh timestamp you specify.

**`[-name-list <text>,...] - Switch Name List`**

Displays information only about the back-end FC switches that match the names you specify.

**`[-domain-id-list <integer>,...] - Switch Domain ID List`**

Displays information only about the back-end FC switches that match the domain ids you specify.

**`[-wwn-list <text>,...] - Switch WWN List`**

Displays information only about the back-end FC switches that match the switch WWNs you specify.

**`[-role-list {unknown|primary|subordinate}] - Switch Role in Fabric List`**

Displays information only about the back-end FC switches that match the switch roles you specify.

**`[-address-list <IP Address>,...] - Switch IP Address List`**

Displays information only about the back-end FC switches that match the switch IP addresses you specify.

## Examples

The following example displays information about all back-end FC switches:

```

# system timeout commands

## system timeout modify

Set the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system timeout modify` command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of 0 (zero).

## Parameters

### **[-timeout <integer>] - Timeout (in minutes)**

Use this parameter to specify the timeout value, in minutes.

## Examples

The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

```
cluster1::> system timeout modify -timeout 10
```

The following example shows how to prevent CLI sessions from timing out:

```
cluster1::> system timeout modify -timeout 0
```

## system timeout show

Display the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system timeout show` command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

## Examples

The following example displays the timeout value for CLI sessions:

```
cluster1::> system timeout show
CLI session timeout: 15 minute(s)
```

# template commands

## template copy

Copy a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to copy an existing template. The copied template becomes a readwrite template and can be customized using template parameter family of commands.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-destination-name <template name> - Destination template**

This parameter specifies the name of the destination template.

### Examples

The following example copies template1 to template2. The template2 will be a readwrite template:

```
cluster1::> template copy -name template1 -destination-name template2
```

## template delete

Delete an existing template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to delete an existing template.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

### Examples

The following example deletes a template named template1 from the cluster:

```
cluster1::> template delete -name template1
```

## template download

Download a template

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Use this command to download a template from an external server to the cluster.

### Parameters

**-uri {scheme://(hostname|IPv4 Address|[' 'IPv6 Address']')...}** - URI of the template (privilege: advanced)

This parameter specifies the URI from which the template will be downloaded.

**[-name <template name>]** - Name of the template (privilege: advanced)

This parameter specifies the name that will be assigned to the template in the cluster.

### Examples

The following example downloads the template specified in the -uri parameter value and names the template as template1:

```
cluster1::> template download -uri http://www.example.com/netapp-  
templates/mysample -name template1
```

The following example downloads the template specified in the -uri parameter value:

```
cluster1::> template download -uri http://www.example.com/netapp-  
templates/template1
```

## template provision

Provision Data ONTAP resources using the template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The command `template provision` provisions ONTAP system based on the template that is passed as an input to the template parameter. A wizard is presented which will accept the required inputs.

## Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template

**[-simulate {true|false}] - Simulate**

If this parameter is specified, the provisioning is just simulated and there will be no changes done to the system.

## Examples

The following example provisions a vservers with required protocols using template.

```
cluster-1::> template provision -name VserverEnvironmentSetup
Press Ctrl+C to abort.

## template rename

Rename a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to rename an existing template.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-new-name <template name> - New name of the template**

This parameter specifies the template's new name.

### Examples

The following example renames a template template1 as template2:

```
cluster1::> template rename -name template1 -new-name template2
```

## template show-permissions

Display Template Allowed and Disallowed System Objects

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The template show-permission command shows all the system objects that are allowed and disallowed for the current user.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

If you specify this parameter, only permissions that match the specified name are displayed.

**[-object-name <text>] - Object Name**

If you specify this parameter, only permissions that match the specified object-name are displayed.

**[-permission <text>] - Permission**

If you specify this parameter, only permissions that match the specified permission are displayed.

**[-command-name <text>] - Command Name**

If you specify this parameter, only permissions that match the specified command-name are displayed.

## Examples

The following example shows all the the allowed and disallowed system objects

```
cluster1::> template show-permissions
Template: VserverEnvironmentSetup
Object Name      Command Name
Permission
-----
access.dns       vservice services name-service dns create
allowed
network.interface network interface create
allowed
network.routes   network route create
allowed
protocols.CIFS    vservice cifs create
allowed
```

# template show

## Display templates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `template show` command displays information about templates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, then the command displays the following information about all the templates:

- Template Name
- Permission (*readonly* or *readwrite*)

To display detailed information about a single template, run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Parent Template Name
- Description
- Version
- UUID of the Template

To display detailed information about all templates, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about templates with *readonly* permissions, run the command with the `-permission readonly` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This parameter specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-name <template name>] - Name of the template**

If this parameter is specified, the command displays the detailed information about the template that matches the specified name.

**[-permission <template\_permission>] - Permission**

If this parameter is specified, the command displays information about the template or templates that matches the specified permission.

**[-parent-template <text>] - Parent template name**

If this parameter is specified, the command displays information about the template or templates that matches the specified parent template name.

### **[-description <text>] - Description**

If this parameter is specified, the command displays information about the template or templates that matches the specified description.

### **[-version <text>] - Version**

If this parameter is specified, the command displays information about the template or templates that matches the specified version.

### **[-uuid <UUID>] - UUID of the template**

If this parameter is specified, the command displays information about the template or templates that matches the specified uuid.

## **Examples**

The following example displays information about all templates in the cluster:

```
cluster1::> template show
Template                               Permission
-----
template1                             readonly
template2                             readwrite
```

The following example displays detailed information about a template named template1:

```
cluster1::> template show -name template1
Name of the Template: template1
      Permission: readonly
Parent Template Name: -
      Description: Template to configure Vserver Environment
      Version: 1.0
UUID of the Template: c8dfef58-b5c5-5697-a829-18d4ee0ba202
```

## **template upload**

Upload an existing template to an external server

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

Use this command to upload an existing template on to an external server.

### **Parameters**

**-name <template name> - Name of the template (privilege: advanced)**

This parameter specifies the name of the template.

**-uri {scheme: //(hostname|IPv4 Address| '[' IPv6 Address' ')] ...} - URI to upload the template (privilege: advanced)**

This parameter specifies the URI to which the template will be uploaded.

## Examples

The following example uploads a template `template1` on to an external server specified in the `uri` input parameter:

```
cluster1::*> template upload -name template1 -uri
http://www.example.com/mytemplates/
```

# template parameter commands

## template parameter modify

Modify the template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `template parameter modify` command can be used to modify the following attributes of a template parameter:

- Default value of the parameter

### Parameters

**-template <template name> - Name of the template**

Name of the template.

**-name <text> - Name of the parameter**

This parameter specifies the name of the parameter.

**[-default-value <text>] - Default value of the parameter**

This parameter specifies the default value of the parameter. This value is used by the [template provision](#) command when it provisions the system using this template.

## Examples

The following example modifies the default value of the parameter `param1` in template `template1` to `value1`:

```
cluster1::> template parameter modify -template template1 -parameter  
param1 -default-value value1
```

## Related Links

- [template provision](#)

## template parameter show

### Display template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `template parameter show` command displays information about the parameters of a template. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the parameters of all the templates in the system:

- Name of the template
- Name of the parameter
- Permission (*readonly* or *readwrite*)
- Default Value for the parameter
- Readonly
- Description

To display detailed information about a single parameter of the template run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Recommended Value for the parameter
- Maximum Length
- Range Maximum
- Range Minimum
- Allowed Values

To display detailed information about all the parameters of the template, run the command with the `-instance` parameter

You can specify additional parameters to display information that matches only those parameters. For example, to display information about all the parameters of the templates with readonly permissions, run the command with the `-permission readonly` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This parameter specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-template <template name>] - Name of the template**

Name of the template.

**[-name <text>] - Name of the parameter**

If this parameter is specified, the command displays information about the parameter of all the templates that matches the specified parameter name.

**[-permission <text>] - Template permission**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified permission.

**[-type <text>] - Type of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified type.

**[-description <text>] - Parameter description**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified description.

**[-recommended-value <text>] - Recommended value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified recommended value.

**[-default-value <text>] - Default value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified default value.

**[-readonly {yes|no}] - Read-only parameter**

If this parameter is specified with a value of true, then all the parameters that cannot be modified of all templates are displayed. If the value specified is false, then all the parameters that can be modified of all templates are displayed.

**[-max-length <integer>] - Maximum length**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum length.

**[-range-max <integer>] - Maximum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum range.

**[-range-min <integer>] - Minimum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified minimum range.

### **[-allowed-vals <text>] - Allowed values**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified allowed values.

### **Examples**

The following example displays information about all the parameters of all the templates in the cluster:

```
cluster1::> template parameter show
```

```
Template: templatel
```

```
Permission: readonly
```

|            |           | Default | Read |             |
|------------|-----------|---------|------|-------------|
| Parameter  | Type      | Value   | Only | Description |
| parameter1 | string    | -       | No   | Parameter1  |
| parameter2 | IPAddress | -       | No   | Parameter2  |

# volume commands

## volume autosize

Set/Display the autosize settings of the flexible volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume autosize` command allows the user to specify the maximum size that a volume automatically grows to when it is out of space or the minimum size that it shrinks to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified, then the current settings are displayed. This command is not supported on infinite volumes.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver on which the volume is located.

#### **-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to set or display the autosize configuration.

#### **{ [-maximum-size {<integer>[KB|MB|GB|TB|PB] }] - Maximum Autosize**

Use this parameter to specify the maximum size to which a flexible volume can grow. The default for flexible volumes is 120% of the volume size. If the value of this parameter is invalidated by manually growing the volume to a size more than the value of the maximum size, the maximum size is reset to 120% of the volume size. The value for `-maximum-size` cannot be set larger than the platform-dependent maximum flexible volume size. If you specify a larger value, the value of `-maximum-size` is automatically reset to the supported maximum without returning an error. The value for `-maximum-size` supports relative sizing.

#### **[-minimum-size {<integer>[KB|MB|GB|TB|PB] }] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-minimum-size` parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. The value for `-minimum-size` supports relative sizing. This parameter is not supported on infinite volumes.

#### **[-grow-threshold-percent <percent>] - Grow Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on infinite volumes.

#### **[-shrink-threshold-percent <percent>] - Shrink Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on infinite volumes.

## **[*-mode {off|grow|grow\_shrink}*] - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- *off* - The volume does not grow or shrink in size in response to the amount of used space.
- *grow* - The volume will automatically grow when used space in the volume is above the grow threshold.
- *grow\_shrink* - The volume will grow or shrink in size in response to the amount of used space.

By default, *-mode* is *off* for new flexible volumes, except for data protection (DP) mirrors, for which the default value is *grow\_shrink*. The *grow* and *grow\_shrink* modes work together with snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter *-space-mgmt-try-first* controls the order in which these two space reclamation policies are attempted.

## **[*-reset <true>*] - Autosize Reset }**

Use this option to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value is set to 120% of the current size of the volume.

## **Examples**

The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1 -maximum-size 1t -mode grow
(volume autosize)
vol autosize: Flexible volume 'vs1:vol1' autosize settings UPDATED.
```

The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1
(volume autosize)
Volume autosize is currently ON for volume 'vs1:vol1'.
The volume is set to grow to a maximum of 1t.
```

## **volume create**

Create a new volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume create` command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, or restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Language
- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVol volumes
- Maximum size for autosizing FlexVol volumes
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVol volumes
- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Use logical space reporting
- Use logical space enforcement
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Encrypt
- File system analytics state
- Tiering object tags
- Key Manager Attribute
- SnapLock type
- Activity tracking state
- Cache retention priority
- Efficiency policy

- Tiering minimum cooling days
- Cloud retrieval policy
- Whether the volume's total number of files will be set to the highest possible value
- Application IO Size
- Preserve unlink

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 197 or fewer characters in length for FlexGroup volumes, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

### **{ [-aggregate <aggregate name>] - Aggregate Name**

This specifies the storage aggregate on which the volume is to be created. This parameter only applies to FlexVol volumes.

### **| [-aggr-list <aggregate name>, ...] - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. The root constituent will always be placed on the first aggregate in the list, unless `optimize-aggr-list` is specified as `true`. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroup volumes.

### **[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order `aggr1`, `aggr2`, `aggr1`, `aggr2`.

+

The default value is 4.

+

This parameter only applies to FlexGroup volumes.

### **[-optimize-aggr-list {true|false}] - Have the System Optimize the Order of the Aggregate List**

Specifies whether to create the constituents of the FlexGroup volume on the aggregates specified in the `aggr-list` in the order they are specified, or whether the system should optimize the ordering of the aggregates. If this value is `true`, the system will optimize the ordering of the aggregates specified in the `aggr-list`. If this value is `false` the order of the `aggr-list` will be unchanged. The default value is `false`. This parameter only applies to FlexGroup volumes.

### **[`-auto-provision-as <FlexGroup>`] - Automatically Provision as Volume of Type**

Use this parameter to automatically select existing aggregates for provisioning FlexGroup volumes. Note that the fastest aggregate type with at least one aggregate on each node of the cluster will be selected. When auto provisioning a FlexGroup volume, the size of the FlexGroup volume should be a minimum of 800 GB per node.

When the UDO License is installed, this will be the default for volume creation if neither the `aggregate` nor `aggr-list` parameters are specified.

This parameter only applies to FlexGroup volumes.

### **[`-support-tiering {true|false}`] - Automatically Provision FlexGroup on FabricPools**

This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup during the protection workflows using the `auto-provision-as` parameter. Only FabricPool aggregates are used if this parameter is set to `true` and only non FabricPool aggregates are used if this parameter is set to `false`. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is `false`

This parameter only applies to FlexGroup volumes created using the `-auto-provision-as` parameter.

### **[`-use-mirrored-aggregates {true|false}`] - Automatically Provision FlexGroup on Mirrored Aggregates**

Use this parameter to specify whether mirrored aggregates are selected when creating a FlexGroup using the `auto-provision-as` parameter. Only mirrored aggregates are used if this parameter is set to `true` and only unmirrored aggregates are used if this parameter is set to `false`. Aggregate level mirroring for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is `true` for a MetroCluster configuration and is `false` for a non-MetroCluster configuration

This parameter only applies to FlexGroup volumes created using the `-auto-provision-as` parameter.

### **[`-encryption-type {none|volume|aggregate|mixed}`] - Encryption Type**

Use this parameter to specify the encryption-type while creating a FlexGroup using the `auto-provision-as` parameter. If the value is `none`, the FlexGroup created will be unencrypted. If the value is `volume`, the FlexGroup created will be of type NVE (NetApp Volume Encryption) and if the value is `aggregate`, the FlexGroup created will be of type NAE (NetApp Aggregate Encryption).

This parameter only applies to FlexGroup volumes created using the `-auto-provision-as` parameter.

### **[`-nodes {<nodename>|local}`] - List of Nodes Hosting the Volume }**

Specifies an array of node names to be used for provisioning the FlexGroup. If an array of node names is specified, only aggregates from the specified nodes will be considered for provisioning. If no value is specified, all nodes in the cluster will be used.

### **[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Volume Size**

This optionally specifies the size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a FlexVol volume is 20 MB. The minimum size for a volume guaranteed FlexGroup is 20 MB per constituent. The minimum size for a none guaranteed FlexGroup is 200 MB per constituent. However, the recommended size for all FlexGroup volumes is a minimum of 100 GB per constituent. For all volumes, the default size is set to the minimum size. The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by

the available space in the hosting aggregates. Volumes can be increased and decreased in size with the [volume modify](#) command. The maximum number of files a volume is configured for is listed under "Total Files" when running the command [volume show](#)-instance .

**[[-state](#) {[online](#)|[restricted](#)|[offline](#)|[force-online](#)|[force-offline](#)|[mixed](#)}] - Volume State**

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

The *mixed* state applies to FlexGroup volumes only and cannot be specified as a target state.

**[[-policy](#) <text>] - Export Policy**

This optionally specifies the ID number of the export policy associated with the volume. For information on export policies, see the documentation for the [vserver export-policy create](#) command. FlexGroup volumes do not support policies that allow NFSv4 protocol access.

**[[-user](#) <user name>] - User ID**

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

**[[-group](#) <group name>] - Group ID**

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

**[[-security-style](#) <security style>] - Security Style**

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume.

**[[-unix-permissions](#) <unix perm>] - UNIX Permissions**

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `---rwxr-xr-x`.

**[[-junction-path](#) <junction path>] - Junction Path**

This optionally specifies the volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.

**[[-junction-active](#) {[true](#)|[false](#)}] - Junction Active (privilege: advanced)**

This optionally specifies whether the volume's junction path is active. The default setting is `true` . If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

**[[-vsroot](#) {[true](#)|[false](#)}] - Vserver Root Volume (privilege: advanced)**

This optionally specifies whether the volume is the root volume of its Vserver. The default setting is `false` . If this parameter is set to `true`, the default size of the newly created volume is 1GB. This parameter is not supported on FlexGroup volumes.

**[[-comment](#) <text>] - Comment**

This optionally specifies a comment for the volume.

### **[`-max-autosize` {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize**

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error.

### **[`-min-autosize` {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-min-autosize` parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size.

### **[`-autosize-grow-threshold-percent` <percent>] - Autosize Grow Threshold Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize.

### **[`-autosize-shrink-threshold-percent` <percent>] - Autosize Shrink Threshold Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size.

### **[`-autosize-mode` {`off`|`grow`|`grow_shrink`}] - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- `off` - The volume will not grow or shrink in size in response to the amount of used space.
- `grow` - The volume will automatically grow when used space in the volume is above the grow threshold.
- `grow_shrink` - The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is `off` for new volumes, except for data protection mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted.

### **[`-files-set-maximum` {`true`|`false`}] - Set Total Files (for user-visible data) to the Highest Value that the Volume can Hold (privilege: advanced)**

This optionally specifies whether the volume's total number of files will be set to the highest possible value. By default, it is `false`. If `true`, the volume's total number of files is set to the highest value that the volume can hold.

### **[`-maxdir-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)**

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent and optimized for the size of system memory.

### **{ [`-space-slo` {`none`|`thick`|`semi-thick`}] - Space SLO**

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. The default setting is `none`. There are three supported values: `none`, `thick` and

*semi-thick*.

- *none* : The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick* : The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
- Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
- Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's fractional-reserve setting is not supported.
- *semi-thick* : The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and snapshots in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
- Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
- Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's fractional-reserve setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
- Snapshot Autodelete: *enabled* - Automatic deletion of snapshots is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
- *enabled* : *true*
- *commitment* : *destroy*
- *trigger* : *volume*
- *defer-delete* : *none*
- *destroy-list* : *vol\_clone, lun\_clone, file\_clone, cifs\_share*

In addition, with a value of ```semi-thick```, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of *autodelete* for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of *range* for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of snapshots.

#### | **`[-s, -space-guarantee {none|volume}]` - Space Guarantee Style**

This optionally specifies the space guarantee style for the volume. A value of *volume* reserves space on the aggregates for the entire volume. A value of *none* reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. The default setting for the volumes on All Flash FAS

systems is *none* , otherwise the default setting is *volume* . The *file* setting is no longer supported.

#### **[`-type {RW|DP}`] - Volume Type }**

This optionally specifies the volume's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

#### **[`-snapdir-access {true|false}`] - Snapshot Directory Access Enabled**

This optionally specifies whether clients have access to .snapshot directories. The default setting is *true* .

#### **[`-percent-snapshot-space <percent>`] - Space Reserved for Snapshot Copies**

This optionally specifies the amount of space that is reserved in the volume for snapshots. The default setting is 5 percent, except for data protection mirrors for which the default is 0 percent.

#### **[`-snapshot-policy <snapshot policy>`] - Snapshot Policy**

This optionally specifies the snapshot policy for the volume. The default is the snapshot policy for all volumes on the Vserver, as specified by the `-snapshot-policy` parameter of the [vserver create](#) and [vserver modify](#) commands. The schedules associated with the `snapshot-policy` for a FlexGroup cannot have an interval shorter than 30 minutes.

#### **[`-language <Language code>`] - Language**

This optionally specifies the language encoding setting for the volume. By default, the volume inherits the Vserver language encoding setting.

You cannot modify the language encoding setting of a volume.

#### **[`-foreground {true|false}`] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

#### **[`-nvfail {on|off}`] - NVFAIL Option**

Setting this optional parameter to *true* causes the volume to set the in-nvfailed-state flag to *true*, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to *false*.

#### **[`-constituent-role <Constituent Roles>`] - Constituent Volume Role**

This parameter is no longer supported.

#### **{ [`-qos-policy-group <text>`] - QoS Policy Group Name**

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that do not adjust based on the volume allocated space or used space. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it.

#### **[ [`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space.

### **`[-caching-policy <text>]` - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. If a caching policy is not assigned to this volume, the system uses *auto* as the default caching policy.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metabytes. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is *auto*.

### **`[-cache-retention-priority {normal|low|high}]` - Cache Retention Priority (privilege: advanced)**

This optionally specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in Flash Pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is available only at the advanced privilege level and higher.

The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.

- high - Cache the cold blocks for the highest time.

**[`-max-constituent-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)**

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroup volumes only.

**[`-efficiency-policy` <efficiency policy>] - Storage Efficiency Policy (privilege: advanced)**

This optionally specifies which storage efficiency policy to apply to the volume. This parameter is applicable only for All-Flash FAS. This parameter is not supported on data protection volumes on any platform. To disable all efficiency features on the volume in All-Flash FAS, use the value `none`. The default value is `auto`. The policies `inline-only` and `none` are not supported on Capacity optimized Flash with QAT supported platforms.

**[`-snaplock-type` {non-snaplock|compliance|enterprise}] - SnapLock Type**

This optionally specifies the SnapLock type of the volume. The default value is `non-snaplock`.

**[`-vserver-dr-protection` {protected|unprotected}] - Vserver DR Protection**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. The default value for a volume of type "RW" is `protected`.

**[`-encrypt` {true|false}] - Enable or Disable Encryption**

This parameter allows the user to create an encrypted volume. When it is set to `true`, a new key is generated, and the volume is encrypted using the generated key. When it is set to `false`, the volume created is unencrypted.

**[`-is-space-reporting-logical` {true|false}] - Logical Space Reporting**

This optionally specifies whether to report space logically on the volume. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. The default setting is `false`.

**[`-is-space-enforcement-logical` {true|false}] - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on the volume. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. The default setting is `false`.

**[`-tiering-policy` <Tiering Policy>] - Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud tier when they become cold. FabricPool combines Flash (performance tier) with an object store (cloud tier) into a single aggregate. The default tiering policy is `snapshot-only` for a FlexVol and `none` for a FlexGroup. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- snapshot-only - This policy allows tiering of only the volume snapshots not associated with the active file system. The default minimum cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.

- auto - This policy allows tiering of both snapshot data and active file system user data to the cloud tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- none - Volume blocks will not be tiered to the cloud tier.
- all - This policy allows tiering of both snapshot data and active file system user data to the cloud tier as soon as possible without waiting for a cooling period. On DP volumes, this policy allows all transferred user data blocks to start in the cloud tier.

**`[-cloud-retrieval-policy {default|on-read|never|promote}]` - Volume Cloud Retrieval Policy (privilege: advanced)**

This optional parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier.

The available cloud retrieval policies are:

- default - This policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot-only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
- on-read - This policy retrieves tiered data for all client driven data reads.
- never - This policy never retrieves tiered data.
- promote - This policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot-only'. If the tiering policy is 'snapshot-only', the only data brought back is the data in the AFS. Data that is only in a snapshot stays in the cloud.

**`[-tiering-minimum-cooling-days <integer>]` - Volume Tiering Minimum Cooling Days (privilege: advanced)**

This optional parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. For volumes hosted on FabricPools, this parameter is used for tiering purposes and does not affect the reporting of inactive data. For volumes hosted on non-FabricPools, this parameter affects the cooling window used for the reporting of inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. Valid values are between 2 and 183. This parameter cannot be set when volume tiering policy is either "none" or "all". The default value of this parameter depends on the volume's tiering policy. See the tiering policy section of this documentation for corresponding default values. If the tiering policy on the volume gets changed, then this parameter will be reset to the default value corresponding to the new tiering policy.

**`[-tiering-object-tags <text>, ...]` - Tags to be Associated with Objects Stored on a FabricPool**

This optional parameter specifies tiering object tags to be associated with objects stored on a FabricPool.

Object tags should follow these rules:

- Each object tag should be a key-value pair separated by '='.
- Multiple tags should be separated by ','. Overall tags should be in format `key1=value1[,key2=value2,...]`.
- All tags of a volume must have a unique key.
- Each tag key should start with either a letter or an underscore. Keys should contain only alphanumeric characters and underscores. Maximum allowed limit is of 127 characters.
- Each tag value should be of maximum 127 characters consisting of only alphanumeric characters and underscores.

- Maximum 4 object tags are allowed per volume.

**{ [-application-io-size <Application I/O Size>] - Block Size to Use by Compression (privilege: advanced)**

This optionally specifies the application IO size to apply to the volume. This parameter specifies the compression group size for enabling compression on the volume. This parameter is applicable only for All Flash FAS. This parameter is not supported on data protection volumes on any platform.

The available application I/O Sizes are:

- 8K
- auto - ONTAP will select compression group size automatically, based on temperature of the block.

**[-storage-efficiency-mode {default|efficient}] - Storage Efficiency Mode**

This optionally specifies efficiency mode of the volume.

The available efficiency modes are:

- default
- efficient

The `default` mode sets 8k adaptive compression on the volume. The `efficient` mode sets auto adaptive compression on the volume. This parameter is supported only on AFF platform. Auto adaptive compression will be set on QAT supported platforms irrespective of the modes.

**[-workflow {auto|data|hybrid|metadata}] - Type of Workflow (privilege: advanced)**

This parameter only applies to FlexGroup volumes.

Use this parameter to specify whether this FlexGroup volume will be used for workloads with mainly I/O operations, metadata operations, or a combination of both, to optimize performance.

If the value is `auto` (default), the system will adjust automatically to the predominate type of operation over time.

If the value is `data`, the FlexGroup volume will be optimized for file reads and writes and does not adjust automatically.

If the value is `metadata`, the FlexGroup volume will be optimized for metadata operations like lookups, readdir, and renames and does not adjust automatically.

If the value is `hybrid`, the FlexGroup volume will be optimized for a mix of both data and metadata operations and does not adjust automatically.

**[-analytics-state <Analytics State>] - File System Analytics State**

This optionally specifies whether the volume will keep track of file system usage for the purpose of analytics. The default value is `off`.

**[-activity-tracking-state <Activity Tracking State>] - Activity Tracking State**

This optionally specifies whether the volume will keep track of volume activity, in real time. Tracked activities include read and write traffic for files, directories, users and clients. The default value is `off`.

### **`[-key-manager-attribute <text>]` - Key Manager Attribute**

This optional parameter specifies an additional key manager attribute that should be an identifier-value pair separated by '=', ex. CRN=my-unique-value

The following identifiers are currently supported:

- CRN

### **`[-anti-ransomware-state {disabled|enabled|dry-run|paused|dry-run-paused|enable-paused|disable-in-progress}]` - Anti-ransomware State**

Use this parameter to specify the anti-ransomware-state while creating a volume. If the value is *disabled*, the volume created will have anti-ransomware feature disabled. If the value is *enabled*, the volume created will have anti-ransomware feature enabled and if the value is *dry-run*, the volume created will be in the anti-ransomware evaluation mode.

### **`[-granular-data {disabled|basic|advanced}]` - Granular data**

This parameter specifies the type of granular data storage supported on the volume. Once this property is changed to any value other than *disabled* on a volume, it cannot be disabled on that volume using this parameter. It can only be disabled on that volume by restoring a snapshot. This property is only supported on FlexGroup volumes. The default value is *basic* for AWS S3 FlexGroup volumes and *disabled* otherwise. Files modified by the granular data algorithms use granular data, which might impact read/write I/O performance.

The available options are:

- disabled - No volume capacity rebalancing operations are performed.
- basic - Volume capacity rebalancing operations are enabled.
- advanced - All *basic* features are enabled. In addition, granular data distribution is enabled. Granular data distribution allows for improved capacity rebalancing and usage balancing in certain scenarios. This property can be set when the current value for the volume is *disabled* or *basic*. Once this property is set on a volume, it cannot be modified to *disabled* or *basic* using this parameter. It can only be changed on that volume by restoring a snapshot.

### **`[-atime-update-period <integer>]` - Access Time Update Period (Seconds) (privilege: advanced)**

This parameter specifies the time period that must be elapsed in between consecutive atime update events. Note: The value of this parameter is only used if `-atime-update` is enabled on the volume.

### **`[-snapshot-locking-enabled {true|false}]` - Enable Snapshot Copy Locking**

This parameter specifies whether the snapshot locking feature is enabled, based on an independent compliance-clock time. Once this property is enabled, it cannot be disabled and the volume cannot be deleted until all locked snapshots are past their expiry time. The default value is false.

### **`[-is-large-size-enabled {true|false}]` - Are Large Size Volumes and Files Enabled**

This parameter specifies whether support for large Flexible volumes and large files is enabled. If this value is true, the maximum volume size for a Flexible volume will be 300TB and the maximum size of a single file will be 128TB. If this value is false, the maximum volume size for a Flexible volume will be 100TB and the maximum size of a single file will be 16TB. The default value is false.

### **`[-is-preserve-unlink-enabled {true|false}]` - Is Preserve Unlink Enabled (privilege: advanced)**

This parameter specifies whether preserve unlink is enabled for NFSV4.1 shares on the volume. Once this

feature is enabled, a file removal op on a file with existing share locks will result in the file being moved to the trash directory. Clients will continue to be able to access the file using its file handle. The last close for that file will result in deletion of the file. The default value is false.

**`[-is-cloud-write-enabled {true|false}] - Is Cloud Write Enabled (privilege: advanced)`**

This parameter specifies whether cloud write is enabled on the volume. This feature is only available on volumes in FabricPools. The default value is false.

**`[-aggressive-readahead-mode`**

**`{none|file_prefetch|sequential_read|cross_file_sequential_read}] - Aggressive readahead mode (privilege: advanced)`**

This parameter specifies the aggressive readahead mode of the volume. Possible values are *none* and *file\_prefetch*. When set to *file\_prefetch*, on a file read, the system aggressively issues readaheads for all of the blocks in the file and retains those blocks in a cache for a finite period of time. This feature is only available on FabricPool volumes on FSx for ONTAP and Cloud Volumes ONTAP. The default value is *none*.

**`[-in-consistency-group {true|false}] - If this Volume is part of a Consistency Group`**

This parameter specified if this volume is associated with a consistency group.

**`[-is-dir-index-transfer-enabled {true|false}] - Is Directory Index Transfer Enabled`**

This parameter specifies whether support for directory index transfer is enabled.

## Examples

The following example creates a new volume named `user_jdoe` on a Vserver named `vs0` and a storage aggregate named `aggr1`. Upon its creation, the volume is placed in the online state. It uses the export policy named `default_expolicy`. The owner of the volume's root is a user named `jdoe` whose primary group is named `dev`. The volume's junction path is `/user/jdoe`. The volume is 250 GB in size, space for the entire volume is reserved on the aggregate, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume user_jdoe -aggregate aggr1
               -state online -policy default_expolicy -user jdoe -group dev
               -junction-path /user/jdoe -size 250g -space-guarantee volume
               -percent-snapshot-space 20 -foreground false
```

The following example creates a new volume named `vol_cached` on a Vserver named `vs0` and a Flash Pool storage aggregate named `aggr1`. The newly created volume is placed online and uses `auto` as the caching policy.

```
cluster1::> volume create -vserver vs0 -volume vol_cached -aggregate aggr1
               -state online -caching-policy auto
```

The following example creates a new FlexGroup named `media_vol` on a Vserver named `vs0` with four constituents on aggregates `aggr1` and `aggr2`. Upon its creation, the volume is placed in the online state. The volume's junction path is `/media`. The volume is 200 TB in size, no space for the volume is reserved on the aggregates, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume media_vol
               -aggr-list aggr1,aggr1,aggr2,aggr2 -junction-path /media -size
200TB
               -space-guarantee none -foreground false
```

The following example creates a new FlexGroup volume named fg on a Vserver named vs0 on aggregates selected by ONTAP.

```
cluster1::> volume create -vserver vs0 -volume fg -auto-provision-as
flexgroup
```

## volume delete

Delete an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume delete` command deletes the specified volumes. Before deleting a volume, the user is prompted to confirm the operation unless the `-force` flag is specified. If this volume was associated with a policy group the underlying qos workload is deleted.

NOTE:

- If there is a qtree or quota policy associated with a volume, it is deleted when you delete the volume.
- A volume must be offline (see [volume offline](#) ) to be deleted.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

**-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be deleted.

### **`[-force <true>]` - Force Delete (privilege: advanced)**

If this parameter is specified, the user is not prompted to confirm each deletion operation. In addition, the operation is run only on the local node, and several potential errors are ignored. By default, this setting is `false`. This parameter is available only at the advanced privilege level and higher.

### **`[-foreground {true|false}]` - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes.

## Examples

The following example deletes a volume named `vol1_old` from a Vserver named `vs0`:

```
cluster1::> volume delete -vserver vs0 -volume vol1_old
```

# volume expand

Expand the size of a volume by adding constituents

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume expand` command allows the user to increase the size of a FlexGroup by adding constituents. The size of the new constituents is determined by the size of the smallest existing constituent. This command only applies to FlexGroup volumes.

## Parameters

### **`-vserver <vserver name>` - Vserver Name**

This parameter can be used to specify the Vserver on which the volume is located.

### **`-volume <volume name>` - Volume Name**

This parameter specifies the volume for which the user wants to expand.

### **`[-aggr-list <aggregate name>, ...]` - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for new FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it.

### **`[-aggr-list-multiplier <integer>]` - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1* , *aggr2* , *aggr1* , *aggr2* . The default value is 1.

### **[-foreground {true|false}] - Foreground Process**

If *false* is specified for this parameter, the command runs as a job in the background. If *true* is specified, the command will not return until the operation is complete. The default value is *true* .

## **Examples**

The following example increases the size of a FlexGroup by adding 3 constituents:

```
cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 180TB

cluster1::> volume expand -vserver vs1 -volume flexgroup -aggr-list
aggr1,aggr2,aggr3
Warning: The following number of constituents of size 20TB will be added
to
FlexGroup "flexgroup": 3. Expanding the FlexGroup will cause the
state of
all snapshots to be set to "partial". Partial snapshots
cannot be restored.
Do you want to continue? {y|n}: y
[Job 52] Job succeeded: Successful

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB
```

The following example increase the size of a FlexGroup by adding 6 constituents using the `-aggr-list` `-multiplier`:

```

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB

cluster1::> volume expand -vserver vs1 -volume flexgroup -aggr-list
aggr1,aggr2 -aggr-list-multiplier 3
Warning: The following number of constituents of size 20TB will be added
to
FlexGroup "flexgroup": 6. Expanding the FlexGroup will cause the
state of
all snapshots to be set to "partial". Partial snapshots
cannot be restored.
Do you want to continue? {y|n}: y
[Job 53] Job succeeded: Successful

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 360TB

```

## volume make-vsroot

Designate a non-root volume as a root volume of the Vserver

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume make-vsroot` command promotes a non-root volume of the Vserver to be the Vserver's root volume. The Vserver's root volume must be a FlexVol volume with a size of at least 1 GB.

For instance, if you run this command on a volume named *user* that is located on a Vserver named *vs0*, the volume *user* is made the root volume of the Vserver *vs0*.

This command is available only at the advanced privilege level and higher.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which a non-root volume is to be made the root volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the non-root volume that is to be made the root volume of its Vserver. This must be an existing FlexVol volume. Using a SnapLock volume as the root volume for a Vserver is not supported.

## Examples

The following example makes a volume named *root\_vs0\_backup* the root volume of its Vserver with FlexVol volumes, which is named *vs0*.

```
node::> volume make-vsroot -vserver vs0 -volume root_vs0_backup
```

The following example makes a volume named *root\_vs1* the root volume of the Vserver with Infinite Volume *vs1*.

```
node::> volume make-vsroot -vserver vs1 -volume root_vs1 -aggregate aggr1
```

## volume modify

### Modify volume attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume modify` command can be used to modify the following attributes of a volume:

- Size
- State (online, offline, restricted, force-online or force-offline)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Whether the junction path is active
- Comment
- Volume nearly full threshold percent
- Volume full threshold percent
- Maximum size for autosizing
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled
- Current mode of operation of volume autosize
- Reset the autosize values to their defaults
- Total number of files for user-visible data permitted on the volume

- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Use logical space reporting
- Use logical space enforcement
- Tiering object tags
- Convert ucode
- Whether the volume's total number of files will be set to the highest possible value
- Caching policy
- Cache retention priority
- Tiering minimum cooling days
- Cloud retrieval policy
- Preserve unlink

You can use the `volume move` command to change a volume's aggregate or node. You can use the `volume rename` command to change a volume's name. You can use the `volume make-vsroot` command to make a volume the root volume of its Vserver.

You can change additional volume attributes by using this command at the advanced privilege level and higher.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter. Although node Vservers are not displayed when using <Tab> completion, this parameter supports node Vservers for modifying the root volume of the specified node Vserver.

### **-volume <volume name> - Volume Name**

This specifies the volume that is to be modified.

### **[-size {<integer>[KB|MB|GB|TB|PB] }] - Volume Size**

This optionally specifies the new size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. A relative rather than absolute size change can be specified by adding + or - before the given size: for example, specifying +30m adds 30 megabytes to the volume's current size. The minimum size for a volume is 20 MB (the default setting). The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregate. If the volume's guarantee is currently disabled, its size cannot be increased.

### **[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State**

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

The *mixed* state applies to FlexGroup volumes only and cannot be specified as a target state.

### **[-policy <text>] - Export Policy**

This optionally specifies the ID number of the export policy associated with the volume. For information on export policy, see the documentation for the [vserver export-policy create](#) command. FlexGroup volumes do not support export policies that allow NFSv4 protocol access.

### **[-user <user name>] - User ID**

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

### **[-group <group name>] - Group ID**

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

### **[-security-style <security style>] - Security Style**

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume.

### **[-unix-permissions <unix perm>] - UNIX Permissions**

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `-rwxr-xr-x`.

### **[-junction-active {true|false}] - Junction Active (privilege: advanced)**

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction is inactive, the volume does not appear in the Vserver's namespace.

### **[-comment <text>] - Comment**

This optionally specifies a comment for the volume.

### **[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent**

This optionally specifies the percentage at which the volume is considered nearly full, and above which an EMS warning will be generated. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the volume nearly full space alerts.

### **[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent**

This optionally specifies the percentage at which the volume is considered full, and above which a critical EMS error will be generated. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the volume full space alerts.

### **{ [-max-autosize {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize**

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error. The value for `-max-autosize` supports relative sizing.

### **[-min-autosize {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was

created with the *grow\_shrink* autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the *-min-autosize* parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size. The value for *-min-autosize* supports relative sizing.

#### **`[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage`**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize.

#### **`[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage`**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size.

#### **`[-autosize-mode {off|grow|grow_shrink}] - Autosize Mode`**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- *off* - The volume will not grow or shrink in size in response to the amount of used space.
- *grow* - The volume will automatically grow when used space in the volume is above the grow threshold.
- *grow\_shrink* - The volume will grow or shrink in size in response to the amount of used space.

By default, *-autosize-mode* is *off* for new volumes, except for DP mirrors, for which the default value is *grow\_shrink*. The *grow* and *grow\_shrink* modes work together with snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter *-space-mgmt -try-first* controls the order in which these two space reclamation policies are attempted.

#### **`[-autosize-reset <true>] - Autosize Reset`**

This allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values. For example, the max-autosize value will be set to 120% of the current size of the volume.

#### **`[-files <integer>] - Total User Visible Files`**

This optionally specifies the total number of files for user-visible data permitted on the volume. This value can be raised or lowered. Raising the total number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and the *files* value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume.

#### **`[-files-set-maximum {true|false}] - Set Total Files (for user-visible data) to the Highest Value that the Volume can Hold (privilege: advanced)`**

This optionally specifies whether the volume's total number of files will be set to the highest possible value. If *true*, the volume's total number of files is set to the highest value that the volume can hold. Only *true* is a valid input. *false* is not permitted. To modify the total number of files to a specific value, use option *files*.

#### **`[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)`**

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent, and optimized for the size of system memory. You can increase it for a specific volume by using this option, but doing so could impact system performance. If you need to increase the maximum directory size, work with customer support.

## **{ [-space-slo {none|thick|semi-thick}] - Space SLO**

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. The default setting is *none*. There are three supported values: *none*, *thick* and *semi-thick*.

- *none*: The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick*: The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's fractional-reserve setting is not supported.
- *semi-thick*: The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and snapshots in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's fractional-reserve setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
  - Snapshot Autodelete: *enabled* - Automatic deletion of snapshots is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - *enabled*: *true*
    - *commitment*: *destroy*
    - *trigger*: *volume*
    - *defer-delete*: *none*
    - *destroy-list*: *vol\_clone, lun\_clone, file\_clone, cifs\_share*

In addition, with a value of ```semi-thick```, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of *autodelete* for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of *range* for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of snapshots.

## **[`-s, -space-guarantee {none|volume}`] - Space Guarantee Style**

This option controls whether the volume is guaranteed some amount of space in the aggregate. The default setting for the volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*. The *file* setting is no longer supported. Volume guaranteed means that the entire size of the volume is preallocated. The *none* value means that no space is preallocated, even if the volume contains space-reserved files or LUNs; if the aggregate is full, space is not available even for space-reserved files and LUNs within the volume. Setting this parameter to *none* enables you to provision more storage than is physically present in the aggregate (thin provisioning). When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. For flexible root volumes, to ensure that system files, log files, and cores can be saved, the space-guarantee must be *volume*. This is to ensure support of the appliance by customer support, if a problem occurs. Disk space is preallocated when the volume is brought online and, if not used, returned to the aggregate when the volume is brought offline. It is possible to bring a volume online even when the aggregate has insufficient free space to preallocate to the volume. In this case, no space is preallocated, just as if the *none* option had been selected. In this situation, the `vol options` and `vol status` command display the actual value of the space-guarantee option, but indicate that it is disabled.

## **[`-fractional-reserve <percent>`] - Fractional Reserve }**

This option changes the amount of space reserved for overwrites of reserved objects (LUNs, files) in a volume. The option is set to 100 by default with `guarantee` set to *volume*. A setting of 100 means that 100% of the required reserved space is actually reserved so the objects are fully protected for overwrites. The value is set to 0 by default with `guarantee` set to *none*. The value can be either 0 or 100 when `guarantee` is set to *volume* or *none*. Using a value of 0 indicates that no space will be reserved for overwrites. This returns the extra space to the available space for the volume, decreasing the total amount of space used. However, this does leave the protected objects in the volume vulnerable to out of space errors. If the percentage is set to 0%, the administrator must monitor the space usage on the volume and take corrective action.

## **[`-min-readahead {true|false}`] - Minimum Read Ahead (privilege: advanced)**

This optionally specifies whether minimum readahead is used on the volume. The default setting is *false*.

## **[`-atime-update {true|false}`] - Access Time Update Enabled (privilege: advanced)**

This optionally specifies whether the access time on inodes is updated when a file is read. The default setting is *true*.

## **[`-snapdir-access {true|false}`] - Snapshot Directory Access Enabled**

This optionally specifies whether clients have access to `.snapshot` directories. The default setting is *true*.

## **[`-percent-snapshot-space <percent>`] - Space Reserved for Snapshot Copies**

This optionally specifies the amount of space that is reserved on the volume for snapshots. The default setting is 5 percent.

## **[`-snapshot-policy <snapshot policy>`] - Snapshot Policy**

This optionally specifies the snapshot policy for the volume. The default is the snapshot policy for all volumes on the SVM, as specified by the `-snapshot-policy` parameter of the `vserver create` and `vserver modify` commands. When replacing a snapshot policy on a volume, any existing snapshots on the volume that do not match any of the prefixes of the new snapshot policy will not be deleted. This is because the snapshot scheduler will not clean up older snapshots if the prefixes do not match. After the new snapshot policy takes effect, depending on the new retention count, any existing snapshots that continue to use the same prefixes might be deleted. For example, your existing snapshot policy is set up to retain 150 weekly

snapshots and you create a new snapshot policy that uses the same prefixes but changes the retention count to 50 snapshots. After the new snapshot policy takes effect, it will start deleting older snapshots until there are only 50 remaining.

#### **[`-language <Language code>`] - Language**

Use this parameter to change the volume language from \*.UTF-8 to utf8mb4. To change the language of a volume, contact technical support.

#### **[`-foreground {true|false}`] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

#### **[`-nvfail {on|off}`] - NVFAIL Option**

Setting this optional parameter to `true` causes the volume to set the in-nvfailed-state flag to `true`, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to `false`.

#### **[`-in-nvfailed-state {true|false}`] - Volume's NVFAIL State (privilege: advanced)**

This field is automatically set to `true` on a volume when committed writes to the volume are possibly lost due to a failure, and the volume has the nvfail option enabled. With this field set, the client access to the volume is fenced to protect against possible corruptions that result from accessing stale data. The administrator needs to take appropriate recovery actions to recover the volume from the possible data loss. After the recovery is completed, the administrator can clear this field and restore the client access to the volume. This field can be cleared using the CLI but it cannot be set.

#### **[`-dr-force-nvfail {on|off}`] - Force NVFAIL on MetroCluster Switchover**

Setting this optional parameter to `true` on a volume causes the MetroCluster switchover operation to set the in-nvfailed-state flag to `true` on that volume. The in-nvfailed-state flag prevents further data access to the volume. The default value is `false`. This parameter has no effect on a negotiated or an automatic switchover.

#### **[`-filesystem-size-fixed {true|false}`] - Is File System Size Fixed**

This parameter is only applicable for a DP relationship. This option causes the file system to remain the same size and not grow or shrink when a SnapMirrored volume relationship is broken, or when a volume add is performed on it. It is automatically set to `true` when a volume becomes a SnapMirrored volume. It stays set to `true` after the SnapMirror break command is issued for the volume. This allows a volume to be SnapMirrored back to the source without needing to add disks to the source volume. If the volume is a flexible volume and the volume size is larger than the file system size, setting this option to `false` forces the volume size to equal the file system size. The default setting is `false`.

#### **[`-extent-enabled {off|on|space-optimized}`] - (DEPRECATED)-Extent Option**

This parameter has been deprecated and may be removed in a future release of ONTAP.

Setting this option to ``on`` or ``space-optimized`` enables extents in the volume. This causes application writes to be written in the volume as a write of a larger group of related data blocks called an extent. Using extents may help workloads that perform many small random writes followed by large sequential reads. However, using extents may increase the amount of disk operations performed on the controller, so this option should only be used where this trade-off is desired. If the option is set to ``space-optimized`` then the reallocation update will not duplicate blocks from snapshots into the active file system, and will result in conservative space utilization. Using ``space-optimized`` may be useful when the volume has snapshots or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that SnapMirror needs to move on the next update. The ``space-optimized`` value can result in degraded read performance of snapshots. The default value is ``off`` ; extents are not used.

#### **`[-space-mgmt-try-first {volume_grow|snap_delete}]` - Primary Space Management Strategy**

A flexible volume can be configured to automatically reclaim space in case the volume is about to run out of space, by either increasing the size of the volume using autogrow or deleting snapshots in the volume using snapshot autodelete. If this option is set to `volume_grow` the system will try to first increase the size of volume before deleting snapshots to reclaim space. If the option is set to `snap_delete` the system will first automatically delete snapshots and in case of failure to reclaim space will try to grow the volume.

#### **`[-read-realloc {off|on|space-optimized}]` - Read Reallocation Option**

Setting this option to `on` or `space-optimized` enables read reallocation in the volume. This results in the optimization of file layout by writing some blocks to a new location on disk. The layout is updated only after the blocks have been read because of a user read operation, and only when updating their layout will provide better read performance in the future. Using read reallocation may help workloads that perform a mixture of random writes and large sequential reads. If the option is set to `space-optimized` then the reallocation update will not duplicate blocks from snapshots into the active file system, and will result in conservative space utilization. Using `space-optimized` may be useful when the volume has snapshots or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that SnapMirror needs to move on the next update. The `space-optimized` value can result in degraded read performance of snapshots. The default value is `off` .

#### **`[-sched-snap-name {create-time|ordinal}]` - Naming Scheme for Automatic Snapshot Copies**

This option specifies the naming convention for automatic snapshots. If set to `create-time` , automatic snapshots are named using the format `<schedule_name>.yyyy-mm-dd_hhmm` . Example: "hourly.2010-04-01\_0831". If set to `ordinal` , only the latest automatic snapshot is named using the format `<schedule_name>.<n>` . Example: "hourly.0". Older automatic snapshots are named using the format `<schedule_name>.yyyy-mm-dd_hhmm` . Example: "hourly.2010-04-01\_0831".

#### **`{ [-qos-policy-group <text>]}` - QoS Policy Group Name**

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. To remove this volume from a policy group, enter the reserved keyword "none".

### **| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. To remove this volume from an adaptive policy group, enter the reserved keyword "none".

### **[-caching-policy <text>] - Caching Policy Name**

This parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

### **[-max-constituent-size {<integer>[KB|MB|GB|TB|PB] }] - Maximum size of a FlexGroup Constituent (privilege: advanced)**

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the -max-constituent-size for the FlexGroup. This parameter applies to FlexGroup volumes only.

### **`[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection`**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

### **`[-is-space-reporting-logical {true|false}] - Logical Space Reporting`**

This optionally specifies whether to report space logically on the volume. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. The default setting is *false*.

### **`[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement`**

This optionally specifies whether to perform logical space accounting on the volume. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. The default setting is *false*.

### **`[-tiering-policy <Tiering Policy>] - Volume Tiering Policy`**

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud tier when they become cold. FabricPool combines Flash (performance tier) with an object store (cloud tier) into a single aggregate. The temperature of a volume block increases if it is accessed frequently, and it decreases when it is not.

The available tiering policies are:

- **snapshot-only** - This policy allows tiering of only the volume snapshots not associated with the active file system. The default cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- **auto** - This policy allows tiering of both snapshot data and active file system user data to the cloud tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- **none** - Volume blocks will not be tiered to the cloud tier.
- **all** - This policy allows tiering of both snapshot data and active file system user data to the cloud tier as soon as possible without waiting for a cooling period. On DP volumes, this policy allows all transferred user data blocks to start in the cloud tier.

### **`[-cloud-retrieval-policy {default|on-read|never|promote}] - Volume Cloud Retrieval Policy (privilege: advanced)`**

This optional parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier.

The available cloud retrieval policies are:

- **default** - This policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot-only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
- **on-read** - This policy retrieves tiered data for all client driven data reads.
- **never** - This policy never retrieves tiered data.
- **promote** - This policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot-only'. If the tiering policy is 'snapshot-only', the only data brought back is the data in the AFS. Data that is only in a snapshot stays in the cloud.

**`[-tiering-minimum-cooling-days <integer>]` - Volume Tiering Minimum Cooling Days (privilege: advanced)**

This parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. For volumes hosted on FabricPools, this parameter is used for tiering purposes and does not affect the reporting of inactive data. For volumes hosted on non-FabricPools, this parameter affects the cooling window used for reporting inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. Valid values are between 2 and 183. This parameter cannot be set when volume tiering policy is either "none" or "all".

**`[-tiering-object-tags <text>,...]` - Tags to be Associated with Objects Stored on a FabricPool**

This optional parameter specifies tiering object tags to be associated with objects stored on a FabricPool.

Object tags should follow these rules:

- Each object tag should be a key-value pair separated by '='.
- Multiple tags should be separated by ','. Overall tags should be in format `key1=value1[,key2=value2,...]`.
- All tags of a volume must have a unique key.
- Each tag key should start with either a letter or an underscore. Keys should contain only alphanumeric characters and underscores. Maximum allowed limit is of 127 characters.
- Each tag value should be of maximum 127 characters consisting of only alphanumeric characters and underscores.
- Maximum 4 object tags are allowed per volume.
- To remove existing tags of a volume, specify empty list as a parameter value.

**`[-workflow {auto|data|hybrid|metadata}]` - Type of Workflow (privilege: advanced)**

This parameter only applies to FlexGroup volumes.

Use this parameter to specify whether this FlexGroup volume will be used for workloads with mainly I/O operations, metadata operations, or a combination of both, to optimize performance.

If the value is *auto* (default), the system will adjust automatically to the predominate type of operation over time.

If the value is *data*, the FlexGroup volume will be optimized for file reads and writes and does not adjust automatically.

If the value is *metadata*, the FlexGroup volume will be optimized for metadata operations like lookups, readdirs, and renames and does not adjust automatically.

If the value is *hybrid*, the FlexGroup volume will be optimized for a mix of both data and metadata operations and does not adjust automatically.

**`[-anti-ransomware-state {disabled|enabled|dry-run|paused|dry-run-paused|enable-paused|disable-in-progress}]` - Anti-ransomware State**

Use this parameter to modify the anti-ransomware-state of the volume. The states *dry-run-paused*, *enable-paused* and *disable-in-progress* are non-modifiable. The following states are supported for modify:

- *enabled* - the feature is enabled.
- *disabled* - the feature is disabled.

- *dry-run* - the feature is in evaluation mode.
- *paused* - the feature is in pause mode.

#### **[-granular-data {disabled|basic|advanced}] - Granular data**

This parameter specifies the type of granular data storage supported on the volume. Once this property is changed to any value other than *disabled* on a volume, it cannot be disabled on that volume using this parameter. It can only be disabled on that volume by restoring a snapshot. This property is only supported on FlexGroup volumes. Files modified by the granular data algorithms use granular data, which might impact read/write I/O performance.

The available options are:

- *disabled* - No volume capacity rebalancing operations are performed.
- *basic* - Volume capacity rebalancing operations are enabled.
- *advanced* - All *basic* features are enabled. In addition, granular data distribution is enabled. Granular data distribution allows for improved capacity rebalancing and usage balancing in certain scenarios. This property can be set when the current value for the volume is *disabled* or *basic*. Once this property is set on a volume, it cannot be modified to *disabled* or *basic* using this parameter. It can only be changed on that volume by restoring a snapshot.

#### **[-atime-update-period <integer>] - Access Time Update Period (Seconds) (privilege: advanced)**

This parameter specifies the time period that must be elapsed in between consecutive atime update events. Note: The value of this parameter is only used if *-atime-update* is enabled on the volume.

#### **[-snapshot-locking-enabled {true|false}] - Enable Snapshot Copy Locking**

This parameter specifies whether snapshot locking is enabled, based on an independent compliance-clock time. Once this property is enabled, it cannot be disabled and the volume cannot be deleted until all locked snapshots are past their expiry time.

#### **[-is-large-size-enabled {true|false}] - Are Large Size Volumes and Files Enabled**

This parameter specifies whether support for large Flexible volumes and large files is enabled. If this value is true, the maximum volume size for a Flexible volume will be 300TB and the maximum size of a single file will be 128TB. If this value is false, the maximum volume size for a Flexible volume will be 100TB and the maximum size of a single file will be 16TB. The default value is false.

#### **[-is-preserve-unlink-enabled {true|false}] - Is Preserve Unlink Enabled (privilege: advanced)**

This parameter specifies whether preserve unlink is enabled for NFSV4.1 shares on the volume. Once this feature is enabled, a file removal op on a file with existing share locks will result in the file being moved to the trash directory. Clients will continue to be able to access the file using its file handle. The last close for that file will result in deletion of the file. The default value is false.

#### **[-is-cloud-write-enabled {true|false}] - Is Cloud Write Enabled (privilege: advanced)**

This parameter specifies whether cloud write is enabled on the volume. This feature is only available on volumes in FabricPools. The default value is false.

#### **[-aggressive-readahead-mode**

#### **{none|file\_prefetch|sequential\_read|cross\_file\_sequential\_read}] - Aggressive readahead mode (privilege: advanced)**

This parameter specifies the aggressive readahead mode of the volume. When set to *file\_prefetch*, on a file

read, the system aggressively issues readaheads for all of the blocks in the file and retains those blocks in a cache for a finite period of time. This feature is only available on FabricPool volumes on FSx for ONTAP and Cloud Volumes ONTAP. The default value is none.

### **`[-is-dir-index-transfer-enabled {true|false}]` - Is Directory Index Transfer Enabled**

This parameter specifies whether support for directory index transfer is enabled.

## **Examples**

The following example modifies a volume named vol4 on a Vserver named vs0. The volume's export policy is changed to default\_expolicy and its size is changed to 500 GB.

```
cluster1::> volume modify -vserver vs0 -volume vol4 -policy
default_expolicy -size 500g
```

The following example modifies a volume named vol2. It enables autogrow and sets the maximum autosize to 500g

```
cluster1::> volume modify -volume vol2 -autosize-mode grow -max-autosize
500g
```

The following example modifies a volume named vol2 to have a space guarantee of none.

```
cluster1::> volume modify -space-guarantee none -volume vol2
```

The following example modifies all volumes in Vserver vs0 to have a fractional reserve of 30%.

```
cluster1::> volume modify -fractional-reserve 30 -vserver vs0 *
```

The following example modifies a volume named vol2 to grow in size by 5 gigabytes

```
cluster1::> volume modify -volume vol2 -size +5g
```

The following example modifies a volume named vol2 to have a different caching policy. The volume must be on a Flash Pool aggregate.

```
cluster1::> volume modify -volume vol2 -caching-policy none
```

## volume mount

Mount a volume on another volume with a junction-path

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume mount` command mounts a volume at a specified junction path.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that is to be mounted.

**-junction-path <junction path> - Junction Path Of The Mounting Volume**

This specifies the junction path of the mounted volume. The junction path name is case insensitive and must be unique within a Vserver's namespace.

**[-active {true|false}] - Activate Junction Path**

This optionally specifies whether the mounted volume is accessible. The default setting is `false`. If the mounted path is not accessible, it does not appear in the Vserver's namespace.

**[-policy-override {true|false}] - Override The Export Policy**

This optionally specifies whether the parent volume's export policy overrides the mounted volume's export policy. The default setting is `false`.

### Examples

The following example mounts a volume named `user_tsmith` on a Vserver named `vs0`. The junction path for the mounted volume is `/user/tsmith`. The mounted volume is accessible, and the mounted volume's export policy is not overridden by the parent volume's export policy.

```
node::> volume mount -vserver vs0 -volume user_tsmith
-junction-path /user/tsmith -active true -policy-override false
```

## volume offline

Take an existing volume offline

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume offline` command takes the volume offline. If the volume is already in restricted or `iron_restricted` state, then it is already unavailable for data access, and much of the following description does not apply. The current root volume might not be taken offline. Several operations being performed on the volume in question can prevent the volume offline command from succeeding for various lengths of time. If such operations are required, the command might take additional time to complete. If you set the volume junction path, it is unmounted when the volume is taken offline. The junction path is not restored when the volume is brought online again. When the volume offline command fails, the command is aborted. The `-force` flag can be used to forcibly offline a volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be taken offline. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be taken offline.

### **[-f, -force <true>] - Force Offline**

This specifies whether the offline operation is forced. Using this option to force a volume offline can potentially disrupt access to other volumes. The default setting is `false`.

### **[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

### **[-disable-block-storage-check <true>] - Disable Check for Existing LUNs and NVMe Namespaces**

Taking the volume offline will make all associated LUNs and NVMe over Fabrics (NVMe-oF) namespaces unavailable, which normally requires a user confirmation. If this parameter is specified, the command proceeds without a confirmation. The default setting is `false`.

## Examples

The following example takes the volume named `vol1` offline:

```
cluster1::> volume offline vol1
Volume 'vs1:vol1' is now offline.
```

## volume online

Bring an existing volume online

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume online` command brings the volume online. A volume can only be brought online if it is offline or restricted. If the volume is inconsistent but has not lost data, the user will be cautioned and prompted before bringing it online. It is advisable to run `waf-iron` (or do a [snapmirror initialize](#) in case of a replica volume) prior to bringing an inconsistent volume online. Bringing an inconsistent volume online increases the risk of further file system corruption. If the containing aggregate cannot honor the space guarantees required by this volume, the volume online operation will fail. It is not advisable to use volumes with their space guarantees disabled. Lack of free space can lead to failure of writes which in turn can appear as data loss to some applications.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the name of the Vserver from which the volume is to be brought online. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume that is to be brought online.

### **[-f, -force <true>] - Force Online**

When this parameter is used, the volume will be brought online even if there is not enough space available in the aggregate to honor the volume's space guarantee.

### **[-foreground {true|false}] - Foreground Process**

This parameter specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

## Examples

The following example brings a volume named `vol1` online:

```
cluster1::> volume online vol1
Volume 'vs1:vol1' is now online.
```

## Related Links

- [snapmirror initialize](#)

## volume rehost

Rehost a volume from one Vserver into another Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `volume rehost` command rehosts a volume from source Vserver onto destination Vserver. The volume name must be unique among the other volumes on the destination Vserver. This command is not supported in a MetroCluster configuration.

## Parameters

**-vserver <vserver name> - Source Vserver name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Target volume name**

This specifies the volume that is to be rehosted.

**-destination-vserver <vserver name> - Destination Vserver name**

This specifies the destination Vserver where the volume must be located post rehost operation.

**{ [-force-unmap-luns {true|false}] - Unmap LUNs in volume**

This specifies whether the rehost operation should unmap LUNs present on volume. The default setting is *false* (the rehost operation shall not unmap LUNs). When set to true, the command will unmap all mapped LUNs on the volume.

**{ [-auto-remap-luns {true|false}] - Automatic Remap of LUNs }**

This specifies whether the rehost operation should perform LUN mapping operation at the destination Vserver for the LUNs mapped on the volume at the source Vserver. The default setting is *false* (the rehost operation shall not map LUNs at the destination Vserver). When set to true, at the destination Vserver the command will create initiators groups along with the initiators (if present) with same name as that of source Vserver. Then the LUNs on the volume are mapped to initiator groups at the destination Vserver as mapped in source Vserver.

**[-key-manager-attribute <text>] - Optional CRN**

This optional parameter specifies an additional key manager attribute that should be an identifier-value pair separated by '=', ex. CRN=my-unique-value

The following identifiers are currently supported:

- CRN

## Examples

The following example rehosts a volume named vol3 on Vserver named vs1 to a destination Vserver named vs2:

```
cluster::> volume rehost -vserver vs1 -volume vol3 -destination-vserver vs2
```

## volume rename

Rename an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume rename` command renames a volume. The volume name must be unique among the other volumes in the same Vserver.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. For a node's root volume, use the name of the node for this parameter.

### **-volume <volume name> - Volume Name**

This specifies the volume that is to be renamed.

### **-newname <volume name> - Volume New Name**

This specifies the volume's new name. A volume's name must start with an alphabetic character (a to z or A to Z) and be 203 or fewer characters in length.

### **[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

## Examples

The following example renames a volume named `vol3_backup` as `vol3_save` on a Vserver named `vs0`:

```
node::> volume rename -vserver vs0 -volume vol3_backup -newname vol3_save
```

## volume restrict

### Restrict an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume restrict` command puts the volume in restricted state. If the volume is online, then it will be made unavailable for data access as described under [volume offline](#) .

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be restricted. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be restricted.

### **[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroup volumes. For FlexVol volumes, the command always runs in the foreground.

## **Examples**

The following example restricts a volume named `vol1`:

```
cluster1::> volume restrict vol1
Volume 'vs1:vol1' is now restricted.
```

## **Related Links**

- [volume offline](#)

## **volume show-footprint**

Display a list of volumes and their data and metadata footprints in their associated aggregate.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume show-footprint` command displays information about the space used in associated aggregates by volumes and features enabled in volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes. + + If the associated aggregates have an object-store attached to them, then the command displays a more detailed split up of the space used in each tier. This additional information is useful to show per-tier space usage which can be used to estimate the space requirements and transfer duration when moving a volume to a different tier with `volume move`.

## **Parameters**

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter and the `-volume` parameter are specified, the command displays detailed information

about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-volume-msid <integer>] - Volume MSID**

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

**[-volume-dsid <integer>] - Volume DSID**

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

**[-vserver-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name**

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

**[-hostname <text>] - Hostname**

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

**[-tape-backup-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata Footprint**

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified amount of space in the aggregate.

**[-tape-backup-metafiles-footprint-percent <percent>] - Tape Backup Metadata Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified percentage of space in the aggregate.

**[-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified amount of space in the aggregate.

**[-dedupe-metafiles-footprint-percent <percent>] - Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified percentage of space in the aggregate.

**`[-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Temporary Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified amount of space in the aggregate.

**`[-dedupe-metafiles-temporary-footprint-percent <percent>]` - Temporary Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified percentage of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Cross Volume Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication metafiles use the specified amount of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-footprint-percent <percent>]` - Cross Volume Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication metafiles use the specified percentage of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Cross Volume Temporary Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified amount of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-temporary-footprint-percent <percent>]` - Cross Volume Temporary Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified percentage of space in the aggregate.

**`[-volume-blocks-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Volume Data Footprint**

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified amount of space in the aggregate.

This field is the total amount of data written to the volume. It includes data in the active file system in the volume as well as data that is consumed by volume snapshots. This row only includes data and not reserved space, so when volumes have reserved files, the volume's total used in the [volume show-space](#) command output can exceed the value in this row.

**`[-volume-blocks-footprint-percent <percent_no_limit>]` - Volume Data Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified percentage of space in the aggregate.

**`[-flexvol-metadata-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Flexible Volume Metadata Footprint**

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified amount of space in the aggregate.

This field includes the space used or reserved in the aggregate for metadata associated with this volume.

**[-flexvol-metadata-footprint-percent <percent>] - Flexible Volume Metadata Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified percentage of space in the aggregate.

**[-delayed-free-footprint {<integer>[KB|MB|GB|TB|PB]}] - Delayed Free Blocks**

If this parameter is specified, the command displays information only about the volumes whose delayed free blocks use the specified amount of space in the aggregate.

When ONTAP frees space in a volume, this space is not always immediately shown as free in the aggregate. This is because the operations to free the space in the aggregate are batched for increased performance. Blocks that are declared free in the FlexVol volume but which are not yet free in the aggregate are called "delayed free blocks" until the associated delayed free blocks are processed. For SnapMirror destinations, this row will have a value of 0 and will not be displayed.

**[-delayed-free-footprint-percent <percent>] - Delayed Free Blocks Percent**

If this parameter is specified, the command displays information only about the volumes that have the specified amount of blocks waiting to be freed in the aggregate. This space is called "delayed free blocks".

**[-snapmirror-destination-footprint {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Destination Footprint**

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified amount of space in the aggregate.

During a SnapMirror transfer, this row will include incoming SnapMirror data and SnapMirror-triggered delayed free blocks from previous SnapMirror transfers.

**[-snapmirror-destination-footprint-percent <percent>] - SnapMirror Destination Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified percentage of space in the aggregate.

**[-volume-guarantee-footprint {<integer>[KB|MB|GB|TB|PB]}] - Volume Guarantee**

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified amount of space in the aggregate.

This field includes the amount of space reserved by this volume in the aggregate for future writes. The amount of space reserved depends on the guarantee type (the provisioning mode) of the volume. + For a "volume" guaranteed volume, this is the size of the volume minus the amount in the Volume Data Footprint row. + For a "file" guaranteed volume, this is the sum of all of the space reserved for hole fills and overwrites in all of the space reserved files in the volume.

**[-volume-guarantee-footprint-percent <percent>] - Volume Guarantee Percent**

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified percentage of space in the aggregate.

**[-file-operation-metadata {<integer>[KB|MB|GB|TB|PB]}] - File Operation Metadata**

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified amount of space in the aggregate.

This metadata is used by file move and copy operations. Although it is not returned as free space once the operations are complete, it can be reused by future file operations.

**[-file-operation-metadata-percent <percent>] - File Operation Metadata Percent**

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified percentage of space in the aggregate.

**[-total-footprint {<integer>[KB|MB|GB|TB|PB]}] - Total Footprint**

If this parameter is specified, the command displays information only about the volumes which use the specified amount of space in the aggregate. This field is the sum of the other rows in this table.

**[-total-footprint-percent <percent\_no\_limit>] - Total Footprint Percent**

If this parameter is specified, the command displays information only about the volumes which use the specified percentage of space in the aggregate.

**[-aggregate-size {<integer>[KB|MB|GB|TB|PB]}] - Containing Aggregate Size**

If this parameter is specified, the command displays information only about the volumes that are associated with an aggregate of the specified size.

**[-bin0-name <text>] - Name for bin0**

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an object store attached to it with an active file system tier name matches the specified value.

**[-volume-blocks-footprint-bin0 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin0**

If this parameter is specified, the command displays information only about volumes whose space in use in the performance tier of the aggregate matches the specified value.

**[-volume-blocks-footprint-bin0-percent <percent>] - Volume Footprint bin0 Percent**

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the performance tier of the aggregate matches the specified value.

**[-bin1-name <text>] - Name for bin1**

If this parameter is specified, the command displays information only about volumes whose associated aggregate has a cloud tier attached to it with a configuration name that matches the specified value.

**[-volume-blocks-footprint-bin1 {<integer>[KB|MB|GB|TB|PB]}] - Volume Footprint for bin1**

If this parameter is specified, the command displays information only about volumes whose space in use in the first cloud tier bucket attached to the associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the cloud tier.

**[-volume-blocks-footprint-bin1-percent <percent>] - Volume Footprint bin1 Percent**

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the first cloud tier bucket attached to associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the cloud tier.

**[-total-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Total Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose total deduplication metafiles use the specified amount of space in the aggregate.

**`[-total-dedupe-metafiles-footprint-percent <percent>]` - Total Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose total deduplication metafiles use the specified percentage of space in the aggregate.

**`[-auto-adaptive-compression-footprint-data-reduction {<integer>[KB|MB|GB|TB|PB]}]` - Footprint Data Reduction by Auto Adaptive Compression**

If this parameter is specified, the command displays information only about the volumes whose estimation of footprint data reduction due to auto adaptive compression use the specified amount of space in the aggregate.

**`[-auto-adaptive-compression-footprint-data-reduction-percent <percent>]` - Footprint Data Reduction by Auto Adaptive Compression Percent**

If this parameter is specified, the command displays information only about the volumes whose percentage estimation of footprint data reduction due to auto adaptive compression use the specified amount of space in the aggregate.

**`[-total-footprint-data-reduction {<integer>[KB|MB|GB|TB|PB]}]` - Total Footprint Data Reduction**

If this parameter is specified, the command displays information only about the total footprint data reduction by the volume in the aggregate.

**`[-total-footprint-data-reduction-percent <percent>]` - Total Footprint Data Reduction Percent**

If this parameter is specified, the command displays information only about the percentage of total footprint data reduction by the volume in the aggregate.

**`[-capacity-tier-footprint-data-reduction {<integer>[KB|MB|GB|TB|PB]}]` - Footprint Data Reduction by Capacity Tier**

If this parameter is specified, the command displays information only about the footprint data reduction in the cloud tier by the volume in a FabricPool.

**`[-capacity-tier-footprint-data-reduction-percent <percent>]` - Footprint Data Reduction by Capacity Tier Percent**

If this parameter is specified, the command displays information only about the percentage of footprint data reduction in the cloud tier bucket by the volume in a FabricPool.

**`[-effective-total-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Effective Total after Footprint Data Reduction**

If this parameter is specified, the command displays information only about the total space used by the volume in the aggregate after total footprint data reduction.

**`[-effective-total-footprint-percent <percent>]` - Effective Total after Footprint Data Reduction Percent**

If this parameter is specified, the command displays information only about the percentage of total space used by the volume in the aggregate after total footprint data reduction.

**`[-compaction-footprint-data-reduction {<integer>[KB|MB|GB|TB|PB]}]` - Footprint Data Reduction by Compaction**

If this parameter is specified, the command displays information only about the volumes whose estimation of footprint data reduction due to compaction use the specified amount of space in the aggregate.

### **`[-compaction-footprint-data-reduction-percent <percent>]` - Footprint Data Reduction by Compaction Percent**

If this parameter is specified, the command displays information only about the volumes whose percentage estimation of footprint data reduction due to compaction use the specified amount of space in the aggregate.

### **`[-total-metadata-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Total Metadata Footprint**

If this parameter is specified, the command displays information only about volume that have the specified amount of space used by volume metadata in the aggregate. The value of this field will be higher than the field 'total-metadata' from the [volume show-space](#) command output since this includes additional metadata of the volume in the aggregate.

### **`[-total-metadata-footprint-percent <percent>]` - Total Metadata Footprint Percentage**

.If this parameter is specified, the command displays information only about the volume that have the specified percentage of space used by volume metadata in the aggregate.

## **Examples**

The following example displays information about all volumes in the system.

```

cluster1::> volume show-footprint

# volume show-space

Display space usage for volume(s)

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume show-space` command displays information about space usage within the volume. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-volume-msid <integer>] - Volume MSID**

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

**[-volume-dsid <integer>] - Volume DSID**

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

**[-vserver-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays information only about the volume on the vservers which has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name**

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

**[-hostname <text>] - Hostname**

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

**[-user-data {<integer>[KB|MB|GB|TB|PB]}] - User Data**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by user data in the volume.

This is the amount of data written to the volume via CIFS, NFS or SAN protocols plus the space reserved in the volume for these files (hole and overwrite reserves). This is the same information displayed by running the Unix `du` command on the mount point.

**[-user-data-percent <percent\_no\_limit>] - User Data Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by user data in the volume.

**[-dedupe-metafiles {<integer>[KB|MB|GB|TB|PB]}] - Deduplication**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by deduplication metafiles in the volume.

**[-dedupe-metafiles-percent <percent>] - Deduplication Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by deduplication metafiles in the volume.

**[-dedupe-metafiles-temporary {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by temporary deduplication metafiles in the volume.

**[-dedupe-metafiles-temporary-percent <percent>] - Temporary Deduplication Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by temporary deduplication metafiles in the volume.

**[-filesystem-metadata {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by file system metadata in the volume.

**[-filesystem-metadata-percent <percent>] - Filesystem Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by file system metadata in the volume.

**[-snapmirror-metadata {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by SnapMirror metafiles in the volume.

Between SnapMirror transfers, some metadata is maintained to support storage-efficient transfers. During transfers, some additional space is used temporarily. This space is used in all SnapMirror destination volumes.

**[-snapmirror-metadata-percent <percent>] - SnapMirror Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by SnapMirror metafiles inside the volume.

**[`-tape-backup-metadata` {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by tape backup metafiles in the volume.

**[`-tape-backup-metadata-percent` <percent>] - Tape Backup Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by tape backup metafiles in the volume.

**[`-quota-metafiles` {<integer>[KB|MB|GB|TB|PB]}] - Quota Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by quota metafiles.

**[`-quota-metafiles-percent` <percent>] - Quota Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by quota metafiles.

**[`-inodes` {<integer>[KB|MB|GB|TB|PB]}] - Inodes**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode metafile in the volume.

This is the amount of space required to store inodes in the file system and is proportional to the maximum number of files ever created in the volume. The inode file is not compacted or truncated, so if a large number of files are created and then deleted, the inode file does not shrink.

**[`-inodes-percent` <percent>] - Inodes Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the inode metafile in the volume.

**[`-inodes-upgrade` {<integer>[KB|MB|GB|TB|PB]}] - Inodes Upgrade**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode subsystem for the purpose of upgrading.

This is the amount of space required to store upgrading inodes in the file system and is proportional to the size of the inode metafile. Once the upgrade is complete, the space used by 'inodes' will be replaced with the space used for upgrade.

**[`-inodes-upgrade-percent` <percent>] - Inodes Upgrade Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for upgrading the inode metafile in the volume.

**[`-snapshot-reserve` {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Reserve**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the snapshot reserve in the volume.

**[`-snapshot-reserve-percent` <percent>] - Snapshot Reserve Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the snapshot reserve in the volume.

**[`-snapshot-reserve-unusable` {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Reserve Unusable**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accommodate volume metadata. Creating space in the volume will make this space available.

**`[-snapshot-reserve-unusable-percent <integer>]` - Snapshot Reserve Unusable Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved but unusable.

**`[-snapshot-spill {<integer>[KB|MB|GB|TB|PB]}]` - Snapshot Spill**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by their snapshot spill.

If snapshot used space exceeds the snapshot reserve it is considered to spill out of the reserve. This space cannot be used by the active file system until snapshots are deleted.

**`[-snapshot-spill-percent <percent>]` - Snapshot Spill Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the snapshot spill.

**`[-performance-metadata {<integer>[KB|MB|GB|TB|PB]}]` - Performance Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use for performance optimization in the volume.

**`[-performance-metadata-percent <percent>]` - Performance Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for performance optimization in the volume.

**`[-total-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Used**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the volume, including the space used by the snapshot reserve. *total-used* differs from *physical-used* space by the sum of of the space that is reserved for future writes and the space that is saved by aggregate storage efficiency savings being removed from *total-used*.

This is equivalent to the *used* field in the output of the [volume show](#) command.

**`[-total-used-percent <percent_no_limit>]` - Total Used Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the volume, including the space used by the snapshot reserve.

**`[-physical-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Physical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of physical space in use by the volume.

This value represents the effective total footprint which is the total footprint after deducting auto adaptive compression and compaction savings. For volumes with a *space-guarantee* of *volume* the value also includes provisioned space. The value also includes aggregate space used by the volume metadata. Because of this the value reported can be more than 100%.

*physical-used* differs from *total-used* space by the sum of the space that is reserved for future writes and the space that is saved saved by aggregate storage efficiency savings being added to *physical-used*. The value includes blocks in use by snapshots.

**[-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of physical space in use in the volume based on volume size including the space reserved for snapshots.

**[-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical space in use by the volume. This includes space saved by all the storage efficiency features along with physical used space. This does not include snapshot reserve but does consider snapshot spill.

**[-logical-used-percent <percent\_no\_limit>] - Logical Used Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of logical space used in the volume.

**[-logical-available {<integer>[KB|MB|GB|TB|PB]}] - Logical Available**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical available space in the volume.

**[-total-metadata {<integer>[KB|MB|GB|TB|PB]}] - Total Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space used by metadata in the volume. This field will not include the metadata of the volume which is residing inside the aggregate.

**[-total-metadata-percent <percent>] - Total Metadata Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space used by metadata in the volume.

## Examples

The following example shows how to display details for all volumes.

```

cluster1::> volume show-space
Vserver : nodevs
  Volume : vol0
Feature                                     Used      Used%
-----

## volume show

Display a list of volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume show` command displays information about volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Aggregate name
- State (online, offline, restricted, or mixed)

- Type (RW for read-write or DP for data-protection)
- Size
- Available size
- Percentage of space used

To display detailed information about a single volume, run the command with the `-vserver` and `-volume` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Name ordinal
- Volume data set ID
- Volume master data set ID
- Volume style (trad or flex)
- FlexCache Endpoint Type (none or cache or origin)
- Whether the volume is a cluster volume or node volume
- Export policy name
- User ID
- Group ID
- Security style (unix, ntfs, mixed or unified)
- UNIX permissions
- Junction path
- Junction path source
- Whether the junction path is active
- Parent volume name
- Vserver root volume
- Comment
- Filesystem size
- Total user-visible size
- Used size
- Used percentage
- Volume nearly full threshold percent
- Volume full threshold percent
- Autosize enabled
- Maximum autosize
- Minimum autosize
- Autosize grow threshold percent
- Autosize shrink threshold percent
- Autosize mode
- Total files

- Files used
- Expected available size
- Over provisioned size
- Snapshot reserve available size
- Logical used size
- Logical used percent
- Logical available size
- Active filesystem logical used size
- Snapshot logical used size
- Use logical space reporting
- Use logical space enforcement
- Maximum directory size
- Space guarantee style
- Whether a space guarantee is in effect
- Space SLO type (none, thick or semi-thick)
- Whether space SLO is in effect
- Whether minimum readahead is enabled
- Whether access time update is enabled
- Whether snapshot directory access is enabled
- Percentage of space reserved for snapshots
- Percentage of snapshot space used
- Snapshot policy name
- Creation time
- If the filesystem size is fixed
- Overwrite reserve
- Fractional reserve
- Which space management strategy to try first
- Language
- Whether there's one data volume per member aggregate
- Concurrency level
- Optimization policy
- Whether the volume is a clone
- Volume UUID
- Whether failover is enabled
- Failover state
- (DEPRECATED)-Extent option
- Read reallocation option

- Consistency state
- Whether volume is quiesced on disk
- Whether volume is quiesced in memory
- Whether volume contains shared or compressed data
- Space saved by storage efficiency
- Percentage of space saved by storage efficiency
- Space saved by deduplication
- Percentage of space saved by deduplication
- Space shared by deduplication
- Space saved by compression
- Percentage of space saved by compression
- Volume size used by snapshots
- Caching policy
- FlexGroup volume master data set ID
- FlexGroup volume index
- FlexGroup volume UUID
- Maximum size of the FlexGroup volume constituent
- Whether the volume has FlexGroup volume enabled
- Whether a FlexGroup volume is Qtree enabled
- Whether the volume is the destination of a move that is currently in cutover
- List of the aggregates used by the FlexGroup volume
- List of the nodes used by the FlexGroup volume
- SnapLock Type
- Is in pre-commit phase of copy-free Transition
- Application that the volume belongs to
- File system analytics state of the volume
- File system analytics scan progress percentage
- File system analytics number of files scanned
- File system analytics total number of files
- Activity tracking state of the volume
- Application UUID
- Whether the volume's total number of files is set to the highest possible value

To display detailed information about all volumes, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about data-protection volumes, run the command with the `-type DP` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The fields Vserver and policy are the default fields (see example).

**| [-encryption ]**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Aggregate name
- Volume state
- Encryption state

**| [-junction ]**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether the volume's junction is active
- Junction path
- Junction path source (if the volume is a mirror)

**| [-settings ] (privilege: advanced)**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether minimum readahead is enabled on the volume
- Whether the access time is updated on inodes when a file on the volume is read
- Whether clients have access to .snapshot directories
- Whether automatic snapshots are enabled on the volume

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[`-aggregate <aggregate name>`] - Aggregate Name**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate. This field is displayed as "-" for FlexGroup volumes.

**[`-aggr-list <aggregate name>,...`] - List of Aggregates for FlexGroup Constituents**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volumes that are located on the specified list of storage aggregates. This parameter applies to FlexGroup volumes only.

**[`-encryption-type {none|volume|aggregate|mixed}`] - Encryption Type**

If this parameter is specified, the command displays information about the type of encryption key used for encrypting the volume. The possible values are *none*, *volume*, and *aggregate*. The value *none* is used for non-encrypted volumes, the value *volume* is used for volumes encrypted with NVE (NetApp Volume Encryption) and *aggregate* is used for volumes encrypted with NAE (NetApp Aggregate Encryption).

**[`-nodes {<nodename>|local}`] - List of Nodes Hosting the Volume**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volumes that are located on the specified list of storage systems. This parameter applies to FlexGroup volumes only.

**[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Volume Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, snapshots, and snapshot reserve. Note that for volumes without a `-space-guarantee` of *volume*, the ability to fill the volume to this maximum size depends on the space available in the associated aggregate or aggregates.

**[`-name-ordinal <text>`] - Name Ordinal (privilege: advanced)**

If this parameter is specified, it denotes the ordinal assignment used in relation to this volume's name. Ordinals are used to disambiguate volumes that have the same base name on the same controller. A value of "0" indicates that the base volume name is unique on the controller. A value greater than zero indicates that the volume's base name is used by two or more volumes on the same controller, and that appending "(n)" to this volume's name uniquely identifies it on this controller.

**[`-dsid <integer>`] - Volume Data Set ID**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID. This field is displayed as "-" for FlexGroup volumes.

**[`-msid <integer>`] - Volume Master Data Set ID**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

**[`-state {online|restricted|offline|force-online|force-offline|mixed}`] - Volume State**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified state. The *mixed* state only applies to FlexGroup volumes. If the state of a FlexGroup volume is *mixed*, that indicates that not all of the constituents are in the same state. If this is the case use the "volume show -is-constituent true" command to find out which constituents are not in the proper state.

**[`-volume-style <flex>`] - Volume Style**

If this parameter is specified, the command displays information only about the volumes that have the specified style. Possible values are *flex* for FlexVol volumes.

**[-volume-style-extended {flexvol|flexgroup|flexgroup-constituent}] - Extended Volume Style**

If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are *flexvol* for FlexVol volumes, *flexgroup* for FlexGroup volumes and *flexgroup-constituent* for FlexGroup volume constituents.

**[-flexcache-endpoint-type {none|cache|origin}] - FlexCache Endpoint Type**

If this parameter is specified, the command displays information only about the volumes that are of the specified flexcache-endpoint-type. Possible values are *none* for volumes that are not part of a FlexCache relationship, *cache* for FlexCache volumes and *origin* for origin of FlexCache volumes.

**[-is-cluster-volume {true|false}] - Is Cluster-Mode Volume**

If this parameter is specified, the command displays information only about cluster volumes (true) or node root volumes and other node scoped volumes (false).

**[-is-constituent {true|false}] - Is Constituent Volume**

If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup volume, depending on the value provided.

**[-constituent-count <integer>] - Number of Constituent Volumes**

The number of constituents in the FlexGroup volume. This parameter applies to FlexGroup volumes only.

**[-policy <text>] - Export Policy**

If this parameter is specified, the command displays information only about the volume or volumes that use the specified export policy.

**[-user <user name>] - User ID**

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified user.

**[-group <group name>] - Group ID**

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified group.

**[-security-style <security style>] - Security Style**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both styles or *unified* for Unified UNIX, NFS and CIFS permissions).

**[-unix-permissions <unix perm>] - UNIX Permissions**

If this parameter is specified, the command displays information only about the volume or volumes whose default UNIX permissions match the specified permissions. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation.

**[-junction-path <junction path>] - Junction Path**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path.

**[-junction-path-source {RW\_volume|LS\_mirror}] - Junction Path Source**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path source.

**[-junction-active {true|false}] - Junction Active**

If this parameter is specified, the command displays information only about the volume or volumes whose junction paths have the specified status.

**[-junction-parent <volume name>] - Junction Parent Volume**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified parent volume.

**[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified setting; that is, whether they are the root volumes for their Vservers.

**[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified comment text.

**[-available {<integer>[KB|MB|GB|TB|PB]}] - Available Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified available size. Available is the amount of free space currently available to be used by this volume. For a volume with a `-space-guarantee` of type *volume*, available is always `-total` minus `-used`. For volumes that do not have a `-space-guarantee` of type *volume*, available could be reduced if the volume's associated aggregate or aggregates are space constrained.

**[-filesystem-size {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified filesystem size. Filesystem size is the same as the volume's `-size` unless the volume is or was a physical replica destination. In this case, the file system size corresponds to the `-size` of the source volume, until `-filesys-size-fixed` is set to *false*.

**[-total {<integer>[KB|MB|GB|TB|PB]}] - Total User-Visible Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified total size. Total is the total space available for user data and file system metadata. It does not include the snapshot reserve.

**[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used size. Used is the amount of space occupied by user data and file system metadata. *used* differs from *physical-used* space by the sum of the space that is reserved for future writes and the space that is saved by aggregate storage efficiency savings being removed from *used*. It includes snapshot spill (the amount of space by which snapshots exceed snapshot reserve). It does not include the snapshot reserve.

**[-percent-used <percent>] - Used Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of used space. This row is based on a value of used space that includes the space used by snapshots or the snapshot reserve (whichever is greater) in relation to the current volume size.

**`[-space-nearly-full-threshold-percent <percent>]` - Volume Nearly Full Threshold Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified nearly full threshold percent.

**`[-space-full-threshold-percent <percent>]` - Volume Full Threshold Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified full threshold percent.

**`[-max-autosize {<integer>[KB|MB|GB|TB|PB] }]` - Maximum Autosize**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum automatic size.

**`[-min-autosize {<integer>[KB|MB|GB|TB|PB] }]` - Minimum Autosize**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum automatic size. This field is displayed as "-" for FlexGroup volumes.

**`[-autosize-grow-threshold-percent <percent>]` - Autosize Grow Threshold Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic grow used space threshold percentage. This field is displayed as "-" for FlexGroup volumes.

**`[-autosize-shrink-threshold-percent <percent>]` - Autosize Shrink Threshold Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic shrink used space threshold percentage. This field is displayed as "-" for FlexGroup volumes.

**`[-autosize-mode {off|grow|grow_shrink}]` - Autosize Mode**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic sizing mode setting. This field is displayed as "-" for FlexGroup volumes.

**`[-files <integer>]` - Total User Visible Files**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files.

**`[-files-used <integer>]` - User Visible Files Used**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files used. This includes all user-visible file system entities such as directories, regular files, streams, ACLS, etc.

**`[-inodefile-public-capacity <integer>]` - User Visible Inode File Capacity (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified public inode file capacity. This includes all user-invisible or metadata files such as private metafiles and zombies.

**`[-files-maximum-possible <integer>]` - Maximum Possible Total User Visible Files (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of maximum files possible. This includes all user-visible file system entities such as directories, regular files, streams, ACLS, etc.

**`[-files-set-maximum {true|false}]` - Set Total Files (for user-visible data) to the Highest Value that the Volume can Hold (privilege: advanced)**

If this parameter is specified, the command displays information about whether the volume's total number of files is set to the highest value that the volume can hold. This includes all user-visible file system entities such as directories, regular files, streams, ACLS, etc.

**`[-files-private-used <integer>]` - Private System Metadata Files Used (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of private system metadata files used. This includes all user-invisible or metadata files such as private metafiles and zombies.

**`[-inodefile-private-capacity <integer>]` - Private System Metadata Inode File Capacity (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified private inode file capacity. This includes all user-visible file system entities such as directories, regular files, streams, ACLS, etc.

**`[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum Directory Size (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum directory size.

**`[-space-guarantee-enabled {true|false}]` - Space Guarantee in Effect**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-guarantee setting. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

**`[-is-space-slo-enabled {true|false}]` - Space SLO in Effect**

If this parameter is specified, the command displays information only about the volume or volumes that have their `space-slo` setting in effect or not, depending on the value specified for this parameter. If the value of `space-slo` is *none*, the space SLO is always considered to be in effect. If the value of `space-slo` is *semi-thick* or *thick*, the space SLO may be in effect depending on whether the required amount of space was available when the volume was mounted.

**`[-space-slo {none|thick|semi-thick}]` - Space SLO**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-slo` setting. The space SLO setting is the Service Level Objective for space management for the volume.

**`[-s, -space-guarantee {none|volume}]` - Space Guarantee Style**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space guarantee style. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

**`[-fractional-reserve <percent>]` - Fractional Reserve**

If this parameter is specified, the command displays information only about the volume or volumes that

have the specified `fractional-reserve` setting.

**`[-type {RW|DP}] - Volume Type`**

If this parameter is specified, the command displays information only about the volume or volumes of the specified volume type (RW for read-write or DP for data-protection).

**`[-min-readahead {true|false}] - Minimum Read Ahead (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum-readahead setting.

**`[-atime-update {true|false}] - Access Time Update Enabled (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified access-time update setting.

**`[-snapdir-access {true|false}] - Snapshot Directory Access Enabled`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified snapshot directory access setting.

**`[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved for snapshots.

**`[-snapshot-space-used <percent_no_limit>] - Snapshot Reserve Used`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used percentage of the reserve for snapshots.

**`[-snapshot-policy <snapshot policy>] - Snapshot Policy`**

If this parameter is specified, the command displays information only about the volume or volumes that use the specified snapshot policy.

**`[-create-time <Date>] - Creation Time`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified creation time.

**`[-language <Language code>] - Language`**

If this parameter is specified, the command displays information only about the volume or volumes that store data in the specified language. To determine the available languages, enter `volume show -language ?`` at the cluster shell command prompt.

**`[-clone-volume {true|false}] - Clone Volume`**

If this parameter is specified, the command displays information only about volumes that are clones (true) or not clones (false).

**`[-node {<nodename>|local}] - Node name`**

If this parameter is specified, the command displays information only the volume or volumes that are located on the specified storage system. This field is displayed as "-" for FlexGroup volumes.

**`[-clone-parent-vserver <vserver name>] - Clone Parent Vserver Name`**

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent Vserver name.

**`[-clone-parent-name <volume name>]` - FlexClone Parent Volume**

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent volume name.

**`[-uuid <UUID>]` - UUID of the Volume (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

**`[-nvfail {on|off}]` - NVFAIL Option**

If this parameter is specified, the command displays information only about volumes for which failover is enabled (on) or disabled (off).

**`[-in-nvfailed-state {true|false}]` - Volume's NVFAIL State**

If this parameter is specified, the command displays information only about volumes which are in the failed over state (true) or not (false). This field is only available when the volume is online.

**`[-dr-force-nvfail {on|off}]` - Force NVFAIL on MetroCluster Switchover**

If this parameter is specified, the command displays information only about volumes for which dr-force-nvfail is enabled (on) or disabled (off).

**`[-filesystem-size-fixed {true|false}]` - Is File System Size Fixed**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `filesystem-size-fixed` setting.

**`[-extent-enabled {off|on|space-optimized}]` - (DEPRECATED)-Extent Option**

This parameter has been deprecated and might be removed in a future release of ONTAP.

If this parameter is specified, the command displays information only about volumes that have extents enabled (on), not enabled (off) or space optimized (space-optimized).

**`[-overwrite-reserve {<integer>[KB|MB|GB|TB|PB]}]` - Reserved Space for Overwrites**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `overwrite-reserve` setting.

**`[-space-mgmt-try-first {volume_grow|snap_delete}]` - Primary Space Management Strategy**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-mgmt-try-first` setting. Possible values are `volume_grow` and `snap_delete`. This field is displayed as "-" for FlexGroup volumes.

**`[-read-realloc {off|on|space-optimized}]` - Read Reallocation Option**

If this parameter is specified, the command displays information only about volumes that have read reallocation enabled (on), not enabled (off) or space optimized (space-optimized).

**`[-sched-snap-name {create-time|ordinal}]` - Naming Scheme for Automatic Snapshot Copies**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic snapshot naming convention.

**`[-is-inconsistent {true|false}]` - Inconsistency in the File System**

If this parameter is specified, the command displays information only about volumes that are inconsistent (true) or consistent (false) in the file system.

**[`-is-quieted-on-disk {true|false}`] - Is Volume Quiesced (On-Disk)**

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) on disk.

**[`-is-quieted-in-memory {true|false}`] - Is Volume Quiesced (In-Memory)**

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) in memory.

**[`-transition-state <state>`] - Transition Operation State (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition state.

**[`-transition-behavior {data-move|data-protection|none}`] - Transition Behavior (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition behavior. Possible values are:

- data-move: Volumes that are being moved from a system operating in 7-Mode.
- data-protection: Volumes that are being replicated from a system operating in 7-Mode for disaster recovery.
- none: Volumes that are not part of transition.

**[`-is-copied-for-transition {true|false}`] - Copied for Transition (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is copied for transition or not.

**[`-is-transitioned {true|false}`] - Transitioned (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is transitioned or not.

**[`-is-sis-volume {true|false}`] - Volume Contains Shared or Compressed Data**

If this parameter is specified, the command displays information only about those volumes that match the specified storage efficiency setting.

**[`-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}`] - Space Saved by Storage Efficiency**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved by the storage efficiency technology.

**[`-sis-space-saved-percent <percent>`] - Percentage Saved by Storage Efficiency**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved by the storage efficiency technology.

**[`-dedupe-space-saved {<integer>[KB|MB|GB|TB|PB]}`] - Space Saved by Deduplication Along With VBN ZERO Savings**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to deduplication.

**[`-dedupe-space-saved-percent <percent>`] - Percentage Saved by Deduplication**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to deduplication.

**`[-dedupe-space-shared {<integer>[KB|MB|GB|TB|PB] }]` - Unique Data Which Got Shared by Deduplication**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of shared space due to deduplication.

**`[-compression-space-saved {<integer>[KB|MB|GB|TB|PB] }]` - Space Saved by Compression**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to compression. If *storage-efficiency-mode* is set to *efficient*, this field would display "-".

**`[-compression-space-saved-percent <percent>]` - Percentage Space Saved by Compression**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to compression. If *storage-efficiency-mode* is set to *efficient*, this field would display "-".

**`[-size-used-by-snapshots {<integer>[KB|MB|GB|TB|PB] }]` - Volume Size Used by Snapshot Copies**

If this parameter is specified, the command displays information about those volumes that have the specified volume size used by snapshots.

**`[-block-type {64-bit|extent|32-bit}]` - Block Type**

If this parameter is specified, the command displays information about only the volumes with the specified indirect block format. Possible values are *32-bit* to display 32-bit volumes and *64-bit* to display 64-bit volumes.

**`[-is-moving {true|false}]` - Is Volume Moving**

If this parameter is specified, the command displays information only about volumes that are moving (true) or not moving (false).

**`[-hybrid-cache-eligibility {read|read-write|none}]` - Flash Pool Caching Eligibility**

If this parameter is specified, the command displays information only about the volume or volumes with the specified Flash Pool caching attributes. Possible caching attributes are:

- 'read' ... Indicates that the volume cannot participate in write caching.
- 'read-write' ... Indicates that the volume can participate in read and write caching.

**`[-hybrid-cache-write-caching-ineligibility-reason <text>]` - Flash Pool Write Caching Ineligibility Reason**

If this parameter is specified, the command displays information only about the volume or volumes which are ineligible to participate in write caching due to the specified reason.

**`[-constituent-role <Constituent Roles>]` - Constituent Volume Role**

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to FlexGroup volumes only.

**`[-is-cft-precommit {true|false}]` - Is in the precommit phase of Copy-Free Transition (privilege: advanced)**

If this parameter is specified with the true value, it displays information only about the volumes that are in the precommit phase of a Copy-Free Transition workflow.

### **[-qos-policy-group <text>] - QoS Policy Group Name**

If this parameter is specified, the command displays information only about volumes that match the specified QoS policy group.

### **[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name**

If this parameter is specified, the command displays information only about volumes that match the specified QoS adaptive policy group.

### **[-caching-policy <text>] - Caching Policy Name**

If this parameter is specified, the command displays the volumes that match the specified caching policy.

A caching policy defines how the system caches a volume's data in a Flash Pool aggregate. Both metadata and user data are eligible for caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

### **[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)**

If this parameter is specified, the command displays the volumes that match the specified cache retention priority policy.

A cache retention priority defines how long the blocks of a volume will be cached in Flash Pool once they become cold. The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

**`[-is-volume-in-cutover {true|false}] - Is Volume Move in Cutover Phase`**

If this parameter is specified, the command displays information only about volumes that are in the cutover phase (true) or not in the cutover phase (false) of a volume move. This field is displayed as "-" for FlexGroup volumes.

**`[-snapshot-count <integer>] - Number of Snapshot Copies in the Volume`**

If this parameter is specified, the command displays information only about the volumes that have the specified number of snapshots.

**`[-vbn-bad-present {true|false}] - VBN_BAD may be present in the active filesystem`**

If this parameter is specified, the command displays information only about volumes that may have VBN\_BAD present in its active filesystem (true) or do not have VBN\_BAD present in its active filesystem (false).

**`[-is-vol-on-hybrid-aggr {true|false}] - Is Volume on a hybrid aggregate`**

If this parameter is specified, the command displays information only about volumes associated with a Flash Pool aggregate (true) or not (false). This field is displayed as "-" for FlexGroup volumes.

**`[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used size. Physical-used represents effective total footprint which is total footprint after deducting auto adaptive compression and compaction savings. For volumes with a space-guarantee of *volume* the value includes provisioned space. The value also includes aggregate space used by the volume metadata. Because of this the value reported can be more than 100%. *physical-used* differs from *total-used* space by the sum of the space that is reserved for future writes and the space that is saved by aggregate storage efficiency savings being added to *physical-used*. The value includes blocks in use by snapshots.

**`[-physical-used-percent <percent_no_limit>] - Physical Used Percentage`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used percent based on volume size including the space reserved for snapshots.

**`[-flexgroup-msid <integer>] - FlexGroup Master Data Set ID (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume master data-set ID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**`[-flexgroup-index <integer>] - FlexGroup Index (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup volume constituents that have the specified FlexGroup volume index. This parameter applies to FlexGroup volume constituents only.

**`[-flexgroup-uuid <UUID>] - UUID of the FlexGroup (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume UUID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**[-flexgroup-name <volume name>] - FlexGroup Name**

If this parameter is specified, the command displays information only about the volumes that have the specified FlexGroup volume name. This parameter only applies to FlexGroup volumes and FlexGroup volume constituents.

**[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volumes that have the specified maximum constituent size. This parameter applies to FlexGroup volumes only.

**[-inofile-version <integer>] - Inofile Version (privilege: advanced)**

If this parameter is specified, the command displays information only about the volumes whose inode files are at the specified version.

**[-is-flexgroup {true|false}] - Is Volume a FlexGroup**

If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroup volumes or not, depending on the value provided.

**[-is-qtree-caching-enabled {true|false}] - Is Qtree Caching Support Enabled (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexGroup volumes and origins of FlexCache volumes with Qtree caching enabled or disabled, depending on the value provided.

**[-is-move-destination-in-cutover {true|false}] - Is the Volume a Target of a Move Which Is Currently in Cutover (privilege: advanced)**

If this parameter is specified, the command displays whether or not the volume is a move destination that is currently in cutover.

**[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays information only about volumes that match the specified snaplock-type.

**[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection**

If this parameter is specified, the command displays information only about the volumes having the specified Vserver SnapMirror protection.

**[-has-optimized-sparse-directories {true|false}] - Volume Has Sparse Directories in an Optimized Format (privilege: advanced)**

If this parameter is specified, the command displays information only about volumes that have sparse directories in an optimized format.

**[-encrypt {true|false}] - Enable or Disable Encryption**

If this parameter is specified, the command displays information only about the volumes that are encrypted (true) or not encrypted (false).

**[-is-encrypted {true|false}] - Is Volume Encrypted**

If this parameter is specified, the command displays information only about the volumes that are encrypted (true) or unencrypted (false).

**[-encryption-state {none|full|partial|converting\_to\_encrypted|converting\_to\_plaintext|rekeying|conversion\_paused|rekey\_paused}] - Encryption State**

If this parameter is specified, the command displays information only about the volumes that have the specified encryption state. The possible values are *none*, *full*, *partial*, *converting\_to\_encrypted*, *converting\_to\_plaintext*, and *rekeying*. The value *partial* is used for FlexGroup volumes, which indicates that some constituents are encrypted and some are not.

**[-key-id <text>] - Encryption Key ID**

If this parameter is specified, the command displays information only about the volume whose encryption key-id matches the specified key-id.

**[-key-creation-time <MM/DD/YYYY HH:MM:SS>] - Encryption Key Creation Time**

If this parameter is specified, the command displays information only about volumes having an encryption key with a creation time that matches, is greater than or less than the provided key-creation-time value. For example, the volume show `-key-creation-time >1/1/2022 13:12:11` command will show all volumes that have an encryption key created later than 1/1/2022 13:12:11

**[-application <text>] - Application**

Selects the volumes that are part of an application that matches the parameter value.

**[-is-protocol-access-fenced {true|false}] - Is Fenced for Protocol Access**

If this parameter is specified, the command displays information only about the volumes that are fenced for protocol access. Only FlexGroup volume constituents and volumes in SnapMirror Synchronous relationships can be fenced for protocol access.

**[-protocol-access-fenced-by {none|coordinated\_snaprestore|coordinated\_redirection|snapmirror\_synchronous|vserver\_migrate}] - Protocol Access Fence Owner**

This field indicates the owner of the protocol access fence when the volume's protocol access is fenced. Only FlexGroup volume constituents and volumes in SnapMirror Synchronous relationships can be fenced for protocol access.

**[-single-instance-data-logging {off|on}] - Is SIDL enabled**

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified volume.

**[-over-provisioned {<integer>[KB|MB|GB|TB|PB]}] - Over Provisioned Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size unavailable in the aggregate. This applies only for a "none" guaranteed volume when its unused size exceeds available space in the aggregate. This value is always zero for "volume" guaranteed volumes. For FlexGroup volumes, the value is not the direct sum of the constituents' overprovisioned size. Instead the value represents the total overprovisioned space across all aggregates for the FlexGroup volume. For each aggregate, the value is computed as the sum of the unused size of the thin provisioned constituents of the FlexGroup volumes that exceed available space in the aggregate.

**[-snapshot-reserve-available {<integer>[KB|MB|GB|TB|PB]}] - Available Snapshot Reserve Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size available for snapshots within the snapshot reserve. This value is zero if snapshot spill is present. For 'none' guaranteed volumes, this may get reduced due to less available space in the

aggregate.

**`[-logical-used {<integer>[KB|MB|GB|TB|PB] }]` - Logical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used size. This value includes all the space saved by the storage efficiency features along with the physically used space. This does not include snapshot reserve but does consider snapshot spill.

**`[-logical-used-percent <percent_no_limit>]` - Logical Used Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used percentage.

**`[-logical-available {<integer>[KB|MB|GB|TB|PB] }]` - Logical Available Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical available size. This value is the amount of free space currently available considering space saved by the storage efficiency features as being used. This does not include snapshot reserve.

**`[-logical-used-by-afs {<integer>[KB|MB|GB|TB|PB] }]` - Logical Size Used by Active Filesystem**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used by the active file system. This value differs from *logical-used* by the amount of snapshot spill that exceeds snapshot reserve. This parameter is not supported on FlexGroup volumes.

**`[-logical-used-by-snapshots {<integer>[KB|MB|GB|TB|PB] }]` - Logical Size Used by All Snapshots**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used across all snapshots. This value differs from *size-used-by-snapshots* by the space saved by the storage efficiency features across the snapshots. This parameter is not supported on FlexGroup volumes.

**`[-is-space-reporting-logical {true|false}]` - Logical Space Reporting**

If this parameter is specified, the command displays information only about the volumes that have logical space reporting enabled or disabled as specified. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used.

**`[-is-space-enforcement-logical {true|false}]` - Logical Space Enforcement**

If this parameter is specified, the command displays information only about the volumes that have logical space enforcement enabled or disabled as specified. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used.

**`[-tiering-policy <Tiering Policy>]` - Volume Tiering Policy**

If this parameter is specified, the command displays information only about the volumes whose tiering policy matches the specified value. Tiering policies determine whether the user data blocks of a volume in a FabricPool will be tiered to the cloud tier when they become cold. FabricPool combines Flash (performance tier) with an object store (cloud tier) into a single aggregate. The temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- snapshot-only - Only the volume snapshots not associated with the active file system are tiered to the cloud tier.
- auto - Both snapshot data and active file system user data are tiered to the cloud tier.
- none - No volume blocks are tiered to the cloud tier.
- all - Both snapshot data and active file system user data are tiered to the cloud tier as soon as possible without waiting for a cooling period. On DP volumes all transferred user data blocks start in the cloud tier.

**[`-cloud-retrieval-policy {default|on-read|never|promote}`] - Volume Cloud Retrieval Policy (privilege: advanced)**

This optional parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier.

The available cloud retrieval policies are:

- default - This policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot-only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
- on-read - This policy retrieves tiered data for all client driven data reads.
- never - This policy never retrieves tiered data.
- promote - This policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot-only'. If the tiering policy is 'snapshot-only', the only data brought back is the data in the AFS. Data that is only in a snapshot stays in the cloud.

**[`-tiering-minimum-cooling-days <integer>`] - Volume Tiering Minimum Cooling Days (privilege: advanced)**

This parameter displays the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. For volumes hosted on FabricPools, this parameter is used for tiering purposes and does not affect the reporting of inactive data. For volumes hosted on non-FabricPools, this parameter affects the cooling window used for reporting inactive data. The default minimum cooling period for the *snapshot-only* policy is 2 days and for the *auto* policy is 31 days.

**[`-performance-tier-inactive-user-data {<integer>[KB|MB|GB|TB|PB]}`] - Performance Tier Inactive User Data**

If this parameter is specified, the command displays the amount of inactive user data stored in the performance tier that could be tiered out to a cloud tier if the volume is in a FabricPool and for which the *auto* tiering policy has been specified. For more information see the *tiering-policy* parameter.

**[`-performance-tier-inactive-user-data-percent <percent>`] - Performance Tier Inactive User Data Percent**

If this parameter is specified, the command displays the percentage of inactive user data in the performance tier.

**[`-tiering-object-tags <text>,...`] - Tags to be Associated with Objects Stored on a FabricPool**

This optional parameter specifies the tiering object tags to be associated with objects stored on a FabricPool.

### **`[-needs-object-retagging {true|false}]` - Does the Object Tagging Scanner Need to Run on This Volume**

This optional parameter specifies if an object tagging scanner needs to run again for the volume.

### **`[-workflow {auto|data|hybrid|metadata}]` - Type of Workflow (privilege: advanced)**

This parameter only applies to FlexGroup volumes.

Use this parameter to specify whether this FlexGroup volume will be used for workloads with mainly I/O operations, metadata operations, or a combination of both, to optimize performance.

If the value is *auto* (default), the system will adjust automatically to the predominate type of operation over time.

If the value is *data*, the FlexGroup volume will be optimized for file reads and writes and does not adjust automatically.

If the value is *metadata*, the FlexGroup volume will be optimized for metadata operations like lookups, readdirs, and renames and does not adjust automatically.

If the value is *hybrid*, the FlexGroup volume will be optimized for a mix of both data and metadata operations and does not adjust automatically.

### **`[-is-analytics-supported {true|false}]` - Is File System Analytics Supported**

If this parameter is specified, the command displays information only about volumes that are supported (true) or not supported (false). This field indicates whether or not file system analytics is supported on the volume. If file system analytics is not supported, the reason will be specified in the *analytics\_unsupported\_reason* field.

### **`[-analytics-unsupported-reason <text>]` - Reason File System Analytics is not Supported**

If this parameter is specified, the command displays information only about volumes that are not supported with the specified reason. If file system analytics is not supported on the volume, this field provides the reason why.

### **`[-analytics-state <Analytics State>]` - File System Analytics State**

If this parameter is specified, the command displays information only about volumes with file system analytics *on*, *off* or *initializing*. If this value is *on*, ONTAP collects extra file system analytics information for all directories on the volume. There will be a slight impact to I/O performance to collect this information. If this value is *off*, file system analytics information is not collected and not available to be viewed. If this value is *initializing*, that means file system analytics was recently turned on, and the initialization scan to gather information for all existing files and directories is currently running.

### **`[-analytics-scan-progress <percent>]` - File System Analytics Scan Progress**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified file system analytics progress percentage. This value will only be set if a file system analytics initialization scan is in progress.

### **`[-analytics-files-scanned <integer>]` - File System Analytics Files Scanned Progress**

If this parameter is specified, the command displays information only about the volume or volumes that have the number of files scanned in the file system. This value will only be set if a file system analytics initialization scan is in progress.

### **`[-analytics-total-files <integer>]` - File System Analytics Total Files**

If this parameter is specified, the command displays information only about the volume or volumes that have the total files in the file system analytics progress percentage. This value will only be set if a file system analytics initialization scan is in progress.

### **`[-activity-tracking-state <Activity Tracking State>]` - Activity Tracking State**

If this parameter is specified, the command displays information only about volumes with volume activity tracking *on* or *off*. If this value is *on*, ONTAP tracks volume activity in real time to provide a more detailed view. There will be a slight impact to I/O performance to collect this information. If this value is *off*, activity is not tracked and not available to be viewed.

### **`[-is-activity-tracking-supported {true|false}]` - Is Activity Tracking Supported**

If this parameter is specified, the command displays information only about volumes that are supported (true) or not supported (false). This field indicates whether or not volume activity tracking is supported on the volume. If volume activity tracking is not supported, the reason will be specified in the *activity\_tracking\_unsupported\_reason* field.

### **`[-activity-tracking-unsupported-reason <text>]` - Reason Activity Tracking Is Not Supported**

If this parameter is specified, the command displays information only about volumes that are not supported with the specified reason. If volume activity tracking is not supported on the volume, this field provides the reason why.

### **`[-is-smbc-master {true|false}]` - Is SnapMirror Active Sync Master**

If this parameter is specified, it displays if the volume is acting as a SnapMirror active sync master.

### **`[-is-smbc-failover-capable {true|false}]` - Is SnapMirror Active Sync Failover Capable**

This parameter specifies if volume is capable of SnapMirror active sync failover.

### **`[-smbc-consensus {Awaiting-consensus|Consensus|No-consensus}]` - SnapMirror Active Sync Consensus**

This parameter specifies the SnapMirror active sync consensus value.

Consensus indicated if cluster has to serve IO. Possible consensus values:

- Consensus Awaiting: Allow IO
- Consensus: Allow IO
- No consensus: Do not allow IO

### **`[-anti-ransomware-state {disabled|enabled|dry-run|paused|dry-run-paused|enable-paused|disable-in-progress}]` - Anti-ransomware State**

If this parameter is specified, the command displays information only about the volumes that have the specified Anti-ransomware-state. The possible values are *disabled*, *enabled*, *dry-run*, *dry-run-paused*, *enable-paused* or *disable-in-progress*. The value *disabled* is used for volumes which do not have Anti-ransomware feature enabled. The value is *enabled* when Anti-ransomware feature is enabled on the volume. If the value is *dry-run*, the volume is in Anti-ransomware evaluation mode. The value is *dry-run-paused* when the Anti-ransomware feature is paused from evaluation mode on the volume. The value is *enable-paused* when the Anti-ransomware feature is paused on the volume. The value is *disable-in-progress* when disable work is in progress on the volume.

**[-granular-data {disabled|basic|advanced}] - Granular data**

If this parameter is specified, the command displays information only about volumes that match the specified value for whether data storage on the volume is granular or not.

**[-atime-update-period <integer>] - Access Time Update Period (Seconds) (privilege: advanced)**

"If this parameter is specified, the command displays information only about volumes that match the specified value for the atime update period."

**[-snapshot-locking-enabled {true|false}] - Enable Snapshot Copy Locking**

"If this parameter is specified, the command displays information only about volumes that match the specified -snapshot-locking-enabled value. A volume with locked snapshots cannot be deleted until the -expiry-time has passed."

**[-expiry-time <text>] - Expiry Time**

If this parameter is specified, the command displays all the volumes that match the specified -expiry-time value.

**[-compliance-clock-time <text>] - ComplianceClock Time**

If this parameter is specified, the command displays all the volumes that match the specified -compliance-clock-time value.

**[-is-large-size-enabled {true|false}] - Are Large Size Volumes and Files Enabled**

If this parameter is specified, the command displays all the volumes that match the specified -is-large-size-enabled value.

**[-is-preserve-unlink-enabled {true|false}] - Is Preserve Unlink Enabled (privilege: advanced)**

If this parameter is specified, the command displays information only about volumes that match the specified -is-preserve-unlink-enabled value.

**[-is-cloud-write-enabled {true|false}] - Is Cloud Write Enabled (privilege: advanced)**

If this parameter is specified, the command displays all the volumes that match the specified -is-cloud-write-enabled value.

**[-aggressive-readahead-mode**

**{none|file\_prefetch|sequential\_read|cross\_file\_sequential\_read}] - Aggressive readahead mode (privilege: advanced)**

If this parameter is specified, the command displays all the volumes that match the specified -aggressive-readahead-mode value.

**[-in-consistency-group {true|false}] - If this Volume is part of a Consistency Group**

This parameter specifies if this volume is associated with a consistency group.

**[-total-metadata {<integer>[KB|MB|GB|TB|PB]}] - Total Metadata Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space used by metadata in the volume. This field will not include the metadata of the volume which is residing inside the aggregate.

**[`-total-metadata-footprint` {<integer>[KB|MB|GB|TB|PB]}] - Total Metadata Footprint Used in Aggregate**

If this parameter is specified, the command displays information only about volume or volumes that have the specified amount of space used by volume metadata footprint in the aggregate. The value of this field will be higher than the field 'total-metadata' from the [volume show-space](#) command output since this includes additional metadata of the volume in the aggregate.

**[`-has-dir-index-public` {true|false}] - Volume Has Directories with Public Index File (privilege: advanced)**

If this parameter is specified, the command displays information only about volumes that if it has directories with public index files.

**[`-is-dir-index-transfer-enabled` {true|false}] - Is Directory Index Transfer Enabled**

If this parameter is specified, the command displays all the volumes that match the specified `-is-dir-index-transfer-enabled` value.

## Examples

The following example displays information about all volumes on the Vserver named vs1:

```
cluster1::> volume show -vserver vs1
```

| Vserver | Volume  | Aggregate | State  | Type | Size  | Available |
|---------|---------|-----------|--------|------|-------|-----------|
| Used%   |         |           |        |      |       |           |
| vs1     | vol1    | aggr1     | online | RW   | 2GB   | 1.9GB     |
| 5%      |         |           |        |      |       |           |
| vs1     | vol1_dr | aggr0_dp  | online | DP   | 200GB | 160.0GB   |
| 20%     |         |           |        |      |       |           |
| vs1     | vol2    | aggr0     | online | RW   | 150GB | 110.3GB   |
| 26%     |         |           |        |      |       |           |
| vs1     | vol2_dr | aggr0_dp  | online | DP   | 150GB | 110.3GB   |
| 26%     |         |           |        |      |       |           |
| vs1     | vol3    | aggr1     | online | RW   | 150GB | 120.0GB   |
| 20%     |         |           |        |      |       |           |
| vs1     | vol3_dr | aggr1_dp  | online | DP   | 150GB | 120.0GB   |
| 20%     |         |           |        |      |       |           |
| vs1     | vol4    | aggr1     | online | RW   | 200GB | 159.8GB   |
| 20%     |         |           |        |      |       |           |
| vs1     | vol4_dr | aggr1_dp  | online | DP   | 200GB | 159.8GB   |
| 20%     |         |           |        |      |       |           |
| vs1     | vol5    | aggr2     | online | RW   | 200GB | 102.3GB   |
| 48%     |         |           |        |      |       |           |
| vs1     | vol5_dr | aggr2_dp  | online | DP   | 200GB | 102.3GB   |
| 48%     |         |           |        |      |       |           |
| vs1     | vol6    | aggr2     | online | RW   | 150GB | 117.2GB   |
| 21%     |         |           |        |      |       |           |

|     |          |          |        |    |       |         |     |
|-----|----------|----------|--------|----|-------|---------|-----|
| vs1 | vol6_dr  | aggr2_dp | online | DP | 150GB | 117.2GB | 21% |
| vs1 | vol7     | aggr3    | online | RW | 150GB | 118.5GB | 20% |
| vs1 | vol7_dr  | aggr3_dp | online | DP | 150GB | 118.5GB | 20% |
| vs1 | vol8     | aggr3    | online | RW | 150GB | 90.03GB | 39% |
| vs1 | vol8_dr  | aggr3_dp | online | DP | 150GB | 90.03GB | 39% |
| vs1 | vol9     | aggr4    | online | RW | 150GB | 43.67GB | 70% |
| vs1 | vol9_dr  | aggr4_dp | online | DP | 150GB | 43.67GB | 70% |
| vs1 | vol10    | aggr4    | online | RW | 150GB | 108.7GB | 27% |
| vs1 | vol10_dr | aggr4_dp | online | DP | 150GB | 108.7GB | 27% |

# volume size

Set/Display the size of the volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume size` command allows the user to set or display the volume size. If *new-size* is not specified then the current volume size is displayed.

## Parameters

**-vserver <vserver name> - Vserver Name**

This parameter can be used to specify the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to set or display the size.

**[-new-size {<integer>[KB|MB|GB|TB|PB] }] - [+|-]<New Size>**

This optional parameter specifies the size of the volume. It can be used to set the volume size to a particular number or grow/shrink the size by a particular amount. The size is specified as a number (preceded with a sign for relative growth/shrinkage) followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a flexible volume is 20 MB, and the maximum size depends on hardware platform and free space in the containing aggregate. If the volume's space guarantee is currently disabled, its size cannot be increased.

## Examples

The following example shows the size of a volume called vol1.

```
cluster1::> vol size vol1
(volume size)
vol size: Flexible volume 'vs1:vol1' has size 2g.
```

The following example sets the size of a volume called vol1 to 1GB.

```
cluster1::> vol size vol1 1g
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1g.
```

The following example increases the size of a volume called vol1 by 500MB.

```
cluster1::> vol size vol1 +500m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.49g.
```

The following example decreases the size of a volume called vol1 by 250MB.

```
cluster1::> vol size vol1 -250m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.24g.
```

## volume transition-prepare-to-downgrade

Verifies that there are no volumes actively transitioning from 7-mode to clustered Data ONTAP, and configures the transition feature for downgrade.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume transition-prepare-to-downgrade` command is used to verify that a volume is not currently being transitioned from 7-Mode to ONTAP. This check must be done before reverting or downgrading a node.

### Parameters

### Examples

The following example executes the `volume transition-inactive-verify` command during active volume transitions.

```
cluster1::*> volume transition-prepare-to-downgrade
```

Error: command failed: Downgrade cannot proceed because one or more volumes are transitioning from 7-Mode to ONTAP.

You must complete or cancel all transitions. View the transitioning volumes that are preventing the downgrade by using the (privilege: advanced) command "`lun transition show -status active -fields vserver, volume`".

To complete a transition, break the SnapMirror transition relationship using the command "`snapmirror break -destination-path <destination-path>`".

For detailed information about transitioning, refer to the "7-Mode Data Transition Using SnapMirror" guide.

To cancel a transition, contact technical support.

# volume unmount

Unmount a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume unmount` command unmounts a volume from its parent volume. The volume can be remounted at the same or a different location by using the [volume mount](#) command.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that is to be unmounted.

## Examples

The following example unmounts a volume named vol2 on a Vserver named vs0:

```
node::> volume unmount -vserver vs0 -volume vol2
```

# volume activity-tracking commands

## volume activity-tracking off

Disable activity tracking for a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume activity-tracking off` command disables volume activity tracking on a volume.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which volume activity tracking is being disabled.

### **[`-foreground <true>`] - Run Operation in the Foreground**

If true, the command doesn't complete until the volume activity tracking state is *off*. If false, the command returns immediately, and the volume activity tracking state can be tracked using the [volume activity-tracking show](#) command.

### **Examples**

The following examples disable volume activity tracking on a volume.

```
cluster::*> volume activity-tracking off -vserver vs1 -volume fv1
```

```
cluster::*> volume activity-tracking off -vserver vs1 -volume fg1
```

### **Related Links**

- [volume activity-tracking show](#)

## **volume activity-tracking on**

Enable activity tracking for a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume activity-tracking on` command enables volume activity tracking on a volume.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver in which the volume is located.

#### **`-volume <volume name>` - Volume Name**

This specifies the name of the volume on which volume activity tracking is being enabled.

### **[`-foreground <true>`] - Run Operation in the Foreground**

If true, the command doesn't complete until the volume activity tracking state is *on*. If false, the command returns immediately, and the volume activity tracking state can be tracked using the [volume activity-tracking show](#) command.

### **Examples**

The following examples enable volume activity tracking on a volume.

```
cluster::*> volume activity-tracking on -vserver vs1 -volume fv1
```

```
cluster::*> volume activity-tracking on -vserver vs1 -volume fg1
```

## Related Links

- [volume activity-tracking show](#)

## volume activity-tracking show

Display activity tracking information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume activity-tracking show` command displays the volume activity tracking information for a volume. By default, the command displays the following information:

- Vserver name
- Volume name
- Activity tracking state

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays volume activity tracking information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays volume activity tracking information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-state <Activity Tracking State>] - State**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified volume activity tracking state.

## Examples

The following examples display the volume activity tracking information for a volume.

```
cluster::*> volume activity-tracking show -vserver vs1 -volume fv1
Vserver Name: vs1
Volume Name: fv1
State: on
```

```
cluster::*> volume activity-tracking show -vserver vs1 -volume fg1
Vserver Name: vs1
Volume Name: fg1
State: on
```

## volume analytics commands

### volume analytics off

Disable collection of file system analytics for a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume analytics off` command disables file system analytics on a volume.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which file system analytics is being disabled.

**[-foreground <true>] - Run Operation in the Foreground**

If true, the command doesn't complete until the `analytics-state` of the volume is *off*. If false, the command returns immediately, and the `analytics-state` can be tracked using the [volume analytics show](#) command.

#### Examples

The following example disables file system analytics on a flexible volume named "flexvol" in Vserver "vs1":

```
cluster::*> volume analytics off -vserver vs1 -volume flexvol
```

#### Related Links

- [volume analytics show](#)

## volume analytics on

Enable collection of file system analytics for a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume analytics on` command enables file system usage analytics on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which file system usage analytics is being enabled.

**[-foreground <true>] - Run Operation in the Foreground**

If true, the command doesn't complete until the `analytics-state` of the volume is *on*. If false, the command returns immediately, and the `analytics-state` and `scan-progress` can be tracked using the [volume analytics show](#) command.

### Examples

The following example enables file system usage analytics on a flexible volume named "flexvol" in Vserver "vs1":

```
cluster::*> volume analytics on -vserver vs1 -volume flexvol
```

### Related Links

- [volume analytics show](#)

## volume analytics show

Display file system analytics information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume analytics show` command displays the file system analytics information for a volume. By default, the command displays the following information:

- Vserver name
- Volume name
- File system analytics state

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays file system analytics information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays file system analytics information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-state <Analytics State>] - State**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified file system analytics state.

**[-scan-progress <percent>] - Scan Progress**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified file system analytics progress percentage. This value will only be set if a file system analytics initialization scan is in progress.

**[-tracked-dirs <integer>] - Tracked Directories**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of tracked directories.

**[-tracked-files <integer>] - Tracked Files**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of tracked files.

**[-tracked-items <integer>] - Tracked Items**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of tracked items. An item is either a file or a directory.

**[-top-level-dirs <integer>] - Top Level Directories**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of top level directories.

**[-average-files-per-dir <integer>] - Average Files Per Directory**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified average number of files per directory.

**[-files-scanned <integer>] - Number of Files Scanned**

If this parameter is specified, the command displays information only about the volume or volumes that

have the specified number of files scanned. This value will only be set if a file system analytics initialization scan is in progress.

#### **[`-total-files <integer>`] - Total Number of Files**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified total number of files. This value will only be set if a file system analytics initialization scan is in progress.

### **Examples**

The following example displays the file system analytics information on a flexible volume named "flexvol" in Vserver "vs1":

```
cluster::*> volume analytics show -vserver vs1 -volume flexvol
Vserver Name: vs1
  Volume Name: flexvol
    State: on
  Scan Progress: -
```

## **volume analytics cluster-config modify**

Modify the file system analytics cluster configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `volume analytics cluster-config modify` command modifies the cluster level file system analytics configuration.

### **Parameters**

#### **[`-is-enabled-by-default {true|false}`] - Is Enabled by Default**

This parameter controls whether file system analytics is enabled by default on all newly created Vservers. The default value is `true`.

### **Examples**

The following example modifies the cluster level file system analytics configuration:

```
cluster::*> volume analytics cluster-config modify -is-enabled-by-default
true
```

## **volume analytics cluster-config reset**

Reset the file system analytics cluster configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `volume analytics cluster-config reset` command resets the cluster-level file system analytics configuration to the platform default.

## Examples

The following example resets the cluster level file system analytics configuration:

```
cluster::*> volume analytics cluster-config reset
```

## volume analytics cluster-config show

Display the file system analytics cluster configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `volume analytics cluster-config show` command displays the cluster level file system analytics configuration. By default, the command displays the following information:

- Is Enabled by Default

## Examples

The following example displays information about the cluster level file system analytics configuration:

```
cluster::*> volume analytics cluster-config show
Is Enabled by Default: True
```

## volume analytics initialization pause

Pause the analytics file system scan

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume analytics initialization pause` command pauses the file system analytics scan.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which file system analytics initialization is being paused.

## Examples

The following example pauses the file system analytics scan on a volume named "vol1" in Vserver "vs1":

```
cluster::*> volume analytics initialization pause -vserver vs1 -volume  
vol1
```

## volume analytics initialization resume

Resume the analytics file system scan

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume analytics initialization resume` command resumes the file system analytics scan.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which file system analytics initialization is being resumed.

## Examples

The following example resumes the file system analytics scan on a volume named "vol1" in Vserver "vs1":

```
cluster::*> volume analytics initialization resume -vserver vs1 -volume  
vol1
```

## volume analytics initialization show

Display file system analytics information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume analytics initialization show` command displays the file system analytics initialization information for a volume. By default, the command displays the following information:

- Vserver name
- Volume name
- File system analytics initialization state

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays information only about the volumes in vservers that match the specified value for `-vserver`

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays information only about the volumes that match the specified value for `-volume`

**[-state <Analytics Initialization State>] - State**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified file system analytics initialization state.

## Examples

The following example displays the file system analytics initialization information on a volume named "vol1" in Vserver "vs1":

```
cluster::*> volume analytics initialization show -vserver vs1 -volume vol1
Vserver Name: vs1
  Volume Name: vol1
    State: Running
```

# volume clone commands

## volume clone create

Create a FlexClone volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume clone create` command creates a FlexClone volume on the aggregate containing the specified parent volume. This command is supported for flexible volumes or FlexGroup volumes. The maximum volume clone hierarchy depth is 500 and the default depth is 60. You can optionally specify the following attributes for the new FlexClone volume:

- Vserver on which the parent volume resides
- Name of the FlexClone parent snapshot

- Junction path where FlexClone volume should be mounted
- State of the junction path
- Space guarantee style (none, volume or file)
- Comment
- Whether the `volume clone create` command runs as a foreground or background process
- Key Manager Attribute

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the FlexClone volume is to be created. If only one data Vserver exists, you do not need to specify this parameter.

### **-flexclone <volume name> - FlexClone Volume**

This parameter specifies the name of the FlexClone volume. The name must be unique within the hosting Vserver.

### **[-type {RW|DP}] - FlexClone Type**

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the *type* as DP; otherwise a read-write FlexClone volume is created.

### **[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

This parameter specifies the name of the Vserver to which the FlexClone parent volume belongs. If it is different from the Vserver on which the FlexClone volume is to be created, then the FlexClone volume inherits the export policies from the residing Vserver, and not from the FlexClone parent volume.

### **-b, -parent-volume <volume name> - FlexClone Parent Volume**

This parameter specifies the name of parent volume from which the FlexClone clone volume is derived.

### **[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

This specifies the name of the parent snapshot from which the FlexClone clone volume is derived.

### **[-junction-path <junction path>] - Junction Path**

This specifies the junction path at which the new FlexClone clone volume should be mounted.

### **[-junction-active {true|false}] - Junction Active**

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

### **[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

This optionally specifies the space guarantee style for the FlexClone volume. A value of *volume* reserves space on the aggregate for the entire volume. A value of *none* reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume.

### **[-comment <text>] - Comment**

This optionally specifies a comment for the FlexClone volume.

### **[`-foreground {true|false}`] - Foreground Process**

This optionally specifies whether the FlexClone volume create operation runs as a foreground process. The default setting is `true` (that is, the operation runs in the foreground).

### **{ [`-qos-policy-group <text>`] - QoS Policy Group Name**

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

### **[ [`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name }**

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroup volumes.

### **[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- `none` - Does not cache any user data or metadata blocks.
- `auto` - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- `meta` - Read caches only metadata blocks.
- `random_read` - Read caches all metadata and randomly read user data blocks.
- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read, and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.
- `noread-random_write` - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- `meta-random_write` - Read caches all metadata and write caches randomly overwritten user data blocks.
- `random_read_write-random_write` - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read-random_write` - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read_random_write-random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- `all-random_write` - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is `auto`.

### **`[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection`**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. By default the clone volume will inherit this value from the parent volume.

### **`[-uid <integer>] - Volume-Level UID`**

This parameter optionally specifies a volume-level user ID (UID). All files and directories in a FlexClone volume will inherit this UID. By default the clone volume will inherit this value from the parent volume.

### **`[-gid <integer>] - Volume-Level GID`**

This parameter optionally specifies a volume-level group ID (GID). All files and directories in a FlexClone volume will inherit this GID. By default the clone volume will inherit this value from the parent volume.

### **`[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type`**

This parameter optionally specifies the SnapLock type for the FlexClone volume. The `snaplock-type` can be `compliance`, `enterprise` or `non-snaplock`. By default, the `snaplock-type` will be same as the parent volume.

### **`[-key-manager-attribute <text>] - Key Manager Attribute`**

This optional parameter specifies an additional key manager attribute that should be an identifier-value pair separated by '=', ex. `CRN=my-unique-value`

The following identifiers are currently supported:

- CRN

## **Examples**

The following command creates a FlexClone volume `fc_vol_1` from parent volume `fv2` on Vserver `vs1` and the job runs as a foreground process.

```

cluster1::> volume clone create -vserver vs1 -flexclone fc_vol_1 -parent
-volume fv2 -junction-active true -foreground true -comment "Testing
FlexClone creation"
cluster1::> volume clone show fc_vol_1 -vserver vs1
Vserver Name: vs1
    FlexClone Volume: fc_vol_1
    FlexClone Parent Volume: fv2
    FlexClone Parent Snapshot: clone_fc_vol_1.0
    Junction Path: -
    Junction Active: -
    Space Guarantee Style: volume
    Space Guarantee In Effect: true
    FlexClone Aggregate: test_aggr
    FlexClone Data Set ID: 1046
FlexClone Master Data Set ID: 2147484694
    FlexClone Size: 19MB
    Used Size: 108KB
    Split Estimate: 0.00B
    Inodes processed: -
    Total Inodes: -
    Percentage complete: -
    Blocks Scanned: -
    Blocks Updated: -
    Comment: Testing FlexClone creation

```

## volume clone show

Display a list of FlexClones

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone show` command displays information about FlexClone clone volumes. This command is only supported for flexible volumes. By default, the command displays the following information about all FlexClone volume clones:

- Vserver name
- FlexClone volume name
- Parent volume name
- Parent snapshot name
- Whether a FlexClone volume is online or offline

To display detailed information about all FlexClone volumes, run the command with the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields to be displayed.

**| [-estimate ]**

Displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported may differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed.

**| [-instance ] }**

Displays detailed information about FlexClone volumes. If `-flexclone` is also specified, the command displays detailed information about the FlexClone volume.

**[-vserver <vserver name>] - Vserver Name**

Selects summary information for the FlexClone volumes on the specified Vserver. If `-flexclone` is also specified, the command displays detailed information about the specified FlexClone volume.

**[-flexclone <volume name>] - FlexClone Volume**

Selects summary information for the specified FlexClone volume. If `-vserver` is also specified, the command displays detailed information about the specified FlexClone volume.

**[-type {RW|DP}] - FlexClone Type**

Selects information for the specified type of FlexClone volume. The type can be specified as either read-only (DP) or read-write (RW).

**[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

Selects summary information for the FlexClone volumes that are clone volumes in the specified parent Vserver.

**[-b, -parent-volume <volume name>] - FlexClone Parent Volume**

Selects summary information for the FlexClone volumes that are clones of the specified parent volume.

**[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

Selects summary information for the FlexClone volumes that are clones of the parent volume to which the specified snapshot belongs.

**[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State**

Selects summary information for the FlexClone volumes that are in the specified state.

**[-junction-path <junction path>] - Junction Path**

Selects summary information for the FlexClone volumes that have the specified junction path.

**[-junction-active {true|false}] - Junction Active**

Selects summary information for the FlexClone volumes that have the specified junction path status.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

If this parameter is specified, the command displays information only about the volumes that have the specified space guarantee style.

**[`-space-guarantee-enabled {true|false}`] - Space Guarantee In Effect**

Selects summary information for the FlexClone volumes that have the specified space-guarantee setting.

**[`-aggregate <aggregate name>`] - FlexClone Aggregate**

Selects summary information for the FlexClone volumes that reside on the specified storage aggregate.

**[`-dsid <integer>`] - FlexClone Data Set ID**

Selects summary information for the FlexClone volumes that have the specified Data Set ID.

**[`-msid <integer>`] - FlexClone Master Data Set ID**

Selects summary information for the FlexClone volumes that have the specified Master Data Set ID.

**[`-size {<integer>[KB|MB|GB|TB|PB]}`] - FlexClone Size**

Selects summary information for the FlexClone volumes that have the specified size.

**[`-used {<integer>[KB|MB|GB|TB|PB]}`] - Used Size**

Selects summary information for the FlexClone volumes that have the specified amount of used space.

**[`-split-estimate {<integer>[KB|MB|GB|TB|PB]}`] - Split Estimate**

Selects summary information for the FlexClone volumes that require the specified amount of free disk space for splitting from the parent.

**[`-blocks-scanned <integer>`] - Blocks Scanned**

Selects summary information for the FlexClone volumes that have the specified number of blocks scanned for splitting the FlexClone volume from its parent volume.

**[`-blocks-updated <integer>`] - Blocks Updated**

Selects summary information for the FlexClone volumes that have the specified number of blocks updated for after splitting the FlexClone volume from its parent volume.

**[`-comment <text>`] - Comment**

Selects summary information for the FlexClone volumes that have the specified comment.

**[`-qos-policy-group <text>`] - QoS Policy Group Name**

Selects summary information for the FlexClone volumes that have the specified QoS policy group.

**[`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name**

Selects summary information for the FlexClone volumes that have the specified QoS adaptive policy group.

**[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.

- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

**`[-parent-vol-type <volAccessType>]` - Parent volume type (privilege: advanced)**

Selects summary information for the FlexClone volumes that are clones of the parent volumes with the specified type.

**`[-flexclone-used-percent <percent>]` - FlexClone Used Percentage**

Selects summary information for the FlexClone volumes that have the specified percentage of used space.

**`[-vserver-dr-protection {protected|unprotected}]` - Vserver DR Protection**

Selects summary information for the FlexClone volumes that have the specified type of Vserver SnapMirror protection. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

**`[-block-percentage-complete <integer>]` - Percentage Complete**

Selects summary information for the FlexClone volumes that have specified percentage of Blocks processed for splitting the FlexClone volume from its parent volume.

**`[-uid <integer>]` - Volume-Level UID**

Selects summary information for the FlexClone volumes that are created with the specified volume-level UID.

**`[-gid <integer>]` - Volume-Level GID**

Selects summary information for the FlexClone volumes that are created with the specified volume-level GID.

**[-flexgroup-uuid <UUID>] - UUID of the FlexGroup**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume UUID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**[-flexgroup-msid <integer>] - FlexGroup Master Data Set ID**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume master data-set ID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**[-flexgroup-index <integer>] - FlexGroup Index**

If this parameter is specified, the command displays information only about the FlexGroup volume constituents that have the specified FlexGroup volume index. This parameter applies to FlexGroup volume constituents only.

**[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volumes that have the specified maximum constituent size. This parameter applies to FlexGroup volumes only.

**[-constituent-role <Constituent Roles>] - Constituent Volume Role**

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to FlexGroup volumes only.

**[-is-flexgroup-constituent-active {true|false}] - Is Active FlexGroup Constituent**

If this parameter is specified, the command displays information only about the volume or volumes that are either active constituent of the FlexGroup or not, depending on the value provided.

**[-is-constituent {true|false}] - Is Constituent Volume**

If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

**[-is-flexgroup {true|false}] - Is Volume a FlexGroup**

If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroup volumes or not, depending on the value provided.

**[-volume-style-extended {flexvol|flexgroup|flexgroup-constituent}] - Extended Volume Style**

If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are *flexvol* for FlexVol volumes, *flexgroup* for FlexGroup volumes and *flexgroup-constituent* for FlexGroup constituents.

**[-snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

Selects summary information for the FlexClone volumes that are created with the specified SnapLock type.

**[-is-sharing-by-split {true|false}] - Sharing by Split**

This flag represent whether the clone split is sharing by physical block or not.

## Examples

The following example displays detailed information about all FlexClone volumes on Vserver *vs0*:

```
cluster1::> volume clone show -vserver vs0
(volume clone show)
Vserver    FlexClone    Parent-Volume    Parent-Snapshot
-----
vs0        fc_vol_1     test_vol         clone_fc_vol_1.0
          fc_vol_2     test_vol2        clone_fc_vol_2.0
          fc_vol_3     tv9              clone_fc_vol_3.0
          tv8        tv7              clone_tv8.0
          tv9        test_vol2        clone_tv9.0
5 entries were displayed.
```

The following example displays detailed information about FlexClone volume *fc\_vol\_2* on Vserver *vs0*:

```
cluster1::> volume clone show -vserver vs0 -flexclone fc_vol_2
Vserver Name: vs0
    FlexClone Volume: fc_vol_2
    FlexClone Parent Volume: test_vol2
    FlexClone Parent Snapshot: clone_fc_vol_2.0
        Junction Path: -
        Junction Active: -
    Space Guarantee Style: volume
    Space Guarantee In Effect: true
    FlexClone Aggregate: test_aggr
    FlexClone Data Set ID: 1038
    FlexClone Master Data Set ID: 2147484686
        FlexClone Size: 47.50MB
            Used Size: 128KB
        Split Estimate: 0.00B
    Inodes processed: -
        Total Inodes: -
    Inode Percentage complete: -
        Blocks Scanned: -
        Blocks Updated: -
        Comment:
    Qos Policy Group Name: pg1
    FlexClone Parent Volume Type: RW
    Block Percentage complete: -
```

The following example displays summary information about all FlexClone volumes residing on Vserver *vs0* along with the fields *msid*, *dsid*, *state* and *parent-volume*.

```
cluster1::> volume clone show -vserver vs0 -fields msid, dsid, state,
parent-volume
vserver flexclone parent-volume state dsid msid
-----
vs0      fc_vol_1  test_vol      online 1037 2147484685
vs0      fc_vol_3  tv9           online 1039 2147484687
vs0      flex_clone1
                fc_vol_1      online 1041 2147484689
vs0      fv_2      fc_vol_1      online 1043 2147484691
vs0      tv9      test_vol2     online 1036 2147484684
5 entries were displayed.
```

The following example displays summary information about all FlexClone volumes residing on Vserver *vs0* along with space-guarantee-enabled and space-guarantee information about each FlexClone volume.

```
cluster1::> vol clone show -vserver vs0 -fields space-guarantee-enabled,
space-guarantee
(volume clone show)
vserver flexclone space-guarantee space-guarantee-enabled
-----
vs0      fc_vol_1  volume      true
vs0      fc_vol_3  volume      true
vs0      flex_clone1
                volume      true
vs0      fv_2      volume      true
vs0      tv9      volume      true
5 entries were displayed.
```

## volume clone sharing-by-split show

Show the split flexclone volumes with shared physical blocks

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split show` command displays the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, this command displays the following information:

- Node Name
- Vserver Name
- Volume Name
- Aggregate Name

- Volume State

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ](privilege: advanced) ]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node Name (privilege: advanced)**

This parameter selects information about the split volumes with shared physical blocks on this node.

**[`-vserver <Vserver Name>`] - Vserver Name (privilege: advanced)**

This parameter selects information about the split volumes with shared physical blocks on this Vserver.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

This parameter selects information about shared physical blocks for this volume.

**[`-aggregate <aggregate name>`] - Aggregate Name (privilege: advanced)**

This parameter specifies the aggregate associated with the given volume.

## Examples

The following example displays the split volumes with shared physical blocks in the node:

```
cluster1::> volume clone sharing-by-split show -node node1
Node           Vserver    Volume      Aggregate
-----
node1          vs1        vol_clone1   aggr1
```

The following example displays information about volume `vol_clone1` residing on vs server `vs1`:

```
cluster1::> volume clone sharing-by-split show -node node1 -vserver vs1
-volume vol_clone1 -instance
Node Name: node1
          Vserver Name: vs1
          Volume Name: vol_clone1
          Aggregate Name: aggr1
```

## volume clone sharing-by-split undo show

Show the status of volume clone undo-sharing operations in-progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo show` command displays the progress information of undo-sharing in the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, the command displays the following information:

- Vserver name
- Volume name
- Total number of blocks scanned for undo sharing
- Total number of blocks present
- Percentage of blocks processed

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[ -instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)`

This parameter selects information about the ongoing undo-sharing scan for all volumes on this Vserver.

`[-volume <volume name>] - Volume Name (privilege: advanced)`

This parameter selects information about the ongoing undo-sharing scan on this volume.

`[-blocks-scanned <integer>] - Scanned Blocks (privilege: advanced)`

This parameter selects information about the total number of blocks scanned by undo-sharing in the given volume.

`[-blocks-total <integer>] - Total Blocks (privilege: advanced)`

This parameter selects information about the total number of blocks for the undo-sharing to scan in the given volume.

`[-blocks-percentage-complete <integer>] - Blocks Percentage Complete (privilege: advanced)`

This parameter selects information about the percentage of block processing completed by undo-sharing in the given volume.

Examples

The following example displays information about all the ongoing undo-sharing scan in the cluster:

```
cluster1::> volume clone sharing-by-split undo show
```

| Vserver | Volume     | Blocks Scanned | Blocks Total | Blocks % Complete |
|---------|------------|----------------|--------------|-------------------|
| vs1     | vol_clone1 | 0              | 1260         | 0                 |

The following example displays information about volume `vol_clone1` residing on vservers `vs1`:

```
cluster1::> volume clone sharing-by-split undo show -vservers vs1 -volume
vol_clone1 -instance
Vserver Name: vs1
    Volume Name: vol_clone1
        Blocks Scanned: 0
        Blocks Total: 1260
    Block Percentage complete: 0
```

## volume clone sharing-by-split undo start-all

Undo the physical block sharing in split FlexClone volumes across the cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split undo start-all` command starts a scan to undo the shared physical blocks in all the relevant volumes across the cluster. The volumes will be available for the duration of the undo-sharing operation. You can monitor the current progress of the scan using the [volume clone sharing-by-split undo show](#) command. This command is supported for flexible volumes that were split from their parent volumes.

### Examples

The following example starts the scan to undo the physical block sharing in all volumes across the cluster:

```
cluster1::> volume clone sharing-by-split undo start-all
```

### Related Links

- [volume clone sharing-by-split undo show](#)

## volume clone sharing-by-split undo start

Undo the physical block sharing in split FlexClone volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split undo start` command starts a scan to undo the shared physical blocks in the given volume. The volume will be available for the duration of the undo-sharing operation. After the scan starts, you can stop it using the [volume clone sharing-by-split undo stop](#) command. You can monitor the current progress of the scan using the [volume clone sharing-by-split undo show](#) command. This command is supported for flexible volumes that were split from their parent volumes.

## Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the vserver that the volume exists on.

**-volume <volume name> - Volume Name (privilege: advanced)**

This parameter specifies the split volume with shared physical blocks, in which the sharing will be undone.

## Examples

The following example starts the scan to undo the physical block sharing in volume *vol\_clone1* on vserver *vs1*:

```
cluster1::> volume clone sharing-by-split undo start -vserver vs1 -volume vol_clone1
```

## Related Links

- [volume clone sharing-by-split undo stop](#)
- [volume clone sharing-by-split undo show](#)

## volume clone sharing-by-split undo stop

Stop an ongoing undo-sharing operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume clone sharing-by-split undo stop` command stops the process of reverting the shared physical blocks from the split volume. If you restart the undo-sharing operation, scan begins from the beginning because no information about previously achieved progress is saved, but previously unshared blocks are not processed again. This command is only supported for flexible volumes.

## Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the vserver that the volume exists on.

**-volume <volume name> - Volume Name (privilege: advanced)**

This parameter specifies the volume whose unsharing of blocks will be stopped.

## Examples

The following example stops an ongoing undo-sharing scan for volume *vol\_clone1* on vserver *vs1*:

```
cluster1::> volume clone sharing-by-split undo stop -vserver vs1 -volume vol_clone1
```

## volume clone split estimate

Estimates the space required by the containing-aggregate to split the FlexClone volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone split estimate` command displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported might differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed. This command is only supported for flexible volumes.

### Parameters

#### **[-vserver <vserver name>] - Vserver Name**

This specifies the estimates for free disk space required for splitting FlexClone volumes residing on this Vserver. If the `-flexclone` option is also specified, then the command displays the free disk space estimate only for the specified FlexClone volume residing on the specified Vserver.

#### **[-flexclone <volume name>] - FlexClone Volume**

This specifies the free disk space estimate for splitting this FlexClone volume.

#### **[-type {RW|DP}] - FlexClone Type**

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the *type* as `DP`; otherwise a read-write FlexClone volume is created.

#### **[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones in the specified parent Vserver.

#### **[-b, -parent-volume <volume name>] - FlexClone Parent Volume**

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent volume.

#### **[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent snapshot.

#### **[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state.

#### **[-junction-path <junction path>] - Junction Path**

This specifies the free disk space estimates for splitting the FlexClone volumes mounted at this junction path.

#### **[-junction-active {true|false}] - Junction Active**

If this specified, the command displays the free disk space estimate for splitting the FlexClone volumes with the specified junction path status.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified type of space guarantee.

**[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state of space guarantee.

**[-aggregate <aggregate name>] - FlexClone Aggregate**

This specifies the free disk space estimates for splitting the FlexClone volumes residing on the specified aggregate.

**[-dsid <integer>] - FlexClone Data Set ID**

This specifies the free disk space estimates for splitting the FlexClone volume with the specified DSID (data set ID).

**[-msid <integer>] - FlexClone Master Data Set ID**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified MSID (master data set ID).

**[-size {<integer>[KB|MB|GB|TB|PB]}] - FlexClone Size**

This specifies the free disk space estimates for splitting FlexClone volumes with the specified size.

**[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified amount of used disk space.

**[-split-estimate {<integer>[KB|MB|GB|TB|PB]}] - Split Estimate**

This specifies the free disk space estimates for splitting the FlexClone volumes which match with the specified free disk space estimate for splitting.

**[-blocks-scanned <integer>] - Blocks Scanned**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been scanned.

**[-blocks-updated <integer>] - Blocks Updated**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been updated.

**[-comment <text>] - Comment**

This specifies the free disk space estimates for splitting the FlexClone volumes that have the specified value for the comment field.

**[-qos-policy-group <text>] - QoS Policy Group Name**

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

**[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name**

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroup volumes.

**[-caching-policy <text>] - Caching Policy Name**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified caching policy.

**[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones of the parent volumes with the specified type.

**[-flexclone-used-percent <percent>] - FlexClone Used Percentage**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified percentage of used space.

**[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified Vserver SnapMirror protection.

**[-block-percentage-complete <integer>] - Percentage Complete**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Block processing has been completed.

**[-uid <integer>] - Volume-Level UID**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level UID.

**[-gid <integer>] - Volume-Level GID**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level GID.

**[-flexgroup-uuid <UUID>] - UUID of the FlexGroup**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume UUID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**[-flexgroup-msid <integer>] - FlexGroup Master Data Set ID**

If this parameter is specified, the command displays information only about the FlexGroup volume or FlexGroup volume constituents that have the specified FlexGroup volume master data-set ID. This parameter applies to FlexGroup volumes and FlexGroup volume constituents only.

**[-flexgroup-index <integer>] - FlexGroup Index**

If this parameter is specified, the command displays information only about the FlexGroup volume constituents that have the specified FlexGroup volume index. This parameter applies to FlexGroup volume constituents only.

**[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent**

If this parameter is specified, the command displays information only about the FlexGroup volume or

FlexGroup volumes that have the specified maximum constituent size. This parameter applies to FlexGroup volumes only.

**`[-constituent-role <Constituent Roles>]` - Constituent Volume Role**

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to FlexGroup volumes only.

**`[-is-flexgroup-constituent-active {true|false}]` - Is Active FlexGroup Constituent**

If this parameter is specified, the command displays information only about the volume or volumes that are either active constituent of the FlexGroup or not, depending on the value provided.

**`[-is-constituent {true|false}]` - Is Constituent Volume**

If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

**`[-is-flexgroup {true|false}]` - Is Volume a FlexGroup**

If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroup volumes or not, depending on the value provided.

**`[-volume-style-extended {flexvol|flexgroup|flexgroup-constituent}]` - Extended Volume Style**

If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are *flexvol* for FlexVol volumes, *flexgroup* for FlexGroup volumes and *flexgroup-constituent* for FlexGroup constituents.

**`[-snaplock-type {non-snaplock|compliance|enterprise}]` - SnapLock Type**

If this parameter is specified, the command displays information only about the volumes that are configured with the specified SnapLock type. Possible values are *compliance* for SnapLock Compliance volumes, *enterprise* for SnapLock Enterprise volumes and *non-snaplock* for non-SnapLock volumes.

**`[-is-sharing-by-split {true|false}]` - Sharing by Split**

This flag represent whether clone split is sharing by physical block or not.

## Examples

The following example displays the FlexClone split free disk space estimates for the FlexClone volumes residing on Vserver *vs0*.

```
cluster1::> volume clone split estimate -vserver vs0
(volume clone split estimate)
      Split
Vserver  FlexClone  Estimate
-----  -
vs0      fc_vol_1    851.5MB
         fc_vol_3     0.00B
         flex_clone1  350.3MB
         fv_2         47.00MB
         tv9          0.00B
5 entries were displayed.
```

## volume clone split show

Show the status of FlexClone split operations in-progress

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone split show` command displays the progress information of all the active FlexClone volume splitting jobs. This command is only supported for flexible volumes. By default, this command displays the following information:

- Vserver name
- FlexClone volume name
- Percentage of blocks processed
- Total number of blocks scanned for clone splitting
- Total number of blocks updated for clone splitting

If the `-instance` option is also specified, detailed information about all splitting jobs is displayed.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields to be displayed, for all the ongoing FlexClone splitting jobs.

**| [-instance ] }**

This specifies the command to display detailed information about the ongoing FlexClone volume splitting jobs.

**[-vserver <vserver name>] - Vserver Name**

Selects information about the ongoing FlexClone volume splitting jobs for all FlexClone volumes on this Vserver.

**[-flexclone <volume name>] - FlexClone Volume**

Selects information about ongoing FlexClone volume splitting jobs for this FlexClone volume.

### **[-block-percentage-complete <integer>] - Percentage Complete**

Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Block processing completed.

### **[-blocks-scanned <integer>] - Blocks Scanned**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks scanned.

### **[-blocks-updated <integer>] - Blocks Updated**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks updated.

### **[-is-sharing-by-split {true|false}] - Sharing by Split**

This flag represent whether the split type is sharing by physical block or not.

## **Examples**

The following example displays information about all the ongoing FlexClone splitting jobs in the cluster.

```
cluster1::> volume clone split show
(volume clone split show)

```

| Vserver | FlexClone | Blocks  |         | % Complete |
|---------|-----------|---------|---------|------------|
|         |           | Scanned | Updated |            |
| vs1     | fc_vol_1  | 229     | 2       | 0          |

The following example displays information about FlexClone volume *fc\_vol\_2* residing on Vserver *vs0*.

```
cluster1::> volume clone split show -vserver vs0 -flexclone fc_vol_2
-instance
(volume clone split show)
Vserver Name: vs0
FlexClone Volume: fc_vol_2
Percentage Complete: 0
Blocks Scanned: 229
Blocks Updated: 2
```

## **volume clone split start**

Split a FlexClone from the parent volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume clone split start` command starts a job to separate the FlexClone volume from the underlying parent volume. Both, the parent and the FlexClone volumes will be available for the duration of the split operation. After the job starts, you can stop it using the [volume clone split stop](#) command. You can also stop the job using the [job stop](#) command. You can monitor the current progress of the job using the [volume clone split show](#) and [job show](#) commands. This command is only supported for flexible volumes. This command is not supported on volumes that are being protected as part of a Vserver level SnapMirror.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver that the FlexClone volume exists on.

### **-flexclone <volume name> - FlexClone Volume**

This specifies the FlexClone volume that will be split from its parent volume.

### **[-foreground <true>] - Foreground Process**

This specifies whether the clone splitting job will run as a foreground job. The default value of this option is `true`.

### **[-match-parent-storage-tier {true|false}] - Match Split Data to Parent Storage Tier**

This specifies whether the FlexClone volume splits the data blocks by matching its parent storage tier. This option is applicable only if the tiering policy and the tiering minimum cooling days of the parent volume and the FlexClone volume are the same. The default value of this option is `false`.

## Examples

The following example starts splitting FlexClone volume `fc_vol_1` on Vserver `vs1` as a foreground job.

```
cluster1::> volume clone split start -vserver vs1 -flexclone fc_vol_1
-foreground true
```

## Related Links

- [job show](#)

## volume clone split stop

Stop an ongoing FlexClone split job

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume clone split stop` command stops the process of separating the FlexClone volume from its

underlying parent volume, but does not lose any of the progress achieved while the split process was active. That is, all the clone volume blocks already separated from the parent volume remain separated. If you restart the split operation, splitting process begins from the beginning because no information about previously achieved progress is saved, but previously split blocks are not re-split. This command is only supported for flexible volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver that the FlexClone volume exists on.

### **-flexclone <volume name> - FlexClone Volume**

This specifies the FlexClone volume whose separation from the parent volume will be stopped.

## Examples

The following example stops an ongoing clone splitting job for FlexClone volume *fc\_vol\_1* on Vserver *vs1*.

```
cluster1::> volume clone split stop -vserver vs1 -flexclone fc_vol_1
```

# volume conversion commands

## volume conversion start

Convert a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume conversion start` command converts a volume.

## Parameters

### **-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver in which the volume is located.

### **-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume to convert.

### **[-check-only <true>] - Validate the Conversion Only (privilege: advanced)**

If true, this specifies whether the command will only validate that the conversion can be done, and that the volume will not be converted. The default value is false.

### **[-foreground <true>] - Foreground Process (privilege: advanced)**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to true, the command will not return until the operation completes.

## Examples

The following example validates and converts a flexible volume named "flexvol" in Vserver "vs1" to a FlexGroup:

```
cluster::*> volume conversion start -vserver vs1 -volume flexvol
```

The following example validates whether flexible volume named "flexvol" in Vserver "vs1" can be converted to a FlexGroup:

```
cluster::*> volume conversion start -vserver vs1 -volume flexvol -check  
-only
```

## volume conversion validation show

Show the result of volume conversion pre checks.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume conversion validation show` command displays the results of volume conversion validation for volumes.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If this parameter is specified, the command displays information only about the conversion operations that are running on volumes on the specified Vserver.

**`[-volume <volume name>] - Volume (privilege: advanced)`**

If this parameter is specified, the command displays information only about the conversion operations on the specified volume.

**`[-precheck <Volume conversions pre check>] - Volume Feature (privilege: advanced)`**

If this parameter is specified, the command displays information only about the specified conversion pre checks.

**`[-status <Feature status for volume conversion>] - Feature Status (privilege: advanced)`**

If this parameter is specified, the command displays information only about the conversion pre checks with the specified status. The supported statuses are:

- supported - The volume can be converted.
- warn - The volume can be converted, though there may be an issue highlighted by a warning in the error value.
- block - The volume cannot be converted until the specified `action` is taken
- unsupported - The volume cannot be converted.
- error - There was an error performing the pre check.

**[`-error <text>`] - Feature Error (privilege: advanced)**

If this parameter is specified, the command displays information only about the conversion pre checks with the specified error message.

**[`-action <text>`] - Feature Action (privilege: advanced)**

If this parameter is specified, the command displays information only about the onversion pre checks with the specified resolution action.

## Examples

The following example displays all conversion pre checks

```
cluster::*> volume conversion validation show
```

The following example displays all conversion pre checks that block conversion until an action is taken, for volume 'vol1' in Vserver 'vs0'

```
cluster::*> volume conversion validation show -vserver vs0 -volume vol1
-status block
```

# volume efficiency commands

## volume efficiency check

Scrub efficiency metadata of a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

This command verifies and updates the fingerprint database for the specified volume. This command is not supported on FlexGroup volumes or Infinite Volumes that are managed by storage services.

### Parameters

**`-vserver <vserver name>` - Vserver Name (privilege: advanced)**

Specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

Specifies the volume on which the verify operation needs to be started.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

Specifies the volume path on which the verify operation needs to be started.

**[-d, -delete-checkpoint {true|false}] - Delete Checkpoint (privilege: advanced)**

Deletes existing checkpoint.

## Examples

The following example runs `volume efficiency check` with delete checkpoint option turned on.

```
cluster1::*> volume efficiency check -vserver vs1 -volume vol1 -delete  
-checkpoint true
```

## volume efficiency modify

Modify the efficiency configuration of a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

This specifies the volume on which efficiency options need to be modified.

**| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency options need to be modified.

**{ [-schedule <text>] - Schedule**

This option is used to set and modify the schedule.

schedule is [day\_list][@hour\_list] or [hour\_list][@day\_list] or - or auto or manual

The `day_list` specifies the days of the week that an efficiency operation should run. It is a list of the first three letters of the day (sun, mon, tue, wed, thu, fri, sat), separated by a comma. Day ranges such as mon-fri can also be used. The default `day_list` is sun-sat. The names are not case sensitive.

The `hour_list` specifies the hours of each scheduled day that an efficiency operation should run. The `hour_list` is from 0 to 23, separated by a comma. Hour ranges such as 8-17 are allowed. Step values can be used in conjunction with ranges (For example, 0-23/2 means every two hours in a day). The default `hour_list` is 0, i.e. at midnight of each scheduled day.

When efficiency is enabled on a volume for the first time, an initial schedule is assigned to the volume. This initial schedule is sun-sat@0, which means run once every day at midnight.

If "-" is specified, no schedule is set on the volume. The auto schedule string triggers an efficiency operation depending on the amount of new data written to the volume. The manual schedule string prevents SIS from automatically triggering any operations and disables change-logging. This schedule string can only be used on SnapVault destination volumes. The use of this schedule is mainly desirable when inline compression is enabled on a SnapVault destination volume and background processing is not necessary.

Note that schedule and policy are mutually exclusive options.

#### **| [-policy <text>] - Efficiency Policy Name }**

This option is used to set an efficiency policy. The policy cannot be changed to the predefined *inline-only* and *auto* policy when there is an active background operation on the volume. The policies *inline-only* and *none* are not supported on Capacity optimized Flash with QAT supported platforms.

Note that schedule and policy are mutually exclusive options.

#### **{ [-compression {true|false}] - Compression**

This option is used to enable and disable compression. The default value is determined based on the platform.

#### **[-inline-compression {true|false}] - Inline Compression**

This option is used to enable and disable inline compression. Inline compression can be enabled only if *compression* is enabled. The default value is determined based on the platform.

You can use the *inline-only* predefined efficiency policy to run inline compression without the need of any background efficiency operations.

#### **[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)**

This option is used to specify the size of compression group on the volume. The default value is determined based on the platform.

#### **| [-storage-efficiency-mode {default|efficient}] - Storage Efficiency Mode }**

This option is used to modify the storage efficiency mode. The default mode sets 8k adaptive compression on the volume. The efficient mode sets auto adaptive compression and attempts to enable inline deduplication, cross volume inline deduplication and cross volume background deduplication on the volume. There is no difference between default and efficient modes on QAT supported platforms and auto adaptive compression is set irrespective of the modes.

The available efficiency modes are:

- default
- efficient

#### **[-inline-dedupe {true|false}] - Inline Dedupe**

This option is used to enable and disable inline deduplication. The default value is determined based on the platform.

You can use the *inline-only* predefined efficiency policy to run inline deduplication without the need of any background efficiency operations.

#### **[-data-compaction {true|false}] - Data Compaction**

This option is used to enable and disable data compaction. The default value is determined based on the platform.

### **[`-cross-volume-inline-dedupe {true|false}`] - Cross Volume Inline Deduplication**

This option is used to enable and disable cross volume inline deduplication. The default value is determined based on the platform.

### **[`-cross-volume-background-dedupe {true|false}`] - Cross Volume Background Deduplication**

This option is used to enable and disable cross volume background deduplication. The default value is determined based on the platform.

## **Examples**

The following examples modify efficiency options on a volume.

```
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -schedule
sun-sat@12
```

```
cluster1::> volume efficiency modify -vserver vs1 -volume vol1 -policy
policy1
```

```
cluster1::> volume efficiency modify -vserver vs1 -volume vol1
-compression true -inline-compression true -inline-dedupe true -data
-compaction true -cross-volume-inline-dedupe true -cross-volume-background
-dedupe true
```

## **volume efficiency off**

Disables efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume efficiency off` command disables efficiency on a volume. Disabling efficiency is not supported on Capacity optimized Flash with QAT supported platforms.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver Name**

Specifies the Vserver on which the volume is located.

#### **`{ -volume <volume name> - Volume Name`**

Specifies the name of the volume on which efficiency needs to be disabled.

#### **`| -path </vol/volume> - Volume Path }`**

Specifies the volume path on which efficiency needs to be disabled.

## Examples

The following examples disable efficiency on a volume:

```
cluster1::> volume efficiency off -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency off -vserver vs1 -path /vol/vol1
```

## volume efficiency on

### Enable efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency on` command enables efficiency on a volume. The specified volume must be online. Efficiency operations will be started periodically according to a per volume schedule or policy. The [volume efficiency modify](#) command can be used to modify schedule and the [volume efficiency policy modify](#) command can be used to modify policy. You can also manually start an efficiency operation with the [volume efficiency start](#) command.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume on which efficiency needs to be enabled.

**| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency needs to be enabled.

## Examples

The following examples enable efficiency on a volume.

```
cluster1::> volume efficiency on -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1
```

### Related Links

## volume efficiency prepare-to-downgrade

Identify any incompatible volumes or Snapshot copies before downgrade

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume efficiency prepare-to-downgrade` command updates efficiency configurations and metadata to be compatible with prior releases as specified. This command also disables the use of incompatible efficiency features. This command is not supported on FlexGroup volumes.

### Parameters

**`[-disable-feature-set <downgrade version>]` - Data ONTAP Version (privilege: advanced)**

This parameter specifies the ONTAP version that introduced new volume efficiency feature set.

### Examples

The following example disables the features introduced in ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1
```

The following example disables the features introduced in ONTAP 9.6.0.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 9.6.0
```

The following example ignores offline volumes while disabling the features introduced in ONTAP 9.6.0 .

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 9.6.0 -skip-offline-volumes true
```

The following example ignores offline volumes while disabling the features introduced in ONTAP 8.3.1 .

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set 8.3.1 -skip-offline-volumes true
```

## volume efficiency promote

Add a volume to the preferred set of volumes for efficiency processing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

Use the `volume efficiency promote` command to promote a volume from deprioritized state back to auto state.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume on which auto scheduling needs to be restarted.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path on which auto scheduling needs to be restarted.

## Examples

The following example promotes a volume from deprioritized state back to auto state.

```
cluster1::*> volume efficiency promote -vserver vs1 -volume vol1
```

## volume efficiency revert-to

Reverts volume efficiency metadata

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume efficiency revert-to` command reverts the format of volume efficiency metadata for the volume to the given version of ONTAP. This command is not supported on FlexGroup volumes.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume for which volume efficiency metadata needs to be reverted.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path for which volume efficiency metadata needs to be reverted.

**[-version <revert version>] - Revert to Version (privilege: advanced)**

Specifies the version of ONTAP to which the volume efficiency metadata needs to be formatted.

**`[-d, -delete {true|false}] - Delete Existing Metafile on Revert (privilege: advanced)`**

If set to `true`, this parameter specifies that the volume efficiency metadata be deleted instead of reverting its format. By default this parameter is set to `false`.

**`[-c, -clean-up {true|false}] - Delete Previously Downgraded Metafiles (privilege: advanced)`**

If set to `true`, this parameter specifies that the volume efficiency metadata already reverted using `volume efficiency revert-to` be deleted. By default this parameter is set to false.`

**`[-revert-adaptive-compression {true|false}] - Downgrade to minor version (privilege: advanced)`**

If set to `true`, this parameter specifies that the volume efficiency metadata needs to be reverted to a minor version of ONTAP. By default this parameter is set to `false`.

**`[-check-snapshot {true|false}] - Revert ignore snapshots (privilege: advanced)`**

If set to `false`, this parameter specifies that the volume efficiency revert will not check for snapshots created by previous releases of ONTAP. By default this parameter is set to `true`.

## Examples

The following examples reverts volume efficiency metadata on a volume named `vol1` located in vserver `vs1` to version 9.8.

```
cluster1::*> volume efficiency revert-to -vserver vs1 -volume vol1
-version 9.8
```

```
cluster1::*> volume efficiency revert-to -vserver vs1 -path /vol/vol1
-version 9.8
```

## volume efficiency show

Display a list of volumes with efficiency

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency show` command displays the information about storage efficiency of volumes. The command output depends on the parameter or parameters specified. If no parameters are specified, the command displays the following information for all volumes with efficiency:

- **Vserver:** Vserver the volume belongs to.
- **Volume:** Name of the volume.
- **State:** Current state of efficiency on the volume (Enabled, Disabled, or Mixed).
- **Status:** Status of the efficiency on the volume. Following are the possible values:
- *Active*: An efficiency operation is currently running.

- *Idle*: There are no efficiency operations running.
- *Initializing*: An efficiency operation is being initialized.
- *Undoing*: Efficiency is being undone on the volume.
- *Pending*: An efficiency operation is queued.
- *Downgrading*: An efficiency operation necessary to downgrade the efficiency metafiles to a previous ONTAP release is active.
- *Disabled*: Efficiency is disabled on the volume.
- **Progress**: The progress of the current efficiency operation with information as to which stage of the efficiency process is currently in progress and how much data is processed for that stage. For example: "25 MB Scanned", "20 MB Searched", "500 KB (2%) Compressed", "40 MB (20%) Done", "30 MB Verified".

To display detailed information, run the command with the `-l`` or `-instance` parameter. The detailed view provides all information in the previous list and the following additional information:

- **Path**: Volume Path.
- **Compression**: Current state of compression on the volume (Enabled or Disabled).
- **Inline Compression**: Current state of inline compression on the volume (Enabled or Disabled).
- **Type**: Type of volume (Regular or SnapVault).
- **Schedule**: The schedule of efficiency operation for the volume.
- **Policy**: Efficiency policy for the volume.
- **Minimum Blocks Shared**: The minimum number of adjacent blocks in a file that can be shared.
- **Blocks Skipped Sharing**: Blocks skipped sharing because of the minimum block share value.
- **Last Operation State**: Status of the last operation (Success or Failure).
- **Last Successful Operation Begin**: The time and date at which the last successful operation began.
- **Last Successful Operation End**: The time and date at which the last successful operation ended.
- **Last Operation Begin**: The time and date at which the last operation began.
- **Last Operation End**: The time and date at which the last operation ended.
- **Last Operation Size**: The size of the last operation.
- **Last Operation Error**: The error encountered by the last operation.
- **Change Log Usage**: The percentage of the change log that is used.
- **Logical Data**: The total logical data in the volume, and how much is reached compared to the deduplication logical data limit.
- **Queued Job**: The job that is queued. Following are the possible values:
  - `-`: There are no queued jobs.
  - *scan*: A job to process existing data is queued.
  - *start*: A job to process newly added data is queued.
  - *check*: A job to eliminate stale data from the fingerprint database is queued.
  - *downgrading*: An efficiency operation necessary to downgrade the efficiency metafiles to a previous ONTAP release is queued.

- **Stale Fingerprints:** The percentage of stale entries in the fingerprint database. If this is greater than 20 percent a subsequent [volume efficiency start](#) operation triggers the verify operation, which might take a long time to complete.
- **Inline Dedupe:** Current state of inline deduplication on the volume (Enabled or Disabled).
- **Cross Volume Inline Deduplication:** Current state of cross volume inline deduplication on the volume (Enabled or Disabled).
- **Cross Volume Background Deduplication:** Current state of cross volume background deduplication on the volume (Enabled or Disabled).
- **Extended Compressed Data:** Is there extended compressed data present on the volume.
- **Inline Adaptive Data Compaction:** Whether Inline Adaptive Data Compaction is enabled or disabled on the volume. When enabled, ONTAP combines data fragments to reduce on-disk block consumption.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with efficiency in Vserver vs1, run the command with the `-vserver vs1` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The fields Vserver and volume name are the default fields.

**| [-l ]**

This option displays detailed information about the volumes with efficiency.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Displays information only for those volumes that match the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Displays information only for those volumes that match the specified volume.

**| [-path </vol/volume>] - Volume Path }**

Displays information only for those volumes that match the specified volume path.

**[-state {Disabled|Enabled|Mixed}] - State**

Displays information only for those volumes that match the specified state.

**[-op-status <Efficiency status>] - Status**

Displays information only for those volumes that match the specified operation status.

**[-progress <text>] - Progress**

Displays information only for those volumes that match the specified progress.

**[-type {Regular|SnapVault}] - Type**

Displays information only for those volumes that match the specified type of volume.

**[-schedule <text>] - Schedule**

Displays information only for those volumes that match the specified schedule.

**[-policy <text>] - Efficiency Policy Name**

Displays information only for those volumes that match the specified policy.

**[-blks-skipped-sharing <integer>] - Blocks Skipped Sharing**

Displays information only for those volumes that match the specified blocks skipped sharing.

**[-last-op-state <text>] - Last Operation State**

Displays information only for those volumes that match the specified last operation state.

**[-last-success-op-begin <Date>] - Last Success Operation Begin**

Displays information only for those volumes that match the specified last successful operation begin time.

**[-last-success-op-end <Date>] - Last Success Operation End**

Displays information only for those volumes that match the specified last successful operation end time.

**[-last-op-begin <Date>] - Last Operation Begin**

Displays information only for those volumes that match the specified last operation begin time.

**[-last-op-end <Date>] - Last Operation End**

Displays information only for those volumes that match the specified last operation end time.

**[-last-op-size {<integer>[KB|MB|GB|TB|PB]}] - Last Operation Size**

Displays information only for those volumes that match the specified last operation size.

**[-last-op-error <text>] - Last Operation Error**

Displays information only for those volumes that match the specified last operation error.

**[-changelog-usage <percent\_no\_limit>] - Changelog Usage**

Displays information only for those volumes that match the specified change log usage.

**[-logical-data-size {<integer>[KB|MB|GB|TB|PB]}] - Logical Data Size**

Displays information only for those volumes that match the specified logical data size.

**[-logical-data-limit {<integer>[KB|MB|GB|TB|PB]}] - Logical Data Limit**

Displays information only for those volumes that match the specified logical data limit.

**[-logical-data-percent <percent\_no\_limit>] - Logical Data Percent**

Displays information only for those volumes that match the specified logical data percentage.

**[-queued-job <text>] - Queued Job**

Displays information only for those volumes that match the specified number of queued jobs.

**[-stale-fingerprint-percentage <integer>] - Stale Fingerprint Percentage**

Displays information only for those volumes that match the specified stale fingerprint percentage.

### **`[-compression {true|false}] - Compression`**

Displays information only for those volumes that match the specified compression setting.

### **`[-inline-compression {true|false}] - Inline Compression`**

Displays information only for those volumes that match the specified inline compression setting.

### **`[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)`**

Displays information about the type of compression on the volume[adaptive or secondary].

### **`[-storage-efficiency-mode {default|efficient}] - Storage Efficiency Mode`**

Displays information only for those volumes that match the specified storage efficiency mode. The default mode sets 8k adaptive compression on the volume. The efficient mode sets auto adaptive compression on the volume.

The available efficiency modes are:

- default
- efficient

### **`[-is-constituent {true|false}] - Constituent Volume`**

Displays information only for those volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

### **`[-inline-dedupe {true|false}] - Inline Dedupe`**

Displays information only for those volumes that match the specified inline deduplication setting.

### **`[-data-compaction {true|false}] - Data Compaction`**

Displays information only for those volumes that match the specified data compaction setting.

### **`[-cross-volume-inline-dedupe {true|false}] - Cross Volume Inline Deduplication`**

Displays information only for those volumes that match the specified cross volume inline deduplication setting.

### **`[-cross-volume-background-dedupe {true|false}] - Cross Volume Background Deduplication`**

Displays information only for those volumes that match the specified cross volume background deduplication setting.

### **`[-extended-compressed-data {true|false}] - Extended Compressed Data`**

Displays information only for those volumes that match the specified extended compressed data value. Extended compressed data is enabled on a volume when both adaptive compression configured with application IO size 8K and data compaction are enabled. Once enabled, extended compressed data can only be disabled by using the `volume efficiency revert-to` command.

### **`[-extended-auto-adaptive-compression {true|false}] - Volume Has Extended Auto Adaptive Compression (privilege: advanced)`**

Displays information only for those volumes that match the specified extended auto adaptive compression setting.

### **`[-active-data-extended-auto-adaptive-compression {true|false}] - Volume Has Active Data Extended Auto Adaptive Compression (privilege: advanced)`**

Displays information only for those volumes that match the specified active data extended auto adaptive compression setting.

Examples

The following example displays information about all volumes with efficiency on the Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1
Vserver      Volume      State      Status      Progress
-----
vs1          vol1        Enabled    Idle         Idle for 22:37:53
vs1          vol2        Enabled    Idle         Idle for 22:37:53
vs1          vol3        Enabled    Idle         Idle for 22:37:49
vs1          vol4        Enabled    Idle         Idle for 22:37:53
vs1          vol5        Enabled    Idle         Idle for 22:37:53
vs1          volham      Enabled    Idle         Idle for 22:37:53
vs1          volham1     Enabled    Idle         Idle for 22:37:53
7 entries were displayed.
```

The following example displays detailed information about a volume named vol1 on a Vserver named vs1:

```

cluster1::> volume efficiency show -vserver vs1 -volume vol1
      Vserver Name: vs1
      Volume Name: vol1
      Volume Path: /vol/vol1
      State: Enabled
      Status: Idle
      Progress: Idle for 02:14:28
      Type: Regular
      Schedule: sun-sat@0
      Efficiency Policy Name: -
      Blocks Skipped Sharing: 0
      Last Operation State: Success
      Last Success Operation Begin: Wed Jul 14 03:08:44 2021
      Last Success Operation End: Wed Jul 14 03:08:46 2021
      Last Operation Begin: Wed Jul 14 03:08:44 2021
      Last Operation End: Wed Jul 14 03:08:46 2021
      Last Operation Size: 2.52MB
      Last Operation Error: -
      Changelog Usage: 0%
      Logical Data Size: 20.48MB
      Logical Data Limit: 640TB
      Logical Data Percent: 0%
      Queued Job: -
      Stale Fingerprint Percentage: 0
      Compression: true
      Inline Compression: true
      Storage Efficiency Mode: -
      Constituent Volume: false
      Inline Dedupe: false
      Data Compaction: false
      Cross Volume Inline Deduplication: false
      Cross Volume Background Deduplication: false
      Extended Compressed Data: false

```

## volume efficiency start

Starts efficiency operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Use the `volume efficiency start` command to start an efficiency operation. The volume must be online and have efficiency enabled. If there is an efficiency operation already active on the volume, this command fails.

When the `volume efficiency start` command is issued, a checkpoint is created at the end of each stage or sub-stage, or on an hourly basis in the gathering phase. If at any point the `volume efficiency start` operation is stopped, the system can restart the efficiency operation from the execution state saved in the checkpoint. The `delete-checkpoint` parameter can be used to delete the existing checkpoint and restart a fresh efficiency operation. The checkpoint corresponding to gathering has a validity period of 24 hours. If the user knows that significant changes have not been made on the volume, then such a gathering checkpoint whose validity has expired can be used with the help of the `use-checkpoint` parameter. There is no time restriction for checkpoints of other stages.

When the volume is configured to use the `inline-only` efficiency policy, the system will stop monitoring changes to the data for the purpose of running background efficiency operations. The background deduplication operations will be disabled. The user can still execute compression specific efficiency operation with `-scan-old-data` and `-compression` parameters to compress the existing data on the volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver on which the volume is located.

### **{ -volume <volume name> - Volume Name**

Specifies the name of the volume.

### **| -path </vol/volume> - Volume Path }**

Specifies the complete path of the volume.

### **[-s, -scan-old-data <true>] - Scan Old Data**

This option scans the file system and processes all existing data. It prompts for user confirmation before proceeding. Use the force option to suppress this confirmation.

### **{ [-p, -use-checkpoint <true>] - Use Checkpoint (if scanning old data)**

Use the checkpoint when scanning existing data. Valid only if `scan-old-data` parameter is true.

### **| [-d, -delete-checkpoint <true>] - Delete Checkpoint }**

Deletes the existing checkpoint and restarts a new `volume efficiency start` operation.

### **[-qos-policy <sis\_qos>] - QoS Policy**

Specifies the qos-policy, which indicates how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

### **[-C, -compression <true>] - Start Compression (if scanning old data) (privilege: advanced)**

Compresses existing data. Deduplication is not run unless the dedupe option is also specified. Valid only if `scan-old-data` parameter is true.

**[-D, -dedupe <true>] - Start Deduplication (if scanning old data) (privilege: advanced)**

Deduplicates existing data on disk. Similarly, compression is not run unless the compression option is also specified. Valid only if `scan-old-data` parameter is true.

**[-P, -compaction <true>] - Start Compaction (if scanning old data) (privilege: advanced)**

Compacts existing data on disk. Valid only if `scan-old-data` parameter is true.

**[-m, -build-metadata <true>] - Build metadata without sharing(if scanning old data)**

Builds deduplication metadata by scanning the entire file system. You will not achieve any space savings with this option. Once the metadata is built, existing data can be shared with newly written data on subsequent deduplication runs.

**[-o, -scan-all <true>] - Scan all the data without shared block optimization(if scanning old data)**

Scans the entire file system and processes the shared blocks also. You may be able to achieve additional space savings using this option. Where as, by default the option `-scan-old-data` saves some time by skipping the shared blocks.

**[-a, -shared-blocks <true>] - Compress Shared Blocks (if scanning old data) (privilege: advanced)**

Compresses the Compression Groups that have shared blocks created by deduplication or cloning data. Valid only if `scan-old-data` parameter is true.

**[-b, -snapshot-blocks <true>] - Compress Blocks In Snapshots (if scanning old data) (privilege: advanced)**

Compresses data blocks locked in a snapshot. Valid only if `scan-old-data` parameter is true.

**[-q, -queue <true>] - Operation Should Be Queued**

Queues an efficiency operation. It will be queued only if an operation is already in progress. Valid only if `scan-old-data` is false.

**[-f, -force <true>] - Force Operation**

Suppresses all confirmation messages.

**[-z, -skip-zero-replacement <true>] - Skip Zero block detection and replacement (privilege: advanced)**

Skip the zero block detection and replacement during the gatherer scan. Valid only if `scan-old-data` parameter is true.

## Examples

The following examples start efficiency on a volume:

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -scan-old-data -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -volume voll -vserver vs1 -queue
-delete-checkpoint
```

## volume efficiency stat

### Show volume efficiency statistics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency stat` command displays efficiency statistics. The output depends on the parameters specified with the command. If no parameters are specified, the command displays the following efficiency statistics fields for all the volumes:

- Vserver: The Vserver that the volume belongs to.
- Volume Name: Name of the volume.
- Inline Compression Attempts: Number of inline compression attempts done.
- Inline Incompressible CGs: Number of compression groups that cannot be compressed by inline compression.

To display detailed information, run the command with `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The Vserver and volume name are the default fields.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Displays statistics only for those volume(s) that match the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Displays statistics only for those volume(s) that match the specified volume name.

**| [-path </vol/volume>] - Volume Path }**

Displays statistics only for those volume(s) that match the specified volume path.

**[-b <true>] - Display In Blocks**

Displays usage size in 4k block counts.

**[-num-compressed-inline <integer>] - Inline Compression Attempts**

Displays statistics only for those volume(s) that match the specified number of Compression Groups attempted inline.

### **[-num-icg-inline <integer>] - Incompressible CGs Found By Inline Compression**

Displays statistics only for those volume(s) that match the specified number of incompressible Compression Groups encountered during Inline Compression.

### **[-inactive-blocks-compressed <integer>] - Number of Inactive Blocks Compressed**

Displays statistics only for those volumes that match the specified number of cold blocks on which compression was done.

## **Examples**

The following example displays default efficiency statistics for all the volumes.

```
cluster1::> volume efficiency stat
Vserver:                vs1
Volume:                 vol2
Inline Compression Attempts: 0
Inline Incompressible CGs: 0

Vserver:                vs1
Volume:                 vol3
Inline Compression Attempts: 0
Inline Incompressible CGs: 0
```

## **volume efficiency stop**

Stop efficiency operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

Use the `volume efficiency stop` command to stop an efficiency operation.

### **Parameters**

#### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

#### **{ -volume <volume name> - Volume Name**

This specifies the name of the volume on which efficiency operation needs to be stopped.

#### **| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency operation needs to be stopped.

#### **[-a, -all <true>] - Stop All Operations**

This specifies both active and queued efficiency operations to be aborted.

## Examples

The following examples stop efficiency on a volume.

```
cluster1::> volume efficiency stop -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency stop -vserver vs1 -volume vol1 -all
```

## volume efficiency undo

### Undo efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The command `volume efficiency undo` removes volume efficiency on a volume by undoing compression, undoing compaction and removing all the block sharing relationships, and cleaning up any volume efficiency specific data structures. Any efficiency operations on the volume must be disabled before issuing this command. The volume efficiency configuration is deleted when the undo process completes. The command is used to revert a volume to an earlier version of ONTAP where some of the efficiency features are not supported. During this revert not all efficiencies needs to be undone but only those gained by that particular feature (for example, compaction), which is not supported in the earlier version.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume name.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path.

**[-C, -compression <true>] - Decompress Data in the Volume (privilege: advanced)**

Undo the effects of compression. This requires efficiency to be disabled (by performing [volume efficiency off](#)).

**[-D, -dedupe <true>] - Undo Block Sharing in the Volume (privilege: advanced)**

Undo the effects of deduplication. This requires efficiency to be disabled (by performing [volume efficiency off](#)).

**[-i, -inode <integer>] - Inode Number to Undo Sharing (privilege: advanced)**

Remove the block sharings from a specified inode.

**[-t, -undo-type {all|wrong}] - Selective Undo (privilege: advanced)**

This specifies to remove either all or only invalid block sharing. When *all* is used, all block sharings are

removed. When *wrong* is used, only invalid sharings present in the volume are removed. When used along with *log* option, it logs information about all or wrong block sharings without sharing removal.

**[*-d*, *-log* <true>] - Only Log Incorrect Savings (privilege: advanced)**

If specified, information about invalid block sharing relationships will only be logged. Invalid sharings will not be removed. This parameter is only valid when the parameter *-undo-type* is specified as *wrong*.

**[*-P*, *-data-compaction* <true>] - Undo Data Compaction in the Volume (privilege: advanced)**

Undo the effects of data compaction.

**[*-A*, *-cross-volume-dedupe* <true>] - Undo Cross Volume Deduplication (privilege: advanced)**

Undo the effects of cross volume deduplication.

**[*-X*, *-extended-compression* <true>] - Extended Compression (privilege: advanced)**

Undo the effects of extended compression. This removes the compression savings for data that requires more resources to compress.

**[*-c*, *-auto-adaptive-compression* <true>] - Auto Adaptive Compression (privilege: advanced)**

Undo the effects of auto adaptive compression.

**[*-Z*, *-undo-compression-algorithm-list* {*lzopro*|*zstd*|*zlib*}] - Undo Compression Algorithm List (privilege: advanced)**

Undo the effects of the specified compression algorithms.

**[*-s*, *-extended-auto-adaptive-compression* <true>] - Undo Extended Auto Adaptive Compression (privilege: advanced)**

Undo the effects of extended auto adaptive compression.

**[*-a*, *-active-data-extended-auto-adaptive-compression* <true>] - Undo Active Data Extended Auto Adaptive Compression (privilege: advanced)**

Undo the effects of active data extended auto adaptive compression.

## Examples

The following are examples of how to use efficiency undo.

To undo deduplication and compression savings, but not compaction savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::*> volume efficiency undo -vserver vs1 -volume vol1
```

To rewrite compressed blocks and undo compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::*> volume efficiency undo -vserver vs1 -volume vol1 -compression
```

To rewrite compressed and deduped blocks without any efficiency in a volume name vol1 on a Vserver named vs1:

```
cluster1::*> volume efficiency undo -vserver vs1 -volume vol1 -dedup
-compression
```

To rewrite compacted blocks in a volume name vol1 on a Vserver named vs1:

```
cluster1::*> volume efficiency undo -vserver vs1 -volume vol1 -data
-compaction
```

## volume efficiency inactive-data-compression modify

Modify volume inactive data compression configuration of a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume efficiency inactive-data-compression modify` command is used to modify the state of inactive data compression on a volume.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver of the volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume on which the inactive data compression state should be modified.

**[-progress <text>] - Progress (privilege: advanced)**

Progress of the scan.

**[-status <text>] - Status (privilege: advanced)**

Operation on the scan succeeded or failed.

**[-failure-reason <text>] - Failure Reason (privilege: advanced)**

If scan failed, the reason of the failure.

**[-total-blocks <integer>] - Total Blocks to be Processed (privilege: advanced)**

Total number of blocks which must be processed by inactive data compression scanner.

**[-total-processed <integer>] - Total Blocks Processed (privilege: advanced)**

Total number of blocks which are already processed by inactive data compression scanner.

**[-percentage <percent>] - Progress (privilege: advanced)**

Scan progress in percentage.

**[-is-enabled {true|false}] - State of Inactive Data Compression on the Volume (privilege: advanced)**

Enable or disable inactive data compression on the volume. Disabling inactive data compression is not allowed on Capacity optimized Flash with QAT supported platforms.

**[-threshold-days <integer>] - Inactive data compression scan threshold days value (privilege: advanced)**

Threshold days value for inactive data compression scan. Valid values for this option range from -threshold-days-min to -threshold-days-max . This field is not supported on QAT supported platforms.

**[-threshold-days-min <integer>] - Inactive data compression scan threshold minimum allowed value. (privilege: advanced)**

Minimum allowed value in threshold days for inactive data compression scan. Valid values for this option range from 1 to -threshold-days-max . This field is not supported on QAT supported platforms.

**[-threshold-days-max <integer>] - Inactive data compression scan threshold maximum allowed value. (privilege: advanced)**

Maximum allowed value in threshold days for inactive data compression scan. Valid values for this option range from -threshold-days-min to 60 . This field is not supported on QAT supported platforms.

**[-read-history-window-size <integer>] - Time window(in days) for which client reads data is collected for tuning. (privilege: advanced)**

Client read history window. Valid values for this option range from 1 to 60 . This field is not supported on QAT supported platforms.

**[-tuning-enabled {true|false}] - State of auto-tuning of Inactive data compression scan on volume. (privilege: advanced)**

Auto-tuning state of inactive data compression scan. This field is not supported on QAT supported platforms.

**[-compression-algorithm {lzopro|zstd|zlib}] - Inactive data compression algorithm (privilege: advanced)**

Inactive data compression algorithm. The only supported algorithm is ZLIB on QAT supported platforms.

## Examples

The following example displays information for modifying the state of inactive data compression scan on volume "vol1":

```
cluster:::> volume efficiency inactive-data-compression modify -vserver
vs1 -volume vol1 -is-enabled true
Inactive data compression scan enabled on volume vol1 in Vserver vs1.
```

## volume efficiency inactive-data-compression show

Display volume inactive data compression progress

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume efficiency inactive-data-compression show` command is used to show details of inactive data compression on a volume.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance`  ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <vserver name>`] - Vserver Name (privilege: advanced)**

This specifies the vservers of the volume.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

This specifies the volume on which inactive data compression should be started.

**[`-progress <text>`] - Progress (privilege: advanced)**

Progress of the scan.

**[`-status <text>`] - Status (privilege: advanced)**

Operation on the scan succeeded or failed.

**[`-failure-reason <text>`] - Failure Reason (privilege: advanced)**

If scan failed, the reason of the failure.

**[`-total-blocks <integer>`] - Total Blocks to be Processed (privilege: advanced)**

Total number of blocks which must be processed by inactive data compression scanner.

**[`-total-processed <integer>`] - Total Blocks Processed (privilege: advanced)**

Total number of blocks which are already processed by inactive data compression scanner.

**[`-percentage <percent>`] - Progress (privilege: advanced)**

Scan progress in percentage.

**[`-cold-blocks-found <integer>`] - Number of Cold Blocks encountered (privilege: advanced)**

Number of cold blocks encountered by inactive data compression scanner.

**[`-compression-done <integer>`] - Number of Compression Done Blocks (privilege: advanced)**

Number of blocks on which compression was done.

**[-vol-overwrites <integer>] - Number of Vol-Overwrites (privilege: advanced)**

count of logical blocks overwritten in compressed data extents.

**[-is-enabled {true|false}] - State of Inactive Data Compression on the Volume (privilege: advanced)**

Is scan enabled on the volume.

**[-last-op-start-time <integer>] - Time since Last Inactive Data Compression Scan started (privilege: advanced)**

Time since the last inactive data compression scan op started.

**[-last-op-end-time <integer>] - Time since Last Inactive Data Compression Scan ended (privilege: advanced)**

Time since the last inactive data compression scan op ended.

**[-last-succ-op-start-time <integer>] - Time since Last Successful Inactive Data Compression Scan started (privilege: advanced)**

Time since the last successful inactive data compression scan op started.

**[-last-succ-op-end-time <integer>] - Time since Last Successful Inactive Data Compression Scan ended (privilege: advanced)**

Time since the last successful inactive data compression scan op ended.

**[-average-run-time <integer>] - Average run time for Inactive Data Compression Scan (privilege: advanced)**

Average runtime of inactive data compression.

**[-threshold-days <integer>] - Inactive data compression scan threshold days value (privilege: advanced)**

Threshold days value for inactive data compression scan. Valid values for this option range from -threshold-days-min to -threshold-days-max .

**[-threshold-days-min <integer>] - Inactive data compression scan threshold minimum allowed value. (privilege: advanced)**

Minimum allowed value in threshold days for inactive data compression scan. Valid values for this option range from 1 to -threshold-days-max .

**[-threshold-days-max <integer>] - Inactive data compression scan threshold maximum allowed value. (privilege: advanced)**

Maximum allowed value in threshold days for inactive data compression scan. Valid values for this option range from -threshold-days-min to 60 .

**[-read-history-window-size <integer>] - Time window(in days) for which client reads data is collected for tuning. (privilege: advanced)**

Client read history window. Valid values for this option range from 1 to 60 .

**[-tuning-enabled {true|false}] - State of auto-tuning of Inactive data compression scan on volume. (privilege: advanced)**

Auto-tuning state of inactive data compression scan.

**[-compression-algorithm {lzopro|zstd|zlib}] - Inactive data compression algorithm (privilege: advanced)**

Inactive data compression algorithm.

**[-scan-mode {default|compute\_compression\_savings|extended\_recompression}] - Mode of Inactive data compression scan (privilege: advanced)**

Mode of the Inactive data compression scanner.

**[-phase1-l1s-processed <integer>] - Phase1 level1s Processed (privilege: advanced)**

Phase1 number of L1s processed by inactive data compression scanner.

**[-phase1-lns-skipped <text>, ...] - Phase1 lns skipped (privilege: advanced)**

Phase1 number of indirect blocks skipped by inactive data compression scanner.

**[-phase2-total-blocks <integer>] - Phase2 Total Blocks to be Processed (privilege: advanced)**

Phase2 number of total blocks which must be processed by inactive data compression scanner.

**[-phase2-blocks-processed <integer>] - Phase2 Blocks Processed (privilege: advanced)**

Phase2 number of blocks processed by inactive data compression scanner.

**[-repacked-blocks <integer>] - Number of Repacked Blocks (privilege: advanced)**

Number of cold blocks repacked by inactive data compression scanner in extended-recompression mode.

**[-re-logical-pending-blocks <integer>] - Number of Logical Pending Blocks (privilege: advanced)**

Number of logical pending blocks.

**[-re-physical-pending-blocks <integer>] - Number of Physical Pending Blocks (privilege: advanced)**

Number of physical pending blocks.

**[-re-reclaimable-blocks <integer>] - Number of GC Reclaimable Blocks (privilege: advanced)**

Number of Garbage collectible Reclaimable Blocks.

**[-re-cvs-logical-pending-blocks <integer>] - Number of CVS Logical Pending Blocks (privilege: advanced)**

Number of Cross Volume Shared Logical Pending Deletes Blocks.

**[-re-gc-compression-factor <text>] - GC Compression Factor (privilege: advanced)**

Number of Garbage collectible Compression Factor.

## Examples

The following example displays details about the inactive data compression on volume "vol1":

```

cluster:::> volume efficiency inactive-data-compression show -vserver vs1
-volume vol1
Volume: vol1

                Vserver: vs1
                Is Enabled: true

                                Progress: IDLE

                Status: SUCCESS
                Compression Algorithm: lzopro
                Failure Reason: -

```

## volume efficiency inactive-data-compression start

Start inactive data compression on a volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume efficiency inactive-data-compression start` command is used to start inactive data compression on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the vservers of the volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume on which inactive data compression should be started.

**[-s, -inactive-days <integer>] - Compression Days Count (privilege: advanced)**

Data older than 'inactive-days' days is compressed.

**[-m, -scan-mode {default|compute\_compression\_savings|extended\_recompression}] - scanner mode (privilege: advanced)**

This specifies in which mode inactive-data-compression-scanner should be started. Three modes are available: 'default', 'compute\_compression\_savings' and 'extended\_recompression'. 'default' scanner will start compressing the cold data in volume. 'compute\_compression\_savings' scanner will calculate the auto adaptive compression savings on the volume. 'extended\_recompression' scanner will attempt to re-write existing cold data to reduce internal fragmentation.

## Examples

The following example displays information for starting inactive data compression scan on volume "vol1":

```
cluster:::> volume efficiency inactive-data-compression start -vserver vs1
-volume vol1
Inactive data compression scan started on volume vol1 in Vserver vs1.
```

## volume efficiency inactive-data-compression stop

Stop inactive data compression on a volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume efficiency inactive-data-compression stop` command is used to stop inactive data compression on a volume.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the vserver of the volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume on which inactive data compression should be stopped.

## Examples

The following example displays information for stopping inactive data compression scan on volume "vol1":

```
cluster:::> volume efficiency inactive-data-compression stop -vserver vs1
-volume vol1
Inactive data compression scan stopped on volume vol1 in Vserver vs1.
```

## volume efficiency inactive-data-reallocation modify

Updates volume inactive data reallocation policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume efficiency inactive-data-reallocation modify` command is used to modify the inactive data reallocation policy on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver of the volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume on which the inactive data compression state should be modified.

**[-policy {none|default|on-read|all}] - Policy for Data Reallocation (privilege: advanced)**

This specifies policy for inactive data reallocation on the volume. Inactive to active data reallocation is not supported on QAT supported platforms.

Following are the possible values:

- *default* : Reallocates data for random client driven data reads on AFS.
- *none* : Disables inactive to active data reallocation.
- *on-read* : Reallocates data for client driven data reads including sequential reads on AFS.

Currently unsupported policy:

- *all* : Reallocates data for all client driven data reads on AFS and snapshots. Also includes highly compressed data which was compressed to one single 4k block.

### Examples

The following example displays information for modifying the inactive data reallocation policy on volume "vol1":

```
cluster:::> volume efficiency inactive-data-reallocation modify -vserver  
vs1 -volume vol1 -policy default
```

## volume efficiency inactive-data-reallocation show

Display volume inactive data reallocation policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume efficiency inactive-data-reallocation show` command is used to show details of inactive data reallocation policy on a volume.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver Name (privilege: advanced)`**

This specifies the vservers of the volume.

**`[-volume <volume name>] - Volume Name (privilege: advanced)`**

This specifies the volume on which inactive data compression should be started.

**`[-policy {none|default|on-read|all}] - Policy for Data Reallocation (privilege: advanced)`**

This specifies policy for inactive data reallocation on the volume.

Following are the possible values:

- *default* : Reallocates data for random client driven data reads on AFS.
- *none* : Disables inactive to active data reallocation.
- *on-read* : Reallocates data for client driven data reads including sequential reads on AFS.

Currently unsupported policy:

- *all* : Reallocates data for all client driven data reads on AFS and snapshots. Also includes highly compressed data which was compressed to one single 4k block.

## Examples

The following example displays details about the inactive data reallocation on volume "vol1":

```
cluster:::> volume efficiency inactive-data-reallocation show -vserver vs1
-volume vol1
Volume: vol1

Vserver: vs1
Policy: default
```

## volume efficiency policy create

Create an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume efficiency policy create` creates an efficiency policy.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver on which the volume is located.

**-policy <text> - Efficiency Policy Name**

This specifies the policy name.

**[-type {threshold|scheduled}] - Policy Type**

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

**[-schedule <text>] - Job Schedule Name**

This specifies the job schedule. Use `job schedule` commands to manage job schedules. Only cron job schedules are supported.

**[-duration <text>] - Duration**

This specifies the duration that an efficiency operation can run (in hours). The possible values are "-" or a number between 1 and 999 inclusive. Default value is "-", which means no duration.

**[-start-threshold-percent <percent>] - Threshold Percentage**

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as *threshold*.

**[-qos-policy {background|best\_effort}] - QoS Policy**

This specifies how the efficiency operations are throttled. This option can be configured to be *background* or *best-effort*. Default value is *best-effort*. If *background* is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If *best-effort* is specified, the efficiency operations might have some impact on the data serving client operations.

**[-enabled {true|false}] - Enabled**

This specifies whether the policy is enabled or not. The policy is enabled by default.

**[-comment <text>] - Comment**

User specified comment.

## Examples

The following example creates an efficiency policy.

```
cluster1::> volume efficiency policy create -vserver vs1 -policy policy1
-schedule daily -duration 100
```

## volume efficiency policy delete

### Delete an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume efficiency policy delete` command deletes an efficiency policy. An efficiency policy can be deleted only when it is not associated with any volume. The pre-defined policies *default* and *inline-only* cannot be deleted.

#### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver on which the volume is located.

**-policy <text> - Efficiency Policy Name**

This specifies the policy name.

#### Examples

The following example deletes an efficiency policy:

```
cluster1::> volume efficiency policy delete -vserver vs1 -policy policy1
```

## volume efficiency policy modify

### Modify an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume efficiency policy modify` command can be used to modify the policy attributes.

The attributes of the *inline-only* predefined policy cannot be modified.

#### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver on which the volume is located.

### **-policy <text> - Efficiency Policy Name**

This specifies the policy name.

### **[-type {threshold|scheduled}] - Policy Type**

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

### **[-schedule <text>] - Job Schedule Name**

This specifies the job schedule. Use [job schedule show](#) to show all the jobs.

### **[-duration <text>] - Duration**

This specifies the duration that an efficiency operation can run in hours. The possible value is between 1 and 999 inclusive.

### **[-start-threshold-percent <percent>] - Threshold Percentage**

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as *threshold*.

### **[-qos-policy {background|best\_effort}] - QoS Policy**

This specifies how the efficiency operations are throttled. This option can be configured to be *background* or *best-effort*. Default value is *best-effort*. If *background* is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If *best-effort* is specified, the efficiency operations might have some impact on the data serving client operations.

### **[-enabled {true|false}] - Enabled**

This specifies whether the policy is enabled or not. Default value is true.

### **[-comment <text>] - Comment**

User specified comment.

## **Examples**

The following example modifies efficiency policy.

```
cluster1::> volume efficiency policy modify -policy policy1 -schedule hourly
```

## **Related Links**

- [job schedule show](#)

## volume efficiency policy show

### Show efficiency policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency policy show` command displays information about efficiency policies. By default, the command displays the following information about all policies:

- **Vserver:** Name of the Vserver that the policy belongs to.
- **Policy Name:** Efficiency policy name.
- **Job Schedule:** Job schedule name.
- **Duration (Hours):** The duration in hours that the efficiency operation can run.
- **Enable:** Whether the policy is enabled or not.
- **Comment:** User specified comment.

You can specify additional parameters to select the displayed information. For example, to display efficiency policies only with duration 5 hours, run the command with the `-duration 5` parameter.

The pre-defined policies *default* and *inline-only* are available when all the nodes in the cluster are running ONTAP version 8.3 or later.

The *inline-only* pre-defined policy must be used when the user wants to use the inline compression feature without any regularly scheduled or manually started background storage efficiency operations. When a volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for running the background efficiency operations on the volume. Volumes cannot be configured with the *inline-only* policy if there is a currently active background efficiency operation.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields to be displayed. Vserver and policy are the default fields (see example).

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-vserver <vserver name>] - Vserver**

Selects information about the policies that match the specified Vserver.

**[-policy <text>] - Efficiency Policy Name**

Selects information about the policies that match the specified policy name.

**[-type {threshold|scheduled}] - Policy Type**

Selects information about the policies that match the specified policy type. There are two possible values - *threshold* and *scheduled*.

**[-schedule <text>] - Job Schedule Name**

Selects information about the policies that match the specified schedule.

**[-duration <text>] - Duration**

Selects information about the policies that match the specified duration hours.

**[-start-threshold-percent <percent>] - Threshold Percentage**

Selects information about the policies that match the specified start-threshold-percent. Valid only if `-type` parameter is set as *threshold*.

**[-qos-policy {background|best\_effort}] - QoS Policy**

Selects information about the policies that match the specified throttling method. The values can be *background* or *best-effort*.

**[-enabled {true|false}] - Enabled**

Selects information about the policies that have the specified enabled setting.

**[-comment <text>] - Comment**

Selects information about the policies that match the specified comment.

**[-policy-owner {cluster-admin|vserver-admin}] - Owner of the Policy**

Selects information about the policies that match the specified owner. The values can be *cluster-admin* or *vserver-admin*.

**Examples**

The following example shows all the efficiency policies with the matching Vserver *vs1*.

```
cluster1::> volume efficiency policy show -vserver vs1
```

| Vserver | Policy Name | Job Schedule | Duration (Hours) | QoS Policy  | Enabled | Comment            |
|---------|-------------|--------------|------------------|-------------|---------|--------------------|
| vs1     | default     | daily        | -                | best_effort | true    | Default            |
| vs1     | inline-only | -            | -                | -           | -       | Inline-Only policy |
| vs1     | policy1     | daily        | -                | best_effort | true    | user-              |

defined  
3 entries were displayed.

The following example shows all the policies with the following fields - Vserver (default), policy (default) and duration.

```
cluster1::> volume efficiency policy show -fields duration
vserver policy      duration
-----
vs1      default    -
vs1      inline-only -
vs1      policy1    -
3 entries were displayed.
```

## volume encryption commands

### volume encryption conversion pause

Pause a running volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume encryption conversion pause` command pauses the running encryption conversion operation on a volume.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the encryption conversion operation is being paused.

**[-ignore-warning {true|false}] - Ignore Warning for Conversion Pause**

If this parameter is set, the command ignores the confirmation message.

#### Examples

### volume encryption conversion resume

Resume a paused volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume encryption conversion resume` command resumes the paused encryption conversion operation on a volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the encryption conversion operation is being resumed.

## Examples

### **volume encryption conversion show**

Show status of a volume encryption conversion

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption conversion show` command displays information about volume encryption conversion in the cluster. By default, with no parameters, it only shows volume encryption operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume encryption conversion operation.
- Start Time: The date and time when the volume encryption operation was started.
- Status of Operation: The status of the operation.
- Percentage Completed: The amount of work to encrypt the volume completed thus far in terms of percentage.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**[-volume <volume name>] - Volume Name**

This parameter specifies the name of the volume being encrypted.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume encryption conversion operation started.

### **[-status <text>] - Status**

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

### **Examples**

The following example shows a sample output for this command:

```
cluster1::> volume encryption conversion show
```

| Vserver | Volume | Start Time         | Status                                       |
|---------|--------|--------------------|----------------------------------------------|
| vs1     | p2     | 9/18/2017 17:44:36 | Phase 2 of 2 (redirect scan) is in progress. |

## **volume encryption conversion start**

Start a volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume encryption conversion start` command converts a non-encrypted volume to encrypted volume.

### **Parameters**

#### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

#### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the encryption conversion operation is being started.

#### **[-ignore-warning {true|false}] - Ignore Warning for Conversion Start**

If this parameter is set, the command ignores the confirmation message.

### **Examples**

## **volume encryption rekey pause**

Pause a running volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume encryption rekey pause` command pauses the running encryption rekey operation on a

volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the rekey operation is being paused.

### **[-ignore-warning {true|false}] - Ignore Warning for Rekey Pause**

If this parameter is set, the command ignores the confirmation message.

## Examples

### **volume encryption rekey resume**

Resume a paused volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption rekey resume` command resumes the paused encryption rekey operation on a volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the rekey operation is being resumed.

## Examples

### **volume encryption rekey show**

Show status of a volume encryption rekey

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption rekey show` command displays information about volume encryption rekey in the cluster. By default, with no parameters, it only shows volume encryption rekey operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running rekey operation.

- **Start Time:** The date and time when the volume rekey operation was started.
- **Status of Operation:** The status of the operation.
- **Percentage Completed:** The amount of work to rekey the volume completed thus far in terms of percentage.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**[-volume <volume name>] - Volume Name**

This parameter specifies the name of the volume being rekeyed.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

If this parameter is specified, the command displays rekey operations that match the specified date and time in the cluster time zone when the rekey operation started.

**[-status <text>] - Status**

If this parameter is specified, the command displays rekey operations that match the specified status of the rekey operation.

## Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption rekey show
```

| Vserver | Volume | Start Time         | Status                                       |
|---------|--------|--------------------|----------------------------------------------|
| vs1     | vol2   | 9/18/2017 17:51:41 | Phase 2 of 2 (redirect scan) is in progress. |

## volume encryption rekey start

Start a volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption rekey start` command changes the encryption key of a volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which the rekey operation is being started.

### **[-ignore-warning {true|false}] - Ignore Warning for Rekey Start**

If this parameter is set, the command ignores the confirmation message.

## Examples

### **volume encryption secure-purge abort**

Abort secure deletion of trash in existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume encryption secure-purge abort` command aborts the secure purge operation on a volume.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume (privilege: advanced)**

This parameter specifies the name of the volume for which the secure purge operation is being aborted.

## Examples

### **volume encryption secure-purge show**

Show status of secure-purge operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume encryption secure-purge show` command displays information about volume encryption securepurge operation in the cluster.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ *-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[ *-vserver* <*vserver name*> ] - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

**[ *-volume* <*volume name*> ] - Volume (privilege: advanced)**

This parameter specifies the name of the volume being secure purged.

**[ *-status* { *invalid|initializing|snapshots-deleting|snapshots-deleted|zombies-draining|zombies-drained|batched-free-log-draining|batched-free-log-drained|finishing-trash-purge|finished-trash-purge|reencrypting|aborting|aborted|success|failure|blocks-reclaim-scan-in-progress|blocks-reclaim-scan-completed|updating-blocks-used* } ] - Status (privilege: advanced)**

This parameter displays the status of the secure purge operation.

## Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption secure-purge show
Vserver      Volume      Secure Purge Phase
-----
vs1          vol1        reencrypting
```

## volume encryption secure-purge start

Start secure deletion of trash in existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume encryption secure-purge start` command performs secure purge of encrypted volume.

### Parameters

***-vserver* <*vserver name*> - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

***-volume* <*volume name*> - Volume (privilege: advanced)**

This parameter specifies the name of the volume for which the secure purge operation is being started.

**{ *-delete-all-snapshots* { *true|false* } } - Delete all Snapshot Copies? (privilege: advanced)**

This parameter specifies if it is required to delete all the snapshots in the volume.

**[`-re-encryption-method {volume-move|in-place-rekey}`] - Method to Use for Re-keying the Volume (privilege: advanced)**

Specifies the re-encryption method of the secure-purge operation. Possible values are:

- volume-move
- in-place-rekey

The volume-move method is faster compared to in-place-rekey method. The volume-move method requires additional space in the same aggregate. The volume-move method will cause unforced MetroCluster switchovers to be blocked while it is running. The volume-move operation involves cut-over phase in which client I/O operations are temporary blocked for short duration - less than 45 seconds. There is no cut-over phase for in-place-rekey method.

**[`-prepare <true>`] - Method to Use for Preparing Secure Purge (privilege: advanced) }**

This parameter specifies if it is required to prepare secure purge of encrypted volume.

## Examples

# volume file commands

## volume file compact-data

Apply Adaptive Data Compaction to a Snapshot copy of a file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `volume file compact-data` command applies the Adaptive Data Compaction feature to the snapshot of a file such that partially filled blocks from that file will merge and consume less storage space.

## Parameters

**`-node <nodename>` - Node**

This parameter indicates the node name that the AWA instance runs on.

**`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver in which the target file is located.

**`-file </vol/<volume name>/<file path>>` - File Path**

This specifies the complete file path. The snapshot name can be specified as part of the path or by specifying the `-snapshot` parameter.

**[`-volume <volume name>`] - Volume Name**

This specifies the volume in which the targeted file is located.

**[`-snapshot <snapshot name>`] - Snapshot Copy Name**

This specifies the snapshot name in which the file will be compacted.

## Examples

The following command applies the Adaptive Data Compaction feature to the snapshot *snap1* of the file */file1* in volume *vol1*:

```
cluster1:> volume file compact-data -vserver vs1 -volume vol1 -file /vol/vol1/file1 -snapshot snap1
```

## volume file modify

Manage the association of a QoS policy group with a file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command adds and removes files from QoS policy groups. QoS policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. A QoS policy group associated with this file can be created, modified, and deleted. You cannot associate a file to a QoS policy group if a LUN was created from the file.

### Parameters

**-vserver <vserver name> - Vserver Managing Volume**

This specifies the Vserver on which the volume (containing the file) resides.

**-volume <volume name> - Volume Name**

This specifies the name of the volume. The name must be unique within the hosting Vserver.

**-file <text> - File Path**

This specifies the actual path of the file with respect to the volume.

**{ [-qos-policy-group <text>] - QoS Policy Group Name**

This option associates the file with a QoS policy group. This policy group manages storage system resources to deliver your desired level of service. If you do not assign a policy to a file, the system will not monitor and control the traffic to it. To remove this file from a QoS policy group, enter the reserved keyword "none".

**| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the file. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file's allocated space or used space. To remove this file from an adaptive policy group, enter the reserved keyword "none".

**[-caching-policy <text>] - Caching Policy Name**

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy.

The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

## Examples

```
cluster1::> vol file modify -vserver vs0 -volume vs0_vol56 -file 1.txt
-qos-policy-group fast -cache all-read
```

Associates the file *1.txt* with the *fast* QoS policy group and *all-read* caching policy.

## volume file privileged-delete

Perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file privileged-delete` command is used to perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume. The only built-in role that has access to the command is `"vsadmin-snaplock"`.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver which hosts the SnapLock enterprise volume.

**-file </vol/<volume name>/<file path>> - File Path**

Specifies the absolute path of the file to be deleted. The value begins with `/vol/<volumename>`.

## Examples

The following example deletes the unexpired WORM file `"/vol/vol1/wormfile"`. The file `wormfile` is stored in volume `vol1` under Vserver `vserver1`.

```
vserver1::> volume file privileged-delete -file /vol/vol1/wormfile
[Job 76] Job succeeded: Privileged-delete of File
"vs1:/vol/sle_vol1/wormfile" Completed.
```

## volume file reservation

Get/Set the space reservation info for the named file.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file reservation` command can be used to query the space reservation settings for the named file, or to modify those settings. With no further modifiers, the command will report the current setting of the space reservation flag for a file. This tells whether or not space is reserved to fill holes in the file and to overwrite existing portions of the file that are also stored in a snapshot. For symlinks, the link is followed and the command operates on the link target.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

#### **-path </vol/<volume name>/<file path>> - File Name**

Specifies the complete file path for which we want to get/set the space reservation settings.

#### **[-is-enabled <text>] - enable | disable**

Specifying enable or disable will turn the reservation setting on or off accordingly for the file.

### Examples

The following example enables the file reservation setting for the file named file1. The file file1 is stored in volume testvol on Vserver vs0.

```
node::> file reservation -vserver vs0 /vol/testvol/file1 enable
space reservations for file /vol/testvol/file1: on.
```

## volume file show-disk-usage

Show disk usage of file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command requires a path to a file in a volume and displays the following information:

- Vserver name
- Total bytes used by the file in kilobytes
- Full Path to the file

If not logged in as Vserver administrator, the command also requires a Vserver name.

The "-instance" option provides the same result as the default as there are no extra fields to display.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-h ]**

If this parameter is specified, the command displays total bytes used by the file in human readable form.

**| [-k ]**

If this parameter is specified, the command displays total bytes used by the file in kilobytes.

**| [-m ]**

If this parameter is specified, the command displays total bytes used by the file in megabytes.

**| [-u ]**

If this parameter is specified, the command displays the unique bytes used by the file (bytes that are not shared with any other file in the volume due to deduplication or FlexClone files) in kilobytes.

**| [-uh ]**

If this parameter is specified, the command displays the unique bytes used by the file in human readable form.

**| [-uk ]**

If this parameter is specified, the command displays the unique bytes used by the file in kilobytes.

**| [-um ]**

If this parameter is specified, the command displays the unique bytes used by the file in megabytes.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver**

This parameter is used to specify the Vserver that contains the file for which the command displays the total bytes used. It is required if not logged in as Vserver administrator.

**-path </vol/<volume name>/<file path>> - Full Path**

This required parameter is used to specify the path of the file for which the command displays the total bytes used.

## **`[-r, -range [start offset>:<end offset]] - Block Range`**

If this parameter is specified, the command displays the total bytes used by the file in the specified block range.

### **Examples**

The following example displays the disk-usage of the file `file1.txt` in volume `/vol/root_vs0`.

```
cluster1::> volume file show-disk-usage -vserver vs0 -path
/vol/root_vs0/file1.txt

Vserver          Total          Path
-----          -
vs0              1408KB          /vol/root_vs0/file1.txt
cluster1::> volume file show-disk-usage -m -vserver vs0 -path
/vol/root_vs0/file1.txt

Vserver          Total          Path
-----          -
vs0              1MB          /vol/root_vs0/file1.txt
vs0::> volume file show-disk-usage -um -path /vol/root_vs0/file1.txt

Vserver          Total          Unique          Path
-----          -
vs0              1MB          1MB          /vol/root_vs0/file1.txt
```

## **volume file show-filehandle**

Show the file handle of a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

This command requires a path to a file in a volume and displays the file handle and volume information described below:

- Vserver name
- Path to the file
- File handle flags
- Snapshot ID of the file (snapid)
- File ID
- File handle generation number
- File system ID (fsid)

- Master data set ID (msid)
- Data set ID (dsid)
- Volume or constituent name

If not logged in as a Vserver administrator, the command also requires a Vserver name.

### Parameters

**[*-fields* <fieldname>,...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

**[*-instance* ] (privilege: advanced) }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[*-vserver* <vserver name>] - Vserver Managing Volume (privilege: advanced)**

This specifies the Vserver where the file resides.

**[*-path* <text>] - Path to File (privilege: advanced)**

This specifies the path to the file.

### Examples

The following example displays the file handle and volume information of a file named *file1.txt* in the volume */vol/vol1*.

```
cluster1::> volume file show-filehandle -vserver vs0 -path
/vol/vol1/file1.txt
```

| Vserver    |        |        |            | Path                |       |            |
|------------|--------|--------|------------|---------------------|-------|------------|
| -----      |        |        |            |                     |       |            |
| vs0        |        |        |            | /vol/vol1/file1.txt |       |            |
| flags      | snapid | fileid | generation | fsid                | msid  | dsid       |
| -----      |        | -----  | -----      | -----               | ----- |            |
|            | 0x0    | 0      | 0x60       | 0x206b6             | 0x402 | 0x80000402 |
| 0x402      |        |        |            |                     |       |            |
| volume     |        |        |            |                     |       |            |
| -----      |        |        |            |                     |       |            |
| ----       |        |        |            |                     |       |            |
| vol1__0003 |        |        |            |                     |       |            |

### volume file show-inode

Display file paths for a given inode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays information about all the files having a given inode in a volume of a Vserver. If the `-snapshot-id` or `-snapshot-name` parameter is specified, the command displays file information from the snapshot; otherwise, it displays the information from the active file system. The `-vserver`, `-volume` and `-inode-number` are mandatory parameters.

If no optional parameter is specified, the command displays the following fields for all the files having the given inode:

- Vserver Name
- Volume Name
- Inode Number
- File Path

The `volume file show-inode` command is only supported on flexible volumes and FlexGroup constituents.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command output also includes the specified field or fields.

**| [-snapshot ]**

If this parameter is specified, the command displays the following information:

- Vserver Name
- Volume Name
- Inode Number
- Snapshot Name
- Snapshot ID
- File Path

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about the files matching the specified inode number. The following information is displayed:

- Vserver Name
- Volume Name
- Inode Number
- File Path
- Snapshot Name
- Snapshot ID
- File Name

- Parent Inode Number
- Parent Directory Cookie

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume or snapshot is located.

**-volume <volume name> - Volume Name**

This specifies the volume in which the inode number is located.

**-inode-number <integer> - Inode Number**

This specifies the inode number whose information has to be retrieved.

**{ [-snapshot-name <snapshot name>] - Snapshot Name**

If this parameter or `-snapshot-id` is specified, information about the files is retrieved from the snapshot instead of the active file system.

**| [-snapshot-id <integer>] - Physical Snapshot ID }**

If this parameter or `-snapshot-name` is specified, information about the files is retrieved from the snapshot instead of the active file system.

**[-file-path <text>] - File Path**

If this parameter is specified, the command displays information only about the files that match the specified file path.

**[-file-name <text>] - File Name**

If this parameter is specified, the command displays information only about the files that match the specified file name.

**[-parent-inode-number <integer>] - Parent Inode Number**

The inode number of the parent directory of the file associated with the inode. If this parameter is specified, the command displays information only about the files that match the specified parent inode number.

**[-parent-dir-cookie <integer>] - Parent Directory Cookie**

The index of the directory entry of the file in its parent directory tree. If this parameter is specified, the command displays information only about the files that match the specified parent directory cookie.

## Examples

The following example displays information about all the files having the inode number 96 in the active file system of a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96
```

| Vserver | Volume | Inode<br>Number | File Path         |
|---------|--------|-----------------|-------------------|
| vs1     | vol1   | 96              | /vol/vol1/file1   |
| vs1     | vol1   | 96              | /vol/vol1/file2   |
| vs1     | vol1   | 96              | /vol/vol1/A/file2 |

3 entries were displayed.

The following example displays information about all the files with inode number 96 in a snapshot named mysnap. The snapshot is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -snapshot
```

| Vserver | Volume | Inode<br>Number | Snapshot<br>Name | Snapshot<br>ID | File Path                        |
|---------|--------|-----------------|------------------|----------------|----------------------------------|
| vs1     | vol1   | 96              | mysnap           | 131            | /vol/vol1/.snapshot/mysnap/file1 |
| vs1     | vol1   | 96              | mysnap           | 131            | /vol/vol1/.snapshot/mysnap/file2 |

2 entries were displayed.

The following example displays detailed information about all the files with inode number 96 in a snapshot named mysnap. The snapshot is present in a volume named vol1 on a Vserver named vs1:

```

cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number
96 -snapshot-name mysnap -instance
Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mysnap/file1
    Snapshot Name: mysnap
    Physical Snapshot ID: 131
    File Name: file1
    Parent Inode Number: 64
    Parent Directory Cookie: 2
Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mysnap/file2
    Snapshot Name: mysnap
    Physical Snapshot ID: 131
    File Name: file2
    Parent Inode Number: 64
    Parent Directory Cookie: 3
    2 entries were displayed.

```

## volume file async-delete cancel

### Cancel an async directory delete job

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `volume file async-delete cancel` command cancels an async delete of a directory.

#### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume containing the directory resides.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume.

**-jobid <text> - Job ID (privilege: advanced)**

This specifies the Job ID of the async directory delete job to cancel. Run [volume file async-delete show](#) to get the job ID.

#### Examples

The following example cancels a job with job ID "0:1" in volume "vol1" in Vserver "vs1".

```
cluster1::*> volume file async-delete cancel -vserver vs1 -volume vol1  
-jobid 0:1
```

## Related Links

- [volume file async-delete show](#)

## volume file async-delete prepare-for-revert

Cancel all async directory delete jobs before starting revert

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume file async-delete prepare_for_revert` command cancels all async directory delete jobs.

## Examples

The following example deletes all async directory delete jobs.

```
cluster1::*> volume file async-delete prepare-for-revert
```

## volume file async-delete show

List ongoing async directory delete jobs

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The event log will contain events for async directory delete operations that have already completed. Use the `event log show -event async_delete` command to find completed async directory delete operations.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <vserver name>] - Vserver Name (privilege: advanced)`**

If this parameter is specified, ongoing async directory delete operations that match the specified Vserver are displayed.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

If this parameter is specified, ongoing async directory delete operations that match the specified volume are displayed.

**[`-jobids <text>,...`] - Job ID (privilege: advanced)**

If this parameter is specified, ongoing async directory delete operations that match the specified job ID are displayed.

**[`-paths <text>,...`] - Directory Path (privilege: advanced)**

If this parameter is specified, ongoing async directory delete operations that match the specified path are displayed.

**[`-deleted-files <integer>,...`] - Number of files deleted (privilege: advanced)**

This parameter specifies the number of files deleted as part of the corresponding async directory delete job.

**[`-deleted-dirs <integer>,...`] - Number of directories deleted (privilege: advanced)**

This parameter specifies the number of directories deleted as part of the corresponding async directory delete job.

**[`-deleted-bytes <integer>,...`] - Deleted size in bytes (privilege: advanced)**

This parameter specifies total number of bytes deleted as part of the corresponding async directory delete job.

**[`-create-times <MM/DD/YYYY HH:MM:SS>,...`] - Time the job was created (privilege: advanced)**

This parameter specifies the time at which the corresponding async directory delete job was requested.

**[`-start-times <MM/DD/YYYY HH:MM:SS>,...`] - Time the job was started (privilege: advanced)**

This parameter specifies the time at which the corresponding async directory delete job began executing.

## Examples

The following example shows that there are two async directory deletes in progress; one in FlexVol `vol1` and another one in FlexGroup `fg`.

```
cluster1::*> volume file async-delete show
      Vserver      Volume      Job ID      Path
-----Progress-----
#Dirs      #Bytes      #Files
-----
      vs1          vol1          0:2          d2/dd          1250
2      24560
      vs2          fg          1:1          d1/d2          250
6      12288
```

## volume file async-delete start

Start async delete of a directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file async-delete start` command starts async delete of a directory.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume containing the directory resides.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume.

**-path <text> - Directory Path (privilege: advanced)**

This specifies the path of the directory.

**[-throttle <integer>] - Throttle (privilege: advanced)**

This specifies maximum number of directory delete operations per second.

### Examples

The following example deletes directory "d2" under directory "d1" in volume "vol1" hosted in Vserver "vs1".

```
cluster1::*> volume file async-delete start -vserver vs1 -volume vol1  
-path d1/d2
```

## volume file async-delete client disable

Disable async delete of a directory from the client

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file async-delete client disable` command disables async delete of a directory on the volume, from client applications.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume resides.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume.

## Examples

The following example disables async directory delete from the client in volume "vol1" hosted in Vserver "vs1".

```
cluster1::*> volume file async-delete client disable -vserver vs1 -volume  
vol1
```

## volume file async-delete client enable

Enable async delete of a directory from the client

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file async-delete client enable` command enables async delete of a directory on the volume, from client applications. When async directory delete from the client is enabled, 'mv' or 'rename' of a directory, to the trashbin name, triggers async delete of the directory.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume resides.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume.

**[-trashbin <text>] - Trashbin Directory Name (privilege: advanced)**

This specifies the name of the trashbin directory.

## Examples

The following example enables async delete of directory in volume "vol1" hosted in Vserver "vs1" from client.

```
cluster1::*> volume file async-delete client enable -vserver vs1 -volume  
vol1 -trashbin ntaptrash
```

## volume file async-delete client show

Display the status of async delete of a directory from the client

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file async-delete client show` command shows the configuration of async delete of a directory on a volume from client applications.

## Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <vserver name>`] - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume resides.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

This specifies the name of the volume.

**[`-is-enabled {true|false}`] - Is Client Async Delete Enabled (privilege: advanced)**

This specifies whether async delete of a directory from client applications is enabled on the volume.

**[`-trashbin <text>`] - Trashbin Directory Name (privilege: advanced)**

This specifies the name of the trashbin directory.

**[`-inode <integer>`] - Trashbin Directory Inode Number (privilege: advanced)**

This specifies the inode number of the trashbin directory.

## Examples

The following example shows the enable status of async directory delete from the client for volume "vol1" hosted in Vserver "vs1".

```
cluster1::*> volume file async-delete client show -vserver vs1 -volume  
vol1
```

## volume file clone autodelete

### Enable/Disable autodelete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file clone autodelete` command enables or disables the automatic deletion of file, LUN or NVMe namespace clones. Newly created file, LUN and NVMe namespace clones are disabled for automatic deletion by default.

## Parameters

**`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver on which the volume resides. If only one data Vserver exists, you do not need to specify this parameter.

### **[`-volume <volume name>`] - Volume Name**

This specifies the name of the volume in which the file, LUN or NVMe namespace is present.

### **`-clone-path <text>` - Clone Path**

This specifies the path where clone resides. If you use the volume parameter, then specify the relative path to the file, LUN or NVMe namespace clone. Otherwise, specify the absolute path.

### **`-enable {true|false}` - Enable or Disable Autodelete**

This parameter enables or disables the autodelete feature for the file, LUN or NVMe namespace clones in a specified volume if the clones are already added for automatic deletion. If you set the parameter to *true*, the specified file, LUN or NVMe namespace clones get automatically deleted in the 'try' or 'disrupt' mode. If the value is *false*, the clones get automatically deleted only in the 'destroy' mode.

### **[`-force <true>`] - Force Enable or Disable Autodelete**

If `-enable` is *true* then this parameter forces automatic deletion of a specified file, LUN or NVMe namespace, or a file, LUN or NVMe namespace clone. If `-enable` is *false* then specifying this parameter disables autodeletion on a file, LUN or NVMe namespace - or a file, LUN or NVMe namespace clone - even if `-commitment destroy` is specified.

## **Examples**

The following command enables for automatic deletion a LUN Clone named *lun\_clone* contained in a volume named *volume1*. This volume is present on a Vserver named *vs1*.

```
cluster1::> volume file clone autodelete /vol/volume1/lun_clone -enable
true -vserver vs1
```

The following command specifies the relative clone path when the volume parameter is specified in the command.

```
cluster1::> volume file clone autodelete lun_clone -enable true
-vserver vs1 -volume volume1
```

## **volume file clone create**

### **Create file or LUN full or sub file clone**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume file clone create` command creates a clone of a file, a LUN or an NVMe namespace. You can optionally specify the following parameters for the clone file creation process:

- Vserver in which the volume resides
- Name of the parent snapshot
- The range of blocks to be cloned

- The option to avoid space reservations for the new file or LUN clone
- The option to assign a QoS policy group to the new file or LUN clone
- The option to assign a caching policy to the new file or LUN clone
- The option to mark the new file, LUN or NVMe namespace clone created for auto deletion
- The option to overwrite an existing file, LUN or NVMe namespace clone

File, LUN or NVMe namespace clones create a duplicate copy of another file, LUN or NVMe namespace, but don't require copying the data itself. This allows the clone operation to occur in constant time, taking the same amount of time to complete no matter the size of the file being cloned. This also means that clones require only a small amount of additional storage space because the clone shares the data with the source file, LUN or NVMe namespace.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.

### **[-volume <volume name>] - Volume**

This specifies the name of volume in which a file, LUN or NVMe namespace is going to be cloned.

### **-source-path <text> - Source Path**

This specifies the path to the file, LUN or NVMe namespace to be cloned relative to the specified volume.

### **-destination-path <text> - Destination Path**

This specifies the path for the newly-created cloned file, LUN or NVMe namespace relative to the specified volume. If the file, LUN or NVMe namespace clone to be created is a whole file, LUN or NVMe namespace, the destination file, LUN or NVMe namespace must not exist. If the `range` parameter is specified, the destination file or LUN must exist. If the `snapshot-name` parameter is specified, this option is mandatory.

### **[-s, -snapshot-name <snapshot name>] - Source Snapshot**

The name of the snapshot to use as the source for the clone operation. If this value is not specified, the active filesystem will be used instead.

### **{ [-r, -range <text>, ...] - Block Range**

This specifies the block range to be cloned. If the range is not specified, the entire file, LUN, or NVMe namespace is cloned. The block range should be specified in the format `s:d:n` where `s` is the source start block number, `d` is the destination start block number, and `n` is the length in blocks to be cloned. The range of `n` should be from 1 to 32768 or 1 to 16777216 in case of clone from Active File System or snapshot respectively. If this parameter is used in the path provided by the `destination-path`, the parameter must refer to a file, LUN, or NVMe namespace which already exists. If either the source or destination is a LUN or NVMe namespace, then the block size is measured in LBA blocks. The source object block size and destination block size must be equal. If neither the source nor destination is a LUN or NVMe namespace, then the block size will be 4KB. If 512-byte sectors are used, the source and destination offsets must have the same offset within 4KB blocks. + This option is most likely to be used by external automated systems in managing virtual disk configurations and not by human administrators.

### **| [-o, -no-reserve {true|false}] - Do not reserve clone }**

If this option is used, the clone file or LUN will not be guaranteed space in the underlying aggregate. While this out-of-space condition persists, writes to the clone file or LUN would fail. This option may be useful if

few writes to the clone are expected to be needed, or to allow a file or LUN clone to be created under space-constrained conditions for recovery purposes. If this option is not specified the clone will inherit the space reservation properties from the source.

**`[-i, -ignore-streams {true|false}] - Ignore streams`**

This parameter specifies whether streams should be ignored during cloning of files, LUNs, or NVMe namespaces. If you set this parameter to false, the streams are ignored; otherwise, they are included in the clones. The default value is false.

**`[-k, -ignore-locks {true|false}] - Ignore locks`**

This parameter specifies whether byte-range locks and shared-mode locks on files, LUNs or NVMe namespaces should be ignored during cloning. If you set this parameter to true, the locks are ignored; otherwise, clone operation fails if locks are present on files, LUNs or NVMe namespaces. The default value is false.

**`[-d, -overwrite-destination {true|false}] - Overwrite Destination`**

Specify this parameter to overwrite the destination file, LUN, or NVMe namespace, if it exists. The default is not to overwrite the destination file. The command will fail if the destination file exists.

**`{ [-qos-policy-group <text>] - QoS Policy Group Name`**

This optionally specifies which QoS policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a file or LUN, the system will not monitor and control the traffic to it. You cannot associate a file to a QoS policy group if a LUN was created from the file.

**`| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }`**

This optionally specifies which QoS adaptive policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file or LUN's allocated space or used space.

**`[-caching-policy <text>] - Caching Policy Name`**

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

### **`[-autodelete {true|false}] - Mark Clone for Autodeletion`**

This parameter marks the file, LUN or NVMe namespace clones created for auto deletion. When set to true, the file, LUN or NVMe namespace clones get automatically deleted when the volume runs out of space. The default value is false.

### **`[-bypass-throttle {true|false}] - Bypass Throttle Checks (privilege: advanced)`**

This parameter specifies whether clone throttle checks should be skipped during clone creation. When set to true, clones are created without enforcing any clone throttle checks. The default value is false.

### **`[-nosplit-entry {true|false}] - Mark Clone to keep Unsplit`**

This parameter specifies whether the clone should be kept unsplit. When set to true, clones created will not undergo split routine. It is applicable only for full-file clones created from Active File System. The default value is false.

### **`[-is-backup {true|false}] - Is a Clone for Backup`**

This parameter is used to mark the destination file as a backup clone, where divergence is expected on the source file and no divergence is expected on the destination file. It is applicable only for full-file clones created from Active File System volumes. The default value is *false*.

### **`[-destination-volume <volume name>] - Destination Volume`**

This specifies the name of the volume where the destination file resides. This can be different from `volume`, whereas parameter `volume` specifies the volume on which source file resides. This is an optional argument that applies only to a MetaWAFL volume where the source and destination volumes for the clone operation can be different. If this parameter is not given, the destination file will be created in the volume where `source_file` resides.

## **Examples**

The following command creates a FlexClone file of the file named *myfile* contained in a volume named *vol*. The file *myfile* is located in the root directory of that volume. The cloned file *myfile\_copy* resides in the root directory same volume.

```
cluster1::> volume file clone create -volume vol -source-path /myfile
-destination-path /myfile_copy
```

The following command optionally associates the FlexClone file named *myfile\_copy* with the *fast* QoS policy group and the caching policy named random-read.

```
cluster1::> volume file clone create -volume vol -source-path /myfile
-destination-path /myfile_copy -qos-policy-group fast -caching-policy
random-read
```

## **volume file clone show-autodelete**

Show the autodelete status for a file or LUN clone

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone show-autodelete` command displays the autodelete details of a file, LUN or NVMe namespace clone. The command displays the following information about a file, LUN or NVMe namespace clone:

- Vserver Name
- Clone Path
- Whether auto deletion of file, LUN or NVMe namespace clone is enabled

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver to which the file, LUN or NVMe namespace clone belongs.

**-clone-path <text> - Clone Path**

This specifies the path of the file, LUN or NVMe namespace clone.

**[-autodelete-enabled {true|false}] - Autodelete Enabled**

If this parameter is true, the file, LUN or NVMe namespace clone gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

## Examples

The following example displays the autodelete information about a file, LUN or NVMe namespace clone.

```
cluster1:> volume file clone show-autodelete -vserver vs1 -clone-path
/vol/v1/f1
Vserver Name: vs1
      Clone Path: /vol/v1/f1
Autodelete Enabled: true
```

## volume file clone deletion add-extension

Add new supported file extensions to be deleted with clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone deletion add-extension` command can be used to add new supported file extensions for clone delete.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the vservers.

**-volume <volume name> - Volume Name**

Name of the volume.

**-extensions <text> - Supported Extensions for Clone Delete**

List of supported file extensions for clone delete.

## Examples

The following example adds the new supported *vmdk*, *vhd* file extensions to volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion add-extension -vserver vs1 -volume  
vol1 -extensions vmdk,vhd
```

## volume file clone deletion modify

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone deletion modify` command can be used to change the required minimum clone file size of a volume for clone delete.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the vservers.

**-volume <volume name> - Volume Name**

Name of the volume.

**[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete**

Minimum clone file size required for clone delete.

## Examples

The following example changes the required minimum file size to 100M for volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion modify -volume vol1 -vserver vs1  
-minimum-size 100M
```

## volume file clone deletion remove-extension

Remove unsupported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file clone deletion remove-extension` command can be used to remove the existing file extensions that are no longer supported for clone delete.

### Parameters

**-vserver <vserver name> - Vserver Name**

Name of the vservers.

**-volume <volume name> - Volume Name**

Name of the volume.

**[-extensions <text>] - Unsupported Extensions for Clone Delete**

List of unsupported file extensions for clone delete.

### Examples

The following example removes the existing unsupported *vmrk*, *vhd* file extensions to volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion remove-extension -vserver vs1  
-volume vol1 -extensions vmrk,vhd
```

## volume file clone deletion show

Show the supported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file clone deletion show` command displays the following information for clone delete:

- Vserver Name
- Volume Name
- Minimum File Size Required for Clone Delete
- List of Supported File Extensions for Clone Delete

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Name of the vservers.

**[-volume <volume name>] - Volume Name**

Name of the volume.

**[-extensions <text>,...] - Supported Extensions for Clone Delete**

List of supported file extensions for Clone Delete.

**[-minimum-size {<integer>[KB|MB|GB|TB|PB] } ] - Minimum Size Required for Clone delete**

Minimum file size required for Clone Delete.

**Examples**

The following example displays the clone deletion information for all volumes of all vservers.

```
cluster1::> volume file clone deletion show
```

| Vserver   | Volume   | Minimum Size | Extensions |
|-----------|----------|--------------|------------|
| -----     | -----    | -----        |            |
| vs0       | testvol  | 100B         | vmdk, vhd, |
| vhd, vswp |          |              |            |
|           | vs0_root | 0B           | -          |
| vs1       | testvol  | 100G         | vmdk, vhd, |
| vhd, vswp |          |              |            |
|           | vs1_root | 0B           | -          |

The following example displays the clone deletion information for volume `vol1` of vservers `vs1`.

```
cluster1::> volume file clone deletion show -vserver vs0 -volume testvol
Vserver Name: vs0
Volume Name: testvol
Supported Extensions for Clone Delete: vmdk, vhd, vhd, vswp
Minimum Size Required for Clone delete: 100B
```

## volume file clone split load modify

Modify maximum split load on a node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file clone split load modify` command can be used to change the maximum split load (file, LUN or NVMe namespace clones) of a node.

### Parameters

**-node {<nodename>|local} - Node Name**

Node name on which the new maximum split load is being applied.

**[-max-split-load {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load**

This specifies the new maximum split load of a node. This is the amount of clone create load, the node can take at any point of time. If it crosses this limit, then the clone create requests will not be allowed, till the split load is less than maximum split load

### Examples

The following example changes the new maximum limit to 10TB on node1.

```
cluster1::*> volume file clone split load*> modify -node clone-01 -max  
-split-load 100KB
```

## volume file clone split load show

Show split load on a node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file clone split load show` command displays the corresponding file, LUN or NVMe namespace clone split loads on nodes. If no parameters are specified, the command displays the following information:

- Node
- Max Split Load
- Current Split Load
- Token Reserved Load
- Allowable Split Load

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name**

Node on which the file, LUN or NVMe namespace clone split load is displayed.

**[-max-split-load {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load**

This specifies the maximum allowable split load on the node.

**[-current-split-load {<integer>[KB|MB|GB|TB|PB]}] - Current Clone Split Load**

This specifies the current on going split load on the node.

**[-token-reserved-load {<integer>[KB|MB|GB|TB|PB]}] - Load Reserved for Clone Creation**

This specifies the reserved split load of the node using the tokens.

**[-allowable-split-load {<integer>[KB|MB|GB|TB|PB]}] - Allowable Clone Split Load**

This specifies the available split load of the node.

## Examples

The following example displays the current and allowable file, LUN or NVMe namespace clone split load on a node.

```
cluster1::> volume file clone split load show
Node
Allowable
Split Load
-----
clone-01
15.97TB
clone-02
15.97TB
2 entries were displayed.
cluster1::> volume file clone split load show -node clone-01 -instance
Node Name: clone-01
Maximum Clone Split Load: 15.97TB
Current Clone Split Load: 0B
Load Reserved for Clone Creation: 100MB
Allowable Clone Split Load: 15.97TB
```

## volume file fingerprint abort

Abort a file fingerprint operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint abort` command aborts an in-progress fingerprint operation. This command only aborts the fingerprint operations that have not yet completed. This command takes `session-id` as input and aborts the fingerprint operation that is associated with that particular session-id.

### Parameters

#### **-session-id <integer> - Session ID of Fingerprint Operation**

Specifies the session-id of the fingerprint operation that needs to be aborted. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

### Examples

The following example aborts the fingerprint operation identified by `17039361`:

```
cluster1::> volume file fingerprint abort -session-id 17039361
```

## volume file fingerprint dump

Display fingerprint of a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint dump` command displays the following information given the `-session-id` of the fingerprint operation:

- **Vserver:**

The Vserver on which the file exists.

\* **Session-ID:**

A unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

\* **Volume:**

The name of the volume on which the file resides.

\* **Path:**

The absolute path of the file on which the fingerprint is calculated. The value begins with `/vol/<volumename>`.

\* **Data Fingerprint:**

The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if the scope is *metadata-only*.

\* Metadata Fingerprint:

The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, file gid, and file type. The fingerprint is base64 encoded. This field is not included if the scope is *data-only*.

\* Fingerprint Algorithm:

The digest algorithm which is used for the fingerprint computation. Fingerprint is computed using *md5* or *sha-256* digest algorithm.

\* Fingerprint Scope:

The scope of the file which is used for the fingerprint computation. Fingerprint is computed over *data-only*, *metadata-only*, or *data-and-metadata*.

\* Fingerprint Start Time:

The start time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Fingerprint Start Time:

The start time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Fingerprint Version:

The version of the fingerprint output format.

\* SnapLock License:

The status of the SnapLock license.

\* Vserver UUID:

A universal unique identifier for the Vserver on which the file exists.

\* Volume MSID:

The mirror set identifier of the volume where the file resides.

\* Volume DSID:

The data set identifier of the volume where the file resides.

\* Hostname:

The name of the storage system where the fingerprint operation is performed.

\* Filer ID:

The NVRAM identifier of the storage system.

\* Volume Containing Aggregate:

The name of the aggregate in which the volume resides.

\* Aggregate ID:

A universal unique identifier for the aggregate containing the volume.

\* SnapLock System ComplianceClock:

The System ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone if it is initialized.

\* Formatted SnapLock System ComplianceClock:

The System ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone if it is initialized.

\* Volume SnapLock Type:

The type of the SnapLock volume. This value is only given for SnapLock volumes. Possible values are *compliance* and *enterprise*.

\* Volume ComplianceClock:

The volume ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone. This has a value only for SnapLock volumes.

\* Formatted Volume ComplianceClock:

The volume ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. This has a value only for SnapLock volumes.

\* Volume Expiry Date:

The expiry date of the SnapLock volume in seconds since 1 January 1970 00:00:00 in GMT timezone. The volume expiry date can be in wraparound format.

\* Is Volume Expiry Date Wraparound:

The value is *true* if the volume expiry date is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Volume Expiry Date:

The expiry date of the SnapLock volume in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The volume expiry date can be in wraparound format.

\* Filesystem ID:

The filesystem identifier of the volume on which the file resides.

\* File ID:

A unique number within the filesystem identifying the file.

\* File Type:

The type of the file. Possible values include: *worm*, *worm\_appendable*, *worm\_active\_log*, *worm\_log*, and *regular*.

\* File Size:

The size of the file in bytes.

\* Creation Time:

The creation time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Creation Time:

The creation time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Modification Time:

The last modification time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Modification Time:

The last modification time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Changed Time:

The last changed time of the file attributes in seconds since 1 January 1970 00:00:00 in GMT timezone. Time is taken from the system clock for regular files and from the volume ComplianceClock for WORM files when they are committed. The changed time can be in wraparound format.

\* Is Changed Time Wraparound:

The value is *true* if the last changed time of the file attributes is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Changed Time:

The last changed time of the file attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The changed time can be in wraparound format.

\* Retention Time:

The retention time of the files committed to WORM on SnapLock volumes in seconds since 1 January 1970 00:00:00 in GMT timezone. The retention time can be in wraparound format.

\* Is Retention Time Wraparound:

The value is *true* if the retention time of the file is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Retention Time:

The retention time of the files protected by SnapLock in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The retention time can be in wraparound format.

\* Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Owner ID:

The integer identifier of the owner of the file.

\* Group ID:

The integer identifier of the group owning the file.

\* Owner SID:

The security identifier of the owner of the file when it has NTFS security style.

\* Fingerprint End Time:

The end time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Fingerprint End Time:

The end time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Litigation Count:

The number of litigations on the file.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-session-id <integer> - Session ID of Fingerprint Operation**

Specifies the session-id of the fingerprint operation whose output is to be displayed. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

## Examples

The following example displays the fingerprint information of the fingerprint session identified by session-id 17039367:

```
cluster1::> volume file fingerprint dump -session-id 17039367
Vserver:vs1

                                Session-ID:17039367
                                Volume:nfs_slc
                                Path:/vol/nfs_slc/worm
                                Data
Fingerprint:MOFJVEvxNSJm3C/4Bn5oEEYH5lCrudOzZYK4r5Cfy1g=
                                Metadata
Fingerprint:8iMjqJXiNcqqXT5XuRhLiEwIrJEihDmwS0hrexnjgmc=

## volume file fingerprint show

Display fingerprint operation status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint show` command returns information for one or several fingerprint operations. This command requires either `-session-id` or `-vserver` and `-volume`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-session-id <integer>] - Session ID of Fingerprint Operation**

If this parameter is specified, the command returns the progress of the fingerprint operation of the specified session-id. The session-id is a unique identifier for the fingerprint operation that is returned when the fingerprint operation is started on a file.

### **[-vserver <vserver name>] - Vserver**

If this parameter is specified, -volume must also be specified. When queried with -vserver and -volume, the command returns the progress of all the fingerprint operations running on that particular volume.

### **[-volume <volume name>] - Volume Name**

If this parameter is specified, -vserver must also be specified. When queried with -vserver and -volume, the command returns the progress of all the fingerprint operations running on that particular volume.

### **[-file </vol/<volume name>/<file path>>] - File Path**

If this parameter is specified, the command returns the progress of all fingerprint operations on the specified file.

### **[-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status**

If this parameter is specified, the command returns the progress of all fingerprint operations with matching status value.

### **[-progress-percentage <integer>] - Progress Percentage**

If this parameter is specified, the command returns the progress of all fingerprint operations with matching progress percentage value.

## **Examples**

The following example displays the progress of all the fingerprint operations running on volume *nfs\_slc*:

```
cluster1::> volume file fingerprint show -vserver vs0 -volume nfs_slc
```

| Progress<br>File-Path<br>Percentage | Session-ID | Status      |
|-------------------------------------|------------|-------------|
| -----                               | -----      | -----       |
| /vol/nfs_slc/worm<br>100            | 17104897   | Completed   |
| /vol/nfs_slc/worm_appedable<br>100  | 17104898   | Completed   |
| /vol/nfs_slc/regular<br>30          | 17104899   | In-Progress |

3 entries were displayed.

## volume file fingerprint start

Start a file fingerprint computation on a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint start` command starts the fingerprint computation on a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is a unique identifier for the fingerprint operation and can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the name of the vservers which owns the volume on which the file resides.

**-file </vol/<volume name>/<file path>> - Path**

Specifies the absolute path of the file on which fingerprint needs to be calculated. The value begins with `/vol/<volumename>`.

**[-algorithm {MD5|SHA256}] - Fingerprint Algorithm**

Specifies the digest algorithm which is used for the fingerprint computation.

Fingerprint can be computed using one of the following digest algorithms:

- `md5`
- `sha-256`

**[-scope {data-and-metadata|data-only|metadata-only}] - Fingerprint Scope**

Specifies the scope of the file which is used for the fingerprint computation.

Fingerprint can be computed using one of the following scope:

- `data-only`
- `metadata-only`
- `data-and-metadata`

### Examples

The following example starts computing fingerprint over data and metadata for file `/vol/nfs_slc/worm` using `md5` hash algorithm. The file `/vol/nfs_slc/worm` is stored in volume `nfs_slc` on Vserver `vs0`.

```
cluster1::> volume file fingerprint start -vserver vs0 -scope data-and-  
metadata -algorithm md5 -file /vol/nfs_slc/worm  
File fingerprint operation is queued. Run "volume file fingerprint show  
-session-id 16973825" to view the fingerprint session status.
```

## volume file retention show

Display retention time of a file protected by SnapLock.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file retention show` command displays the retention time of a file protected by SnapLock given `-vserver` and `-file`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This specifies the Vserver on which the volume is located having the file in a SnapLock volume. An exact value is required for this parameter.

**[-file </vol/<volume name>/<file path>>] - File path**

This specifies the absolute path of the file in a SnapLock volume. The value begins with `/vol/<volumename>`. An exact value is required for this parameter.

**[-retention-time <integer>] - Retention Time of the File**

If this parameter is specified, the command displays information only about the file protected by SnapLock that matches the specified `retention-time`. The value represents file retention time in seconds since 1 January 1970 00:00:00.

**[-formatted-retention-time <text>] - Formatted Retention Period**

If this parameter is specified, the command displays information only about the file protected by SnapLock that matches the specified `formatted-retention-time`. The expiry date format is `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone taking care of wraparound. A value of *infinite* indicates that this file has infinite retention time. A value of *indefinite* indicates that this file has indefinite retention time. A value of *unspecified* indicates that this file will be retained forever; however, the retention time can be changed to an absolute value.

**[-is-wraparound {true|false}] - Is Retention Time Wraparound**

If this parameter is specified, the command displays information only about the file protected by SnapLock that matches the specified `-is-wraparound`. The value is `true` if the date represented in retention time is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

**[-seconds-until-expiry <integer>] - Seconds until the File Expires**

If this parameter is specified, the command displays information only about the file protected by SnapLock that matches the specified `-seconds-until-expiry`. The value represents the number of seconds until the expiration time.

### **`[-is-expired {true|false}]` - Has the File Expired**

If this parameter is specified, the command displays information only about the file protected by SnapLock that matches the specified `-is-expired`. The value represents file expiration status. The value is *false* if the file is under active retention or *true* if the file is past its expiry time.

### **Examples**

The following example displays the retention time of the file `/vol/nfs1/file1`:

```
cluster1::> volume file retention show -vserver vs0 -file /vol/nfs1/file1
Vserver : vs0
Path : /vol/nfs1/file1
Retention Time (Secs from Epoch) : 1439111404
Formatted Retention Time : Sun Aug 9 09:10:04 GMT 2015
Is Retention Time Wraparound : false
```

## **volume flexcache commands**

### **volume flexcache config-refresh**

Refresh FlexCache configuration for a peer volume

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The ``volume flexcache config-refresh`` command is used to refresh the FlexCache configuration. It can be used to update the configuration on either the FlexCache or origin of a FlexCache cluster. This command only needs to be run if the automatic refresh failed and the corresponding EMS was generated.

### **NOTE:**

- This command must be run on the peer cluster. For example, refresh of origin of a FlexCache volume must be run from the FlexCache cluster. Refresh a FlexCache volume must be run from the of an origin of a FlexCache cluster.

### **Parameters**

**`-peer-vserver <vserver name>` - Peer Vserver (privilege: advanced)**

Name of the Vserver for which the configuration is being refreshed.

**`-peer-volume <volume name>` - Peer Volume (privilege: advanced)**

Name of the volume for which the configuration is being refreshed.

### **-peer-endpoint-type {cache|origin} - Origin/Cache Volume (privilege: advanced)**

The peer-endpoint-type specifies the FlexCache endpoint type of the peer volume. Possible values are *cache* for FlexCache volumes and *origin* for origin of a FlexCache volumes.

### **Examples**

The following example triggers config-refresh on origin of a FlexCache volume "origin1".

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume  
origin1 -peer-endpoint-type origin  
          (volume flexcache config-refresh)
```

The following example triggers config-refresh on FlexCache volume "fc1".

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume fc1  
-peer-endpoint-type cache  
          (volume flexcache config-refresh)
```

The following example triggers config-refresh on FlexCache volume "fc1" with an incorrect peer-endpoint-type.

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume fc1  
-peer-endpoint-type origin  
          (volume flexcache config-refresh)  
Error: command failed: Failed to store the configuration for peer volume  
"fc1"  
          in Vserver "vs34" on cluster "cluster1". Check the  
FlexCache  
          configuration on the local cluster and retry the  
operation.
```

## **volume flexcache create**

Create a new cache relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume flexcache create` command is used to create a FlexCache volume. It also creates the relationship between the FlexCache volume and the specified origin volume.

NOTE:

- If the `vserver` and `origin-vserver` are different, the Vservers must be in a peer relationship.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This specifies the Vserver on which the FlexCache volume is to be created.

### **-volume <volume name> - Cache Volume Name**

This specifies the name of the FlexCache volume that is to be created.

### **{ [-aggr-list <aggregate name>,...] - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for creating the FlexCache volume. Each entry in the list will create a constituent on the specified aggregate. The root constituent will always be placed on the first aggregate in the list, unless `optimize-aggr-list` is specified as `true`. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroup volumes.

### **[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order `aggr1`, `aggr2`, `aggr1`, `aggr2`.

+

The default value is 4.

### **[-optimize-aggr-list {true|false}] - Have the System Optimize the Order of the Aggregate List**

Specifies whether to create the constituents of the FlexCache volume on the aggregates specified in the `aggr-list` in the order they are specified, or whether the system should optimize the ordering of the aggregates. If this value is `true`, the system will optimize the ordering of the aggregates specified in the `aggr-list`. If this value is `false` the order of the `aggr-list` will be unchanged. The default value is `false`. This parameter only applies to FlexGroup volumes.

### **[-auto-provision-as <FlexGroup>] - Automatically Provision as Volume of Type**

Use this parameter to automatically select existing aggregates for provisioning the FlexCache volume.

### **[-use-tiered-aggregate {true|false}] - Automatically Provision FlexGroup on FabricPool }**

This parameter specifies whether or not FabricPool-enabled aggregates are selected when provisioning a FlexCache volume using the `auto-provision-as` parameter. Only FabricPool-enabled aggregates are used if this parameter is set to `true` and only non-FabricPool-enabled aggregates are used if this parameter is set to `false`. The default value is `false`. Tiering-policy is always `none` for FlexCache.

This parameter only applies to flexible caches created using the `-auto-provision-as` parameter.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Volume Size**

This optionally specifies the size of the FlexCache volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not

specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. If the size parameter is not specified, it defaults to 10% of the origin volume size.

**`[-origin-vserver <vserver name>] - Origin Vserver Name`**

This specifies the name of the Vserver where the origin volume is located.

**`-origin-volume <volume name> - Origin Volume Name`**

This specifies the name of the origin volume.

**`[-junction-path <junction path>] - Cache Junction Path`**

This optionally specifies the FlexCache volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.

**`[-foreground {true|false}] - Foreground Process`**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the operation completes.

**`[-s, -space-guarantee {none|volume}] - Space Guarantee Style`**

This optionally specifies the space guarantee style for the volume. A value of *volume* reserves space on the aggregates for the entire volume. A value of *none* reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. The default setting for the FlexCache volumes is *none*.

**`[-is-cifs-enabled {true|false}] - CIFS access Enabled/Disabled (privilege: advanced)`**

This parameter specifies CIFS access for the volume. The default value is *true*.

**`[-preserve-msid {true|false}] - Preserve Origin MSID on the Cache (privilege: advanced)`**

Create the cache with the same MSID as the origin. Set this parameter to *true* to create FlexCache DR. The default setting for the FlexCache volumes is *false* to avoid a situation where a FlexCache create operation using `-preserve-msid` fails on a Vserver because of collision with a previously used MSID.

**`[-is-global-file-locking-enabled {true|false}] - Global File Locking Mode Enabled/Disabled`**

This parameter specifies the global file locking mode for the volume. The default value of global file locking mode is *false*.

**`[-is-nfsv4-enabled {true|false}] - NFSv4 access Enabled/Disabled (privilege: advanced)`**

This parameter specifies NFSv4 access for the volume. The default value is *true*.

**`[-is-writeback-enabled {true|false}] - Is Writeback Enabled (privilege: advanced)`**

This parameter specifies whether writeback is enabled for the FlexCache volume. Writeback is a storage method where data is first written to the FlexCache volume and then written to the origin of a FlexCache volume. The default value is *false*.

**`[-is-relative-size-enabled {true|false}] - Is Relative Sizing Enabled/Disabled (privilege: advanced)`**

This parameter specifies whether the relative sizing is enabled for the FlexCache volume. Relative sizing is introduced as a part of follow the origin feature. When relative sizing is enabled, it will block any modifications done manually in the absolute size of the FlexCache. The size of FlexCache will be calculated and entered automatically based on the size of the origin. The default value for create is *false*.

**`[-relative-size-percentage <integer>]` - Relative FlexCache Size Percentage (privilege: advanced)**

This parameter specifies the percent size FlexCache should have relative to the total size of the origin. The default value for create is 10%.

**`[-override-encryption {true|false}]` - Override FlexCache Volume Encryption**

Use this parameter to create a plaintext FlexCache volume of an encrypted origin volume. The default value is *false*.

This parameter cannot be modified after the FlexCache volume is created.

**`[-is-atime-scrub-enabled {true|false}]` - Is atime-Based Scrubbing Enabled/Disabled (privilege: advanced)**

This parameter specifies whether automatic scrubbing of inactive files based on atime is enabled. When enabled, inactive files are automatically scrubbed based on specified atime duration. The scrubbing operation will only occur if `-atime-update` is enabled on the FlexCache volume. The default value for the atime scrubber is *false*.

**`[-atime-scrub-period <integer>]` - Days After Which An Inactive File Is Scrubbed (privilege: advanced)**

This parameter specifies the number of days for inactivity on a file after which the file will be scrubbed out. The default value is 30 days.

**`[-is-cifs-change-notify-enabled {true|false}]` - Is CIFS CHANGE\_NOTIFY Enabled/Disabled (privilege: advanced)**

This parameter specifies whether the FlexCache volume sends change notifications to CIFS clients. The default value is *false*.

## Examples

The following example triggers FlexCache volume create:

```
cluster1::> flexcache create -vserver vs34 -volume fc1 -aggr-list
aggr34,aggr43 -origin-volume origin1 -size 400m
(volume flexcache create)
[Job 894] Job succeeded: Successful
```

```
cluster1::> flexcache create -vserver vs34 -volume fc3 -auto-provision-as
flexgroup -origin-volume origin1 -size 400m
(volume flexcache create)
[Job 898] Job succeeded: Successful
```

```
cluster1::> flexcache create -vserver vs34 -volume fc4 -aggr-list
aggr34,aggr43 -origin-volume origin1 -size 400m -junction-path /fc4
(volume flexcache create)
[Job 903] Job succeeded: Successful
```

## volume flexcache delete

### Delete a cache relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume flexcache delete` command deletes the specified FlexCache volumes and their relationships.

### NOTE:

- FlexCache volumes must be offline (see [volume offline](#) ) to be deleted.

### Parameters

#### **-vserver <Vserver Name> - Vserver Name**

This specifies the name of the Vserver from which the FlexCache volume is to be deleted.

#### **-volume <volume name> - Cache Volume Name**

This specifies the name of the FlexCache volume that is to be deleted.

#### **[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the operation completes.

### Examples

The following example deletes FlexCache volume "fc1":

```
cluster1::> flexcache delete -volume fc1 -vserver vs34
(volume flexcache delete)
```

```
Error: command failed: Volume fc1 in Vserver vs34 must be offline to be
deleted. Use "volume offline -vserver vs34 -volume fc1" command to
offline the volume
```

```
cluster1::> volume offline -vserver vs34 -volume fc1
Volume "vs34:fc1" is now offline.
```

```
cluster1::> flexcache delete -volume fc1 -vserver vs34
(volume flexcache delete)
[Job 891] Job succeeded: Successful
```

```
cluster1::> flexcache delete -volume fc1 -vserver vs34 -foreground false
(volume flexcache delete)
```

## Related Links

- [volume offline](#)

## volume flexcache prepare-to-downgrade

Disables FlexCache features not supported by a previous version

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command disables the FlexCache feature enabled for a version.

### Parameters

**[-disable-feature-set <ClusterVersion>] - Cluster Version (privilege: advanced)**

This specifies the version for which we are running this command.

### Examples

The following example disables FlexCache features for cluster "cluster1":

```
cluster1::> flexcache prepare-to-downgrade -disable-feature-set 9.8.0
FlexCache features introduced in 9.8 are successfully disabled.
```

## volume flexcache show

Display cache relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume flexcache show` command displays information about FlexCache volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all FlexCache volumes:

- Vserver name

- Volume name
- Size
- Space guarantee
- Origin Vserver
- Origin volume
- Origin cluster

To display detailed information about all FlexCache volumes, run the command with the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all values.

**[-vserver <Vserver Name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about FlexCache volumes on the specified Vserver.

**[-volume <volume name>] - Cache Volume Name**

If this parameter is specified, the command displays detailed information about the specified FlexCache volume.

**[-aggr-list <aggregate name>,...] - List of Aggregates for FlexGroup Constituents**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that are located on the specified list of storage aggregates.

**[-size {<integer>[KB|MB|GB|TB|PB] } ] - Volume Size**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, snapshots, and snapshot reserve. Note that for volumes without a `-space-guarantee` of *volume*, the ability to fill the volume to this maximum size depends on the space available in the associated aggregate or aggregates.

**[-flexgroup-msid <integer>] - Cache FlexGroup MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified FlexGroup master data-set ID.

**[-origin-vserver <vserver name>] - Origin Vserver Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes which have a relationship with the specified origin-vserver.

**[-origin-vserver-uuid <UUID>] - Origin Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes which have a relationship with the origin-vserver UUID.

**[`-origin-volume <volume name>`] - Origin Volume Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin-volume.

**[`-origin-volume-msid <integer>`] - Origin Volume MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin master data set ID.

**[`-origin-cluster <Cluster name>`] - Origin Cluster Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin-cluster.

**[`-junction-path <junction path>`] - Cache Junction Path**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified junction path.

**[`-create-time <Date>`] - FlexCache Create Time**

If you specify this parameter, the command displays information only about the FlexCache volume or volumes for which the `create-time` option matches the specified input.

**[`-s, -space-guarantee {none|volume}`] - Space Guarantee Style**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified space guarantee style.

**[`-relationship-type {Intravserver|Intervserver|Intercluster}`] - Relationship Type (privilege: advanced)**

If this parameter is specified, the command displays the FlexCache volumes matching the relationship type.

**[`-is-cifs-enabled {true|false}`] - CIFS access Enabled/Disabled (privilege: advanced)**

If this parameter is specified, the command displays the FlexCache volumes matching the value for CIFS access.

**[`-preserve-msid {true|false}`] - Preserve Origin MSID on the Cache (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that match the given value for the `-preserve-msid`. If this parameter is `true`, then FlexCache DR is enabled for the FlexCache volume.

**[`-is-global-file-locking-enabled {true|false}`] - Global File Locking Mode Enabled/Disabled**

If this parameter is specified, the command displays the FlexCache volumes matching the global file locking mode.

**[`-is-nfsv4-enabled {true|false}`] - NFSv4 access Enabled/Disabled (privilege: advanced)**

If this parameter is specified, the command displays the FlexCache volumes matching the value for NFSv4 access.

**[`-is-writeback-enabled {true|false}`] - Is Writeback Enabled (privilege: advanced)**

This parameter specifies whether writeback is enabled for the FlexCache volume. Writeback is a storage method where data is first written to the FlexCache volume and then written to the origin of a FlexCache volume.

**`[-is-relative-size-enabled {true|false}] - Is Relative Sizing Enabled/Disabled (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that match the given value for `-is-relative-size-enabled`. When relative size is enabled, the FlexCache size will be automatically updated based on the size of the origin.

**`[-relative-size-percentage <integer>] - Relative FlexCache Size Percentage (privilege: advanced)`**

If this parameter is specified, the command displays the information only about the FlexCache volume or volumes for which the value of `-relative-size-percentage` is specified. The relative size percentage is used to calculate the size of a FlexCache volume when the `is-relative-size-enabled` field is *true*.

**`[-override-encryption {true|false}] - Override FlexCache Volume Encryption`**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that match the given value for the `-override-encryption`. If this parameter is *true*, then the volume is a plaintext FlexCache volume.

**`[-is-atime-scrub-enabled {true|false}] - Is atime-Based Scrubbing Enabled/Disabled (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that match the given value for `-is-atime-scrub-enabled`. When atime scrubber is enabled, the FlexCache volume will automatically scrub inactive files based on the specified atime duration.

**`[-atime-scrub-period <integer>] - Days After Which An Inactive File Is Scrubbed (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes for which the value of `-atime-scrub-period` is specified. The atime scrub period is used to remove the files from the FlexCache volume when the duration is met. The default duration to scrub files is set to *30 days*.

**`[-is-cifs-change-notify-enabled {true|false}] - Is CIFS CHANGE_NOTIFY Enabled/Disabled (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that match the given value for `-is-cifs-change-notify-enabled`. When CIFS CHANGE\_NOTIFY is enabled, the FlexCache volume will notify clients about changes on a directory.

## Examples

The following example displays information about all FlexCache volumes on the Vserver named "vs34":

```
cluster1::> flexcache show -vserver vs34
(volume flexcache show)
Vserver Volume      Size      Origin-Vserver Origin-Volume
Origin-Cluster
-----
vs34      fc1        800MB     vs34        origin1
cluster-2
vs34      fc2        800MB     vs34        origin1
cluster-2
2 entries were displayed.
```

The following example displays detailed information about a FlexCache volume named fc1 on an SVM named vs34:

```
cluster1::> flexcache show -vserver vs34 -volume fc1 -instance
(volume flexcache show)
Vserver: vs34
Cache Volume Name: fc1
List of Aggregates for FlexGroup Constituents: aggr34
Volume Size: 800MB
Cache Flexgroup MSID: 2155934574
Origin Vserver Name: vs34
Origin Vserver UUID: a8717aeb-2826-11e8-bf56-
00505695f37a
Origin Volume Name: origin1
Origin Volume MSID: 2155934545
Origin Cluster Name: cluster-2
Cache Junction Path: -
FlexCache Create Time: Thu Aug 23 04:36:19 2018
Relationship Type: inter-vserver
Preserve Origin MSID on the Cache: false
```

## volume flexcache sync-properties

### Sync volume properties

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume flexcache sync-properties` command is used to sync a FlexCache volume's properties with its origin volume or to update FlexCache origin volume name in FlexCache relationship during a origin volume rename operation in disconnected mode.

NOTE:

- This command should be used when there is a failure to sync properties from the origin of a FlexCache volume to the FlexCache volume or to update the FlexCache origin volume name in the FlexCache relationship in the case of a volume rename from the origin in disconnected mode.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Specifies the SVM on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

Specifies the volume name whose properties need to be synced. If the volume is a FlexCache volume, its properties are synced with its origin volume. If the volume is a FlexCache origin volume, the origin volume name is updated in the FlexCache relationship where the origin volume is renamed in disconnected mode.

## Examples

```
cluster1::> flexcache sync-properties -volume fcl -vserver vs34
(volume flexcache sync-properties)
```

## volume flexcache config modify

### Modify cache configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume flexcache config modify` command is used to modify the configuration for a FlexCache volume.

## Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This specifies the Vserver in which the FlexCache volume exists.

**-volume <volume name> - Cache Volume Name (privilege: advanced)**

This specifies the name of the FlexCache volume.

**[-is-cifs-enabled {true|false}] - Is CIFS Access Enabled (privilege: advanced)**

This parameter specifies whether CIFS access is allowed on a FlexCache volume.

**[-is-nfsv4-enabled {true|false}] - Is NFSv4 Access Enabled (privilege: advanced)**

This parameter specifies whether NFSv4 access is allowed on a FlexCache volume.

**[-is-writeback-enabled {true|false}] - Is Writeback Enabled (privilege: advanced)**

This parameter specifies whether writeback is enabled for the FlexCache volume. Writeback is a storage method where data is first written to the FlexCache volume and then written to the origin of a FlexCache

volume.

**`[-is-relative-size-enabled {true|false}] - Is Relative Sizing Enabled (privilege: advanced)`**

This parameter specifies whether the relative sizing is enabled for the FlexCache volume. Relative sizing is introduced as a part of follow the origin feature. When relative sizing is enabled, it will block any modifications done manually in the absolute size of the FlexCache. The size of FlexCache will be calculated and entered automatically based on the size of the origin. The default value for create is *false*.

**`[-relative-size-percentage <integer>] - Relative FlexCache Size Percentage (privilege: advanced)`**

This parameter specifies the percent size FlexCache should have relative to the total size of the origin. The default value for create is 10%.

**`[-is-atime-scrub-enabled {true|false}] - Is atime based Scrubbing Enabled/Disabled (privilege: advanced)`**

This parameter specifies if the files can be scrubbed out automatically if they have not been accessed for a specified duration. This feature to scrub out inactive files is dependent on enabling the atime feature on the FlexCache volume. The default value for create is *disabled*.

**`[-atime-scrub-period <integer>] - Days after which an inactive file is scrubbed (privilege: advanced)`**

This parameter specifies the duration in days after which the inactive files can be scrubbed out from the cache volume. The default value for create is *30 days* when atime-scrub is enabled.

**`[-is-cifs-change-notify-enabled {true|false}] - Is CIFS CHANGE_NOTIFY Enabled/Disabled (privilege: advanced)`**

This parameter specifies whether the FlexCache volume sends change notifications to CIFS clients. The default value is *false*.

## Examples

The following example triggers FlexCache volume configuration modify:

```
cluster1::> volume flexcache config modify -vserver vs34 -volume fc1 -is
-cifs-enabled true
```

```
cluster1::> volume flexcache config modify -volume originvol -is-cifs
-enabled false
(volume flexcache config modify)
Error: command failed: FlexCache config modify is only applicable for
volumes
      with "flexcache-endpoint-type" cache.
```

## volume flexcache config show

Display cache configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The ``volume flexcache config show`` command is used to view the FlexCache configuration for a FlexCache volume.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)`**

If this parameter and the `-volume` parameter are specified, the command displays config information about the specified volume. If this parameter is specified by itself, the command displays information about FlexCache volumes on the specified Vserver.

**`[-volume <volume name>] - Cache Volume Name (privilege: advanced)`**

If this parameter is specified, the command displays config information about the specified FlexCache volumes matching the specified name.

**`[-is-cifs-enabled {true|false}] - Is CIFS Access Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the value for CIFS access.

**`[-is-nfsv4-enabled {true|false}] - Is NFSv4 Access Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the value for NFSv4 access.

**`[-is-writeback-enabled {true|false}] - Is Writeback Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the writeback mode. Writeback is a storage method where data is first written to the FlexCache volume and then written to the origin of a FlexCache volume.

**`[-is-relative-size-enabled {true|false}] - Is Relative Sizing Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the value for relative size.

**`[-relative-size-percentage <integer>] - Relative FlexCache Size Percentage (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the percentage for relative size.

**`[-is-atime-scrub-enabled {true|false}] - Is atime based Scrubbing Enabled/Disabled (privilege: advanced)`**

If this parameter is specified, the command displays the FlexCache volumes matching the atime scrubbing mode.

**[-atime-scrub-period <integer>] - Days after which an inactive file is scrubbed (privilege: advanced)**

If this parameter is specified, the command displays the FlexCache volumes matching the period for atime scrubbing.

**[-is-cifs-change-notify-enabled {true|false}] - Is CIFS CHANGE\_NOTIFY Enabled/Disabled (privilege: advanced)**

If this parameter is specified, the command displays the FlexCache volumes matching the value for CIFS CHANGE\_NOTIFY mode.

## Examples

The following example triggers FlexCache volume configuration show:

```
cluster1::> flexcache config show
(volume flexcache config show)
Vserver Volume      CIFS Access Enabled
-----
vs1      cachevol    false
vs1      cachevol_2  true
2 entries were displayed.
```

## volume flexcache origin show-caches

Display all the caches connected to origin

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume flexcache origin show-caches` command displays FlexCache relationships for origin of a FlexCache volumes on the origin cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-origin-vsriver <Vserver Name>] - Vserver Name**

If this parameter and the `origin-volume` parameter are specified, the command displays the FlexCache relationship for the specified origin of a FlexCache volume. If this parameter is specified by itself, the command displays all the FlexCache relationships for all origin of a FlexCache volumes in the specified Vserver.

**[`-origin-volume <volume name>`] - Origin Volume**

If this parameter is specified, the command displays all the FlexCache relationships for the specified origin of a FlexCache volume.

**[`-cache-vserver <vserver name>`] - Cache Vserver**

If this parameter is specified then the command displays FlexCache relationships for the specified Vserver hosting FlexCache volumes.

**[`-cache-volume <volume name>`] - Cache Volume**

If this parameter is specified then the command displays FlexCache relationships for the specified FlexCache volume.

**[`-cache-cluster <Cluster name>`] - Cache Cluster**

If this parameter is specified then the command displays FlexCache relationships for the specified cluster hosting FlexCache volumes.

**[`-cache-volume-msid <integer>`] - Cache Volume MSID**

If this parameter is specified then the command displays FlexCache relationships for the specified FlexCache volume's FlexGroup master data-set ID.

**[`-relationship-create-time <Date>`] - Relationship Create Time**

If you specify this parameter, the command displays FlexCache relationships for which the `relationship-create-time` option matches the specified input.

**[`-relationship-type {Intravserver|Intervserver|Intercluster}`] - Relationship Type (privilege: advanced)**

If this parameter is specified, the command displays the origin of a FlexCache volume matching the relationship type

**[`-preserve-msid {true|false}`] - Preserve Origin MSID on the Cache (privilege: advanced)**

If this parameter is specified, the command displays the origin of a FlexCache volume whose Msid is preserved

**Examples**

The following example displays information about all origin of a FlexCache volumes on the Vserver named vs34:

```
cluster1::> flexcache origin show-caches -origin-vserver vs34
(volume flexcache origin show-caches)
Origin-Vserver Origin-Volume Cache-Vserver Cache-Volume Cache-Cluster
-----
vs34            origin1      vs56          fc1_c3_origin1
                                     cluster-3
vs34            origin1      vs34          fc1            cluster-2
vs34            origin1      vs34          fc2            cluster-2
vs34            origin2_new   vs56          fc1_c3_origin2
                                     cluster-3

4 entries were displayed.
```

```
cluster1::> flexcache origin show-caches -origin-vserver vs56 -instance
(volume flexcache origin show-caches)
Vserver: vs56
    Origin Volume: origin
    Cache Vserver: vs56
    Cache Volume: fc1
    Cache Cluster: cluster-3
    Cache Volume MSID: 2156002002
Relationship Create Time: Thu Aug 23 04:36:24 2018
Relationship Type: intra-vserver
```

## volume flexcache origin config modify

### Modify FlexCache Origin Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `volume flexcache origin config modify` command modifies volume specific options of an origin of a FlexCache volume.

#### Parameters

**-origin-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This specifies the Vserver in which the origin of a FlexCache volume is located.

**-origin-volume <volume name> - Origin Volume Name (privilege: advanced)**

This specifies the origin of a FlexCache volume.

**[-is-bli-enabled {true|false}] - Is BLI Enabled (privilege: advanced)**

This parameter specifies whether data invalidation at block level is enabled or not. By default, `-is-bli-enabled` is *false*.

**`[-is-global-file-locking-enabled {true|false}] - Is Global File Locking Enabled (privilege: advanced)`**

This parameter specifies the global file locking mode for the volume. By default, `-is-global-file-locking-enabled` is *false*. When global file locking mode is enabled for the volume, the "is\_disconnected\_mode\_off\_for\_locks" flag is always set to *true*.

## Examples

The following example modifies the `is-bli-enabled` field value to *true*:

```
cluster1::> flexcache origin config modify -origin-volume origin_flexgroup
-origin-vserver vs3_c2 -is-bli-enabled true
(volume flexcache origin config show)
```

```
cluster1::> flexcache origin config show -origin-volume origin_flexgroup
-origin-vserver vs3_c2
(volume flexcache origin config show)
Vserver: vs3_c2
Origin Volume Name: origin_flexgroup
Is BLI Enabled: true
```

## volume flexcache origin config show

### Show FlexCache Origin Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume flexcache origin config show` command displays volume specific options of an origin of a FlexCache volume.

### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-origin-vserver <Vserver Name>] - Vserver Name (privilege: advanced)`**

If this parameter and the `-origin-volume` parameter are specified, the command displays options for the specified origin of a FlexCache volume. If this parameter is specified by itself, the command displays options for all origin of a FlexCache volumes in the specified Vserver.

### **`[-origin-volume <volume name>] - Origin Volume Name (privilege: advanced)`**

If this parameter is specified, the command displays options for the specified origin of a FlexCache volume.

### **`[-is-bli-enabled {true|false}] - Is BLI Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the origin of a FlexCache volume matching the specified value. Possible values are:

- *false* - Block level invalidation is not set
- *true* - Block level invalidation is set

### **`[-is-global-file-locking-enabled {true|false}] - Is Global File Locking Enabled (privilege: advanced)`**

If this parameter is specified, the command displays the origin configurations matching the specified value. Global file locking mode is a mode where protocol read locking semantics are enforced across all FlexCache volumes and origins of a FlexCache volume. To completely disable/enable global file locking mode, use `flexcache origin config modify` in advanced privilege with `-is-global-file-locking-enabled` set to *true/false* depending upon the requirement. When global file locking mode is enabled for the volume, the "is\_disconnected\_mode\_off\_for\_locks" flag is always set to *true*. Possible values are:

- *false* - Global file locking mode is not set
- *true* - Global file locking mode is set

## **Examples**

The following example displays FlexCache origin options:

```
cluster1::> volume flexcache origin config show
(volume flexcache origin config show)
Origin-Vserver    Origin-Volume    Is-BLI-Enabled  Is-Global-File-Locking-
                  Enabled
-----
vs34              origin1          true            true
vs34              origin2_new      false           false
2 entries were displayed.
```

## **volume flexcache prepopulate start**

### **Prepopulate flexcache volume**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### **Description**

The ``volume flexcache prepopulate start`` command is used to prepopulate a FlexCache volume with the data of given directory path(s) from the origin volume.

#### NOTE:

- The FlexCache prepopulate job fails when the directories listed with the `-path-list` have one or more non-existing paths.

#### Parameters

**`-cache-vserver <vserver name>` - Cache Vserver Name (privilege: advanced)**

This specifies the Vserver that has the FlexCache volume to be prepopulated.

**`-cache-volume <volume name>` - Cache Volume Name (privilege: advanced)**

This specifies the FlexCache volume which needs to be prepopulated.

**`-path-list <text>,...` - List of Paths (privilege: advanced)**

This specifies an array of directory names that need to be prepopulated in the FlexCache volume.

**`[-isRecursion {true|false}]` - Recursively populate (privilege: advanced)**

This specifies that the directories listed with the `-path-list` need to be recursively prepopulated in the `-cache-volume` FlexCache volume.

The default value is true.

**`[-exclude-path-list <text>,...]` - Exclude List of Paths (privilege: advanced)**

This specifies an array of directory names that need not be populated.

The path provided should be absolute path. If same path provided is for include and exclude path list then include-path will take the preference

#### Examples

The following example triggers FlexCache volume prepopulate:

```
cluster1::> flexcache prepopulate start -cache-volume
vol_cache2_vs3_c2_vol_origin1_vs1_c1 -cache-vserver vs3_c2 -path-list
/dir1 -isRecursion false
(volume flexcache prepopulate start)
[JobId 164]: FlexCache prepopulate job queued.
```

```
cluster1::> flexcache prepopulate start -cache-volume  
vol_cache2_vs3_c2_vol_origin1_vs1_c1 -cache-vserver vs3_c2 -path-list  
/dir1  
    (volume flexcache prepopulate start)  
[JobId 188]: FlexCache prepopulate job queued.
```

```
cluster1::> flexcache prepopulate start -cache-volume  
vol_cache2_vs3_c2_vol_origin1_vs1_c1 -cache-vserver vs3_c2 -path-list  
/dir1, dir5, dir6  
    (volume flexcache prepopulate start)  
  
Error: command failed: Path(s) "dir5, dir6" does not exist in origin  
volume  
    "vol_origin1_vs1_c1" in Vserver "vs1_c1".
```

## volume flexgroup commands

### volume flexgroup qtree-disable

Disable qtree support on a FlexGroup

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `volume flexgroup qtree-disable` command disables qtree support on a FlexGroup.

#### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver in which the FlexGroup is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the FlexGroup.

#### Examples

The following example disables the qtree support on a FlexVol named "fg" in Vserver "vs0":

```
cluster::*> volume flexgroup qtree-disable -vserver vs0 -volume fg
```

## volume inode-upgrade commands

## volume inode-upgrade resume

Resume suspended inode upgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume inode-upgrade resume` command resumes suspended inode upgrade process. The inode upgrade process may be suspended earlier due to performance reasons.

### Parameters

**-vserver <vserver name> - VServer Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume for which the inode upgrade process is to be resumed.

### Examples

The following example resumes a volume upgrade process.

```
cluster1::> volume inode-upgrade resume -vserver vs0 -volume vol1
```

## volume inode-upgrade show

Display Inode Upgrade Progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume inode-upgrade show` command displays information about volumes in the middle of the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all volumes in the middle of the inode upgrade process. Default fields are `vserver`, `volume`, `aggregate`, `status`, `scan-percent`, `remaining-time`, `space-needed`, and `scanner-progress`.

### Parameters

**[-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**[-instance ] (privilege: advanced) }**

If this parameter is specified, the command displays information about all entries.

**[-vserver <vserver name>] - Vserver (privilege: advanced)**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about

volumes on the specified Vserver.

**[-volume <volume name>] - Volume (privilege: advanced)**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes that match the specified name.

**[-node <nodename>] - Node Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage system.

**[-vol-dsid <integer>] - Volume DSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID.

**[-vol-uuid <UUID>] - Volume UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

**[-volume-msid <integer>] - Volume MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

**[-vserver-uuid <UUID>] - Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume on the Vserver that has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the storage aggregate with the specified UUID.

**[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade status.

**[-scan-percent <percent>] - Upgrade Scan Percent Complete (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade progress percentage.

**[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the space needed to complete the upgrade process match the specified size.

**[`-remaining-time` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Remaining Upgrade Time (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the remaining time to complete the inode upgrade process match the specified time.

**[`-scanner-progress` <text>] - Scanner Progress (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the progress of the inode upgrade process match the input.

## Examples

The following example displays information about all volumes in the middle of the inode upgrade process on the Vserver named vs0:

```
cluster1::> volume inode-upgrade show -vserver vs0
Vserver Volume Aggregate Status %Complete Time          Space   Inode
                                     Remaining Needed Progress
-----
vs0      vol1    aggr1    pending    0%      -          3.07MB Public : Inode
0 out of 3822
```

## volume move commands

### volume move abort

Stop a running volume move operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The "volume move abort" command sends an abort message to the volume move operation and returns immediately. The volume move operation might not abort immediately depending on the stage it is in. For example, if the volume move operation is in a cut-over or clean-up phase, the abort is ignored. You invoke the "volume move show" command to view the list of running volume move operations and monitor the progress of the abort operation. This command has the same behavior as the [job stop-id <job-id>](#) command where the job-id is the identifier of the volume move job.

### Parameters

**`-vserver` <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**`-volume` <volume name> - Volume Name**

This specifies the name of the volume being moved.

## Examples

The following example aborts running volume move operation on volume *vol1*

```
cluster1::> volume move show
      Vserver   Volume   State   Move Phase Percent-Complete Time-To-
Complete
-----
vs0      vol1      alert   cutover_hard_deferred 0%   -

## volume move modify

Modify parameters for a running volume move operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `volume move modify` command modifies the parameters used by the volume move operation in progress. These modified values can be verified by invoking the [volume move show](#) command. The volume move operation will use the modified cutover parameters in its next cutover attempt. Note that the modifications to the job are not applied if the move is in the "finishing" state. This command is not supported.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume being moved.

### **[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}] - Specified Action For Cutover (privilege: advanced)**

Specifies the action to be taken for cutover. If the effective cluster version is ONTAP 8.3 and later, the default is *retry\_on\_failure*; otherwise the default is *defer\_on\_failure*. If the *abort\_on\_failure* action is specified, the job will try to cutover until cutover attempts are exhausted. If it fails to cutover, it will cleanup and end the operation. If the *defer\_on\_failure* action is specified, the job will try to cutover until the cutover attempts are exhausted. If it fails to cutover, it will move into the "cutover\_hard\_deferred" state. The volume move job waits for a [volume move trigger-cutover](#) command to restart the cutover process. If the *force* action is specified, the job will try to cutover until the cutover attempts are exhausted and force the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it will not go into cutover automatically, instead it will wait for a [volume move trigger-cutover](#) command as the signal to try the cutover.

### **[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)**

This specifies the time interval in seconds to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

### **[-enforce-network-throttling {true|false}] - Enforce Replication Engine Node Level Network Throttling (privilege: advanced)**

This specifies whether this move should enforce replication engine node level network throttling. If this parameter is specified with *true*, the move will be throttled by the replication engine. The default is *false*.

## Examples

The following example modifies the parameters for volume move operation on volume vol2.

```
cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2

## volume move show

Show status of a volume moving from one aggregate to another aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `volume move show` command displays information about volume moves in the cluster. By default, with

no parameters, it only shows volume moves that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- **Vserver Name:** The Vserver on which the volume is located.
- **Volume Name:** The volume that is part of a completed or running volume move operation.
- **Actual Completion Time:** The date and time in the cluster time zone when the volume move completed.
- **Bytes Remaining:** The number of bytes remaining to be sent during volume move. This is an approximate number and lags the current status by a few minutes while the volume move is in operation.
- **Specified Action for Cutover:** The action to be taken for cutover or during cutover failure. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Specified Cutover Time Window:** The time window in seconds given as an input for the cutover phase of volume move. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Job ID:** The Job-ID of move job.
- **Destination Node:** The name of the node where the destination aggregate is present.
- **Source Node:** The name of the node where the source aggregate is present.
- **Prior Issues Encountered:** The latest issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.
- **Move Initiated by Auto Balance Aggregate:** The value "true" indicates the move is initiated by Auto Balance Aggregate feature.
- **Destination Aggregate:** The name of the aggregate to which the volume is moved.
- **Detailed Status:** The detail about any warnings, errors, and state of the move operation.
- **Estimated Time of Completion:** The approximate date and time in the cluster time zone when the entire volume move operation is expected to complete. Note that this time may keep increasing when the move goes into cutover-deferred mode. In those cases where the input for cutover-action is wait, during the data copy phase, the estimated time of completion will approximate the time to reach the cutover point and wait for user intervention.
- **Managing Node:** The node in the cluster on which the move job is or was running. This is usually on the node hosting the volume to be moved.
- **Percentage Complete:** The amount of work to move the volume completed thus far in terms of percentage.
- **Move Phase:** The phase of the move operation.
- **Estimated Remaining Duration:** The approximate amount of time in terms of days, hours, minutes and seconds remaining to complete the volume move.
- **Replication Throughput:** The current replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.
- **Duration of Move:** The duration in days, hours and minutes for which the volume move was or is in progress.
- **Source Aggregate:** The name of the aggregate where the volume being moved originally resides or resided.
- **Start Time of Move:** The date and time in the cluster time zone when the volume move operation started.
- **Move State:** The state of the volume move at the time of issuing the command and the system gathering up the information about the move.
- **Original Job ID:** The job-id assigned when the job was first created. This value will only be populated when

the original job-id differs from the current job-id.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This specifies the Vserver on which the volume is located. If this parameter and the `-volume` parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about latest moves performed on volumes of the specified Vserver.

**[-volume <volume name>] - Volume Name**

This specifies the volume that is part of a completed or running volume move operation. If this parameter and the `-vserver` parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about the latest move on all volumes matching the specified name.

**[-actual-completion-time <Date>] - Actual Completion Time**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move completed.

**[-bytes-remaining {<integer>[KB|MB|GB|TB|PB]}] - Bytes Remaining**

If this parameter is specified, the command displays move operations that match the specified number of bytes remaining to be sent during volume move.

**[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}]  
- Specified Action For Cutover (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified action to be taken for cutover or during cutover failure.

**[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified time window in seconds for the cutover phase of volume move.

**[-destination-aggregate <aggregate name>] - Destination Aggregate**

If this parameter is specified, the command displays move operations that match the specified name of the aggregate to which the volume is being moved.

**[-destination-node <nodename>] - Destination Node (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified name of the node where the destination aggregate is present.

**[-details <text>] - Detailed Status**

If this parameter is specified, the command displays move operations that match the specified detail about any warnings, errors and state of the move operation.

**[-estimated-completion-time <Date>] - Estimated Time of Completion**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the entire volume move operation is expected to complete.

**[-job-id <integer>] - Job ID (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified Job-ID of the move job.

**[-managing-node <nodename>] - Managing Node**

If this parameter is specified, the command displays move operations that match the specified node in the cluster on which the move job is or was running.

**[-percent-complete <percent>] - Percentage Complete**

If this parameter is specified, the command displays move operations that match the specified amount of work to move the volume completed thus far in terms of percentage.

**[-phase**

**{queued|initializing|replicating|cutover|cutover\_hard\_deferred|cutover\_soft\_deferred|aborting|completed|cleaning\_up|failed|restarting|finishing}] - Move Phase**

If this parameter is specified, the command displays move operations that match the specified phase of the move operation.

**[-prior-issues <text>] - Prior Issues Encountered (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.

**[-estimated-remaining-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Estimated Remaining Duration**

If this parameter is specified, the command displays move operations that match the specified time.

**[-replication-throughput <text>] - Replication Throughput**

If this parameter is specified, the command displays move operations that match the specified replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.

**[-actual-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Duration of Move**

If this parameter is specified, the command displays move operations that match the specified duration for which the volume move was or is in progress.

**[-source-aggregate <aggregate name>] - Source Aggregate**

If this parameter is specified, the command displays move operations that match the specified name of the aggregate where the volume being moved originally resides or resided.

**[-source-node <nodename>] - Source Node (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified name of the node where the source aggregate is present.

**[-start-time <Date>] - Start Time of Move**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move operation started.

**[`-state {healthy|warning|alert|failed|done}`] - Move State**

If this parameter is specified, the command displays move operations that match the specified state of the volume move operation.

**[`-moved-by-autobalance {true|false}`] - Move Initiated by Auto Balance Aggregate (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-original-job-id <integer>`] - Original Job ID (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-is-source-encrypted {true|false}`] - Is Source Volume Encrypted**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-source-key-id <text>`] - Encryption Key ID of Source Volume**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-is-destination-encrypted {true|false}`] - Is Destination Volume Encrypted**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-destination-key-id <text>`] - Encryption Key ID of Destination Volume**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-enforce-network-throttling {true|false}`] - Enforce Replication Engine Node Level Network Throttling (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[`-is-capacity-tier-optimized {true|false}`] - Is Capacity Tier Move Optimized (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

## Examples

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0

```
cluster1::> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2
Actual Completion Time: -
    Bytes Remaining: 6.37GB
Destination Aggregate: cluster1_aggr2
    Detailed Status: Transferring data: 3.67GB sent.
Estimated Time of Completion: Sat Jul 16 20:25:50 2011
    Managing Node: node1
    Percentage Complete: 36%
        Move Phase: replicating
Estimated Remaining Duration: 00:01
    Replication Throughput: 61.08MB/s
        Duration of Move: 00:02
        Source Aggregate: cluster1_aggr1
        Start Time of Move: Sat Jul 16 20:22:01 2011
            Move State: healthy
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```

cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2
        Actual Completion Time: -
                Bytes Remaining: 156KB
        Specified Action For Cutover: wait
        Specified Cutover Time Window: 30
                Destination Aggregate: cluster1_aggr2
                Destination Node: node2
                Detailed Status: Cutover Deferred, Waiting for
user intervention (2.04MB Sent)::Volume move job preparing transfer.
        Estimated Time of Completion: -
                Job ID: 265
                Managing Node: node1
                Percentage Complete: -
                Move Phase: cutover_hard_deferred
        Prior Issues Encountered: -
        Estimated Remaining Duration: -
        Replication Throughput: -
                Duration of Move: 00:24:59
                Source Aggregate: cluster1_aggr1
                Source Node: node1
                Start Time of Move: Tue Mar 17 22:31:32 2011
                Move State: alert
Move Initiated by Auto Balance Aggregate: false
                Original Job ID: -

```

The following example lists status of running and failed volume move operations in the cluster.

```

cluster1::> volume move show

```

| Complete Time-To-Complete | Vserver | Volume | State  | Move Phase            | Percent- |
|---------------------------|---------|--------|--------|-----------------------|----------|
| -----                     | -----   | -----  | -----  | -----                 |          |
| -----                     | vs0     | s1     | alert  | cutover_hard_deferred | 98%      |
| -                         | vs0     | vol2   | failed | failed                | -        |
| -                         |         |        |        |                       |          |

2 entries were displayed.

The following example lists status of all the volume move operations in the cluster.

```
cluster1::> vol move show -phase *

              vs0      vol1     failed failed      -
-
              3 entries were displayed.
```

## volume move start

Start moving a volume from one aggregate to another aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `volume move start` command moves a flexible volume from one storage aggregate to another. The destination aggregate can be located on the same node as the original aggregate or on a different node. The move occurs within the context of the same Vserver.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that will be moved.

**-destination-aggregate <aggregate name> - Destination Aggregate**

This specifies the aggregate to which the volume will be moved.

**[-cutover-window <integer>] - Cutover time window in seconds (privilege: advanced)**

This specifies the time interval to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

**[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}]**

**- Action for Cutover (privilege: advanced)**

Specifies the action to be taken for cutover. If the effective cluster version is ONTAP 8.3 and later, the default is `retry_on_failure`; otherwise the default is `defer_on_failure`. If the `abort_on_failure` action is specified, the job tries to cutover until cutover attempts are exhausted. If it fails to cutover, it cleans up and ends the operation. If the `defer_on_failure` action is specified, the job

tries to cutover until the cutover attempts are exhausted. If it fails to cutover, it moves into the "cutover deferred" state. The volume move job waits to issue a [volume move trigger-cutover](#) command to restart the cutover process. If the *force* action is specified, the job tries to cutover until the cutover attempts are exhausted and forces the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it does not go into cutover automatically, instead it waits to issue a [volume move trigger-cutover](#) command as the signal to try the cutover. Once cutover is manually triggered, the cutover action changes to *defer\_on\_failure*. If the *retry\_on\_failure* action is specified, the job retries to cutover indefinitely and it never enters a "hard-deferred" state. After exhausting cutover attempts, the move job waits one hour before trying to cutover again. Issue a [volume move trigger-cutover](#) command at any time to restart the cutover process.

#### **`[-perform-validation-only <true>]` - Performs validation checks only**

This is a boolean option allowing to perform pre-move validation checks for the intended volume. When set to *true*, the command only performs the checks without creating a move job. The default value is *false*.

#### **`[-foreground {true|false}]` - Foreground Process**

This specifies whether the volume move operation runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). Note that using this parameter will not affect how long it takes for the operation to complete.

#### **`[-encrypt-destination {true|false}]` - Encrypt Destination Volume**

This specifies whether the move operation should result in creating an encrypted volume on the destination aggregate. When this option is set to *true*, the destination volume will be encrypted. When it is set to *false*, the destination volume will be a plain-text volume. When this parameter is not specified, then destination will be same as the source type.

#### **`[-generate-destination-key {true|false}]` - Generate New Encryption Key for Destination Volume**

This option is specified along with `-encrypt-destination`, a new key will be generated, and that new key will be used for encrypting the destination volume.

#### **`[-tiering-policy <Tiering Policy>]` - Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the destination volume. Tiering policies decide whether the user data blocks of a volume in a FabricPool will be tiered to the cloud tier when they become cold. FabricPool combines Flash (performance tier) with an object store (cloud tier) into a single aggregate. The temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- `snapshot-only` - Only the volume snapshots not associated with the active file system are tiered to the cloud tier.
- `auto` - Both snapshot data and active file system user data are tiered to the cloud tier.
- `none` - Volume blocks are not tiered to the cloud tier.
- `all` - Both snapshot data and active file system user data are tiered to the cloud tier as soon as possible without waiting for a cooling period.

#### **`[-allow-mixed-aggr-types {true|false}]` - Allow Mixing FabricPool and non-FabricPool**

If set to *true*, moving a FlexGroup constituent from a FabricPool to a non-FabricPool, or vice versa, is allowed. The default value is *false*. This parameter is only supported for FlexGroup constituents.

### **`[-encrypt-with-aggr-key {true|false}]` - Encrypt Destination Volume with aggr key**

This specifies whether the move operation should result in creating an encrypted volume with aggr key on the destination aggregate. When this option is set to `true`, the destination volume will be encrypted as NAE (NetApp Aggregate Encryption) volume.

### **`[-enforce-network-throttling {true|false}]` - Enforce Replication Engine Node Level Network Throttling (privilege: advanced)**

This specifies whether this move should enforce replication engine node level network throttling. If this parameter is specified with `true`, the move will be throttled by the replication engine. The default is `false`.

### **`[-is-capacity-tier-optimized {true|false}]` - Capacity Tier Optimized Volume Move (privilege: advanced)**

This specifies whether this move should perform capacity tier optimized volume move, in which data in the capacity tier does not need to be copied over. If this parameter is specified as `true` and optimized volume move is not supported, the volume move operation will fail. If this parameter is specified as `false`, non-optimized volume move will be performed. When this parameter is not specified, optimized volume move is attempted, and if it is not supported, non-optimized volume move will be performed automatically.

## **Examples**

The following examples perform a validation-check for a volume named `volume_test` on a Vserver named `vs0` to determine if it can be moved to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr -perform-validation-only true
      Error: command failed: There is 2.54GB of available space on the
aggregate
      dest_aggr which is not enough to accommodate a volume.
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr -perform-validation-only true
      Validation succeeded.
```

The following example performs a volume move start operation to move a volume named `volume_test` on a Vserver name `vs0` to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr
      [Job 267] Job is queued: Move "volume_test" in Vserver
"vs0" to aggregate "dest_aggr".
      Use the "volume move show -vserver vs0 -volume
volume_test" command to view the status of this operation.
```

The following example performs a volume move start operation to move a plain-text volume named `vol1` to an encrypted volume on destination-aggregate `aggr1`.

```
cluster1::> volume move start -volume voll -destination-aggregate aggr1
-encrypt-destination true
    [Job 267] Job is queued: Move "voll" in Vserver "vs1" to aggregate
"aggr1".
        Use the "volume move show -vserver vs1 -volume voll" command to
view the status of this operation.
```

## Related Links

- [volume move trigger-cutover](#)

## volume move trigger-cutover

Trigger cutover of a move job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command causes a replicating or deferred volume move job to attempt cutover. Unless the force option is set, cutover entry is not guaranteed.

### Parameters

**-vserver <vserver name> - Vserver Name**

The Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

The volume that is being moved.

**[-force <true>] - Force Cutover**

If this parameter is specified, the cutover is done without confirming the operation - even if the operation could cause client I/O disruptions.

### Examples

```
cluster1::> volume move trigger-cutover -vserver vs0 -volume testvol_1 -force
```

## volume move recommend show

Display Move Recommendations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume move recommend show` command displays moves that were recommended by the Auto Balance Aggregate feature.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver Name (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a Vserver that matches the specified value.

**`[-volume <volume name>] - Volume Name (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a volume that matches the specified value.

**`[-creation-time <MM/DD/YYYY HH:MM:SS>] - Time Stamp of Recommendation (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a creation-time that matches the specified value.

**`[-source-aggregate <aggregate name>] - Unbalanced Aggregate Name (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a source-aggregate that matches the specified value.

**`[-source-space-after <percent>] - Space Free After Move (%) (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a source-space-after that matches the specified value.

**`[-destination-aggregate <aggregate name>] - Destination Aggregate Name (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a destination-aggregate that matches the specified value.

**`[-destination-space-after <percent>] - Space Bump After Move (%) (privilege: advanced)`**

If this parameter is specified, the display will be limited to only those recommendations with a destination-space-after that matches the specified value.

## Examples

The following example displays information about the recommendations made by the Auto Balance Aggregate feature.

```
cluster1::*> volume move recommend show -instance
                Vserver Name: vs0.example.com
                Volume Name: ro10
Time Stamp of Recommendation: 3/13/2014 16:26:39
    Unbalanced Aggregate Name: aggr_1
    Space Free After Move (%): 36%
    Destination Aggregate Name: aggr_3
    Space Bump After Move (%): 36%
```

## volume move target-aggr show

List target aggregates compatible for volume move

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The volume move target-aggr show displays information about compatible target aggregates for the specified volume to be moved to.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name (Required field)**

Selects information about compatible target aggregates for volumes of the specified Vserver.

**[-volume <volume name>] - Volume Name (Required field)**

Selects information about compatible target aggregates that have enough space for the specified volume.

**[-aggregate <aggregate name>] - Aggregate Name**

Selects information about compatible target aggregates with the specified aggregate name (to which the volume might be moved).

**[-tiering-policy <Tiering Policy>] - Volume Tiering Policy**

Selects information about compatible target aggregates with the specified destination tiering policy.

**[-availsize {<integer>[KB|MB|GB|TB|PB]}] - Available size**

Selects information about compatible target aggregates that have the specified available size.

### **[-storagetype <text>] - Storage Type**

Selects information about compatible target aggregates with the specified storage type. Examples of storage types are “ATA”, “BSAS”, “FCAL”, “LUN”, “SATA”, “SAS” and “SSD”.

### **[-allow-mixed-aggr-types {true|false}] - Allow Mixing FabricPool and non-FabricPool**

If set to true, moving a FlexGroup constituent from a FabricPool to a non-FabricPool, or vice versa, is allowed. The default value is false. This parameter is only supported for FlexGroup constituents.

## **Examples**

The following example lists target aggregates compatible for moving a volume vol1 on a Vserver vs1.

```
cluster1::> volume move target-aggr show -vserver vs1 -volume vol1
Aggregate Name      Available Size      Storage Type
-----
aggr1                113.5GB             FCAL
aggr2                113.5GB             FCAL
2 entries were displayed.
```

# **volume object-store commands**

## **volume object-store tiering show**

### **Display Tiering Status of FabricPool Volumes**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `volume object-store tiering show` command displays information about the tiering scanner status of FabricPool aggregate volumes. The tiering scanner will, depending on the combination of the tiering-policy and cloud-retrieval-policy settings, both retrieve from and tier to the capacity tier. This show command can be used to display the status of the scanner, whether it has aborted, what errors it has encountered and when it will be scheduled to run again.

### **Parameters**

#### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

#### **| [-instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### **[-vserver <vserver name>] - Vserver (privilege: advanced)**

vserver name

**[-volume <volume name>] - Volume (privilege: advanced)**

volume name

**[-node <nodename>] - Node Name (privilege: advanced)**

node name

**[-vol-dsid <integer>] - Volume DSID (privilege: advanced)**

volume dsid

**[-aggregate <aggregate name>] - Aggregate Name (privilege: advanced)**

aggregate name

**[-scanner-state {ready|active|waiting|waiting\_work}] - State (privilege: advanced)**

The state of the scanner. The values active, ready and waiting may appear in this field. Active means the scanner is currently running, waiting means the scanner is waiting to be scheduled, and ready means the scanner is ready to run. Once a scanner is ready to run, it must be scheduled by the system's scan scheduler, the amount of time it takes for it to become active is variable and depends on how busy the system is..

**[-scanner-last-status {aborted-nospace-promote|aborted-fabricpool|aborted-nospace-defrag|aborted-nospace|aborted-exception|aborted-policy|aborted|completed|prev-not-run|aborted-defrag-throttled|aborted-nospace-revert-format|aborted-revert-format-paused|aborted-dual-tier-dirty-failed}] - Previous Run Status (privilege: advanced)**

The status of the tiering scanner the last time it ran. This field will indicate if the scanner has aborted or completed. Possible status options are:

- aborted-nospace-promote : The tiering scanner was aborted because of an internal space check error or a lack of space while promoting data from the capacity tier to the performance tier. Check the promotion-space-needed field.
- aborted-fabricpool: The tiering scanner was aborted because it tried running inactive data reporting on a FabricPool volume.
- aborted-nospace-defrag : The tiering scanner was aborted because of an internal space check error while defragmenting.
- aborted-nospace : The tiering scanner was aborted because of an internal space check error.
- aborted-exception : The tiering scanner encountered an exception while reading data from the capacity tier. Check the scanner-abort-exception field to see the error code that caused the exception.
- aborted-policy : The tiering scanner was aborted because either the tiering-policy or the cloud-retrieval-policy changed while the scan was in progress.
- aborted : The tiering scan was manually aborted.
- completed : The tiering scanner was completed successfully.
- prev-not-run : The tiering scanner has not run before.
- aborted-defrag-throttled : The tiering scanner was aborted because the defragmentation cannot continue due to its threshold limit.
- aborted-nospace-revert-format : The tiering scanner was aborted because of an internal space check error while reverting unified object format to native format.
- aborted-revert-format-paused: The tiering scanner was aborted because it failed to drain waiting objects

while reverting unified object format to native format.

- aborted-dual-tier-dirty-failed: The tiering scanner was aborted because it failed to tier blocks while reverting unified object format to native format.

**[-scanner-abort-exception <integer>] - Aborted Exception Status (privilege: advanced)**

If the scanner last status indicates the scanner aborted with an exception then this field is set to the exception error code that caused the abort.

**[-time-last-scan <Date>] - Time Scanner Last Finished (privilege: advanced)**

This field displays the date and time the last scanner status field was set.

**[-scan-percent <percent>] - Scanner Percent Complete (privilege: advanced)**

This field displays the completion percentage of scans in the active state.

**[-time-next-scan <Date>] - Time Waiting Scan will be scheduled (privilege: advanced)**

This field displays the date and time scans in the waiting state will enter the ready state.

**[-tiering-policy <Tiering Policy>] - Tiering Policy (privilege: advanced)**

The tiering policy. This field displays the current tiering-policy in effect on the volume.

**[-promotion-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Estimated Space Needed for Promotion (privilege: advanced)**

If the scanner aborted due to no space for promote, then this field is set to the estimated minimum space required for promotion to take effect.

**[-scan-start-time <Date>] - Time Scan Started (privilege: advanced)**

This field displays the date and time the scan, if in active state, started.

**[-cloud-retrieval-policy {default|on-read|never|promote}] - Cloud Retrieval Policy (privilege: advanced)**

The cloud retrieval policy. This field displays the current cloud-retrieval-policy in effect on the volume.

**[-scan-elapsed-time [<integer>d][<integer>h][<integer>m][<integer>s]] - Elapsed Time Scanner Ran (privilege: advanced)**

This field displays the time it took for the last scan to run to complete or abort.

**[-revert-scan-state <text>] - Object Format Revert Scan State (privilege: advanced)**

This field displays the state of object format revert scan. The values inactive, ready, active and complete may appear in this field. Inactive means revert scan is not running on this volume, ready means scan is waiting to start running, active mean scanner is running and complete indicates revert scan is complete on this volume.

**[-scan-last-space-err <integer>] - space error code encountered in last scan (privilege: advanced)**

This field displays the most recent space check error code, if any, that was encountered.

**[-blocks-promoted <integer>] - Blocks Promoted (privilege: advanced)**

This field displays the number of blocks that were promoted from the capacity tier to the performance tier.

## Examples

```
cluster1::> volume object-store tiering show
```

| Vserver    | Volume | Aggregate | State   | %Complete | Tiering         | Policy | CloudRetrieve |
|------------|--------|-----------|---------|-----------|-----------------|--------|---------------|
| LastStatus |        |           |         |           |                 |        |               |
| -----      | -----  | -----     | -----   | -----     | -----           | -----  | -----         |
| vs1        | vol    | aggr1     | waiting |           | - snapshot-only |        |               |
|            |        |           |         |           |                 |        | default       |
| completed  |        |           |         |           |                 |        |               |

Shows the tiering status for all FabricPool volumes.

## volume object-store tiering trigger

Trigger a tiering scan

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume object-store tiering trigger` command triggers a tiering and retrieve scan. Tiering and retrieval behavior is driven by the tiering and cloud retrieve policy settings on the volume. The cloud retrieve policy must be set to promote to enable scanner based retrieval.

### Parameters

**-vserver <vserver name> - VServer Name (privilege: advanced)**

vserver name

**-volume <volume name> - Volume Name (privilege: advanced)**

volume name

## volume qtree commands

### volume qtree create

Create a new qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command creates a qtree in the Vserver and volume you specify. You can create up to 4,994 qtrees per volume.

You can optionally specify the following attributes when creating a new qtree:

- Security style
- Opportunistic lock mode
- User ID
- Group ID
- UNIX permissions
- Export Policy

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

### **{ -volume <volume name> - Volume Name**

This specifies the name of the volume that will contain the qtree you are creating.

### **-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree you are creating.

A qtree name cannot contain a forward slash (/). The qtree name cannot be more than 64 characters long.

### **| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

### **[-security-style <security style>] - Security Style**

This optionally specifies the security style for the qtree, which determines how access to the qtree is controlled. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). If you do not specify a security style for the qtree, it inherits the security style of its containing volume.

### **[-oplock-mode {enable|disable}] - Oplock Mode**

This optionally specifies whether oplocks are enabled for the qtree. If you do not specify a value for this parameter, it inherits the oplock mode of its containing volume.

### **[-user <user name>] - User ID**

This optionally specifies the name or ID of the user that is set as the owner of the qtree.

### **[-group <group name>] - Group ID**

This optionally specifies the name or ID of the group that is set as the owner of the qtree.

### **[-m, -unix-permissions <unix perm>] - Unix Permissions**

This optionally specifies the UNIX permissions for the qtree when the *-security-style* is set to *unix* or *mixed*. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX *ls* command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. If you do not specify UNIX permissions for the qtree, it inherits the UNIX permissions of its containing volume.

### **[[-export-policy <text>](#)] - Export Policy**

This optional parameter specifies the name of the export policy associated with the qtree. For information on export policies, see the documentation for the [vserver export-policy create](#) command. If you do not specify a value for this parameter, it inherits the export policy of its containing volume.

### **[[-qos-policy-group <text>](#)] - QoS policy group**

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a qtree, the system does not monitor and control the traffic to it.

## **Examples**

The following example creates a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree has a mixed security style. Its other attributes are inherited from volume vol1.

```
cluster1::> volume qtree create -vserver vs0 -volume vol1 -qtree qtree1
-security-style mixed
```

The following example uses a 7G-compatible command to create the qtree.

```
cluster1::> vserver context vs0
vs0::> qtree create /vol/vol1/qtree1
```

## **Related Links**

- [vserver export-policy create](#)

## **volume qtree delete**

### **Delete a qtree**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command deletes a qtree. The length of time that it takes to delete a qtree depends on the number of directories and files it contains. You can monitor the progress of the delete operation by using the [job show](#) and [job watch-progress](#) commands, respectively.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be deleted.

### **NOTE:**

- Quota rules associated with this qtree in all the quota policies will be deleted when you delete this qtree. Qtree deletion will not be allowed if Storage-level Access Guard (SLAG) is configured.

## **Parameters**

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree to be deleted.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be deleted.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

**[-force <true>] - Force Delete (privilege: advanced)**

This optionally forces the qtree delete operation to proceed when the qtree contains files. The default setting is false (that is, the qtree will not be deleted if it contains files). This parameter is available only at the advanced privilege and higher.

**[-foreground <true>] - Foreground Process**

This optionally specifies whether the qtree delete operation runs as a foreground process. The default setting is false (that is, the operation runs in the background).

## Examples

The following example deletes a qtree named qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree delete -vserver vs0 -volume vol1 -qtree qtree4
WARNING: Are you sure you want to delete qtree qtree4 in volume vol1
vserver vs0? {y|n}: y
[Job 38] Job is queued: Delete qtree qtree4 in volume vol1 vserver vs0.
```

- [job watch-progress](#)

## volume qtree modify

### Modify qtree attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command allows you to modify the following attributes of an existing qtree in the given Vserver and volume:

- Security style

- Opportunistic lock mode
- User ID
- Group ID
- UNIX permissions
- Export policy

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

### **{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree to be modified.

### **-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be modified. You can modify the attributes of qtree0 (represented as "" in the CLI) by omitting the `-qtree` parameter from the command or by specifying the value "" for the `-qtree` parameter.

### **| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

### **[-security-style <security style>] - Security Style**

This optionally modifies the security style for the qtree. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

### **[-oplock-mode {enable|disable}] - Oplock Mode**

This optionally modifies whether oplocks are enabled for the qtree.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

### **[-user <user name>] - User ID**

This optionally modifies the name or ID of the user that is set as the owner of the qtree.

### **[-group <group name>] - Group ID**

This optionally modifies the name or ID of the group that is set as the owner of the qtree.

### **[-unix-permissions <unix perm>] - Unix Permissions**

This optionally modifies the UNIX permissions for the qtree. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation.

The unix permissions can be modified only for qtrees with unix or mixed security style.

### **[-export-policy <text>] - Export Policy**

This optional parameter modifies the export policy associated with the qtree. If you do not specify an export

policy name, the qtree inherits the export policy of the containing volume. For information on export policy, see the documentation for the [vserver export-policy create](#) command.

### **[[-qos-policy-group](#) <text>] - QoS Policy Group**

This optional parameter specifies which QoS policy group to apply to the qtree. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a qtree, the system does not monitor and control the traffic to it. To remove this qtree from a policy group, enter the reserved keyword "none".

## **Examples**

The following example modifies a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree now has a UNIX security style and oplocks are enabled.

```
cluster1::> volume qtree modify -vserver vs0 -volume vol1 -qtree qtreet1
-security-style unix -oplocks enabled
```

## **Related Links**

- [vserver export-policy create](#)

## **volume qtree oplocks**

### **Modify qtree oplock mode**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command allows you to display or modify the opportunistic lock mode of a qtree.

## **Parameters**

### **[-vserver](#) <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

### **{ [-volume](#) <volume name> - Volume Name**

This specifies the name of the volume containing the qtree.

### **[-qtree](#) <qtree name> - Qtree Name**

This specifies the name of the qtree for which the oplock mode is being displayed or modified.

### **| [-qtree-path](#) <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

### **[[-oplock-mode](#) {enable|disable}] - Oplock Mode**

This specifies the new oplock mode of the qtree. If this parameter is not specified, then the current oplock mode of the qtree is displayed.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

## Examples

The following example displays the oplock mode of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the oplock mode of a qtree called qtree2 to enabled. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree2
-oplock-mode enable
```

The following example uses a 7G-compatible command to display and modify the oplock mode of a qtree.

```
cluster1::> vsserver context vs0
vs0::> qtree oplocks /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree oplocks /vol/vol1/qtree2 enable
```

## volume qtree rename

### Rename an existing qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command allows you to rename an existing qtree.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be renamed.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree to be renamed.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be renamed.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

**[-newname <qtree name>] - Qtree New Name**

This specifies the new name of the qtree. The new qtree name cannot contain a forward slash (/) and cannot be more than 64 characters long.

**Examples**

The following example renames a qtree named qtree3 to qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree rename -vserver vs0 -volume vol1 -qtree qtree3
-newname qtree4
```

**volume qtree security****Modify qtree security style**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command allows you to display or modify the security style of a qtree.

**Parameters****-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree for which the security style is being displayed or modified.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as /vol/<volume name>.

**[-security-style <security style>] - Security Style**

This specifies the new security style of the qtree. If this parameter is not specified, then the current security style of the qtree is displayed. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). Modifying a qtree's security style will not affect any of

the files in the other qtrees of this volume.

## Examples

The following example displays the security style of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the security style of a qtree called qtree2 to unix. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree2
-security-style unix
```

The following example uses a 7G-compatible command to display and modify the security style of a qtree.

```
cluster1::> vsserver context vs0
vs0::> qtree security /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree security /vol/vol1/qtree2 unix
```

## volume qtree show

Display a list of qtrees

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays information about qtrees for online volumes. By default, the command displays the following information about all qtrees in the cluster:

- Vserver name
- Volume name
- Qtree name
- Security style (unix, ntfs, mixed or unified)
- Whether oplocks is enabled
- Status (normal or readonly)

The display will also include information about Qtree 0. When you create a volume, a special qtree referred to

as "qtree0", also called the default qtree is automatically created for the volume. It represents all of the data stored in a volume that is not contained in a qtree. In the CLI output, qtree0 is denoted by empty quotation marks ("") and has the ID zero (0). The qtree called qtree0 cannot be manually created or deleted.

The qtree status indicates readonly for data protection and load sharing volumes.

To display detailed information about a single qtree, run the command with the `-instance` and `-qtree` parameters. The detailed view adds the following information:

- User ID
- Group ID
- UNIX permissions
- Qtree ID
- Export policy
- Is Export Policy Inherited

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-exports ]**

Displays the following information about qtree exports:

- Vserver - The name of the Vserver the qtree belongs to
- Volume - The name of the volume the qtree resides on
- Qtree name - The name of the qtree
- Policy Name - The name of the export policy assigned to the qtree
- Is Export Policy Inherited - Whether the export policy assigned to the qtree is inherited

**| [-id ]**

Displays qtree IDs in addition to the default output.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Selects information about the qtrees in the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Selects information about the qtrees in the specified volume.

**[-qtree <qtree name>] - Qtree Name**

Selects information about the qtrees that have the specified name.

**[`-qtree-path <qtree path>`] - Actual (Non-Junction) Qtree Path }**

Selects information about the qtrees that have the specified path.

**[`-security-style <security style>`] - Security Style**

Selects information about the qtrees that have the specified security style.

**[`-oplock-mode {enable|disable}`] - Oplock Mode**

Selects information about the qtrees that have the specified oplock mode.

**[`-user <user name>`] - User ID**

Selects information about the qtrees that have the specified user.

**[`-group <group name>`] - Group ID**

Selects information about the qtrees that have the specified group.

**[`-m, -unix-permissions <unix perm>`] - Unix Permissions**

Selects information about the qtrees that have the specified UNIX permissions.

**[`-qtree-id <integer>`] - Qtree Id**

Selects information about the qtrees that have the specified ID. A valid qtree ID is an integer from 0 to 4994. All qtree0 (automatically created) qtrees have an ID of zero (0).

**[`-status {normal|readonly}`] - Qtree Status**

Selects information about the qtrees that have the specified status.

**[`-export-policy <text>`] - Export Policy**

Selects information about the qtrees that use the specified export policy.

**[`-is-export-policy-inherited {true|false}`] - Is Export Policy Inherited**

Selects information about the qtrees that inherit (true) or not inherit (false) the export policy of containing volume.

**[`-qos-policy-group <text>`] - QoS policy group**

Selects information about the qtrees that use the specified QoS policy.

## Examples

The following example displays default information about all qtrees along with each qtree ID. Note that on vs0, no qtrees have been manually created, so only the automatically created qtrees referred to as qtree 0 are shown. On vs1, the volume named vs1\_vol1 contains qtree 0 and two manually created qtrees, qtree1 and qtree2.

```
cluster1::> volume qtree show -id
```

| Vserver | Volume      | Qtree  | Style | Oplocks | Status   | Id |
|---------|-------------|--------|-------|---------|----------|----|
| vs0     | vs0_vol1    | ""     | unix  | enable  | readonly | 0  |
| vs0     | vs0_vol2    | ""     | unix  | enable  | normal   | 0  |
| vs0     | vs0_vol3    | ""     | unix  | enable  | readonly | 0  |
| vs0     | vs0_vol4    | ""     | unix  | enable  | readonly | 0  |
| vs0     | root_vs_vs0 | ""     | unix  | enable  | normal   | 0  |
| vs1     | vs1_vol1    | ""     | unix  | enable  | normal   | 0  |
| vs1     | vs1_vol1    | qtree1 | unix  | disable | normal   | 1  |
| vs1     | vs1_vol1    | qtree2 | unix  | enable  | normal   | 2  |
| vs1     | root_vs_vs1 | ""     | unix  | enable  | normal   | 0  |

9 entries were displayed.

## volume quota commands

### volume quota modify

Modify quota state for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command allows you to modify the following quota attributes for one or more volumes:

- Quota state
- Whether quota exceeded messages are logged or not
- Frequency with which quota exceeded messages are logged

Modifications to the quota state for a volume creates a job to perform the quota state changes for that volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume whose quota attributes you are modifying is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume whose quota attributes you are modifying.

**[-state <quota\_state>] - Quota State**

This parameter optionally modifies the quota state to one of the following:

- `off` - This indicates that quotas be deactivated for the specified volume.
- `on` - This indicates that quotas be activated for the specified volume.

- `resize` - This indicates that the quota limits be resized according to the values specified in the quota policy assigned to the Vserver. Note that quotas must be activated first for a volume before a resize operation can be performed.

Both quota activation and quota resize operations apply the quota rules configured for the volume within the quota policy that is currently assigned to the Vserver. These quota rules are managed by using the commands in the `volume quota policy rule` menu. Quotas, when activated for a volume, go through an initialization process. As part of the quota initialization all the quota rules are applied to the volume. In addition, a filesystem scanner is started to scan the entire filesystem within the volume to bring the quota accounting and reporting up to date. The quota job finishes after the filesystem scanner is started on the volume. The quota state for the volume is `initializing` until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on`.

When quotas are resized, the quota state is `resizing` until the resizing operation finishes. As part of this operation, the quota limits for quotas currently in effect are resized to the limits currently configured for the volume. After the quota resize operation finishes, the quota state will be `on`.

Quota state changes can also be performed using the commands `volume quota on`, `volume quota off` and `volume quota resize`.

### **`[-logging {on|off}] - Logging Messages`**

This parameter optionally specifies whether quota exceeded syslog/EMS messages are logged in the system log messages. When it is set to `on`, quota exceeded messages are generated when the user exceeds the quota's disk limit or the file limit through a NFS/CIFS operation or any operation within the ONTAP software. When set to `off` no quota exceeded messages are generated. This parameter can be changed only after quotas are activated for a volume.

### **`[-logging-interval <text>] - Logging Interval`**

This parameter optionally specifies a logging interval, which indicates the frequency with which quota exceeded messages are generated. You can specify a logging interval in the `<integer><suffix>` format, where suffix can be minutes (`m`), hours (`h`), or days (`d`), but not combinations thereof (in other words, `90m` is a valid logging interval, but `1h30m` is not a valid logging interval). You can modify the logging interval only when the logging is `on`. When quotas are first activated, the logging parameter is automatically set to `on`, and the logging interval set to `1h`. If continuous logging is required, an interval of `0m` should be specified. This parameter can be changed only after quotas are activated for a volume.

quota message logging may not occur at exactly the same interval rate as specified by the user, especially for very small intervals. This is due to the behavior of the logging system that buffers messages instead of outputting them immediately. Setting the logging interval to `0m` can cause lots of quota exceeded messages to be logged in the system log messages.

### **`[-foreground <true>] - Foreground Process`**

This parameter optionally specifies whether the job created by quota state modify operation runs as a foreground process. The default setting is `false` (that is, the quota state modify operation runs in the background). When set to `true`, the command will not return until the job completes.

## **Examples**

The following example activates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota modify -vserver vs0 -volume voll -state on
[Job 24] Job is queued: Quota ON Operation on vs0 volume voll.
```

The following example turns on quota message logging and sets the logging interval to 4 hours.

```
cluster1::> volume quota modify -vserver vs0 -volume voll -logging on
-logging-interval 4h
```

The following example resizes quota limits on a volume.

```
cluster1::> volume quota modify -vserver vs0 -volume voll -state resize
-foreground true
[Job 80] Job succeeded: Successful
```

## volume quota off

Turn off quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command creates a job to deactivate quotas for the specified volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are deactivating quotas.

### **[-foreground <true>] - Foreground Process**

This optionally specifies whether the job created for deactivating quotas runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). When set to *true*, the command will not return until the job completes.

## Examples

The following example deactivates quotas on the volume named `vol1` , which exists on Vserver `vs0` .

```
cluster1::> volume quota off -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota OFF Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to deactivate quotas on the volume named `vol1` which exists on Vserver `vs0` .

```
cluster1::> vserver context vs0
vs0::> quota off vol1
[Job 25] Job is queued: Quota OFF Operation on vserver vs0 volume vol1.
```

## volume quota on

Turn on quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command creates a job to activate quotas for the specified volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are activating quotas.

### **[-w, -foreground <true>] - Foreground Process**

This optionally specifies whether the job created for activating quotas runs as a foreground process. The default setting is `false` (that is, the operation runs in the background). When set to `true` , the command will not return until the job completes. The quota job finishes after the filesystem scanner is started. The quota state for the volume is `initializing` until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on` .

## Examples

The following example activates quotas on the volume named `vol1` , which exists on Vserver `vs0` .

```
cluster1::> volume quota on -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota ON Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to activate quotas on the volume named `vol1` which exists on Vserver `vs0` .

```
cluster1::> vserver context vs0
vs0::> quota on -w vol1
[Job 25] Job is queued: Quota ON Operation on vserver vs0 volume vol1.

[Job 25] Job succeeded: Successful
```

## volume quota report

Display the quota report for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays the quota report for all volumes in each Vserver that are online and for which quotas are activated. Quota report includes the quota rules (default, explicit, and derived) in effect and the associated resource usage (disk space and files). If quotas are still initializing for a specific volume, that volume is not included.

This command displays the following information:

- Vserver name
- Volume name
- Index - This is a unique number within a volume assigned to each quota rule displayed in the quota report.
- Tree name - This field gives the name of the qtree if the quota rule is at the qtree level. It is empty if the quota rule is at the volume level.
- Quota type - Type of quota rule (`tree` or `user` or `group` ).
- Quota target - This field gives the name of the target of the quota rule. For tree quota rules, it will be the qtree ID of the qtree. For user quota rules, it will be the UNIX user name or the Windows user name. For group quota rules, it will be the UNIX group name. For default rules (`tree` or `user` or `group`), this will display "\*" . If the UNIX user identifier, UNIX group identifier, or Windows security identifier no longer exists or if the identifier-to-name conversion fails, the target appears in numeric form.
- Quota target ID - This field gives the target of the quota rule in numeric form. For tree quota rules, it will be the qtree ID of the qtree. For group quota rules, it will be the UNIX group identifier. For UNIX user quota rules, it will be the UNIX user identifier. For Windows user quota rules, it will be the Windows security

identifier in its native format. For default rules (tree or user or group), "\*" will be displayed.

- Disk space used - For a default quota, the value is 0.
- Disk space limit
- Soft disk space limit
- Threshold for disk space limit
- Files used - For a default quota, the value is 0.
- File limit
- Soft file limit
- Quota specifier - For an explicit quota, this field shows how the quota target was configured by the administrator using the volume quota policy rule command. For a default quota, the field shows "" . For a derived tree quota, this field shows the qtree path. For a derived user and group quota, the field is either blank or "" .

The following parameters: `-soft` , `-soft-limit-thresholds` , `-target-id` , `-thresholds` , `-fields` and `-instance` display different set of fields listed above. For example, `-soft` will display the soft disk space limit and soft file limit apart from other information. Similarly `-target-id` will display the target in the numeric form.

A quota report is a resource intensive operation. If you run it on many volumes in the cluster, it might take a long time to complete. A more efficient way would be to view the quota report for a particular volume in a Vserver.

Depending upon the quota rules configured for a volume, the quota report for a single volume can be large. If you want to monitor the quota report entry for a particular tree/user/group repeatedly, find the index of that quota report entry and use the `-index` field to view only that quota report entry. See the examples section for an illustration.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-soft ]**

If this parameter is specified, the command display will include the soft disk space limit and the soft file limit.

**| [-soft-limit-thresholds ]**

If this parameter is specified, the command display will include the soft disk space limit, threshold for disk space limit and soft file limit.

**| [-target-id ]**

If this parameter is specified, the command will display the target of a user or group quota rule in numeric form.

**| [-thresholds ]**

If this parameter is specified, the command display will include the threshold for disk space limit.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays the quota report for volumes in the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays the quota report for the specified volume.

**[-index <integer>] - Index**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified index.

**[-tree <qtree name>] - Qtree Name**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified qtree name.

**[-quota-type {tree|user|group}] - Quota Type**

If this parameter is specified, the command displays the quota report for the quota rules of the given type.

**[-quota-target <text>, ...] - Quota Target**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target.

**[-quota-target-id <text>, ...] - Quota Target ID**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target identifier.

**[-disk-used {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Used**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space used value.

**[-disk-limit {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space limit.

**[-files-used <integer>] - Files Used**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified files used value.

**[-file-limit <integer>] - Files Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified file limit.

**[-threshold {<integer>[KB|MB|GB|TB|PB]}] - Disk Space Threshold**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified threshold for disk space limit.

**`[-soft-disk-limit {<integer>[KB|MB|GB|TB|PB] }]` - Soft Disk Space Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft disk space limit.

**`[-soft-file-limit <integer>]` - Soft Files Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft file limit.

**`[-quota-specifier <text>]` - Quota Specifier**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota specifier.

**`[-path <text>]` - Path**

If this parameter is specified, the command will display the quota report for the quota rules that are applicable for the file in the specified path. The format of the path to the file should begin with `/vol/<volume name>/`. The quota rules that are applicable typically consists of the tree quota rule corresponding to the qtree in which the file resides within the volume, user quota rule at the volume and qtree level corresponding to the UNIX user identifier or the Windows security identifier associated with the file and the group quota rule at the volume and qtree level corresponding to the UNIX group identifier associated with the file.

**`[-disk-used-pct-soft-disk-limit <percent_no_limit>]` - Disk Space Used % Soft Disk Space Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `soft-disk-limit`.

**`[-disk-used-pct-threshold <percent_no_limit>]` - Disk Space Used % Disk Space Threshold**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `threshold`.

**`[-disk-used-pct-disk-limit <percent_no_limit>]` - Disk Space Used % Disk Space Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `disk-limit`.

**`[-files-used-pct-soft-file-limit <percent_no_limit>]` - Files Used % Soft File Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `files-used` and `soft-file-limit`.

**`[-files-used-pct-file-limit <percent_no_limit>]` - Files Used % File Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `files-used` and `file-limit`.

## Examples

The following example displays the quota report for all the volumes.

```
cluster1::> volume quota report
```

```
Vserver: vs0
```

| ----Disk---- |       | ----Files----- |                | Quota |       |       |       |
|--------------|-------|----------------|----------------|-------|-------|-------|-------|
| Volume       | Tree  | Type           | ID             | Used  | Limit | Used  | Limit |
| Specifier    |       |                |                |       |       |       |       |
| -----        | ----- | -----          | -----          | ----- | ----- | ----- | ----- |
| vol2         |       | tree           | *              | 0.00B | 100MB | 0     | 10000 |
| vol2         | vxw02 | tree           | 3              | 0.00B | 200MB | 1     | 20000 |
| vol2         |       | user           | *              | 0.00B | 50MB  | 0     | -     |
| vol2         | vxw02 | user           | sam,Engr\Sammy | 0.00B | 100MB | 0     | -     |
| vol2         |       | group          | *              | 0.00B | 500MB | 0     | -     |
| vol2         | q1    | tree           | 1              | 1MB   | 100MB | 2     | 10000 |
| vol2         | q1    | user           | *              | 0.00B | 50MB  | 0     | -     |
| vol2         | q1    | group          | *              | 0.00B | 500MB | 0     | -     |
| vol2         | q1    | group          | root           | 1MB   | -     | 2     | -     |
| vol2         | vxw01 | tree           | 2              | 0.00B | 100MB | 1     | 10000 |
| vol2         | vxw01 | user           | *              | 0.00B | 50MB  | 0     | -     |
| vol2         | vxw01 | group          | *              | 0.00B | 500MB | 0     | -     |
| vol2         | vxw01 | group          | root           | 0.00B | -     | 1     | -     |
| vol2         | vxw02 | user           | *              | 0.00B | 50MB  | 0     | -     |
| vol2         | vxw02 | group          | *              | 0.00B | 500MB | 0     | -     |
| vol2         | vxw02 | group          | root           | 0.00B | -     | 1     | -     |
| vol2         | vxw03 | tree           | 4              | 0.00B | 100MB | 1     | 10000 |
| vol2         | vxw03 | user           | *              | 0.00B | 50MB  | 0     | -     |
| vol2         | vxw03 | group          | *              | 0.00B | 500MB | 0     | -     |

## volume quota resize

### Resize quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command resizes the quota limits for the quotas currently in effect for the specified volume. It creates a job to resize quotas. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

#### NOTE:

- Quotas must be activated before quota limits can be resized.

#### Parameters

##### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

##### **-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are resizing the quota limits and threshold.

##### **[-foreground <true>] - Foreground Process**

This optionally specifies whether the job created for resizing quotas runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). When set to *true*, the command will not return until the job completes.

## Examples

The following example resizes quotas on the volume named `vol1` , which exists on Vserver `vs0` .

```
cluster1::> volume quota resize -vserver vs0 -volume vol1
[Job 34] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to resize quotas on the volume named `vol1` which exists on Vserver `vs0` .

```
cluster1::> vserver context vs0
vs0::> quota resize vol1
[Job 35] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

## volume quota show

Display quota state for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays information about quotas for online volumes. The command output depends on the parameters specified with the command. Quotas can only be administered on FlexVol volumes. If no parameters are specified, the command displays the following information for all volumes:

- Vserver name
- Volume name
- Quota state - quota state for this volume. The possible values are as follows:
  - `off` - this state indicates that quotas are deactivated for the volume.
  - `on` - this state indicates that quotas are activated for the volume.
  - `initializing` - this state indicates that quotas are being initialized for the volume.
  - `resizing` - this state indicates that quota limits are being resized for the volume.
  - `corrupt` - this state indicates that quotas are corrupt for this volume.
  - `mixed` - this state may only occur for FlexGroup volumes, and indicates that the constituent volumes are not all in the same state.
- Scan status - percentage of the files in the volume scanned by the quota scanner that runs as part of activating quotas.
- Last error - most recently generated error message as part of the last quota operation (`on` or `resize` ).

Present only if an error has been generated.

To display detailed information about all volumes, run the command with the `-instance` parameter. The detailed view provides all of the information in the previous list and the following additional information:

- Logging messages - whether quota exceeded syslog/EMS messages are logged or not. For volumes where the quota logging parameter is set to `on`, quota exceeded messages are generated when a NFS/CIFS operation or any internal ONTAP operation is being prevented because the quota disk usage is exceeding the disk limit or the quota file usage is exceeding the file limit. For quotas where the logging parameter is set to `off`, no quota exceeded messages are generated.
- Logging interval - frequency with which quota exceeded messages are logged. This parameter only applies to volumes that have the logging parameter set to `on`.
- Sub status - additional status about quotas for this volume. Following are the possible values reported:
  - `upgrading` - this indicates that the quota metadata format is being upgraded from an older version to a newer version for the volume.
  - `setup` - this indicates that the quotas are being setup on the volume.
  - `transferring rules` - this indicates that the quota rules are being transferred to the volume.
  - `scanning` - this indicates that the quota filesystem scanner is currently running on the volume.
  - `finishing` - this indicates that the quota `on` or `resize` operation is in the final stage of the operation.
  - `done` - this indicates that the quota operation is finished.
  - `none` - this indicates that there is no additional status.
- All errors - collection of all the error messages generated as part of the last quota operation (`on` or `resize`) since the volume was online.
- User quota enforced (advanced privilege only) - indicates whether there are user quota rules being enforced.
- Group quota enforced (advanced privilege only)- indicates whether there are group quota rules being enforced.
- Tree quota enforced (advanced privilege only) - indicates whether there are tree quota rules being enforced.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-logmsg ]**

If this parameter is specified, the command displays whether quota exceeded messages are logged and the logging interval for the quota messages.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays information for the volumes in the specified Vserver.

**[`-volume <volume name>`] - Volume Name**

If this parameter is specified, the command displays information for the specified volume.

**[`-state <quota_state>`] - Quota State**

If this parameter is specified, the command displays information for the volumes that have the specified quota state.

**[`-scan-status <percent>`] - Scan Status**

If this parameter is specified, the command displays information about the volumes whose scan-status matches the specified percentage value. The scan status is displayed in the format [0-100]%.

**[`-logging {on|off}`] - Logging Messages**

If this parameter is specified, the command displays information about the volumes that have the specified logging setting.

**[`-logging-interval <text>`] - Logging Interval**

If this parameter is specified, the command displays information about the volumes that have the specified quota logging interval.

**[`-sub-status <text>`] - Sub Quota Status**

If this parameter is specified, the command displays information about the volumes that have the specified quota sub-status.

**[`-last-error <text>`] - Last Quota Error Message**

If this parameter is specified, the command displays information about the volumes whose last error matches the specified error message.

**[`-errors <text>`] - Collection of Quota Errors**

If this parameter is specified, the command displays information about the volumes whose collection of errors match the specified error message.

**[`-is-user-quota-enforced {true|false}`] - User Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

**[`-is-group-quota-enforced {true|false}`] - Group Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

**[`-is-tree-quota-enforced {true|false}`] - Tree Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

## Examples

The following example displays information about all volumes on the Vserver named `vs0`.

```
cluster1::> volume quota show -vserver vs0
```

| Vserver                                          | Volume   | State        | Scan Status |
|--------------------------------------------------|----------|--------------|-------------|
| -----                                            | -----    | -----        | -----       |
| vs0                                              | root_vs0 | off          | -           |
| vs0                                              | vol1     | off          | -           |
| Last Error: Volume vol1 has no valid quota rules |          |              |             |
| vs0                                              | vol2     | on           | -           |
| vs0                                              | vol3     | initializing | 30%         |

4 entries were displayed.

The following example displays the logging information for all the volumes.

```
cluster1::> volume quota show -logmsg
```

| Vserver | Volume   | State | Logging Message | Logging Interval |
|---------|----------|-------|-----------------|------------------|
| -----   | -----    | ----- | -----           | -----            |
| vs0     | root_vs0 | off   | -               | -                |
| vs0     | vol1     | off   | -               | -                |
| vs0     | vol2     | on    | on              | 1h               |
| vs0     | vol3     | on    | on              | 1h               |

4 entries were displayed.

The following example displays detailed information in advanced privilege for a volume `vol1` , which exists on Vserver `vs0`

```
cluster1::> set advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.

Do you want to continue? {y|n}: y

```
cluster1::*> volume quota show -instance -vserver vs0 -volume vol1
```

Vserver Name: vs0

Volume Name: vol1

Quota State: on

Scan Status: -

Logging Messages: on

Logging Interval: 1h

Sub Quota Status: none

Last Quota Error Message: -

Collection of Quota Errors: -

User Quota enforced: true

Group Quota enforced: false

Tree Quota enforced: false

The following example displays the detailed information when quotas are upgrading for volume vol1 , which exists on Vserver vs0 .

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
```

Vserver Name: vs0

Volume Name: vol1

Quota State: initializing

Scan Status: 3%

Logging Messages: -

Logging Interval: -

Sub Quota Status: upgrading

Last Quota Error Message: -

Collection of Quota Errors: -

The following example displays the "Last Quota Error Message" and the "Collection of Quota Errors" for volume vol1 , which exists on Vserver vs0

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
Vserver Name: vs0
Volume Name: vol1
Quota State: on
Scan Status: -
Logging Messages: on
Logging Interval: 1h
Sub Quota Status: none
Last Quota Error Message: second definition for user2 (type:user
target:user2,user4 qtree:"").
Collection of Quota Errors: second definition for user1 (type:user
target:user1,user3 qtree:"").
                                second definition for user2 (type:user
target:user2,user4 qtree:"").
```

## volume quota policy copy

### Copy a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command copies a quota policy and the rules it contains. You must enter the following information to copy a quota policy:

- Vserver name
- Policy name
- New policy name

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver from which you are copying the quota policy.

#### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are copying.

#### **-new-policy-name <text> - New Policy Name**

This parameter specifies the name of the new quota policy you are copying to. The new name cannot have more than 32 characters.

### Examples

The following example copies a quota policy named `quota_policy_0` on Vserver `vs0`. It is copied to `quota_policy_1`.

```
cluster1::> volume quota policy copy -vserver vs0 -policy-name  
quota_policy_0 -new-policy-name quota_policy_1
```

## volume quota policy create

### Create a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

A quota policy is collection of quota rules for all the volumes in a specific Vserver. This command creates a quota policy for a specific Vserver. Multiple quota policies can be created for a Vserver, but only one of them can be assigned to the Vserver. A Vserver can have a maximum of five quota policies. If five quota policies already exist, the command fails and a quota policy must be deleted before another quota policy can be created.

When you turn on quotas for a volume, the quota rules to be enforced on that volume will be picked from the quota policy that is assigned to the Vserver containing that volume. The quota policy for clustered volumes is equivalent to the `/etc/quotas` file in 7G.

You must enter the following information to create a quota policy:

- Vserver name
- Policy name

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver for which you are creating the quota policy. You can create a quota policy only for a data Vserver. Quota policies cannot be created for a node or admin Vserver.

##### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are creating. The quota policy name cannot be more than 32 characters long and must be unique within the Vserver.

#### Examples

The following example creates a quota policy named `quota_policy_0` on Vserver `vs0`.

```
cluster1::> volume quota policy create -vserver vs0 -policy-name  
quota_policy_0
```

## volume quota policy delete

### Delete a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command deletes a quota policy and all the rules it contains. The policy can be deleted only when it is not assigned to the Vserver. You must enter the following information to delete a quota policy:

- Vserver name
- Policy name

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy you want to delete.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you want to delete.

## Examples

The following example deletes a quota policy named quota\_policy\_5 on Vserver vs0.

```
cluster1::> volume quota policy delete -vserver vs0 -policy-name  
quota_policy_5
```

## volume quota policy rename

### Rename a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command renames a quota policy. You must enter the following information to rename a quota policy:

- Vserver name
- Policy name
- New policy name

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy you want to rename.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are renaming.

### **-new-policy-name <text> - New Policy Name**

This parameter specifies the new name of the quota policy. The new name cannot be more than 32 characters long.

## Examples

The following example renames a quota policy named `quota_policy_0` on Vserver `vs0`. The policy's new name is `quota_policy_1`.

```
cluster1::> volume quota policy rename -vserver vs0 -policy-name  
quota_policy_0 -new-policy-name quota_policy_1
```

## volume quota policy show

Display the quota policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays information about quota policies. The command displays the following information about all quota policies:

- Vserver name
- Policy name
- When the policy was last modified

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information about the quota policies for the specified Vserver.

**[-policy-name <text>] - Policy Name**

If this optional parameter is specified, the command displays information about quota policies that match the specified name.

**[-last-modified <MM/DD/YYYY HH:MM:SS>] - Last Modified**

If this optional parameter is specified, the command displays information about quota policies with the last modified time that match the given time.

## Examples

The following example displays information about all quota policies.

```
cluster1::> volume quota policy show
Vserver          Policy Name      Last Modified
-----
vs0              quota_policy_vs0 10/16/2008 17:40:05
vs1              quota_policy_vs1 10/16/2008 17:47:45
vs2              quota_policy_vs2 10/16/2008 17:44:13
vs3              quota_policy_vs3 10/16/2008 17:44:13
4 entries were displayed.
```

## volume quota policy rule create

### Create a new quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command creates a quota policy rule. You must enter the following information to create a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

You can optionally specify the following additional attributes for the quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

### NOTE:

- For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the "[volume quota modify](#)" command.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are creating a rule.

**-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are creating a rule.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are creating a rule.

**-type {tree|user|group} - Type**

This parameter specifies the quota target type of the rule you are creating.

**-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies. For default quota rules, this parameter should be specified as "". For explicit tree quotas rules, this parameter should indicate the qtree name. For explicit user quota rules, this parameter can contain UNIX user name, UNIX user identifier, Windows user name, Windows Security Identifier or a path to an existing object within the volume. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash (\) or an @ sign; user names with these characters are treated as Windows names. For multi-user quotas, this parameter can contain multiple user targets separated by a comma. For explicit group quota rules, this parameter can contain UNIX group name or UNIX group identifier or a path to an existing object within the volume. When a path is specified as the target, it should be of the format /vol/<vol-name>/<path to file from volume root> where the volume matches that of the -volume parameter.

**-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree to which the quota rule applies. This parameter is not applicable for tree type rules. For user or group type rules at the volume level, this parameter should contain "".

**[-user-mapping {on|off}] - User Mapping**

This parameter optionally specifies if user mapping needs to be performed for a user quota rule. If this parameter is "on", the UNIX user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together. The mapping will be obtained as configured in "vserver name-mapping".

Note that this parameter can be specified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a UNIX user name or a Windows user name and cannot be specified for multi-user quota targets.

**[-disk-limit {<size>|-}] - Disk Limit**

This parameter optionally specifies a hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. When the hard disk space limit is reached, no additional disk space can be consumed by the specified target. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks. The value can be larger than the amount of disk space available in the volume.

**[-file-limit {<integer>|-}] - Files Limit**

This parameter optionally specifies a hard limit for the number of files permitted on the quota target. When the hard number of files limit is reached, no additional files can be created by the specified target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of

unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

#### **`[-threshold {<size>|-}] - Threshold for Disk Limit`**

This parameter optionally specifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. When the disk limit threshold is exceeded, a console message, EMS events, and SNMP traps are generated. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

#### **`[-soft-disk-limit {<size>|-}] - Soft Disk Limit`**

This parameter optionally specifies a soft limit for the disk space that can be consumed by the quota target. The soft disk limit indicates that the hard limit for the disk space will soon be exceeded. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. When the soft limit for the disk space is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the disk space used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

#### **`[-soft-file-limit {<integer>|-}] - Soft Files Limit`**

This parameter optionally specifies a soft limit for the number of files permitted on the quota target. The soft file limit indicates that the hard limit for the number of files will soon be exceeded. When the soft limit for the number of files is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the files used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

## **Examples**

The following example creates a default tree quota rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to all qtrees on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type tree -target ""
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX user *myuser* for a qtree named *qtree1* on volume *vol0* with a disk limit of 20 Gigabytes, soft disk limit of 15.4 Gigabytes and threshold limit of 15.4 Gigabytes. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtrees qtrees1 -user-mapping on -disk-limit 20GB -soft-disk-limit 15.4GB
-threshold 15.4GB
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the Windows user *DOMXYZ\myuser* for a qtrees named *qtrees1* on volume *vol0* with a file limit of *40000* and a soft file limit of *26500*. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target DOMXYZ\myuser
-qtrees qtrees1 -user-mapping on -file-limit 40000 -soft-file-limit 26500
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX user identifier *12345* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target 12345
-qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the Windows Security Identifier *S-123-456-789* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target S-123-456-789 -qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX group *engr* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type group -target engr
-qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the user who is the owner of the file */vol/vol0/qtrees1/file1.txt* for qtrees *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0 -policy-name
quota_policy_0 -volume vol0 -type user -target /vol/vol0/qtrees1/file1.txt
-qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the users specified in the target for qtrees *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target user1,DOMXYZ\user2,23457,S-126-098-567,/vol/vol0/qtrees1/file2.txt
-qtrees qtrees1
```

## Related Links

- [volume quota modify](#)

## volume quota policy rule delete

Delete an existing quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume quota policy rule delete` command deletes a quota policy rule. You must enter the following information to delete a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtrees to which the rule applies

## NOTE:

- If the rule being deleted belongs to the quota policy that is currently assigned to the Vserver, enforcement of the rule on the volume must be terminated by performing a quota off and on or a quota resize operation using the "[volume quota modify](#)" command.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are deleting a rule.

**-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are deleting a rule.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are deleting a rule.

**-type {tree|user|group} - Type**

This parameter specifies the quota target type for the rule.

**-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies.

**-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree for which you are deleting a rule.

**Examples**

The following example deletes a quota policy rule on Vserver vs1 for the quota policy named quota\_policy\_1. This quota policy applies to the group named engr for the qtree named qtree1 on volume vol1.

```
cluster1::> volume quota policy rule delete -vserver vs1  
-policy-name quota_policy_1 -volume vol1 -type group -target engr  
-qtree qtree1
```

**Related Links**

- [volume quota modify](#)

**volume quota policy rule modify**

Modify an existing quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command can be used to modify the following attributes of a quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

**NOTE:**

- If the rule being modified belongs to the quota policy that is currently assigned to the Vserver, rule

enforcement on the volume must be enabled by performing a quota off and on or a quota resize operation using the "[volume quota modify](#)" command.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are modifying a rule.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are modifying a rule.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are modifying a rule.

### **-type {tree|user|group} - Type**

This parameter specifies the quota target type for the rule you are modifying.

### **-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies. If the target is a user, the user ID or username must be the same one that was used to create the quota. The same restriction is there for both group ID or groupname and Windows SID or Windows account name.

### **-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree to which the quota policy rule applies.

### **[-user-mapping {on|off}] - User Mapping**

This parameter optionally modifies the user mapping for a user quota rule. The value for this parameter can be modified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a unix user name or a Windows user name and cannot be specified for multi-user quota targets. If this parameter is "on", the unix user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together.

### **[-disk-limit {<size>|-}] - Disk Limit**

This parameter optionally modifies the hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter.

### **[-file-limit {<integer>|-}] - Files Limit**

This parameter optionally modifies the hard limit for the number of files permitted on the quota target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter.

### **[-threshold {<size>|-}] - Threshold for Disk Limit**

This parameter optionally modifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold limit of unlimited can be specified with a "-" for this parameter.

### **[`-soft-disk-limit` {<size>|-}] - Soft Disk Limit**

This parameter optionally modifies the soft limit for the disk space that can be consumed by the quota target. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter.

### **[`-soft-file-limit` {<integer>|-}] - Soft Files Limit**

This parameter optionally modifies the soft limit for the number of files permitted on the quota target. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter.

## **Examples**

The following example modifies a quota policy rule for the quota policy named `quota_policy_0`. This quota policy exists on Vserver `vs0` and applies to the user named `myuser` for qtree named `qtree1` on volume `vol0`. The user mapping is turned on, the hard disk limit is set to 20 GB and the hard file limit is set to 100,000 files.

```
cluster1::> volume quota policy rule modify -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtree qtree1 -user-mapping on -disk-limit 20GB -file-limit 100000
```

## **Related Links**

- [volume quota modify](#)

## **volume quota policy rule show**

Display the quota rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command displays the following information about quota policy rules by default.

- Vserver name
- Quota policy name
- Volume name
- Type of quota policy rule
- Target of the quota policy rule
- Qtree name
- User mapping
- Hard disk limit
- Soft disk limit
- Hard file limit
- Soft file limit

- Threshold for disk limit

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information about quota rules for the quotas contained on volumes on the specified Vserver.

**[-policy-name <text>] - Policy Name**

If this parameter is specified, the command displays information about quota rules for the specified quota policy.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays information about quota rules for the quota policy associated with the specified volume.

**[-type {tree|user|group}] - Type**

If this parameter is specified, the command displays information about quota rules for the specified quota type.

**[-target <text>] - Target**

If this parameter is specified, the command displays information about quota rules for the specified target.

**[-qtree <qtree name>] - Qtree Name**

If this parameter is specified, the command displays information about quota rules for the specified qtree.

**[-user-mapping {on|off}] - User Mapping**

If this parameter is specified, the command displays information about quota rules having the specified user-mapping value.

**[-disk-limit {<size>|-}] - Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified hard disk limit.

**[-file-limit {<integer>|-}] - Files Limit**

If this parameter is specified, the command displays information about quota rules having the specified hard file limit.

**[-threshold {<size>|-}] - Threshold for Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified disk limit threshold.

### **[`-soft-disk-limit` {<size>|-}] - Soft Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified soft disk limit.

### **[`-soft-file-limit` {<integer>|-}] - Soft Files Limit**

If this parameter is specified, the command displays information about quota rules having the specified soft file limit.

## **Examples**

The following example displays information about all the quota policy rules in a cluster. There is one user rule that exists on Vserver vs0 for the quota policy named quota\_policy\_0. This quota policy applies to the user named myuser for qtree named qtree0 on volume vol0.

```
cluster1::> volume quota policy rule show
Vserver: vs0      Policy: quota_policy_0      Volume: vol0
Soft      Soft
Type      Target  Qtree  User      Disk      Disk      Files      Files
-----  -
tree      myuser  qtree0 on      20GB      18GB      100000     80000
                                         Threshold
                                         16GB
```

## **volume quota policy rule count show**

Display count of quota rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command displays various counts of quota policy rules defined within a quota policy. By default, the subtotal for each volume is displayed. Optionally, the command can provide the total rule count across the entire quota policy or detailed subtotals organized by qtree and quota rule type.

## **Parameters**

**{ [`-fields` <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-detail` ]**

Displays rule count subtotals for each quota rule type. The subtotals for each type are computed for a specific volume and qtree.

**| [-hierarchy ]**

Displays rule count subtotals in hierarchical format with subtotals at the quota policy, volume, qtree, and quota rule type levels.

**| [-total ]**

Displays the total rule count for each Vserver and quota policy.

**| [-instance ] }**

Displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Displays quota rule counts for the specified Vserver.

**[-policy-name <text>] - Policy Name**

Displays quota rule counts for the specified quota policy.

**[-volume <volume name>] - Volume Name**

Displays quota rule counts for the specified volume.

**[-qtree <qtree name>] - Qtree Name**

Displays quota rule counts for the specified qtree.

**[-type {tree|user|group}] - Type**

Displays quota rule counts for the specified quota rule type.

**[-count-where-policy-volume-qtree-type <integer>] - Qtree/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, qtree, and quota rule type. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume-qtree <integer>] - Qtree Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, and qtree. All quota rule types are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume-type <integer>] - Volume/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, and quota rule type. All qtrees are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume <integer>] - Volume Subtotal**

Subtotal of rules matching the given Vserver, quota policy, and volume. All qtrees and quota rule types are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-type <integer>] - Policy/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, and quota rule type. All volumes and qtrees are included. If specified as input, only matching totals are displayed.

**[-count-where-policy <integer>] - Policy Total**

Total rule count matching the given Vserver and quota policy. All volumes, qtrees, and quota rule types are included. If specified as input, only matching totals are displayed.

## Examples

The following example shows quota rule counts for Vserver *vs0* , quota policy *default* . The total number of rules in quota policy *default* is 7500. There are two volumes with quota rules configured. Volume *volume0* has a total of 1000 rules, and *volume1* has a total of 6500 rules.

```
cluster1:> volume quota policy rule count show -vserver vs0 -policy-name
default

Vserver: vs0                Policy: default
Rule
Volume                      Count
-----
volume0                     1000
volume1                     6500
2 entries were displayed.
```

## volume reallocation commands

### volume reallocation measure

Start reallocate measure job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Performs a measure-only reallocation check on a LUN, NVMe namespace, file, or volume. At the end of each check, the system logs the optimization results in the Event Message System (EMS). If you use the `logfile` , the system records detailed information about the LUN, NVMe namespace, file, or volume layout in the log file. To view previous measure-only reallocation checks, use the [volume reallocation show](#) command.

NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

#### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**{ [-i, -interval <text>] - Interval Schedule**

Specifies the reallocation scan interval in

- m for minutes

- h for hours
- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

#### **| [-o, -once <true>] - Once }**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

#### **[-l, -logpath <text>] - Log Path**

Specifies the path for reallocation logs.

#### **[-t, -threshold <integer>] - Threshold**

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

### **Examples**

```
cluster1::> volume reallocation measure -path /vol/vol2 -once
[Job 167] Job is queued: Reallocate Job.
```

Performs a one-time, measure-only reallocation scan on volume vol2.

### **Related Links**

- [volume reallocation show](#)

## **volume reallocation off**

Disable reallocate jobs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

Disables all reallocation jobs globally in a cluster. After you use this command, you cannot start or restart any reallocation jobs. All jobs that are executing when you use this command are stopped. You must use the `reallocate on` command to enable or restart reallocation jobs globally in a cluster.

NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Examples

```
cluster1::> volume reallocation off
```

Disables all reallocation jobs globally in a cluster.

## volume reallocation on

### Enable reallocate jobs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Globally enables all reallocation jobs in a cluster. You must globally enable reallocation scans in the cluster before you can run a scan or schedule regular scans. Reallocation scans are disabled by default.

NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Examples

```
cluster1::> volume reallocation on
```

Globally enables all reallocation jobs on a cluster.

## volume reallocation quiesce

### Quiesce reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [volume reallocation restart](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced state.

NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the file path of the LUN, NVMe namespace, file, or volume that you want to stop temporarily.

## Examples

```
cluster1::> volume reallocation quiesce /vol/vol2
2 entries were acted on.
```

Temporarily stops all reallocation jobs on volume vol2.

## Related Links

- [volume reallocation restart](#)

## volume reallocation restart

### Restart reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Starts a reallocation job. Use this command to start a quiesced (temporarily stopped) job or a scheduled scan that is idle.

### NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the file path of the LUN, NVMe namespace, file, or volume on which you want to restart reallocation scans.

**[-i, -ignore-checkpoint <true>] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

## Examples

```
cluster1::> volume reallocation restart /vol/vol2
2 entries were acted on.
```

Restarts two reallocation jobs on volume vol2.

## volume reallocation schedule

### Modify schedule of reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [volume reallocation start](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [volume reallocation start](#) command.

#### NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

#### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**[-d, -del <true>] - Delete**

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

**[-s, -cron <text>] - Cron Schedule**

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

- day of week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month

field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

## Examples

```
cluster1::> volume reallocation schedule -s "0 23 6 *" /vol/db/lun1
```

Schedules a reallocation job to run at 11 pm every Saturday on lun1.

## Related Links

- [volume reallocation start](#)

## volume reallocation show

Show reallocate job status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Displays the status of a reallocation scan, including the state, schedule, interval, optimization, and log files. If you do not specify the `path` for a particular reallocation scan, then the command displays all the reallocation scans.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-v ]**

Specify this parameter to display the output in a verbose format.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Specify this parameter to display reallocation scans that match the Vserver that you specify.

**[-path <text>] - Path**

Specify this parameter to display reallocation scans that match the path that you specify.

**[-t, -threshold <integer>] - Threshold**

Specify this parameter to display reallocation scans that match the threshold that you specify.

**[-id <integer>] - Job ID**

Specify this parameter to display reallocation scans that match the reallocation job ID that you specify.

### **[-description <text>] - Job Description**

Specify this parameter to display reallocation scans that match the text description that you specify.

### **[-state**

**{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State**

Specify this parameter to display reallocation jobs that match the state that you specify.

### **[-progress <text>] - Execution Progress**

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all of the jobs that are starting.

### **[-schedule <job\_schedule>] - Schedule Name**

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the [job schedule show](#) command.

### **[-global-status <text>] - Global State of Scans**

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

## **Examples**

```
cluster1::> volume reallocation show
Vserver      Description      Schedule      State
-----
Reallocation scans are on
vs0          /vol/vol2,space-optimized  reallocate_1d  Queued
```

Displays the Vserver, description, schedule, and state for the reallocation scans on the local node.

## **Related Links**

- [job schedule show](#)

## **volume reallocation start**

### **Start reallocate job**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

Begins a reallocation scan on a LUN, NVMe namespace, file, or volume when you specify the path. If a volume has several small files that would benefit from periodic optimization, specify the /vol/volname.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the LUN, NVMe namespace, file, or volume.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [volume reallocation schedule](#) command to schedule reallocation jobs.

NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**{ [-i, -interval <text>] - Interval Schedule**

Specifies the reallocation scan interval in

- m for minutes
- h for hours
- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

**| [-o, -once <true>] - Once**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

**| [-f, -force <true>] - Force }**

Performs a one-time full reallocation on a LUN, file, or volume when set to true. A forced reallocation rewrites blocks on a LUN, file, or volume unless the reallocation would result in worse performance. If you use this command without specifying this parameter, its effective value is false and a forced reallocation is not performed. If you specify this parameter without a value, it is set to true, and a forced reallocation is performed.

**{ [-p, -space-optimized <true>] - Space Optimized**

Specifies that snapshot blocks are not copied to save space when set to true. If you use this command without specifying this parameter, its effective value is false and snapshot blocks are copied. However, reads from snapshots might have a slightly higher latency. If you specify this parameter without a value, it is set to true and snapshot blocks are not copied. You cannot use the `space-optimized` option with the `unshare` option.

### | [-u, -unshare <true>] - Unshare Deduplicated Blocks }

Specifies that blocks that are shared by deduplication will be unshared. This option can help remove fragmentation caused on dense volumes. This may result in increased disk usage, especially for full reallocation. You cannot use the `unshare` option with the `space-optimized` option.

### { [-t, -threshold <integer>] - Threshold

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

### | [-n, -no-check <true>] - No Threshold Check }

Does not check the current layout to determine if a reallocation is needed when set to true. If you use this command without specifying this parameter, its effective value is false and the system does check the current layout to determine if a reallocation is needed. If you specify this parameter without a value, it is set to true and the system does not check the current layout to determine if a reallocation is needed.

## Examples

```
cluster1::> volume reallocation start -path /vol/vol2 -interval 30m  
[Job 165] Job is queued: Reallocate Job.
```

Starts a reallocation job on volume vol2 every 30 minutes.

## Related Links

- [volume reallocation schedule](#)

## volume reallocation stop

### Stop reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Stops and deletes any reallocation scans on a LUN, NVMe namespace, file, or volume. This command stops and deletes in-progress, scheduled, and quiesced scans.

### NOTE:

- This command is not supported for FlexGroup volumes or FlexGroup constituents.

## Parameters

### -vserver <vserver name> - Vserver

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**Examples**

```
cluster1::> volume reallocation stop /vol/vol2
1 entry was deleted.
```

Stops and deletes one reallocation scan on volume vol2.

## volume rebalance commands

**volume rebalance modify**

Modify the configuration for volume capacity rebalancing operations.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `volume rebalance modify` command modifies the configuration for volume capacity rebalancing operations on a FlexGroup volume in the specified Vserver. When a new capacity rebalancing operation is started on a FlexGroup volume, it will use the current configuration values. Once the operation is started, any changes to the configuration will not affect the currently running capacity rebalancing operation. Only future capacity rebalancing operations will use the new configuration values.

The `volume rebalance modify` command is only supported on FlexGroup volumes.

**Parameters****-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume whose capacity rebalancing configuration will be modified.

**-volume <volume name> - Volume Name**

Identifies the FlexGroup volume whose capacity rebalancing configuration will be modified.

**[-max-runtime <time\_interval>] - Maximum Runtime**

Specifies the maximum time a capacity rebalancing operation will run for.

**[-max-threshold <percent>] - Maximum Imbalance Threshold per Constituent**

Specifies the maximum imbalance percentage for constituents. When a constituent's imbalance percentage is larger than this value, files will be moved from the constituent. The default value is 20%.

**[-min-threshold <percent>] - Minimum Imbalance Threshold per Constituent**

Specifies the minimum imbalance percentage for constituents. When a constituent's imbalance percentage is smaller than this value, files will not be moved from the constituent. The default value is 5%.

### **[`-max-file-moves <integer>`] - Maximum Concurrent File Moves per Constituent**

Specifies the maximum number of concurrent file moves in a volume capacity rebalancing operation on a constituent of the FlexGroup volume. The default value is 25.

### **[`-min-file-size {<integer>[KB|MB|GB|TB|PB]}`] - Minimum File Size**

Specifies the minimum file size to consider for a volume capacity rebalancing operation. The value must be a multiple of 4KB. The default value is 100MB, and the minimum configurable value is 20MB. Setting the minimum file size to less than the default value leads to more files being moved. Moved files use granular data, which might impact read/write I/O performance.

### **[`-exclude-snapshots {true|false}`] - Exclude Files Stuck in Snapshot Copies**

Specifies whether files stuck in snapshots should be excluded in a volume capacity rebalancing operation. The default value is true.

### **[`-start-time <Date>`] - Scheduled start time**

Specifies the scheduled start time of the volume capacity rebalancing operation. The value must be a time later than 'now'.

## **Examples**

In this example, the volume capacity rebalancing configuration is modified for the FlexGroup volume "fg1" in vservers "vs0" with the maximum threshold being 30%, the minimum threshold being 10%, the maximum file moves being 35, and the minimum file size being 200MB.

```
cluster::volume rebalance*> modify -vservers vs0 -volume fg1 -max-threshold 30 -min-threshold 10 -max-file-moves 35 -min-file-size 200MB
```

In this example, a previously scheduled volume capacity rebalancing is rescheduled for a different time.

```
cluster::volume rebalance*> modify -vservers vs0 -volume fg1 -start-time 12/30/2022 22:59:59
```

## **volume rebalance show**

Display a list of volume capacity rebalancing operations on FlexGroup volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume rebalance show` command displays information about volume capacity rebalancing operations on FlexGroup volumes.

The `volume rebalance show` command is only supported on FlexGroup volumes and constituents. The command displays rebalancing information for volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Rebalancing state
- Total size
- Used size for calculating imbalance
- Size used by snapshots
- Target used size
- Imbalance size
- Imbalance percent

To display detailed rebalancing information about each FlexGroup volume or constituent, run the command with the `-instance` parameter. The detailed view provides the following information for FlexGroup volumes:

- Vserver name
- Volume name
- Is constituent
- Rebalance state
- Total size
- Used size for calculating imbalance
- Size used by snapshots
- Imbalance size
- Imbalance percentage
- Maximum constituent imbalance percentage
- Rebalance start time
- Rebalance stop time
- Rebalance runtime
- Rebalance maximum runtime
- Maximum imbalance threshold per constituent
- Minimum imbalance threshold per constituent
- Maximum files moved per constituent
- Minimum file size
- Exclude files stuck in snapshots
- Rebalance notice messages

The detailed view provides the following information for FlexGroup constituents:

- Vserver name
- Volume name
- Is constituent
- Rebalance state

- Total size
- Used size for calculating imbalance
- Size used by snapshots
- Constituent target used size
- Imbalance size
- Imbalance percentage
- Moved data size
- Rebalance start time
- Rebalance stop time
- Rebalance runtime
- Rebalance maximum runtime
- Rebalance maximum runtime
- Maximum imbalance threshold per constituent
- Minimum imbalance threshold per constituent
- Maximum files moved per constituent
- Minimum file size
- Exclude files stuck in snapshots

You can specify parameters from the above list to display information. For example, to display information only about currently running rebalancing operations, run the command with the `-state rebalancing` parameter

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-config ]**

If this parameter is specified, the command displays the following information:

- max-runtime
- max-threshold
- min-threshold
- max-file-moves
- min-file-size
- exclude-snapshots

**| [-time ]**

If this parameter is specified, the command displays the following information:

- start-time
- runtime

- max-runtime

**[`-instance` ] }**

If this parameter is specified, the command displays the additional detailed information described above.

**[`-vserver` <vserver name>] - Vserver Name**

Selects information about volume capacity rebalancing operations on FlexGroup volumes in the specified Vserver.

**[`-volume` <volume name>] - Volume Name**

Selects information about volume capacity rebalancing operations on the specified FlexGroup volume.

**[`-is-constituent` {`true`|`false`}] - Is Constituent**

If specified, the command displays information about volume capacity rebalancing operations on constituents.

**[`-state` {`idle`|`starting`|`rebalancing`|`rebalancing-source`|`rebalancing-dest`|`scanning`|`stopping`|`paused`|`not-running`|`unknown`|`scheduled`}] - Rebalance State**

Selects information about volume capacity rebalancing operations with the specified state. While a FlexGroup volume is rebalancing, every constituent will have a rebalancing engine that can either be scanning the filesystem for space usage and files to move, actively moving files or temporarily doing neither. If one or more constituents has a state of *rebalancing-source* or *rebalancing-dest*, then files are being moved to rebalance the FlexGroup. If no files are being moved, more information about what the rebalancing engine is doing for each constituent is available using the (privilege: advanced) `volume rebalance show -instance` command. The following values apply to FlexGroup volumes.

- *not-running* - Capacity rebalancing is not running on the volume. This will only change when the user explicitly starts rebalancing.
- *idle* - Capacity rebalancing is running, however, no active scanning or file movement is currently happening.
- *starting* - The capacity rebalancing operation is starting on the volume.
- *rebalancing* - Volume capacity rebalancing is running on the volume.
- *paused* - The capacity rebalancing operation is paused on the volume.
- *stopping* - The capacity rebalancing operation is stopping on the volume.
- *unknown* - The system was unable to determine the rebalancing state for the volume.

**[`-notices` <text>,...] - Rebalance Notice Messages**

Selects information about volume capacity rebalancing operations with the specified notice messages.

**[`-total` {<integer>[`KB`|`MB`|`GB`|`TB`|`PB`]}] - Total Size**

Selects information about volume capacity rebalancing operations with the specified total size.

**[`-used-for-imbalance` {<integer>[`KB`|`MB`|`GB`|`TB`|`PB`]}] - Used Size for Calculating Imbalance**

Selects information about volume capacity rebalancing operations with the specified used size for calculating imbalance. This is calculated by subtracting the size used by snapshots, the size of files pending deletion and the size used by filesystem metadata from the volume's used size.

**[`-size-used-by-snapshots` {<integer>[KB|MB|GB|TB|PB]}] - Volume Size Used by Snapshot Copies**

Selects information about volume capacity rebalancing operations with the specified volume size used by snapshots.

**[`-target-used` {<integer>[KB|MB|GB|TB|PB]}] - Constituent Target Used Size**

Selects information about volume capacity rebalancing operations with the specified target used size on a constituent. Represents the average used size among all constituents.

**[`-imbalance-size` {<integer>[KB|MB|GB|TB|PB]}] - Imbalance Size**

Selects information about volume capacity rebalancing operations with the specified imbalance size.

**[`-imbalance-percent` <percent\_no\_limit\_signed>] - Imbalance Percentage**

Selects information about volume capacity rebalancing operations with the specified imbalance percentage.

**[`-data-moved` {<integer>[KB|MB|GB|TB|PB]}] - Moved Data Size**

Selects information about volume capacity rebalancing operations with the specified moved data size.

**[`-max-constituent-imbalance-percent` <percent\_no\_limit>] - Maximum Constituent Imbalance Percentage**

Selects information about volume capacity rebalancing operations with the specified maximum constituent imbalance percentage. Represents the imbalance percentage of the constituent most out of balance.

**[`-start-time` <Date>] - Rebalance Start Time**

Selects information about volume capacity rebalancing operations with the specified start time.

**[`-stop-time` <Date>] - Rebalance Stop Time**

Selects information about volume capacity rebalancing operations with the specified stop time.

**[`-runtime` <time\_interval>] - Rebalance Runtime**

Selects information about volume capacity rebalancing operations with the specified run time.

**[`-max-runtime` <time\_interval>] - Rebalance Maximum Runtime**

Selects information about volume capacity rebalancing operations with the specified maximum run time. Represents the maximum amount of time a rebalancing operation can run for before stopping.

**[`-max-threshold` <percent>] - Maximum Imbalance Threshold per Constituent**

Selects information about volume capacity rebalancing operations with the specified maximum threshold. Represents the acceptable imbalance threshold beyond which rebalancing should be started on that constituent in the FlexGroup volume.

**[`-min-threshold` <percent>] - Minimum Imbalance Threshold per Constituent**

Selects information about volume capacity rebalancing operations with the specified minimum threshold. Represents the minimum imbalance threshold at which rebalancing is stopped for the constituent in the FlexGroup volume.

**[`-max-file-moves` <integer>] - Maximum Concurrent File Moves per Constituent**

Selects information about volume capacity rebalancing operations with the specified maximum concurrent file moves. Represents the maximum number of concurrent file moves allowed per constituent.

**[-min-file-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum File Size**

Selects information about volume capacity rebalancing operations with the specified minimum file size.  
Represents the minimum size of file to be considered for rebalancing a constituent in a FlexGroup volume.

**[-exclude-snapshots {true|false}] - Exclude Files Stuck in Snapshot Copies**

Selects information about volume capacity rebalancing operations with the specified excluding snapshot flag. Represents whether or not files that are in snapshots as candidates for rebalancing are ignored.

**Examples**

The following example displays rebalancing information about all FlexGroup volumes on Vserver "vs0":

```
cluster::> volume rebalance show -vserver vs0
Vserver: vs0
```

|                           |        |             | Projected |         |        |
|---------------------------|--------|-------------|-----------|---------|--------|
|                           |        |             |           | AFS     | Target |
| Imbalance                 | Volume | State       | Total     | Used    | Used   |
| Size                      | %      |             |           |         |        |
| -----                     |        |             |           |         |        |
| -----                     | -----  |             |           |         |        |
|                           | fg1    | rebalancing | 400MB     | 117.7MB | -      |
| 176KB                     | 0%     |             |           |         |        |
|                           | fg2    | not-running | 800MB     | 115.0MB | -      |
| 8KB                       | 0%     |             |           |         |        |
| 2 entries were displayed. |        |             |           |         |        |

The following example displays rebalancing information about all FlexGroup constituents on Vserver "vs0":

```
cluster::> volume rebalance show -vserver vs0 -is-constituent True
Vserver: vs0
```

|                           |           |             | Projected |         |         |
|---------------------------|-----------|-------------|-----------|---------|---------|
|                           |           |             |           | AFS     | Target  |
| Imbalance                 | Volume    | State       | Total     | Used    | Used    |
| Size                      | %         |             |           |         |         |
| -----                     | -----     | -----       | -----     | -----   | -----   |
|                           | fg1__0001 | idle        | 200MB     | 59.03MB | 58.86MB |
| 176KB                     | 0%        |             |           |         |         |
|                           | fg1__0002 | idle        | 200MB     | 58.69MB | 58.86MB |
| -172KB                    | 0%        |             |           |         |         |
|                           | fg2__0001 | not-running | 200MB     | 28.77MB | 28.76MB |
| 4KB                       | 0%        |             |           |         |         |
|                           | fg2__0002 | not-running | 200MB     | 28.76MB | 28.76MB |
| -4KB                      | 0%        |             |           |         |         |
|                           | fg2__0003 | not-running | 200MB     | 28.77MB | 28.76MB |
| 4KB                       | 0%        |             |           |         |         |
|                           | fg2__0004 | not-running | 200MB     | 28.76MB | 28.76MB |
| -4KB                      | 0%        |             |           |         |         |
| 6 entries were displayed. |           |             |           |         |         |

The following example displays detailed rebalancing information about a specific FlexGroup volume "fg1" on Vserver "vs0":

```

cluster::> volume rebalance show -vserver vs0 -volume fg1 -instance
Vserver Name: vs0
                                Volume Name: fg1
                                Is Constituent: false
                                Rebalance State: not-running
                                Rebalance Notice Messages: -
                                    Total Size: 400MB
                                Projected AFS Used Size: 117.7MB
                                Volume Size Used by Snapshot Copies: 10.57MB
                                Constituent Target Used Size: -
                                    Imbalance Size: 176KB
                                    Imbalance Percentage: 0%
                                    Moved Data Size: -
                                Maximum Constituent Imbalance Percentage: 0%
                                Rebalance Start Time: Fri Mar 25 17:26:09
2022
                                Rebalance Stop Time: Fri Mar 25 17:29:29
2022
                                Rebalance Runtime: 0h3m20s
                                Rebalance Maximum Runtime: 0h3m20s
                                Maximum Imbalance Threshold per Constituent: 20%
                                Minimum Imbalance Threshold per Constituent: 5%
                                Maximum Concurrent File Moves per Constituent: 25
                                    Minimum File Size: 4KB
                                Exclude Files Stuck in Snapshot Copies: true

```

The following example displays detailed rebalancing information about a specific FlexGroup constituent "fg1\_\_0001" on Vserver "vs0":

```

cluster::> volume rebalance show -vserver vs0 -volume fgl__0001 -instance
-is-constituent True
Vserver Name: vs0
                                Volume Name: fgl__0001
                                Is Constituent: true
                                Rebalance State: not-running
                                Rebalance Notice Messages: -
                                Total Size: 200MB
                                Projected AFS Used Size: 59.04MB
                                Volume Size Used by Snapshot Copies: 5.46MB
                                Constituent Target Used Size: 58.86MB
                                Imbalance Size: 176KB
                                Imbalance Percentage: 0%
                                Moved Data Size: 0B

                                Minimum Imbalance Threshold per Constituent: 5%
                                Maximum Concurrent File Moves per Constituent: 25
                                Minimum File Size: 4KB
                                Exclude Files Stuck in Snapshot Copies: true

```

## volume rebalance start

Start a volume capacity rebalancing operation on a FlexGroup volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume rebalance start` command starts a volume capacity rebalancing operation on a FlexGroup volume in the specified Vserver. Only one volume capacity rebalancing operation is supported per FlexGroup volume at a time. Running capacity rebalancing operations on multiple FlexGroup volumes at the same time is supported.

The `volume rebalance start` command is only supported on FlexGroup volumes. If granular data is not already enabled on the volume, it will automatically be set to *basic* when this command is run.

### Parameters

**-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume whose capacity will be rebalanced.

**-volume <volume name> - Volume Name**

Identifies the FlexGroup volume whose capacity will be rebalanced.

**[-max-runtime <time\_interval>] - Maximum Runtime**

Specifies the maximum time a capacity rebalancing operation will run for. The default value is 6 hours.

**[-max-threshold <percent>] - Maximum Imbalance Threshold per Constituent**

Specifies the maximum imbalance percentage for constituents. When a constituent's imbalance percentage is larger than this value, files will be moved from the constituent. The default value is 20%.

**[-min-threshold <percent>] - Minimum Imbalance Threshold per Constituent**

Specifies the minimum imbalance percentage for constituents. When a constituent's imbalance percentage is smaller than this value, files will not be moved from the constituent. The default value is 5%.

**[-max-file-moves <integer>] - Maximum Concurrent File Moves per Constituent**

Specifies the maximum number of concurrent file moves in a volume capacity rebalancing operation on a constituent of the FlexGroup volume. The default value is 25.

**[-min-file-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum File Size**

Specifies the minimum file size to consider for a volume capacity rebalancing operation. The value must be a multiple of 4KB. The default value is 100MB, and the minimum configurable value is 20MB. Setting the minimum file size to less than the default value leads to more files being moved. Moved files use granular data, which might impact read/write I/O performance.

**[-exclude-snapshots {true|false}] - Exclude Files Stuck in Snapshot Copies**

Specifies whether files stuck in snapshots should be excluded in a volume capacity rebalancing operation. The default value is true.

**[-start-time <Date>] - Scheduled start time, e.g. 12/31/2022 23:59:59**

Specifies the scheduled start time of the volume capacity rebalancing operation. The value must be a time later than 'now'.

## Examples

In this example, a volume capacity rebalancing operation is started for the FlexGroup volume "fg1" in vserver "vs0" with the maximum run time being 72000 seconds or 20 hours starting at 23:59:59 on 12/31/2022.

```
cluster::volume rebalance*> start -vserver vs0 -volume fg1 -max-runtime
72000 -start-time 12/31/2022 23:59:59
```

## volume rebalance stop

Stop a volume capacity rebalancing operation on a FlexGroup volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume rebalance stop` command stops a volume capacity rebalancing operation on a FlexGroup volume in the specified Vserver.

The `volume rebalance stop` command is only supported on FlexGroup volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume whose capacity rebalancing operation will be stopped.

### **-volume <volume name> - Volume Name**

Identifies the FlexGroup volume whose capacity rebalancing operation will be stopped.

## Examples

In this example, a volume capacity rebalancing operation is stopped for the FlexGroup volume "fg1" in vs0.

```
cluster::volume rebalance rebalance*> stop -vserver vs0 -volume fg1
```

## volume rebalance file-move abort

Abort a file-move operation that is in progress

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume rebalance file-move abort` command aborts a file-move operation that has been started and is in progress.

A file-move operation goes through different stages as part of the move operation. During the cutover stage of the file-move operation, the actual file is created at the destination FlexGroup constituent, after which the data blocks are transferred. Once the file is created at the destination FlexGroup constituent, the file is visible in the namespace of the FlexGroup volume. If the file-move operation has entered the cutover stage, it cannot be aborted.

The `volume rebalance file-move abort` command is only supported on FlexGroup volumes. For a given FlexGroup volume, there can be many file-move operations that are currently in progress for different sets of constituents. The parameters for this command provide a way to identify a particular file-move operation within a FlexGroup volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume involved in the file-move operation.

**-volume <volume name> - Volume Name**

Identifies the FlexGroup volume that is hosting the file being moved in the file-move operation.

**-path <text> - Path**

Identifies the path to the file being moved within the FlexGroup volume.

**-destination-constituent <volume name> - Destination Constituent Volume**

Identifies the destination constituent name of the FlexGroup volume where the file is being moved.

**[-operation-uuid <UUID>] - Operation UUID**

If specified, this parameter identifies the UUID of the file-move operation. Use the [volume rebalance file-move show](#) command to obtain the UUID for a file-move operation.

## Examples

The following example aborts a file-move operation for the file `"/system/build/image.tgz"` within the FlexGroup volume `"bld_volume"`:

```
cluster1::*> volume rebalance file-move abort -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005

File-move operation cancelled.
```

The following example aborts the file-move operation in progress for the file `"/system/build/image.tgz"` within the FlexGroup `"bld_volume"`. The UUID of the file-move operation is also provided:

```
cluster1::*> volume rebalance file-move abort -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005 -operation-uuid f8d780b4-32fc-4053-be5e-2f6edc0a652b

File-move operation cancelled.
```

The following example attempts to abort the file-move operation for the file `"/system/build/image.tgz"` within the FlexGroup volume `"bld_volume"`. However, the file-move operation could not be aborted as it is past the cutover stage of the operation. A file-move operation can only be aborted if it has not entered the cutover stage:

```
cluster1::*> volume rebalance file-move abort -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005

Error: command failed: The file move abort operation failed. Reason:
Cannot
    destroy file operation. File move operation has completed the
cutover
    phase.
```

## volume rebalance file-move modify

### Modify a file-move operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume rebalance file-move modify` command modifies certain attributes of a file-move operation that is currently in progress. Specifically, the maximum throughput allowed on a particular file-move operation can be modified, and the data transfer of a file-move operation can be paused or resumed.

The `volume rebalance file-move modify` command is only supported on FlexGroup volumes. For a given FlexGroup volume, there can be many file-move operations that are currently in progress for different sets of constituents. The parameters for this command provide a way to identify a particular file-move operation within a FlexGroup volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume involved in the file-move operation.

**-volume <volume name> - Volume Name**

Identifies the FlexGroup volume that is hosting the file being moved in the file-move operation.

**-path <text> - Path**

Identifies the path to the file being moved within the FlexGroup volume. This parameter can be specified with the `-destination-constituent` parameter to identify a particular file-move operation within a FlexGroup volume.

**-destination-constituent <volume name> - Destination Constituent Volume**

Identifies the destination constituent name of the FlexGroup volume where the file is being moved. This parameter can be specified with the `-path` parameter to identify a particular file-move operation within a FlexGroup volume.

### **[`-operation-uuid <UUID>`] - Operation UUID**

Identifies the UUID of the file-move operation. Use the [volume rebalance file-move show](#) command to obtain the UUID for a file-move operation. This parameter can be specified in addition to the `-path` and `-destination-constituent` parameters to identify a particular file-move operation if there are multiple ongoing operations involving the same path and destination constituent.

### **[`-max-throughput {<integer>[KB|MB|GB|TB|PB]}`] - Maximum Scanner Speed**

If specified, this parameter will modify the rate limit for the data transfer in bytes per second. A non-zero value less than 1 MB/s will be set to 1 MB/s. A non-zero value greater than 1 MB/s will be truncated to the nearest integral megabyte value. A value of "0" specifies that no range will be set for the data transfer. This value does not represent a throughput the system will guarantee, but a limit that cannot be exceeded.

### **[`-scanner-paused {true|false}`] - Scanner Paused**

If specified, the data transfer of the file-move operation will be paused or resumed. Using a value of *false* will pause the data transfer while using a value of *true* will resume the data transfer.

## **Examples**

The following example modifies the maximum throughput of the ongoing file-move operation for the file `/system/build/image.tgz` within the FlexGroup volume `"bld_volume"`. `-path` and `-destination-constituent` are used to identify the particular file-move operation:

```
cluster1::*> volume rebalance file-move modify -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005 -max-throughput 2MB
```

The following example pauses the data transfer of the ongoing file-move operation for the file `/system/build/image.tgz` within the FlexGroup volume `"bld_volume"`. This stops any further data from being transferred from the source volume to the destination volume:

```
cluster1::*> volume rebalance file-move modify -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005 -scanner-paused true
```

The following example resumes the data transfer of a paused file-move operation for the file `/system/build/image.tgz` within the FlexGroup volume `"bld_volume"`. `-path` and `-destination-constituent` are used to identify the particular file-move operation:

```
cluster1::*> volume rebalance file-move modify -vserver vs0 -volume
bld_volume -path /system/build/image.tgz -destination-constituent
bld_volume__0005 -scanner-paused false
```

## volume rebalance file-move show

Display a list of files being moved

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume rebalance file-move show` command displays a list of files being moved between the FlexGroup Constituents.

The `volume rebalance file-move show` command is only supported on FlexGroup volumes. The command displays information about each ongoing file-move operation, as well as any file-move operations that have completed, failed or have been cancelled within the last two minutes. For all file-move operations matching the specified parameters, the command displays the following information:

- Vserver name
- Volume name
- File Path
- Source Constituent Volume
- Destination Constituent Volume
- Current status of the file-move operation ("Preparing", "Data-Transfer", "Paused", "Complete", "Failed" or "Terminated-Manual")
- Percentage of total data bytes transferred to the destination

To display detailed information about each file-move operation, run the command with the `-instance` parameter. The detailed view provides the following information:

- Vserver Name
- Volume Name
- Destination Constituent Volume
- Source Constituent Volume
- Destination Constituent Node
- Source Constituent Node
- Operation Status: Current status of the file-move operation ("Preparing", "Data-Transfer", "Paused", "Complete", "Failed" or "Terminated-Manual")
- Scanner Progress Percentage
- Operation UUID: UUID of the overall file-move operation
- Source Operation UUID: UUID used to identify the file-move operation on the source constituent
- File Path: Path of the file being moved
- Source Constituent Master Data Set ID
- Source Constituent Data Set ID
- Source File ID: ID of the inode on the source constituent
- Source Generation: Generation number of the inode on the source constituent

- Destination File ID: ID of the inode on the destination constituent
- Destination Data Set ID
- Destination Master Data Set ID
- Destination Generation: Generation number of the inode on the destination constituent
- Maximum Scanner Speed (per sec): Maximum throughput of the data scanner
- Scanner Paused: Displays information if the underlying data transfer scanner is paused
- Scanner Status: The current stage of the underlying data transfer scanner ("Preparing", "Allocation-Map", "Data", "Destroying", "Paused-Manual", "Paused-Error", "Complete", "Terminated-Manual" or "Destroyed")
- Scanner Progress: Number of bytes transferred
- Scanner Total: Total number of bytes to be transferred
- Data Scanner Priority: Priority of the data scanner assigned to the file-move operation (high or low)
- Elapsed Time
- Cutover Time: Time elapsed during the cutover stage of the file-move operation, in seconds
- Is Snapshot Fenced: Whether snapshots are fenced for the file-move operation
- Is Destination Ready: Whether the destination volume is ready for the file-move operation
- Last Failure Time
- Last Failure Reason

You can specify parameters from the above list to display information. For example, to display information only about paused operations, run the command with the `-status Paused` parameter.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If this parameter is specified, the command displays the additional detailed information described above.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If this parameter and the `-volume` parameter are specified, the command displays the file-move operations on the specified volume. If this parameter is specified by itself, the command displays the file-move operations on all volumes on the specified Vserver.

**`[-volume <volume name>] - Volume Name (privilege: advanced)`**

If this parameter and the `-vserver` parameter are specified, the command displays the file-move operations on the specified volume. If this parameter is specified by itself, the command displays the file-move operations on all volumes matching the specified name.

**`[-destination-constituent <volume name>] - Destination Constituent Volume (privilege: advanced)`**

If this parameter is specified, the command displays only the file-move operations with the specified destination FlexGroup constituent name.

**[`-operation-uuid <UUID>`] - Operation UUID (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operation with the specified operation UUID.

**[`-destination-node <nodename>`] - Destination Constituent Node (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations for files being moved to the specified destination node.

**[`-destination-dsid <integer>`] - Destination Constituent DSID (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified destination volume data set ID.

**[`-source-constituent <volume name>`] - Source Constituent Volume (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified source FlexGroup constituent name.

**[`-source-operation-uuid <UUID>`] - Source Operation UUID (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operation with the specified internal source job operation UUID.

**[`-source-node <nodename>`] - Source Constituent Node (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations for files being moved from the specified source node.

**[`-source-dsid <integer>`] - Source Constituent DSID (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified source volume data set ID.

**[`-status {Preparing|Data-Transfer|Paused|Complete|Failed|Manually-Terminated}`] - Operation Status (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified status ("Preparing", "Data-Transfer", "Paused", "Complete", "Failed" or "Terminated-Manual").

**[`-scanner-percent <percent>`] - Scanner Progress Percentage (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations that have transferred the specified percentage of total bytes.

**[`-last-failure-reason <text>`] - Last Failure Reason (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations whose last failure reason matches the specified string.

**[`-path <text>`] - File Path (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations for files that match the specified path.

**[`-destination-msid <integer>`] - Destination Constituent MSID (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified destination volume master data set ID.

**[-destination-fileid <integer>] - Destination Fileid (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations pertaining to files with the specified file ID on the destination constituent.

**[-destination-generation <integer>] - Destination Generation (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations pertaining to files with the specified generation number on the destination constituent.

**[-source-msid <integer>] - Source Constituent MSID (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified source volume master data set ID.

**[-source-fileid <integer>] - Source Fileid (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations pertaining to files with the specified file ID on the source constituent.

**[-source-generation <integer>] - Source Generation (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations pertaining to files with the specified generation number on the source constituent.

**[-max-throughput {<integer>[KB|MB|GB|TB|PB]}] - Maximum Scanner Speed (per sec) (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations that use the specified value as the maximum scanner speed (in MB/s). This value does not represent a throughput the system will guarantee, but a limit that cannot be exceeded.

**[-scanner-paused {true|false}] - Scanner Paused (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations that are paused (true) or unpaused (false).

**[-scanner-status {Preparing|Allocation-Map|Data|Destroying|Paused-Manual|Paused-Error|Complete|Destroyed|Terminated-Manual}] - Scanner Status (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations in the specified scanner stage ("Preparing", "Allocation-Map", "Data", "Destroying", "Paused-Manual", "Paused-Error", "Complete", "Terminated-Manual" or "Destroyed")

**[-scanner-progress {<integer>[KB|MB|GB|TB|PB]}] - Scanner Progress (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations that have transferred the specified number of bytes.

**[-scanner-total {<integer>[KB|MB|GB|TB|PB]}] - Scanner Total (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations with the specified total transfer size in bytes.

**[-data-scanner-priority {high|low}] - Data Scanner Priority (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operations that give the data scanner high priority (high) or low priority (low).

**[-elapsed-time <time\_interval>] - Elapsed Time (privilege: advanced)**

If this parameter is specified, the command displays only file-move operations that have a matching

elapsed-time interval. Specify an elapsed-time range by using the ".." operator between two values. For example, the following command displays file-move operations with elapsed-time between 2 hours and 3 hours 30 minutes:

```
volume rebalance file-move show -elapsed-time 2h..3h30m
```

+

Specify a comparative elapsed-time value using the ">" and "<" operators. For example, the following command displays the file-move operations with an elapsed-time greater than 5 hours and 30 minutes:

```
volume rebalance file-move show -elapsed-time >5h30m
```

**[*-cutover-time* <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Cutover Time (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operations with the specified cutover time.

**[*-is-snapshot-fenced* {true|false}] - Is Snapshot Fenced (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operations with snapshots fenced (true) or unfenced (false).

**[*-is-destination-ready* {true|false}] - Is Destination Ready (privilege: advanced)**

If this parameter is specified, the command displays only the file-move operations for which the destination volume is ready (true) or not ready (false).

**[*-last-failure-time* <MM/DD/YYYY HH:MM:SS>] - Last Failure Time (privilege: advanced)**

If this parameter is specified, the command displays file-move operations that have a matching last-failure-time value. Use the format: "MM/DD/YYYY HH:MM:SS". Specify a time range by using the ".." operator between two time statements. For example, the following command displays file-move operations with a last-failure-time value between "08/13/2014 05:55:00" and "08/13/2014 06:10:00":

```
volume rebalance file-move show -last-failure-time "08/13/2021  
05:55:00".. "08/13/2021 06:10:00"
```

+

Specify a comparative last-failure-time value using the ">" and "<" operators. For example, the following command displays file-move operations with a last-failure-time value after "8/27/2021 14:58:00":

```
volume rebalance file-move show -last-failure-time >"8/27/2021 14:58:00"
```

## Examples

The following example displays information about all file-move operations on the Vserver named "vs1":

```

cluster1::volume rebalance file-move*> show -vserver vs1
Vserver: vs1
Volume: fg1
Path          Source          Destination    Status
Progress
-----
-----
/d1/d2/foo    fg1__0002    fg1__0003    Paused
0%
/d1/d2/bar    fg1__0002    fg1__0004    Completed
100%

Vserver: vs1
Volume: bld_volume
Path          Source          Destination    Status
Progress
-----
-----
/system/build/image.tgz  bld_volume__0001
                        bld_volume__0005
                        Data-Transfer
50%
3 entries were displayed.

```

The following example displays detailed information about a specific file-move operation on Vserver vs0:

```

cluster1::volume rebalance file-move*> show -instance -vserver vs0 -volume
fg -path /test
(volume rebalance file-move show)
Vserver Name: vs0
      Volume Name: fg
Destination Constituent Volume: fg__0001
      Operation UUID: 283a983e-c06a-42bc-8bd7-8830211cb2a9
Destination Constituent Node: sti96-vsimeucs539i
Destination Constituent DSID: 1635
      Source Constituent Volume: fg__0004
      Source Operation UUID: 283a983e-c06a-42bc-8bd7-8830211cb2a9
      Source Constituent Node: sti96-vsimeucs539j
      Source Constituent DSID: 1638
      Operation Status: Paused
Scanner Progress Percentage: 0%
      Last Failure Reason: -
      File Path: /test
Destination Constituent MSID: 2154447497
      Destination Fileid: 97
      Destination Generation: 247243720
      Source Constituent MSID: 2154447500
      Source Fileid: 504
      Source Generation: 214935427
Maximum Scanner Speed (per sec): 1MB
      Scanner Paused: true
      Scanner Status: Paused-Manual
      Scanner Progress: 0B

## volume rebalance file-move start

Moves a file from one FlexGroup constituent to another

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume rebalance file-move start` command initiates a retroactive file movement for a file residing in a FlexGroup volume in the given Vserver. You must provide the path to the file to be moved. Additional parameters may be used to control certain properties of the move operation. The parent directory's

mtime may be modified by this command which may impact analytics mtime histogram. This command only takes NFS filenames and only UTF-8 encoding is supported.

The `volume rebalance file-move start` command is only supported on FlexGroup volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Identifies the Vserver that contains the FlexGroup volume involved in this operation.

### **-volume <volume name> - Volume Name**

Identifies the FlexGroup volume that is hosting the file being moved in this operation.

### **-path <text> - Path**

Path to the file being moved within this FlexGroup volume.

### **[-destination-constituent <volume name>] - Destination Constituent Volume**

Identifies the destination constituent name of the FlexGroup volume where the file is being moved to. The constituent must be a member of the same FlexGroup volume as the source constituent.

### **[-max-throughput {<integer>[KB|MB|GB|TB|PB] }] - Maximum Scanner Speed**

Specifies the range of the data transfer in bytes per second. A non-zero value less than 1 MB/s will be set to 1 MB/s. A non-zero value greater than 1 MB/s will be truncated to the nearest integral megabyte value. If unspecified, the default value is "0" which means no range will be set for the data transfer. This value does not represent a throughput the system will guarantee, but a limit that cannot be exceeded.

### **[-scanner-paused {true|false}] - Scanner Paused**

Specifies that the data scanner should not be started immediately when the move operations starts. If unspecified, the default value is "false". Use the [volume rebalance file-move modify](#) command to start the data scanner.

### **[-force <true>] - Force**

If this parameter is specified, the file move operation will break the existing lock state on the file and proceed. This may cause a disruption for some client applications.

### **[-is-disruptive {true|false}] - Is Disruptive**

Specifies whether the file move operation should be disruptive. The default value is "false".

## Examples

In this example, a file-move operation is started for the file `/d1/d2/foo` within the FlexGroup volume `"fg1"` in vserver `"vs0"`. The path is relative to the root directory of this FlexGroup volume, not the global namespace path of the file. In this example, the file is being moved to the destination constituent identified by the name `"fg1__0003"`.

```
cluster::volume rebalance file-move*> start -vserver vs0 -volume fg1 -path
/d1/d2/foo -destination-constituent fg1__0003
File move started with operation-uuid f8d780b4-32fc-4053-be5e-2f6edc0a652b
```

volume rebalance file-move statistics reset

Reset statistics for file-move operations between FlexGroup constituents

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `volume rebalance file-move statistics reset` command resets completed statistics for the file-move operations.

The `volume rebalance file-move statistics reset` command is only supported on FlexGroup volumes.

Parameters

**-vserver <vserver name> - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command resets statistics for the FlexGroup constituents on the specified volume. If this parameter is specified by itself, the command resets statistics for the FlexGroup constituents on all volumes on the specified Vserver.

**-volume <volume name> - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command resets statistics for the FlexGroup constituents on the specified volume. If this parameter is specified by itself, the command resets statistics for the FlexGroup constituents on all volumes matching the specified name.

Examples

The following example resets completed statistics for all FlexGroup constituents on the FlexGroup volume "bld\_volume" in Vserver "vs0":

```
cluster1::*> volume rebalance file-move statistics show -vserver vs0

## volume rebalance file-move statistics show

Display statistics for file-move operations across FlexGroup Constituents

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume rebalance file-move statistics show` command displays common statistics for the file-move operations at a FlexGroup constituent level.

The `volume rebalance file-move statistics show` command is only supported on FlexGroup volumes. For all FlexGroup constituents matching the specified parameters, the command displays the following information:

- Vserver name
- Volume name
- Constituent name
- Source Files In-Progress: Number of files currently being moved from the FlexGroup constituent
- Source Files Completed: Number of files already moved from the FlexGroup constituent
- Source Bytes In-Progress: Total number of bytes of all the files currently being moved from the FlexGroup constituent
- Source Bytes Completed: Total number of bytes of all the files already moved from the FlexGroup constituent
- Destination Files In-Progress: Number of files currently being moved to the FlexGroup constituent
- Destination Files Completed: Number of files already moved to the FlexGroup constituent
- Destination Bytes In-Progress: Total number of bytes of all the files currently being moved to the FlexGroup constituent
- Destination Bytes Completed: Total number of bytes of all the files already moved to the FlexGroup constituent

You can specify parameters from the above list to display information. For example, to display statistics only for FlexGroup constituents with more than one file currently being moved from them, run the command with the `-source-files-inprogress >1` parameter.

### Parameters

**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-vserver <vserver name>`] - Vserver (privilege: advanced)**

If this parameter and the `-volume` parameter are specified, the command displays statistics for the FlexGroup constituents on the specified volume. If this parameter is specified by itself, the command displays statistics for the FlexGroup constituents on all volumes on the specified Vserver.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

If this parameter and the `-vserver` parameter are specified, the command displays statistics for the FlexGroup constituents on the specified volume. If this parameter is specified by itself, the command displays statistics for the FlexGroup constituents on all volumes matching the specified name.

**[`-constituent <volume name>`] - Constituent Name (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents matching the specified name.

**[`-source-files-inprogress <integer>`] - Source Files In Progress (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of files currently being moved from them.

**[`-source-files-completed <integer>`] - Source Files Completed (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of files already moved from them.

**[`-source-bytes-inprogress {<integer>[KB|MB|GB|TB|PB]}`] - Source Bytes in Progress (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of bytes currently being moved from them (across all files currently being moved from them).

**[`-source-bytes-completed {<integer>[KB|MB|GB|TB|PB]}`] - Source Bytes Completed (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of bytes already moved from them (across all files already moved from them).

**[`-destination-files-inprogress <integer>`] - Destination Files In Progress (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of files currently being moved to them.

**[`-destination-files-completed <integer>`] - Destination Files Completed (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of files already moved to them.

**[`-destination-bytes-inprogress {<integer>[KB|MB|GB|TB|PB]}`] - Destination Bytes In Progress (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of bytes currently being moved to them (across all files currently being moved to them).

**[`-destination-bytes-completed {<integer>[KB|MB|GB|TB|PB]}`] - Destination Bytes Completed (privilege: advanced)**

If this parameter is specified, the command displays statistics only for FlexGroup constituents which have the specified number of bytes already moved to them (across all files already moved to them).

## Examples

The following example displays statistics for all FlexGroup constituents on the FlexGroup volume "bld\_volume"

in Vserver "vs0":

```
cluster1::*> volume rebalance file-move statistics show -vserver vs0
-volume bld_volume

Vserver: vs0
Volume: bld_volume

Constituent          Source          Destination
Bytes               Files          Bytes          Files
-----
bld_volume__0001
    In Progress:      1             10GB           0

```

## volume recovery-queue commands

### volume recovery-queue modify

Modify attributes of volumes in the recovery queue

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `volume recovery-queue modify` command modifies the retention period of a volume in the recovery queue.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume that is to be modified.

**[-retention-hours <integer>] - Volume Delete Retention (privilege: advanced)**

This specifies the time in hours that the volume will be available in the recovery queue for recovery. For example, a value of "10" means that the volume will be retained in the recovery queue for at least 10 hours. The maximum allowed Volume retention-hours is 4294967295 hours.

## Examples

The following example modifies a volume named vol1\_1234 on a Vserver named vs1 in the recovery queue.

```
cluster1::*> volume recovery-queue modify -vserver vs1 -volume vol1_1234  
-retention-hours 10
```

## volume recovery-queue purge-all

Purge all volumes from the recovery queue belonging to a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume recovery-queue purge-all` command purges all volumes from the recovery queue belonging to a Vserver.

## Parameters

**-vserver <vserver name> - Vserver name (privilege: advanced)**

This specifies the Vserver whose volumes in the recovery queue need to be purged.

## Examples

The following example purges all volumes on a Vserver named vs1 from the recovery queue.

```
cluster1::*> volume recovery-queue purge-all -vserver vs1
```

## volume recovery-queue purge

Purge volumes from the recovery queue belonging to a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume recovery-queue purge` command purges a volume from the recovery queue belonging to a Vserver.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume that is to be purged from the recovery queue.

## Examples

The following example purges a volume named `vol1_1234` on a Vserver named `vs1` from the recovery queue.

```
cluster1::*> volume recovery-queue purge -vserver vs1 -volume vol1_1234
```

## volume recovery-queue recover-all

Recover all volumes from the recovery queue belonging to a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume recovery-queue recover-all` command recovers all the volumes from the recovery-queue belonging to a Vserver.

NOTE:

- This command will restore volumes with their previous access types and volumes will remain offline. This command will not restore the volumes with their previous name, junction, LUN mappings, NVMe namespace mappings, quota policy rules and snapshot schedules.

## Parameters

**-vserver <vserver name> - Vserver name (privilege: advanced)**

This specifies the Vserver for which the volumes need to be recovered.

## Examples

The following example recovers all volumes on a Vserver named `vs1` from the recovery queue.

```
cluster1::*> volume recovery-queue recover-all -vserver vs1
```

## volume recovery-queue recover

Recover volumes from the recovery queue belonging to a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume recovery-queue recover` command recovers a volume from the recovery queue belonging to a Vserver.

NOTE:

- This command will restore the volume with its previous access type and the volume will remain offline. This command will not restore the volume with its previous name, junction, LUN mappings, NVMe namespace mappings, quota policy rules and snapshot schedules.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume that is to be recovered.

### Examples

The following example recovers a volume named `vol1_1234` on a Vserver named `vs1` from the recovery queue.

```
cluster1::*> volume recovery-queue recover -vserver vs1 -volume vol1_1234
```

## volume recovery-queue show

Show volumes in the recovery queue

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume recovery-queue show` command displays information about volumes in the recovery queue. The command output depends on the parameter(s) specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Deletion Request Time
- Retention Hours

To display information about a single volume, run the command with the `-vserver` and `-volume` parameters.

To display detailed information about all volumes, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with retention hours 10, run the command with the `-retention-hours 10` parameter.

## Parameters

**`[-fields <fieldname>,...]`**

This specifies the fields that need to be displayed. The fields `Vserver` and `Volume` are the default fields.

**`[-instance ] (privilege: advanced) }`**

If this parameter is specified, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver Name (privilege: advanced)`**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**`[-volume <volume name>] - Volume Name (privilege: advanced)`**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**`[-delete-time <Date>] - Deletion Request Time (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified delete time.

**`[-retention-hours <integer>] - Volume Delete Retention (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified retention hours.

**`[-instance-uuid <UUID>] - Volume Instance UUID (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified instance uuid.

## Examples

The following example displays information about all volumes on a Vserver named `vs1` in the recovery queue:

```
cluster1::*> volume recovery-queue show -vserver vs1
Vserver    Volume          Deletion Request Time  Retention Hours
-----
vs1        vol1_1234       Wed Aug 22 06:50:19 2012      10
vs1        vol2_1235       Wed Aug 22 06:50:26 2012      12
2 entries were displayed.
```

The following example displays detailed information about a volume named `vol1_1234` on a Vserver named `vs1` in the recovery queue:

```
cluster1::*> volume recovery-queue show -vserver vs1 -volume vol1_1234
Vserver Name: vs1
      Volume Name: vol1_1234
      Deletion Request Time: Wed Aug 22 06:50:19 2012
      Volume Delete Retention: 10
```

## volume schedule-style commands

### volume schedule-style prepare-to-downgrade

Disables volume schedule style feature and sets schedule style to default (create-time)

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

This command will disable the volume schedule style feature and set schedule style to default (create-time).

#### Examples

The following example prepares the schedule-style on all volumes for revert/downgrade.

```
cluster1::*> volume schedule-style prepare-to-downgrade
```

## volume snaplock commands

### volume snaplock modify

Modify SnapLock attributes of a SnapLock volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

```
The ` volume snaplock modify ` command modifies one or more SnapLock
attributes of a SnapLock volume.
```

#### Parameters

**-vserver <vserver name> - Vserver**

This specifies the vservers which owns the required SnapLock volume.

**-volume <volume name> - Volume**

This specifies the SnapLock volume whose attribute needs to be modified.

**`[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Minimum Retention Period`**

Specifies the minimum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period shorter than this minimum value, is assigned this minimum value.

If this option value is *infinite*, then every file committed to the volume will have a retention period that never expires.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

**`[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite | unspecified}] - Default Retention Period`**

Specifies the default retention period that is applied to files while committing to WORM state without an associated retention period.

If this option value is *min*, then minimum-retention-period is used as the default retention period. If this option value is *max*, then maximum-retention-period is used as the default retention period. If this option value is *infinite*, then a retention period that never expires will be used as the default retention period. If this option value is *unspecified*, then the file will be retained forever; however, the retention time can be changed to an absolute value.

The retention period can also be explicitly specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum valid retention period is 70 years.

**`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period`**

Specifies the maximum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period longer than this maximum value, is assigned this maximum value.

If this option value is *infinite*, then files that have retention period that never expires might be committed to the volume.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

**`[-autocommit-period {{<integer> minutes|hours|days|months|years} | none}] - Autocommit Period`**

Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater the autocommit period of the volume are committed to WORM state.

The autocommit period option is specified as a number followed by a suffix. The valid suffixes for autocommit period are hours, minutes, days, months and years. For example, a value of 2hours represents an autocommit period of 2 hours. The minimum allowed autocommit period is 5 minutes and the maximum allowed autocommit period is 10 years.

If this option value is *none*, then autocommit is disabled on the SnapLock volume.

### **`[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled`**

Specifies if the volume append mode is enabled or disabled.

It can be modified only when the volume is not mounted and does not have any data or snapshots.

The volume append mode is not supported on SnapLock audit log volumes.

When it is enabled, all the files created with write permissions on the volume are WORM appendable files by default. All the WORM appendable files that are not modified for a period greater than the autocommit period of the volume are also committed to the WORM read-only state.

If it is set to *true* , then the volume append mode is enabled.

If it is set to *false* , then the volume append mode is disabled.

Volume append mode is disabled by default when the volume is created.

### **`[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete`**

Specifies the privileged-delete attribute of a SnapLock volume. This parameter must be specified alone.

If it is set to *enabled* then the privileged-delete operation can be performed using the [volume file privileged-delete](#) command.

If it is set to *disabled* , then the privileged-delete operation is not supported.

Once it is set to *permanently-disabled* , then neither the privileged-delete operation nor any change in the volume privileged-delete attribute is permitted.

## **Examples**

The following command sets `-default-retention-period` of a given SnapLock volume:

```
cluster1::> volume snaplock modify -volume vol_slc -default-retention
-period 2years

cluster1::>
```

The following command sets `-maximum-retention-period` of a given SnapLock volume to *infinite*:

```
cluster1::> volume snaplock modify -volume vol_slc -maximum-retention
-period infinite

cluster1::>
```

The following command enables the privileged-delete operation on a SnapLock volume.

```
cluster1::> volume snaplock modify -vserver vs1 -volume vol_sle
-privileged-delete enabled
[Job 38] Job succeeded: Privileged-delete Attribute Change for Volume
"vs1:vol_sle" Completed.
cluster1::>
cluster1::>volume snaplock show -vserver vs1 -volume vol_sle -fields
privileged-delete
vserver volume    privileged-delete
-----
vs1      vol_sle  enabled

cluster1::>
```

## Related Links

- [volume file privileged-delete](#)

## volume snaplock prepare-to-downgrade

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume snaplock prepare-to-downgrade` command prepares nodes to downgrade to a release without SnapLock volume append mode feature. Prior to disabling the feature, the command disables volume append mode on all SnapLock volumes in the cluster.

### Examples

The following example disables the SnapLock volume append mode feature in the local cluster:

```
cluster1::> volume snaplock prepare-to-downgrade
```

## volume snaplock show

Display SnapLock attributes of a SnapLock volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `` volume snaplock show `` command displays following information :

- Vserver name

- Volume name
- SnapLock Type of the volume
- Minimum retention period applicable of the volume
- Default retention period applicable of the volume
- Maximum retention period applicable of the volume
- Autocommit period of the volume
- Volume Append Mode attribute of the volume
- Privileged Delete attribute of the volume
- Litigation count on the volume
- Volume expiry time of the volume
- Volume ComplianceClock
- SnapLock audit log volume
- Unspecified retention file count on the volume

This command is applicable only for SnapLock volumes.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information for all the SnapLock volumes that match the specified `-vserver` value.

**[-volume <volume name>] - Volume**

If this parameter is specified, the command displays information for the specified `-volume` value.

**[-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays all the volumes that match the specified `-type` value.

**[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}}] - Minimum Retention Period**

If this parameter is specified, the command displays all the volumes that match the specified `-minimum-retention-period` value.

**[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite | unspecified}}] - Default Retention Period**

If this parameter is specified, the command displays all the volumes that match the specified `-default-retention-period` value.

**`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period`**

If this parameter is specified, the command displays all the volumes that match the specified `-maximum-retention-period` value.

**`[-autocommit-period {{<integer> minutes|hours|days|months|years} | none}] - Autocommit Period`**

If this parameter is specified, the command displays all the volumes that match the specified `-autocommit-period` value.

**`[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled`**

If this parameter is specified, the command displays all the volumes that match the specified `-is-volume-append-mode-enabled` value.

**`[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete`**

If this parameter is specified, the command displays all the volumes that match the specified `-privileged-delete` value.

**`[-expiry-time <text>] - Expiry Time`**

If this parameter is specified, the command displays all the volumes that match the specified `-expiry-time` value.

**`[-compliance-clock-time <text>] - ComplianceClock Time`**

If this parameter is specified, the command displays all the volumes that match the specified `-compliance-clock-time` value.

**`[-litigation-count <integer>] - Litigation Count`**

If this parameter is specified, the command displays all the volumes that match the specified `-litigation-count` value.

**`[-is-audit-log-volume {true|false}] - Is SnapLock Audit Log Volume`**

If this parameter is specified, the command displays all the volumes that match the specified `-is-audit-log-volume` value.

**`[-unspecified-retention-file-count <integer>] - Unspecified Retention File Count`**

If this parameter is specified, the command displays all the volumes that match the specified `-unspecified-retention-file-count` value.

## Examples

The following command shows summary of SnapLock volumes on a vserver:

```

cluster1::> volume snaplock show
Vserver          Volume          SnapLock Type ComplianceClock Time
-----
vs1              vol_slc         compliance      Mon Jan 19 14:12:34 IST 2015
+05:30
vs1              vol_sle         enterprise      Mon Jan 19 14:12:34 IST 2015
+05:30
2 entries were displayed.

cluster1::>

```

The following commands lists the complete SnapLock attributes of two given SnapLock volumes:

```

cluster1::> volume snaplock show -vserver vs1 -volume vol_slc
Vserver Name: vs1
                Volume Name: vol_slc
                SnapLock Type: compliance
                Minimum Retention Period: 1 years
                Default Retention Period: max
                Maximum Retention Period: 30 years
                Autocommit Period: 12 hours
Is Volume Append Mode Enabled: false
                Privileged Delete: permanently-disabled
                Expiry Time: Thu May 11 14:37:21 GMT 2017
                ComplianceClock Time: Wed May 11 20:08:41 IST 2016 +05:30
                Litigation Count: 0
Is SnapLock Audit Log Volume: false
Unspecified Retention File Count: 0

```

```
cluster1::>
```

```

cluster1::> volume snaplock show -vserver vs1 -volume vol_sle
Vserver Name: vs1
                Volume Name: vol_sle
                SnapLock Type: enterprise
                Minimum Retention Period: 6 months
                Default Retention Period: min
                Maximum Retention Period: infinite
                Autocommit Period: none
Is Volume Append Mode Enabled: false
                Privileged Delete: enabled
                Expiry Time: infinite
                ComplianceClock Time: Wed May 11 20:08:44 IST 2016 +05:30
                Litigation Count: 0
Is SnapLock Audit Log Volume: false
Unspecified Retention File Count: 0

```

## volume snapshot commands

### volume snapshot compute-reclaimable

Calculate the reclaimable space if specified snapshots are deleted

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume snapshot compute-reclaimable` command calculates the volume space that can be reclaimed if one or more specified snapshots are deleted.

The command heavily uses system's computational resources so it can reduce the performance for client requests and other system processes. Therefore, the queries that use query operators (\* , | , etc.), are disabled for this command. You should not specify more than three snapshots per query. snapshots must be specified as a comma-separated list with no spaces after the commas.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the volume for which reclaimable space is to be calculated.

### **-snapshots <snapshot name>, ... - List of Snapshots**

This specifies one or more than one snapshots that are to be considered for deletion. If you list more than one snapshot, specify a comma-separated list with no spaces after the commas.

## Examples

The following example calculates the space that can be reclaimed if the snapshot named hourly.2008-01-10\_1505 is deleted on a volume named vol3, which is a part of the Vserver named vs0:

```
cluster1::> volume snapshot compute-reclaimable -vserver vs0
-volume vol3 -snapshots hourly.2008-01-10_1505
```

## volume snapshot create

### Create a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot create` command creates a snapshot of a specified volume.

## Parameters

### **-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the snapshot is to be created.

### **-volume <volume name> - Volume**

This specifies the volume where a snapshot is to be created.

### **-snapshot <snapshot name> - Snapshot**

This specifies the name of the snapshot that is to be created.

### **[-comment <text>] - Comment**

This optionally specifies a comment for the snapshot.

### **`[-foreground {true|false}] - Foreground Process`**

If you use this option and select *false*, the snapshot creation process runs in the background. If you use this option and select *true*, the snapshot creation process runs in the foreground. The default is *true*.

### **`[-snapmirror-label <text>] - Label for SnapMirror Operations`**

If you specify this option, the snapshot is created with the SnapMirror Label that you specify. If this option is not specified, the snapshot is created with no SnapMirror Label. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

### **`[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time`**

If you specify this option, the snapshot is created with the expiry time that you specify. The expiry time indicates the time at which the snapshot becomes eligible for deletion.

### **`[-snaplock-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}] - SnapLock Expiry Time`**

This optionally specifies an expiry time for the snapshot. A snapshot with an expiry time cannot be deleted until the expiry time has elapsed. This option takes effect only on volumes with *snapshot-locking-enabled* set to true. If this option is not specified, the snapshot will not be under retention.

## **Examples**

The following example creates a snapshot named `vol3_snap` on a volume named `vol3` on a Vserver named `vs0`. The snapshot is given the comment "Single snapshot" and the operation runs in the background.

```
cluster1::> volume snapshot create -vserver vs0 -volume vol3 -snapshot  
vol3_snapshot -comment "Single snapshot" -foreground false
```

## **volume snapshot delete**

### **Delete a snapshot**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot delete` command deletes a snapshot from a specified volume.

### **Parameters**

#### **`-vserver <vserver name> - Vserver`**

This specifies the Vserver that contains the volume on which the specified snapshot is saved.

#### **`-volume <volume name> - Volume`**

This specifies the volume from which a snapshot is to be deleted.

#### **`-snapshot <snapshot name> - Snapshot`**

This specifies the snapshot that is to be deleted.

### **`[-foreground {true|false}] - Foreground Process`**

If you use this option and set it to *false*, the delete operation runs as a background process. If you specify this option and set it to *true*, the operation runs as a foreground process. The default is *true*.

### **`[-force <true>] - Force Delete (privilege: advanced)`**

If you use this switch, the snapshot is immediately deleted without generating any confirmation messages. If you do not use this option the operation generates confirmation messages and the operation is disallowed on application tagged volumes. Passing in a value of *true* is supported, but not required. The *force* switch is typically used for scripting applications where users cannot directly confirm the delete operation.

### **`[-ignore-owners <true>] - Ignore Snapshot Owners (privilege: advanced)`**

If you use this switch, the command ignores other processes that might be accessing the snapshot. If you do not use this option the operation exhibits default behavior and checks the owners tags before allowing the deletion to occur. Passing in a value of *true* is supported, but not required.

## **Examples**

The following example deletes a snapshot named `vol3_daily` from a volume named `vol3` on a Vserver named `vs0`:

```
cluster1::> volume snapshot delete -vserver vs0 -volume vol3 -snapshot  
vol3_daily
```

## **volume snapshot modify-snaplock-expiry-time**

### **Modify expiry time of a SnapLock Snapshot copy**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot modify-snapshot-expiry-time` extends SnapLock expiry time of an existing snapshot.

### **Parameters**

#### **`-vserver <vserver name> - Vserver`**

This specifies the Vserver that contains the volume on which the snapshot is located.

#### **`-volume <volume name> - Volume`**

This specifies the volume where a snapshot is to be located.

#### **`-snapshot <text> - Snapshot`**

This specifies the name of the snapshot locked by SnapLock whose SnapLock expiry time needs to be modified.

#### **`[-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}] - SnapLock Expiry Time`**

Specifies the new SnapLock expiry that is applied to snapshot locked by SnapLock.

If this option value is *infinite*, then a retention period that never expires is applied to the snapshot.

## Examples

The following example extends the retention period of a snapshot *snap1* to "03/03/2020 00:00:00":

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1
              -volume vol1 -snapshot snap1 -expiry-time "03/03/2020 00:00:00"
cluster1::>
```

The following example extends the retention period of a snapshot *snap2* to *infinite*:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1
              -volume vol1 -snapshot snap2 -expiry-time infinite
cluster1::>
```

```
cluster1::> volume snapshot show -vserver vs1 -fields snaplock-expiry-time
vserver volume snapshot snaplock-expiry-time
-----
vs1      vol1      snap1      3/3/2020 00:00:00 +05:30
vs1      vol1      snap2      infinite
```

## volume snapshot modify

### Modify snapshot attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot modify` command enables you to change the text comment associated with a snapshot.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified snapshot is saved.

**-volume <volume name> - Volume**

This specifies the volume whose snapshot is to be modified.

**-snapshot <snapshot name> - Snapshot**

This specifies the snapshot whose text comment is to be modified.

### **[-comment <text>] - Comment**

This specifies the new comment for the snapshot.

### **[-snapmirror-label <text>] - Label for SnapMirror Operations**

This specifies the SnapMirror Label for the snapshot. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination. If an empty label ("" ) is specified, the existing label will be deleted.

### **[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time**

This specifies the expiry time for the snapshot. The expiry time indicates the time at which the snapshot becomes eligible for deletion. If an expiry time of ("0") is specified, the existing expiry time will be deleted.

## **Examples**

The following example modifies the comment of a snapshot named vol3\_snapshot of a volume named vol3 on a Vserver named vs0. The comment is changed to "Pre-upgrade snapshot".

```
cluster1::> volume snapshot modify -vserver vs0 -volume vol3
-snapshot vol3_snapshot -comment "Pre-upgrade snapshot"
```

## **volume snapshot partial-restore-file**

Restore part of a file from a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot partial-restore-file` command enables you to restore a range of bytes in a file from the version of the file saved in the snapshot. This command is intended to be used to restore particular pieces of LUNs, NVMe namespaces, and NFS or CIFS container files that are used by a host to store multiple sources of data. For example, a host might be storing multiple user databases in the same LUN. A partial file restore can be used to restore one of those databases in the LUN without touching other databases stored in the LUN. This command is not intended for restoring parts of normal user-level files that are stored in the volume. You should use [volume snapshot restore-file](#) command to restore normal user-level files. The volume for the partial-restore should be online during this operation.

For LUNs and NVMe namespaces, this command is supported across all LUN and NVMe namespace source and destination objects with equal logical block sizes.

### **Parameters**

#### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver which contains the volume.

#### **[-volume <volume name>] - Volume Name**

This specifies the volume in which the snapshot is saved.

### **-s, -snapshot <snapshot name> - Snapshot Name**

This specifies the snapshot which contains the version of file from which a range of bytes is restored. The source file, LUN, or NVMe namespace must be present in the snapshot.

### **-path <text> - Filepath**

This specifies the relative path to the file, LUN, or NVMe namespace which is partially restored from the snapshot. You should specify the `-volume` option so that the file, LUN, or NVMe namespace is searched and restored from the snapshot of the specified volume. If you do not specify the `-volume` then the file, LUN, or NVMe namespace is searched and restored from the snapshot of the root volume. The destination file, LUN, or NVMe namespace must be present in the active file system.

### **-start-byte <integer> - Starting Byte Offset (Multiple of 4096)**

This specifies the starting byte offset in the file to partially restore. The first byte of the file is byte zero. The start byte must be a multiple of 4096. In addition, the start byte must not exceed the size of the source or destination file.

### **-byte-count <integer> - Number of Bytes to Restore (Multiple of 4096)**

This specifies the total number of bytes to restore, beginning at the `-start-byte` value. The `-byte-count` option must be a multiple of 4096. The maximum number of bytes that can be restored is 16 MB. The byte count must not exceed the range of the source or destination file.

## **Examples**

The following example restores first 4096 bytes in the file `foo.txt` inside the volume `vol3` from the snapshot `vol3_snap`:

```
cluster1::> volume snapshot partial-restore-file -vserver vs0 -volume vol3  
-snapshot vol3_snap -path /foo.txt -start-byte 0 -byte-count 4096
```

## **Related Links**

- [volume snapshot restore-file](#)

## **volume snapshot prepare-for-revert**

Deletes multiple Snapshot copies of the current File System version.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

This command will delete all snapshots that have the format used by the current version of ONTAP. It will fail if snapshot policies are enabled, or if snapshots have an owner.

Snapshot policies must be disabled prior to running this command.

## **Parameters**

**-node <nodename> - Node (privilege: advanced)**

The name of the node.

## Examples

The following example prepares the snapshots for revert.

```
cluster1::*> volume snapshot prepare-for-revert -node node1
```

## volume snapshot rename

### Rename a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot rename` command renames a snapshot.

You cannot rename a snapshot that is created as a reference copy during the execution of the `volume move` command.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified snapshot is to be renamed

**-volume <volume name> - Volume**

This specifies the volume that contains the snapshot to be renamed.

**-snapshot <snapshot name> - Snapshot**

This specifies the snapshot that is to be renamed.

**-new-name <snapshot name> - Snapshot New Name**

This specifies the new name for the snapshot.

**[-force <true>] - Force Rename (privilege: advanced)**

If this parameter is specified, the snapshot rename operation is allowed on application tagged volumes. Otherwise, the operation is disallowed on application tagged volumes.

## Examples

The following example renames a snapshot named `vol3_snap` on a volume named `vol3` and a Vserver named `vs0`. The snapshot is renamed to `vol3_snap_archive`.

```
cluster1:::> volume snapshot rename -vserver vs0 -volume vol3  
-snapshot vol3_snap -new-name vol3_snap_archive
```

## volume snapshot restore-file

Restore a file from a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot restore-file` command enables you to restore a single file to a version saved in the snapshot. You can restore a file over an existing copy of the file in the parent read-write volume or to a different location within the same parent read-write volume. If the destination file for the restore operation does not exist, a new file is created with the same version as the one saved in the snapshot. If the destination file for the restore operation exists, then it is overwritten by the version from the snapshot. This operation is used to restore normal user-level files, LUNs and NVMe namespaces. The command also supports restoring normal user-level files with streams. The command fails if you try to restore directories (and their contents). During the restore operation the parent read-write volume should remain online. The command fails if the destination path for the restore operation is in a different volume than the source volume.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver which contains the volume.

#### **[-volume <volume name>] - Volume Name**

This specifies the volume which contains the specified snapshot.

#### **-s, -snapshot <snapshot name> - Snapshot Name**

This specifies the snapshot from which the file is restored.

#### **-path <text> - Filepath**

This specifies the relative path to the file which is restored from the snapshot. You should specify the `-volume` option so that the file is searched and restored from the snapshot of the specified volume. If you do not specify the `-volume` then the file is searched and restored from the snapshot of the root volume.

#### **[-r, -restore-path <text>] - Restore Filepath**

This option specifies the destination location inside the volume where the file is restored. If you do not specify this option, the file is restored at the same location referred by `-path` option. If you specify `-restore-path` option, then it should refer to a relative path location within the same volume which contains the source file. If you do not specify `-volume` along with the relative path, the file is restored in the root volume.

#### **[-split-disabled <true>] - Disable Space Efficient LUN Splitting**

If you use this option and set it to `true`, space efficient LUN or NVMe namespace clone split is not allowed during the restore operation. If you use this option and set it to `false` or do not use this option, then space efficient LUN or NVMe namespace clone split is allowed during the restore operation.

#### **[-ignore-streams <true>] - Ignore Streams**

If you use this parameter, the file is restored without its streams. By default, the streams are restored.

## Examples

The following example restores a file `foo.txt` from the snapshot `vol3_snap` inside the volume `vol3` contained in a Vserver `vs0`:

```
cluster1::> volume snapshot restore-file -vserver vs0 -volume vol3
-snapshot vol3_snap -path /foo.txt
```

## volume snapshot restore

Restore the volume to a snapshot.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot restore` command restores a snapshot to be the read-write parent volume for the volume family. This replaces the current working copy of the volume with the snapshot that results in a loss of all changes made since the snapshot was created.

You should manually update all the SnapMirror relationships of a volume immediately after you restore its snapshot. Not doing so can result in unusable SnapMirror relationships that must be deleted and re-created.

After the restore is complete, the size of the flexible volume will be set to either the current volume size or the snapshot size - whichever is greater.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified snapshot to be restored is saved.

**-volume <volume name> - Volume**

This specifies the parent read-write volume whose snapshot is to be restored to take its place.

**-snapshot <snapshot name> - Snapshot**

This specifies the snapshot that is to be restored to be the read-write parent volume.

**[-force <true>] - Force Restore**

If you use this parameter, the snapshot is restored even if the volume has one or more newer snapshots which are currently used as reference snapshot by SnapMirror. If a restore is done in this situation, this will cause future SnapMirror transfers to fail. The SnapMirror relationship may be repaired using [snapmirror resync](#) command if a common snapshot is found between the source and destination volume. If there is no common snapshot between the source and the destination volume, a baseline SnapMirror copy would be required. If you use this parameter, the operation is also allowed on application tagged volumes.

**[-preserve-lun-ids {true|false}] - Preserve LUN Identifiers**

This option enables you to select whether the snapshot restore needs to be non-disruptive to clients due to LUN or NVMe namespace identifiers changing. If you use this option and set it to `true`, or choose to not use this option at all, the `volume snapshot restore` command fails if the system determines that it

cannot be non-disruptive with regards to LUN or NVMe namespace identifiers. If you use this option and set it to *false* , the restore operation proceeds even if this might cause client-visible effects. In this case, administrators should take the LUNs or NVMe namespaces offline before proceeding.

## Examples

The following example restores a snapshot named `vol3_snap_archive` to be the parent read-write volume for the volume family. The existing read-write volume is named `vol3` and is located on a Vserver named `vs0`:

```
cluster1::> volume snapshot restore -vserver vs0 -volume vol3
-snapshot vol3_snap_archive
```

## volume snapshot show-delta

Computes delta between two Snapshot copies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot show-delta` command returns the number of bytes that changed between two snapshots or a snapshot and the active filesystem. This is calculated from the number of blocks that differ multiplied by the block size. The command also shows the time elapsed between the snapshots in seconds.

Queries that use query operators (\* , | , etc.) are disabled for this command to avoid performance degradation for client requests.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume for which the delta is to be calculated.

**-snapshot1 <snapshot name> - First Snapshot Name**

This specifies the first snapshot for the comparison.

**[-snapshot2 <snapshot name>] - Second Snapshot Name**

This specifies the second snapshot for the comparison. If the field is not specified, it is assumed to be the Active File System.

## Examples

The following example shows the bytes changed and the time separating the two snapshots:

```
cluster1::> volume snapshot show-delta -vserver vs0 -volume vol2
-snapshot1 one -snapshot2 two
A total of 139264 bytes (34 blocks) are different. Elapsed time between
the snapshots: 1s.
```

## volume snapshot show

Display a list of snapshots

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot show` command displays information about snapshots. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available snapshots:

- Vserver name
- Volume name
- Snapshot name
- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

To display a detailed list view with additional information, run the command and select the `-instance` view. In addition to the above mentioned information about the snapshots, the detailed list view provides the following additional information:

- Creation time
- Snapshot busy
- List of the snapshot's owners
- Comment associated with the snapshot
- SnapMirror Label associated with the snapshot
- 7-Mode Snapshot
- Constituent Snapshot
- Expiry Time
- SnapLock Expiry Time
- SnapLock Snapshot Expired
- Seconds until SnapLock Snapshot Expiry

At the advanced or higher privilege level the detailed view provides the following additional information:

- Snapshot's Dataset ID

- Snapshot's master Dataset ID
- Number of consistency points in the snapshot
- Internal status of the snapshot
- File system version
- File system block format
- Physical Snap ID
- Logical Snap ID
- Database record owner
- Snapshot tags
- Instance UUID
- Version UUID
- Node
- AFS used size
- Compression savings size
- Deduplication savings size
- Vbn0 savings size
- Reserved size
- Logical used size
- Performance metadata size
- Status of FlexGroup Qtree support in the snapshot

For snapshots whose parent volume is a FlexGroup, some information is not available and empty values will be displayed. This information includes:

- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

All information is available for snapshots whose parent volume is a FlexGroup Constituent.

At the admin and advanced privilege level, snapshots whose parent volume is a FlexGroup Constituent are not displayed by default. To display these, run the command and set the `is-constituent` to `true`. At the diagnostic or higher privilege level, all snapshots are displayed by default.

The list view is automatically enabled if a single snapshot is specified by using the `-vserver`, `-volume` and `-snapshot` options together.

A preformatted query for displaying the time-related information is available by specifying the `-time` format specifier. This displays a table that contains the following fields for all the available snapshots:

- Vserver name
- Volume name
- Snapshot name
- Creation time

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about snapshots of the load-sharing volumes, run the command with the `-volume-type LS` parameter. If you specify multiple filtering parameters, only those snapshots that match all the specified parameters are displayed.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-time ]**

If the `-time` format is specified, the command displays time related information about all entries.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you use this parameter, the snapshots located only on the specified Vserver will be displayed.

**[-volume <volume name>] - Volume**

If you use this parameter only snapshots located on the specified volume will be displayed.

**[-snapshot <snapshot name>] - Snapshot**

If you use this parameter only snapshots matching the specified name will be displayed.

**[-dsid <integer>] - Snapshot Data Set ID (privilege: advanced)**

If this parameter is specified, the command displays information only about the snapshot that has the specified data set ID.

**[-msid <integer>] - Snapshot Master Data Set ID (privilege: advanced)**

If this parameter is specified, the command displays information only about the snapshot that has the specified master data set ID.

**[-create-time <Date>] - Creation Time**

If this parameter is specified, the command displays information only about the snapshots that match the specified creation time.

### **[-busy {true|false}] - Snapshot Busy**

If this parameter is specified, the command displays information only about the snapshots that have the specified busy status.

### **[-owners <text>,...] - List of Owners**

If this parameter is specified, the command displays information only about the snapshots that are owned by the specified list of owners.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Size**

If this parameter is specified, the command displays information only about the snapshots that have the specified size. The size is specified as a character specifying the unit of measurement after a number specifying the size in the mentioned unit of measurement: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit of measurement is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. You may also use an inequality such as *>10 MB* as input.

### **[-blocks <percent>] - Percentage of Total Blocks**

If this parameter is specified, the command displays information only about the snapshots that have the specified percentage of total blocks on their parent volumes. You may also use an inequality such as *>10* as input.

### **[-usedblocks <percent>] - Percentage of Used Blocks**

If this parameter is specified, the command displays information only about the snapshots that have the specified percentage of used blocks on their parent volumes. You may also use an inequality such as *>10* as input.

### **[-cpcount <integer>] - Consistency Point Count (privilege: advanced)**

If this parameter is specified, the command displays information only about the snapshots that have the specified number of consistency points. You may also use an inequality such as *<100* as input.

### **[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the snapshots that have the specified comment text. You may also specify an inequality such as *! "-"* as input.

### **[-fs-version <text>] - File System Version (privilege: advanced)**

If you use this parameter the only snapshots displayed are those that were created when the file system was of a specific release. This parameter is helpful especially when you need to upgrade to newer software release and want to know the snapshots that will be impacted by the upgrade process.

### **[-logical-snap-id <integer>] - Logical Snap ID (privilege: advanced)**

If you use this parameter only those snapshots which have the specified logical snapshot ID will be shown. Logical snapshot ids are internal implementation details of volume snapshots.

### **[-is-7-mode {true|false}] - 7-Mode Snapshot**

If you use this parameter only those snapshots which have the specified value are shown. This value is *true* for the snapshots that exist on the volume that was in 7-mode configuration and then transitioned to a clustered configuration. In such a scenario, the volume is in a clustered configuration and the existing snapshots are still in the 7-mode configuration.

### **[-snapmirror-label <text>] - Label for SnapMirror Operations**

If you use this parameter, only those snapshots that have the specified SnapMirror Label value are shown.

**`[-state {valid|invalid|partial|pre-conversion}] - Snapshot State`**

If you use this parameter only those snapshots which have the specified state will be shown.

**`[-is-constituent {true|false}] - Constituent Snapshot`**

If you use this parameter, only those snapshots whose parent volume is a constituent volume of a FlexGroup will be shown.

**`[-node <nodename>] - Node (privilege: advanced)`**

If you use this parameter only those snapshots that are located on the specified storage system are shown.

**`[-inofile-version <integer>] - Snapshot Infile Version (privilege: advanced)`**

If this parameter is specified, the command displays information only about the snapshots whose inode files are at the specified version.

**`[-expiry-time <MM/DD/YYYY HH:MM:SS>] - Expiry Time`**

If you use this parameter only those snapshots that have the specified expiry time are shown.

**`[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)`**

If you use this parameter only those snapshots that have the specified compression type are shown.

**`[-snaplock-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}] - SnapLock Expiry Time`**

If you use this parameter only those snapshots that have the specified SnapLock expiry time are shown.

**`[-application-io-size <Application I/O Size>] - Application IO Size (privilege: advanced)`**

If you use this parameter only those snapshots that have the specified application IO size are shown.

**`[-is-qtree-caching-enabled {true|false}] - Is Qtree Caching Support Enabled (privilege: advanced)`**

If you use this parameter, only those snapshots of FlexGroup volumes or origin of a FlexCache volumes that have the specified Qtree caching status are shown.

**`[-snaplock-snapshot-expired {true|false}] - Has the SnapLock Snapshot Expired`**

If this parameter is specified, the command displays information as to whether or not a locked snapshot has expired.

**`[-seconds-until-snaplock-snapshot-expiry <integer>] - Seconds until the SnapLock Snapshot Expiry`**

If this parameter is specified, the command displays remaining SnapLock expiry time (in seconds) of a locked snapshot.

## Examples

The following example displays default information about all snapshots of a volume named vol1:

```
cluster1::> volume snapshot show -volume vol1
```

|          |        |          |      | ---Blocks |
|----------|--------|----------|------|-----------|
| Vserver  | Volume | Snapshot | Size | Total%    |
| cluster1 | vol1   | one      | 68KB | 0%        |
|          |        | two      | 72KB | 0%        |

2 entries were displayed.

The following example displays snapshots which are older than 1 hour, limiting the output to wanted fields:

```
cluster1::> volume snapshot show -create-time <1h -fields create-time,
size
```

| vserver  | volume | snapshot | create-time              | size |
|----------|--------|----------|--------------------------|------|
| cluster1 | vol1   | one      | Mon Nov 17 10:23:42 2014 | 68KB |
| cluster1 | vol1   | two      | Mon Nov 17 10:23:44 2014 | 72KB |

2 entries were displayed.

The following example displays detailed information about a specific snapshot, using the 'snap' alias:

```

cluster1::> snap show -volume vol1 -snapshot one -instance
Vserver: cluster1

                Volume: vol1
                Snapshot: one
                Snapshot Data Set ID: 4294968322
                Snapshot Master Data Set ID: 6442451970
                Creation Time: Mon Nov 17 10:23:42 2014
                Snapshot Busy: false
                List of Owners: -
                Snapshot Size: 68KB
                Percentage of Total Blocks: 0%
                Percentage of Used Blocks: 33%
                Consistency Point Count: 4
                Comment: -
                File System Version: 9.0
                7-Mode Snapshot: false
                Label for SnapMirror Operations: -
                Constituent Snapshot: false
                Node: node1
                Snapshot Inofile Version: 3
                Expiry Time: -
                SnapLock Expiry Time: -
                SnapLock Snapshot Expired: -
                Seconds until SnapLock Snapshot Expiry: -

```

## volume snapshot autodelete modify

### Modify autodelete settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot autodelete modify` command enables you to modify snapshot autodelete and LUN, NVMe namespace or file clone autodelete policy settings. Based on the defined policy, automatic deletion of snapshots and LUN, NVMe namespace or file clones is triggered. Automatic deletion of snapshots and LUN, NVMe namespace or file clones is useful when you want to automatically reclaim space consumed by the snapshots and LUN, NVMe namespace or file clones from the volume when it is low in available space. LUN, NVMe namespace or file clone autodelete follows snapshot autodelete. This command works only on a read-write parent volume. You cannot setup automatic snapshot deletion and automatic LUN, NVMe namespace or file clone deletion for read-only volumes.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the volume whose autodelete policy has to be modified.

### **[-enabled {true|false}] - Enabled**

This option specifies whether automatic deletion of snapshots and LUN, NVMe namespace or file clones is enabled or disabled. If set to *true*, automatic deletion of snapshots and LUN, NVMe namespace or file clones is enabled. If set to *false*, automatic deletion of snapshots and LUN, NVMe namespace or file clones is disabled.

### **[-commitment {try|disrupt|destroy}] - Commitment**

This option specifies which snapshots and LUN, NVMe namespace or file clones can be automatically deleted to reclaim back space. + When set to *try*, the snapshots which are not locked by any application and the LUN, NVMe namespace or file clones which are not configured as preserved are deleted. + When set to *disrupt*, the snapshots which are not locked by data backing functionalities (such as volume clones, LUN clones, NVMe namespace clones and file clones) and LUN, NVMe namespace or file clones which are not configured as preserved are deleted. In the *disrupt* mode, the snapshots locked by data protection utilities such as SnapMirror and Volume Move can be deleted. If such a locked snapshot is deleted during the data transfer, the transfer is aborted. + When set to *destroy*, the snapshots locked by the data backing functionalities are deleted. In addition, all the LUN, NVMe namespace or file clones in the volume are deleted.

### **[-defer-delete {scheduled|user\_created|prefix|none}] - Defer Delete**

This option determines the order in which snapshots can be deleted. + Possible values are as follows:

- When set to *scheduled*, scheduled snapshots are the last to be deleted.
- When set to *user\_created*, user snapshots are the last to be deleted.
- When set to *prefix*, snapshots matching a certain prefix are the last to be deleted.
- When set to *none*, no defer deletion order is honored.

This option is not applicable for LUN, NVMe namespace or file clones.

### **[-delete-order {newest\_first|oldest\_first}] - Delete Order**

This option specifies if the oldest snapshot and the oldest LUN, NVMe namespace or file clone or the newest snapshot and the newest LUN, NVMe namespace or file clone are deleted first.

### **[-defer-delete-prefix <text>] - Defer Delete Prefix**

This option specifies the prefix string for the `-defer-delete prefix` parameter. The option is not applicable for LUN, NVMe namespace or file clones.

### **[-target-free-space <percent>] - Target Free Space**

This option specifies the free space percentage at which the automatic deletion of snapshots and LUN, NVMe namespace or file clones must stop. Depending on the `-trigger` snapshots and LUN, NVMe namespace or file clones are deleted until you reach the target free space percentage.

### **[-trigger {volume|snap\_reserve| (DEPRECATED) -space\_reserve}] - Trigger**

This option specifies the condition which starts the automatic deletion of snapshots and LUN, NVMe namespace or file clones. + Setting this option to *volume* triggers automatic deletion of snapshots and

LUN, NVMe namespace or file clones when the volume reaches threshold capacity and the volume space reserved for snapshots is exceeded. + Setting the option to *snap\_reserve* triggers automatic deletion of snapshots and LUN, NVMe namespace or file clones when the space reserved for snapshots reaches threshold capacity. + Setting the option to (DEPRECATED)-*space\_reserve* triggers automatic deletion of snapshots when reserved space in the volume reaches threshold capacity and the volume space reserved for snapshots is exceeded. +

The option *space\_reserve* is deprecated.

The threshold capacity is determined by the size of the volume as follows:

- If the volume size is less than 20 GB, the autodelete threshold is 85%.
- If the volume size is equal to or greater than 20 GB and less than 100 GB, the autodelete threshold is 90%.
- If the volume size is equal to or greater than 100 GB and less than 500 GB, the autodelete threshold is 92%.
- If the volume size is equal to or greater than 500 GB and less than 1 TB, the autodelete threshold is 95%.
- If the volume size is equal to or greater than 1 TB, the autodelete threshold is 98%.

#### **[*-destroy-list* <text>] - Destroy List**

This option specifies a comma separated list of data backing functions which are affected if the automatic deletion of the snapshot backing that service is triggered. The possible values for this option are *lun\_clone*, *fileclone*, *lun\_clone,sfsr*, *vol\_clone*, *cifs\_share*, or *none*. Except *none*, all the other options can be combined as a comma separated list. Note that "lun\_clone", "file\_clone" and "sfsr" individually are not valid values. Only pairs "lun\_clone,file\_clone" and "lun\_clone,sfsr" are supported.

For the purposes of autodelete, *lun\_clone* includes both LUNs and NVMe namespaces.

If you specify *vol\_clone*, the cloned volume backed by the snapshot is deleted. + If you specify *lun\_clone*, and a LUN or NVMe namespace is in the process of being cloned when autodelete is triggered, the cloning operation is aborted. Any access to this LUN or NVMe namespace will result in an error being reported to the client. + If you specify *file\_clone*, and the file cloning operation is in progress when autodelete is triggered, the cloning operation is aborted. Any access to this file will result in an error being reported to the client. + If you specify *sfsr*, and the file restore is in progress when autodelete is triggered, the restore operation is aborted. + If the snapshot is locked either by a *lun\_clone* or *file\_clone* or both, the *-destroy-list* must be set to *lun\_clone,file\_clone*. + If the snapshot is locked either by a *lun\_clone* or *sfsr* operation or both, the *-destroy-list* must be set to *lun\_clone,file\_clone*. The options *file\_clone* and *sfsr* are equivalent to each other. + If you set *-destroy-list* to *lun\_clone,file\_clone* and the snapshot is backing a file clone or sfsr operation, both the operations are aborted. This is also the case when you set *-destroy-list* to *lun\_clone,sfsr*. + LUN, NVMe namespace or file clone autodelete is applicable only if *-destroy-list* contains *lun\_clone* and *file\_clone*

#### **Examples**

The following example enables snapshot autodelete and sets the trigger to *snap\_reserve* for volume *vol3* which is part of the Vserver *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3
-enabled true -trigger snap_reserve
```

The following example enables snapshot autodelete and LUN, NVMe namespace or file clone autodelete for volume *vol3* which is part of the Vserver *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3
-enabled true -trigger volume -commitment try -delete-order oldest_first
-destroy-list lun_clone,file_clone
```

## volume snapshot autodelete show

### Display autodelete settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot autodelete show` command displays information about snapshot autodelete policies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available snapshot autodelete policies:

- Vserver name
- Volume name
- Option name
- Option value

To display a detailed list view with additional information, run the command and select the `-instance` view. The detailed list view provides the following information:

- Vserver name
- Volume name
- Enabled
- Commitment
- Defer Delete
- Delete Order
- Defer Delete Prefix
- Target Free Space
- Trigger
- Destroy List
- Is Constituent Volume

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the

selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about snapshot autodelete policies which are enabled, run the command with `-enabled true` parameter. If you specify multiple filtering parameters, only those policies that match all the specified parameters are displayed.

## Parameters

**{ [-fields <fieldname>,...]**

This option allows you to print only certain fields in the output.

**| [-instance ] }**

This option allows you to print a detailed list view.

**[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about all volumes matching the specified name.

**[-enabled {true|false}] - Enabled**

If this parameter is specified, the command displays information about autodelete policies that match the specified parameter value.

**[-commitment {try|disrupt|destroy}] - Commitment**

If this parameter is specified, the command displays information about autodelete policies that match the specified commitment value.

**[-defer-delete {scheduled|user\_created|prefix|none}] - Defer Delete**

If this parameter is specified, the command displays information about autodelete policies that match the specified defer deletion criterion.

**[-delete-order {newest\_first|oldest\_first}] - Delete Order**

If this parameter is specified, the command displays information about autodelete policies that match the specified deletion order.

**[-defer-delete-prefix <text>] - Defer Delete Prefix**

If this parameter is specified, the command displays information about autodelete policies that match the prefix used for deferring deletion.

**[-target-free-space <percent>] - Target Free Space**

If this parameter is specified, the command displays information about autodelete policies that match the specified target free space.

**[`-trigger {volume|snap_reserve| (DEPRECATED) -space_reserve}`] - Trigger**

If this parameter is specified, the command displays information about autodelete policies that match the specified trigger condition.

**[`-destroy-list <text>`] - Destroy List**

If this parameter is specified, the command displays information about autodelete policies that match the specified value.

**[`-is-constituent {true|false}`] - Is Constituent Volume**

If this parameter is specified, the command displays information about autodelete policies for the constituent volumes of FlexGroup volumes.

## Examples

The following example displays snapshot autodelete policy settings for volume vol3 which is inside the Vserver vs0:

```
cluster1::> volume snapshot autodelete show -vserver vs0 -volume vol3
```

| Vserver | Volume | Option Name         | Option Value    |
|---------|--------|---------------------|-----------------|
| vs0     | vol3   |                     |                 |
|         |        | Enabled             | false           |
|         |        | Commitment          | try             |
|         |        | Trigger             | volume          |
|         |        | Target Free Space   | 20%             |
|         |        | Delete Order        | oldest_first    |
|         |        | Defer Delete        | user_created    |
|         |        | Defer Delete Prefix | (not specified) |
|         |        | Destroy List        | none            |

## volume snapshot policy add-schedule

Add a schedule to snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy add-schedule` command adds a schedule to a snapshot policy. You can create a schedule by using the [job schedule cron create](#) or [job schedule interval create](#) commands.

### Parameters

**`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver on which a snapshot policy schedule is to be added.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy to which a schedule is to be added.

### **-schedule <text> - Schedule Name**

This specifies the schedule that is to be added to the snapshot policy.

### **-count <integer> - Maximum Snapshot Copies for Schedule**

This specifies the maximum number of snapshots that can be taken by the specified schedule. The total count of all the snapshots to be retained for the policy cannot be more than 1023.

### **[-prefix <text>] - Snapshot Copy Name Prefix for Schedule**

This option specifies the prefix with which snapshots will be created for the added schedule. Every schedule has only one prefix. Once a prefix gets associated with a schedule, you cannot update the prefix. If some prefix is already associated with the schedule and you do not specify this parameter, then the previously defined prefix is used. The command fails if you try to update an existing prefix for a schedule. If no prefix is associated with the schedule and you do not specify this parameter, then schedule name is be used as the prefix.

### **[-snapmirror-label <text>] - Label for SnapMirror Operations**

This specifies the SnapMirror Label identified with a snapshot when it is created for the added schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

### **[-retention-period <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots created by the schedule.

## **Examples**

The following example adds a schedule named midnight to the snapshot policy named snappolicy\_nightly on Vserver vs0. The schedule can take a maximum of five snapshots.

```
cluster1::> volume snapshot policy add-schedule -vserver vs0 -policy
snappolicy_nightly -schedule midnight -count 5 -retention-period "7 days"
```

## **volume snapshot policy create**

Create a new snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume snapshot policy create` command creates a snapshot policy. A snapshot policy includes at least one schedule, up to a maximum of five schedules, and a maximum number of snapshots per schedule.

You can create a schedule by using the [job schedule cron create](#) or [job schedule interval create](#) commands. When applied to a volume, the snapshot policy specifies the schedule on which snapshots are taken and the maximum number of snapshots that each schedule can take. The total count of all the snapshots to be retained for the policy cannot be more than 1023.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the snapshot policy is to be created.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy that is to be created.

### **-enabled {true|false} - Snapshot Policy Enabled**

This specifies whether the snapshot policy is enabled.

### **[-comment <text>] - Comment**

This option specifies a text comment for the snapshot policy.

### **-schedule1 <text> - Schedule1 Name**

This specifies the name of the first schedule associated with the snapshot policy.

### **-count1 <integer> - Maximum Snapshot Copies for Schedule1**

This specifies the maximum number of snapshots that can be taken by the first schedule.

### **[-prefix1 <text>] - Snapshot Copy Name Prefix for Schedule1**

This option specifies the prefix associated with the first schedule. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

### **[-snapmirror-label1 <text>] - Label for SnapMirror Operations for Schedule1**

This specifies the SnapMirror Label of the first schedule associated with the snapshot policy. Once specified, all snapshots created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

### **[-retention-period1 <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots that can be taken by the first schedule. If this parameter is specified, the `-schedule1` parameter must also be specified. The default is no retention period.

### **[-schedule2 <text>] - Schedule2 Name**

This option specifies the name of the second schedule associated with the snapshot policy. If this parameter is specified, the `-count2` parameter must also be specified.

### **[-count2 <integer>] - Maximum Snapshot Copies for Schedule2**

This option specifies the maximum number of snapshots that can be taken by the second schedule. If this parameter is specified, the `-schedule2` parameter must also be specified.

### **[-prefix2 <text>] - Snapshot Copy Name Prefix for Schedule2**

This option specifies the prefix associated with the second schedule. If this parameter is specified, -schedule2 and -count2 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

### **[-snapmirror-label2 <text>] - Label for SnapMirror Operations for Schedule2**

This specifies the SnapMirror Label of the second schedule associated with the snapshot policy. Once specified, all snapshots created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

### **[-retention-period2 <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots that can be taken by the second schedule. If this parameter is specified, the -schedule2 parameter must also be specified. The default is no retention period.

### **[-schedule3 <text>] - Schedule3 Name**

This option specifies the name of the third schedule associated with the snapshot policy. If this parameter is specified, the -count3 parameter must also be specified.

### **[-count3 <integer>] - Maximum Snapshot Copies for Schedule3**

This option specifies the maximum number of snapshots that can be taken by the third schedule. If this parameter is specified, the -schedule3 parameter must also be specified.

### **[-prefix3 <text>] - Snapshot Copy Name Prefix for Schedule3**

This option specifies the prefix associated with the third schedule. If this parameter is specified, -schedule3 and -count3 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

### **[-retention-period3 <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots that can be taken by the third schedule. If this parameter is specified, the -schedule3 parameter must also be specified. The default is no retention period.

### **[-snapmirror-label3 <text>] - Label for SnapMirror Operations for Schedule3**

This specifies the SnapMirror Label of the third schedule associated with the snapshot policy. Once specified, all snapshots created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

### **[-schedule4 <text>] - Schedule4 Name**

This option specifies the name of the fourth schedule associated with the snapshot policy. If this parameter is specified, the -count4 parameter must also be specified.

### **[-count4 <integer>] - Maximum Snapshot Copies for Schedule4**

This option specifies the maximum number of snapshots that can be taken by the fourth schedule. If this parameter is specified, the -schedule4 parameter must also be specified.

#### **[-prefix4 <text>] - Snapshot Copy Name Prefix for Schedule4**

This option specifies the prefix associated with the fourth schedule. If this parameter is specified, -schedule4 and -count4 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

#### **[-retention-period4 <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots that can be taken by the fourth schedule. If this parameter is specified, the -schedule4 parameter must also be specified. The default is no retention period.

#### **[-snapmirror-label4 <text>] - Label for SnapMirror Operations for Schedule4**

This specifies the SnapMirror Label of the fourth schedule associated with the snapshot policy. Once specified, all snapshots created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

#### **[-schedule5 <text>] - Schedule5 Name**

This option specifies the name of the fifth schedule associated with the snapshot policy. If this parameter is specified, the -count5 parameter must also be specified.

#### **[-count5 <integer>] - Maximum Snapshot Copies for Schedule5**

This option specifies the maximum number of snapshots that can be taken by the fifth schedule. If this parameter is specified, the -schedule5 parameter must also be specified.

#### **[-prefix5 <text>] - Snapshot Copy Name Prefix for Schedule5**

This option specifies the prefix associated with the fifth schedule. If this parameter is specified, -schedule5 and -count5 parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

#### **[-retention-period5 <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots that can be taken by the fifth schedule. If this parameter is specified, the -schedule5 parameter must also be specified. The default is no retention period.

#### **[-snapmirror-label5 <text>] - Label for SnapMirror Operations for Schedule5**

This specifies the SnapMirror Label of the fifth schedule associated with the snapshot policy. Once specified, all snapshots created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination.

## **Examples**

The following example creates a snapshot policy named snappolicy\_4hrs on a Vserver named vs0. The policy runs on a single schedule named 4hrs with a prefix every\_4\_hour and has a maximum number of five snapshots.

```
cluster1::> volume snapshot policy create -vserver vs0 -policy
snappolicy_4hrs
-schedule1 4hrs -count1 5 -prefix1 every_4_hour -retention-period1 "8
hours"
```

## volume snapshot policy delete

Delete a snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy delete` command deletes a snapshot policy.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the snapshot policy is to be deleted.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy that is to be deleted.

### Examples

The following example deletes a snapshot policy named `snappolicy_hourly` on Vserver `vs0`:

```
cluster1::> volume snapshot policy delete -vserver vs0 -policy
snappolicy_hourly
```

## volume snapshot policy modify-schedule

Modify a schedule within snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy modify-schedule` command modifies the maximum number of snapshots that can be taken by a snapshot policy's schedule.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which a snapshot policy schedule is to be modified.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy whose schedule is to be modified.

### **-schedule <text> - Schedule Name**

This specifies the schedule that is to be modified.

### **[-newcount <integer>] - Maximum Snapshot Copies for Schedule**

This specifies the maximum number of snapshots that can be taken by the specified schedule. The total count of all the snapshots to be retained for the policy cannot be more than 1023.

### **[-newsnapmirror-label <text>] - Label for SnapMirror Operations**

This specifies the SnapMirror Label identified with a snapshot when it is created for the specified schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up snapshots to the Vault Destination. If an empty label ("") is specified, the existing label will be deleted.

### **[-newretention-period <snaplock minmax period>] - SnapLock Retention Period**

This specifies the retention period for snapshots created by the schedule.

## Examples

The following example changes the maximum number of snapshots from five to four for a schedule named midnight on a snapshot policy named snappolicy\_nightly on Vserver vs0:

```
cluster1::> volume snapshot policy modify-schedule -vserver vs0 -policy
snappolicy_nightly -schedule midnight -newcount 4 -newretention-period "7
days"
```

## volume snapshot policy modify

### Modify a snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy modify` command enables you to modify the description associated with a snapshot policy and whether the policy is enabled or disabled.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the snapshot policy is to be modified.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy that is to be modified.

**[-enabled {true|false}] - Snapshot Policy Enabled**

This optionally specifies whether the snapshot policy is enabled.

**[-comment <text>] - Comment**

This specifies the comment text for the snapshot policy.

**[-snapmirror-labels <text>,...] - Label for SnapMirror Operations**

This optionally specifies a comma separated list of SnapMirror labels that are applied to the schedules in the snapshot policy. Each label in the list applies to only one schedule in the snapshot policy (maximum of 5 SnapMirror labels), the first label applying to the first schedule, the second label applying to the second schedule, and so on. You can have a maximum of five SnapMirror labels, which corresponds to the maximum number of schedules a snapshot policy can have. If an empty string ("" ) is specified, the existing labels will be deleted from all the schedules.

**Examples**

The following example changes the description of a snapshot policy named snappolicy\_wknd on Vserver vs0 to "Runs only on weekends":

```
cluster1::> volume snapshot policy modify -vserver vs0 -policy
snappolicy_wknd -comment "Runs only on weekends"
```

**volume snapshot policy remove-schedule****Remove a schedule from snapshot policy**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `volume snapshot policy remove-schedule` command removes a schedule from a snapshot policy.

**Parameters****-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which a snapshot policy schedule is to be removed.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the snapshot policy from which a schedule is to be removed.

**-schedule <text> - Schedule Name**

This specifies the schedule that is to be removed from the snapshot policy.

## Examples

The following example removes a schedule named `hourly` from a snapshot policy named `snappolicy_daily` on Vserver `vs0`:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy
snappolicy_daily -schedule hourly
```

## volume snapshot policy show

### Show snapshot policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy show` command displays the following information about snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of snapshots associated with each schedule
- Snapshot name prefixes for the schedules
- SnapMirror Labels associated with the schedules

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-revert-incompatible ] (privilege: advanced)**

If this parameter is specified, the command displays snapshot policies that are not supported in ONTAP 8.2. The total snapshot count in the policy needs to be reduced to be equal to or less than the supported count for the revert operation to succeed.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays snapshot policies on the specified Vserver.

**[-policy <snapshot policy>] - Snapshot Policy Name**

If this parameter is specified, the command displays detailed information about the specified snapshot policy.

**[-enabled {true|false}] - Snapshot Policy Enabled**

If this parameter is specified, the command displays detailed information only about the snapshot policy or policies that have the specified enabled value.

**[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified comment.

**[-total-schedules <integer>] - Total Number of Schedules in This Policy**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified total number of schedules.

**[-schedules <text>,...] - Schedule Name**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified list of schedules.

**[-counts <integer>,...] - Maximum Snapshots for the Schedule**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified list of maximum numbers of snapshots per schedule.

**[-prefixes <text>,...] - Prefix Name**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified list of prefixes.

**[-snapmirror-labels <text>,...] - Label for SnapMirror Operations**

If this parameter is specified, the command displays information only about the snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the snapshot policies that contain any of the SnapMirror Labels specified in the list.

**[-policy-owner <text>] - Owner of the policy**

If this parameter is specified, the command displays information only about the snapshot policies that have the specified policy owner.

**[-total-count <integer>] - Total Number of Snapshots in This Policy**

If this parameter is specified, the command displays information only about the snapshot policies that have the specified total number of snapshots.

**[-retention-periods <snaplock minmax period>,...] - SnapLock Retention Period**

If this parameter is specified, the command displays information only about the snapshot policy or policies that have the specified retention-period set.

**Examples**

The following example displays information about all snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm
Policy Name          Number of Is
                    Schedules Enabled Comment
```

```

-----
default                                3 false   Default policy with hourly,
daily weekly schedules.

## volume upgrade-tasks commands

### volume upgrade-tasks run

Triggers the M-Host upgrade tasks for the volume

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `volume upgrade-tasks run` command triggers the M-host upgrade tasks for the volume and sets the volume upgrade status.

#### Parameters

**-vserver <vserver name> - Vserver where the volume is located (privilege: advanced)**

This specifies the vservers on which the volume is located.

**-volume <volume name> - Volume on which we are running triggering the upgrade (privilege: advanced)**

This specifies the volume on which we have to trigger the upgrade-tasks.

#### Examples

The following example triggers upgrade-tasks on volume named vol1 on a vservers named vs0:

```
node::> volume upgrade-tasks run -vserver vs1 -volume vol1
```

# vserver commands

## vserver add-aggregates

Add aggregates to the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver add-aggregates` command adds aggregates to the Vserver.

### Parameters

**-vserver <vserver> - Vserver**

Specifies the Vserver for which aggregates have to be added.

**-aggregates <aggregate name>, ... - List of Aggregates to Be Added**

Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

### Examples

The following example illustrates how to add aggregates *aggr1* and *aggr2* to a Vserver named *vs.example.com*:

```
cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates  
aggr1,aggr2
```

## vserver add-protocols

Add protocols to the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver add-protocols` command adds given protocols to a specified Vserver.

### Parameters

**-vserver <vserver> - Vserver**

This specifies the Vserver that is to be modified.

### **-protocols {nfs|cifs|fc|iscsi|ndmp|nvme|s3} - Protocols**

This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp*, *s3*, and *nvme*.

## Examples

The following example shows adding protocol 'cifs' to a vs0.vserver.example.com.

```
cluster1::> vs0.vserver.example.com add-protocols -vserver vs0.vserver.example.com -protocols cifs
```

## vserver context

### Set Vserver context

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Cluster administrators can use the `vserver context` command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The [exit](#) command can be used to return to the original context.

### Parameters

#### **-vserver <vserver> - Vserver**

Use this parameter to specify the Vserver.

#### **[-username <text>] - Vserver Administrator User Name**

Use this parameter to specify a Vserver administrator user name for the context. The default value *vsadmin* is used if one is not specified.

## Examples

The following example sets the CLI context to Vserver *vs0.vserver.example.com*. All subsequently issued commands will be executed in the context of that Vserver:

```
cluster1::> vs0.vserver.example.com context -vserver vs0.vserver.example.com
Info: Use 'exit' command to return.
vs0.vserver.example.com::>
```

## Related Links

- [exit](#)

# vserver create

Create a Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver create` command creates a Vserver.

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

### **[-subtype <vserver subtype>] - Vserver Subtype**

This specifies the subtype of the Vserver being created. Possible values are:

- default - For default data Vservers
- dp-destination - For Data Protection destination Vservers
- sync-source - For MetroCluster source Vservers
- sync-destination - For MetroCluster destination Vservers

### **[-rootvolume <volume name>] - Root Volume**

This parameter optionally specifies the name of the Vserver's root volume, which is created when the Vserver is created. The default name is `vserverName_root`. The size of the Vserver's root volume is 1GB

### **[-aggregate <aggregate name>] - Aggregate**

This parameter optionally specifies the storage aggregate that holds the Vserver's root volume. Selection of the aggregate is based on the Vserver setup algorithm.

- Creating a root volume on the SnapLock aggregate is not supported.
- Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

### **[-rootvolume-security-style <security style>] - Root Volume Security Style**

This parameter optionally specifies the security style for the Vserver's root volume. Possible values include `unix` (for UNIX mode bits), `ntfs` (for CIFS ACLs), and `mixed` (for mixed NFS and CIFS access). The default value is `unix`. Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume.

### **[-language <Language code>] - Default Volume Language Code**

This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append `.UTF-8` for the language encoding values. For example, for the `en_US` language, the recommended format is `en_US.UTF-8`. The default setting is `C.UTF-8`.

### **[-snapshot-policy <snapshot policy>] - Snapshot Policy**

This optionally specifies the snapshot policy for new volumes created on the Vserver. If no value is specified, the default snapshot policy is used. You can use the `-snapshot-policy` parameter on the [volume create](#) or [volume modify](#) commands to set the snapshot policy on a specific volume, regardless of its Vserver's snapshot policy setting.

### **[-data-services <LIF Service Name>,...] - Data Services**

This optionally specifies the data services for new network interfaces created on the Vserver. If no value is specified, the default services list will be applied. This information will be used to construct the default service policies for this Vserver, which can be viewed using the `network interface service-policy show` command.

### **[-comment <text>] - Comment**

This optionally specifies a comment for the Vserver.

### **[-quota-policy <text>] - Quota Policy**

This optionally specifies a quota policy for the Vserver.

### **[-caching-policy <text>] - Caching Policy Name**

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

### **[-ipspace <IPspace>] - IPspace Name**

This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

### **[-foreground {true|false}] - Foreground Process**

This parameter optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.

### **[-is-space-reporting-logical {true|false}] - Logical Space Reporting**

This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used.

### **`[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement`**

This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used.

### **`[-anti-ransomware-default-volume-state {disabled|dry-run}] - Default Anti_ransomware State of the Vserver's Volumes`**

This optionally specifies the default anti\_ransomware state for volumes in the Vserver. The available anti\_ransomware states for the volumes in the Vserver are:

- disabled - Anti\_ransomware protection is not enabled on the volumes in the Vserver.
- dry-run - Anti\_ransomware protection is in learning mode on the volumes in the Vserver.

Default anti-ransomware-default-volume-state is *disabled*.

### **`[-auto-enable-analytics {true|false}] - Enable Analytics on New Volumes`**

This parameter specifies whether analytics is automatically enabled on volumes that will be created in the Vserver. The default value is false.

### **`[-auto-enable-activity-tracking {true|false}] - Enable Activity Tracking on New Volumes`**

This parameter specifies whether activity tracking is automatically enabled on volumes that will be created in the Vserver. The default value is false.

### **`[-storage-limit {<integer>[KB|MB|GB|TB|PB]}] - Storage Limit`**

This parameter specifies the maximum size limit for a Vserver. Default value is 0, which means no limit.

### **`[-storage-limit-threshold-alert <percent>] - Storage Limit Threshold Alert`**

This parameter specifies when the "vserver.storage.threshold" event log message is generated. This is a percentage value of storage-limit. Default value is 90%.

### **`[-anti-ransomware-auto-switch-from-learning-to-enabled {true|false}] - Anti-ransomware Auto-switch from Learning to Enabled`**

This parameter optionally specifies whether anti-ransomware state of the volumes in this Vserver are automatically switched by the system from "learning" (dry-run) to "enabled" (active) state after sufficient learning. The default value is *true*.

### **`[-anti-ransomware-auto-switch-minimum-incoming-data-percent <percent>] - Anti-ransomware Auto-switch Minimum Incoming Data (in percentage)`**

One of the many conditions to be satisfied to automatically switch the anti-ransomware state of the volumes in this Vserver from "learning" (dry-run) to "enabled" is that the volume should have sufficient data ingested to do the learning. This parameter optionally specifies the minimum amount of data (in percentage) to be written to a given volume during the learning period to automatically switch the anti-ransomware state from "learning" to "enabled". The amount of data considered as ingested also includes the data that is deleted or overwritten after ingestion. The default value is 5%.

### **`[-anti-ransomware-auto-switch-duration-without-new-file-extension <integer>] - Anti-ransomware Auto-switch Duration Without New File Extension (in Days)`**

One of the many conditions to be satisfied to automatically switch the anti-ransomware state of the volumes in this Vserver from "learning" (dry-run) to "enabled" is that no new file-extensions are observed in the volume in recent time. This parameter optionally specifies the recent time duration (in days) to be considered during which no new file-extension should be observed in a given volume to automatically

switch the anti-ransomware state from “learning” to “enabled”. The default value is 3 days.

#### **`[-anti-ransomware-auto-switch-minimum-learning-period <integer>]` - Anti-ransomware Auto-switch Minimum Learning Period**

One of the many conditions to be satisfied to automatically switch the anti-ransomware state of the volumes in this Vserver from “learning” (dry-run) to “enabled” is that the volume should be in “learning” state for sufficient time period. This parameter optionally specifies the minimum number of days a given volume should be in “learning” state to automatically switch the anti-ransomware state from “learning” to “enabled”. The default value is 10 days.

#### **`[-anti-ransomware-auto-switch-minimum-file-count <integer>]` - Anti-ransomware Auto-switch Minimum File Count**

One of the many conditions to be satisfied to automatically switch the anti-ransomware state of the volumes in this Vserver from “learning” (dry-run) to “enabled” is that the volume should have sufficient number of files created in “learning” state. This parameter optionally specifies the minimum number of new files to be created in a given volume in “learning” state to automatically switch the anti-ransomware state from “learning” to “enabled”. The default value is 200.

#### **`[-anti-ransomware-auto-switch-minimum-file-extension <integer>]` - Anti-ransomware Auto-switch Minimum File Extension**

One of the many conditions to be satisfied to automatically switch the anti-ransomware state of the volumes in this Vserver from “learning” (dry-run) to “enabled” is that the volume should have sufficient unique file extension count in “learning” state. This parameter optionally specifies the minimum number of unique file extension count in a given volume in “learning” state to automatically switch the anti-ransomware state from “learning” to “enabled”. The default value is 10 days.

## **Examples**

The following example creates a Vserver named `vs0.example.com` in the IPspace `ipspace123`. The Vserver’s root volume is named `root_vs0` and is located on aggregate `aggr0`. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```
cluster1::> vsriver create -vsriver vs0.example.com -ipspace ipspace123
-rootvolume root_vs0 -aggregate aggr0
-language en_US.UTF-8 -rootvolume-security-style mixed
```

The following example creates a Vserver named `vs1` using default values. The default name for the Vserver’s root volume is `vserverName_root` and the Vserver is located on an aggregate selected on the basis of the Vserver setup algorithm. The default root volume’s security style is set to `unix`.

```
cluster1::> vsriver create -vsriver vs1
cluster1::> vsriver show -vsriver vs1 -fields rootvolume, rootvolume-
security-style, aggregate
vsriver rootvolume aggregate rootvolume-security-style
-----
vs1      vs1_root    aggr1      unix
```

# vserver delete

Delete an existing Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver delete` command deletes a specified Vserver. If the Vserver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vserver. If the Vserver subtype is *dp-destination*, change the Vserver subtype to *default* by specifying the Vserver as the destination in the [snapmirror break](#) command before deleting the objects owned by the Vserver.

## Parameters

**-vserver <vserver> - Vserver**

This specifies the Vserver that is to be deleted.

**[-foreground {true|false}] - Foreground Process**

This optionally specifies the Vserver delete operation can be executed in the background. If nothing is specified, by default the Vserver delete operation is executed in the foreground.

## Examples

The following example deletes a Vserver named `vs2.example.com`:

```
cluster1::> vserver delete -vserver vs2.example.com
```

# vserver modify

Modify a Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver modify` command modifies the attributes of a specified Vserver. If the Vserver subtype is of type *dp-destination*, then only the `-aggr-list` parameter can be modified.

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the Vserver that is to be modified.

### **[-language <Language code>] - Default Volume Language Code**

This optional parameter specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append *.UTF-8* for the language encoding values. For example, for the *en\_US* language, the recommended format is *en\_US.UTF-8*. The default setting is *C.UTF-8*.

### **[-snapshot-policy <snapshot policy>] - Snapshot Policy**

This optional parameter specifies the snapshot policy for new volumes created on the Vserver. Changing the snapshot policy for a Vserver will not change the snapshot policy for the existing volumes within the Vserver and it will only be applicable for the new volumes that will be created later. You can use the *-snapshot-policy* parameter with the volume create or volume modify commands to set the snapshot policy on a specific volume, regardless of its Vserver's snapshot policy setting.

### **[-comment <text>] - Comment**

This optional parameter specifies a comment for the Vserver.

### **[-quota-policy <text>] - Quota Policy**

This optional parameter specifies a quota policy to be used for all volumes associated with a Vserver. You can create and configure multiple, different quota policies, but each Vserver must have one and only one associated quota policy.

### **[-aggr-list <aggregate name>,...] - List of Aggregates Assigned**

This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vserver by the Vserver administrator. But these aggregates do not become exclusive property of the Vserver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as "-", then the Vserver administrator cannot create any volumes for that Vserver. Note that the cluster administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

### **[-max-volumes <integer\_or\_unlimited>] - Limit on Maximum Number of Volumes allowed**

This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume.

### **[-admin-state {running|stopped|starting|stopping|initializing|deleting}] - Vserver Admin State (privilege: advanced)**

Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include *running* and *stopped*.

### **[-allowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme|s3}] - Allowed Protocols**

This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of *vserver-modify*, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*.

### **[-disallowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme|s3}] - Disallowed Protocols**

This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of *vserver-modify*, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*.

### **`[-qos-policy-group <text>]` - QoS Policy Group**

This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none".

### **`[-caching-policy <text>]` - Caching Policy Name**

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

### **`[-is-space-reporting-logical {true|false}]` - Logical Space Reporting**

This optionally specifies whether to report space logically on residing volumes which are created after this operation. Existing volumes will not be affected by modifying this value on an existing Vserver. To change whether space is reported logically for existing volumes, you will have to modify the setting on those volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used.

### **`[-is-space-enforcement-logical {true|false}]` - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on residing volumes which are created after this operation. Older volumes will continue to have old value. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used.

### **`[-anti-ransomware-default-volume-state {disabled|dry-run}]` - Default Anti\_ransomware State of the Vserver's Volumes**

This optional parameter specifies the default anti\_ransomware state for the volumes in the Vserver. When this is dry\_run, all the volumes created henceforth will by default have anti\_ransomware state as dry-run. Similarly, when this is disabled, all the volumes created henceforth will by default have anti\_ransomware state as disabled.

### **`[-auto-enable-analytics {true|false}]` - Enable Analytics on New Volumes**

This optional parameter specifies whether analytics is automatically enabled for the volumes in the Vserver that is being modified. The default value is false.

**`[-auto-enable-activity-tracking {true|false}] - Enable Activity Tracking on New Volumes`**

This optional parameter specifies whether activity tracking is automatically enabled for the volumes in the Vserver that is being modified. The default value is `false`.

**`[-storage-limit {<integer>[KB|MB|GB|TB|PB]}] - Storage Limit`**

This parameter specifies the storage size limit for a Vserver. This parameter can be set to zero to disable storage-limit enforcement on a Vserver. Default value is 0.

**`[-storage-limit-threshold-alert <percent>] - Storage Limit Threshold Alert`**

This parameter specifies when the "vserver.storage.threshold" event log message is generated. This parameter can be set to zero to disable "vserver.storage.limit.threshold.exceeded" event log message. Default value is 90%.

**`[-anti-ransomware-auto-switch-from-learning-to-enabled {true|false}] - Anti-ransomware Auto-switch from Learning to Enabled`**

This optional parameter specifies whether anti-ransomware will be automatically enabled on the volumes in the Vserver that is being modified. The default value when creating a Vserver is `true`.

**`[-anti-ransomware-auto-switch-minimum-incoming-data-percent <percent>] - Anti-ransomware Auto-switch Minimum Incoming Data (in percentage)`**

This optional parameter specifies minimum incoming writes (in percentage) required to automatically enable anti-ransomware on volumes in the Vserver. The default value when creating a Vserver is 5%.

**`[-anti-ransomware-auto-switch-duration-without-new-file-extension <integer>] - Anti-ransomware Auto-switch Duration Without New File Extension (in Days)`**

This optional parameter specifies number of days without a new incoming extension to automatically enable anti-ransomware on volumes in the Vserver. The default value when creating a Vserver is 3 days.

**`[-anti-ransomware-auto-switch-minimum-learning-period <integer>] - Anti-ransomware Auto-switch Minimum Learning Period`**

This optional parameter specifies minimum number of days a volume in the Vserver must be in learning mode to automatically enable anti-ransomware. The default value when creating a Vserver is 10 days.

**`[-anti-ransomware-auto-switch-minimum-file-count <integer>] - Anti-ransomware Auto-switch Minimum File Count`**

This optional parameter specifies minimum number of new files created in volume to automatically enable anti-ransomware on volume in the vservers. The default value when creating a Vserver is 200.

**`[-anti-ransomware-auto-switch-minimum-file-extension <integer>] - Anti-ransomware Auto-switch Minimum File Extension`**

This optional parameter specifies minimum number of new file extensions in a volume to automatically enable anti-ransomware on volume in the vservers. The default value when creating a Vserver is 10.

## Examples

The following example modifies the quota policy for a Vserver named `vs0.example.com` to `pol1`, specifies a snapshot policy named `daily`, adds the comment "Sales team access".

```
cluster1::> vserver modify -vserver vs0.example.com -snapshot-policy daily  
-comment "Sales team access" -quota-policy poll
```

## vserver prepare-for-revert

Prepares Vservers to be reverted

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver prepare-for-revert` command prepares Vservers to be reverted to the previous version of ONTAP. It disables any operations that cannot be scheduled during revert.

### Examples

The following example prepares all Vservers to be reverted.

```
cluster1::*> vserver prepare-for-revert
```

## vserver remove-aggregates

Remove aggregates from the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver remove-aggregates` command removes aggregates from the Vserver.

### Parameters

**-vserver <vserver> - Vserver**

Specifies the Vserver from which aggregates have to be removed.

**-aggregates <aggregate name>, ... - List of Aggregates to Be Removed**

Specifies the list of aggregates to remove from the Vserver.

### Examples

The following example illustrates how to remove aggregates *aggr1* and *aggr2* from a Vserver named *vs.example.com*:

```
cluster1::> vsriver remove-aggregates -vsriver vs.example.com -aggregates
aggr1,aggr2
```

## vsriver remove-protocols

Remove protocols from the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vsriver remove-protocols` command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.

### Parameters

**-vsriver <vsriver> - Vserver**

Specifies the Vserver that is to be modified.

**-protocols {nfs|cifs|fcp|iscsi|ndmp|nvme|s3} - Protocols**

This parameter specifies the list of protocols to be removed. on the Vserver. Possible values include *nfs* , *cifs* , *fcp* , *iscsi* , *ndmp* , *s3* , and *nvme* .

### Examples

The following example shows removing protocol 'cifs' from a Vserver named vs0.example.com.

```
cluster1::> vsriver remove-protocols -vsriver vs0.example.com -protocols
cifs
```

## vsriver rename

Rename a Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vsriver rename` command renames the Vserver. If the vsriver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

### Parameters

### **-vserver <text> - Vserver**

This specifies the Vserver that is to be renamed.

### **-newname <vserver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)**

This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

### **[-foreground {true|false}] - Foreground Process**

This specifies whether the rename job will be run in foreground or background. By default, the job runs in foreground.

## **Examples**

The following examples rename a Vserver named *vs1.example.com* as *vs2.example.com*, and then finally back to its original name:

```
(When there is no intercluster Vserver peer relationship with the vsriver)
cluster1::> vsriver rename -vsriver vs1.example.com -newname
vs2.example.com
(When there is at least one intercluster peer relationship with the
Vserver)
cluster1::> vsriver rename -vsriver vs1.example.com -newname
vs2.example.com
[Job 277] Job succeeded: Vserver rename completed successfully
cluster1::> vsriver rename -vsriver vs2.example.com -newname
vs1.example.com -foreground false
[Job 278] Job is queued: Rename Vserver vs2.example.com to
vs1.example.com.
```

## **vserver restamp-msid**

Restamp the MSIDs of all the volumes in a Vserver to match or be different from the source Vserver

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `vserver restamp-msid` command restamps MSIDs of all volumes in a dp-destination Vserver to make them either identical to the VserverDR source Vserver. The command is run on secondary VserverDR site and automatically updates the MSID preserve behavior for the Vserver. A [snapmirror resync](#) must be run after this command completes.

## Parameters

**-vserver <vserver name> - Vserver name (privilege: advanced)**

The name of the dp-destination Vserver.

**-preserve-msid {true|false} - Make MSID same as that of source Vserver. False sets the values as different. (privilege: advanced)**

Boolean value through which the user can specify whether to make the MSIDs of the volumes same as that of Source Vserver. Specifying true will make the MSIDs same and specifying false will make them different.

## Examples

This example will stamp all the volumes of Vserver vs1dp with the same MSID as the source Vserver.

```
cluster1::>vserver restamp-msid -vserver vs1dp -preserve-msid true
```

## Related Links

- [snapmirror resync](#)

## vserver show-aggregates

Show details of aggregates in a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver show-aggregates` command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

**[-aggregate <aggregate name>] - Aggregate**

If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

## Examples

The following example displays the aggregates configured for Vserver vs.

```
cluster1::> vservers show-aggregates -vservers vs
```

| Vserver | Aggregate | State  | Size    | Type | SnapLock-Type |
|---------|-----------|--------|---------|------|---------------|
| vs      | aggr1     | online | 795.2MB | hdd  | non-snaplock  |
| vs      | aggr2     | online | 795.2MB | hdd  | non-snaplock  |

2 entries were displayed.

## vservers show-protocols

Show protocols for Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservers show-protocols` command displays the running protocols on a given Vserver.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vservers <vservers>] - Vservers**

If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

**[-protocol {nfs|cifs|fc|iscsi|ndmp|nvme|s3}] - Protocols**

If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.

## Examples

The following example displays the protocols configured for Vserver vs1.

```
cluster1::> vservers show-protocols -vservers vs1
Vserver: vs1
Protocols: nfs, cifs
```

# vserver show

## Display Vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver show` command displays the following information:

- Vserver name
- Vserver type (*data* , *admin* , *node* or *system* - detailed view only)
- Vserver subtype (*default* , *dp-destination* , *sync-source* , and *sync-destination* - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
- Aggregate on which the root volume is located
- Associated NIS domain
- Root volume security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both (detailed view only)
- LDAP client
- Language (detailed view only)
- Snapshot policy (detailed view only)
- Comment text (detailed view only)
- Quota policy (detailed view only)
- Aggregate list (detailed view only)
- Maximum Volumes (detailed view only)
- Qos-policy-group (detailed view only)
- Config-lock (detailed view only)
- Admin state (*running* , *stopped* , *starting* , *stopping* , *initializing* , or *deleting* )
- Operational state (*running* , or *stopped* )
- Operational state stopped reason (*sync-destination-and-switchover-not-done* , or *cluster-reboot-done* , or *admin-state-stopped* )
- Allowed Protocols (*nfs* , *cifs* , *fc* , *iscsi* , *nvme* , *ndmp* - detailed view only)
- Disallowed Protocols (*nfs* , *cifs* , *fc* , *iscsi* , *nvme* , *ndmp* - detailed view only)
- IPspace to which the Vserver belongs (detailed view only)
- Caching policy

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-protocols ]**

If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If this parameter is specified, the command displays detailed information about the specified Vserver.

**[-type <vserver type>] - Vserver Type**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include *admin* for the cluster-wide management Vserver, *system* for cluster-level communications in an IPspace, *data* for data serving Vserver, and *node* for node management Vserver.

**[-subtype <vserver subtype>] - Vserver Subtype**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:

- *default* for default data Vserver  
\*
- and
- *dp-destination* for Data Protection destination Vserver.
- *sync-source* for MetroCluster source Vserver,
- *sync-destination* for MetroCluster destination Vserver.

**[-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

**[-rootvolume <volume name>] - Root Volume**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

**[-nisdomain <nis domain>] - NIS Domain**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

**[-rootvolume-security-style <security style>] - Root Volume Security Style**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style.

**[-ldap-client <text>] - LDAP Client**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

**[-language <Language code>] - Default Volume Language Code**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "`vserver show-language` ?``" at the clustershell command prompt and at the Vserver prompt.

**[-snapshot-policy <snapshot policy>] - Snapshot Policy**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified snapshot policy.

**[-data-services <LIF Service Name>,...] - Data Services**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified data services.

**[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.

**[-quota-policy <text>] - Quota Policy**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified quota policy.

**[-aggr-list <aggregate name>,...] - List of Aggregates Assigned**

If this parameter is specified, the command displays information only about the Vserver or Vservers to which the specified aggregate(s) are assigned for use.

**[-max-volumes <integer\_or\_unlimited>] - Limit on Maximum Number of Volumes allowed**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified maximum volume count is configured.

**[-admin-state {running|stopped|starting|stopping|initializing|deleting}] - Vserver Admin State**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified admin-state.

**[-operational-state {running|stopped}] - Vserver Operational State**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in stopped state, will be operationally down.

**[-operational-state-stopped-reason {sync destination and switchover is not done|cluster reboot is done|admin state stopped| dp destination not started}] - Vserver Operational State Stopped Reason**

If this parameter is specified, the command displays information only about the Vserver or Vservers that are operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the Vserver being stopped

#### **[`-allowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme|s3}`] - Allowed Protocols**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are allowed to run.

#### **[`-disallowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme|s3}`] - Disallowed Protocols**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are disallowed to run.

#### **[`-is-repository {true|false}`] - Is Vserver with Infinite Volume**

If this parameter is no longer supported.

#### **[`-qos-policy-group <text>`] - QoS Policy Group**

Display the Vservers that match the specified qos-policy-group.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it.

#### **[`-caching-policy <text>`] - Caching Policy Name**

Display the Vservers that match the specified caching-policy.

A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read, and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

#### **[`-config-lock {true|false}`] - Config Lock**

This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

#### **[`-ipspace <IPspace>`] - IPspace Name**

If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

### **[`-foreground {true|false}`] - Foreground Process**

This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

### **[`-is-space-reporting-logical {true|false}`] - Logical Space Reporting**

This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used.

### **[`-is-space-enforcement-logical {true|false}`] - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used.

### **[`-anti-ransomware-default-volume-state {disabled|dry-run}`] - Default Anti\_ransomware State of the Vserver's Volumes**

This optionally specifies the default anti\_ransomware state for the volumes in the Vserver. The available anti\_ransomware states for the volumes in the Vserver are:

- disabled - Anti\_ransomware protection is not enabled on the volumes in the Vserver.
- dry-run - Anti\_ransomware protection is in evaluation mode on the volumes in the Vserver.

### **[`-auto-enable-analytics {true|false}`] - Enable Analytics on New Volumes**

This parameter specifies whether analytics is automatically enabled for the volumes in the Vserver.

### **[`-auto-enable-activity-tracking {true|false}`] - Enable Activity Tracking on New Volumes**

This parameter specifies whether activity tracking is automatically enabled for the volumes in the Vserver.

### **[`-storage-allocated {<integer>[KB|MB|GB|TB|PB]}`] - Total Size of the Volumes**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for storage allocated.

### **[`-storage-available {<integer>[KB|MB|GB|TB|PB]}`] - Available Size**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for storage available.

### **[`-storage-used-percentage <percent>`] - Used Percent**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for used storage percentage.

### **[`-number-of-volumes-in-recovery-queue <integer>`] - Number of Volumes in Recovery Queue**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for number of volumes in recovery queue.

### **[`-total-volume-size-in-recovery-queue {<integer>[KB|MB|GB|TB|PB]}`] - Storage Space in Recovery Queue Volumes**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for total volume size in recovery queue.

**[`-storage-limit-threshold-exceeded {true|false}`] - Max Storage Alert Threshold Exceeded**

If this parameter is specified, the command displays the information only about the Vserver or Vservers whether that exceeded the value specified in the storage-limit-threshold-alert.

**[`-storage-limit {<integer>[KB|MB|GB|TB|PB]}`] - Storage Limit**

If this parameter is specified, the command displays the information only about the Vserver or Vservers that match the specified value for storage limit.

**[`-storage-limit-threshold-alert <percent>`] - Storage Limit Threshold Alert**

If this parameter is specified, the command display the information only about the Vserver or Vservers that match the specified value for storage limit threshold alert.

**[`-anti-ransomware-auto-switch-from-learning-to-enabled {true|false}`] - Anti-ransomware Auto-switch from Learning to Enabled**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_from\_learning\_to\_enabled.

**[`-anti-ransomware-auto-switch-minimum-incoming-data-percent <percent>`] - Anti-ransomware Auto-switch Minimum Incoming Data (in percentage)**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_minimum\_incoming\_data.

**[`-anti-ransomware-auto-switch-duration-without-new-file-extension <integer>`] - Anti-ransomware Auto-switch Duration Without New File Extension (in Days)**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_duration\_without\_new\_file\_extension.

**[`-anti-ransomware-auto-switch-minimum-learning-period <integer>`] - Anti-ransomware Auto-switch Minimum Learning Period**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_minimum\_learning\_period.

**[`-anti-ransomware-auto-switch-minimum-file-count <integer>`] - Anti-ransomware Auto-switch Minimum File Count**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_minimum\_file\_count.

**[`-anti-ransomware-auto-switch-minimum-file-extension <integer>`] - Anti-ransomware Auto-switch Minimum File Extension**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for anti\_ransomware\_auto\_switch\_minimum\_file\_extension.

**[`-storage-reserved {<integer>[KB|MB|GB|TB|PB]}`] - Storage Reserved for In-flight Volume Operations**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified value for storage reserved.

## Examples

The following example displays information about all Vservers.

```
cluster1::> vsriver show
```

```
non mcc setup:
```

| Vserver | Type  | Admin Subtype  | Operational state | Root state | Volume   | Aggregate |
|---------|-------|----------------|-------------------|------------|----------|-----------|
| cluster | admin | -              | -                 | -          | -        | -         |
| node1   | node  | -              | -                 | -          | -        | -         |
| vs0     | data  | default        | running           | running    | root_vs1 | aggr0     |
| vs1     | data  | dp-destination | stopped           | stopped    | -        | -         |

```
4 entries were displayed.
```

```
mcc setup:
```

```
cluster1::> vsriver show
```

| Vserver   | Type  | Admin Subtype    | Operational state | Root state | Volume | Aggregate |
|-----------|-------|------------------|-------------------|------------|--------|-----------|
| cluster   | admin | -                | -                 | -          | -      | -         |
| node1     | node  | -                | -                 | -          | -      | -         |
| vs2       | data  | sync-source      | running           | running    | rv     |           |
| data_aggr |       |                  |                   |            |        |           |
| vs3-mc    | data  | sync-destination | running           | stopped    | -      | -         |

```
4 entries were displayed.
```

## vsvrr start

### Start a Vsvrr

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vsvrr start` command starts data access on a Vsvrr.

### Parameters

**-vsvrr <vsvrr> - Vsvrr**

This specifies the name of the Vsvrr on which the data access is to be started. This operation is only supported on a data Vsvrr.

The name must be of 47 characters length or less.

### **`[-foreground {true|false}] - Foreground Process`**

This specifies if the `vserver start` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver start` command is executed in the foreground.

### **`[-force <true>] - Force Vserver Start`**

In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to `false`.

## **Examples**

The following example starts data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver start -vserver vs0.example.com -foreground false
```

## **vserver stop**

### **Stop a Vserver**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vserver stop` command stops data access on a Vserver.

### **Parameters**

#### **`-vserver <vserver> - Vserver`**

This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

The name must be of 47 characters length or less.

### **`[-foreground {true|false}] - Foreground Process`**

This specifies if `vserver stop` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver stop` command is executed in the foreground.

## **Examples**

The following example stops data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

# vserver unlock

## Unlock Vserver configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver unlock` command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the `-force` option.

### Parameters

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of the Vserver that has to be unlocked.

**[-force <true>] - Force Unlock (privilege: advanced)**

This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

### Examples

The following example illustrates how to unlock the Vserver named `vs123.example.com`, *forcefully*:

```
cluster1::> vserver unlock -vserver vs1.example.com -force true
```

## vserver active-directory commands

### vserver active-directory create

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

Each Vserver can have only one Active Directory account.

## Parameters

### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

### **-account-name <NetBIOS> - Active Directory NetBIOS Name**

This parameter specifies the name of the Active Directory account (up to 15 characters).

### **-domain <TextNoCase> - Fully Qualified Domain Name**

This parameter specifies the name of the Active Directory domain.

### **[-ou <text>] - Organizational Unit**

This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to *CN=Computers*. When specifying this parameter, specify only the organizational unit portion of the distinguished name. ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used when creating the Vserver's Active Directory account in the domain.

Nested OUs must be provided in a specific order with all containers separated by a comma. Reading from left to right you travel up the directory tree until you reach the root OU.

## Examples

The following example creates an Active Directory account *ADSERVER1* for Vserver *vs1* and domain *example.com*.

```
cluster1::> vsriver active-directory create -vserver vs1 -account-name  
ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account *ADSERVER2* for Vserver *vs2*, domain *example.com* and organizational unit *sample\_ou*.

```
cluster1::> vsserver active-directory create -vsserver vs2 -account-name  
ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample\_ou" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account *ADSERVER2* for Vserver *vs2*, domain *example.com* and nested organizational unit *OU=developers,OU=engineering,OU=corp*.

```
cluster1::> vsserver active-directory create -vsserver vs2 -account-name  
ADSERVER2 -domain example.com -ou OU=developers,OU=engineering,OU=corp
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=developers,OU=engineering,OU=corp" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

## vsserver active-directory delete

### Delete an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver active-directory delete` command deletes the Active Directory account for a specified Vserver.

#### Parameters

**-vsserver <vsserver> - Vserver**

This parameter specifies the Vserver for the Active Directory account you want to delete.

## Examples

The following example deletes the Active Directory account for a Vserver named *vs1* :

```
cluster1::> vsriver active-directory delete -vsriver vs1
In order to delete an Active Directory machine account, you must supply
the
name and password of a Windows account with sufficient privileges to
remove
computers from the "example.com" domain.

Enter the user name: Administrator

Enter the password:
```

## vsriver active-directory modify

Modify the domain of an Active Directory account. If re-joining the current domain or joining a new one, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver active-directory modify` command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

### Parameters

#### **-vsriver <vsriver> - Vsriver**

This parameter specifies the Vsriver for the Active Directory account whose associated domain you want to modify.

#### **[-domain <TextNoCase>] - Fully Qualified Domain Name**

This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

## Examples

The following example modifies the Active Directory domain associated with Vsriver *vs1* .

```
cluster1::> vserver active-directory modify -vserver vs1 -domain
example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

## vserver active-directory password-change

Change the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver active-directory password-change` command changes the domain account password for the specified Vserver's Active Directory account.

### Parameters

#### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to change.

### Examples

The following example changes the password for the Active Directory account for a Vserver named *vs1*.

```
cluster1::> vserver active-directory password-change -vserver vs1
```

## vserver active-directory password-reset

Reset the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver active-directory password-reset` command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that

contains the machine account.

## Parameters

### **-vserver <vserver> -Vserver**

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to reset.

## Examples

The following example resets the password for the Active Directory account for a Vserver named *vs1*.

```
cluster1::> vserver active-directory password-reset -vserver vs1
```

```
Enter your user ID: Administrator
```

```
Enter your password:
```

## **vserver active-directory show**

### Display Active Directory accounts

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver active-directory show` command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

- Vserver name
- Active Directory account NetBIOS name
- Domain or workgroup name

You can specify the `-fields` parameter to specify which fields of information to display about Active Directory accounts. You can use `-fields ?` to display the valid values for the `-fields` parameter. In addition to the fields above, you can display the following fields:

- Fully-qualified domain name
- Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named *RUBY*, run the command with the value of the `-domain-workgroup` parameter set to *RUBY*.

You can specify the `-instance` parameter to display all information for all Active Directory accounts in list form.

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

| [-instance ] }

If you specify the -instance parameter, the command displays detailed information about all entries.

[-vserver <vserver>] - Vserver

If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.

[-account-name <NetBIOS>] - Active Directory NetBIOS Name

If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.

[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

Workgroups are not supported in this release.

[-domain <TextNoCase>] - Fully Qualified Domain Name

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.

[-ou <text>] - Organizational Unit

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.

[-auth-style {domain|workgroup|realm}] - Authentication Style

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

Examples

The following example displays a subset of the information about all Active Directory accounts.

```
cluster1::> vsserver active-directory show
Account      Domain/Workgroup
Vserver      Name          Name
-----
vs1          ADSERVER1     EXAMPLE
```

The following example displays all information about all Active Directory Vservers in list form.

```
cluster1::> vsserver active-directory show -instance
Vserver: vs1
    Active Directory account NetBIOS Name: ADSERVER1
    NetBIOS Domain/Workgroup Name: EXAMPLE
    Fully Qualified Domain Name: EXAMPLE.COM
    Organizational Unit: CN=Computers
```

## vsserver audit commands

### vsserver audit create

#### Create an audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver audit create` command creates an audit configuration for a *Vserver*.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (`-rotate-schedule-month`, `-rotate-schedule-dayofweek`, `-rotate-schedule-day`, `-rotate-schedule-hour`, and `-rotate-schedule-minute`). The `-rotate-schedule-minute` parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the `-rotate-schedule-minute` parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say `-rotate-schedule-month` and `-rotate-schedule-minutes`), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both `-rotate-schedule-dayofweek` and `-rotate-schedule-day`, they are considered independently. For example if you specify `-rotate-schedule-dayofweek` as `Friday` and `-rotate-schedule-day` as `13` then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the *Vserver* on which to create the audit configuration. The *Vserver* must already exist.

##### **-destination <text> - Log Destination Path**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write

permissions.

**[*-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group|async-delete}*] -**

### **Categories of Events to Audit**

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops* , *cifs-logon-logoff* , *cap-staging* , *file-share* , *audit-policy-change* , *user-account* , *security-group* and *authorization-policy-change* .By default, *file-ops* , *cifs-logon-logoff* and *audit-policy-change* events are enabled. The support for *audit-policy-change* event can be modified from diag prompt using [vserver audit modify](#) command.

### **[*-format {xml|evt}*] - Log Format**

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVT log format. By default, the output format is EVT.

### **[*-rotate-size {<size>|-}*] - Log File Size Limit**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

### **[*-rotate-schedule-month <cron\_month>,...*] - Log Rotation Schedule: Month**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

### **[*-rotate-schedule-dayofweek <cron\_dayofweek>,...*] - Log Rotation Schedule: Day of Week**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

### **[*-rotate-schedule-day <cron\_dayofmonth>,...*] - Log Rotation Schedule: Day**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

### **[*-rotate-schedule-hour <cron\_hour>,...*] - Log Rotation Schedule: Hour**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

### **[*-rotate-schedule-minute <cron\_minute>,...*] - Log Rotation Schedule: Minute**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

### **{ [*-rotate-limit <integer>*] - Log Files Rotation Limit**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 10 for cloud optimized platform and 0 for all other platform. For example, if

you enter a value of 5, the last five audit logs are retained.

## **| [-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Log Retention Duration }**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. The default value is 0s. For example, if you enter a value of 5d0h0m, logs more than 5 days old are deleted.

### **Examples**

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vsserver audit create -vserver vs1 -destination /audit_log  
-rotate-size 10MB -rotate-limit 5
```

+ +

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsserver audit create -vserver vs1 -destination /audit_log  
-rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule  
-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vsserver audit create -vserver vs1 -destination /audit_log  
-rotate-schedule-month January, March, May, July, September, November -rotate  
-schedule-dayofweek Monday, Wednesday, Friday -rotate-schedule-hour 6, 12, 18  
-rotate-schedule-minute 15, 30, 45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVT\_X.

```
cluster1::> vsserver audit create -vserver vs1 -destination /audit_log  
-format evt_x -events file-ops
```

### **Related Links**

- [vsserver audit modify](#)

## vserver audit delete

### Delete audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver audit delete` command deletes the audit configuration for a Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

**[-force <true>] - Force Delete (privilege: advanced)**

This parameter is used to forcibly delete the audit configuration. By default the setting is `false`.

### Examples

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vserver audit delete -vserver vs1
```

## vserver audit disable

### Disable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver audit disable` command disables auditing for a Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

### Examples

The following example disables auditing for Vserver vs1.

```
cluster1::> vserver audit disable -vserver vs1
```

## vserver audit enable

### Enable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver audit enable` command enables auditing for a Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

#### **[-force <true>] - Force Enable (privilege: advanced)**

This parameter is used to ignore errors while enabling auditing.

### Examples

The following example enables auditing for Vserver vs1:

```
cluster1::> vserver audit enable -vserver vs1
```

## vserver audit modify

### Modify the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver audit modify` command modifies an audit configuration for a Vserver.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the `-rotate-schedule-dayofweek` parameter to Monday,Wednesday,Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".

#### **[-destination <text>] - Log Destination Path**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path

is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

**`[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group|async-delete}] - Categories of Events to Audit`**

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. By default, *file-ops*, *cifs-logon-logoff* and *audit-policy-change* events are enabled

**`[-format {xml|evt}] - Log Format`**

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVT log format. By default, the output format is EVT.

**`[-rotate-size {<size>|-}] - Log File Size Limit`**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

**`[-rotate-schedule-month <cron_month>,...] - Log Rotation Schedule: Month`**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

**`[-rotate-schedule-dayofweek <cron_dayofweek>,...] - Log Rotation Schedule: Day of Week`**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

**`[-rotate-schedule-day <cron_dayofmonth>,...] - Log Rotation Schedule: Day`**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

**`[-rotate-schedule-hour <cron_hour>,...] - Log Rotation Schedule: Hour`**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

**`[-rotate-schedule-minute <cron_minute>,...] - Log Rotation Schedule: Minute`**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

**`{ [-rotate-limit <integer>] - Log Files Rotation Limit`**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

## **| [-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Log Retention Duration }**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. For example, if you enter a value of 5d0h0m0s, logs more than 5 days old are deleted.

## **[-audit-guarantee {true|false}] - Strict Guarantee of Auditing**

This parameter specifies strict guarantee of auditing for a Vserver. If this value is true, file access is denied if audit records cannot be generated. If this value is false, auditing is done on a best-effort basis.

## **[-charge-qos {true|false}] - Audit Log Extra Charge**

This parameter specifies whether the audit logs will incur an extra charge. This extra charge is counted against the Volume's Qos policy. If this value is set to *false*, it indicates that audit logs will not incur an extra charge.

## **Examples**

The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

```
cluster1::> vsserver audit modify -vserver vs1 -rotate-size 10MB -rotate
-limit 3
```

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsserver audit modify -vserver vs1 -destination /audit_log
-rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule
-hour 12 -rotate-schedule-minute 30
```

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vsserver audit modify -vserver vs1 -format evtx -events file-
ops
```

## **vsserver audit prepare-to-downgrade**

### **Restore the Audit configuration to Earlier Release of Data ONTAP**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `vsserver audit prepare-to-downgrade` command restores the Audit configurations for ONTAP based on the input parameter `disable-feature-set`.

## Parameters

### **-disable-feature-set <downgrade version> - Data ONTAP Version (privilege: advanced)**

This parameter specifies the ONTAP version that introduced the new Audit features and needs to be removed. The value can be one of the following:

- 9.0.0 - Disables the Audit features introduced in the ONTAP release 9.0.0. The following events are removed from the event list:
- File share event. The corresponding parameter value is *file-share*.
- Audit policy change event. The corresponding parameter value is *audit-policy-change*.
- Local user account management event. The corresponding parameter value is *user-account*.
- Local security group management event. The corresponding parameter value is *security-group*.
- Authorization policy change event. The corresponding parameter value is *authorization-policy-change*.

## Examples

```
cluster1::*> vserver audit prepare-to-downgrade -disable-feature-set 9.0.0
```

## **vserver audit rotate-log**

Rotate audit log

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit rotate-log` command rotates audit logs for a Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

## Examples

The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver audit rotate-log -vserver vs1
```

## **vserver audit show**

Display the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit show` command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields` parameter to specify which audit configuration information to display about Vservers. + You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size 10MB` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-log-save-details ]**

You can specify the `-log-save-details` parameter to display the following information about all the Vservers:

- Vserver name
- Rotation file size
- Rotation schedules
- Rotation limit

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information about the specified Vserver.

**[-state {true|false}] - Auditing State**

If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

**[-destination <text>] - Log Destination Path**

If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

**[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group|async-delete}] - Categories of Events to Audit**

If you specify this parameter, the command displays information about the Vservers that use the specified

category of events that are audited. Valid values are *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. *audit-policy-change* will appear only in diag mode.

**`[-format {xml|evt}] - Log Format`**

If you specify this parameter, the command displays information about the Vservers that use the specified log format.

**`[-rotate-size {<size>|-}] - Log File Size Limit`**

If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

**`[-rotate-schedule-month <cron_month>,...] - Log Rotation Schedule: Month`**

If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

**`[-rotate-schedule-dayofweek <cron_dayofweek>,...] - Log Rotation Schedule: Day of Week`**

If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

**`[-rotate-schedule-day <cron_dayofmonth>,...] - Log Rotation Schedule: Day`**

If you specify this parameter, the command displays information about the Vservers that use the specified day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

**`[-rotate-schedule-hour <cron_hour>,...] - Log Rotation Schedule: Hour`**

If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

**`[-rotate-schedule-minute <cron_minute>,...] - Log Rotation Schedule: Minute`**

If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

**`[-rotate-schedule-description <text>] - Rotation Schedules`**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.

**`[-rotate-limit <integer>] - Log Files Rotation Limit`**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

**`[-retention-duration [<integer>d [<integer>h [<integer>m [<integer>s]]] - Log Retention Duration`**

If you specify this parameter, the command displays information about the Vservers audit logs retention duration.

**`[-audit-guarantee {true|false}] - Strict Guarantee of Auditing`**

If you specify this parameter, the command displays information about the Vservers that have the specified audit guarantee value.

## **[-charge-qos {true|false}] - Audit Log Extra Charge**

If you specify this parameter, the command displays information about the Vservers that have the specified charge-qos value.

### **Examples**

The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver audit show
Vserver      State  Event Types Log Format Target Directory
-----
vs1          false  file-ops    evtx      /audit_log
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details
Rotation
Vserver      File Size Rotation Schedule Limit
-----
vs1          100MB    -
```

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vserver audit show -instance
Vserver: vs1
    Auditing state: true
    Log Destination Path: /audit_log
    Categories of Events to Audit: file-ops
    Log Format: evtx
    Log File Size Limit: 100MB
    Log Rotation Schedule: Month: -
    Log Rotation Schedule: Day of Week: -
    Log Rotation Schedule: Day: -
    Log Rotation Schedule: Hour: -
    Log Rotation Schedule: Minute: -
    Rotation Schedules: -
    Log Files Rotation Limit: 0
    Log Retention Time: 0s
```

## **vserver audit audit-log-redirect create**

Create Audit Log Redirect Vserver destination

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver audit audit-log-redirect create` command creates an audit log redirect configuration to designate a dedicated Vserver for all audit logs in a cluster to reside in.

## Parameters

**-vserver <vserver name> - Audit Log Redirect Vserver (privilege: advanced)**

Use this parameter to specify a dedicated Vserver for all audit logs to reside in.

## Examples

The following example causes all audit logs in a cluster to be redirected to `vserver1` :

```
cluster1::> vserver audit audit-log-redirect create -vserver vserver1
```

## vserver audit audit-log-redirect delete

Delete Audit Log Redirect Vserver destination

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver audit audit-log-redirect delete` command deletes the dedicated Vserver for all audit logs in a cluster to reside in.

## Examples

The following example delete the audit-log-redirect Vserver.

```
cluster1::> vserver audit audit-log-redirect delete
```

## vserver audit audit-log-redirect modify

Modify Audit Log Redirect Vserver destination

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver audit audit-log-redirect modify` command changes the dedicated Vserver for all audit logs in a cluster to reside in.

## Parameters

## **[*-vserver* <*vserver* name>] - Audit Log Redirect Vserver (privilege: advanced)**

Use this parameter to specify a dedicated Vserver for all audit logs to reside in.

### **Examples**

The following example modify the current audit-log-redirect Vserver to *vserver1* :

```
cluster1::> vserver audit audit-log-redirect modify -vserver vserver1
```

## **vserver audit audit-log-redirect show**

Display Audit Log Redirect Vserver destination

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `vserver audit audit-log-redirect show` command displays the dedicated Vserver for all audit logs in a cluster to reside in.

### **Examples**

The following example displays the audit-log-redirect Vserver:

```
cluster1::> vserver audit audit-log-redirect show
Audit Log Redirect Vserver: vserver1
```

## **vserver check commands**

### **vserver check lif-multitenancy run**

(DEPRECATED)-Run check for LIF multitenancy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command is deprecated and may be removed in a future release of ONTAP.

The `run` command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result

from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.

Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.

For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-".

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

## Parameters

### **-vserver <vserver> - Vserver**

Use this parameter to specify the Vserver to check.

### **[-verbose {true|false}] - Show Positive and Negative Result (privilege: advanced)**

When this parameter is specified the results of all connectivity tests will be displayed in the success and failure cases.

## Examples

This is an example of a successful run:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
..
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

```

cluster1::> vserver check lif-multitenancy run -vserver vs0
      Vserver      Severity Service      Address      LIF
Connected Details
-----
vs0      warning  -      -      vs0_lif1
-      operationally down
vs0      warning  -      -      vs0_lif2
-      operationally down
...
vs0      failure  DNS      10.98.200.20  -
no      cache
...
vs0      failure  NIS domain  10.98.13.53  -
no      cache
Error : command failed:  FAILURES FOUND.
      You must correct these failures to avoid service disruptions
      in DOT 8.3 and above.
      Corrective actions may include:
      - removing decommissioned external servers from the vserver
configuration
      - restoring network interfaces that are down
      - adding network interfaces or routes
      - modifying the locations where network interfaces may
reside
      (through
      adjusting failover groups/policies or changing the home-
node or
      auto-revert settings).
      For assistance, please consult the 8.3 Upgrade Document,
      or contact support personnel.

```

At advanced privilege, additional information for messages at all severities is displayed.

```
cluster1::*> vserver check lif-multitenancy run -vserver vs0 -verbose true
....
Vserver      Severity Service      Address      LIF
Connected  Details
-----
vs0          info    DNS          10.98.200.20  vs0_lif1
yes         ping
....
vs0          info    NIS domain   10.98.13.53  vs0_lif1
yes         ping
SUCCESS: All external servers are reachable.
```

## vserver check lif-multitenancy show-results

(DEPRECATED)-Show the results of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future release of ONTAP.

You can view detailed information about the latest completed run, or the run for a Vserver.

- Vserver - name of vserver run was for
- Severity - severity of the message which is failure, warning, or info.  
\*  
Failures are problems that need fixed. Warnings are potential problems that may need to be fixed. Values are "failure", "warning" or "info".
- Service - name of service that is being checked for connectivity
- Address - address of server configured for the above service that is being  
\*  
checked for connectivity.
- LIF - the LIF a successful connectivity check to the above server was made from
- Connected - true of there is connectivity, false if there is not
- Status - additional information useful for resolving issues

### Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

Selects the messages matching the specified Vserver

**[-severity <text>] - Severity**

Selects the messages matching the specified severity of failure, warning, and info.

**[-service <text>] - Service Name**

Selects the messages matching the specified service.

**[-address <text>] - Address of Server**

Selects the messages matching the specified address.

**[-lif <lif-name>] - Logical Interface**

Selects the messages matching the specified LIF.

**[-connected {yes|no}] - Vserver Connectivity**

Selects the messages matching the specified connectivity.

**[-status <text>] - Additional Information**

Selects the messages matching the specified search criteria.

## Examples

Runs that are successful will not have any content.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.
```

Successful runs made with `-verbose true` will show the LIF used to Ping the network address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0

      Vserver      Severity  Service      Network      Logical
      Status      Address      Interface    Connected
-----
vs0
      info      DNS      10.98.200.20      vs0_lif1      yes
ping
      info      NIS domain  10.98.13.53      vs0_lif1      yes
ping
2 entries were displayed.
```

Runs that fail display each failure that needs to be fixed.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
```

| Vserver            | Severity | Service    | Network Address | Logical Interface | Connected |
|--------------------|----------|------------|-----------------|-------------------|-----------|
| vs0                | warning  | -          | -               | vs0_lif1          | -         |
| operationally down | warning  | -          | -               | vs0_lif2          | -         |
| operationally down | failure  | DNS        | 10.98.200.20    | -                 | no        |
| cache              | failure  | NIS domain | 10.98.13.53     | -                 | no        |
| cache              |          |            |                 |                   |           |

4 entries were displayed.

**vserver check lif-multitenancy show**

(DEPRECATED)-Show the summary of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command is deprecated and may be removed in a future release of ONTAP.

You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- Vserver - Name of Vserver that was checked for LIF connectivity
- Start Time - Date And Time the run was started
- Status - Not Started, In Progress, Complete, or Aborted
- Success - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- Updated - The date and time the scan was last updated.

**Parameters**

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

Selects the summary information matching the specified Vserver.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Selects the summary information matching the specified date and time the run was started

**[-status {not started|in progress|complete|aborted}] - Run Status**

Selects the summary information matching the specified status of the run.

**[-success {yes|no}] - Successful Run**

Selects the summary information matching the specified success or failure of the run.

**[-updated <MM/DD/YYYY HH:MM:SS>] - Run Updated**

Selects the summary information matching the last time the run was still in progress.

## Examples

This is what a successful run looks like:

```
cluster1::> vsriver check lif-multitenancy show
Vserver      Start Time      Status      Success
-----
vs0
              7/16/2014 14:28:35    complete    yes
```

This is what a failed run looks like:

```
cluster1::> vsriver check lif-multitenancy show
Vserver      Start Time      Status      Success
-----
vs0
              7/16/2014 14:40:55    complete    no
```

This is what specifying the Vserver looks like:

```
cluster1::> vsriver check lif-multitenancy show -vserver vs0
Vserver: vs0
  Start Time: 7/16/2014 14:40:55
  Run Status: complete
  Successful Run: no
```

Advanced privilege adds in the Updated field.

```
cluster1::*> vserver check lif-multitenancy show
```

| Vserver | Start Time         | Status   | Success | Updated   |
|---------|--------------------|----------|---------|-----------|
| -----   | -----              | -----    | -----   | -----     |
| vs0     | 7/16/2014 14:40:55 | complete | no      | 7/16/2014 |

14:40:56

## vserver cifs commands

### vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The ``vserver cifs add-netbios-aliases`` command creates or adds a list of NetBIOS aliases for the CIFS server name.

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which NetBIOS alias are to be created or added.

##### **-netbios-aliases <NetBIOS>,... - List of NetBIOS Aliases**

This parameter specifies one or more NetBIOS aliases to be added to an existing list of NetBIOS aliases. A new list of NetBIOS aliases is created if the list is currently empty.

#### Examples

The following example creates a new list of NetBIOS aliases for Vserver vs\_a.

```

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
NetBIOS Aliases: -

cluster1::> cifs add-netbios-aliases -netbios-aliases
alias_1,alias_2,alias_3

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3

```

The following example adds several NetBIOS aliases for the CIFS server CIFS\_SERVER on Vserver vs\_a.

```

cluster1::> cifs add-netbios-aliases -netbios-aliases
alias_4,alias_5,alias_6

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                    ALIAS_5, ALIAS_6

cluster1::> vserver cifs add-netbios-aliases -vserver v1 -netbios-aliases
alias_7

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a

    Server Name: CIFS_SERVER
    NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                    ALIAS_5, ALIAS_6, ALIAS_7

```

## vserver cifs check

### Display Validation Status of CIFS Configuration from Each Node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Use the `vserver cifs check` command to check the status of configured CIFS server on a particular vserver.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Use this parameter to specify the Vserver whose CIFS server needs to be validated.

**[-node {<nodename>|local}] - Node**

Use this parameter to specify the node name from which CIFS server connectivity needs to be validated.

**[-netbios-name <TextNoCase>] - CIFS NetBIOS Name**

Use this parameter to display netbios-name of the configured CIFS server.

**[-cifs-status <TextNoCase>] - CIFS Server Status**

Use this parameter to display status of configured CIFS server.

**[-site <TextNoCase>] - CIFS Server Site**

This parameter specifies the site discovered from ONTAP for the Active Directory domain associated with the CIFS server. If the discovery fails, this parameter will be updated with the default-site of associated cifs server.

**[-server <TextNoCase>] - Domain Controller Name**

Use this parameter to display Domain name of the configured CIFS server.

**[-server-ip <text>] - Domain Controller IP Addr**

Use this parameter to display IP-address of the configured CIFS server.

**[-status {down|up}] - Connectivity Status**

Use this parameter to display information only about CIFS servers with a status that matches the value you specify.

**[-status-details <text>] - Connectivity Status Details**

Use this parameter to display information only about CIFS servers with status details that match the value you specify.

## Examples

The following example checks the connectivity of CIFS server on vserver vs0 from each node.

```
cluster1::> vserver cifs check -vserver vs0
```

```
Vserver : vs0
```

```
      Cifs NetBIOS Name : NEWSERVER
```

```
      Cifs Status : up
```

```
      Site : Bangalore
```

| Node Name | DC Server Name | DC Server IP | Status | Status Details             |
|-----------|----------------|--------------|--------|----------------------------|
| node1     | CIFSSERVER.COM | 10.11.12.13  | up     | Response time (msec): 55   |
| node2     | CIFSSERVER.COM | 10.11.12.13  | up     | Response time (msec): 70   |
| node3     | CIFSSERVER.COM | 10.11.12.13  | down   | Secd: No Server available. |

## vserver cifs create

### Create a CIFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs create` command creates a CIFS server on a Vserver. When you create the CIFS server, you can add it to an existing CIFS domain, or you can join it to a workgroup. When you add it to an existing CIFS domain, the storage system prompts you to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. If the new CIFS server is joining a domain, this command might take several minutes to complete.

Each Vserver can have only one CIFS server.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which to create the CIFS server. The Vserver must already exist.

#### **-cifs-server <NetBIOS> - CIFS Server NetBIOS Name**

This parameter specifies the name of the CIFS server (up to 15 characters).

#### **{ -domain <TextNoCase> - Fully Qualified Domain Name**

This parameter specifies the name of the Active Directory domain to associate with the CIFS server.

#### **[-ou <text>] - Organizational Unit**

This parameter specifies the organizational unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to CN=Computers. When specifying this parameter, specify only the organizational unit portion of the distinguished name. ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used to associate with the CIFS server.

Nested OUs must be provided in a specific order with all containers separated by a comma. Reading from left to right you travel up the directory tree until you reach the root OU.

#### **[`-default-site <text>`] - Default Site Used by LIFs Without Site Membership**

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if ONTAP cannot determine an appropriate site. This parameter will also be used for discovering KDCs in the trusted domain if ONTAP cannot determine an appropriate site in the trusted domain.

#### **[`-workgroup <NetBIOS>`] - Workgroup Name }**

This parameter specifies the name of the workgroup (up to 15 characters).

#### **[`-keytab-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}`] - Kerberos Keytab File URI (privilege: advanced)**

This parameter specifies loading a keytab file from the specified URI. This is applicable if the CIFS server is being created in realm mode or domain mode.

#### **[`-status-admin {down|up}`] - CIFS Server Administrative Status**

Use this parameter to specify whether the initial administrative status of the cifs server is up or down. The default setting is `up`.

#### **[`-comment <text>`] - CIFS Server Description**

This optional parameter specifies a text comment for the server. CIFS clients can see this CIFS server description when browsing servers on the network. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks.

#### **[`-netbios-aliases <NetBIOS>,...`] - List of NetBIOS Aliases**

This parameter specifies a list of NetBIOS aliases, which are alternate names to the CIFS server name.

### **Examples**

The following example creates a CIFS server CIFSSEVER1 for Vserver vs1 and domain EXAMPLE.com.

```
cluster1::> vsserver cifs create -vserver vs1 -cifs-server CIFSSEVER1
-domain EXAMPLE.com
```

In order to create an Active Directory machine account for the CIFS server, you

must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "EXAMPLE.com" domain.

Enter the user name: Administrator

Enter the password:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER2
-domain EXAMPLE.com -keytab-uri
http://nbsweb.eng.btc.netapp.in/~user/Sample1.keytab
Info: SMB1 protocol version is disabled on this CIFS server. If required,
use
the (privilege: advanced) command "vserver cifs options modify -vserver
vs1
-smb1-enabled true" to enable it.
```

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and workgroup Sales:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1
-workgroup Sales
```

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 and domain EXAMPLE.com with a user Administrator1 from a different domain, in this case an administrator from a trusted domain TRUST.LAB.COM:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFSSERVER1
-domain EXAMPLE.com
In order to create an Active Directory machine account for the CIFS
server, you
must supply the name and password of a Windows account with sufficient
privileges to add computers to the "CN=Computers" container within the
"EXAMPLE.com" domain.
```

Enter the user name: Administrator1@TRUST.LAB.COM

Enter the password:

The following example creates a CIFS server CIFSSERVER1 for Vserver vs1 with domain EXAMPLE.com using nested OUs:

```
cluster1::> vserver cifs create -vserver vs1 -cifs-server CIFS_SERVER1
-domain EXAMPLE.com -ou OU=developers,OU=engineering,OU=corp
In order to create an Active Directory machine account for the CIFS
server, you
must supply the name and password of a Windows account with sufficient
privileges to add computers to the "OU=developers,OU=engineering,OU=corp"
container within the
"EXAMPLE.com" domain.

Enter the user name: Administrator

Enter the password:
```

## vserver cifs delete

Delete a CIFS server.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs delete` command deletes a CIFS server.

### Parameters

**-vserver <vserver name> -Vserver**

This parameter specifies the Vserver for the CIFS server you want to delete.

**[-skip-ad-account-delete {true|false}] - If this option is enabled, the local CIFS configuration will be removed without deleting the AD account. The default setting for this field is false.**

This parameter skips the deletion of the AD account and proceeds directly to the deletion of the local CIFS configuration.

**[-client-id <text>] - Application (Client) ID of Deployed Azure Application**

This parameter specifies the Application (Client) ID of Deployed "Entra ID" Application.

**[-tenant-id <text>] - Directory (Tenant) ID of Deployed Azure Application**

This parameter specifies the Directory (Tenant) ID of Deployed "Entra ID" Application.

**[-client-certificate <text>] - Certificate for Azure Application**

This parameter specifies the Certificate to authenticate with Deployed "Entra ID" Application.

### Examples

The following example deletes the CIFS server from a Vserver named vs1:

```
cluster1::> vserver cifs delete -vserver vs1
```

## vserver cifs modify

### Modify a CIFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs modify` command modifies the site within the Active Directory domain to associate with the CIFS server if ONTAP cannot determine an appropriate site. You also can modify the name and ou of the CIFS server, join to a new domain or a workgroup, or rejoin to current domain. When a CIFS server is joining a domain, this command might take several minutes to complete.

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver for the CIFS server whose associated site you want to modify.

##### **[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name**

This parameter specifies the name of the CIFS server (up to 15 characters). Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify-status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to `up`.

##### **{ [-domain <TextNoCase>] - Fully Qualified Domain Name**

This parameter specifies the fully qualified name of the Active Directory domain to associate with the CIFS server. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify-status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to `up`.

##### **[-ou <text>] - Organizational Unit**

This parameter specifies the organization unit within the Active Directory domain to associate with the CIFS server. By default, this parameter is set to `CN=Computers`. Before setting this parameter, the CIFS server must be stopped using the `vserver cifs modify-status-admin down` command. When the command completes successfully, the administrative status of the CIFS server is automatically set to `up`. Modifications to this parameter are not supported for workgroup CIFS servers.

##### **[-default-site <text>] - Default Site Used by LIFs Without Site Membership**

This parameter specifies the site within the Active Directory domain to associate with the CIFS server if ONTAP cannot determine an appropriate site. Modifications to this parameter are not supported for workgroup CIFS servers. The default site will be validated if it is specified, to ensure the site and the associated DNS SRV records are present in Active Directory."

##### **| [-workgroup <NetBIOS>] - Workgroup Name }**

This parameter specifies the name of the workgroup (up to 15 characters).

##### **[-keytab-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - Kerberos Keytab File URI (privilege: advanced)**

This parameter specifies loading a keytab file from the specified URI. This is applicable if the CIFS server is being created in realm mode or domain mode.

### **[-status-admin {down|up}] - CIFS Server Administrative Status**

Use this parameter to modify the administrative status of the cifs server. Modify the administrator status to down to stop cifs access.

### **[-comment <text>] - CIFS Server Description**

Use this parameter to modify the comment of the server.

## **Examples**

The following example changes the default site and administrative status of the CIFS server associated with Vserver "vs1":

```
cluster1::> vsriver cifs modify -vsriver vs1 -default-site default -status
-admin up
```

The following example modifies the Active Directory domain and ou for the CIFS server associated with Vserver "vs1". The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vsriver cifs modify -vsriver vs1 -domain example.com -ou
ou=example_ou -cifs-server example -status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example\_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a domain to a workgroup. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vsriver cifs modify -vsriver vs1 -workgroup Sales -status  
-admin down
```

Warning: To enter workgroup mode, all domain-based features must be disabled

and their configuration removed automatically by the system, including continuously-available shares, shadow copies, and AES. However, domain-configured share ACLs such as "EXAMPLE.COM\userName" will not work properly, but cannot be removed by ONTAP. Remove these share ACLs as soon as possible using external tools after the command completes. If AES is enabled, you may be asked to supply the name and password of a Windows account with sufficient privileges to disable it in the "EXAMPLE.COM" domain.  
Do you want to continue? {y|n}: y

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vsriver cifs modify -vsriver vs1 -domain example.com -status  
-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example\_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

```
cluster1::>
```

The following example modifies the CIFS server associated with Vserver "vs1" from a workgroup to a domain using keytab-uri. The administrative status of the CIFS server must be set to "down" for this command. If the command completes successfully, the administrative status is automatically set to "up".

```
cluster1::> vserver cifs modify -vserver vs1 -domain example.com -keytab
-uri http://nbsweb.eng.btc.netapp.in/~shravanp/Sample1.keytab -status
-admin down

cluster1::>
```

The following example modifies the CIFS server name associated with Vserver "vs1" from above example. The administrative status of the CIFS server must be set to "down" to proceed with Active Directory domain modification. If the command completes successfully, the administrative status is automatically set to "up" and there will be a job running to update related configurations.

```
cluster1::> vserver cifs modify -vserver vs1 -cifs-server new_example
-status-admin down
```

In order to create an Active Directory machine account for the CIFS server, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "ou=example\_ou" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

Successfully queued CIFS Server Modify job [id: xx] for CIFS server "NEW\_EXAMPLE". To view the status of the job, use the "job show -id <jobid>" command.

```
cluster1::>
```

## vserver cifs nbtstat

### Display NetBIOS information over TCP connection

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs nbtstat` command displays information about NetBIOS over TCP (NBT) connections for the cluster. It displays the IP address associated with the interfaces, the IP addresses of the WINS servers in use, and information about the registered NetBIOS names for the cluster. You can use this command to troubleshoot NetBIOS name resolution problems.

NetBIOS name service (NBNS) over IPv6 is not supported.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified node.

**[-vserver <vserver name>] - Vserver**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified Vserver.

**[-nbt-name <text>] - NBT Name**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name.

**[-netbios-suffix <Hex String>] - NetBIOS Suffix**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS suffix.

**[-interface <IP Address>,...] - Interfaces**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified IP address.

**[-wins-servers <IP Address>,...] - Servers**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS servers.

**[-server-state <text>,...] - Server State (active, inactive)**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified WINS server state. The following are possible values for this parameter:

- active
- inactive

**[-nbt-scope <text>] - NBT Scope**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name scope.

**[-nbt-mode <text>] - NBT Mode**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name service mode. The following are possible values for this parameter:

- 'p' - Point to Point
- 'h' - Hybrid

- 'm' - Mixed
- 'b' - Broadcast

#### **[-state <text>] - State**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified NetBIOS name registration state. The following are possible values for this parameter:

- must\_register
- must\_unregister
- wins
- broadcast
- name\_released
- wins\_conflict
- broadcast\_conflict

#### **[-time-left <integer>] - Time Left**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified registration time left in minutes with the WINS server.

#### **[-type <text>] - Type**

If you specify this optional parameter, the command displays the NetBIOS name service information only for the specified name registration type. The following are possible values for this parameter:

- registered
- active
- permanent
- group

### **Examples**

The following example displays the NetBIOS name service information.

```

cluster1::> nbtstat
      (vserver cifs nbtstat)

      Vserver: vs1
      Node:    cluster1-01
      Interfaces:
                10.10.10.32
                10.10.10.33
      Servers:
                17.17.1.2  (active  )
      NBT Scope:
                [ ]
      NBT Mode:
                [h]

```

| Type  | NBT Name  | NetBIOS Suffix | State | Time Left |
|-------|-----------|----------------|-------|-----------|
| ----- | -----     | -----          | ----- | -----     |
| ----- | CLUSTER_1 | 00             | wins  | 57        |
|       | CLUSTER_1 | 20             | wins  | 57        |

```

Vserver: vs1
      Node:    cluster1-02
      Interfaces:
                10.10.10.35
      Servers:
                17.17.1.2  (active  )
      CLUSTER_1      00      wins      58
      CLUSTER_1      20      wins      58
      4 entries were displayed.

```

## vserver cifs prepare-to-downgrade

### Restore the CIFS Configurations to Earlier Release of Data ONTAP Version

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `vserver cifs prepare-to-downgrade` command restores the CIFS configurations for ONTAP based on the input parameter `disable-feature-set`.

#### Parameters

**-disable-feature-set <downgrade version> - Data ONTAP Version (privilege: advanced)**

This parameter specifies the ONTAP release for which the CIFS configurations are restored. The value can be one of the following:

- 8.3.1 - Restores the CIFS configurations for ONTAP release 8.3.1. These features include:
  - FPolicy "close with read" filters from FPolicy events.
  - CIFS server options `-guest-unix-user` and `-is-admin-users-mapped-to-root-enabled`.
  - CIFS security option `is-smb-encryption-required`.
  - Storage-Level Access Guard (SLAG) for qtrees.
  - CIFS share property `encrypt-data`.
- 8.3.2 - Restores the CIFS configurations for ONTAP release 8.3.2. These features include:
  - CIFS server option `-grant-unix-group-perms-to-others`.
- 9.0.0 - Restores the CIFS configurations for ONTAP release 9.0.0. These features include:
  - Disable CIFS multichannel feature and close all multichannel connections.
  - Delete all the name-mapping entries that have a hostname or an address field configured.
  - Terminate all SMB 3.1 client connections.
  - Terminate all client connections that have large MTU negotiated.
  - Remove the symlink property `no-strict-security`.
  - Remove all symlink pathmap entries with locality `freelink`.

## Examples

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.1
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 8.3.2
```

```
cluster1::*> vserver cifs prepare-to-downgrade -disable-feature-set 9.0.0
```

## vserver cifs remove-netbios-aliases

### Remove NetBIOS aliases

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The ``vserver cifs remove-netbios-aliases`` command deletes NetBIOS aliases for the CIFS server.

### Parameters

**-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver from which the list of NetBIOS aliases are deleted.

**-netbios-aliases <NetBIOS>,... - List of NetBIOS Aliases**

This parameter specifies one or more NetBIOS aliases to be deleted. To delete all the NetBIOS aliases of a Vserver use '-'.

**Examples**

The following example deletes NetBIOS aliases for the CIFS server CIFS\_SERVER on Vserver vs\_a.

```
cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_1, ALIAS_2, ALIAS_3, ALIAS_4,
                  ALIAS_5, ALIAS_6, ALIAS_7

cluster1::> cifs remove-netbios-aliases -netbios-aliases
alias_1,alias_3,alias_5

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6, ALIAS_7

cluster1::> cifs remove-netbios-aliases -netbios-aliases alias_7

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
  NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6

cluster1::> cifs remove-netbios-aliases -netbios-aliases -

cluster1::> cifs show -display-netbios-aliases

Vserver: vs_a
Server Name: CIFS_SERVER
  NetBIOS Aliases: -
```

**vserver cifs repair-modify**

Repair a partially-failed Vserver CIFS server modify operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

Use this `vserver cifs repair-modify -vserver <vserver name>` command when the background job created during a Vserver CIFS server modify operation fails.

## Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies a Vserver containing a configured CIFS server that has been modified.

## Examples

The following example starts the CIFS server modify job on Vserver vs1 successfully:

```
cluster1::*> vserver cifs repair-modify -vserver vs1

Successfully queued CIFS Server Modify job [id: 10] for CIFS server
"CIFSNAME1".
To view the status of the job, use the "job show -id <jobid>" command.

cluster1::*>
```

The following example fails the command with specific error:

```
cluster1::*> vserver cifs repair-modify -vserver vs2

Error: Job Out of memory. Failed to queue CIFS Server Modify Job for CIFS
server "CIFSNAME2". Retry the operation by running (privilege: advanced)
"vserver cifs repair-modify -vserver vs2".
Error: command failed: unable to save data

cluster1::*>
```

## **vserver cifs security-encryption-required-dc-connections-prepare-to-downgrade**

Disabled encryption-required-for-dc-connections option and capability for downgrade.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver cifs security-encryption-required-dc-connections-prepare-to-downgrade` prepares the cluster for downgrade by disabling SMB3.encrypted.required.dc.connection capability

## Examples

```
cluster1::*> vserver cifs security-encryption-required-dc-connections-prepare-to-downgrade
```

## vserver cifs show

### Display CIFS servers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs show` command displays information about CIFS servers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- CIFS server NetBIOS name
- Domain or workgroup name
- Authentication style

You can specify the `-fields` parameter to specify which fields of information to display about CIFS servers. In addition to the fields above, you can display the following fields:

- Default site
- Fully-qualified domain name

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about CIFS servers that are in the CIFS domain named RUBY, run the command with the `-domain-workgroup RUBY` parameter.

You can specify the `-instance` parameter to display all information for all CIFS servers in list form.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-display-netbios-aliases ]**

If you specify this parameter, the command displays information about configured NetBIOS aliases.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about the CIFS servers for the specified Vserver.

**[`-cifs-server <NetBIOS>`] - CIFS Server NetBIOS Name**

If you specify this parameter, the command displays information only for CIFS servers that match the specified CIFS server NetBIOS name.

**[`-domain-workgroup <CIFS domain>`] - NetBIOS Domain/Workgroup Name**

If you specify this parameter, the command displays information only for CIFS servers that are in the specified NetBIOS domain or workgroup.

**[`-domain <TextNoCase>`] - Fully Qualified Domain Name**

If you specify this parameter, the command displays information only for CIFS servers that are in the specified domain.

**[`-ou <text>`] - Organizational Unit**

If you specify this parameter, the command displays information only for CIFS servers that are in the specified organizational unit.

**[`-default-site <text>`] - Default Site Used by LIFs Without Site Membership**

If you specify this parameter, the command displays information only for CIFS servers that have the specified default site.

**[`-workgroup <NetBIOS>`] - Workgroup Name**

If you specify this parameter, the command displays information only for CIFS servers that are in the specified workgroup.

**[`-auth-style {domain|workgroup|realm}`] - Authentication Style**

If you specify this parameter, the command displays information only for CIFS servers that match the specified authentication style.

**[`-status-admin {down|up}`] - CIFS Server Administrative Status**

If you specify this parameter, the command displays information only for CIFS servers that match the specified administrative status.

**[`-comment <text>`] - CIFS Server Description**

If you specify this parameter, the command displays information only for CIFS servers that match the specified comment field.

**[`-netbios-aliases <NetBIOS>,...`] - List of NetBIOS Aliases**

If you specify this parameter, the command displays information only for CIFS servers that have specified NetBIOS alias.

## Examples

The following example displays a subset of the information about all CIFS servers:

```
cluster1::> vservice cifs show
```

| Server  | Domain/Workgroup |         |                      |
|---------|------------------|---------|----------------------|
| Vserver | Name             | Name    | Authentication Style |
| -----   | -----            | -----   | -----                |
| vs1     | CIFS_SERVER1     | EXAMPLE | domain               |

The following example displays all information about all CIFS-enabled Vservers in list form:

```
cluster1::> vservice cifs show -instance
Vserver: vs1

CIFS Server NetBIOS Name: CIFS_SERVER1
NetBIOS Domain/Workgroup Name: EXAMPLE
Fully Qualified Domain Name: EXAMPLE.COM
Organizational Unit: CN=Computers
Default Site Used by LIFs Without Site Membership:
Workgroup Name: -
Authentication Style: domain
CIFS Server Administrative Status: up
CIFS Server Description:
List of NetBIOS Aliases: ALIAS_2, ALIAS_4,
ALIAS_6
```

The following example displays the NetBIOS aliases for the CIFS server CIFS\_SERVER1

```
cluster1::> cifs show -display-netbios-aliases

Vserver: vs1
Server Name: CIFS_SERVER1
NetBIOS Aliases: ALIAS_2, ALIAS_4, ALIAS_6
```

## vservice cifs start

### Start a CIFS server

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command starts the CIFS server on the specified Vserver. The CIFS server must already exist. To create a CIFS server, run [vservice cifs create](#) .

### Parameters

### **-vserver <vserver name> -Vserver**

This parameter specifies a Vserver containing a configured CIFS server that has been stopped.

### **Examples**

The following example starts the CIFS server on Vserver vs1:

```
cluster1::> cifs start -vserver vs1
```

### **Related Links**

- [vserver cifs create](#)

## **vserver cifs stop**

### **Stop a CIFS server**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

This command stops the CIFS server on the specified Vserver.

Established sessions will be terminated and their open files closed. Workstations with cached data will not be able to save those changes, which could result in data loss.

### **Parameters**

#### **-vserver <vserver name> -Vserver**

This parameter specifies a Vserver containing a configured CIFS server that is running.

### **Examples**

The following example stops the CIFS server on Vserver vs1:

```
cluster1::> cifs stop -vserver vs1
```

## **vserver cifs branchcache create**

### **Create the CIFS BranchCache service**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver cifs branchcache create` command creates the configuration for computing and retrieving BranchCache hash data. Only a single instance of the BranchCache service can be created on a Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver on which you want to set up the BranchCache service.

### **[-versions {v1-enable|v2-enable|enable-all}] - Supported BranchCache Versions**

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- `v1-enable` - This option enables BranchCache Version 1.
- `v2-enable` - This option enables BranchCache Version 2.
- `enable-all` - This option enables all supported versions of BranchCache.

### **-hash-store-path <text> - Path to Hash Store**

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

### **[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of the Hash Store**

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

### **[-server-key <text>] - Encryption Key Used to Secure the Hashes**

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server.

### **[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes**

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- `disable` - This option disables the BranchCache service for the Vserver.
- `all-shares` - This option enables the BranchCache service for all the shares on this Vserver.
- `per-share` - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the `branchcache` flag in the `-share -properties` parameter of the [vserver cifs share modify](#) command.

## Examples

The following example creates the BranchCache service on the Vserver named `vs1`. The path to the hash store is `/vs1_hash_store`.

```
cluster1::> vserver cifs branchcache create -vserver vs1 -hash-store-path /vs1_hash_store
```

The following example creates the BranchCache service on the Vserver vs1. The path to the hash store is /vs\_hash\_store. The service is enabled on all the shares of the Vserver, supports BranchCache version 2, supports a maximum of 1 GB of BranchCache hashes, and secures the hashes using the key "vs1 secret".

```
cluster1::> vsserver cifs branchcache create -vsserver vs1 -hash-store-path /vs1_hash_store -operating-mode all-shares -versions v2-enable -hash-store -max-size 1GB -server-key "vs1 secret"
```

## Related Links

- [vsserver cifs share modify](#)

## vsserver cifs branchcache delete

Stop and remove the CIFS BranchCache service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsserver cifs branchcache delete` command stops and removes the Vserver BranchCache configuration.

## Parameters

**-vsserver <vsserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver whose BranchCache configuration you want to remove.

**-flush-hashes {true|false} - Delete Existing Hashes**

This parameter specifies whether to keep or delete all existing hashes after deleting the BranchCache service.

## Examples

The following example stops and removes the BranchCache service on the Vserver vs1. It also deletes all existing hashes.

```
cluster1::> vsserver cifs branchcache delete -flush-hashes true -vsserver vs1
```

## vsserver cifs branchcache hash-create

Force CIFS BranchCache hash generation for the specified path or file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs branchcache hash-create` command causes the BranchCache service to compute hashes for a single file, for a directory, or for all the files in a directory structure if you specify the `-recurse` option.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver on which the hash is computed.

### **-path <text> - Path of File or Directory to Hash**

This parameter specifies the path of the directory or file for which hashes are to be computed. If a file is specified, the hashes are computed on the whole file. If a directory is specified, hashes are computed on all files within the directory.

### **-recurse {true|false} - Process All Files in the Directory Recursively**

If this option is set to true and the `-path` parameter specifies a directory, hashes are computed recursively for all directories in the path.

## Examples

The following example creates hashes for the file "report.doc":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path  
/repository/report.doc -recurse false
```

The following example creates hashes for all the files in the directory "repository":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path  
/repository -recurse false
```

The following example recursively creates hashes for all the files and directories inside the directory "documents":

```
cluster1::> vserver cifs branchcache hash-create -vserver vs1 -path  
/documents -recurse true
```

## **vserver cifs branchcache hash-flush**

Flush all generated BranchCache hashes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs branchcache hash-flush` command deletes all hash data from the configured hash store.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver whose hash data is to be deleted.

## Examples

The following example flushes all the hashes for Vserver vs1:

```
cluster1::> vserver cifs branchcache hash-flush -vserver vs1
```

## vserver cifs branchcache modify

Modify the CIFS BranchCache service settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs branchcache modify` command modifies the configuration for computing and retrieving BranchCache hash data.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver whose BranchCache service is to be modified.

**[-versions {v1-enable|v2-enable|enable-all}] - Supported BranchCache Versions**

This optional parameter specifies a list of versions of the BranchCache protocol that the storage system supports. The default is `enable-all`. This list can include one or more of the following:

- `v1-enable` - This option enables BranchCache Version 1.
- `v2-enable` - This option enables BranchCache Version 2.
- `enable-all` - This option enables all supported versions of BranchCache.

**[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes**

This optional parameter specifies the mode in which the BranchCache service operates. The default is `per-share`. Possible values include:

- `disable` - This option disables the BranchCache service for the Vserver.
- `all-shares` - This option enables the BranchCache service for all the shares on this Vserver.
- `per-share` - This option enables the BranchCache service on a per-share basis. You can enable the BranchCache service on an existing share by adding the `branchcache` flag in the `-share -properties` parameter of the `vserver cifs share modify` command.

### **[`-hash-store-max-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of the Hash Store**

This optional parameter specifies the maximum size to use for the hash data. If the size of the hash data exceeds this value, older hashes are deleted to make room for newer hashes. The default is 1 GB.

### **[`-flush-hashes` {true|false}] - Delete Existing Hashes**

This parameter specifies whether to keep or delete all the existing hashes. This must be set to true when modifying the server key.

### **[`-hash-store-path` <text>] - Path to Hash Store**

This parameter specifies an existing directory into which the hash data is stored. Read-only paths, such as snapshot directories, are not allowed.

### **[`-server-key` <text>] - Encryption Key Used to Secure the Hashes**

This optional parameter specifies a server key that the BranchCache service uses to prevent clients from impersonating the BranchCache server. If you specify this parameter, all existing hashes for the Vserver are deleted.

## **Examples**

The following example modifies the BranchCache service on the Vserver named vs1. The path to the hash store is /vs1\_hash\_store\_2, the server key used to secure the hashes is set to "new vs1 secret", all existing hashes are removed, the service supports all BranchCache versions, and is enabled on a per-share basis.

```
cluster1:> vs1 cifs branchcache modify -vserver vs1 -hash-store-path  
/vs1_hash_store_2 -server-key "new vs1 secret" -flush-hashes true  
-versions enable-all -operating-mode per-share
```

The following example modifies the BranchCache service on the Vserver vs1. The service is enabled on all the shares of the Vserver, supports BranchCache version 1, and supports a maximum of 1 TB of BranchCache hashes.

```
cluster1:> vs1 cifs branchcache modify -vserver vs1 -operating-mode  
all-shares -versions v1-enable -hash-store-max-size 1TB
```

## **Related Links**

- [vs1 cifs share modify](#)

## **vs1 cifs branchcache show**

Display the CIFS BranchCache service status and settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs branchcache show` command displays information about the BranchCache configuration for the Vserver. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information:

- Operating Mode
- Allowed Versions
- Maximum Size
- Path

You can specify additional parameters to display only information that matches those parameters.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command displays only the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information for the specified Vserver.

**[-versions {v1-enable|v2-enable|enable-all}] - Supported BranchCache Versions**

If you specify this parameter, the command displays information for the Vservers that support the specified BranchCache versions.

**[-hash-store-path <text>] - Path to Hash Store**

If you specify this parameter, the command displays information for Vservers that store their hashes at the specified location.

**[-hash-store-max-size {<integer>[KB|MB|GB|TB|PB] } ] - Maximum Size of the Hash Store**

If you specify this parameter, the command displays information for Vservers that have a maximum hash store size that is set to the specified value.

**[-server-key <text>] - Encryption Key Used to Secure the Hashes**

If you specify this parameter, the command displays information for Vservers that have the specified server key.

**[-operating-mode <BranchCache Mode>] - CIFS BranchCache Operating Modes**

If you specify this parameter, the command displays information for Vservers whose BranchCache configuration operates in the specified mode.

## Examples

The following example displays a subset of the information about the BranchCache service in the cluster.

```
cluster1::> vsriver cifs branchcache show
```

| Vserver | Operating Mode | Allowed Versions | Max Size | Path       |
|---------|----------------|------------------|----------|------------|
| vs1     | per_share      | enable_all       | 1GB      | /hash_dir/ |

The following example displays all information about all the Vservers with BranchCache configurations.

```
cluster1::> vsriver cifs show -instance
Vserver: vs1
    Supported Versions of BranchCache: enable_all
    Path to Hash Store: /hash_dir/
    Maximum Size of the Hash Store: 1GB
    Encryption Key Used to Secure the Hashes: asdad
    CIFS BranchCache Operating Modes: per_share
```

The following example displays information about BranchCache configurations that store the hash data at the location /branchcache\_hash\_store.

```
cluster1::> vsriver cifs branchcache show -hash-store-path
/branchcache_hash_store
```

| Vserver | Operating Mode | Allowed Versions | Max Size | Path                    |
|---------|----------------|------------------|----------|-------------------------|
| vs1     | per_share      | enable_all       | 1GB      | /branchcache_hash_store |

## vsriver cifs cache name-to-sid delete-all

Delete all the entries for the vsriver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vsriver cifs cache name-to-sid delete-all` command removes all of the Windows user cache entries cached by the Windows name for the specified Vserver.

### Parameters

**-vsriver <vsriver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the name-to-sid cache entries need to be deleted.

## Examples

The following example shows how to delete all of the cached name-to-sid entries for Vserver vs0:

```
cluster1::> vsriver cifs cache name-to-sid delete-all -vsriver vs0
```

## vsriver cifs cache name-to-sid delete

### Delete an entry

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *advanced* privilege level.

### Description

The `vsriver cifs cache name-to-sid delete` command removes the Windows user cache entries cached by the Windows name. If cache propagation is enabled, the corresponding sid-to-name cache entry will also be removed.

### Parameters

**-vsriver <vsriver name> - Vsriver (privilege: advanced)**

Use this parameter to specify the Vsriver for which the name-to-sid cache entry needs to be deleted.

**-win-name <text> - Windows Name (privilege: advanced)**

Use this parameter to specify the Windows name for which the cached entry needs to be deleted.

## Examples

The following example shows how to delete the name-to-sid cache entry for Vsriver vs0 with Windows name user1:

```
cluster1::> vsriver cifs cache name-to-sid delete -vsriver vs0 -win-name  
user1
```

## vsriver cifs cache name-to-sid show

### Display name-to-sid cache entries

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *advanced* privilege level.

### Description

The `vsriver cifs cache name-to-sid show` command displays the Windows user information cached by Windows name.

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**[-instance ] (privilege: advanced) }**

Use this parameter to display detailed information about the Windows user entries cached by the Windows name.

**[-vserver <vserver name>] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the Windows user entries that are cached by the Windows name need to be displayed.

**[-win-name <text>] - Windows Name (privilege: advanced)**

Use this parameter to specify the Windows name for which the cached entries need to be displayed.

**[-sid <text>] - SID (privilege: advanced)**

Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID).

**[-sid-type <integer>] - SID type (privilege: advanced)**

Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) type.

**[-flags <integer>] - Flags (privilege: advanced)**

Use this parameter to display information only about the Windows user entries cached by the Windows name that have the specified flags.

**[-domain-name <text>] - Domain Name (privilege: advanced)**

Use this parameter to display information only about the Windows user entries cached by the Windows name that have the specified domain name.

**[-create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)**

Use this parameter to display information only about the Windows user entries that were cached at the specified time.

**[-source {none|files|dns|nis|ldap|netgrp\_byname|dc}] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the user entries cached by the Windows name that have the specified lookup source.

## Examples

The following example shows how to display all of the Windows users which are cached by the Windows name:

```
cluster1::> vsriver cifs cache name-to-sid show
```

The following example shows how to display all of the Windows user entries cached by the Windows name for Vserver vs0:

```
cluster1::> vserver cifs cache name-to-sid show -vserver vs0
```

## vserver cifs cache settings modify

### Modify CIFS Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver cifs cache settings modify` command modifies the Windows users cache configuration of the specified Vserver.

#### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the Windows users cache settings need to be modified.

**[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the Windows users database. The value *true* means the cache is enabled and the value *false* means the cache is disabled. The default value for this parameter is *false*.

**[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)**

Use this parameter to specify if the cache needs to be enabled for the negative entries. Negative entries means the entries which are not present in the Windows users database and the look-up fails. The default value for this parameter is *true*. Negative cache is disabled by default if the parameter *is-enabled* is set to *false*.

**[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes, and seconds) for which the positive entries need to be cached. The positive entries means the entries which are present in the Windows users database and the look-up succeeds. The default value is 24 hours.

**[-negative-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to specify the time (in hours, minutes, and seconds) for which the negative entries need to be cached. The default value is 5 minutes.

**[-is-propagation-enabled {true|false}] - Is Propagation Enabled? (privilege: advanced)**

Use this parameter to specify whether the cached user entries need to be propagated to the sid-to-name cache. The default value is *true*. Specify *false* to disable propagation.

#### Examples

The following example shows how to modify the Windows users cache configuration settings for Vserver vs0:

```
cluster1::> vserver cifs cache settings modify -vserver vs0 -ttl 600
-negative-ttl 300
```

The following example shows how to disable the Windows users cache for Vserver vs0:

```
cluster1::> vserver cifs cache settings modify -vserver vs0 -is-enabled
false
```

## vserver cifs cache settings show

### Display CIFS Cache Configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `vserver cifs cache settings show` command displays information about the Windows users cache configuration of the specified Vserver.

#### Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`[-instance ] (privilege: advanced) }`**

Use this parameter to display detailed information about the Windows users cache configuration settings.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

Use this parameter to display information about the Windows users cache configuration settings for the Vserver you specify.

**`[-is-enabled {true|false}] - Is Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the Windows users cache configuration settings that have the specified cache enabled setting. Value `true` displays only the entries that have cache enabled and value `false` displays only the entries that have cache disabled.

**`[-is-negative-cache-enabled {true|false}] - Is Negative Cache Enabled? (privilege: advanced)`**

Use this parameter to display information only about the Windows users cache configuration settings that have the specified negative cache enabled setting. Value `true` displays only the entries that have negative cache enabled and value `false` displays only the entries that have negative cache disabled.

**`[-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Time to Live (privilege: advanced)`**

Use this parameter to display information only about the Windows users cache configuration settings that have the specified Time to Live.

**[*-negative-ttl* <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Negative Time to Live (privilege: advanced)**

Use this parameter to display information only about the Windows users cache configuration settings that have the specified negative Time to Live.

**[*-is-propagation-enabled* {*true*|*false*}] - Is Propagation Enabled? (privilege: advanced)**

Use this parameter to display information only about the Windows users cache configuration settings that have the specified propagation enabled setting. Value *true* displays only the entries that have the propagation of cached entries to sid-to-name cache enabled and value *false* displays only the entries that have the propagation of cached entries to sid-to-name cache disabled.

## Examples

The following example shows how to display the Windows users cache configuration settings for all the Vservers:

```
cluster1::> vserver cifs cache settings show
```

The following example shows how to display the Windows users cache configuration settings for Vserver vs0:

```
cluster1::> vserver cifs cache settings show -vserver vs0
```

The following example shows how to display the Windows users cache configuration settings that have cache disabled:

```
cluster1::> vserver cifs cache settings show -is-enabled false
```

## vserver cifs cache sid-to-name delete-all

Delete all the entries for the vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs cache sid-to-name delete-all` command removes all of the Windows user cache entries cached by the security identifier (SID) for the specified Vserver.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the sid-to-name cache entries need to be deleted.

## Examples

The following example shows how to delete all the cached sid-to-name entries for Vserver vs0:

```
cluster1::> vserver cifs cache sid-to-name delete-all -vserver vs0
```

## vserver cifs cache sid-to-name delete

### Delete an entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs cache sid-to-name delete` command removes the Windows user cache entries cached by security identifier (SID). If cache propagation is enabled, the corresponding name-to-sid cache entry will also be removed.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the sid-to-name cache entry needs to be deleted.

**-sid <text> - SID (privilege: advanced)**

Use this parameter to specify the security identifier (SID) for which the cached entry needs to be deleted.

### Examples

The following example shows how to delete the sid-to-name cache entry for Vserver vs0 with SID S-1-5-21-1380078113-1824080971-954447143-1152:

```
cluster1::> vserver cifs cache sid-to-name delete -vserver vs0 -sid S-1-5-21-1380078113-1824080971-954447143-1152
```

## vserver cifs cache sid-to-name show

### Display sid-to-name cache entries

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs cache sid-to-name show` command displays the Windows user information cached by security identifier (SID).

### Parameters

**[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ -instance ] (privilege: advanced) }**

Use this parameter to display detailed information about the Windows user entries cached by the security identifier (SID).

**[ -vserver <vserver name>] - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which the Windows user entries that are cached by the security identifier (SID) need to be displayed.

**[ -sid <text>] - SID (privilege: advanced)**

Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID).

**[ -win-name <text>] - Windows Name (privilege: advanced)**

Use this parameter to specify the Windows name for which the cached entries need to be displayed.

**[ -sid-type <integer>] - SID type (privilege: advanced)**

Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) type.

**[ -sid-mode <integer>] - SID mode (privilege: advanced)**

Use this parameter to display information only about the cached Windows user entries that have the specified security identifier (SID) mode.

**[ -flags <integer>] - Flags (privilege: advanced)**

Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified flags.

**[ -domain-name <text>] - Domain Name (privilege: advanced)**

Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified domain name.

**[ -create-time <MM/DD/YYYY HH:MM:SS>] - Create Time (privilege: advanced)**

Use this parameter to display information only about the Windows user entries that were cached at the specified time.

**[ -source {none|files|dns|nis|ldap|netgrp\_byname|dc} ] - Source of the Entry (privilege: advanced)**

Use this parameter to display information only about the Windows user entries cached by the security identifier (SID) that have the specified lookup source.

## Examples

The following example shows how to display all of the Windows users which are cached by the security identifier (SID):

```
cluster1::> vsriver cifs cache sid-to-name show
```

The following example shows how to display all of the Windows user entries cached by the security identifier (SID) for Vserver vs0:

```
cluster1::> vsriver cifs cache sid-to-name show -vsriver vs0
```

## vsriver cifs character-mapping create

### Create character mapping on a volume

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

#### Description

The `vsriver cifs character-mapping create` command creates the CIFS character mapping for the specified volume on a particular Vsriver.

Choose target characters in the "Private Use Area" of Unicode in the following range: U+E000... U+F8FF.

The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but "-" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vsriver cifs character-mapping create` command is not supported for FlexGroup volumes.

#### Parameters

##### **-vsriver <vsriver name> - Vsriver**

This parameter specifies the Vsriver on which a volume is located for which you are creating the character mapping. If only one data Vsriver exists, you do not need to specify this parameter.

##### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are creating the character mapping.

##### **-mapping <text>, ... - Character Mapping**

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

#### Examples

The following example creates a character mapping for a volume vol1 on Vsriver vs1.

```
cluster1::> vservers cifs character-mapping create -volume vol1 -mapping
3c:e17c, 3e:f17d, 2a:f745
cluster1::> vservers cifs character-mapping show
```

| Vserver | Volume Name | Character Mapping         |
|---------|-------------|---------------------------|
| vs1     | vol1        | 3c:e17c, 3e:f17d, 2a:f745 |

## vserver cifs character-mapping delete

### Delete character mapping on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs character-mapping delete` command deletes the CIFS character mapping for the specified volume on a particular Vserver.

The `vserver cifs character-mapping delete` command is not supported for FlexGroup volumes.

#### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which a Volume is located for which you are deleting the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are deleting the character mapping.

#### Examples

The following example deletes all character mappings for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping delete -volume vol1
```

## vserver cifs character-mapping modify

### Modify character mapping on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs character-mapping modify` command modifies the CIFS character mapping for the specified volume on a particular Vserver.

You can modify a particular volume's character mapping by specifying the following two parameters in the

modify command:

- Vserver associated with the volume
- Name of the Volume

Choose target characters in the "Private Use Area" of Unicode in the following range: U+E000... U+F8FF.

The target Unicode characters must not appear in existing file names; otherwise, unwanted character mappings would occur, resulting in clients being unable to access mapped files. For example, if ":" is mapped to "-" but "-" appears in files normally, a Windows client using the mapped share to access a file named "a-b" would have its request mapped to the NFS name "a:b", which is not the desired file.

The `vserver cifs character-mapping modify` command is not supported for FlexGroup volumes.

Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which a Volume is located for which you are modifying the character mapping. If only one data Vserver exists, you do not need to specify this parameter.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are modifying the character mapping.

**[-mapping <text>,...] - Character Mapping**

This parameter specifies the mapping of the invalid CIFS filename characters to valid CIFS filename characters. The mapping consists of a list of source-target character pairs separated by ":". The characters are Unicode characters entered using hexadecimal digits. For example: 3C:E03C.

The permissible Unicode character set for source mapping is: 0x01-0x19, 0x5C, 0x3A, 0x2A, 0x3F, 0x22, 0x3C, 0x3E, 0x7C, 0xB1.

Examples

The following example modifies a character mapping for a volume vol1 on Vserver vs1.

```
cluster1::> vserver cifs character-mapping modify -volume vol1 -mapping
3c:e17d, 3e:f17e, 2a:f746
cluster1::> vserver cifs character-mapping show
```

| Vserver | Volume Name | Character Mapping         |
|---------|-------------|---------------------------|
| vs1     | vol1        | 3c:e17d, 3e:f17e, 2a:f746 |

**vserver cifs character-mapping show**

Display character mapping on volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs character-mapping show` command displays information about character mapping configured for volumes. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about character mapping configured for volumes:

- Vserver name
- Volume name
- Character mapping

**Parameters**

`{ [-fields <fieldname>, ...]`

If you specify this parameter, the command displays only the fields that you specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all entries.

`[-vserver <vserver name>] - Vserver`

If you specify this parameter, the command displays information about character mapping configured for all the volumes that belong to the specified Vserver.

`[-volume <volume name>] - Volume Name`

If you specify this parameter, the command displays information about the character mapping configured for all the volumes that match the specified volume name.

`[-mapping <text>, ...] - Character Mapping`

If you specify this parameter, the command displays information about the character mapping configured for all volumes that match the specified mapping.

**Examples**

The following example displays information about all character mappings configured for volumes

```
cluster1::> vserver cifs character-mapping show

Vserver          Volume Name  Character Mapping
-----
vs1              vol1        3c:e17d, 3e:f17e
```

**vserver cifs connection show**

Displays established CIFS connections

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs connection show` command displays information about established CIFS connections.

## Parameters

**{ [-fields <fieldname>,...]**

Use this parameter to display only the specified fields

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display information about CIFS connections on the specified node.

**[-vserver <vserver name>] - Vserver**

Use this parameter to display information about CIFS connections on the specified CIFS-enabled SVM.

**[-connection-id <integer>] - Connection ID**

Use this parameter to display information about CIFS connections that match the specified connection ID.

**[-session-id <integer>,...] - Session ID**

Use this parameter to display information about CIFS connections that match the specified session ID.

**[-workstation-ip <IP Address>] - Workstation IP Address**

Use this parameter to display information about CIFS connections that are established through the specified data LIF IP address.

**[-workstation-port <integer>] - Workstation Port Number**

Use this parameter to display information about CIFS connections that are opened from the specified Port number.

**[-lif-ip <IP Address>] - Incoming Data LIF IP Address**

Use this parameter to display information about CIFS connections that are opened from the specified IP address.

**[-network-context-id <integer>] - Network Context ID (privilege: advanced)**

Use this parameter to display information about CIFS connections that match the specified network context ID.

## Examples

The following example displays information about all CIFS connections:

```
cluster1::> vserver cifs connection show
Node:      node1
Vserver:   vs1
Connection Session
ID          IDs          Workstation IP Port      LIF IP
-----
127834      1,2          172.17.193.172 15536      10.53.50.42
```

The following example displays information about a CIFS connection at advanced privilege level:

```
cluster1::*> vserver cifs connection show
Node:      node1
Vserver:   vs1
Connection Session
Network
ID          IDs          Workstation IP Port      LIF IP
Context ID
-----
-----
127834      1,2          172.17.193.172 15536      10.53.50.42 2
```

The following example displays information about a CIFS connection with session-id 1:

```
cluster1::*> vserver cifs connection show -session-id 1 -instance

Vserver: vs1
Node: node1

          Connection ID: 127834
                Session ID: 1
          Workstation IP Address: 172.17.193.172
          Workstation Port Number: 15536
Incoming Data LIF IP Address: 10.53.50.42
          Network Context ID: 2
```

## vserver cifs domain discovered-servers reset-servers

Reset and rediscover servers for a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs domain discovered-servers reset-servers` command discards information the storage system has stored about domain controllers, LDAP, and NIS servers. After that, it begins the discovery

process to reacquire current information about external servers.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver.

## Examples

The following is an example use of this command. It produces no output.

```
cluster1::> vserver cifs domain discovered-servers reset-servers  
  
cluster1::>
```

## **vserver cifs domain discovered-servers show**

### Display discovered server information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs domain discovered-servers show` command displays information about the discovered servers for the CIFS domains of one or more Vservers. Server displays are grouped by node and Vserver, and each group is preceded by the node and Vserver identification. Within each grouping, the server display is limited to those associated with the domain specified by the domain parameter, if it is present.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you use this parameter, the command only displays servers for the specified node.

**[-vserver <vserver name>] - Vserver**

If you use this parameter, the command only displays servers for the specified Vserver.

**[-domain <TextNoCase>] - Fully Qualified Domain Name**

If you use this parameter, the command only displays servers in the specified domain.

**[-type {Unknown|KERBEROS|MS-LDAP|MS-DC|LDAP}] - Server Type**

If you use this parameter, the command only displays servers of the specified type.

### **[`-name <text>`] - Server Name**

If you use this parameter, the command only displays servers the with the specified name. This can result in multiple lines because the same server may provide multiple services.

### **[`-address <InetAddress>`] - Server Address**

If you use this parameter, the command only displays servers with the specified IP address. This can result in multiple lines because the same server may provide multiple services.

### **[`-preference {unknown|preferred|favored|adequate}`] - Preference**

If you use this parameter, the command only displays servers of the specified preference level.

### **[`-status {OK|unavailable|slow|expired|undetermined|unreachable}`] - Status**

If you use this parameter, the command only displays servers of the specified status.

### **[`-dc-functional-level`**

**{`win2000|unknown|win2003|win2008|win2008r2|win2012|win2012r2|win2016|winthreshold` }]** - DC Functional Level

If you use this parameter, the command only displays servers with the specified functional level.

### **[`-is-dc-read-only {true|false}`] - Is DC Read Only**

If this parameter is set to true, the command only displays servers with read only domain controller. If set to false, the command only displays servers with writable domain controller.

## **Examples**

The following example display shows the information provided by this command.

```
cluster1::> vservers cifs domain discovered-servers show
```

```
Node: node1
```

```
Vserver: vs1
```

| Domain Name | Type    | Preference | DC-Name        | DC-Address     | Status |
|-------------|---------|------------|----------------|----------------|--------|
| -----       | -----   | -----      | -----          | -----          | -----  |
| ""          | NIS     | preferred  | 192.168.10.222 | 192.168.10.222 | OK     |
| example.com | MS-LDAP | adequate   | DC-1           | 192.168.192.24 | OK     |
| example.com | MS-LDAP | adequate   | DC-2           | 192.168.192.25 | OK     |
| example.com | MS-DC   | adequate   | DC-1           | 192.168.192.24 | OK     |
| example.com | MS-DC   | adequate   | DC-2           | 192.168.192.25 | OK     |

5 entries were displayed.

## **vservers cifs domain discovered-servers discovery-mode modify**

### **Modify Server Discovery Mode**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver cifs domain discovered-servers discovery-mode modify` command modifies the configuration for the server discovery mode of one or more Data Vservers. This option controls the way domain controllers(DCs) are discovered.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

Use this parameter to specify the Vserver for which you want to modify the server discovery mode.

### **[-mode {all|site|none}] - Server Discovery Mode (privilege: advanced)**

Use this parameter to specify the server discovery mode for the Vserver. Following are the possible values for this parameter:

- all - Discover all the DCs in the domain, including the DCs local to the site. If trusted domains are present, then discover all the KDCs in the trusted domain as well, to be used for kerberos communication (default).
- site - Discover the DCs local to the site. If trusted domains are present, then discover KDCs local to the trusted domain site as well, to be used for kerberos communication.
- none - Discover nothing. Depend only on preferred-dc configured.

## Examples

The following example disables server discovery for a Vserver.

```
cluster1::*> vserver cifs domain discovered-servers discovery-mode modify  
-vserver vs1 -mode none
```

## **vserver cifs domain discovered-servers discovery-mode show**

### Display Server Discovery Mode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver cifs domain discovered-servers discovery-mode show` command displays information about the discovery mode for domain controllers(DCs) of one or more Vservers.

## Parameters

### **[-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **[ -instance ] (privilege: advanced) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **`[-vserver <vserver name>]` - Vserver (privilege: advanced)**

If you use this parameter, the command only displays discovery mode for the specified Vserver.

### **`[-mode {all|site|none}]` - Server Discovery Mode (privilege: advanced)**

If you use this parameter, the command only displays Vservers with the specified mode.

## **Examples**

The following example shows the server discovery mode for all Vservers.

```
cluster1::*> vserver cifs domain discovered-servers discovery-mode show
Vserver          Mode
-----
vs1              all
vs2              site
vs3              none
3 entries were displayed.
```

## **vserver cifs domain name-mapping-search add**

Add to the list of trusted domains for name-mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vserver cifs domain name-mapping-search add` command adds one or more trusted domains to the list of trusted domains to be used in preference to all others by the specified Vserver for looking up Windows user names when performing UNIX user to Windows user name-mapping. If a list already exists for the specified vserver, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

## **Parameters**

### **`-vserver <vserver name>` - Vserver**

This parameter specifies the name of the Vserver for which you want to add trusted domains.

### **`-trusted-domains <domain name>,...` - Trusted Domains**

This parameter specifies a comma-delimited list of fully-qualified domain names of the trusted domains for the home domain.

## **Examples**

The following example adds two trusted domains (`cifs1.example.com` and `cifs2.example.com`) to the preferred list used by Vserver `vs1`:

```
cluster1::> vsriver cifs domain name-mapping-search add -vsriver vs1
-trusted-domains cifs1.example.com, cifs2.example.com
```

## vsriver cifs domain name-mapping-search modify

Modify the list of trusted domains for name-mapping search

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs domain name-mapping-search modify` command modifies the current list of trusted domains to be used in preference to all others by the specified Vsriver to lookup Windows user names when performing UNIX user to Windows user name-mapping. The new list overwrites the existing list. This command is not supported for workgroup CIFS servers.

### Parameters

**-vsriver <vsriver name> - Vsriver**

This parameter specifies the name of the Vsriver for which you want to modify the trusted domain list.

**-trusted-domains <domain name>,... - Trusted Domains**

This parameter specifies a comma-delimited list of fully qualified domain names of the trusted domains of the home domain.

### Examples

The following example modifies the trusted domain list used by Vsriver vs1:

```
cluster1::> vsriver cifs domain name-mapping-search modify -vsriver vs1
-trusted-domains cifs3.example.com
```

## vsriver cifs domain name-mapping-search remove

Remove from the list of trusted domains for name-mapping search

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs domain name-mapping-search remove` command removes one or more trusted domains from the list used by the specified Vsriver to lookup Windows user names when performing UNIX user to Windows user name-mapping. If a list of trusted domains is not provided, the entire trusted domain list for the specified Vsriver is removed. This command is not supported for workgroup CIFS servers.

### Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver from which you want to remove trusted domains.

### **[-trusted-domains <domain name>,...] - Trusted Domains**

This parameter specifies a comma-delimited list of trusted domains of the home domain.

## **Examples**

The following example removes two trusted domains from the list used by Vserver vs1:

```
cluster1::> vsriver cifs domain name-mapping-search remove -trusted
-domains cifs1.example.com, cifs2.example.com
```

## **vsriver cifs domain name-mapping-search show**

Display the list of trusted domains for name-mapping searches

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vsriver cifs domain name-mapping-search show` command displays information about trusted domains of the home domain by Vserver.

## **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

This parameter specifies the name of the Vserver for which you want to display information about the trusted domains.

**[-trusted-domains <domain name>,...] - Trusted Domains**

This parameter specifies a comma-delimited list of fully qualified domain names of trusted domains for which you want to display information.

## **Examples**

The following example displays information about all preferred trusted domains:

```
cluster1::> vserver cifs domain name-mapping-search show
Vserver          Trusted Domains
-----
vserver_1        CIFS1.EXAMPLE.COM
```

## vserver cifs domain password change

Generate a new password for the CIFS server's machine account and change it in the Windows Active Directory domain.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs domain password change` changes the domain account password for a CIFS server. This command is not supported for workgroup CIFS servers.

### Parameters

#### **-vserver <vserver name> -Vserver**

This parameter specifies the name of the Vserver for whose CIFS server you want to change the domain account password.

### Examples

The following example changes the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vserver cifs domain password change -vserver vs1

cluster1::>
```

## vserver cifs domain password reset

Reset the CIFS server's machine account password in the Windows Active Directory domain.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs domain password reset` command resets the domain account password for a CIFS server. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that the machine account is a member of. This command is not supported for workgroup CIFS servers.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for whose CIFS server you want to reset the domain account password.

### **[-client-id <text>] - Application (Client) ID of Deployed Azure Application**

This parameter specifies the Application (Client) ID of Deployed "Entra ID" Application.

### **[-tenant-id <text>] - Directory (Tenant) ID of Deployed Azure Application**

This parameter specifies the Directory (Tenant) ID of Deployed "Entra ID" Application.

### **[-client-certificate <text>] - Certificate for Azure Application**

This parameter specifies the Certificate to authenticate with Deployed "Entra ID" Application.

## Examples

The following example resets the password for the CIFS server on a Vserver named vs1.

```
cluster1::> vsserver cifs domain password reset -vserver vs1

Enter your user ID: Administrator
Enter your password:

cluster1::>
```

## vserver cifs domain password schedule modify

Modify the domain account password change schedule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsserver cifs domain passwordschedule modify` command enables you to modify a domain account password change schedule for a CIFS server. This command is not supported for workgroup CIFS servers.

## Parameters

### **-vserver <vserver name> - Vserver**

This specifies the name of the Vserver containing the CIFS server for which you want to change the domain account password.

### **[-is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled**

This specifies whether the domain account password change schedule is enabled.

### **`[-schedule-weekly-interval <integer>]` - Interval in Weeks for Password Change Schedule**

This specifies the number of weeks after which the scheduled domain account password change must occur.

### **`[-schedule-randomized-minute <integer>]` - Minutes Within Which Schedule Start Can be Randomized**

This specifies the minutes within which the scheduled domain account password change must begin.

### **`[-schedule-day-of-week <cron_dayofweek>]` - Day of Week for Password Change Schedule**

This sets the day of week when the scheduled domain account password change occurs.

### **`[-schedule-time-of-day <HH:MM:SS>]` - Start Time for Password Change Schedule**

This sets the time in HH:MM:SS at which the scheduled domain account password change starts.

## **Examples**

The following example enables the domain account password change schedule and configures it to run at any time between 23:00:00 to 00:59:00 (one hour before midnight to one hour after midnight) on every 4th Sunday.

```
cluster1::> vsriver cifs domain password schedule modify -is-schedule
-enabled true -schedule-randomized-minute 120 -schedule-weekly-interval 4
-schedule-time-of-day 23:00:00 -schedule-day-of-week sunday
```

## **vsvrr cifs domain password schedule show**

Display the domain account password change schedule

**Availability:** This command is available to *cluster* and *Vsvrr* administrators at the *admin* privilege level.

## **Description**

The `vsvrr cifs domain password schedule show` command displays the domain account password change schedule configuration. It displays the following fields:

- Vsvrr: Vsvrr for which the schedule is configured
- Schedule Enabled: Whether the schedule is enabled or disabled for this Vsvrr
- Schedule Interval: Weeks after which the password change schedule occurs again for this Vsvrr
- Schedule Randomized Within: Minutes within which the schedule must begin for this Vsvrr
- Schedule: Password change schedule currently set on this Vsvrr
- Last Successful Password Change/Reset Time: Time at which the last password change or reset happened successfully on this Vsvrr
- Warning: Warning message, applicable only when the change password job is deleted with the feature still enabled on this Vsvrr

## **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information for the specified Vserver.

**[-is-schedule-enabled {true|false}] - Is Password Change Schedule Enabled**

If you specify this parameter, the command displays information for all the Vservers on which the `is-schedule-enabled` value applies.

**[-schedule-weekly-interval <integer>] - Interval in Weeks for Password Change Schedule**

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-weekly-interval` value applies.

**[-schedule-randomized-minute <integer>] - Minutes Within Which Schedule Start Can be Randomized**

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-randomized-minute` value applies.

**[-schedule-last-changed <text>] - Last Successful Password Change/Reset Time**

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-last-changed` value applies.

**[-schedule-description <text>] - Schedule Description**

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-description` value applies.

**[-schedule-warn-msg <text>] - Warning Message in Case Job Is Deleted**

If you specify this parameter, the command displays information for all the Vservers on which the `schedule-warn-msg` value applies.

## Examples

The following example shows the domain account password change schedule configuration when the password change feature is enabled for Vserver `vs1`.

```
cluster1::> vserver cifs domain password schedule show
Vserver: vs1
Schedule Enabled: true
      Schedule Interval: 4    week
    Schedule Randomized Within: 120 min
          Schedule: Fri@23:00
      Last Changed At: Thu Apr  4 02:35:23 2013
```

The following example shows the domain account password change schedule configuration when the password change job has been accidentally deleted.

```
cluster1::> vsriver cifs domain password schedule show
Vserver: vs1
Schedule Enabled: true
      Schedule Interval: 4    week
    Schedule Randomized Within: 120 min
          Schedule: Fri@23:00
      Last Changed At: Thu Apr  4 02:35:23 2013
          Warning: Password change job was deleted. Re-enable
the password change schedule.
```

## vsvver cifs domain preferred-dc add

### Add to a list of preferred domain controllers

**Availability:** This command is available to *cluster* and *Vsvver* administrators at the *admin* privilege level.

#### Description

The `vsvver cifs domain preferred-dc add` command adds one or more domain controllers to be used in preference to all others by the specified Vsvver for interactions with the specified domain. If a list already exists for the specified domain, the new list is merged with the existing list. This command is not supported for workgroup CIFS servers.

Each Vsvver discovers domain controllers and attempts to sort them internally based on real-world performance. Therefore it should not be necessary to create a preferred list of domain controllers under most circumstances.

#### Parameters

##### **-vsvver <vsvver name> - Vsvver**

This parameter specifies the name of the Vsvver for which you want to add preferred domain controllers.

##### **-domain <TextNoCase> - Fully Qualified Domain Name**

This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

##### **-preferred-dc <InetAddress>,... - Preferred Domain Controllers**

This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the `-domain` parameter.

##### **[-skip-config-validation {true|false}] - Skip Configuration Validation**

Use this parameter to skip the Preferred-DC configuration validation.

The hosts specified with the `-DC-servers` parameter are validated to verify that each of the DC servers are reachable, and is providing NETLOGON services.

The validation fails if there is no valid Preferred-DC server.

## Examples

The following example adds two domain controllers (192.168.0.100 and 192.168.0.101) to the preferred list used by Vserver vs1 when connecting to the example.com domain:

```
cluster1::> vsriver cifs domain preferred-dc add -vsriver vs1 -domain
example.com -preferred-dc 192.168.0.100,192.168.0.101
```

## vsriver cifs domain preferred-dc check

Display validation status of the Preferred-DC configuration

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

Use the `vsriver cifs domain preferred-dc check` command to check the status of configured preferred DC on a particular vsriver.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vsriver <vsriver> - Vsriver**

Use this parameter to specify the Vsriver whose preferred DC needs to be validated.

**[-server-ip <text>,...] - DC Address**

Use this parameter to display IP-address of the configured CIFS Preferred-DC servers.

**[-domain <TextNoCase>,...] - Domain Name**

Use this parameter to display Domain name of the configured CIFS Preferred-DCs.

**[-status {down|up}] - DC Status**

Use this parameter to display information only about CIFS Preferred-DC servers with a status that matches the value you specify.

**[-status-details <text>,...] - Status Details**

Use this parameter to display information only about CIFS Preferred-DC servers with status details that match the value you specify.

## Examples

The following example checks the connectivity of preferred DC on vsriver vs0.

```
cluster1::> vsriver cifs domain preferred-dc check -vsriver vs0
```

Vsriver : vs0

| Domain Name  | DC Address | Status | Status Details |
|--------------|------------|--------|----------------|
| -----        | -----      | -----  | -----          |
| example.com  | 1.1.1.1    | up     | Response time  |
| (msec): 426  |            |        |                |
| example.com  | 1.1.1.2    | up     | Response time  |
| (msec): 425  |            |        |                |
| example1.com | 2.2.2.2    | up     | Response time  |
| (msec): 423  |            |        |                |
| example2.com | 3.3.3.3    | up     | Response time  |
| (msec): 422  |            |        |                |

## vsriver cifs domain preferred-dc remove

Remove from a list of preferred domain controllers

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs domain preferred-dc remove` command removes one or more domain controllers from the list used by the specified Vsriver for interactions with the specified domain. If a list of preferred domain controllers is not provided, the entire list for the specified domain is removed. This command is not supported for workgroup CIFS servers.

### Parameters

#### **-vsriver <vsriver name> - Vsriver**

This parameter specifies the name of the Vsriver from which you want to remove preferred domain controllers.

#### **-domain <TextNoCase> - Fully Qualified Domain Name**

This parameter specifies the fully-qualified name of the domain that the domain controllers belong to.

#### **[-preferred-dc <InetAddress>,...] - Preferred Domain Controllers**

This parameter specifies a comma-delimited list of IP addresses for domain controllers that belong to the domain specified in the `-domain` parameter.

### Examples

The following example removes one domain controller (192.168.0.101) from the preferred list used by Vsriver vs1 when connecting to the example.com domain:

```
cluster1::> vsriver cifs domain preferred-dc remove -vsriver vs1 -domain
example.com -preferred-dc 192.168.0.101
```

## vsriver cifs domain preferred-dc show

Display a list of preferred domain controllers

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs domain preferred-dc show` command displays lists of preferred domain controllers by Vsriver and domain.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vsriver <vsriver name>] - Vsriver**

This parameter specifies the name of the Vsriver for which you want to display preferred domain controllers.

**[-domain <TextNoCase>] - Fully Qualified Domain Name**

This parameter specifies the fully-qualified name of the domain of the domain controllers to display.

**[-preferred-dc <InetAddress>,...] - Preferred Domain Controllers**

This parameter specifies a comma-delimited list of IP addresses for domain controllers to display.

### Examples

The following example displays all preferred domain controllers for all Vsriver:

```
cluster1::> vsriver cifs domain preferred-dc show
Vsriver          Domain Name          Preferred Domain Controllers
-----
vs1              example.com          192.168.0.100, 192.168.0.101
```

## vsriver cifs domain trusts rediscover

Reset and rediscover trusted domains for a Vsriver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs domain trusts rediscover` command discards information the Vserver has stored about trusted domains. After that, it begins the discovery process to reacquire current information about trusted domains. This command is not supported for workgroup CIFS servers.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver.

## Examples

The following example rediscovers trusted domains. It produces no output.

```
cluster1::> vserver cifs domain trusts rediscover
```

## vserver cifs domain trusts show

Display discovered trusted domain information

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs domain trusts show` command displays information about the trusted domains for the CIFS home domain of one or more Vservers. The displayed trusted domain information is grouped by node and Vserver, and each group is preceded by the node and Vserver identification. This command is not supported for workgroup CIFS servers.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you use this parameter, the command displays information only about trusted domains of the home domains for the specified node.

**[-vserver <vserver name>] - Vserver**

If you use this parameter, the command displays information only about trusted domains of the home domain for the specified Vserver.

### **[`-home-domain <domain name>`] - Home Domain Name**

If you use this parameter, the command displays information only about trusted domains of the home domain with the specified name.

### **[`-trusted-domain <domain name>,...`] - Trusted Domain Name**

If you use this parameter, the command displays information only about trusted domains with the specified name.

## **Examples**

The following example displays information about all the bidirectional trusted domains for node-01 and vservers\_1.

```
cluster1::> vsriver cifs domain trusts show -node node-01 -vsriver
vsriver_1
Node: node-01
Vserver: vsriver_1

Home Domain                Trusted Domain
-----
EXAMPLE.COM                CIFS1.EXAMPLE.COM,
                           CIFS2.EXAMPLE.COM
```

## **vsriver cifs group-policy modify**

### **Change group policy configuration**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsriver cifs group-policy modify` command modifies the group policy configuration of a CIFS server. This command is not supported for workgroup CIFS servers.

### **Parameters**

#### **`-vsriver <vsriver name>` - Vserver**

This parameter specifies the Vserver whose group policy configuration you want to modify.

#### **[`-status {enabled|disabled}`] - Group Policy Status**

This parameter specifies whether the CIFS-enabled Vserver's group policy is enabled or disabled.

## **Examples**

The following example enables the group policy for CIFS-enabled Vserver vs1.

```
cluster1::> vsriver cifs group-policy modify -vsriver vs1 -status enabled
```

## vserver cifs group-policy show-applied

Show currently applied group policy setting

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays only group policy information that has been applied to the Vserver you specify.

**[-gpo-index <integer>] - GPO Index**

If you specify this parameter, the command displays only group policy information at gpo-index.

### Examples

The following example displays all group policy information about all group policies that have been applied to a Vserver:

```
cluster1::> vserver cifs group-policy show-applied

## vserver cifs group-policy show-defined

Show applicable group policy settings defined in Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays only group policy information that has been defined in Active Directory for the Vserver that you specify.

**[-gpo-index <integer>] - GPO Index**

If you specify this parameter, the command displays only group policy information at gpo-index.

### Examples

The following example displays all group policy information for all group policies that have been defined in Active Directory:

```
cluster1::> vserver cifs group-policy show-defined
```

Vserver: vs1

## **vserver cifs group-policy show**

Show group policy configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs group-policy show` command displays information about group policy configuration for CIFS-enabled Vserver. It displays all or a subset of the group policy configuration matching the criteria that you specify.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays group policy configuration only for the Vserver that you specify.

**[-status {enabled|disabled}] - Group Policy Status**

If you specify this parameter, the command displays group policy configuration only for the Vservers that match the status you specify.

## Examples

The following example displays group policy configuration for all Vservers:

```
cluster1::> vserver cifs group-policy show
```

| Vserver | GPO Status |
|---------|------------|
| vs1     | disabled   |

## vserver cifs group-policy update

Apply group policy settings defined in Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs group-policy update` command applies the group-policy settings defined in Active Directory for the given Vserver. This command is not supported for workgroup CIFS servers.

## Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the CIFS-enabled Vserver to which the group-policy settings be applied.

### **`[-force-reapply-all-settings {true|false}] - Force Re-apply All Settings`**

This parameter specifies whether to ignore all processing optimizations and re-apply all settings. The default is false.

### **Examples**

The following example applies the group-policy settings defined in Active Directory for Vserver vs1.

```
cluster1::> vsriver cifs group-policy update -vsriver vs1 -force-reapply
-all-settings true
```

## **`vsriver cifs group-policy central-access-policy show-applied`**

Show currently applied central access policies

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### **Description**

The `vsriver cifs group-policy central-access-policy show-applied` command displays information about the central access policies assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

### **Parameters**

**`{ [-fields <fieldname>, ...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**`| [-instance ] }`**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**`[-vsriver <vsriver name>] - Vsriver`**

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

**`[-name <TextNoCase>] - Name`**

If you specify this parameter, the command displays information only for central access policies that match the specified name.

**[-sid <windows sid>] - Identifier**

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

**[-description <text>] - Description**

If you specify this parameter, the command displays information only for central access policies that match the specified description.

**[-ctime <Date>] - Creation Time**

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

**[-mtime <Date>] - Modification Time**

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

**[-rules <TextNoCase>, ...] - Central Access Rules**

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

**Examples**

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-applied
```

## vserver cifs group-policy central-access-policy show-defined

Show applicable central access policies defined in the Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs group-policy central-access-policy show-defined` command displays information about the central access policies that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access policy
- SID
- Description
- Creation time
- Modification time
- Member rules

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only for central access policies for the specified Vserver.

**[-name <TextNoCase>] - Name**

If you specify this parameter, the command displays information only for central access policies that match the specified name.

**[-sid <windows sid>] - Identifier**

If you specify this parameter, the command displays information only for central access policies that match the specified SID.

**[-description <text>] - Description**

If you specify this parameter, the command displays information only for central access policies that match the specified description.

**[-ctime <Date>] - Creation Time**

If you specify this parameter, the command displays information only for central access policies that match the specified creation time.

### **[-mtime <Date>] - Modification Time**

If you specify this parameter, the command displays information only for central access policies that match the specified modification time.

### **[-rules <TextNoCase>, ...] - Central Access Rules**

If you specify this parameter, the command displays information only for central access policies that match the specified member rules.

## **Examples**

The following example displays information for all central access policies:

```
cluster1::> vserver cifs group-policy central-access-policy show-defined

Vserver      Name                      SID
-----
-----
vs1          p1                          S-1-17-3386172923-1132988875-3044489393-
3993546205
      Description: policy #1
      Creation Time: Tue Oct 22 09:34:13 2013
      Modification Time: Wed Oct 23 08:59:15 2013
      Member Rules: r1

vs1          p2                          S-1-17-1885229282-1100162114-134354072-
822349040
      Description: policy #2
      Creation Time: Tue Oct 22 10:28:20 2013
      Modification Time: Thu Oct 31 10:25:32 2013
      Member Rules: r1
                   r2

2 entries were displayed.
```

## **vserver cifs group-policy central-access-rule show-applied**

Show currently applied central access rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver cifs group-policy central-access-rule show-applied` command displays information about the central access rules assigned to Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name

- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

**[-name <TextNoCase>] - Name**

If you specify this parameter, the command displays information only for central access rules that match the specified name.

**[-description <text>] - Description**

If you specify this parameter, the command displays information only for central access rules that match the specified description.

**[-ctime <Date>] - Creation Time**

If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

**[-mtime <Date>] - Modification Time**

If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

**[-effective <text>] - Effective Security Policy**

If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

**[-proposed <text>] - Proposed Security Policy**

If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

**[-resource <text>] - Resource Condition**

If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

## Examples

The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-applied

Vserver      Name
-----
vs1          r1
             Description: rule #1
             Creation Time: Tue Oct 22 09:33:48 2013
             Modification Time: Tue Oct 22 09:33:48 2013
             Current Permissions: O:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

vs1          r2
             Description: rule #2
             Creation Time: Tue Oct 22 10:27:57 2013
             Modification Time: Tue Oct 22 10:27:57 2013
             Current Permissions: O:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

2 entries were displayed.
```

## vserver cifs group-policy central-access-rule show-defined

Show applicable central access rules defined in the Active Directory

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs group-policy central-access-rule show-defined` command displays information about the central access rules that are defined in the Active Directory. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS servers:

- Vserver name
- Name of the central access rule
- Description
- Creation time
- Modification time
- Current permissions
- Proposed permissions
- Target resources

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only for central access rules for the specified Vserver.

**[-name <TextNoCase>] - Name**

If you specify this parameter, the command displays information only for central access rules that match the specified name.

**[-description <text>] - Description**

If you specify this parameter, the command displays information only for central access rules that match the specified description.

**[-ctime <Date>] - Creation Time**

If you specify this parameter, the command displays information only for central access rules that match the specified creation time.

**[-mtime <Date>] - Modification Time**

If you specify this parameter, the command displays information only for central access rules that match the specified modification time.

**[-effective <text>] - Effective Security Policy**

If you specify this parameter, the command displays information only for central access rules that match the specified effective security policy.

**[-proposed <text>] - Proposed Security Policy**

If you specify this parameter, the command displays information only for central access rules that match the specified proposed security policy.

**[-resource <text>] - Resource Condition**

If you specify this parameter, the command displays information only for central access rules that match the specified resource condition.

## Examples

The following example displays information for all central access rules:

```
cluster1::> vserver cifs group-policy central-access-rule show-defined

Vserver      Name
-----
vs1          r1
             Description: rule #1
             Creation Time: Tue Oct 22 09:33:48 2013
             Modification Time: Tue Oct 22 09:33:48 2013
             Current Permissions: O:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

vs1          r2
             Description: rule #2
             Creation Time: Tue Oct 22 10:27:57 2013
             Modification Time: Tue Oct 22 10:27:57 2013
             Current Permissions: O:SYG:SYD:AR(A;;FA;;;WD)
             Proposed Permissions: O:SYG:SYD:(A;;FA;;;OW)(A;;FA;;;BA)(A;;FA;;;SY)

2 entries were displayed.
```

## vserver cifs group-policy restricted-group show-applied

Show the applied restricted-group settings.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs group-policy restricted-group show-applied` command displays settings of all the restricted groups applied to a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups applied to all the Vservers in the cluster.

- **Group Policy Name:** Specifies the name of the group policy.
- **Version:** Specifies the version of the group policy.
- **Link:** Specifies the level in which the group policy is configured. Possible values are:
  - **Local:** Group policy is configured in ONTAP.
  - **Site:** Group policy is configured at the site level in the Domain Controller.
  - **Domain:** Group policy is configured at the domain level in the Domain Controller.
  - **OrganizationalUnit:** Group policy is configured at the OU level in the Domain controller.
- **RSOP:** Resultant set of policies derived from all the group policies defined at various levels.
- **Group Name:** Specifies the name of a restricted group.
- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.

- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays the restricted-group information that has been applied to the specified Vserver.

**[-index <integer>] - Index**

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

**[-group-name <text>] - Group Name**

If this parameter is specified, the command displays the restricted-group information for the specified group name.

**[-group-policy-name <text>] - Group Policy Name**

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

**[-uuid <UUID>] - UUID**

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

**[-version <integer>] - Version**

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

**[-link <gpo-link>] - Link Type**

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

**[-members <gpoUserGroup>,...] - Members, List of Users/groups**

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

**[-member-of <gpoUserGroup>,...] - MemberOf, List of Groups**

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

## Examples

The following example displays information about all restricted groups that have been applied to a Vserver.

```
cluster1::> vservers cifs group-policy restricted-group show-applied

Vserver: vs_1
-----

      Group Policy Name: gp01
              Version: 16
                  Link: OrganizationalUnit
      Group Name: grp1
              Members: usr1
              MemberOf: GPO\g9
Group Policy Name: Resultant Set of Policy
              Version: 0
                  Link: RSOP
      Group Name: grp1
              Members: usr1
              MemberOf: GPO\g9
```

## vservers cifs group-policy restricted-group show-defined

Show the defined restricted-group settings.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservers cifs group-policy restricted-group show-defined` command displays settings of all the restricted groups defined in Domain Controller for a Vserver.

If you do not specify any parameters, the command displays the following information about all the restricted groups defined in Domain Controller for all the Vservers in the cluster.

- Group Policy Name: Specifies the name of the group policy.
- Version: Specifies the version of the group policy.
- Link: Specifies the level in which the group policy is configured. Possible values are:
  - Local: Group policy is configured in ONTAP.
  - Site: Group policy is configured at the site level in the Domain Controller.
  - Domain: Group policy is configured at the domain level in the Domain Controller.
  - OrganizationalUnit: Group policy is configured at the OU level in the Domain Controller.
  - RSOP: Resultant set of policies derived from all the group policies defined at various levels.
- Group Name: Specifies the name of a restricted group.

- **Members:** Specifies users and groups who belong to and who do not belong to the restricted group.
- **MemberOf:** Specifies list of groups to which the restricted group is added. A group can be a member of groups other than the groups listed here.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays the restricted-group information that is defined in Domain Controller for the specified Vserver.

**[-index <integer>] - Index**

If this parameter is specified, the command displays the specified index for the group policy in the restricted group. The restricted-group information for the group policy at the specified index.

**[-group-name <text>] - Group Name**

If this parameter is specified, the command displays the restricted-group information for the specified group name.

**[-group-policy-name <text>] - Group Policy Name**

If this parameter is specified, the command displays the restricted-group information for the specified group policy name.

**[-uuid <UUID>] - UUID**

If this parameter is specified, the command displays the restricted-group information for the specified UUID of the group policy.

**[-version <integer>] - Version**

If this parameter is specified, the command displays the restricted-group information for the specified version of the group policy.

**[-link <gpo-link>] - Link Type**

If this parameter is specified, the command displays the restricted-group information for the specified link for the group policy.

**[-members <gpoUserGroup>,...] - Members, List of Users/groups**

If this parameter is specified, the command displays the restricted-group information for the specified members of users and groups.

**[-member-of <gpoUserGroup>,...] - MemberOf, List of Groups**

If this parameter is specified, the command displays the restricted-group information for the specified member of the group.

## Examples

The following example displays information about all restricted groups that are defined in Domain Controller for a Vserver.

```
cluster1::> vsriver cifs group-policy restricted-group show-defined

Vserver: vs_1
-----

      Group Policy Name: gp01
              Version: 16
              Link: OrganizationalUnit
      Group Name: grp1
              Members: usr1
              MemberOf: GPO\g9
Group Policy Name: Resultant Set of Policy
              Version: 0
              Link: RSOP
      Group Name: grp1
              Members: usr1
              MemberOf: GPO\g9
```

## vsvrer cifs home-directory modify

Modify attributes of CIFS home directories

**Availability:** This command is available to *cluster* and *Vsvrer* administrators at the *admin* privilege level.

### Description

The `vsvrer cifs home-directory modify` command modifies the CIFS home directory configuration for a CIFS server. To use the home directory option `s` (`-is-home-dirs-access-for-admin-enabled` or/and `-is-home-dirs-access-for-public-enabled`), a home directory share must be configured with a dynamic share pattern preceded by a tilde (~). Valid dynamic share patterns are `~%w` and `%d%w`. The pattern `%u` is not supported with the `se` option `s`.

### Parameters

#### **-vsvrer <vsvrer> -Vsvrer**

This parameter specifies the name of the CIFS server for which you want to modify the CIFS home directory configuration.

#### **[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled**

This optional parameter specifies whether a user with Windows administrative privileges can connect to another user's home directory. The default value for this parameter is *true*.

## **`[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled (privilege: advanced)`**

This optional parameter specifies whether any user can connect to another user's home directory. The default value for this parameter is *false*.

### **Examples**

The following example modifies the CIFS home directory configuration for the Vserver "vs1". It enables users with Windows administrative privileges to connect to another user's home directory, and enables any user to connect to another user's home directory.

```
cluster1::> vsserver cifs home-directory modify -vsserver vs1 -is-home-dirs
-access-for-admin-enabled true
-is-home-dirs-access-for-public-enabled true
```

The following example shows the usage of the share creation pattern `%d/%w`.

```
cluster1::> vsserver cifs share create -vsserver vs1 -share-name ~%d~%w
-path %d/%w -share-properties homedirectory
```

The following example shows the usage of the share creation pattern `~%w`.

```
cluster1::> vsserver cifs share create -vsserver vs1 -share-name ~%w -path
%d/%w -share-properties homedirectory
```

## **vserver cifs home-directory show-user**

### **Display the Home Directory Path for a User**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver cifs home-directory show-user` command prints the path of a user's CIFS home directory. Use this command if multiple CIFS home directory paths exist and you want to see which path holds the user's CIFS home directory.

### **Parameters**

**`{ [-fields <fieldname>,...]`**

If you specify this parameter, the command displays only the fields that you specify.

**`[-instance ]`**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

### **-vserver <vserver> - Vserver**

Use this required parameter to specify the Vserver that contains the home directory of the user specified with the required `-username` parameter.

### **-username <text> - User Name**

Use this required parameter to locate the home directory of the specified user. You must enter this parameter in the following format: `user`, `domain/user` or `cifs_server_name/user`.

### **[-path <text>] - Path**

If you specify this parameter, the command displays information about the user's home directory with the specified path.

### **[-share-name <text>] - Share Name**

If you specify this parameter, the command displays information about the user's home directory with the specified home-directory share.

## **Examples**

The following command displays information about the home directory of user `gpo\rpuser1` belonging to Vserver `vs1`.

```
cluster1::> vsriver cifs home-directory show-user -vserver vs1 -username
gpo\rpuser1
Vserver   : vs1
  Username : GPO/rpuser1
ShareName                               Home Dir Path
-----
root                                     /home/rpuser1
rpuser1                                  /home/rpuser1
~GPO~rpuser1                            /home/GPO/rpuser1
```

The following command displays information about the home directory of user `gpo\rpuser1` belonging to Vserver `vs1` at share path `/home/rpuser1`.

```
cluster1::> vsriver cifs home-directory show-user -vserver vs1 -username
gpo\rpuser1 -path /home/rpuser1
Vserver   : vs1
  Username : GPO/rpuser1
ShareName                               Home Directory Path
-----
root                                     /home/rpuser1
rpuser1                                  /home/rpuser1
2 entries were displayed.
```

The following command displays information about the home directory of user gpo\rpuser1 belonging to Vserver vs1 at share `_GPO~rpuser1`.

```
cluster1::> vserver cifs home-directory show-user -vserver vs1 -username
gpo\rpuser1 -share-name ~GPO~rpuser1
Vserver   : vs1
  Username : GPO/rpuser1
ShareName                               Home Directory Path
-----
~GPO~rpuser1                           /home/GPO/rpuser1
```

## vserver cifs home-directory show

Display home directory configurations

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs home-directory show` command displays the CIFS home directory configuration for one or more Vservers.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If you specify this parameter, the command displays CIFS home directory configuration for the specified Vserver.

**[-is-home-dirs-access-for-admin-enabled {true|false}] - Is Home Directory Access for Admin Enabled**

If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

**[-is-home-dirs-access-for-public-enabled {true|false}] - Is Home Directory Access for Public Enabled (privilege: advanced)**

If you specify this parameter, the command displays home directory configuration for CIFS servers that have the specified setting.

### Examples

The following example lists the CIFS home directory configuration for a Vserver on the cluster.

```
cluster1::> vsriver cifs home-directory show -vsriver vs1
Vserver: vs1
Is Home Directory Access for Admin Enabled: true
```

At the advanced privilege level or above, the output displays the information below:

```
cluster1::*> vsriver cifs options show
Vserver: vs1
  Is Home Directory Access for Admin Enabled: true
  Is Home Directory Access for Public Enabled: false
```

## **vsriver cifs home-directory search-path add**

Add a home directory search path

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsriver cifs home-directory search-path add` command adds a search path to a CIFS home directory configuration.

### **Parameters**

#### **-vsriver <vsriver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration to which you want to add the search path.

#### **-path <text> - Path**

This parameter specifies the search path you want to add.

### **Examples**

The following example adds the path `/home1` to the CIFS home directory configuration on Vserver `vs1`.

```
cluster1::> vsriver cifs home-directory search-path add -vsriver vs1 -path
/home1
```

## **vsriver cifs home-directory search-path remove**

Remove a home directory search path

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs home-directory search-path remove` command removes a search path from a CIFS home directory configuration.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver containing the CIFS home directory configuration from which you want to remove the search path.

### **-path <text> - Path**

This parameter specifies the search path you want to remove.

## Examples

The following example removes the path `/home1` from the CIFS home directory configuration on Vserver `vs1`.

```
cluster1::> vserver cifs home-directory search-path remove -vserver vs1  
-path /home1
```

## **vserver cifs home-directory search-path reorder**

Change the search path order used to find a match

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs home-directory search-path reorder` command moves a search path to a new position in the search path order in the CIFS home directory configuration for the CIFS-enabled Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS enabled Vserver for which you want to reorder searches.

### **-path <text> - Path**

This parameter specifies the search path you want to move.

### **-to-position <integer> - Target Position**

This parameter specifies the new position of the search path in the search path order.

## Examples

The following example moves the search path `/home1` to position 1 in the search path order for the CIFS home directory configuration on Vserver `vs1`.

```
cluster1::> vsriver cifs home-directory search-path reorder -vsriver vs1
-path /home1 -to-position 1
```

## vsriver cifs home-directory search-path show

Display home directory search paths

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs home-directory search-path show` command displays information about the search paths that are in the home directory configuration for the CIFS-enabled Vservers.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify this parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vsriver <vsriver name>] - Vsriver**

If you specify this parameter, the command displays home directory configuration for the CIFS-enabled Vsriver that you specify.

**[-path <text>] - Path**

If you specify this parameter, the command displays information only for the search path that you specify.

### Examples

The following example displays information about search paths for all CIFS home directories on all CIFS-enabled Vservers:

```
cluster1::> vsriver cifs home-directory search-path show
Vsriver      Position Path
-----
vs1          1      /home1
vs2          2      /home2
```

## vsriver cifs options modify

Modify CIFS options

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

## Description

The `vserver cifs options modify` command modifies CIFS options for a CIFS server.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the CIFS server for which you want to modify CIFS options.

### **[-default-unix-user <text>] - Default UNIX User**

This optional parameter specifies the name of the default UNIX user for the CIFS server.

### **[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits**

This optional parameter specifies whether the CIFS server does read grant execution for mode bits.

### **[-wins-servers <InetAddress>,...] - Windows Internet Name Service (WINS) Addresses**

This optional parameter specifies a list of Windows Internet Name Server (WINS) addresses for the CIFS server. You must specify the WINS servers using an IP address. You can enter multiple WINS addresses as a comma-delimited list.

Use an IPv4 address because WINS over IPv6 is not supported.

### **[-smb1-enabled {true|false}] - (DEPRECATED)-Enable SMB1 Protocol (privilege: advanced)**

This optional parameter specifies whether the CIFS server negotiates the SMB 1.0 version of the CIFS protocol. The default value for this parameter is false.

This parameter is deprecated because the SMB1 protocol is obsolete and considered not secure. It might be removed in a future release.

### **[-smb2-enabled {true|false}] - Enable all SMB2 Protocols (privilege: advanced)**

This optional parameter specifies whether the CIFS server negotiates the SMB 2 version of the CIFS protocol. The default value for this parameter is true.

### **[-smb3-enabled {true|false}] - Enable SMB3 Protocol (privilege: advanced)**

This optional parameter specifies whether the CIFS server negotiates the SMB 3 version of the CIFS protocol. The default value for this parameter is true.

### **[-smb31-enabled {true|false}] - Enable SMB3.1 Protocol (privilege: advanced)**

This optional parameter specifies whether the CIFS server negotiates the SMB 3.1 version of the CIFS protocol. The default value for this parameter is true.

### **[-max-mpx <integer>] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)**

This optional parameter specifies the maximum number of simultaneous operations the CIFS server reports it can process per TCP connection. The default value for this parameter is 255. This option only applies to SMB 1.0 protocol.

### **[-shadowcopy-dir-depth <integer>] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)**

This optional parameter specifies the maximum depth of directories on which to create shadow copies in

the CIFS server. The default for this parameter is 5. The value 0 indicates that all sub-directories should be shadow copied. This parameter is not supported for workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroup volumes do not support shadow copy.

**[`-copy-offload-enabled {true|false}`] - Enable Copy Offload Feature (privilege: advanced)**

This optional parameter enables the Copy Offload feature in the CIFS server. If set to false, the Copy Offload feature is disabled. The default for this parameter is true.

**[`-is-copy-offload-direct-copy-enabled {true|false}`] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)**

This optional parameter enables the direct-copy mechanism for ODX copy offload in the CIFS server. If set to false, the direct-copy mechanism is disabled. The default for this parameter is true. + The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

**[`-default-unix-group <text>`] - Default UNIX Group**

This optional parameter specifies the name of the default UNIX group for the CIFS server. If you do not specify a default UNIX group, the CIFS ACL to NFSv4 ACL translation may result in incomplete NFSv4 ACL information. This parameter is not supported by Vservers with FlexVol volumes.

**[`-shadowcopy-enabled {true|false}`] - Enable Shadow Copy Feature (VSS) (privilege: advanced)**

This optional parameter enables the Shadow Copy (VSS) feature in the CIFS server when set to true. The VSS feature is disabled when set to false. The default for this parameter is true. This parameter is not supported for workgroup CIFS servers. Directories and files within a FlexGroup will not be shadow copied because FlexGroup volumes do not support shadow copy.

**[`-is-referral-enabled {true|false}`] - Refer Clients to More Optimal LIFs (privilege: advanced)**

This optional parameter specifies whether the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. The default value for this parameter is false.

**[`-is-local-auth-enabled {true|false}`] - Is Local User Authentication Enabled (privilege: advanced)**

This optional parameter specifies whether local user authentication is enabled for the CIFS server.

**[`-is-local-users-and-groups-enabled {true|false}`] - Is Local Users and Groups Enabled (privilege: advanced)**

This optional parameter specifies whether the local users and groups feature is enabled for the CIFS server.

**[`-is-use-junctions-as-reparse-points-enabled {true|false}`] - Is Reparse Point Support Enabled (privilege: advanced)**

This optional parameter specifies whether the CIFS server exposes junction points to Windows clients as reparse points. The default value for this parameter is true. This parameter is only active if the client has negotiated use of the SMB 2 or SMB 3 protocol.

**[`-is-exportpolicy-enabled {true|false}`] - Is Export Policies for CIFS Enabled (privilege: advanced)**

This optional parameter specifies whether the CIFS server uses export policies to control client access. The default value for this parameter is false.

**`[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server has the NT ACLs enabled on UNIX security-style volumes. The default value for this parameter is true.

**`[-is-trusted-domain-enum-search-enabled {true|false}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports enumeration of bidirectional trusted domains. It also supports the search in all the bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. The default value is true. This parameter is not supported for workgroup CIFS servers.

**`[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)`**

This optional parameter specifies the amount of idle time (in seconds) before a CIFS session is disconnected. The default value for this parameter is 900 seconds.

**`[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)`**

This optional parameter enables the Dynamic Access Control (DAC) feature in the CIFS server when set to true. The DAC feature is disabled when set to false. The default for this parameter is false. This parameter is not supported for workgroup CIFS servers.

**`[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User (privilege: advanced)`**

This optional parameter controls the access restrictions of non-authenticated sessions and applies the restrictions for the anonymous user based on the permitted values. The default value for this parameter is no-restriction. Permitted values for this option are:

- no-restriction - This option specifies no access restriction for anonymous users (default).
- no-enumeration - This option specifies that only enumeration is restricted.
- no-access - This option specifies that access is restricted for anonymous users.

**`[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled`**

This optional parameter controls deletion of read-only files and directories. NTFS delete semantics forbid deletion of a file or directory when the read-only attribute is set. UNIX delete semantics ignore it, focusing instead on parent directory permissions, which some applications require. This option is used to select the desired behavior. By default this option is disabled, yielding NTFS behavior.

**`[-file-system-sector-size {512|4096 (in bytes)}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)`**

This optional parameter specifies the size of file system sector reported to SMB clients (in bytes). The default value for this parameter is 4096. Valid values are 512 and 4096.

**`[-is-fake-open-enabled {true|false}] - Is Fake Open Support Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports fake open requests. This parameter allows you to optimize the open and close requests coming from SMB 2 clients. The default value for this parameter is true.

**`[-is-unix-extensions-enabled {true|false}] - Is UNIX Extensions Enabled (privilege: advanced)`**

When set to true, this optional parameter enables the UNIX Extensions feature in the CIFS server. If set to

false, the UNIX Extensions feature is disabled. The default for this parameter is false. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

**`[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled`  
(privilege: advanced)**

This optional parameter specifies whether the CIFS server supports searching short names. A search query with this option enabled will try to match 8.3 file names along with long file names. The default value for this parameter is false.

**`[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled` (privilege: advanced)**

This optional parameter specifies whether the CIFS server supports the advanced sparse file capabilities. This allows CIFS clients to query the allocated ranges of a file and to write zeroes or free data blocks for ranges of a file.

**`[-is-fsctl-file-level-trim-enabled {true|false}] - Is Fsctl File Level Trim Enabled`  
(privilege: advanced)**

This optional parameter specifies whether trim requests (FSCTL\_FILE\_LEVEL\_TRIM) are supported on the CIFS server.

**`[-guest-unix-user <text>] - Map the Guest User to Valid UNIX User` (privilege: advanced)**

This optional parameter specifies that an unauthenticated user coming from any untrusted domain can be mapped to a specified UNIX user for the CIFS server. If the CIFS server cannot authenticate the user against a domain controller for the home domain or a trusted domain or the local database, and this option is enabled, the CIFS server considers the user as a guest user and maps the user to the specified UNIX user. The UNIX user must be a valid user.

**`[-smb1-max-buffer-size <integer>] - Maximum Buffer Size Used for SMB1 Message` (privilege: advanced)**

This optional parameter specifies the maximum buffer size used for an SMB 1.0 message that the CIFS server can receive. If the LARGE\_READ or LARGE\_WRITE capability is negotiated during session setup, then 'Read' or 'Write' SMB 1.0 operations are allowed to exceed the configured 'smb1-max-buffer-size' value. This parameter does not have any effect on SMB 2 or SMB 3 buffer size. The default value for this parameter is 65535. The supported range for this parameter is 4356 through 65535.

**`[-max-same-user-sessions-per-connection <integer>] - Maximum Same User Sessions per TCP Connection` (privilege: advanced)**

This optional parameter specifies the maximum number of CIFS sessions that can be set up by the same user per TCP connection. The default value of this parameter is 2500. The maximum value of this parameter is 4294967295.

**`[-max-same-tree-connect-per-session <integer>] - Maximum Same Tree Connect per Session`  
(privilege: advanced)**

This optional parameter specifies the maximum number of CIFS tree connects to the same share per CIFS session. The default value of this parameter is 5000. The maximum value of this parameter is 4294967295.

**`[-max-opens-same-file-per-tree <integer>] - Maximum Opens on Same File per Tree`  
(privilege: advanced)**

This optional parameter specifies the maximum number of existing opens on the same file per CIFS tree. The default value of this parameter is 1000. The maximum value of this parameter is 4294967295.

**`[-max-watches-set-per-tree <integer>]` - Maximum Watches Set per Tree (privilege: advanced)**

This optional parameter specifies the maximum number of watches, also known as change notifies, that can be set per CIFS tree. Tree here refers to a share connect from a single client. The default value of this parameter is 500. The maximum value of this parameter is 4294967295.

**`[-is-admin-users-mapped-to-root-enabled {true|false}]` - Map Administrators to UNIX User 'root' (privilege: advanced)**

If this optional parameter is set to true, Windows users who are members of the "BUILTIN\Administrators" group are mapped to UNIX user 'root' unless a user who is a member of this group is explicitly mapped to a UNIX user. If a Windows user is a member of the "BUILTIN\Administrators" group and an explicit user mapping exists for that user, the explicit name mapping takes precedence. If this parameter is set to false, users that are members of the "BUILTIN\Administrators" group are not mapped to UNIX 'root'. The default value for this parameter is true.

**`[-is-advertise-dfs-enabled {true|false}]` - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)**

This optional parameter specifies whether to advertise DFS referral of the CIFS protocol. The default value for this parameter is false. This option is not applicable to SMB 1.0.

This parameter is deprecated and may be removed in a future release of ONTAP. The functionality provided by this parameter is now controlled by the `-symlink-properties` parameter instead.

**`[-is-path-component-cache-enabled {true|false}]` - Is Path Component Cache Enabled (privilege: advanced)**

This optional parameter specifies whether the path component cache is enabled. The default value for this parameter is true.

**`[-win-name-for-null-user <TextNoCase>]` - Map Null User to Windows User or Group (privilege: advanced)**

This optional parameter specifies a valid Windows user or group name that will be added to the CIFS credentials for a NULL user Session.

**`[-is-hide-dotfiles-enabled {true|false}]` - Is Hide Dot Files Enabled (privilege: advanced)**

This optional parameter specifies whether the CIFS server supports hiding dot files. Directory enumeration with this option enabled hides files and directories that begin with a dot ("."). The default value for this parameter is false.

**`[-is-client-version-reporting-enabled {true|false}]` - Is Client Version Reporting Enabled (privilege: advanced)**

If this parameter is set to true, CIFS client version tracking information is collected by AutoSupport. The default value of this parameter is true.

**`[-is-client-dup-detection-enabled {true|false}]` - Is Client Duplicate Session Detection Enabled (privilege: advanced)**

This optional parameter specifies whether the CIFS server supports duplicate session detection. Duplicate sessions that come from the same client with VcNumber of zero with this option enabled will be closed, and is only applicable for SMB 1.0 clients. The default value for this parameter is true.

**`[-grant-unix-group-perms-to-others {true|false}]` - Grant UNIX Group Permissions to Others (privilege: advanced)**

This optional parameter specifies whether the incoming CIFS user who is not the owner of the file, can be granted the group permission. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to true, then at all times the file's "group" permissions are granted. If the CIFS incoming user is not the owner of UNIX security-style file and this option is set to false, then the normal UNIX rules are applicable to grant the permissions. The default value of this parameter is false.

**`[-is-multichannel-enabled {true|false}] - Is Multichannel Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports Multichannel or not. The default value for this parameter is false.

**`[-max-connections-per-session <integer>] - Maximum Connections Allowed Per Multichannel Session (privilege: advanced)`**

This optional parameter specifies the maximum number of connections allowed per Multichannel session. The default value for this parameter is 32.

**`[-max-lifs-per-session <integer>] - Maximum LIFs Advertised Per Multichannel Session (privilege: advanced)`**

This optional parameter specifies the maximum number of network interfaces advertised per Multichannel session. The default value for this parameter is 256.

**`[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports the SMB 2.1 "large MTU" feature. The default value for this parameter is true.

**`[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports the NetBIOS over TCP (port 139) feature. The default value for this parameter is true.

**`[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)`**

This optional parameter specifies whether the CIFS server supports the NBNS protocol. The default value for this parameter is *false*.

**`[-widelink-as-reparse-point-versions <CIFS Dialects>,...] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)`**

This optional parameter specifies the CIFS protocol versions for which the widelink is reported as reparse point. The default value for this parameter is *SMB1*.

Any values entered for this parameter is replaced with the existing values.

**`[-max-credits <integer>] - Maximum Credits to Grant (privilege: advanced)`**

This optional parameter specifies the maximum number of outstanding requests on a CIFS connection. The default value for this parameter is 128.

**`[-is-inherit-modebits-with-nfsv4acl-enabled {true|false}] - Enable Modebits on CIFS File Inheriting NFSv4 ACLs (privilege: advanced)`**

This optional parameter specifies whether to set mode bits on the files created by the cifs user that inherit NFSv4 acls. This parameter is not supported for SMB1 clients.

**`[-is-share-enum-permission-check-enabled {true|false}]` - Check Share Permission for NetShareEnumAll Request (privilege: advanced)**

If this parameter is set to *true*, the NetShareEnum call will only respond with the shares the user has access to. The default value is *false* which means it will respond with all shares.

**`[-is-backup-symlink-enabled {true|false}]` - Preserve UNIX Symlink During Backup through SMB (privilege: advanced)**

This optional parameter specifies whether the UNIX symlinks are preserved during backup through SMB. The default value is *false* which means symlink will not be preserved and it will be copied as regular file or directory.

## Examples

The following example modifies CIFS options for the Vserver "vs1". It changes the default UNIX user, disables read grants exec, disables SMB2.x, changes maximum multiplex count to 1124, changes the file system sector size reported to SMB clients to 512, disables the direct-copy offload mechanism for ODX copy offload, enables the UNIX Extensions feature, disables fake open requests changes WINS servers to 192.168.11.112 and changes the client session timeout to 6000.

```
cluster1::> vsriver cifs options modify -vsriver vs1
-default-unix-user pcuser -read-grants-exec disabled
-smb2-enabled false -max-mpx 1124 -file-system-sector-size
512 -is-copy-offload-direct-copy-enabled false
-is-unix-extensions-enabled true -is-fake-open-enabled false
-wins-servers 192.168.11.112 -client-session-timeout 6000
```

The following example modifies CIFS options for the Vserver "vs1". It enables the advanced sparse file support .

```
cluster1::> vsriver cifs options modify -vsriver vs1
-is-advanced-sparse-file-support-enabled true
```

The following example modifies CIFS options for the Vserver "vs1". It modifies limits for maximum opens on the same file, max sessions by the same user, max tree connects per session, and max watches set.

```
cluster1::> vsriver cifs options modify -vsriver vs1
-max-same-user-sessions-per-connection 100
-max-same-tree-connect-per-session 100 -max-opens-same-file-per-tree 150
-max-watches-set-per-tree 200
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable the path component cache. .

```
cluster1::> vsriver cifs options modify -vsriver vs1
-is-path-component-cache-enabled false
```

The following example modifies CIFS options for the Vserver "vs1". It modifies the option to disable CIFS client version tracking.

```
cluster1::> vserver cifs options modify -vserver vs1
-is-client-version-reporting-enabled false
```

The following example modifies CIFS option for the Vserver "vs1". It modifies the option to enable granting of UNIX group permissions to others.

```
cluster1::> vserver cifs options modify -vserver vs1
-grant-unix-group-perms-to-others true
```

## vserver cifs options show

### Display CIFS options

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs options show` command displays the CIFS configuration options for one or more Vservers.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command only displays CIFS options for the specified Vserver.

**[-default-unix-user <text>] - Default UNIX User**

If you specify this parameter, the command displays options for CIFS server with the specified UNIX user.

**[-read-grants-exec {enabled|disabled}] - Read Grants Exec for Mode Bits**

If this parameter is set to `enabled`, the command displays options for CIFS servers that grant execution access when granting read access using mode bits. If set to `disabled`, the command displays options for CIFS servers that do not grant execution access when granting read access using mode bits.

**[-wins-servers <InetAddress>,...] - Windows Internet Name Service (WINS) Addresses**

If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified Windows Internet Name Server (WINS) addresses.

**[`-smb1-enabled {true|false}`] - (DEPRECATED)-Enable SMB1 Protocol (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where SMB 1.0 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 1.0 version of the CIFS protocol is not negotiated.

This parameter is deprecated because the SMB1 protocol is obsolete and considered not secure. It might be removed in a future release.

**[`-smb2-enabled {true|false}`] - Enable all SMB2 Protocols (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 2 version of the CIFS protocol is not negotiated.

**[`-smb3-enabled {true|false}`] - Enable SMB3 Protocol (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3 version of the CIFS protocol is not negotiated.

**[`-smb31-enabled {true|false}`] - Enable SMB3.1 Protocol (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is negotiated. If set to false, the command displays options for CIFS servers where SMB 3.1 version of the CIFS protocol is not negotiated.

**[`-max-mpx <integer>`] - Maximum Simultaneous Operations per TCP Connection (privilege: advanced)**

If you specify this parameter, the command displays options for CIFS server with the specified maximum number of simultaneous operations the CIFS server can process per TCP connection.

**[`-shadowcopy-dir-depth <integer>`] - Maximum Depth of Directories to Shadow Copy (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified depth of directories on which to create shadow copies.

**[`-copy-offload-enabled {true|false}`] - Enable Copy Offload Feature (privilege: advanced)**

If set to true, this command displays options only for CIFS servers where the Copy Offload feature is enabled. If set to false, options are displayed for CIFS servers where the Copy Offload feature is disabled.

**[`-is-copy-offload-direct-copy-enabled {true|false}`] - Is Direct-copy Copy Offload Mechanism Enabled (privilege: advanced)**

If set to true, this command displays options only for CIFS servers where the direct-copy mechanism for ODX Copy Offload is enabled. If set to false, options are displayed for CIFS servers where the direct-copy offload mechanism is disabled. + The direct-copy mechanism increases the performance of the copy offload operation when Windows clients try to open the source file of a copy in a mode that prevents the file being changed while the copy is in progress. If turned off, regular copy offloading takes place.

**[`-default-unix-group <text>`] - Default UNIX Group**

If you specify this parameter, the command displays options for CIFS server with the specified default UNIX group.

**`[-shadowcopy-enabled {true|false}] - Enable Shadow Copy Feature (VSS) (privilege: advanced)`**

If set to true, this command displays options only for CIFS servers where the Shadow Copy (VSS) feature is enabled. If set to false, options are displayed for CIFS servers where the Shadow Copy (VSS) feature is disabled.

**`[-is-referral-enabled {true|false}] - Refer Clients to More Optimal LIFs (privilege: advanced)`**

If set to true, the command displays options for the CIFS server where the CIFS server automatically refers clients to a data LIF local to the node which hosts the root of the requested share. If set to false, the command displays options for the CIFS server where the mechanism, to automatically refer the clients to data LIF local to the node which hosts the root of the requested share, is disabled.

**`[-is-local-auth-enabled {true|false}] - Is Local User Authentication Enabled (privilege: advanced)`**

If this parameter is set to true, the command displays CIFS options only for CIFS servers where local user authentication is enabled. If set to false, the command displays options for CIFS servers where local user authentication is disabled.

**`[-is-local-users-and-groups-enabled {true|false}] - Is Local Users and Groups Enabled (privilege: advanced)`**

If this parameter is set to true, the command displays CIFS options only for CIFS servers where the local users and groups feature is enabled. If set to false, the command displays options for CIFS servers where the local users and groups feature is disabled.

**`[-is-use-junctions-as-reparse-points-enabled {true|false}] - Is Reparse Point Support Enabled (privilege: advanced)`**

If you specify this parameter, the command only displays CIFS options for Vservers which have the specified reparse point setting.

**`[-is-exportpolicy-enabled {true|false}] - Is Export Policies for CIFS Enabled (privilege: advanced)`**

If you specify this parameter, the command only displays CIFS options for Vservers which have the specified export policy setting.

**`[-is-unix-nt-acl-enabled {true|false}] - Is NT ACLs on UNIX Security-style Volumes Enabled (privilege: advanced)`**

If this parameter is set to true, the command only displays CIFS options for Vservers that have the NT ACLs on UNIX security-style volumes enabled. If set to false, the command displays CIFS options for Vservers that have the NT ACLS on UNIX security-style volumes disabled.

**`[-is-trusted-domain-enum-search-enabled {true|false}] - Is Enumeration of Trusted Domain and Search Capability Enabled (privilege: advanced)`**

If this parameter is set to true, the command displays CIFS options only for CIFS servers that support enumeration of bidirectional trusted domains and that support searching in all bidirectional trusted domains when performing Windows user lookups for UNIX user to Windows user name mapping. If set to false, the command displays options for CIFS servers that do not support enumeration of bidirectional trusted domains.

**`[-client-session-timeout <integer>] - Idle Timeout Before CIFS Session Disconnect (secs)`**

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified client session timeout value (in seconds).

**`[-is-dac-enabled {true|false}] - Is Dynamic Access Control (DAC) Enabled (privilege: advanced)`**

If set to true, this command displays options only for CIFS servers where the Dynamic Access Control (DAC) feature is enabled. If set to false, options are displayed for CIFS servers where the Dynamic Access Control (DAC) feature is disabled.

**`[-restrict-anonymous {no-restriction|no-enumeration|no-access}] - Restrictions for Anonymous User (privilege: advanced)`**

If you specify this parameter, the command displays CIFS options only for CIFS servers that have the specified permitted value for the anonymous user. Permitted values for this option are:

- no-restriction - There is no access restriction for anonymous users.
- no-enumeration - Only enumeration is restricted.
- no-access - Access is restricted for anonymous users.

**`[-is-read-only-delete-enabled {enabled|disabled}] - Is Deletion of Read-Only Files Enabled`**

If you specify this parameter, the command displays options only for CIFS servers that have the specified is-read-only-delete-enabled setting.

**`[-file-system-sector-size {512|4096 (in bytes)}] - Size of File System Sector Reported to SMB Clients (bytes) (privilege: advanced)`**

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified file system sector size (in bytes).

**`[-is-fake-open-enabled {true|false}] - Is Fake Open Support Enabled (privilege: advanced)`**

If you set this parameter to true, the command displays options for CIFS servers where fake open is enabled. If set to false, the command displays options for CIFS servers where fake open is disabled.

**`[-is-unix-extensions-enabled {true|false}] - Is UNIX Extensions Enabled (privilege: advanced)`**

If set to true, this command displays options only for CIFS servers where the UNIX Extensions feature is enabled. If set to false, options are displayed for CIFS servers where the UNIX Extensions feature is disabled. UNIX Extensions allows POSIX/UNIX style security to be displayed through the CIFS protocol.

**`[-is-search-short-names-enabled {true|false}] - Is Search Short Names Support Enabled (privilege: advanced)`**

If you set this parameter to true, the command displays options for CIFS servers where search short names is enabled. If set to false, the command displays options for CIFS servers where search short names is disabled.

**`[-is-advanced-sparse-file-support-enabled {true|false}] - Is Advanced Sparse File Support Enabled (privilege: advanced)`**

If set to true, the command displays options for CIFS servers where the advanced sparse file capabilities for CIFS are enabled. If set to false, options are displayed for CIFS servers where the advanced sparse file capabilities for CIFS are disabled.

**`[-is-fsctl-file-level-trim-enabled {true|false}] - Is Fsctl File Level Trim Enabled (privilege: advanced)`**

If set to true, the command displays options for all the CIFS servers where trim requests (FSCTL\_FILE\_LEVEL\_TRIM) are supported. If set to false, options are displayed for all the CIFS servers where trim requests (FSCTL\_FILE\_LEVEL\_TRIM) are not supported.

**[`-guest-unix-user <text>`] - Map the Guest User to Valid UNIX User (privilege: advanced)**

If you specify this parameter, the command displays options for CIFS server with the specified guest UNIX user.

**[`-smb1-max-buffer-size <integer>`] - Maximum Buffer Size Used for SMB1 Message (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum buffer size value.

**[`-max-same-user-sessions-per-connection <integer>`] - Maximum Same User Sessions per TCP Connection (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same user session per connection.

**[`-max-same-tree-connect-per-session <integer>`] - Maximum Same Tree Connect per Session (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum same tree connects per session.

**[`-max-opens-same-file-per-tree <integer>`] - Maximum Opens on Same File per Tree (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum opens on same file per tree.

**[`-max-watches-set-per-tree <integer>`] - Maximum Watches Set per Tree (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum watches set per tree. Tree here refers to a share connect from a single client.

**[`-is-admin-users-mapped-to-root-enabled {true|false}`] - Map Administrators to UNIX User 'root' (privilege: advanced)**

If you set this parameter to true, the command displays options for CIFS servers where members of "BUILTIN\Administrators" group are mapped to UNIX user 'root'. If set to false, the command displays options for CIFS servers where members of the "BUILTIN\Administrators" group are not mapped to UNIX user 'root'.

**[`-is-advertise-dfs-enabled {true|false}`] - (DEPRECATED)-Enable DFS Referral Advertisement (privilege: advanced)**

If this parameter is set to true, the command displays CIFS options only for CIFS servers where DFS referral advertisement is enabled. If set to false, the command displays options for CIFS servers where DFS referral advertisement is disabled. This option is not applicable to SMB 1.0.

This parameter is deprecated and may be removed in a future release of ONTAP. The functionality provided by this parameter is now controlled by the `-symlink-properties` parameter instead.

**[`-is-path-component-cache-enabled {true|false}`] - Is Path Component Cache Enabled (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where the path component cache is enabled. If set to false, the command displays options for CIFS servers where the path component cache is disabled.

**[-win-name-for-null-user <TextNoCase>] - Map Null User to Windows User or Group (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS servers that are configured to add the specified windows user or group into CIFS credentials for null sessions.

**[-is-hide-dotfiles-enabled {true|false}] - Is Hide Dot Files Enabled (privilege: advanced)**

When set to true, this optional parameter enables the Hide Dot Files feature in the CIFS server. If set to false, the Hide Dot Files feature is disabled. The default value for this parameter is false.

**[-is-client-version-reporting-enabled {true|false}] - Is Client Version Reporting Enabled (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where CIFS client version tracking is enabled. If set to false, the command displays options for CIFS servers where CIFS client version tracking is disabled.

**[-is-client-dup-detection-enabled {true|false}] - Is Client Duplicate Session Detection Enabled (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where client duplicate session detection is enabled. If set to false, the command displays options for CIFS servers where client duplicate session detection is not enabled.

**[-grant-unix-group-perms-to-others {true|false}] - Grant UNIX Group Permissions to Others (privilege: advanced)**

If this parameter is set to true, the command displays CIFS options only for CIFS servers where grant unix group permissions to others feature is enabled. If set to false, the command displays options for CIFS servers where grant unix group permissions to others feature is disabled.

**[-is-multichannel-enabled {true|false}] - Is Multichannel Enabled (privilege: advanced)**

If this parameter is set to true, the command displays options for CIFS servers where the multichannel is enabled. If set to false, the command displays options for CIFS servers where the multichannel is disabled.

**[-max-connections-per-session <integer>] - Maximum Connections Allowed Per Multichannel Session (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum connections allowed per multichannel session.

**[-max-lifs-per-session <integer>] - Maximum LIFs Advertised Per Multichannel Session (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS server that are configured with the specified maximum network interfaces advertised per multichannel session.

**[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the SMB 2.1 "Large MTU" feature.

**[-is-netbios-over-tcp-enabled {true|false}] - Is NetBIOS over TCP (port 139) Enabled (privilege: advanced)**

If you specify this parameter, the command displays options only for CIFS servers that are configured to support the NetBIOS over TCP (port 139) feature.

**`[-is-nbns-enabled {true|false}] - Is NBNS over UDP (port 137) Enabled (privilege: advanced)`**

If you specify this parameter, the command displays CIFS options only for CIFS servers that use the specified setting for the NBNS protocol.

**`[-widelink-as-reparse-point-versions <CIFS Dialects>,...] - Protocol Versions for Which Widelink Will Be Reported as Reparse Point (privilege: advanced)`**

If you specify this parameter, the command displays CIFS options only for the CIFS servers that matches the specified CIFS protocol versions for which widelinks are reported as reparse points. If a list is entered, entries are returned that matches all the specified versions.

**`[-max-credits <integer>] - Maximum Credits to Grant (privilege: advanced)`**

If you specify this parameter, the command displays options only for CIFS servers that are configured with the specified maximum credits.

**`[-is-inherit-modebits-with-nfsv4acl-enabled {true|false}] - Enable Modebits on CIFS File Inheriting NFSv4 ACLs (privilege: advanced)`**

If you specify this parameter, mode bits are set on the files created by the cifs user that inherit nfsv4 acls.

**`[-is-share-enum-permission-check-enabled {true|false}] - Check Share Permission for NetShareEnumAll Request (privilege: advanced)`**

If this parameter is set to true, the command only displays CIFS options for Vservers that enabled share permission check for NetShareEnumAll request. If set to false, options are displayed for CIFS servers that disabled share permission check for NetShareEnumAll request.

**`[-is-backup-symlink-enabled {true|false}] - Preserve UNIX Symlink During Backup through SMB (privilege: advanced)`**

If this parameter is specified, the command displays options only for CIFS servers that are configured to support preserving UNIX symlinks during backup through SMB.

## Examples

The following example lists CIFS options for a Vserver on the cluster.

```
cluster1::> vserver cifs options show

Vserver: vs1

Client Session Timeout: 900
Default Unix Group: -
Default Unix User: pcuser
Guest Unix User: guestusers
Read Grants Exec: disabled
WINS Servers: -
```

At the advanced level, the output displays the information below.

```
cluster1::*> vserver cifs options show

Vserver: vs1
```

Client Session Timeout: 900

```
Copy Offload Enabled: true
Default Unix Group: -
Default Unix User: pcuser
Guest Unix User: -
Are Administrators mapped to 'root': true
Is Advanced Sparse File Support Enabled: true
Direct-Copy Copy Offload Enabled: true
Export Policies Enabled: false
Grant Unix Group Permissions to Others: true
Is Advertise DFS Enabled: true
Is Client Duplicate Session Detection Enabled: true
Is Client Version Reporting Enabled: true
Is DAC Enabled: false
Is Fake Open Support Enabled: true
Is Hide Dot Files Support Enabled: false
Is Large MTU Enabled: true
Is Local Auth Enabled: true
Is Local Users and Groups Enabled: true
Is Multichannel Enabled: false
Is NetBIOS over TCP (port 139) Enabled: true
Is Referral Enabled: false
Is Search Short Names Support Enabled: false
Is Trusted Domain Enumeration And Search Enabled: true
Is UNIX Extensions Enabled: false
Is Use Junction as Reparse Point Enabled: true
Max Multiplex Count: 255
Max Connections per Multichannel Session: 32
Max LIFs per Multichannel Session: 256
Max Same User Session Per Connection: 2500
Max Same Tree Connect Per Session: 5000
Max Opens Same File Per Tree: 1000
Max Watches Set Per Tree: 500
NBNS Interfaces : -
Is Path Component Cache Enabled: true
NT ACLs on UNIX Security Style Volumes Enabled: true
Read Grants Exec: disabled
Read Only Delete: disabled
Reported File System Sector Size: 4096
Restrict Anonymous: no-restriction
Shadowcopy Dir Depth: 5
Shadowcopy Enabled: true
SMB1 Enabled: true
Max Buffer Size for SMB1 Message: 65535
SMB2 Enabled: true
SMB3 Enabled: true
```

```
SMB3.1 Enabled: true
Map Null User to Windows User or Group: cifsGroup
WINS Servers: -
Report Widelink as Reparse Point Versions: SMB1
```

## vserver cifs security modify

### Modify CIFS security settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs security modify` command modifies CIFS server security settings.

#### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver whose CIFS security settings you want to modify.

**[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew**

This parameter specifies the maximum allowed Kerberos ticket clock skew in minutes. The default setting is 5 minutes.

**[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime**

This parameter specifies the Kerberos ticket lifetime in hours. The default setting is 10 hours.

**[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days**

This parameter specifies the maximum Kerberos ticket renewal lifetime in days. The default setting is 7 days.

**[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)**

This parameter specifies the timeout for sockets on KDCs after which all KDCs are marked as unreachable. The default setting is 3 seconds.

**[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic**

This parameter specifies whether signing is required for incoming CIFS traffic. The default setting is *false*.

**[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts**

This parameter specifies whether password complexity is required for CIFS local users. If this parameter is set to *true*, password complexity is required. If the value is set to *false*, password complexity is not required. The default setting is *true* for CIFS servers.

**[-use-start-tls-for-ad-ldap {true|false}] - Use start\_tls for AD LDAP Connections**

This parameter specifies whether to use Start TLS over AD LDAP connections. When enabled, the communication between the ONTAP LDAP Client and the LDAP Server will be encrypted using Start TLS. Start TLS is a mechanism to provide secure communication by using the TLS/SSL protocols. The default

setting is *false*.

Ensure right certificates are installed for CIFS home domain and trusted domains.

### **`[-is-aes-encryption-enabled {true|false}] - (DEPRECATED)-Is AES-128 and AES-256 Encryption for Kerberos Enabled`**

This parameter specifies whether to use Kerberos AES-128 and AES-256 encryption types for authentication. When enabled, and depending on negotiation with the KDC service, it is possible for authentication operations to use these encryption types. The default setting is *true*.

This parameter is deprecated and might be removed from a future release.

### **`[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level`**

This parameter specifies the LM compatibility level. The default setting is *lm-ntlm-ntlmv2-krb* (LM, NTLM, NTLMv2 and Kerberos).

### **`[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic`**

This parameter specifies whether SMB encryption is required when accessing shares in the Vserver. When enabled and depending on negotiation during session setup, it is possible that data transfers between the client and the server are made secure by encrypting the SMB traffic. The default setting is *false*.

### **`[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security`**

This parameter specifies the level of security to be used for LDAP communications. The default setting is *none*.

LDAP Client Session Security can be one of the following:

- none - No Signing or Sealing.
- sign - Sign LDAP traffic.
- seal - Seal and Sign LDAP traffic.

### **`[-smb1-enabled-for-dc-connections {false|true|system-default}] - (DEPRECATED)-SMB1 Enabled for DC Connections`**

This parameter specifies whether SMB1 is enabled for use with connections to domain controllers. The default setting is *system-default*.

SMB1 Enabled For DC Connections can be one of the following:

- false - SMB1 is not enabled.
- true - SMB1 is enabled.
- system-default - This sets the option to whatever is the default for the release of ONTAP that is running. For this release it is: SMB1 is enabled.

This parameter is deprecated because the SMB1 protocol is obsolete and considered not secure. It might be removed in a future release.

### **[`-smb2-enabled-for-dc-connections {false|true|system-default}`] - SMB2 Enabled for DC Connections**

This parameter specifies whether SMB2 is enabled for use with connections to domain controllers. The default setting is *system-default*.

SMB2 Enabled For DC Connections can be one of the following:

- `false` - SMB2 is not enabled.
- `true` - SMB2 is enabled.
- `system-default` - This sets the option to whatever is the default for the release of ONTAP that is running. For this release it is: SMB2 is enabled.

### **[`-referral-enabled-for-ad-ldap {true|false}`] - LDAP Referral Chasing Enabled For AD LDAP Connections**

This parameter specifies whether LDAP referral is enabled for AD LDAP connections. The default setting is *false*.

### **[`-use-ldaps-for-ad-ldap {true|false}`] - Use LDAPS for Secure Active Directory LDAP Connections**

This parameter specifies whether to use LDAPS over AD LDAP connections. When enabled, the communication between the ONTAP LDAP Client and the LDAP Server will be encrypted using LDAPS and port 636 will be used. LDAPS is a mechanism to provide secure communication by using the TLS/SSL protocols and port 636. The default setting is *false*.

Ensure right certificates are installed for CIFS home domain and trusted domains.

### **[`-encryption-required-for-dc-connections {true|false}`] - Encryption is required for DC Connection**

This parameter specifies whether encryption is required for use with connections to domain controllers. The default setting is *false*.

Encryption required For DC Connections can be one of the following:

- `false` - Encryption is not required.
- `true` - Encryption is required.

### **[`-aes-enabled-for-netlogon-channel {true|false}`] - AES session key enabled for NetLogon channel**

This parameter specifies whether AES session key will be negotiated as part of the NetLogon secure channel establishment. The default setting is *true*.

### **[`-try-channel-binding-for-ad-ldap {true|false}`] - Try Channel Binding For AD LDAP Connections**

This parameter specifies whether channel binding will be tried for AD LDAP connections. The default setting is *true*. Channel binding will be tried only if `-use-start-tls-for-ad-ldap` or `-use-ldaps-for-ad-ldap` is enabled along with `-session-security-for-ad-ldap` set to either *sign* or *seal*.

### **[`-advertised-enc-types <CIFS Kerberos Encryption Type>,...`] - Encryption Types Advertised to Kerberos**

Encryption types advertised to Kerberos. The default setting is ``aes-256``,`aes-128`,`rc4`,`des``.

## Examples

The following example makes the following changes: the Kerberos clock skew is set to 3 minutes, the Kerberos ticket lifetime to 8 hours and it makes signing required for Vserver "vs1".

```
cluster1::> vsserver cifs security modify -vsserver vs1 -kerberos-clock-skew
3 -kerberos-ticket-age 8 -is-signing-required true
cluster1::> vsserver cifs security show
Vserver: vs1
Kerberos Clock Skew:          3 minutes
                                Kerberos Ticket Age:          8
hours
                                Kerberos Renewal Age:          7
days
                                Kerberos KDC Timeout:         3
seconds
                                Is Signing Required:          true
                                Is Password Complexity Required: true
                                Use start_tls For AD LDAP connection: false
                                Is AES Encryption Enabled:      true
                                LM Compatibility Level:         krb
                                Is SMB Encryption Required:     false
                                Client Session Security:        none
                                SMB1 Enabled For DC Connections: system-default
                                SMB2 Enabled For DC Connections: system-default
LDAP Referral Chasing Enabled For AD LDAP Connections: false
                                Use LDAPS for AD LDAP Connections: true
                                Encryption required For DC Connections: false
                                AES enabled for Netlogon channel: false
                                Try Channel Binding For AD LDAP Connections: true
                                Encryption Types Advertised to Kerberos: aes-256, aes-128,
des, rc4
```

## vsserver cifs security show

Display CIFS security settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver cifs security show` command displays information about CIFS server security settings.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

This parameter specifies the name of the Vserver whose CIFS security settings you want to display.

**[-kerberos-clock-skew <integer>] - Maximum Allowed Kerberos Clock Skew**

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket clock skew.

**[-kerberos-ticket-age <integer>] - Kerberos Ticket Lifetime**

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos ticket age.

**[-kerberos-renew-age <integer>] - Maximum Kerberos Ticket Renewal Days**

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos renewal age.

**[-kerberos-kdc-timeout <integer>] - Timeout for Kerberos KDC Connections (Secs)**

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos KDC timeout.

**[-realm <text>] - Kerberos Realm**

If this parameter is specified, the command displays information only about the security settings that match the specified Kerberos realm.

**[-kdc-ip <text>,...] - KDC IP Address**

If this parameter is specified, the command displays information only about the security settings that match the specified KDC IP address.

**[-kdc-name <text>,...] - KDC Name**

If this parameter is specified, the command displays information only about the security settings that match the specified KDC name.

**[-site <text>,...] - KDC Site**

If this parameter is specified, the command displays information only about the security settings that match the specified Windows site.

**[-is-signing-required {true|false}] - Require Signing for Incoming CIFS Traffic**

This parameter specifies whether signing is required for incoming CIFS traffic. If this parameter is specified, the command displays information only about the security settings that match the specified value for `is-signing-required`.

**[-is-password-complexity-required {true|false}] - Require Password Complexity for Local User Accounts**

If this parameter is set to `true`, the command displays CIFS security configuration information only for CIFS servers where password complexity for local user accounts is required. If set to `false`, the command displays security configuration information for CIFS servers where password complexity for local user accounts is not required.

### **`[-use-start-tls-for-ad-ldap {true|false}] - Use start_tls for AD LDAP Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where Start TLS is used for communication with the AD LDAP Server. If set to *false*, the command displays CIFS security configuration information only for CIFS servers where Start TLS is not used for communication with the AD LDAP Server.

### **`[-is-aes-encryption-enabled {true|false}] - (DEPRECATED)-Is AES-128 and AES-256 Encryption for Kerberos Enabled`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are enabled. If set to *false*, the command displays security configuration information for CIFS servers where AES-128 and AES-256 encryption types for Kerberos are disabled.

This parameter is deprecated and may be removed from a future release.

### **`[-lm-compatibility-level {lm-ntlm-ntlmv2-krb|ntlm-ntlmv2-krb|ntlmv2-krb|krb}] - LM Compatibility Level`**

If this parameter is specified, the command displays information only about the security settings that match the specified LM compatibility level.

### **`[-is-smb-encryption-required {true|false}] - Require SMB Encryption for Incoming CIFS Traffic`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where SMB encryption is required. If set to *false*, the command displays security configuration information for CIFS servers where SMB encryption is not required.

### **`[-session-security-for-ad-ldap {none|sign|seal}] - Client Session Security`**

If this parameter is set to *seal*, the command displays CIFS security configuration information only for CIFS servers where both signing and sealing are required for LDAP communications. If set to *sign*, the command displays security configuration information for CIFS servers where only signing is required for LDAP communications. If set to *none*, the command displays security configuration information for CIFS servers where no security is required for LDAP communications.

### **`[-smb1-enabled-for-dc-connections {false|true|system-default}] - (DEPRECATED)-SMB1 Enabled for DC Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where SMB1 is enabled for use with connections to domain controllers. If set to *false*, the command displays security configuration information for CIFS servers where SMB1 is not enabled for use with connections to domain controllers. If set to *system-default*, the command displays security configuration information for CIFS servers where the system-default setting (SMB1 enabled) is used for connections to domain controllers.

This parameter is deprecated because the SMB1 protocol is obsolete and considered not secure. It might be removed in a future release.

### **`[-smb2-enabled-for-dc-connections {false|true|system-default}] - SMB2 Enabled for DC Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where SMB2 is enabled for use with connections to domain controllers. If set to *false*, the command displays security configuration information for CIFS servers where SMB2 is not enabled for use

with connections to domain controllers. If set to *system-default*, the command displays security configuration information for CIFS servers where the system-default setting (SMB2 enabled) is used for connections to domain controllers.

**`[-referral-enabled-for-ad-ldap {true|false}] - LDAP Referral Chasing Enabled For AD LDAP Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where LDAP referral is enabled for AD LDAP connections. If set to *false*, the command displays security configuration information for CIFS servers where LDAP referral is not enabled for AD LDAP connections.

**`[-use-ldaps-for-ad-ldap {true|false}] - Use LDAPS for Secure Active Directory LDAP Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where LDAPS is used for communication with the AD LDAP Server. If set to *false*, the command displays CIFS security configuration information only for CIFS servers where LDAPS is not used for communication with the AD LDAP Server.

**`[-encryption-required-for-dc-connections {true|false}] - Encryption is required for DC Connection`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where encryption is required for use with connections to domain controllers. If set to *false*, the command displays security configuration information for CIFS servers where encryption is not required for use with connections to domain controllers.

**`[-aes-enabled-for-netlogon-channel {true|false}] - AES session key enabled for NetLogon channel`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where AES session key is used for Netlogon secure channel. If set to *false*, the command displays CIFS security configuration information only for CIFS servers where AES session key is not used for Netlogon secure channel.

**`[-try-channel-binding-for-ad-ldap {true|false}] - Try Channel Binding For AD LDAP Connections`**

If this parameter is set to *true*, the command displays CIFS security configuration information only for CIFS servers where channel binding is tried for AD LDAP connections. If set to *false*, the command displays CIFS security configuration information only for CIFS servers where channel binding is not tried for AD LDAP connections.

**`[-advertised-enc-types <CIFS Kerberos Encryption Type>,...] - Encryption Types Advertised to Kerberos`**

If this parameter is specified, the command displays information only about the security settings that match the specified advertised encryption types.

## Examples

The following example displays CIFS server security settings.

```

cluster1::> vservice cifs security show
Vservice: vs1
Kerberos Clock Skew:          3 minutes
                                Kerberos Ticket Age:          8
hours
                                Kerberos Renewal Age:          7
days
                                Kerberos KDC Timeout:          3
seconds
                                Is Signing Required:          true
                                Is Password Complexity Required: true
                                Use start_tls For AD LDAP connection: false
                                Is AES Encryption Enabled:      false
                                LM Compatibility Level:         krb
                                Is SMB Encryption Required:     false
                                Client Session Security:        none
                                SMB1 Enabled For DC Connections: system-default
                                SMB2 Enabled For DC Connections: system-default
LDAP Referral Chasing Enabled For AD LDAP Connections:      false
                                Use LDAPS for AD LDAP Connections: true
                                Encryption required For DC Connections: false
                                AES session key enabled for NetLogon channel: false
                                Try Channel Binding For AD LDAP Connections: true
                                Encryption Types Advertised to Kerberos: des, rc4

```

The following example displays the Kerberos clock skew for all Vservices.

```

cluster1::> vservice cifs security show -fields kerberos-clock-skew
vservice kerberos-clock-skew
-----
vs1      5

```

## vservice cifs session close

Close an open CIFS session

**Availability:** This command is available to *cluster* and *Vservice* administrators at the *admin* privilege level.

### Description

The `vservice cifs session close` command closes the specified CIFS sessions.

### Parameters

**-node {<nodename>|local} - Node**

If you specify this parameter, the command will close all the opened CIFS sessions on the specified node.

**-vserver <vserver name> - Vserver**

If you specify this parameter, the command will close all the opened CIFS sessions on the specified CIFS-enabled Vserver.

**-session-id <integer> - Session ID**

If you specify this parameter, the command will close the open CIFS session that matches the specified session ID.

**[-connection-id <integer>] - Connection ID**

If you specify this parameter, the command will close all the opened CIFS sessions that match the specified connection ID.

**[-lif-address <IP Address>] - Incoming Data LIF IP Address**

If you specify this parameter, the command will close all the opened CIFS sessions that are established through the specified data LIF IP address.

**[-address <IP Address>] - Workstation IP address**

If you specify this parameter, the command will close all the opened CIFS sessions that are opened from the specified IP address.

**[-auth-mechanism <Authentication Mechanism>] - Authentication Mechanism**

If you specify this parameter, the command will close all the opened CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:

- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

**[-windows-user <TextNoCase>] - Windows User**

If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]\user.

**[-unix-user <text>] - UNIX User**

If you specify this parameter, the command will close all the opened CIFS sessions that are established for the specified UNIX user.

**[-protocol-version <CIFS Dialects>] - Protocol Version**

If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2\_1 - SMB 2.1
- SMB3 - SMB 3.0

- SMB3\_1 - SMB 3.1

### **[`-continuously-available <CIFS Open File Protection>`] - Continuously Available**

If you specify this parameter, the command will close all the opened CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously\_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
- Yes - The session contains one or more open files and all of them are continuously available.
- Partial - The session contains at least one continuously available open file but other open files that are not.

### **[`-is-session-signed {true|false}`] - Is Session Signed**

If you specify this parameter, the command will close all the opened CIFS sessions that are established with the specified SMB signing option.

### **[`-smb-encryption-status {unencrypted|encrypted|partially-encrypted}`] - SMB Encryption Status**

If you specify this parameter, the command will close all the opened CIFS sessions that are established over the specified SMB encryption status.

The SMB encryption status can be one of the following:

- unencrypted - The CIFS session is not encrypted.
- encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

## **Examples**

The following example closes all open CIFS sessions on all the nodes with protocol-version SMB2:

```
cluster1::> cifs session close -node * -protocol-version SMB2
2 entries were acted on.
```

The following example closes all open CIFS sessions for all Vservers on node node1:

```
cluster1::> cifs session close -node node1 -vserver *  
3 entries were acted on.
```

## vserver cifs session show

### Display established CIFS sessions

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs session show` command displays information about established CIFS sessions. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS sessions:

- Node name
- Vserver name
- CIFS connection ID
- CIFS session ID
- Workstation IP address
- CIFS user name
- CIFS open files
- Session idle time

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS sessions established on connection ID 2012, run the command with the `-connection-id` parameter set to `2012`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify this parameter, the command only displays the fields that you specify.

**| [-active-volumes ]**

If you specify this parameter, the command displays the list of Volumes that session has been connected.

**| [-show-win-unix-creds ]**

If you specify this parameter along with a valid session-id, the command displays Windows and UNIX credentials along with the detailed information about matching CIFS sessions.

**[`-instance` ] }**

If you specify this parameter, the command displays detailed information about matching CIFS sessions.

**[`-node` {<nodename>|local}] - Node**

If you specify this parameter, the command displays information about the CIFS sessions on the specified node.

**[`-vserver` <vserver name>] - Vserver**

If you specify this parameter, the command displays information about CIFS sessions on the specified CIFS-enabled Vserver.

**[`-session-id` <integer>] - Session ID**

If you specify this parameter, the command displays information about the CIFS session that match the specified session ID.

**[`-connection-id` <integer>] - Connection ID**

If you specify this parameter, the command displays information about CIFS sessions that match the specified connection ID.

**[`-lif-address` <IP Address>] - Incoming Data LIF IP Address**

If you specify this parameter, the command displays information about CIFS sessions that are established through the specified data LIF IP address.

**[`-address` <IP Address>] - Workstation IP address**

If you specify this parameter, the command displays information about CIFS sessions that are opened from the specified IP address.

**[`-auth-mechanism` <Authentication Mechanism>] - Authentication Mechanism**

If you specify this parameter, the command displays information about CIFS sessions that used the specified authentication mechanism. The authentication mechanism can include one of the following:

- None - Could not authenticate
- NTLMv1 - NTLMv1 authentication mechanism
- NTLMv2 - NTLMv2 authentication mechanism
- Kerberos - Kerberos authentication mechanism
- Anonymous - Anonymous authentication mechanism

**[`-windows-user` <TextNoCase>] - Windows User**

If you specify this parameter, the command displays information about CIFS sessions that are established for the specified CIFS user. The acceptable format for CIFS user is [domain]\user.

**[`-unix-user` <text>] - UNIX User**

If you specify this parameter, the command displays information about CIFS sessions that are established for the specified UNIX user.

**[`-shares` <integer>] - Open Shares**

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS shares opened.

### **[-files <integer>] - Open Files**

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of regular CIFS files opened.

### **[-other <integer>] - Open Other**

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of special CIFS files opened such as streams or directories.

### **[-connected-time <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Connected Time**

If you specify this parameter, the command displays information about CIFS sessions that are established for the specified time duration.

### **[-idle-time <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Idle Time**

If you specify this parameter, the command displays information about CIFS sessions on which there is no activity for the specified time duration.

### **[-protocol-version <CIFS Dialects>] - Protocol Version**

If you specify this parameter, the command displays information about CIFS sessions that are established over the specified version of CIFS protocol. The protocol version can include one of the following:

- SMB1 - SMB 1.0
- SMB2 - SMB 2.0
- SMB2\_1 - SMB 2.1
- SMB3 - SMB 3.0
- SMB3\_1 - SMB 3.1

### **[-continuously-available <CIFS Open File Protection>] - Continuously Available**

If you specify this parameter, the command displays information about CIFS sessions with open files that have the specified level of continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously\_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. This is in addition to the traditional SMB 2 capability allowing clients to recover from LIF migration and other brief network interruptions.

The CA protection levels depict the continuous availability at the connection level so it might not be accurate for a session if the connection has multiple sessions. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the sessions on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The session contains one or more open file but none of them are continuously available.
- Yes - The session contains one or more open files and all of them are continuously available.
- Partial - The session contains at least one continuously available open file but other open files that are not.

### **[-is-session-signed {true|false}] - Is Session Signed**

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB signing option.

### **[-user-type {local-user|domain-user|guest-user|anonymous-user|hybrid-user}] - User Authenticated as**

If you specify this parameter, the command displays information about CIFS sessions that are established for the specified user type. The user type can include one of the following:

- local-user - Authenticated as a local CIFS user
- domain-user - Authenticated as a domain user
- guest-user - Authenticated as a guest user
- anonymous-user - Authenticated as an anonymous or null user
- hybrid-user - Authenticated as a hybrid user (A domain user synced to Azure Entra ID)

### **[-netbios-name <text>] - NetBIOS Name**

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified NetBIOS Name.

### **[-smb-encryption-status {unencrypted|encrypted|partially-encrypted}] - SMB Encryption Status**

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified SMB encryption status.

The SMB encryption status can be one of the following:

- unencrypted - The CIFS session is not encrypted.
- encrypted - The CIFS session is fully encrypted. Vserver level encryption is enabled and encryption happens for the entire session.
- partially-encrypted - The CIFS session is partially encrypted. Share level encryption is enabled and encryption is initiated when the tree-connect occurs.

### **[-connection-count <integer>] - Connection Count**

If you specify this parameter, the command displays information about CIFS sessions that have the specified number of CIFS connections.

### **[-is-large-mtu-enabled {true|false}] - Is Large MTU Enabled**

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified Large MTU option.

### **[-vol-names <volume name>,...] - Volumes List**

If you specify this parameter, the command displays information about CIFS sessions that are established with the specified volume names.

### **[-share-names <Share>,...] - Open Shares Lists**

If you specify this parameter, the command displays information about CIFS sessions that are established including the specified share names.

## Examples

The following example displays information about all CIFS sessions:

```
cluster1::> vserver cifs session show
Node:    node1
Vserver: vs1
Connection Session                               Open
Idle      Connection                               Files
ID         ID      Workstation      Windows User
Time                               Count
-----
-----
127834     1        172.17.193.172  CIFSQA\
22s                               4
                               Administrator
```

The following example displays information about a CIFS session with session-id 1.

```
cluster1::> vserver cifs session show -session-id 1 -instance
Node: node1
Vserver: vs1
Session ID: 1
Connection ID: 127834
Incoming Data LIF IP Address: 10.53.13.224
Workstation: 172.17.193.172
Authentication Mechanism: NTLMv2
Windows User: CIFSQA\Administrator
UNIX User: root
Open Shares: 2
Open Files: 2
Open Other: 0
Connected Time: 2d 17h 58m 5s
Idle Time: 22s
Protocol Version: SMB3
Continuously Available: No
Is Session Signed: true
User Authenticated as: domain-user
NetBIOS Name: ALIAS1
SMB Encryption Status: encrypted
Connection Count: 4
Windows Unix Credentials: -
Active Volumes: vol1,fg
```

## vserver cifs session file close

Close an open CIFS file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs session file close` command closes the specified open CIFS file.

### Parameters

**-node {<nodename>|local} - Node**

If you specify this parameter, the command will close all the opened CIFS files on the specified node.

**-vserver <vserver name> - Vserver**

If you specify this parameter, the command will close all the opened CIFS files on the specified CIFS-enabled Vserver.

**-file-id <integer> - File ID**

If you specify this parameter, the command will close the opened CIFS file that matches the specified file ID.

**[-connection-id <integer>] - Connection ID**

If you specify this parameter, the command will close all the opened CIFS files connected on the specified connection ID.

**[-session-id <integer>] - Session ID**

If you specify this parameter, the command will close all the opened CIFS files connected on the specified session ID.

### Examples

The following example closes all the opened CIFS files that are connected to the data LIFs of Vserver vs1 on the node node1 with the connection-id 1:

```
cluster1::> vserver cifs session file close -node node1 -vserver vs1
-connection-id 1
5 entries were acted on.
```

The following example closes all the opened CIFS files on the node node1 with the file-id 1, connection-id 1 and the session-id 1:

```
cluster1::> vserver cifs session file close -node node1 -file-id 1
-connection-id 1 -session-id 1
2 entries were acted on.
```

## vserver cifs session file show

### Display opened CIFS files

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs session file show` command displays information about all open CIFS files. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all open CIFS files:

- Node name
- Vserver name
- CIFS connection ID
- CIFS session ID
- CIFS file ID
- CIFS file type
- CIFS file open mode
- CIFS file hosting volume
- CIFS share name
- CIFS file path
- Continuously available protection level

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS files opened on connection ID 2012, run the command with the `-connection-id` parameter set to `2012`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify this parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify this parameter, the command displays detailed information about matching open CIFS files.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information about the open CIFS files on the specified node.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information about open CIFS files on the specified CIFS-enabled Vserver.

**[`-file-id <integer>`] - File ID**

If you specify this parameter, the command displays information about the open CIFS file that match the specified file ID.

**[`-connection-id <integer>`] - Connection ID**

If you specify this parameter, the command displays information about open CIFS files that are opened on the specified connection ID.

**[`-session-id <integer>`] - Session ID**

If you specify this parameter, the command displays information about the CIFS file that are opened on the specified session ID.

**[`-connection-count <integer>`] - Connection Count**

If you specify this parameter, the command displays information about CIFS files opened through a session that have the specified number of CIFS connections.

**[`-file-type <CIFS File Type>`] - File Type**

If you specify this parameter, the command displays information about opened CIFS files that are of the specified file type. The file type can be any of these: Regular, Symlink, Stream, or Directory.

**[`-open-mode <CIFS Open Mode>`] - Open Mode**

If you specify this parameter, the command displays information about CIFS files that are opened with the specified mode. The open mode can include one or more of the following:

- R - This property specifies that the file is opened for read.
- W - This property specifies that the file is opened for write.
- D - This property specifies that the file is opened for delete.

The open mode can have multiple values specified as a list with no commas.

**[`-hosting-aggregate <aggregate name>`] - Aggregate Hosting File**

If you specify this parameter, the command displays information about open CIFS files that reside on the specified aggregate.

**[`-hosting-volume <volume name>`] - Volume Hosting File**

If you specify this parameter, the command displays information about open CIFS files that reside on the specified volume.

**[`-share <Share>`] - CIFS Share**

If you specify this parameter, the command displays information about CIFS files that are opened over the specified CIFS share.

**[`-path <text>`] - Path from CIFS Share**

If you specify this parameter, the command displays information about open CIFS files that match the specified CIFS file path.

**[`-share-mode <CIFS Open Mode>`] - Share Mode**

If you specify this parameter, the command displays information about open CIFS files that are opened with the specified share mode. The share mode can include one or more of the following:

- R - This property specifies that the file is shared for read.
- W - This property specifies that the file is shared for write.
- D - This property specifies that the file is shared for delete.

The share mode can have multiple values specified as a list with no commas.

#### **[-range-locks <integer>] - Range Locks**

If you specify this parameter, the command displays information about open CIFS files that have the specified number of range locks.

#### **[-continuously-available <CIFS Open File Protection>] - Continuously Available**

If you specify this parameter, the command displays information about open CIFS files with or without continuously available protection. The open files are "continuously available" if they are opened from an SMB 3 client through a share with the "continuously\_available" property set. These open files are capable of non-disruptively recovering from takeover and giveback as well as general aggregate relocation between partners in a high-availability relationship. Streams opened through a continuously available share are permitted, but are not currently made continuously available. Directories may be opened through a continuously available share, but, by design, will not appear continuously available as clients do not open them that way. These protection levels are applicable to the files on read/write volumes residing on storage failover aggregates.

The continuously available status can be one of the following:

- No - The open file is not continuously available.
- Yes - The open file is continuously available.

#### **[-reconnected <text>] - Reconnected**

If you specify this parameter, the command displays information about open CIFS files that have the specified reconnected state. The reconnected state can be one of the following:

- No - The open file is not reconnected.
- Yes - The open file is reconnected.

#### **[-flexgroup-msid <integer>] - FlexGroup MSID**

If you specify this parameter, the command displays information about open CIFS files that reside on the volume within the FlexGroup with the specified MSID..

### **Examples**

The following example displays information about all open CIFS files:

```
cluster1::> vserver cifs session file show
```

```
Node:      node1
Vserver:   vs1
Connection: 2192
Session:    1
Connection Count: 4
```

| File ID | File Type | Open Mode | Hosting Volume | Share  | Continuously Available |
|---------|-----------|-----------|----------------|--------|------------------------|
| 7       | Regular   | rw        | rootvs1        | rootca | Yes                    |

```
Path: \win8b8.txt
```

The following example displays information about a CIFS file with file-id 7.

```
cluster1::> vserver cifs session file show -file-id 7 -instance
```

```
Node: node1
      Vserver: vs1
      File ID: 7
      Connection ID: 2192
      Session ID: 1
      Connection count: 4
      File Type: Regular
      Open Mode: rw
Aggregate Hosting File: aggr1
  Volume Hosting File: rootvs1
      CIFS Share: rootca
  Path from CIFS Share: \win8b8.txt
      Share Mode: rd
      Range Locks: 0
Continuously Available: Yes
      Reconnected: No
```

## vserver cifs share create

### Create a CIFS share

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs share create` command creates a CIFS share.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver on which you want to create a CIFS share.

### **-share-name <Share> - Share**

This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 80 characters long. If this is a home directory share (designated as such by specifying the *homedirectory* on the `-share-properties` parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name. If the share is used by administrators to connect to other users' home directory (the option `is-home-dirs-access-for-admin-enabled` is set to true) or by a user to connect to other users' home directory (the option `is-home-dirs-access-for-public-enabled` is set to true), the dynamic share pattern must be preceded by a tilde (~).

### **-path <text> - Path**

This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "/new volume/mount here"). If this is a home directory share as specified by value of *home directory* on the `-share-properties` parameter, you can make the path name dynamic by specifying the %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter.

### **[-share-properties <share properties>,...] - Share Properties**

This optional parameter specifies a list of properties for the share. The list can include one or more of the following:

- **homedirectory** - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, ONTAP can dynamically generate the share's name and path by substituting %w, %u, and %d variables with the corresponding Windows user name, UNIX user name, and domain, respectively, specified as the value of the `-share-name` and `-path` parameters. For instance, if a dynamic share is defined with a name of %d%w\_, a user logged on as barbara from a domain named *FIN* sees the share as *FIN\_barbara*. Using the *homedirectory* value specifies that the share and path names are dynamically expanded. This property cannot be added or removed after share creation.
- **oplocks** - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named /dept/finance contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.
- **browsable** - This property allows Windows clients to browse the share. This is the default initial property for all shares.
- **showsnapshot** - This property specifies that snapshots can be viewed and traversed by clients.
- **changenotify** - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.
- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

For certain workloads, stale file attribute data could be delivered to a client.

- continuously-available - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for workgroup CIFS servers. If ONTAP VSCAN feature is used, it is not supported in continuous availability (CA) shares.
- branchcache - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify *per-share* as the operating mode in the CIFS BranchCache configuration, and also specify the "*oplocks*" share property.
- access-based-enumeration - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- namespace-caching - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- encrypt-data - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.
- show-previous-versions - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

**[*-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable|no-strict-security}*] - Symlink Properties**

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The default value for this parameter is "symlinks". The list can include one or more of the following:

- enable (DEPRECATED\*) - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option *-is-advertise-dfs-enabled* is set to false.
- hide (DEPRECATED\*) - This property hides symlinks. DFS advertisements are generated if the CIFS option *-is-advertise-dfs-enabled* is set to true.
- read-only (DEPRECATED\*) - This property enables symlinks for read-only access.
- symlinks - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option *-is-advertise-dfs-enabled* is set to true.
- symlinks-and-widelinks - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option *-is-advertise-dfs-enabled* is set to false.
- disable - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option *-is-advertise-dfs-enabled* is set to true.
- no-strict-security - This property enables clients to follow symlinks outside share boundaries.

\* The *enable*, *hide*, and *read-only* parameters are deprecated and may be removed in a future release of ONTAP.

The *no\_strict\_security* setting does not apply to wide links.

**[*-file-umask <Octal Integer>*] - File Mode Creation Mask**

This optional parameter specifies the default UNIX umask for new files created on the share.

### **[-dir-umask <Octal Integer>] - Directory Mode Creation Mask**

This optional parameter specifies the default UNIX umask for new directories created on the share.

### **[-comment <text>] - Share Comment**

This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

### **[-attribute-cache-ttl <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - File Attribute Cache Lifetime**

This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the -share-properties parameter.

This value is useful only if you specify attributecache as a share property.

### **[-offline-files {none|manual|documents|programs}] - Offline Files**

This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

- none - Disallows Windows clients from caching any files on this share.
- manual - Allows users on Windows clients to manually select files to be cached.
- documents - Allows Windows clients to cache user documents that are used by the user for offline access.
- programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

### **[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile**

This optional parameter controls which operations trigger virus scans. The value can be one of the following:

- no-scan: Virus scans are never triggered for this share.
- standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
- strict: Virus scans can be triggered by open, read, close, and rename operations.
- writes-only: Virus scans can be triggered only when a file that has been modified is closed.

### **[-max-connections-per-share <integer>] - Maximum Tree Connections on Share**

This optional parameter specifies the maximum number of simultaneous connections on the new share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

### **[-force-group-for-create <text>] - UNIX Group for File Create**

This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. If "force-group" has been specified for a share, the following becomes true for the share:

- Primary GID of the CIFS users who access this share is temporarily changed to the GID of the "force-

group".

- All files in this share that CIFS users create belong to the same "force-group", regardless of the primary GID of the file owner.

## Examples

The following example creates a CIFS share named SALES\_SHARE on a Vserver named vs1. The path to the share is /sales.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name SALES_SHARE  
-path /sales -symlink-properties enable
```

The following example creates a CIFS share named SALES\_SHARE on a Vserver named vs1. The path to the share is /sales and the share uses opportunistic locks (client-side caching), the share can be browsed by Windows clients, and a notification is generated when a change occurs.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name SALE -share  
-properties browsable,changenotify,oplocks, show-previous-versions
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to ask for BranchCache hashes for files in the share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS  
path /documents -share-properties branchcache,changenotify,oplocks
```

The following example creates a CIFS share named DOCUMENTS on a Vserver named vs1. The path to the share is /documents and the share uses opportunistic locks (client-side caching), a notification is generated when a change occurs, and the share allows clients to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share create -vserver vs1 -share-name DOCUMENTS  
-path /documents -share-properties changenotify,oplocks -offline-files  
documents
```

The following example creates a home directory share on a Vserver named vs1. The path to the share has a %d and %w combination.

```
cluster1::> vsserver cifs share create -share-name %d%w -path %d/%w -share
-properties homedirectory -vsserver vs1
```

The following example creates a home directory share on a Vserver vs1 to be used with the home directory option `s is-home-dirs-access-for-admin-enabled` and/or `is-home-dirs-access-for-public-enabled`. The path to the share has a %d and %w combination.

```
cluster1::> vsserver cifs share create -share-name ~%d~%w -path %d/%w
-share-properties homedirectory -vsserver vs1
```

## vserver cifs share delete

### Delete a CIFS share

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver cifs share delete` command deletes a CIFS share.

#### Parameters

**-vsserver <vsserver name> - Vserver**

This parameter specifies the Vserver from which you want to delete a CIFS share.

**-share-name <Share> - Share**

This parameter specifies the name of the CIFS share you want to delete.

#### Examples

The following example deletes a CIFS share named share1 from a Vserver named vs1.

```
cluster1::> vsserver cifs share delete -vsserver vs1 -share-name share1
```

## vserver cifs share modify

### Modify a CIFS share

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver cifs share modify` command modifies a CIFS share.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the CIFS-enabled Vserver containing the CIFS share you want to modify.

### **-share-name <Share> - Share**

This parameter specifies the name of the CIFS share that you want to create. A share name can be up to 80 characters long. If this is a home directory share (designated as such by specifying the *homedirectory* on the `-share-properties` parameter), you can include %w (Windows user name), %u (UNIX user name) and %d (Windows domain name) variables in any combination with this parameter to generate shares dynamically, with the resultant share names based on the authenticating user's Windows user name, UNIX user name, and/or Windows domain name.

### **[-path <text>] - Path**

This parameter specifies the path to the CIFS share. This path must exist in a volume. A directory path name can be up to 256 characters long. If there is a space in the path name, you must enclose the entire string in quotation marks (for example, "/new volume/mount here"). If this is a *homedirectory* share as specified by value of home directory on the `-share-properties` parameter, a dynamic path name must be specified using %w (Windows user name), %u (UNIX user name), or %d (domain name) variables or any of their combination as a part of the value of this parameter. If this is a *continuously-available* share as specified by value of continuously-available on the `-share-properties` parameter, the path must not be within a FlexGroup because this property is not supported for FlexGroup volumes.

### **[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable|no-strict-security}] - Symlink Properties**

This optional parameter specifies how the storage system presents UNIX symbolic links (symlinks) to CIFS clients. The list can include one or more of the following:

- **enable (DEPRECATED\*)** - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.
- **hide (DEPRECATED\*)** - This property hides symlinks. DFS advertisements are generated if the CIFS option `-is-advertise-dfs-enabled` is set to true.
- **read-only (DEPRECATED\*)** - This property enables symlinks for read-only access.
- **symlinks** - This property enables local symlinks for read-write access. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.
- **symlinks-and-widelinks** - This property enables both local symlinks and wide links for read-write access. DFS advertisements are generated for both local symlinks and wide links even if the CIFS option `-is-advertise-dfs-enabled` is set to false.
- **disable** - This property disables symlinks and wide links. DFS advertisements are not generated even if the CIFS option `-is-advertise-dfs-enabled` is set to true.
- **no-strict-security** - This property enables clients to follow symlinks outside share boundaries.

The `read_only` setting does not apply to wide links.

\* The *enable*, *hide*, and *read-only* parameters are deprecated and may be removed in a future release of ONTAP.

The `no_strict_security` setting does not apply to wide links.

### **[`-file-umask` <Octal Integer>] - File Mode Creation Mask**

This optional parameter specifies the default UNIX umask for new files created on the share.

### **[`-dir-umask` <Octal Integer>] - Directory Mode Creation Mask**

This optional parameter specifies the default UNIX umask for new directories created on the share.

### **[`-comment` <text>] - Share Comment**

This optional parameter specifies a text comment for the share that is made available to Windows clients. The comment can be up to 256 characters long. If there is a space in the descriptive remark or the path, you must enclose the entire string in quotation marks (for example, "This is engineering's share.").

### **[`-attribute-cache-ttl` <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - File Attribute Cache Lifetime**

This optional parameter specifies the lifetime for the attribute cache share property, which you specify as the value of the `-share-properties` parameter.

This value is useful only if you specify `attributecache` as a share property.

### **[`-offline-files` {none|manual|documents|programs}] - Offline Files**

This optional parameter allows Windows clients to cache data on this share. The actual caching behavior depends upon the Windows client. The value can be one of the following:

- none - Disallows Windows clients from caching any files on this share.
- manual - Allows users on Windows clients to manually select files to be cached.
- documents - Allows Windows clients to cache user documents that are used by the user for offline access.
- programs - Allows Windows clients to cache programs that are used by the user for offline access and may use those files in an offline mode even if the share is available.

### **[`-vscan-fileop-profile` {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile**

This optional parameter controls which operations trigger virus scans. The value can be one of the following:

- no-scan: Virus scans are never triggered for this share.
- standard: Virus scans can be triggered by open, close, and rename operations. This is the default profile.
- strict: Virus scans can be triggered by open, read, close, and rename operations.
- writes-only: Virus scans can be triggered only when a file that has been modified is closed.

### **[`-max-connections-per-share` <integer>] - Maximum Tree Connections on Share**

This optional parameter specifies a maximum number of simultaneous connections to the share. This limit is at the node level, not the Vserver or cluster level. The default for this parameter is 4294967295. The value 4294967295 indicates no limit. The allowed range for this parameter is (1 through 4294967295).

### **[`-force-group-for-create <text>`] - UNIX Group for File Create**

This optional parameter specifies that all files that CIFS users create in a specific share belong to the same group (also called the "force-group"). The "force-group" must be a predefined group in the UNIX group database. This setting has no effect unless the security style of the volume is UNIX or mixed security style. You can disable this option by passing a null string "".

### **Examples**

The following example modifies a CIFS share named SALES\_SHARE on a Vserver named vs1. The share uses opportunistic locks. The file mask is set to 644 and the directory mask to 777.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name SALES_SHARE
-symlink-properties hide -file-umask 644 -dir-umask 777
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. This triggers a virus scan on write-only files in the share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS
-vscan-fileop-profile writes-only
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver vs1. The share allows client to cache (client-side caching) user documents on this share.

```
cluster1::> vserver cifs share modify -vserver vs1 -share-name DOCUMENTS
-offline-files documents
```

The following example modifies a CIFS share named DOCUMENTS on a Vserver named vs1. The optional parameter "force-group-for-create" can be disabled by passing the null string as parameter to "force-group-for-create" option.

```
cluster1::> cifs share modify -vserver vs1 -share-name DOCUMENTS -force
-group-for-create ""
```

The following example modifies the symlink property of all the shares on all the Vserver to "enable".

```
cluster1::> vserver cifs share modify -vserver * -share-name * -symlink
-properties enable
```

## **vserver cifs share show**

Display CIFS shares

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs share show` command displays information about CIFS shares. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all CIFS shares:

- Vserver name
- CIFS share name
- Path
- Share properties
- Comment

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about CIFS shares that use dynamic shares, run the command with the ``-share-properties dynamicshare`` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify this parameter, the command only displays the fields that you specify.

**| [-shadowcopy ]**

If you specify this parameter, the command displays information only about CIFS shadow copy shares.

**| [-umask ]**

If you specify this parameter, the command displays file and directory masks for CIFS shares.

**| [-instance ] }**

If you specify this parameter, the command displays detailed information about all CIFS shares.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information only about CIFS shares on the specified CIFS-enabled Vserver.

**[-share-name <Share>] - Share**

If you specify this parameter, the command displays information only about the CIFS share or shares that match the specified name.

**[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name**

If you specify this parameter, the command displays information only about the CIFS share or shares that use the CIFS-enabled Vserver with the specified CIFS server name.

**[-path <text>] - Path**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified path.

**[-share-properties <share properties>,...] - Share Properties**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified share properties.

**[-symlink-properties {enable|hide|read-only|symlinks|symlinks-and-widelinks|disable|no-strict-security}] - Symlink Properties**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified symbolic link properties.

**[-file-umask <Octal Integer>] - File Mode Creation Mask**

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified file mask.

**[-dir-umask <Octal Integer>] - Directory Mode Creation Mask**

If you specify this parameter, the command displays information only about the CIFS share or shares that use the specified directory mask.

**[-comment <text>] - Share Comment**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified comment.

**[-acl <text>,...] - Share ACL**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified ACL.

**[-attribute-cache-ttl <[<integer>d][<integer>h][<integer>m][<integer>s]>] - File Attribute Cache Lifetime**

If you specify this parameter, the command displays information only about the CIFS share or shares that have the specified attribute-cache-ttl for attribute cache.

**[-volume <volume name>] - Volume Name**

If you specify this parameter, the command displays information only about the CIFS shares that are present in this volume.

**[-offline-files {none|manual|documents|programs}] - Offline Files**

If you specify this parameter, the command displays information only about the CIFS shares that have the specified Offline Files properties.

**[-vscan-fileop-profile {no-scan|standard|strict|writes-only}] - Vscan File-Operations Profile**

If you specify this parameter, the command displays information only about the CIFS shares that have the specified Vscan fileop profile.

**[-max-connections-per-share <integer>] - Maximum Tree Connections on Share**

If you specify this parameter, the command displays information only about the CIFS shares that have the specified maximum connections per share configured.

**[-force-group-for-create <text>] - UNIX Group for File Create**

This optional parameter displays information about the CIFS shares that have the specified "force-group" parameter configured.

## Examples

The following example displays information about all CIFS shares:

```
cluster1::> vserver cifs share show
Vserver      Share      Path      Properties Comment  ACL
-----
vs1          ROOTSHARE  /          oplocks   Share   CNC \
browsable   mapped
Everyone /
changenoti  to top   Full
fy          of       Control
Vserver
global
namespac
e
vs1          admin$     /          browsable -        -
vs1          c$         /          oplocks   -
BUILTIN\Administrators /

fy          Control
vs1          ipc$       /          browsable -        -
4 entries were displayed.
```

The following example displays information about a CIFS share named SALES\_SHARE on a Vserver named vs1.

```
cluster1::> vserver cifs share show -vserver vs1 -share-name SALES_SHARE
Vserver: vs1
Share: SALES_SHARE
CIFS Server NetBIOS Name: WINDATA
Path: /sales
Share Properties: oplocks
browsable
Symlink Properties: enable
File Mode Creation Mask: -
Directory Mode Creation Mask: -
Share Comment: -
Share ACL: Everyone / Full Control
File Attribute Cache Lifetime: -
Offline Files: manual
Vscan File-Operations Profile: standard
```

## vserver cifs share access-control create

Create an access control list

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs share access-control create` command adds a user or group to a CIFS share's ACL.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the CIFS share.

**-share <Share> - Share Name**

This parameter specifies the name of the CIFS share.

**-user-or-group <TextNoCase> - User/Group Name**

This parameter specifies the user or group to add to the CIFS share's access control list. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

**[-user-group-type {windows|unix-user|unix-group}] - User or Group Type**

This parameter specifies the type of the user or group to add to the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

**-permission <access rights> - Access Type**

This parameter specifies the permissions for the user or group. The permissions can be one of the following:

- No\_access
- Read
- Change
- Full\_Control

### Examples

The following example adds the windows group "Everyone" with "Full\_Control" permission to the access control list of the share "vol3".

```
vs1::> vserver cifs share access-control create -share vol3 -user-or-group  
Everyone -user-group-type windows -permission Full_Control
```

The following example adds the unix-user "pcuser" and unix-group "daemon" with "read" permission to the access control list of the share "vol3".

```
vs1::> vsriver cifs share access-control create -share vol3 -user-or-group
pcuser -user-group-type unix-user -permission read
      vs1::> vsriver cifs share access-control create -share vol3 -user
-or-group daemon -user-group-type unix-group -permission read
```

## vsvrr cifs share access-control delete

Delete an access control list

**Availability:** This command is available to *cluster* and *Vsvrr* administrators at the *admin* privilege level.

### Description

The `vsvrr cifs share access-control delete` command deletes a user or group from a CIFS share's ACL.

### Parameters

**-vsvrr <vsvrr name> - Vsvrr**

This parameter specifies the name of the Vsvrr containing the CIFS share.

**-share <Share> - Share Name**

This parameter specifies the name of the CIFS share.

**-user-or-group <TextNoCase> - User/Group Name**

This parameter specifies the user or group to delete from the CIFS share's access control list. If you specify a user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

**[-user-group-type {windows|unix-user|unix-group}] - User or Group Type**

This parameter specifies the type of the user or group to delete from the CIFS share's access control list. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

### Examples

The following example deletes the group "Everyone" for the access control list of share "vol3".

```
vs1::> vsriver cifs share access-control delete -share vol3 -user-or-group
Everyone
```

## vserver cifs share access-control modify

Modify an access control list

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs share access-control modify` command modifies the permissions of a user or group in a CIFS share's ACL.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the CIFS share whose ACL you want to modify.

**-share <Share> - Share Name**

This parameter specifies the name of the CIFS share whose ACL you want to modify.

**-user-or-group <TextNoCase> - User/Group Name**

This parameter specifies the user or group to modify. If you specify the user name, you must include the user's domain using the format "domain\username". The user-or-group parameter is case-insensitive text.

**[-user-group-type {windows|unix-user|unix-group}] - User or Group Type**

This parameter specifies the type of the user or group to modify. The default type is windows. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

**[-permission <access rights>] - Access Type**

This parameter specifies the permissions for the user or group. The permissions can be one of the following:

- No\_access
- Read
- Change
- Full\_Control

### Examples

The following example modifies the access control list for a share named "vol3". It changes the permission for the windows group "Everyone" to "Full\_Control".

```
vs1::*> vserver cifs share access-control modify -share vol3 -user-or-group Everyone -user-group-type windows -permission Full_Control
```

The following example modifies the access control list for a share named "vol3". It changes the permission for the unix-user "pcuser" and unix-group "daemon" to "change".

```
vs1::> vsriver cifs share access-control modify -share vol3 -user-or-group
pcuser -user-group-type unix-user -permission change
      vs1::> vsriver cifs share access-control modify -share vol3 -user
-or-group daemon -user-group-type unix-group -permission change
```

## **vserver cifs share access-control show**

Display access control lists on CIFS shares

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vserver cifs share access-control show` command displays the ACLs of CIFS shares.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

This optional parameter specifies the name of the Vserver containing the share for which you want to display the access control list.

**[-share <Share>] - Share Name**

This optional parameter specifies the name of the CIFS share for which you want to display the access control list.

**[-user-or-group <TextNoCase>] - User/Group Name**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user or group.

**[-user-group-type {windows|unix-user|unix-group}] - User or Group Type**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified user-group-type. The user-group-type can be one of the following:

- windows
- unix-user
- unix-group

### **[-permission <access rights>] - Access Type**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified permission. The permissions can be one of the following:

- No\_access
- Read
- Change
- Full\_Control

### **[-winsid <windows sid>] - Windows SID**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified Windows SID.

### **[-unixId <integer>] - User/Group ID**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified unix user/group Identifier.

### **[-access-mask <Hex Integer>] - Access mask**

If you specify this optional parameter, the command displays only access control lists for the CIFS shares that have ACLs matching the specified access rights.

## **Examples**

The following example displays all the ACLs for shares in Vserver vs1.

```
vs1::> vsserver cifs share access-control show
```

|              | Share | User/Group           | User/Group | Access |
|--------------|-------|----------------------|------------|--------|
| Vserver      | Name  | Name                 | Type       |        |
| Permission   |       |                      |            |        |
| -----        | ----- | -----                | -----      |        |
| -----        |       |                      |            |        |
| vs1          | vol3  | CIFSQA\administrator | windows    | Read   |
| vs1          | vol3  | Everyone             | windows    |        |
| Full_Control |       |                      |            |        |
| vs1          | vol3  | pcuser               | unix-user  | Read   |
| vs1          | vol3  | daemon               | unix-group | Read   |

## **vsserver cifs share properties add**

Add to the list of share properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vsserver cifs share properties add` command adds share properties to the list of share properties of an existing CIFS share. You can add one or more share properties. You can add additional share properties at any time by rerunning this command. Any share properties that you have previously specified will

remain in effect and newly added properties are appended to the existing list of share properties.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to add.

### **-share-name <Share> - Share**

This parameter specifies the name of the CIFS share.

### **-share-properties <share properties>,... - Share Properties**

This parameter specifies the list of share properties you want to add to the CIFS share. The share properties can be one or more of the following:

- **oplocks** - This property specifies that the share uses opportunistic locks, also known as client-side caching. This is a default initial property for all shares; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named */dept/finance* contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.
- **browsable** - This property allows Windows clients to browse the share. This is a default initial property for all shares.
- **showsnapshot** - This property specifies that snapshots can be viewed and traversed by clients.
- **changenotify** - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.
- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for workgroup CIFS servers. If ONTAP VSCAN feature is used, it is not supported in continuous availability (CA) shares.
- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the *"oplocks"* share property.
- **access-based-enumeration** - This property specifies that Access Based Enumeration (ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- **namespace-caching** - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.
- **show-previous-versions** - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

The `oplock`, `browsable`, `changenotify` and `show-previous-versions` share properties are assigned to a share by default. If you have removed them from a share, you can use the `vserver cifs share properties add` command to add these properties to the share.

## Examples

The following example adds the `"showsnapshot"` and `"changenotify"` properties to a share named `"sh1"`.

```
cluster1::> vserver cifs share properties add -vserver vs1 -share-name sh1  
-share-properties showsnapshot,changenotify
```

## vserver cifs share properties remove

### Remove from the list of share properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs share properties remove` command removes share properties from the list of share properties of an existing CIFS share. You can remove one or more share properties. You can remove additional share properties at any time by rerunning this command. Any existing share properties that you do not remove remain in effect.

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver containing the CIFS share whose share properties you want to remove.

#### **-share-name <Share> - Share**

This parameter specifies the name of the CIFS share.

#### **-share-properties <share properties>,... - Share Properties**

This parameter specifies the list of share properties you want to remove from the CIFS share. The share properties can be one or more of the following:

- `oplocks` - This property specifies that the share uses opportunistic locks, also known as client-side caching. Oplocks are enabled on shares by default; however, some applications do not work well when oplocks are enabled. In particular, database applications such as Microsoft Access are vulnerable to corruption when oplocks are enabled. An advantage of shares is that a single path can be shared multiple times, with each share having different properties. For instance, if a path named `/dept/finance` contains both a database and other types of files, you can create two shares to it, one with oplocks disabled for safe database access and one with oplocks enabled for client-side caching.
- `browsable` - This property allows Windows clients to browse the share.
- `showsnapshot` - This property specifies that snapshots can be viewed and traversed by clients.
- `changenotify` - This property specifies that the share supports ChangeNotify requests. This is a default initial property for all shares.

- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This option is not supported for workgroup CIFS servers. If ONTAP VSCAN feature is used, it is not supported in continuous availability (CA) shares.
- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the "*oplocks*" share property.
- **access-based-enumeration** - This property specifies that Access Based Enumeration (ABE) is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- **namespace-caching** - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.
- **show-previous-versions** - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

## Examples

The following example removes "showsnapshot" and "changenotify" properties to a share named "sh1".

```
cluster1::> vservers cifs share properties remove -vservers vs1 -share-name
sh1 -share-properties showsnapshot,changenotify
```

## vservers cifs share properties show

### Display share properties

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservers cifs share properties show` command displays the CIFS share properties.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

This optional parameter specifies the name of the Vserver containing the CIFS share for which you want to display share properties.

**[-share-name <Share>] - Share**

If you specify this parameter, the command displays share properties only for the CIFS share that you specify.

**[-share-properties <share properties>,...] - Share Properties**

If you specify this parameter, the command displays share properties only for CIFS shares using the properties you specify. The share properties can be one or more of the following:

- **homedirectory** - This property specifies that the share and path names are dynamic. Specify this value for a home directory share. In a home directory share, the share's name and path can be generated by substituting `%w` and `%d` variables with the corresponding user's name and domain, respectively, specified as the value of the `-share-name` and `-path` parameters. For instance, if a dynamic share is defined with a name of `%d%w_`, a user logged on as *barbara* from a domain named *FIN* sees the share as *FIN\_barbara*. Using the `homedirectory` value specifies that the share and path names are dynamically expanded.
- **oplocks** - This property specifies that the share uses opportunistic locks, also known as client-side caching.
- **browsable** - This property allows Windows clients to browse the share.
- **showsnapshot** - This property specifies that snapshots can be viewed and traversed by clients.
- **changenotify** - This property specifies that the share supports Change Notify requests.
- **attributecache** - This property enables the file attribute caching on the CIFS share in order to provide faster access of attributes over SMB 1.0.

For certain workloads, stale file attribute data could be delivered to a client.

- **continuously-available** - This property permits SMB clients that support it to open files in a persistent manner. Files opened this way are protected from disruptive events, such as failover and giveback. This attribute is not supported for workgroup CIFS servers. If ONTAP VSCAN feature is used, it is not supported in continuous availability (CA) shares.
- **branchcache** - This property specifies that the share allows clients to request BranchCache hashes on the files within this share. This option is useful only if you specify "per-share" as the operating mode in the CIFS BranchCache configuration, and also specify the `"oplocks"` share property.
- **shadowcopy** - This property specifies that the share is pointing to a shadow copy. This attribute cannot be added nor removed from a share.
- **access-based-enumeration** - This property specifies that Access Based Enumeration is enabled on this share. ABE-filtered shared folders are visible to a user based on that individual user's access rights, preventing the display of folders or other shared resources that the user does not have rights to access.
- **namespace-caching** - This property specifies that the SMB clients connecting to this share can cache the directory enumeration results returned by the CIFS servers.
- **encrypt-data** - This property specifies that SMB encryption must be used when accessing this share. Clients that do not support encryption will not be able to access this share.

- `show-previous-versions` - This property specifies that the previous version can be viewed and restored from the client. This property is enabled by default.

## Examples

The following example displays share properties for shares in Vserver vs1.

```
cluster1::> vserver cifs share properties show
Vserver      Share      Properties
-----
vs1          abc        oplocks
              browsable
              changenotify
              show-previous-versions
vs1          admin$     browsable
vs1          ipc$       browsable
vs1          sh1        oplocks
              browsable
              changenotify
              show-previous-versions

4 entries were displayed.
```

## vserver cifs superuser create

Adds superuser permissions to a CIFS account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs superuser create` command elevates the privileges of the specified domain account in this Vserver to superuser. With superuser privileges, ONTAP bypasses some of the security checks. This command is not supported for workgroup CIFS servers.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Vserver name.

**-domain <CIFS domain> - Domain (privilege: advanced)**

The domain name of accountname.

**-accountname <CIFS account> - User (privilege: advanced)**

The domain account to which you want to give superuser privileges.

## Examples

The following example shows how to elevate ExampleUser in EXAMPLE domain to superuser for a Vserver vs1.

```
vs1::> vserver cifs superuser create -domain EXAMPLE -accountname  
ExampleUser -vserver vs1
```

## vserver cifs superuser delete

Deletes superuser permissions from a CIFS account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs superuser delete` command removes the superuser privileges for the specified domain account in this Vserver. With superuser privileges, ONTAP bypasses some of the security checks.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

Vserver name.

**-domain <CIFS domain> - Domain (privilege: advanced)**

The domain name of accountname.

**-accountname <CIFS account> - User (privilege: advanced)**

The domain account name you want to remove superuser privileges.

### Examples

The following example shows how to remove superuser privileges for ExampleUser in EXAMPLE domain for a Vserver vs1.

```
vs1::> vserver cifs superuser delete -domain EXAMPLE -accountname  
ExampleUser -vserver vs1
```

## vserver cifs superuser show

Display superuser permissions for CIFS accounts

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `vserver cifs superuser show` command displays all account names with superuser privileges. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following superuser information for all CIFS servers:

- Vserver name
- CIFS server NetBIOS name

- Domain
- Account Name

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver name>] - Vserver (privilege: advanced)`**

If you specify this parameter, the command displays superuser information of only the specified Vservers.

**`[-domain <CIFS domain>] - Domain (privilege: advanced)`**

If you specify this parameter, the command displays superuser information of only for accounts that are in the specified domain.

**`[-accountname <CIFS account>] - User (privilege: advanced)`**

If you specify this parameter, the command displays superuser information of only the CIFS servers with the specified superuser account.

**`[-cifs-server <NetBIOS>] - CIFS Server NetBIOS Name (privilege: advanced)`**

If you specify this parameter, the command displays superuser information of only the Vservers with specified CIFS server name.

## Examples

The following example displays superuser information of all Vservers.

```
vs1::> vserver cifs superuser show
```

| Vserver | CIFS Server | Domain     | Account Name  |
|---------|-------------|------------|---------------|
| -----   | -----       | -----      | -----         |
| vs1     | SMB_SERVER1 | CIFSDOMAIN | ADMINISTRATOR |
| vs2     | SMB_SERVER2 | CIFSDOMAIN | ADMINISTRATOR |

## vserver cifs symlink create

### Create a symlink path mapping

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs symlink create` command creates a symbolic link mapping for CIFS. A mapping consists of a Vserver name, a UNIX (NFS) path, a CIFS share name, and a CIFS path. You can also specify a

CIFS server name and whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. If the target share is a Home Directory, then the `-home-directory` field must be set to true for correct processing.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which you want to create the mapping.

### **-unix-path <text> - UNIX Path**

This parameter specifies the UNIX (NFS) path for the mapping.

It must begin and end with a forward slash (/).

### **[-share-name <Share>] - CIFS Share**

This parameter specifies the CIFS share for the mapping.

### **-cifs-path <TextNoCase> - CIFS Path**

This parameter specifies the CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.

It must begin and end with a forward slash (/).

### **[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name**

This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

### **[-locality {local|widelink}] - Local or Wide Symlink**

This parameter specifies whether the CIFS symbolic link is a local link, a free link (obsolete), or wide link. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is `local`. The free link option is obsolete.

### **[-home-directory {true|false}] - Home Directory**

This parameter specifies whether the target share is a home directory. The default value is false.

This field must be set to true when the target share is a Home Directory for correct processing.

## Examples

The following example creates a symbolic link mapping on a Vserver named `vs1`. It has the UNIX path `/sales/`, the CIFS share name `SALES_SHARE`, and the CIFS path `/mycompany/sales/`.

```
cluster1::> vsserver cifs symlink create -vserver vs1
-unix-path /sales/ -share-name SALES_SHARE -cifs-path "/mycompany/sales/"
```

The following example creates a symbolic link mapping on a Vserver named `vs1`. It has the UNIX path

/example/, the CIFS share name EXAMPLE\_SHARE, the CIFS path /mycompany/example/, the CIFS server IP address, and is a wide link.

```
cluster1::> vsync cifs symlink create -vsync vs1 -unix-path /example/  
-share-name EXAMPLE_SHARE  
-cifs-path "/mycompany/example/" -cifs-server CIFS_SERVER1 -locality  
widelink
```

## vsync cifs symlink delete

Delete a symlink path mapping

**Availability:** This command is available to *cluster* and *Vsync* administrators at the *admin* privilege level.

### Description

The `vsync cifs symlink delete` command deletes a symbolic link mapping for CIFS.

### Parameters

**-vsync <vsync name> - Vsync**

This specifies the Vsync on which the symbolic link mapping is located.

**-unix-path <text> - UNIX Path**

This specifies the UNIX (NFS) path of the mapping that you want to delete.

### Examples

The following example deletes a symbolic link mapping to a UNIX path /example/ from a Vsync named vs1:

```
cluster1::> vsync cifs symlink delete -vsync vs1 -unix-path /example/
```

## vsync cifs symlink modify

Modify a symlink path mapping

**Availability:** This command is available to *cluster* and *Vsync* administrators at the *admin* privilege level.

### Description

The `vsync cifs symlink modify` command modifies the CIFS share name, CIFS path, CIFS server name, or locality of a symbolic link mapping. It can also be used to modify the value of `-home-directory` field.

### Parameters

**-vsync <vsync name> - Vsync**

This parameter specifies the Vsync on which the symbolic link mapping is located.

### **-unix-path <text> - UNIX Path**

This parameter specifies the UNIX (NFS) path of the mapping that you want to modify.

It must begin and end with a forward slash (/).

### **[-share-name <Share>] - CIFS Share**

This parameter specifies a new CIFS share name for the mapping.

### **[-cifs-path <TextNoCase>] - CIFS Path**

This parameter specifies a new CIFS path for the mapping. Note that this value is specified by using a UNIX-style path.

It must begin and end with a forward slash (/).

### **[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name**

This parameter specifies a new CIFS server DNS name, IP address, or NetBIOS name for the mapping.

### **[-locality {local|widelink}] - Local or Wide Symlink**

This parameter specifies a new locality for the mapping. A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The default setting is `local`. The free link option is obsolete.

### **[-home-directory {true|false}] - Home Directory**

This parameter specifies whether the new target share is a home directory.

This field must be set to true when the target share is a Home Directory for correct processing.

## **Examples**

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named `vs1`. The mapping is modified to use the CIFS path `/mycompany/example/`.

```
cluster1::> vsserver cifs symlink modify -vserver vs1 -unix-path /example/
-cifs-path "/mycompany/example/"
```

The following example modifies the symbolic link mapping to a UNIX path `/example/` on a Vserver named `vs1`. The mapping is modified to use the CIFS share name `EXAMPLE_SHARE`, the CIFS path `/mycompany/example/`, on the CIFS server `cifs.example.com`, and to be a wide link.

```
cluster1::> vsserver cifs symlink modify -vserver vs1 -unix-path /example/
-share-name EXAMPLE_SHARE -cifs-path "/mycompany/example/" -cifs-server
cifs.example.com
-locality widelink
```

## vserver cifs symlink show

### Show symlink path mappings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver cifs symlink show` command displays the following information about symbolic link mappings for CIFS:

- Vserver
- UNIX (NFS) path
- The DNS name, IP address, or NetBIOS name of the CIFS server
- CIFS share name
- CIFS path
- Whether the locality of the CIFS server is a local, free, or wide link. (A local symbolic link maps to the local CIFS share. A free symbolic link can map anywhere on the local server. A wide symbolic link maps to any CIFS share on the network. The free link option is deprecated and may be removed in a future release of ONTAP.)

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information about symbolic link mappings on the specified Vserver.

**[-unix-path <text>] - UNIX Path**

If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified UNIX (NFS) path.

**[-share-name <Share>] - CIFS Share**

If you specify this parameter, the command displays information only about the symbolic link mapping or mappings that use the specified CIFS share.

**[-cifs-path <TextNoCase>] - CIFS Path**

If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS path.

**[-cifs-server <TextNoCase>] - Remote NetBIOS Server Name**

If you specify this parameter, the command displays information only about the symbolic link mapping that uses the specified CIFS server.

### **[-locality {local|widelink}] - Local or Wide Symlink**

If you specify this parameter, the command displays information only about the symbolic link mappings that have the specified locality.

### **[-home-directory {true|false}] - Home Directory**

If you specify this parameter, the command displays information only about the symbolic link mappings that have the target share as a home directory (if true) or as a static CIFS share (if false).

## **Examples**

The following example displays information about all symbolic link mappings for CIFS:

```
cluster1::> vservers cifs symlink show
Vserver      Unix Path  CIFS Server      CIFS Share  CIFS Path
Locality
-----
-----
vs1          /hr/      192.0.2.160      HR_SHARE    /mycompany/hr/
widelink
vs1          /sales/   WINDATA          SALES_SHARE /mycompany/sales/
local
vs1          /web/     cifs.example.com  WEB_SHARE   /mycompany/web/
widelink
3 entries were displayed.
```

The following example displays information about all symbolic link mappings that are wide links:

```
cluster1::> vservers cifs symlink show -locality widelink
Vserver      Unix Path  CIFS Server      CIFS Share  CIFS Path
Locality
-----
-----
vs1          /hr/      192.0.2.160      HR_SHARE    /mycompany/hr/
widelink
vs1          /web/     cifs.example.com  WEB_SHARE   /mycompany/web/
widelink
2 entries were displayed.
```

## **vservers cifs users-and-groups remove-stale-records**

Delete the Stale CIFS local users-and-groups records for the specified vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver cifs users-and-groups remove-stale-records` command removes Stale local users and groups entries associated with old CIFS server.

## Parameters

### **-vserver <vserver> - Vserver (privilege: advanced)**

The command deletes Stale local users and groups entries associated with the specified Vserver.

## Examples

The following example displays the syntax of the command.

```
cluster1::*> vserver cifs users-and-groups remove-stale-records -vserver vs1
```

## vserver cifs users-and-groups update-names

Update the names of Active Directory users and groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `vserver cifs users-and-groups update-names` command updates the names of Active Directory users and groups that are registered in local databases on the cluster and reports the status of the update operations. This is done so that objects that were renamed in the Active Directory can be properly displayed and configured in the local databases.

## Parameters

### **-vserver <vserver name> - Vserver (privilege: advanced)**

If you specify this parameter, the command will only be performed within the scope of the Vserver that matches the specified Vserver name.

### **{ [-display-failed-only {true|false}] - Display Only Failures (privilege: advanced)**

If you set this parameter to true, the command displays only the Active Directory users and groups that failed to update. If set to false, the command displays only the Active Directory users and groups that successfully updated.

### **| [-suppress-all-output {true|false}] - Suppress All Output (privilege: advanced) }**

If you set this parameter to true, the command does not display information about the status of the updates of Active Directory users and groups. To display information about the status of the updates, set this parameter to false or do not specify this parameter in the command.

## Examples

The following example updates the names of Active Directory users and groups associated with Vserver "vs1". In the last case, there is a dependent chain of names that needs to be updated.

```

cluster1::*> vserver cifs users-and-groups update-names -vserver vs1
Vserver:          vs1
  SID:             S-1-5-21-123456789-234565432-987654321-12345
  Domain:          EXAMPLE1
  Out-of-date Name: dom_user1
  Updated Name:    dom_user2
  Status:          Successfully updated
Vserver:          vs1
  SID:             S-1-5-21-123456789-234565432-987654322-23456
  Domain:          EXAMPLE2
  Out-of-date Name: dom_user1
  Updated Name:    dom_user2
  Status:          Successfully updated
Vserver:          vs1
  SID:             S-1-5-21-123456789-234565432-987654321-123456
  Domain:          EXAMPLE1
  Out-of-date Name: dom_user3
  Updated Name:    dom_user4
  Status:          Successfully updated; also updated SID "S-1-5-21-
123456789-234565432-987654321-123457"
                    to name "dom_user5"; also updated SID "S-1-5-21-
123456789-234565432-987654321-123458"
                    to name "dom_user6"; also updated SID "S-1-5-21-
123456789-234565432-987654321-123459"
                    to name "dom_user7"; also updated SID "S-1-5-21-
123456789-234565432-987654321-123460"
                    to name "dom_user8"

The command completed successfully. 7 Active Directory objects have been
updated.

```

## vserver cifs users-and-groups local-group add-members

### Add members to a local group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs users-and-groups local-group add-members` command adds members to a local group.

### Parameters

**-vserver <vserver name> -Vserver**

This specifies the name of the Vserver.

**-group-name <CIFS name> - Group Name**

This specifies the name of the local group.

**-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Added**

This specifies the list of local users, Active Directory users, or Active Directory groups to be added to a particular local group.

## Examples

The following example adds a local user "CIFS\_SERVER\loc\_usr1" and an Active Directory group "CIFS\_SERVER\dom\_grp2" to the local group "CIFS\_SERVER\g1".

```
cluster1::> vsserver cifs users-and-groups local-group add-members -vsserver  
vs1 -group-name CIFS_SERVER\g1 -member-names  
CIFS_SERVER\loc_usr1,AD_DOMAIN\dom_grp2
```

## vsserver cifs users-and-groups local-group create

### Create a local group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver cifs users-and-groups local-group create` command creates a local group and optionally sets the description of that local group. The group name must meet the following criteria:

- The group name length must not exceed 256 characters.
- The group name cannot be terminated by a period.
- The group name cannot include commas.
- The group name cannot include any of the following printable characters: " , / \ , [ , ] , : , | , < , > , + , = , ; , ? , \* , @
- The group name cannot include characters in the ASCII range 1-31, which are non-printable.

### Parameters

**-vsserver <vsserver name> - Vserver**

This specifies the name of the Vserver.

**-group-name <CIFS name> - Group Name**

This specifies the name of the local group.

**[-description <TextNoCase>] - Description**

This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

## Examples

The following example creates a local group "CIFS\_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vsserver cifs users-and-groups local-group create -vsserver vs1
-group-name CIFS_SERVER\g1
```

## vsserver cifs users-and-groups local-group delete

### Delete a local group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver cifs users-and-groups local-group delete` command deletes a local group. Removing a local group removes its membership records.

#### Parameters

**-vsserver <vsserver name> - Vserver**

This specifies the name of the Vserver.

**-group-name <CIFS name> - Group Name**

This specifies the name of the local group to delete.

#### Examples

The following example deletes the local group "CIFS\_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vsserver cifs users-and-groups local-group delete -vsserver vs1
-group-name CIFS_SERVER\g1
```

## vsserver cifs users-and-groups local-group modify

### Modify a local group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vsserver cifs users-and-groups local-group modify` command modifies the description of a local group.

#### Parameters

**-vsserver <vsserver name> - Vserver**

This specifies the name of the Vserver.

**-group-name <CIFS name> - Group Name**

This specifies the name of the local group.

### **[-description <TextNoCase>] - Description**

This specifies a description for this local group. If the description contains a space, enclose the parameter in quotation marks.

### **Examples**

The following example modifies the description of the local group "CIFS\_SERVER\g1" associated with Vserver "vs1".

```
cluster1::> vsriver cifs users-and-groups local-group modify -vsriver vs1
-group-name CIFS_SERVER\g1 -description "Example Description"
```

## **vsriver cifs users-and-groups local-group remove-members**

### **Remove members from a local group**

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### **Description**

The `vsriver cifs users-and-groups local-group remove-members` command removes members from a local group.

### **Parameters**

#### **-vsriver <vsriver name> - Vsriver**

This specifies the name of the Vsriver.

#### **-group-name <CIFS name> - Group Name**

This specifies the name of the local group.

#### **-member-names <CIFS name>, ... - Names of Users or Active Directory Groups to be Removed**

This specifies the list of local users, Active Directory users, or Active Directory groups to be removed from a particular local group.

### **Examples**

The following example removes the local users "CIFS\_SERVER\u1" and "CIFS\_SERVER\u2" from the local group "CIFS\_SERVER\g1".

```
cluster1::> vsriver cifs users-and-groups local-group remove-members
-vsriver vs1 -group-name CIFS_SERVER\g1 -member-names
CIFS_SERVER\u1,CIFS_SERVER\u2
```

## **vsriver cifs users-and-groups local-group rename**

### **Rename a local group**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs users-and-groups local-group rename` command renames a local group. The new group name must remain in the same domain as the old group name. The new group name must meet the following criteria:

- The group name length must not exceed 256 characters.
- The group name cannot be terminated by a period.
- The group name cannot include commas.
- The group name cannot include any of the following printable characters: " , /, \, [, ], :, |, <, >, +, =, ;, ?, \*, @
- The group name cannot include characters in the ASCII range 1-31, which are non-printable.

## Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

**-group-name <CIFS name> - Group Name**

This specifies the local group's name.

**-new-group-name <CIFS name> - New Group Name**

This specifies the local group's new name.

## Examples

The following example renames the local group "CIFS\_SERVER\g\_old" to "CIFS\_SERVER\g\_new" on Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-group rename -group-name  
CIFS_SERVER\g_old -new-group-name CIFS_SERVER\g_new -vserver vs1
```

## vserver cifs users-and-groups local-group show-members

Display local groups' members

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs users-and-groups local-group show-members` command displays members of a local group. The members can be local or Active Directory users or groups.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ [-instance ] ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ -vserver <vserver name> ] - Vserver**

If this parameter is specified, the command displays group members of local groups that match the specified Vserver name.

**[ -group-name <CIFS name> ] - Group Name**

If this parameter is specified, the command displays group members of local groups that match the specified group name.

**[ -member <CIFS name>, ... ] - Member Name**

If this parameter is specified, the command displays group members that match the specified member name. The name can be that of a local user, Active Directory user, or Active Directory group.

## Examples

The following example displays members of local groups associated with Vserver "vs1".

```
cluster1::> vsriver cifs users-and-groups local-group show-members
-vserver vs1
Vserver      Group Name      Members
-----
vs1          BUILTIN\Administrators  CIFS_SERVER\Administrator
                                     AD_DOMAIN\Domain Admins
                                     AD_DOMAIN\dom_grp1
                                     BUILTIN\Users
                                     AD_DOMAIN\Domain Users
                                     AD_DOMAIN\dom_usr1
                                     CIFS_SERVER\g1
                                     CIFS_SERVER\u1
6 entries were displayed.
```

## vsriver cifs users-and-groups local-group show

Display local groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver cifs users-and-groups local-group show` command displays local groups.

### Parameters

**{ [-fields <fieldname>, ... ] }**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information only about local groups that match the specified Vserver name.

**[-group-name <CIFS name>] - Group Name**

If this parameter is specified, the command displays information only about local groups that match the specified group name.

**[-description <TextNoCase>] - Description**

If this parameter is specified, the command displays information only about local groups that match the specified description.

## Examples

The following example displays all local groups associated with Vserver "vs1".

```
cluster1::> vsriver cifs users-and-groups local-group show -vserver vs1
Vserver          Group Name          Description
-----
vs1              BUILTIN\Administrators    Built-in Administrators
group
vs1              BUILTIN\Backup Operators   Backup Operators group
vs1              BUILTIN\Power Users        Restricted administrative
privileges
vs1              BUILTIN\Users              All users
vs1              CIFS_SERVER\g1
vs1              CIFS_SERVER\g2
6 entries were displayed.
```

## vsvrrvr cifs users-and-groups local-user cravr

### Create a local user

**Availability:** This command is available to *cluster* and *Vsvrrvr* administrators at the *admin* privilege level.

### Description

The `vsvrrvr cifs users-and-groups local-user cravr` command creates a local user and optionally sets the attributes for that local user. The command prompts for the local user's password. + + + The user name must meet the following criteria: +

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.

- The user name cannot include commas.
- The user name cannot include any of the following printable characters: ", /, \, [, ], :, |, <, >, +, =, ;, ?, \*, @
- The user name cannot include characters in the ASCII range 1-31, which are non-printable.

The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
  - Special characters: ~, !, @, #, 0, ^, , \*, \_ , -, +, =, ` , \, |, ( , ) , [ , ] , : , ; , " , ' , < , > , , , . , ? , /

## Parameters

### **-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

### **-user-name <CIFS name> - User Name**

This specifies the user name.

### **[-full-name <TextNoCase>] - Full Name**

This specifies the user's full name. If the full name contains a space, enclose the full name within double quotation marks.

### **[-description <TextNoCase>] - Description**

This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

### **[-is-account-disabled {true|false}] - Is Account Disabled**

This specifies whether the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account. If this parameter is not specified, the default is to enable the user account.

## Examples

The following example creates a local user "CIFS\_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vsriver cifs users-and-groups local-user create -vserver vs1
-user-name CIFS_SERVER\u1
```

Enter the password:

Confirm the password:

# vserver cifs users-and-groups local-user delete

Delete a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs users-and-groups local-user delete` command deletes a local user. Upon deletion, all membership entries for this local user are deleted.

## Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

**-user-name <CIFS name> - User Name**

This specifies the user name.

## Examples

The following example deletes the local user "CIFS\_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user show-membership
(vserver cifs users-and-groups local-user show-membership)
Vserver      User Name      Membership
-----
vs1          CIFS_SERVER\Administrator  BUILTIN\Administrators
              CIFS_SERVER\u1      CIFS_SERVER\g1
2 entries were displayed.

cluster1::> vserver cifs users-and-groups local-user delete -vserver vs1
-user-name CIFS_SERVER\u1

cluster1::> vserver cifs users-and-groups local-user show-membership
Vserver      User Name      Membership
-----
vs1          CIFS_SERVER\Administrator  BUILTIN\Administrators
```

# vserver cifs users-and-groups local-user modify

Modify a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver cifs users-and-groups local-user modify` command modifies attributes of a local user.

## Parameters

### **-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

### **-user-name <CIFS name> - User Name**

This specifies the user name.

### **[-full-name <TextNoCase>] - Full Name**

This specifies the user's full name. If the full name contains a space in the name, enclose it within double quotation marks

### **[-description <TextNoCase>] - Description**

This specifies a description for this local user. If the description contains a space, enclose the parameter in quotation marks.

### **[-is-account-disabled {true|false}] - Is Account Disabled**

This specifies if the user account is enabled or disabled. Set this parameter to true to disable the account. Set this parameter to false to enable the account.

## Examples

The following example modifies the full name of the local user "CIFS\_SERVER\u1".

```
cluster1::> vsserver cifs users-and-groups local-user modify -user-name  
CIFS_SERVER\u1 -full-name "John Smith" -vserver vs1
```

## **vsserver cifs users-and-groups local-user rename**

### Rename a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver cifs users-and-groups local-user rename` command renames a local user. The new user name must remain in the same domain as the old user name. + The new user name must meet the following criteria:

- The user name length must not exceed 20 characters.
- The user name cannot be terminated by a period.
- The user name cannot include commas.
- The user name cannot include any of the following printable characters: ", /, \, [, ], :, |, <, >, +, =, ;, ?, \*, @
- The user name cannot include characters in the ASCII range 1-31, which are non-printable.

## Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

**-user-name <CIFS name> - User Name**

This specifies the user name.

**-new-user-name <CIFS name> - New User Name**

This specifies the new user name.

**Examples**

The following example renames the local user "CIFS\_SERVER\u\_old" to "CIFS\_SERVER\u\_new" on Vserver "vs1".

```
cluster1::> vserver cifs users-and-groups local-user rename -user-name  
CIFS_SERVER\u_old -new-user-name CIFS_SERVER\u_new -vserver vs1
```

**vserver cifs users-and-groups local-user set-password**

Set a password for a local user

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vserver cifs users-and-groups local-user set-password` command sets the password for the specified local user. The password must meet the following criteria:

- The password must be at least six characters in length.
- The password must not contain user account name.
- The password must contain characters from three of the following four categories:
  - English uppercase characters (A through Z)
  - English lowercase characters (a through z)
  - Base 10 digits (0 through 9)
  - Special characters: ~, !, @, #, 0, ^, , \*, \_ , -, +, =, ` , \, |, (, ), [, ], ;, :, " , ' , < , > , , , . , ? , /

**Parameters****-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

**-user-name <CIFS name> - User Name**

This specifies the user name.

**Examples**

The following example sets the password for the local user "CIFS\_SERVER\u1" associated with Vserver "vs1".

```
cluster1::> vsriver cifs users-and-groups local-user set-password -user
-name CIFS_SERVER\ul -vsriver vs1
```

Enter the new password:

Confirm the new password:

+ + The following example attempts to set the password but fails because the password did not meet password complexity requirements.

```
cluster1::> vsriver cifs users-and-groups local-user set-password -user
-name CIFS_SERVER\ul -vsriver vs1
```

Enter the new password:

Confirm the new password:

Error: command failed: The password does not meet the password complexity requirements. Refer to the man page for details.

## **vsriver cifs users-and-groups local-user show-membership**

### Display local users' membership information

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

#### **Description**

The `vsriver cifs users-and-groups local-user show-membership` command displays the membership of local users.

#### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vsriver <vsriver name>] - Vsriver**

If this parameter is specified, the command displays local user membership information for local users that are associated with the specified Vsriver.

**[-user-name <CIFS name>] - User Name**

If this parameter is specified, the command displays local user membership information for a local user that matches the specified user name.

### **[-membership <CIFS name>,...] - Local Group That This User is a Member of**

If this parameter is specified, the command displays local user membership information for the local group of which this local user is a member.

### **Examples**

The following example displays the membership information of all local users; user "CIFS\_SERVER\Administrator" is a member of "BUILTIN\Administrators" group, and "CIFS\_SERVER\u1" is a member of "CIFS\_SERVER\g1" group.

```
cluster1::> vservers cifs users-and-groups local-user show-membership
Vserver      User Name      Membership
-----
vs1          CIFS_SERVER\Administrator  BUILTIN\Administrators
              CIFS_SERVER\u1          CIFS_SERVER\g1
2 entries were displayed.
```

## **vservers cifs users-and-groups local-user show**

### **Display local users**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vservers cifs users-and-groups local-user show` command displays local users and their attributes.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information only about local users that match the specified Vserver name.

**[-user-name <CIFS name>] - User Name**

If this parameter is specified, the command displays information only about local users that match the specified user name.

**[-full-name <TextNoCase>] - Full Name**

If this parameter is specified, the command displays information only about local users that match the specified full name.

### **[-description <TextNoCase>] - Description**

If this parameter is specified, the command displays information only about local users that match the specified description.

### **[-is-account-disabled {true|false}] - Is Account Disabled**

If this parameter is specified, the command displays information only about local users that match the status specified.

## **Examples**

The following example displays information about all local users.

```
cluster1:> vsriver cifs users-and-groups local-user show
Vserver      User Name                               Full Name           Description
-----
vs1          CIFS_SERVER\Administrator   James Raynor        Built-in
administrator account
vs1          CIFS_SERVER\u1             Sarah Kerrigan
2 entries were displayed.
```

## **vsriver cifs users-and-groups privilege add-privilege**

Add local privileges to a user or group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsriver cifs users-and-groups privilege add-privilege` command adds privileges to a local or Active Directory user or group.

### **Parameters**

#### **-vsriver <vsriver name> - Vserver**

This specifies the name of the Vserver.

#### **-user-or-group-name <CIFS name> - User or Group Name**

This specifies the name of the local or Active Directory user or group.

#### **-privileges <Privilege>,... - Privileges**

This specifies the list of privileges to be associated with this user or group.

## **Examples**

The following example adds the privileges "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" to the user "CIFS\_SERVER\u1".

```
cluster1::> vsserver cifs users-and-groups privilege add-privilege -vsserver
vs1 -user-or-group-name CIFS_SERVER\u1 -privileges
SeTcbPrivilege,SeTakeOwnershipPrivilege
```

## vsserver cifs users-and-groups privilege remove-privilege

Remove privileges from a user or group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver cifs users-and-groups privilege remove-privilege` command removes privileges from a local or Active Directory user or group. This command creates a new or modifies an existing privilege entry.

### Parameters

**-vsserver <vsserver name> - Vserver**

This specifies the name of the Vserver.

**-user-or-group-name <CIFS name> - User or Group Name**

This specifies the name of the local or Active Directory user or group.

**-privileges <Privilege>,... - Privileges**

This specifies the list of privileges to be removed from this user or group.

### Examples

The following example removes the previously added "SeTcbPrivilege" and "SeTakeOwnershipPrivilege" privileges from the user "CIFS\_SERVER\u1".

```
cluster1::> vsserver cifs users-and-groups privilege show
Vserver      User or Group Name      Privileges
-----
vs1          CIFS_SERVER\u1          SeTcbPrivilege
                                   SeTakeOwnershipPrivilege

cluster1::> vsserver cifs users-and-groups privilege remove-privilege
-vserver vs1 -user-or-group-name CIFS_SERVER\u1 -privileges
SeTcbPrivilege,SeTakeOwnershipPrivilege

cluster1::> vsserver cifs users-and-groups privilege show
Vserver      User or Group Name      Privileges
-----
vs1          CIFS_SERVER\u1          -
```

+ + The following example removes "SeBackupPrivilege" from the group "BUILTIN\Administrators".

```
cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.

cluster1::> vserver cifs users-and-groups privilege remove-privilege
-vserver vs1 -user-or-group-name BUILTIN\Administrators -privileges
SeBackupPrivilege

cluster1::> vserver cifs users-and-groups privilege show
Vserver          User or Group Name          Privileges
-----
vs1              BUILTIN\Administrators      SeRestorePrivilege
                                      SeSecurityPrivilege
                                      SeTakeOwnershipPrivilege
```

## vserver cifs users-and-groups privilege reset-privilege

Reset local privileges for a user or group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs users-and-groups privilege reset-privilege` command resets privileges of a local or Active Directory user or group.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver.

**-user-or-group-name <CIFS name> - User or Group Name**

This specifies the name of the local or Active Directory user or group.

### Examples

The following example resets the privileges for the local user "CIFS\_SERVER\u1". This operation removes the privilege entry, if any, associated with the local user "CIFS\_SERVER\u1".

```
cluster1::> vserver cifs users-and-groups privilege show
Vserver          User or Group Name          Privileges
-----
vs1              CIFS_SERVER\ul                  SeTakeOwnershipPrivilege
                                                SeRestorePrivilege

cluster1::> vserver cifs users-and-groups privilege reset-privilege
-vserver vs1 -user-or-group-name CIFS_SERVER\ul

cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
```

+ + The following example resets the privileges for the group "BUILTIN\Administrators", effectively removing the privilege entry.

```
cluster1::> vserver cifs users-and-groups privilege show
Vserver          User or Group Name          Privileges
-----
vs1              BUILTIN\Administrators          SeRestorePrivilege
                                                SeSecurityPrivilege
                                                SeTakeOwnershipPrivilege

cluster1::> vserver cifs users-and-groups privilege reset-privilege
-vserver vs1 -user-or-group-name BUILTIN\Administrators

cluster1::> vserver cifs users-and-groups privilege show
This table is currently empty.
```

## vserver cifs users-and-groups privilege show

### Display privileges

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver cifs users-and-groups privilege show` command displays privilege overrides assigned to local or Active Directory users or groups.

### Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[ *-instance* ] }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[ *-vserver* <*vserver name*> ] - Vserver**

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified Vserver name.

**[ *-user-or-group-name* <*CIFS name*> ] - User or Group Name**

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified user name or group name.

**[ *-privileges* <*Privilege*>,... ] - Privileges**

If this parameter is specified, the command displays information only about privilege overrides assigned to local or Active Directory users or groups that match the specified privileges.

## Examples

The following example displays all privileges explicitly associated with local or Active Directory users or groups for Vserver "vs1".

```
cluster1:> vsriver cifs users-and-groups privilege show -vserver vs1
Vserver          User or Group Name          Privileges
-----
vs1              BUILTIN\Administrators     SeTakeOwnershipPrivilege
                                   SeRestorePrivilege
```

## vsvrr config-replication commands

### vsvrr config-replication pause

Temporarily pause Vsvrr configuration replication

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

Vsvrr domain locking functionality locks the Vsvrr while Vsvrr DM is recording a configuration baseline. This command aborts the ongoing baseline generation activity, unlocks the Vsvrr and temporarily pauses configuration replication for the Vsvrr. Command confirmations have to be enabled to execute this command. The time at which replication resumes is displayed after successful completion of the command. Configuration changes made after executing this command are not replicated to the partner cluster. If a disaster occurs during this time, the configuration changes made are lost. Replication can be manually resumed by executing the [vsvrr config-replication resume](#) command.

#### Parameters

**-vsvrr <*vsvrr name*> - Vsvrr name (privilege: advanced)**

== Examples

```
cluster::> vserver config-replication pause -vserver vs1
Vserver configuration replication will be paused, then automatically
resumed after five minutes.
    Manually resume configuration replication by running the "vserver
config-replication resume -vserver vs1" command.
    Do you want to continue ? {y|n}: y
Vserver configuration replication is paused and will be resumed at:
5/24/2014 06:11:23
```

## Related Links

- [vserver config-replication resume](#)

## vserver config-replication resume

Resume Vserver configuration replication

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

This command resumes configuration replication of the Vserver which was temporarily paused by using the [vserver config-replication pause](#) command. Successful completion of the command ensures that configuration replication has been resumed for the Vserver.

## Parameters

**-vserver <vserver name>** - Vserver name (privilege: advanced)

== Examples

```
cluster::> vserver config-replication resume -vserver vs1
```

## Related Links

- [vserver config-replication pause](#)

## vserver config-replication show

Display Vserver configuration replication resume time

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver config-replication show` command displays the time at which the configuration replication resumes for the Vserver.

## Parameters

**`[-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] (privilege: advanced) }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-vserver <vserver>] - Vserver (privilege: advanced)`**

If you specify this parameter, the command displays resume time for the specified Vserver.

**`[-resume-time <MM/DD/YYYY HH:MM:SS>] - Replication resume time (privilege: advanced)`**

If you specify this parameter, the command displays Vservers whose configuration replications are resumed at the specified resume time.

## Examples

```
cluster::> vserver config-replication show

                Vserver      Replication
                -----      -
                vs1          12/9/2014 03:18:48
```

# vserver consistency-group commands

## vserver consistency-group attach

Attach a consistency group to an existing parent consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver consistency-group attach` command can be used to attach a consistency group to a parent consistency group.

## Parameters

**`-vserver <Vserver Name> - Vserver Name`**

This parameter specifies the Vserver that contains the consistency group that is to be attached.

**`-consistency-group <text> - Consistency Group`**

This parameter specifies the consistency group that is to be attached.

**`-parent-consistency-group <text> - Parent Consistency Group`**

This parameter specifies the parent consistency group to be attached to.

### **[*-new-name* <text>] - New Name for the Consistency Group**

This parameter optionally specifies a new name for the attached consistency group.

### **Examples**

The following command attaches the consistency group `singleCG` to a parent consistency group `parentCG` in Vserver `vs0`.

```
cluster1::> vsriver consistency-group attach -vsriver vs0 -consistency
-group childCG -parent-consistency-group parentCG
[Job 174] Job succeeded: Success
```

+ The following command attaches the consistency group `singleCG` to a parent consistency group `parentCG` in Vserver `vs0`, which is renamed to `childCG`.

```
cluster1::> vsriver consistency-group attach -vsriver vs0 -consistency
-group childCG -parent-consistency-group parentCG -new-name childCG
(vsvriver consistency-group attach)
[Job 174] Job succeeded: Success
```

## **vsvriver consistency-group create**

### **Create a new consistency group**

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

### **Description**

The `vsvriver consistency-group create` command can be used to create a consistency group using existing consistency groups or volumes, or by creating new volumes.

### **Parameters**

#### **-vsriver <Vsvriver Name> - Vsvriver Name**

This parameter specifies the Vsvriver in which the consistency group is to be created.

#### **-consistency-group <text> - Consistency Group Name**

This parameter specifies the name of the consistency group which is to be created.

#### **[*-parent-consistency-group* <text>] - Parent Consistency Group Name**

This parameter specifies the name of the existing parent consistency group in which the consistency group is to be created. If the parent consistency group does not exist, it will be created.

**[-storage-service <text>] - Storage Service**

This parameter specifies the storage service name. If not specified, the default value is the most performant for the platform.

**[-qos-policy <text>] - QoS Policy Group**

This parameter specifies the QoS policy to be applied to the consistency group during creation.

**[-tiering-placement-rules <FabricPool Placement Preferences>] - Tiering Placement Rules**

This parameter specifies the storage tiering placement rules for the consistency group.

**[-tiering-policy <Tiering Policy>] - Tiering Policy**

This parameter specifies the tiering policy to be applied to the consistency group during creation.

**[-object-stores <text>,...] - Object Store Name**

This parameter specifies the remote object stores to be used for placement.

**[-snapshot-policy <snapshot policy>] - Snapshot Copy Policy**

This parameter specifies the snapshot policy to be applied to the consistency group during creation.

**{ [-application-type <Application type for the parent or top level CG>] - Application Type**

This parameter specifies the application type for the parent consistency group.

**| [-application-component-type <Application component type for child CG>] - Application Component Type }**

This parameter specifies the application component type of the child consistency group.

**{ [-consistency-groups <text>,...] - Consistency Groups**

This parameter optionally specifies a comma separated list of existing consistency groups under the Vserver.

**| [-volumes <text>] - Volume Names**

This parameter specifies a filter to choose any existing volumes in the Vserver to add to the new consistency group.

**| [-volume-prefix <volume name>] - Volume Name Prefix**

This parameter specifies a volume prefix to be added to the volume name for new volumes created in the new consistency group.

**[-volume-count <integer>] - Number of Volumes to Create }**

This parameter specifies the number of new volumes to be created in the new consistency group.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Provisioned Size**

This parameter specifies the size of each new volume that is to be created in the consistency group. If `-lun` or `-namespace` parameter is specified, this refers to the size of each LUN or namespace.

**{ [-luns <text>] - Existing LUN Names**

This parameter specifies a filter to choose any existing LUNs in the Vserver to add to the new consistency group.

**[-lun-prefix <text>] - LUN Name Prefix**

This parameter specifies the name of the LUN to be created in the consistency group. If the `-lun-count` parameter is specified this field is treated as prefix.

**[-lun-count <integer>] - Number of LUNs to Create**

This parameter specifies the number of new LUNs to be created in the consistency group.

**[-lun-os-type <LUN Operating System Format>] - LUN Operating System Type**

This parameter specifies the OS type for the new LUNs.

**[-igroup <text>] - iGroup Name**

This parameter specifies the name of the initiator group.

**| [-namespaces <text>] - Existing Namespace Names**

This parameter specifies a filter to choose any existing namespaces in the Vserver to add to the new consistency group.

**[-namespace-prefix <text>] - Namespace Name Prefix**

This parameter specifies the name of the namespace to be created in the consistency group. If the `-namespace-count` parameter is specified this field is treated as prefix.

**[-namespace-count <integer>] - Number of Namespaces to Create**

This parameter specifies the number of new namespaces to be created in the consistency group.

**[-namespace-os-type {aix|linux|vmware|windows}] - NVME Operating System Type**

This parameter specifies the OS type for the new namespaces.

**[-subsystem <text>] - Subsystem Name**

This parameter specifies the name of the nvme subsystem.

**| [-export-policy <text>] - Export Policy Name**

This parameter specifies the name of the export policy to be associated with the newly created volumes.

**[-nas-gid <integer>] - NAS Group ID**

This parameter specifies the UNIX group ID of the newly created volumes.

**[-nas-path <text>] - Junction Path**

This parameter specifies the mount path for the newly created volumes.

**[-nas-junction-parent-volume <volume name>] - Junction Parent Volume Name**

This parameter specifies the name of the parent volume that contains the junction inode of this volume.

**[-nas-security-style <security style>] - NAS Security Style**

This parameter specifies the security style associated with the newly created volumes.

**[-nas-uid <integer>] - NAS User ID**

This parameter specifies the UNIX user ID of the newly created volumes.

**[-nas-unix-permissions <unix perm>] - NAS UNIX Permissions**

This parameter specifies the UNIX permissions for the newly created volumes.

**[-cifs-share <Share>] - Volume CIFS Share Name**

This parameter specifies the name of the CIFS share for each volume in the new consistency group.

**[-cifs-share-acl-user-or-group <text>] - CIFS User/Group Name**

This parameter specifies the ACL user or group of the CIFS share for each volume in the new consistency group.

**[-cifs-share-acl-win-unix-id <text>] - Windows SID or UNIX ID**

This parameter specifies the ACL windows or unix id of the CIFS share for each volume in the new consistency group.

**[-cifs-share-acl-type {windows|unix-user|unix-group}] - CIFS User or Group Type**

This parameter specifies the ACL type of the CIFS share for each volume in the new consistency group.

**[-cifs-share-acl-permission <access rights>] - CIFS Access Type }**

This parameter specifies the ACL permission of the CIFS share for each volume in the new consistency group.

**Examples**

+ The following command creates a new parent consistency group parentcg with existing consistency groups cg1 and cg2.

```
cluster1::> vservers consistency-group create -consistency-group parentcg
-consistency-groups cg1,cg2
      (vservers consistency-group create)
[Job 32] Job succeeded: Success
```

+ The following command creates a new consistency group singlecg with existing volumes vol1 and vol2.

```
cluster1::> vservers consistency-group create -consistency-group singlecg
-volumes vol1,vol2
      (vservers consistency-group create)
[Job 33] Job succeeded: Success
```

+ The following command creates a new consistency group singlecg with two new volumes each of size 1gb and volume name prefix with db\_vols.

```
cluster1:> vservers consistency-group create -consistency-group singlecg
-volume-prefix db_vols -volume-count 2 -size 1gb
(vservers consistency-group create)
[Job 34] Job succeeded: Success
```

+ The following command creates a new consistency group singlecg2 with two new volumes each of size 1gb and volume name prefix with db\_vols and a snapshot policy of default and application-type mongodb.

```
cluster1:> vservers consistency-group create -consistency-group singlecg
-volume-prefix db_vols -volume-count 2 -size 1gb -snapshot-policy default
-application-type mongodb
(vservers consistency-group create)
[Job 35] Job succeeded: Success
```

+ The following command creates a new consistency group child1 under existing parent consistency group parent1 and create two new volumes each of size 1gb.

```
cluster1:> vservers consistency-group create -consistency-group child1
-parent-consistency-group parent1 -volume-count 2 -size 1gb
(vservers consistency-group create)
[Job 36] Job succeeded: Success
```

+ The following command creates a new consistency group child2 under existing parent consistency group parent2 and creates two new volumes each of size 1gb and volume name prefix with child2\_volumes.

```
cluster1:> vservers consistency-group create -consistency-group child2
-parent-consistency-group parent2 -volume-prefix child2_volumes -volume
-count 2 -size 1gb
(vservers consistency-group create)
[Job 37] Job succeeded: Success
```

+ The following command creates a new consistency group child3 under existing parent consistency group parent2 and creates two new volumes vol1 and vol2 each of size 1gb.

```
cluster1::> vservers consistency-group create -consistency-group child3
-parent-consistency-group parent2 -volumes vol1,vol2 -size 1gb
(vserver consistency-group create)
[Job 38] Job succeeded: Success
```

+ The following command creates a new consistency group singlecg with two new volumes each of size 1gb and volume name prefix with db\_vols and CIFS share share1 and ACL properties.

```
cluster1::> vservers consistency-group create -consistency-group singlecg
-volume-prefix db_vols -volume-count 2 -size 1gb -cifs-share share1 -cifs
-share-acl-type windows -cifs-share-acl-user-or-group Everyone -cifs-share
-acl-permission Read -nas-path "/vol"
(vserver consistency-group create)
[Job 39] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with existing LUNs lun1 and lun2.

```
cluster1::> vservers consistency-group create -consistency-group cg1 -luns
lun1,lun2
(vserver consistency-group create)
[Job 33] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with existing namespaces ns1 and ns2 using wildcards.

```
cluster1::> vservers consistency-group create -consistency-group cg1
-namespaces ns*
(vserver consistency-group create)
[Job 33] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with two new LUNs each of size 1gb with OS type linux.

```
cluster1::> vservers consistency-group create -consistency-group cg1 -lun
-prefix db_luns -lun-count 2 -lun-os-type linux -size 1gb
(vserver consistency-group create)
[Job 34] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with three new namespaces each of size 1gb with OS type linux.

```
cluster1::> vservers consistency-group create -consistency-group cg1
-namespace-prefix db_ns -namespace-count 3 -namespace-os-type linux -size
1gb
(vserver consistency-group create)
[Job 34] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with existing volumes vol1 and vol2.

```
cluster1::> vservers consistency-group create -consistency-group cg1
-volumes vol1,vol2
(vserver consistency-group create)
[Job 33] Job succeeded: Success
```

+ The following command creates a new consistency group cg1 with two new volumes each of size 1gb.

```
cluster1::> vservers consistency-group create -consistency-group cg1
-volume-prefix db_vol -volume-count 2 -size 1gb
(vserver consistency-group create)
[Job 34] Job succeeded: Success
```

## **vserver consistency-group delete**

Delete an existing consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver consistency-group delete` command can be used to delete a consistency group.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group that is to be deleted.

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group that is to be deleted.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group of the consistency group that is to be deleted.

## Examples

The following command deletes the consistency group parentCG in Vserver vs0.

```
cluster1::> vserver consistency-group delete -vserver vs0 -consistency
-group parentCG -parent-consistency-group -
(vserver consistency-group delete)
Warning: Are you sure you want to delete consistency group "parentCG" in
Vserver "vs0" ? {y|n}: y
[Job 174] Job succeeded: Success
1 entry was deleted.
```

## vserver consistency-group demote

Demote a parent consistency group to become standalone consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver consistency-group demote` command can be used to demote a parent consistency group to be on its own, deleting its child consistency groups.

## Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group that is to be demoted.

**-parent-consistency-group <text> - Parent Consistency Group**

This parameter specifies the parent consistency group that is to be demoted.

### **[*-new-name* <text>] - New name for the Consistency Group**

This parameter optionally specifies a new name for the consistency group after demotion.

### **Examples**

The following command demotes the consistency group parentCG in Vserver vs0, which is renamed to singleCG at demotion.

```
cluster1::> vsriver consistency-group demote -vsriver vs0 -parent
-consistency-group parentCG -new-name singleCG
      (vsriver consistency-group demote)
[Job 174] Job succeeded: Success
```

## **vsriver consistency-group detach**

Detach a child consistency group from an existing parent consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsriver consistency-group detach` command can be used to detach a child consistency group from its parent, to be on its own. If this was the only child under that parent, the parent consistency group will be deleted.

### **Parameters**

#### **-vsriver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group that is to be detached.

#### **-parent-consistency-group <text> - Parent Consistency Group Name**

This parameter specifies the parent consistency group.

#### **-consistency-group <text> - Consistency Group to Detach**

This parameter specifies the consistency group that is to be detached.

### **[*-new-name* <text>] - New name for the Detached Consistency Group**

This parameter optionally specifies a new name for the detached consistency group.

### **Examples**

The following command detaches the consistency group childCG from its parent Consistency Group parentCG in Vserver vs0, which is renamed to singleCG at removal.

```
cluster1::> vsriver consistency-group detach -vsriver vs0 -parent
-consistency-group parentCG -consistency-group childCG -new-name singleCG
      (vsriver consistency-group detach)
[Job 174] Job succeeded: Success
```

## vsriver consistency-group modify

Modify the configuration of an existing consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver consistency-group modify` command can be used to modify the following attributes of a consistency group:

- Application component type
- Application type
- Snapshot policy
- Minimum SnapLock retention
- Maximum SnapLock retention
- Default SnapLock retention

### Parameters

**-vsriver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group that is to be modified

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group that is to be modified.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group.

**[-snapshot-policy <snapshot policy>] - Snapshot Copy Policy**

This optionally specifies the snapshot policy for the consistency group.

**{ [-application-type <Application type for the parent or top level CG>] - Application Type**

This optionally specifies the application type for the parent consistency group.

**| [-application-component-type <Application component type for child CG>] - Application Component Type }**

This optionally specifies the application component type for the child consistency group.

## Examples

The following command modifies the snapshot policy of consistency group childCg in parent consistency group parentCg in vserver vs0 to default snapshot policy.

```
cluster1::> vserver consistency-group modify -vserver vs0 -consistency
-group childCg -parent-consistency-group parentCg -snapshot-policy default
[Job 51] Job succeeded: Success
1 entry was modified.
```

## vserver consistency-group promote

Promote a standalone consistency group to become parent consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver consistency-group promote` command can be used to promote a consistency group to a parent consistency group. A new child consistency group will be created and associated with the newly promoted parent consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group that is to be promoted.

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group that is to be promoted.

**-child-consistency-group <text> - Child Consistency Group Name**

This parameter specifies the child consistency group which will get created during promotion.

**[-new-name <text>] - New name for the Consistency Group**

This parameter optionally specifies a new name for the consistency group after promotion.

## Examples

The following command promotes the consistency group singleCG in Vserver vs0, which is renamed to parentCG at promotion gets assigned a new child consistency group childCG at promotion.

```
cluster1::> vserver consistency-group promote -vserver vs0 -consistency
-group singleCG -child-consistency-group childCG -new-name parentCG
(vserver consistency-group promote)
[Job 65] Job succeeded: Success
```

## vserver consistency-group show

Display a list of existing consistency groups

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The command displays information for consistency groups. Use the ``instance`` parameter to display additional consistency group details.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-statistics ]**

Selects the last recorded historic and real time statistics for consistency group.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Selects information about the consistency groups in the specified Vserver.

**[-consistency-group <text>] - Consistency Group Name**

Selects information about the specified consistency group.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

Selects information about the specified parent consistency group.

**[-qos-policy <text>] - QoS Policy Group**

Selects information about the consistency groups that have the specified QoS policy.

**[-tiering-policy <Tiering Policy>] - Tiering Policy**

Selects information about the consistency groups that have the specified tiering policy.

**[-snapshot-policy <snapshot policy>] - Snapshot Copy Policy**

Selects information about the consistency groups that have the specified snapshot policy.

**[-application-type <Application type for the parent or top level CG>] - Application Type**

Selects information about the consistency groups that have the specified application type.

**[-application-component-type <Application component type for child CG>] - Application Component Type**

Selects information about the consistency groups that have the specified application component type.

**[-size {<integer>[KB|MB|GB|TB|PB] } ] - Provisioned Size**

Selects information about the consistency groups that have the specified size.

**[-state {online|creating|deleting|modifying|restoring}] - State**

Selects information about the consistency groups that have the specified state.

**[-uuid <UUID>] - Consistency Group UUID**

Selects information about the consistency group that matches the specified consistency group UUID.

**[-create-time <Date>] - Creation Time**

Selects information about the consistency groups that have the specified creation time.

**[-space-available {<integer>[KB|MB|GB|TB|PB]}] - Available Space**

Selects information about the consistency groups that have the specified available space.

**[-space-used {<integer>[KB|MB|GB|TB|PB]}] - Space Used**

Selects information about the consistency groups that have the specified used space.

**[-replicated {true|false}] - Is Replicated**

Selects information about the consistency groups that have the specified replicated status.

**[-replication-policy <text>] - Replication Policy Name**

Selects information about the consistency groups that have the specified replication policy.

**[-replication-source {true|false}] - Is Replication Source**

Selects information about the consistency groups that have the specified replication source.

**[-vdisk-type {luns|namespaces|mixed}] - Consistency Group Type**

Selects information about the consistency groups that have the specified vdisk type.

**[-timestamp-metric <MM/DD/YYYY HH:MM:SS>] - Timestamp of the Sample**

Selects information about the last processed consistency group statistic under the specified timestamp.

**[-duration <text>] - Duration of Time Used to Measure the Sample**

Selects information about the last processed consistency group statistic under the specified duration.

**[-status-metric**

**{ok|error|partial\_no\_data|partial\_no\_response|partial\_other\_error|negative\_delta|not\_found|backfilled\_data|inconsistent\_delta\_time|partial\_no\_uuid|undefined}] -**

**Status of the Sample**

Selects information about the last processed consistency group statistic under the specified status.

**[-available-space-metric <integer>] - Available Space in the Consistency Group**

Selects information about the last processed consistency group statistic under the specified space available.

**[-used-space-metric <integer>] - Space Used in the Consistency Group**

Selects information about the last processed consistency group statistic under the specified space used.

**[-size-metric <integer>] - Size of the Consistency Group**

Selects information about the last processed consistency group statistic under the specified size.

**[-latency-read-metric <integer>] - Latency of Read Operations (Us)**

Selects information about the last processed consistency group statistic under the specified read latency.

**[-latency-write-metric <integer>] - Latency of Write Operations (Us)**

Selects information about the last processed consistency group statistic under the specified write latency.

**[-latency-other-metric <integer>] - Latency of Other Operations (Us)**

Selects information about the last processed consistency group statistic under the specified other latency.

**[-latency-total-metric <integer>] - Total Latency over All Operations (Us)**

Selects information about the last processed consistency group statistic under the specified total latency.

**[-iops-read-metric <integer>] - Number of Read Operations**

Selects information about the last processed consistency group statistic under the specified read iops.

**[-iops-write-metric <integer>] - Number of Write Operations**

Selects information about the last processed consistency group statistic under the specified write iops.

**[-iops-other-metric <integer>] - Number of Other Operations**

Selects information about the last processed consistency group statistic under the specified other iops.

**[-iops-total-metric <integer>] - Total number of Operations**

Selects information about the last processed consistency group statistic under the specified total iops.

**[-throughput-read-metric <integer>] - Throughput of Read Operations (Bytes/s)**

Selects information about the last processed consistency group statistic under the specified read throughput.

**[-throughput-write-metric <integer>] - Throughput of Write Operations (Bytes/s)**

Selects information about the last processed consistency group statistic under the specified write throughput.

**[-throughput-other-metric <integer>] - Throughput of Other Operations (Bytes/s)**

Selects information about the last processed consistency group statistic under the specified other throughput.

**[-throughput-total-metric <integer>] - Total Throughput over All Operations (Bytes/s)**

Selects information about the last processed consistency group statistic under the specified total throughput.

**[-timestamp-raw <MM/DD/YYYY HH:MM:SS>] - Timestamp of the Raw Sample**

Selects information about the real time consistency group statistic under the specified timestamp.

**[-status-raw**

**{ok|error|partial\_no\_data|partial\_no\_response|partial\_other\_error|negative\_delta|not\_found|backfilled\_data|inconsistent\_delta\_time|partial\_no\_uuid|undefined}] -**

**Status of the Raw Sample**

Selects information about the real time consistency group statistic under the specified status.

**[-available-space-row <integer>] - Available Space in the Consistency Group**

Selects information about the real time consistency group statistic under the specified available space.

**[-used-space-row <integer>] - Space Used in the Consistency Group**

Selects information about the real time consistency group statistic under the specified used space.

**[-size-row <integer>] - Size of the Consistency Group**

Selects information about the real time consistency group statistic under the specified size.

**[-latency-read-row <integer>] - Raw Latency over All Read Operations (Us)**

Selects information about the real time consistency group statistic under the specified read latency.

**[-latency-write-row <integer>] - Raw Latency over All Write Operations (Us)**

Selects information about the real time consistency group statistic under the specified write latency.

**[-latency-other-row <integer>] - Raw Latency of Other Operations (Us)**

Selects information about the real time consistency group statistic under the specified other latency.

**[-latency-total-row <integer>] - Raw Total Latency over All Operations (Us)**

Selects information about the real time consistency group statistic under the specified total latency.

**[-iops-read-row <integer>] - Number of Read Operations**

Selects information about the real time consistency group statistic under the specified read iops.

**[-iops-write-row <integer>] - Number of Write Operations**

Selects information about the real time consistency group statistic under the specified write iops.

**[-iops-other-row <integer>] - Number of Other Operations**

Selects information about the real time consistency group statistic under the specified other iops.

**[-iops-total-row <integer>] - Total number of Operations**

Selects information about the real time consistency group statistic under the specified total iops.

**[-throughput-read-row <integer>] - Number of Bytes of Read Operations**

Selects information about the real time consistency group statistic under the specified read throughput.

**[-throughput-write-row <integer>] - Number of Bytes of Write Operations**

Selects information about the real time consistency group statistic under the specified write throughput.

**[-throughput-other-row <integer>] - Number of Bytes of Other Operations**

Selects information about the real time consistency group statistic under the specified other throughput.

**[-throughput-total-row <integer>] - Number of Total Bytes of All Operations**

Selects information about the real time consistency group statistic under the specified total throughput.

**[-clone-is-flexclone {true|false}] - Is Consistency Group a FlexClone**

Selects information about the consistency group that have specified FlexClone to be true.

**[-clone-source-consistency-group <text>] - Clone Source Consistency Group**

Selects information about the consistency group that have specified clone source consistency group.

**[-clone-source-consistency-group-uuid <UUID>] - Clone Source Consistency Group UUID**

Selects information about the consistency group that have specified clone source consistency group UUID.

**[-clone-source-snapshot <snapshot name>] - Snapshot Name of the Clone Source**

Selects information about the consistency group that have specified clone snapshot.

**[-clone-source-snapshot-uuid <UUID>] - Snapshot UUID of the Clone Source**

Selects information about the consistency group that have specified clone snapshot UUID.

**[-clone-parent-vserver <vserver name>] - Clone Parent Vserver Name**

Selects information about the cloned consistency groups with specified clone parent Vserver

**[-clone-parent-vserver-uuid <UUID>] - Clone Parent Vserver UUID**

Selects information about the cloned consistency groups with specified clone parent Vserver UUID

## Examples

The following command lists all the consistency groups on Vserver vs0.

```
vserver consistency-group show -vserver vs0
(vserver consistency-group show)
      Parent
      Consistency
Vserver  Consistency  Consistency  State  Size      Available  Used
-----  -

## vserver consistency-group clone create

Create a consistency group clone

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver consistency-group clone create` command creates a clone of a specified consistency group. It also takes in an optional parameter `source-snapshot-name` to use for creating the clone. Only parent consistency groups support cloning.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group whose clone is to be created.

### **-clone-consistency-group <text> - Consistency Group Name of the Clone**

This parameter specifies the name of the clone consistency group.

### **-source-parent-consistency-group <text> - Parent Consistency Group Name of the Source**

This parameter specifies the name of the consistency group to clone from or its parent consistency if cloning a child consistency group.

### **[-source-snapshot-name <snapshot name>] - Snapshot of the Source Consistency Group**

This parameter optionally specifies the snapshot of the source parent consistency group to be used for creating the clone.

### **[-space-guarantee {none|volume}] - Space Guarantee Style**

This parameter optionally specifies the space guarantee style for the FlexClone volumes in the clone consistency group. A value of *volume* reserves space on the aggregate for the entire volume. A value of *none* reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume in the source parent consistency group.

### **[-split-after-clone <true>] - Split clone Volumes**

This parameter optionally specifies if the FlexClone volumes within the clone consistency group would be split from their parent volume in the source parent consistency group after the FlexClone volume is created.

### **[-clone-volume-prefix <text>] - Clone Volume Name Prefix**

This parameter specifies an optional volume name prefix for cloned volumes in the clone consistency group.

### **[-clone-volume-suffix <text>] - Clone Volume Name Suffix**

This parameter specifies an optional volume name suffix for cloned volumes in the clone consistency group.

## Examples

The following example creates a clone `clone1` of the source parent consistency group `container1` on Vserver `vs0`. The space guarantee of the cloned volumes under the clone consistency group is `volume` and the volume names have a prefix `clone1` and suffix of `clone1end`. The cloned volumes have split initiated as `True` to split the clones from the parent volumes.

```
cluster1::> vsserver consistency-group clone create -vsserver vs0 -clone
-consistency-group clone1 -source-parent-consistency-group container1
-space-guarantee volume -clone-volume-prefix clone1 -clone-volume-suffix
clone1end -split-after-clone true -snaplock-type enterprise
      (vsserver consistency-group clone create)
[Job 264] Job succeeded: Success
```

+ The following example creates a clone clone\_child\_1 of the source child consistency group child\_1 in parent consistency group parentcg on Vserver vs0.

```
cluster1::> vsserver consistency-group clone create -vsserver vs0 -clone
-child-consistency-group clone_child_1 -source-parent-consistency-group
parentcg
      (vsserver consistency-group clone create)
[Job 264] Job succeeded: Success
```

The following example creates a clone clone1 of the source parent consistency group container1 on Vserver vs0. The space guarantee of the cloned volumes under the clone consistency group is volume and the volume names have a prefix clone1 and suffix of clone1end. The cloned volumes have split initiated as True to split the clones from the parent volumes.

```
cluster1::> vsserver consistency-group clone create -vsserver vs0 -clone
-consistency-group clone1 -source-parent-consistency-group container1
-space-guarantee volume -clone-volume-prefix clone1 -clone-volume-suffix
clone1end -split-after-clone true -snaplock-type enterprise
      (vsserver consistency-group clone create)
[Job 264] Job succeeded: Success
```

+ The following example creates a clone clone\_child\_1 of the source child consistency group child\_1 in parent consistency group parentcg on Vserver vs0.

```
cluster1::> vsserver consistency-group clone create -vsserver vs0 -clone
-child-consistency-group clone_child_1 -source-parent-consistency-group
parentcg
      (vsserver consistency-group clone create)
[Job 264] Job succeeded: Success
```

The following example creates a clone clone1 of the source parent consistency group container1 on Vserver

vs0. The storage unit names have a prefix `pre_clone` and suffix of `clone_end`. The cloned consistency group will have SnapLock type to be enterprise.

```
cluster1::> vsriver consistency-group clone create -vsriver vs0 -clone
-consistency-group clone1 -source-parent-consistency-group container1
-clone-storage-unit-prefix pre_clone -clone-storage-unit-suffix clone_end
-snaplock-type enterprise
      (vsriver consistency-group clone create)
[Job 264] Job succeeded: Success
```

## vsriver consistency-group lun show

Display a list of existing consistency group Luns

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The command displays information for consistency group LUNs. Use the ``instance`` parameter to display additional consistency group LUN details.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vsriver <Vsriver Name>] - Vsriver Name**

Selects information about the consistency group LUNs in the specified Vsriver.

**[-consistency-group <text>] - Consistency Group**

Selects information about the consistency group LUNs in the specified consistency group.

**[-parent-consistency-group <text>] - Parent Consistency Group**

Selects information about the consistency group LUNs in the specified parent consistency group.

**{ [-path <path>] - LUN Path**

Selects information about the consistency group LUN that matches the specified LUN path.

**| [-lun <text>] - LUN Name**

Selects information about the consistency group LUN that matches the specified LUN name.

**[-volume <volume name>] - Volume Name**

Selects information about the consistency group LUNs that matches the specified volume name.

**[-qtree <qtree name>] - Qtree Name }**

Selects information about the consistency group LUNs that matches the specified qtree name.

**[-uuid <UUID>] - LUN UUID**

Selects information about the consistency group LUN that matches the specified LUN UUID.

**[-vserver-uuid <UUID>] - Vserver UUID**

Selects information about the consistency group LUNs that matches the specified Vserver UUID.

**[-consistency-group-uuid <UUID>] - Consistency Group UUID**

Selects information about the consistency group LUNs that matches the specified consistency group UUID.

**[-parent-consistency-group-uuid <UUID>] - Parent Consistency Group UUID**

Selects information about the consistency group LUNs that matches the specified parent consistency group UUID.

## Examples

The following command lists all the LUNS that are associated with a consistency group.

```
cluster1::> consistency-group lun show
(vserver consistency-group lun show)

          Parent
Consistency Consistency LUN
Vserver      Group      Group      Path
-----
vs0          ChildCG_1    ParentCG
/vol/ParentCG_01_vol_1/ChildCG_1_lun_1_1
vs0          ChildCG_2    ParentCG
/vol/ParentCG_02_vol_1/ChildCG_2_lun_1_1
vs0          singleCG      -
/vol/singleCG_vol_1/singleCG_lun_1_1
vs0          singleCG      -
/vol/singleCG_vol_1/singleCG_lun_1_2
vs1          singleCG      -
/vol/singleCG_vol_1/singleCG_lun_1_1
vs1          singleCG      -
/vol/singleCG_vol_1/singleCG_lun_1_2
6 entries were displayed.
```

## vserver consistency-group metrics show

Display a list of existing consistency group metrics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays metrics for consistency groups.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

This specifies the additional consistency group metrics details.

**[-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp of the Sample**

Selects information about the consistency group metrics under the specified timestamp.

**-consistency-group <text> - Consistency Group Name**

Selects information about the metrics of a specified consistency group.

**[-vserver <Vserver Name>] - Vserver Name**

Selects information about the consistency groups metrics in the specified Vserver.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

Selects information about the metrics of a specified parent consistency group.

**[-interval {1h|1d|1w|1m|1y}] - Interval of Consistency Group Metrics**

Selects information about the consistency group metrics under the specified interval.

**[-status**

**{ok|error|partial\_no\_data|partial\_no\_response|partial\_other\_error|negative\_delta|not\_found|backfilled\_data|inconsistent\_delta\_time|partial\_no\_uuid|undefined}] -**

**Status of the Sample**

Shows information about the consistency group metrics under the specified status.

**[-duration <text>] - Duration of Time Used to Measure the Sample**

Shows information about the consistency group metrics under the specified duration.

**[-available-space <integer>] - Available Space in the Consistency Group**

Shows information about the consistency group metrics under the specified space availability.

**[-used-space <integer>] - Space Used in the Consistency Group**

Shows information about the consistency group metrics under the specified used space.

**[-size <integer>] - Size of the Consistency Group**

Shows information about the consistency group metrics under the specified size.

**[-latency-read <integer>] - Latency of Read Operations (us)**

Shows information about the consistency group metrics under the specified read latency.

**[-latency-write <integer>] - Latency of Write Operations (us)**

Shows information about the consistency group metrics under the specified write latency.

**[-latency-other <integer>] - Latency of Other Operations (us)**

Shows information about the consistency group metrics under the specified other latency.

**[-latency-total <integer>] - Total Latency over All Operations (us)**

Shows information about the consistency group metrics under the specified total latency.

**[-iops-read <integer>] - Number of Read Operations**

Shows information about the consistency group metrics under the specified read iops.

**[-iops-write <integer>] - Number of Write Operations**

Shows information about the consistency group metrics under the specified write iops.

**[-iops-other <integer>] - Number of Other Operations**

Shows information about the consistency group metrics under the specified other iops.

**[-iops-total <integer>] - Total number of Operations**

Shows information about the consistency group metrics under the specified total iops.

**[-throughput-read <integer>] - Throughput of Read Operations (bytes/s)**

Shows information about the consistency group metrics under the specified read throughput.

**[-throughput-write <integer>] - Throughput of Write Operations (bytes/s)**

Shows information about the consistency group metrics under the specified write throughput.

**[-throughput-other <integer>] - Throughput of Other Operations (bytes/s)**

Shows information about the consistency group metrics under the specified other throughput.

**[-throughput-total <integer>] - Total throughput over all Operations (bytes/s)**

Shows information about the consistency group metrics under the specified total throughput.

**Examples**

The following command lists all the historical metrics for 1 hour interval for consistency group cg1 on Vserver vs0.

```
SimpleClus::*> vsriver consistency-group metrics show -vsriver vs0
-consistency-group cg1 -interval -1h
(vsvriver consistency-group metrics show)
```

|                     |                 |          | Iops  | Latency |       |
|---------------------|-----------------|----------|-------|---------|-------|
| Throughput          |                 |          |       |         |       |
| Timestamp           | Status          | Duration | Total | Total   | Total |
| -----               |                 |          |       |         |       |
| 10/31/2023 19:33:45 | ok              | PT15S    |       | 0       | 0     |
| 0                   |                 |          |       |         |       |
| 10/31/2023 19:33:30 | partial_no_data | PT15S    |       | 0       | 0     |
| 0                   |                 |          |       |         |       |
| 10/31/2023 19:33:15 | partial_no_data | PT15S    |       | 0       | 0     |
| 0                   |                 |          |       |         |       |
| 10/31/2023 19:33:00 | partial_no_data | PT15S    |       | 0       | 0     |
| 0                   |                 |          |       |         |       |

The following command lists all the timestamps in historical metrics iops for 1 day interval for consistency group cg1 on Vserver vs0 where write iops were greater than 100.

```
SimpleClus::*> vsriver consistency-group metrics show -vsriver vs0
-consistency-group cg1 -fields iops-write -interval 1d -iops-write >100
(vsvriver consistency-group metrics show)
```

| timestamp            | iops-write |
|----------------------|------------|
| -----                |            |
| "4/25/2024 15:35:00" | 101        |
| "4/24/2024 17:30:00" | 105        |
| "4/24/2024 17:25:00" | 102        |

3 entries were displayed.

The following command lists all the timestamps in historical metrics for 1 day interval for consistency group cg1 on Vserver vs0 where other iops were between a given interval.

```
SimpleClus::*> vsriver consistency-group metrics show -vsriver vs0
-consistency-group cg1 -interval 1d -fields iops-other -iops-other
1078..1070|590..600
```

```
(vsriver consistency-group metrics show)
timestamp                iops-other
-----
"4/25/2024 13:55:00" 1078
"4/25/2024 13:50:00" 1074
"4/25/2024 13:45:00" 1070
"4/25/2024 03:55:00" 598
"4/25/2024 03:50:00" 594
5 entries were displayed.
```

The following command lists all the historical metrics for 1 day interval for consistency group cg1 on Vserver vs0 with a given timestamp when throughput write was more than 1102.

```
SimpleClus::*> vsriver consistency-group metrics show -vsriver vs0
-consistency-group cg1 -interval 1d -fields throughput-total -timestamp
"4/25/2024 14:30:00".."4/25/2024 13:25:00" -throughput-write >=1102
```

```
(vsriver consistency-group metrics show)

-----
"4/25/2024 14:30:00" 1106
"4/25/2024 14:25:00" 1102
2 entries were displayed.
```

## vserver consistency-group namespace show

Display a list of existing consistency group namespaces

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The command displays information for consistency group namespaces. Use the ``instance`` parameter to display additional consistency group namespace details.

### Parameters

```
{ [-fields <fieldname>,...]
```

This specifies the fields that need to be displayed.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Selects information about the consistency group namespaces in the specified Vserver.

**[-consistency-group <text>] - Consistency Group Name**

Selects information about the consistency group namespaces in the specified consistency group.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

Selects information about the consistency group namespaces in the specified parent consistency group.

**{ [-path <path>] - Namespace Path**

Selects information about the consistency group namespace that matches the specified namespace path.

**| [-namespace <text>] - Namespace Name**

Selects information about the consistency group namespace that matches the specified namespace.

**[-volume <volume name>] - Volume Name**

Selects information about the consistency group namespaces that matches the specified volume name.

**[-qtree <qtree name>] - Qtree Name }**

Selects information about the consistency group namespaces that matches the specified qtree name.

**[-uuid <UUID>] - Namespace UUID**

Selects information about the consistency group namespace that matches the specified namespace UUID.

**[-vserver-uuid <UUID>] - Vserver UUID**

Selects information about the consistency group namespaces that matches the specified Vserver UUID.

**[-consistency-group-uuid <UUID>] - Consistency Group UUID**

Selects information about the consistency group namespaces that matches the specified consistency group UUID.

**[-parent-consistency-group-uuid <UUID>] - Parent Consistency Group UUID**

Selects information about the consistency group namespaces that matches the specified parent consistency group UUID.

## Examples

The following command lists all the namespaces that are associated with a consistency group.

```
cluster1::> still5nscluster-1::*> consistency-group namespace show
(vserver consistency-group namespace show)
```

|         |                   | Parent            |                                   |
|---------|-------------------|-------------------|-----------------------------------|
| Vserver | Consistency Group | Consistency Group | Namespace Path                    |

## vserver consistency-group snapshot commit

Commit a 2 phase Snapshot copy for a consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver consistency-group snapshot commit` command commits a 2-phase snapshot of a specified consistency group.

### Parameters

#### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group where the snapshot is to be committed.

#### **-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be committed.

#### **-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot that is to be committed.

#### **[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group where a snapshot is to be committed.

## Examples

The following example commits a 2-phase snapshot named `snap1` on a child consistency group named `cg1` in parent consistency group `parentCg` on a Vserver named `vs0`.

```
cluster1::> vsnapshot consistency-group snapshot commit -vserver vs0
-consistency-group cg1 -parent-consistency-group parentCg -snapshot snap1
(vserver consistency-group snapshot commit)
[Job 100] Job succeeded: Success
```

## vsnapshot consistency-group snapshot create

Create a new consistency group Snapshot copy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsnapshot consistency-group snapshot create` command creates a snapshot of a specified consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group where the snapshot is to be created.

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be created.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group where a snapshot is to be created.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot that is to be created.

**[-consistency-type {crash|application}] - Consistency Type**

This parameter specifies the consistency level of a snapshot to be created. The default value is *crash*.

**[-comment <text>] - Comment**

This parameter specifies the comment associated with a snapshot to be created.

**[-snapmirror-label <text>] - Snapmirror Label**

This parameter specifies the label associated with a snapshot to be created.

**[-write-fence {true|false}] - Take write fence**

This parameter specifies if a write fence is taken on the volumes in the consistency group while creating a snapshot.

## Examples

The following example creates a snapshot named snap1 on a child consistency group named cg1 in parent consistency group parentCg on a Vserver named vs0. The snapshot has a comment "Feb golden image", a SnapMirror label "Label" and is crash-consistent.

```
cluster1::> vsnapshot consistency-group snapshot create -vserver vs0
-consistency-group cg1 -parent-consistency-group parentCg -snapshot snap1
-comment "Feb golden image" -snapmirror-label "Label" -consistency-type
crash
      (vsnapshot consistency-group snapshot create)
[Job 100] Job succeeded: Success
```

## vsnapshot consistency-group snapshot delete

### Delete an existing consistency group Snapshot Copy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsnapshot consistency-group snapshot delete` command deletes a snapshot of a specified consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group on which the snapshot is to be deleted.

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be deleted.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group where a snapshot is to be deleted.

**-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot that is to be deleted.

## Examples

The following example deletes a snapshot named snap1 on a child consistency group named cg1 in parent consistency group parentCg on a Vserver named vs0.

```
cluster1::> vsserver consistency-group snapshot delete -vsserver vs0
-consistency-group cg1 -parent-consistency-group parentCg -snapshot snap1
(vserver consistency-group snapshot delete)
Warning: Deleting a snapshot permanently removes data that is stored only
in that snapshot. Are you sure you want to delete snapshot
"snap1" for consistency group "cg1" in Vserver "vs0" ? {y|n}: y
```

## vserver consistency-group snapshot modify-snaplock-expiry-time

### Modify SnapLock expiry time of a consistency group snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver consistency-group snapshot modify-snaplock-expiry-time` command modifies a snapshot of a specified consistency group.

#### Parameters

**-vsserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group on which the snapshot is to be modified.

**-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be modified.

**-snapshot <snapshot name> - Snapshot Name**

This parameter specifies the name of the snapshot that is to be modified.

**-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite} - SnapLock Expiry Time**

Specifies the new SnapLock expiry that is applied to snapshot locked by SnapLock.

If this option value is *infinite*, then a retention period that never expires is applied to the snapshot.

#### Examples

The following example extends the retention period of a snapshot *snap1* to `"03/03/2020 00:00:00"`:

```
cluster1::> vsserver consistency-group snapshot modify-snaplock-expiry-time
-vsserver vs1 -consistency-group dst -snapshot s1 -expiry-time "03/03/2020
00:00:00"
cluster1::>
```

The following example extends the retention period of a snapshot *snap2* to *infinite*:

```
cluster1::> vservers consistency-group snapshot modify-snaplock-expiry-time
-vserver vs1 -consistency-group dst -snapshot s2 -expiry-time infinite
cluster1::>
```

```
cluster1::> vservers consistency-group snapshot show -vserver vs1 -fields
snaplock-expiry-time
                (vservers consistency-group snapshot show)
                vservers consistency-group parent-consistency-group
snapshot snaplock-expiry-time
-----
-----
                vs1      dst      -      s1
3/3/2020 00:00:00 +05:30
                vs1      dst      -      s2
infinite
```

## vservers consistency-group snapshot restore

Restore a consistency group to a specified Snapshot copy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vservers consistency-group snapshot restore` command restores a snapshot of a specified consistency group. This replaces the current working copy of the volume in the consistency group with the snapshot that results in a loss of all changes made since the snapshot was created.

### Parameters

#### **-vserver <Vserver Name> - Vserver Name**

This specifies the Vserver that contains the consistency group on which the specified snapshot to be restored is saved.

#### **-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be restored.

#### **-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot that is to be restored.

#### **[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group where a snapshot is to be restored.

### Examples

The following example restores a snapshot named snap1 on a consistency group named childCG on parent consistency group parentCG and is located on a Vserver named vs0.

```
cluster1::> vsserver consistency-group snapshot restore -vsserver vs0
-consistency-group childCG -parent-consistency-group parentCG -snapshot
snap1
      (vsserver consistency-group snapshot restore)
[Job 100] Job succeeded: Success
```

## vsserver consistency-group snapshot show

Display a list of existing consistency group Snapshot Copies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The command displays information for consistency group snapshots. Use the ``instance`` parameter to display additional consistency group snapshot details.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that will be displayed.

**| [-instance ] }**

Selects detailed information about all fields about the consistency group snapshots.

**[-vsserver <Vserver Name>] - Vserver Name**

Selects information about the consistency group snapshots with a specified Vserver.

**[-consistency-group <text>] - Consistency Group Name**

Selects information about the consistency group snapshots with a specified consistency group.

**[-parent-consistency-group <text>] - Parent Consistency Group Name**

Selects information about the consistency group snapshots with a specified parent consistency group.

**[-snapshot <snapshot name>] - Snapshot Copy Name**

Selects information about the specified consistency group snapshot.

**[-consistency-type {crash|application}] - Consistency Type**

Selects information about the consistency group snapshots with a specified consistency type.

**[-comment <text>] - Comment**

Selects information about the consistency group snapshots with a specified comment.

**[-snapmirror-label <text>] - Snapmirror Label**

Selects information about the consistency group snapshots with a specified SnapMirror label.

**[`-create-time` <Date>] - Create Time**

Selects information about the consistency group snapshots with a specified create time.

**[`-pg-generation` <integer>] - Protection Group Generation**

Selects information about the consistency group snapshots with a specified pg generation.

**[`-is-partial` {`true`|`false`}] - Is Snapshot Copy Partial?**

Selects information about the consistency group snapshots with a specified partial state.

**[`-snapshot-volumes` <volume name>,...] - List of Volume Names with this Snapshot Copy**

Selects information about the consistency group snapshots with specified snapshot volumes.

**[`-missing-volumes` <volume name>,...] - List of Volume Names Missing this Snapshot Copy**

Selects information about the consistency group snapshots with specified missing volumes.

**[`-snapshot-uuid` <UUID>] - Snapshot UUID**

Selects information about the consistency group snapshot that matches the specified snapshot UUID.

**[`-write-fence` {`true`|`false`}] - Take write fence**

Selects information about the consistency group snapshots that matches the specified write fence value.

**Examples**

The following command lists all the snapshots that are associated with consistency groups on Vserver svm1.

```
cluster1::> vsnapshot consistency-group snapshot show -vserver svm1
(vserver consistency-group snapshot show)
Parent
Vserver      Consistency  Consistency  Snapshot      Create
Group        Group
-----
svm1         cg1 -        snap1         Thu Jun 08 12:00:00 2023
svm1         cg2 -        snap2         Thu Jun 08 1:00:00 2023
2 entries were displayed.
```

**vsnapshot consistency-group snapshot start**

Start a 2 phase Snapshot copy for a consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `vsnapshot consistency-group snapshot start` command starts a 2-phase snapshot of a specified consistency group.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group where the snapshot is to be started.

### **-consistency-group <text> - Consistency Group Name**

This parameter specifies the consistency group where a snapshot is to be started.

### **-snapshot <snapshot name> - Snapshot Copy Name**

This parameter specifies the name of the snapshot that is to be started.

### **[-parent-consistency-group <text>] - Parent Consistency Group Name**

This parameter specifies the parent consistency group where a snapshot is to be started for a child consistency group.

### **[-consistency-type {crash|application}] - Consistency Type**

This parameter optionally specifies the consistency level of a snapshot. The default value is *crash*.

### **[-comment <text>] - Comment**

This parameter optionally specifies the comment associated with a snapshot.

### **[-snapmirror-label <text>] - Snapmirror Label**

This parameter optionally specifies the label associated with a snapshot.

### **[-start-timeout <integer>] - Timeout for 2-phase snapshot**

This parameter optionally specifies the timeout limit for the snapshot to be started. The default value is 7 seconds.

### **[-write-fence {true|false}] - Take write fence**

This parameter specifies if a write fence is taken on the volumes in the consistency group while creating a snapshot.

## Examples

+ The following example starts a 2-phase snapshot named snap2 on a child consistency group named childCg in parent consistency group parentCg on a Vserver named vs0. The snapshot has start-timeout set to "90".

```
cluster1::> vsserver consistency-group snapshot start -vserver vs0
-consistency-group childCg -parent-consistency-group parentCg -snapshot
snap2 -start-timeout 90
      (vsserver consistency-group snapshot start)
```

## vserver consistency-group volume add

Add a volume to the consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver consistency-group volume add` adds existing volumes to a consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group to which the volumes will be added.

**-consistency-group <text> - Consistency Group**

This parameter specifies the consistency group to which the volumes will be added.

**[-parent-consistency-group <text>] - Parent Consistency Group**

This parameter specifies the parent consistency group to which the volumes will be added.

**-volume <text> - Volume**

This parameter specifies the volume to be added to the consistency group.

### Examples

The following example will add volumes vol1,vol2 to a child consistency group named cg in parent consistency group parentCg on a Vserver named vs0.

```
cluster1::> vserver consistency-group volume add -vserver vs0 -consistency
-group cg -parent-consistency-group parentCg -volume vol1,vol2
(vserver consistency-group volume add)
[Job 100] Job succeeded: Success
```

## vserver consistency-group volume create

Create a new volume in a consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver consistency-group volume create` command creates new volumes in a consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group in which the volumes will be created.

**-consistency-group <text> - Consistency Group**

This parameter specifies the consistency group in which the volumes will be created.

**[-parent-consistency-group <text>] - Parent Consistency Group**

This parameter specifies the parent of the consistency group in which the volumes will be created.

**-volume <volume name> - Volume**

This parameter specifies the name of the volume to be created in the consistency group. If the `-volume-count` parameter is specified this field is treated as prefix.

**-size {<integer>[KB|MB|GB|TB|PB]} - Size**

This parameter specifies the size of each new volume that is to be created in the consistency group. If `-lun` or `-namespace` parameter is specified, this refers to the size of each LUN or namespace.

**[-volume-count <integer>] - Number of volumes**

This parameter specifies the number of new volumes to be created in the consistency group.

**{ [-export-policy <export policy name>] - Volume Export Policy**

This parameter specifies the name of the export policy to be associated with the newly created volumes.

**[-nas-path <junction path>] - Junction Path**

This parameter specifies the junction path for mounting the volumes.

**[-nas-gid <integer>] - NAS Group ID**

This parameter specifies the NAS gid.

**[-nas-junction-parent-volume <volume name>] - Junction Parent Volume Name**

This parameter specifies the NAS junction parent volume.

**[-nas-security-style <security style>] - NAS Security Style**

This parameter specifies the NAS security style.

**[-nas-uid <integer>] - NAS User ID**

This parameter specifies the NAS UID.

**[-nas-unix-permissions <unix perm>] - NAS UNIX Permissions**

This parameter specifies the NAS UNIX permissions.

**[-cifs-shares <Share>,...] - Volume CIFS Share Names**

This parameter specifies the name of the CIFS share to be created.

**[-cifs-share-acl-user-or-group <text>] - CIFS User/Group Name**

This parameter specifies the acl user or group of the CIFS share for each volume in the new consistency group.

**`[-cifs-share-acl-win-unix-id <text>]` - Windows SID or UNIXID**

This parameter specifies the acl windows or unix id of the CIFS share for each volume in the new consistency group.

**`[-cifs-share-acl-type {windows|unix-user|unix-group}]` - CIFS User or Group Type**

This parameter specifies the acl type of the CIFS share for each volume in the new consistency group.

**`[-cifs-share-acl-permission <access rights>]` - CIFS Access Type**

This parameter specifies the acl permission of the CIFS share for each volume in the new consistency group.

**`[-lun <text>]` - LUN Name**

This parameter specifies the name of the LUN to be created in the consistency group. If the `-lun-count` parameter is specified this field is treated as prefix.

**`[-lun-count <integer>]` - Number of LUNs**

This parameter specifies the number of new LUNs to be created in the consistency group.

**`[-lun-os-type <LUN Operating System Format>]` - OS Type**

This parameter specifies the OS type for the new LUNs.

**`[-igroup <text>]` - Igroup Name**

This parameter specifies the name of the initiator group.

**`[-namespace <text>]` - Namespace Name**

This parameter specifies the name of the namespace to be created in the consistency group. If the `-namespace-count` parameter is specified this field is treated as prefix.

**`[-namespace-count <integer>]` - Number of Namespaces**

This parameter specifies the number of new namespaces to be created in the consistency group.

**`[-namespace-os-type {aix|linux|vmware|windows}]` - OS Type**

This parameter specifies the OS type for the new namespaces.

**`[-subsystem <text>]` - Subsystem Name }**

This parameter specifies the name of the nvme subsystem.

## Examples

+ The following command creates 2 new volumes in consistency group singleCG.

```
cluster1::> vsriver consistency-group volume create -vsriver vs0
-consistency-group singleCG -parent-consistency-group - -volume
vol_singleCG -size 20M -volume-count 2
        (vsriver consistency-group volume create)
[Job 100] Job succeeded: Success
```

+ The following command creates a new volume in consistency group singleCG with CIFS share along with acl properties.

```
cluster1::> vsriver consistency-group volume create -vsriver vs0
-consistency-group singleCG -parent-consistency-group - -volume
vol_singleCG -size 20M -volume-count 2 -cifs-shares share1 -cifs-share-acl
-type windows -cifs-share-acl-user-or-group Everyone -cifs-share-acl
-permission Read -nas-path "/vol"
        (vsriver consistency-group volume create)
[Job 103] Job succeeded: Success
```

+ The following command creates 2 new volumes in consistency group singleCG with 2 new LUNs in each volume.

```
cluster1::> vsriver consistency-group volume create -vsriver vs0
-consistency-group singleCG -parent-consistency-group - -volume vol -size
20M -volume-count 2 -lun lun -lun-count 2 -lun-os-type linux -igroup ig1
        (vsriver consistency-group volume create)
[Job 101] Job succeeded: Success
```

+ The following command creates 2 new volumes in consistency group singleCG with 2 new nvme namespaces in each volume.

```
cluster1::> vsriver consistency-group volume create -vsriver vs0
-consistency-group singleCG -parent-consistency-group - -volume vol -size
20M -volume-count 2 -namespace ns -namespace-count 2 -namespace-os-type
linux -subsystem ss1
        (vsriver consistency-group volume create)
[Job 102] Job succeeded: Success
```

## vserver consistency-group volume reassign

Reassign a volume to a different consistency group.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver consistency-group volume reassign` will reassign volumes from one child consistency group to another child consistency group within a parent consistency group.

### Parameters

**-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group from which the volumes are reassigned.

**-consistency-group <text> - Consistency Group**

This parameter specifies the consistency group from which the volumes are detached.

**-parent-consistency-group <text> - Parent Consistency Group**

This parameter specifies the parent consistency group from which the volumes are detached.

**-volume <text> - Volume**

This parameter specifies the volumes which are reassigned.

**{ -new-consistency-group <text> - New Consistency Group**

This optional parameter specifies a new child consistency group to which the volumes are reassigned and attached to.

**| -destination-consistency-group <text> - Destination Consistency Group }**

This optional parameter specifies existing child consistency group to which the volumes are reassigned and attached to.

### Examples

The following example will reassign volumes vol1,vol2 from child consistency group named cg in parent consistency group parentCg on a Vserver named vs0 to new child consistency group new\_cg.

```
cluster1::> vserver consistency-group volume reassign -vserver vs0
-consistency-group cg -parent-consistency-group parentCg -volume vol1,vol2
-new-consistency-group new_cg
      (vserver consistency-group volume reassign)
[Job 100] Job succeeded: Success
```

## vserver consistency-group volume remove

Remove a volume from consistency group

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver consistency-group volume remove` removes volumes from a consistency group.

## Parameters

### **-vserver <Vserver Name> - Vserver Name**

This parameter specifies the Vserver that contains the consistency group from which the volume will be removed.

### **-consistency-group <text> - Consistency Group**

This parameter specifies the consistency group from which the volume will be removed.

### **[-parent-consistency-group <text>] - Parent Consistency Group**

This parameter specifies the parent consistency group from which the volume will be removed.

### **-volume <volume name> - Volume**

This parameter specifies the volume to be removed from the consistency group.

## Examples

The following example will remove volumes vol1,vol2 from child consistency group named cg in parent consistency group parentCg on a Vserver named vs0.

```
cluster1::> vserver consistency-group volume remove -vserver vs0
-consistency-group cg -parent-consistency-group parentCg -volume vol1
(vserver consistency-group volume remove)
Warning: Are you sure you want to remove volume "vol1" from
consistency group "cg" in Vserver "vs0" ? {y|n}: y
[Job 100] Job succeeded: Success
```

## vserver consistency-group volume show

Display a list of existing consistency group Volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The command displays information for consistency group volumes. Use the ``instance`` parameter to display additional consistency group volume details.

## Parameters

### **{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver Name**

Selects information about the consistency group volumes in the specified Vserver.

**[-consistency-group <text>] - Consistency Group**

Selects information about the consistency group volumes in the specified consistency group.

**[-parent-consistency-group <text>] - Parent Consistency Group**

Selects information about the consistency group volumes in the specified parent consistency group.

**[-volume <volume name>] - Volume**

Selects information about the specified consistency group volume.

**[-uuid <UUID>] - Volume UUID**

Selects information about the consistency group volume that matches the specified volume UUID.

**[-vserver-uuid <UUID>] - Vserver UUID**

Selects information about the consistency group volumes that matches the specified Vserver UUID.

**[-consistency-group-uuid <UUID>] - UUID**

Selects information about the consistency group volumes that matches the specified consistency group UUID.

**[-parent-consistency-group-uuid <UUID>] - Parent CG UUID**

Selects information about the consistency group volumes that matches the specified parent consistency group UUID.

**[-size {<integer>[KB|MB|GB|TB|PB] } ] - Size**

Selects information about the consistency group volumes that have the specified size.

**[-space-available {<integer>[KB|MB|GB|TB|PB] } ] - Available Space**

Selects information about the consistency group volumes that have the specified available space.

**[-space-used {<integer>[KB|MB|GB|TB|PB] } ] - Used Space**

Selects information about the consistency group volumes that have the specified used space.

**[-export-policy <export policy name>] - Volume Export Policy**

Selects information about the consistency group volumes that have the specified export policy.

**[-cifs-shares <Share>,...] - Volume CIFS Share Names**

Selects information about the consistency group volumes that have the specified CIFS share name.

## Examples

The following command lists all the volumes that are associated with a consistency group.

```
cluster1::> vserver consistency-group volume show
              (vserver consistency-group volume show)
              Parent
Consistency   Consistency
Used          Available

## vserver export-policy commands

### vserver export-policy check-access

Given a Volume And/or a Qtree, Check to See If the Client Is Allowed Access

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `vserver export-policy check-access` command checks whether a specific client is allowed access to a specific export path. This enables you to test export policies to ensure they work as intended and to troubleshoot client access issues.

The command takes the volume name (and optionally the qtree name) as input and computes the export path for the volume/qtree. It evaluates the export policy rules that apply for each path component and displays the policy name, policy owner, policy rule index and access rights for that path component. If no export policy rule matches the specified client IP address access is denied and the policy rule index will be set to 0. The output gives a clear view on how the export policy rules are evaluated and helps narrow down the policy and (where applicable) the specific rule in the policy that grants or denies access.

#### Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver Name**

This parameter specifies the name of the Vserver in which the export policy resides.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume that you want to check export access for. To check export access for a qtree use the `-qtree` parameter. The `-qtree` parameter is optional. If you specify the `-qtree` parameter, you must provide the name of the volume containing the qtree. If you do not specify the `-qtree` parameter, export access will be checked only for the volume.

**-client-ip <IP Address> - Client IP Address**

This parameter specifies the IP address of the client that you want to check export access for.

**-authentication-method <authentication method> - Authentication Method**

This parameter specifies the authentication method of the client that is attempting access. Possible values include the following:

- *sys* - The authentication method used by the client is AUTH\_SYS.
- *krb5* - The authentication method used by the client is Kerberos v5.
- *krb5i* - The authentication method used by the client is Kerberos v5 with integrity service.
- *krb5p* - The authentication method used by the client is Kerberos v5 with privacy service.
- *ntlm* - The authentication method used by the client is CIFS NTLM.
- *none* - The authentication method used by the client is not explicitly listed in the list of values in the `rorule`.

**-protocol <Client Access Protocol> - Protocol**

This parameter specifies the protocol that the client is using when attempting to access the exported path. Possible values include the following:

- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol

**-access-type {read|read-write|denied} - Access Rights to Check for**

This parameter specifies the type of access you want to check for. Possible values are `read` for read-only access and `read-write` for read-write access.

**[-qtree <qtree name>] - Name of the Qtree**

This optional parameter specifies the qtree in the volume that is part of the exported path. If you specify this parameter, you must also provide the name of the volume the qtree belongs to.

**[-path <text>] - Path**

Selects the entries in the output that match the specified path value. This field describes the junction-path path component encountered when evaluating the export policies starting from the root ('/') of the Vserver.

### **[-policy <text>] - Export Policy**

Selects the entries in the output that match the specified policy value. This field describes the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the Vserver.

### **[-policy-owner <text>] - Export Policy Owner**

Selects the entries in the output that match the specified policy owner value. This field describes the owner of the export policy that is in effect for the path encountered so far when evaluating the export policies starting from the root ('/') of the vservers. The owner of the export policy could be a volume or a qtree.

### **[-policy-owner-type {volume|qtree}] - Type of Export Policy Owner**

Selects the entries in the output that match the specified type of the owner of an export policy. Possible values include the following:

- *volume* - The owner of the export policy is a volume
- *qtree* - The owner of the export policy is a qtree

### **[-rule-index <integer>] - Export Policy Rule Index**

Selects the entries in the output that match the specified export policy rule index. This field describes the rule index of the rule in the export policy that grants or denies access. If the value of the rule index is 0 it implies none of the client match strings provided in the rules of the export policy matched the specified IP address of the client.

### **[-access {read|read-write|denied}] - Access Rights**

Selects the entries in the output that match the specified access value. This field describes the access rights to the path. Possible values include the following:

- *read* - Read access is granted
- *read-write* - Read-write access is granted
- *denied* - Requested access is denied

### **[-partial-rule-match {true|false}] - Did a Subset of the Rules Match?**

Selects the entries in the output that match if a partially matched subset of rules in the export policy were used to grant access to the client.

### **[-clientmatch <text>] - Client Match Spec**

Selects the entries in the output that match the specified clientmatch string. The clientmatch string denotes the string that resulted in a rule match for the specified client IP address.

### **[-security-style <security style>] - Security Style**

Selects the entries in the output that match the specified security style value. Possible values are *unix*, *ntfs* and *mixed*.

## **Examples**

The following examples of the `vserver export-policy check-access` command display various possible results for client export access checks.

```
cluster1::> vserver export-policy check-access -vserver vs1 -client-ip
```

```
10.22.32.42 -volume flex_vol -authentication-method sys -protocol nfs3
-access-type read
```

## vserver export-policy copy

### Copy an export policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver export-policy copy` command creates a copy of an export policy on the same or a different Vserver. The command fails if an export policy with the specified new name already exists on the target Vserver.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy that you want to copy is located.

**-policyname <export policy name> - Policy Name**

This parameter specifies the export policy that you want to copy.

**-newvserver <vserver name> - New Vserver**

This parameter specifies the Vserver to which you want to copy the export policy.

**-newpolicyname <export policy name> - New Export Policy Name**

This parameter specifies the name of the new policy.

### Examples

The following example copies an existing policy named `read_only_expolicy` located on a Vserver named `vs0` to a new policy named `default_expolicy` located on a Vserver named `vs1`.

```
vs1::> vsriver export-policy copy -vsriver vs0 -policyname  
read_only_expolicy -newvsriver vs1 -newpolicyname default_expolicy
```

## vsriver export-policy create

### Create a rule set

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver export-policy create` command creates an export policy. You can use the [vsriver export-policy rule create](#) command to add rules to a policy. Each cluster has an empty default export policy with the ID 0. This default export policy does not contain any rules. You cannot delete the default export policy, but you can rename or modify it.

### Parameters

**-vsriver <vsriver name> - Vsriver**

This parameter specifies the Vsriver on which you want to create the export policy.

**-policyname <export policy name> - Policy Name**

This parameter specifies the export policy that you want to create.

### Examples

The following example creates an export policy named `read_only_expolicy` on a Vsriver named `vs0`:

```
vs1::> vsriver export-policy create -vsriver vs0 -policyname  
read_only_expolicy
```

### Related Links

- [vsriver export-policy rule create](#)

## vsriver export-policy delete

### Delete a rule set

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

### Description

The `vsriver export-policy delete` command deletes an export policy. You cannot delete the default policy (named `default` ) for a Vsriver unless you delete the Vsriver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy that you want to delete is located.

### **-policyname <export policy name> - Policy Name**

This parameter specifies the export policy that you want to delete.

## Examples

The following example deletes an export policy named test\_expolicy from a Vserver named vs0:

```
vs1::> vsriver export-policy delete -vserver vs0 -policyname test_expolicy
```

## vsriver export-policy rename

### Rename an export policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vsriver export-policy rename` command renames an export policy.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

### **-policyname <export policy name> - Policy Name**

This parameter specifies the export policy that you want to rename.

### **-newpolicyname <export policy name> - New Export Policy Name**

This parameter specifies the new name of the export policy.

## Examples

The following example renames an export policy named user\_expolicy with the name read\_only\_expolicy on a Vserver named vs0:

```
vs1::> vsriver export-policy rename -vserver vs0 -policyname user_expolicy  
-newpolicyname read_only_expolicy
```

## vsriver export-policy show

### Display a list of rule sets

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy show` command displays the following information:

- Vserver name
- Export policy name
- Policy ID (diagnostic privilege level only)

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays a list of export policies that are located on the Vserver that you specify.

**[-policyname <export policy name>] - Policy Name**

If you specify this parameter, the command displays only the export policy or sets that match the specified name.

## Examples

The following example displays a list of all export policies:

```
vs1::> vserver export-policy show
VServer          Policy Name
-----
vs0              default_expolicy
vs0              read_only_expolicy
vs1              default_expolicy
vs1              test_expolicy
4 entries were displayed.
```

## vserver export-policy access-cache flush

Flush an entry from the access cache

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache flush` command can be used to remove all entries in the access cache that belong to the specified export policy. The command can also be used to remove the access cache entry for a specific IP address belonging to an export policy. You must provide the name of the node that

hosts the access cache and the name of the Vserver that owns the export policy. This command differs from the `vserver export-policy cache flush` command. The `vserver export-policy cache flush` command allows you to flush all access cache entries across all export policies in a Vserver. In contrast the `vserver export-policy access-cache flush` command gives you the granularity to flush a specific access cache entry or the granularity to flush all access cache entries for a specific export policy.

This command is useful to clear out a negative access cache entry. A negative cache entry is one where a client IP address experiences an access denied error due to stale export policy rule information present in the cache entry. ONTAP maintains several caches in the kernel and userspace to speed access to exports. A negative cache entry can get created in the access cache if a client tries to access an export path before the export rules or the name server settings or the caches in management gateway have been updated to grant access to that client. The negative cache entry will remain in the access cache until the TTL for the entry expires and the entry is refreshed. You can use the ``export-policy access-cache config show`` command to find out the refresh intervals and timeouts for the access cache. If you know that the caches in userspace have the latest information for the client and don't want to wait until the TTL for the access cache entry expires then you can use this command to remove the access cache entry in the kernel and force the cache entry to get re-populated with the latest information that will allow the client to access the export path.

You can use the `vserver export-policy access-cache entry show` and `vserver export-policy access-cache entry show-rules` commands to examine the contents of an entry in the access cache before removing it using the flush command.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to flush the access cache entry.

### **-node <nodename> - Node**

This parameter specifies the node on which you want to flush the access cache entry.

### **-policy <text> - Export Policy Name**

This parameter specifies the name of the export policy that is effective for the exported path that the client is trying to access.

### **[-address <IP Address>] - IP Address**

This parameter is optional. It specifies the IP address of the client whose access cache entry you want to remove. If this parameter is not specified all access cache entries belonging to the specified export policy will be removed.

## Examples

The following example flushes the access cache entry for client IP address '1.2.3.4' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1':

```
cluster1::*> vserver export-policy access-cache flush -vserver vs1 -node
vsim1 -policy testpol -address 1.2.3.4
Successfully removed access cache entry for IP address "1.2.3.4" belonging
to export policy "testpol" in Vserver "vs1" on node "vsim1".

cluster1::*> vserver export-policy access-cache flush -vserver vs1 -node
vsim1 -policy testpol

Warning: This command removes all access cache entries for export policy
"testpol" in Vserver "vs1" on node "vsim1". Do you want to continue?
{y|n}: y

Successfully removed 1 access cache entry for export policy "testpol" in
Vserver "vs1" on node "vsim1".
```

- [vserver export-policy cache flush](#)

## vserver export-policy access-cache show-negative

Display information about the negative access cache entry

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache show-negative` command can be used to display the contents of access cache having negative polarity of the specified node for a particular client IP address belonging to an export policy in a Vserver.

The command will display information such as the age, policy name and client IP address of the negative access cache entry.

If you are interested in finding out more details about the access cache then you can use the [vserver export-policy access-cache show](#) command.

If the client IP address for which access is denied is not cached in the access cache then the command will display an error message stating that this table is current empty.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[`-node` <nodename>|local}] - Node Name**

This parameter specifies the node on which you want to examine the access cache entry. Use an exact value. Queries are not supported.

### **[`-vserver` <vserver>] - Vserver**

This parameter specifies the name of the Vserver on which you want to see the access cache entry. Use an exact value. Queries are not supported.

### **[`-policy` <text>] - Export Policy Name**

This parameter specifies the name of the export policy that is in effect on the export path that the client is trying to access. Use an exact value. Queries are not supported.

### **[`-client-ip` <IP Address>] - Client IP Address**

This parameter specifies the IP address of the client whose access cache entry you want to examine. Use an exact value. Queries are not supported.

### **[`-age` <[<integer>h] [<integer>m] [<integer>s]>] - Age of Entry**

Selects the access cache entries that match the specified age of the entry. This field describes the age of the access cache entry.

## **Examples**

The following example shows the contents of the access cache entry having negative polarity:

```
cluster1::*> vserver export-policy access-cache show-negative
Node: vikash2-vs1m1
Vserver: vs12
Policy Name      IP Address      Age of Entry
-----
default          1.1.1.1         16s
default          1.1.1.2         17s
default          1.1.1.3         18s
3 entries were displayed.
```

## **vserver export-policy access-cache show-rules**

Display information about the export policy rules in the access cache entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `vserver export-policy access-cache show-rules` command is used in conjunction with the [vserver export-policy access-cache show](#) command. The [vserver export-policy access-cache show](#) command displays the state and contents of an access cache entry on the specified node for a particular client IP

address belonging to an export policy in a Vserver. The command lists the rule indexes of the export policy rules that matched. If you are interested in finding out the security settings for each policy rule that matched then you can use the ``vserver export-policy access-cache show-rules`` command. You can use the `-instance` switch to get a more detailed listing. Do note that the security settings of the rules cached in the access cache entry match the security settings of the rules that can be obtained by running the [vserver export-policy rule show](#) command with the corresponding rule index.

If the client IP address is not cached in access cache then the command will display an error message stating that the entry does not exist.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-node <nodename> - Node**

This parameter specifies the node on which you want to examine the export policy rule details in the access cache entry.

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to see the policy rule details in the access cache entry.

**-policy <export policy name> - Policy Name**

This parameter specifies the name of the export policy that is in effect on the export path that the client is trying to access.

**-address <IP Address> - IP Address**

This parameter specifies the IP address of the client whose access cache entry you want to examine in greater detail.

**[-ruleindex <integer>] - Entry Policy Rule Index**

This optional parameter specifies the index number of the export rule of a specific policy.

**[-protocol <Client Access Protocol>,...] - Access Protocol**

This optional parameter specifies the list access protocols of export rules.

**[-rorule <authentication method>,...] - RO Access Rule**

This parameter specifies the security type for read-only access to volumes that use the export rule.

**[-rwrule <authentication method>,...] - RW Access Rule**

This parameter specifies the security type for read-write access to volumes that use the export rule.

**[-superuser <authentication method>,...] - Superuser Security Types**

This parameter specifies a security type for superuser access to files.

**[-anon-uid <integer>] - Anonymous User ID**

This parameter specifies an anonymous user ID that the user credentials are mapped to.

**[-anon-gid <integer>] - Anonymous User Primary GID**

This parameter specifies an anonymous User Primary GID.

**[-anon-gid-list <integer>,...] - Anonymous User GID List**

This parameter specifies an anonymous User Primary GID list.

**[-protocol-flags {allow-suid|allow-dev|allow-nfs-tls-only}] - Protocol Flags**

This parameter specifies protocol flags such as allow-suid, allow-dev and allow-nfs-tls-only.

**[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options**

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore).

**[-chown-mode {restricted|unrestricted}] - Change Ownership Mode**

This parameter specifies a change ownership mode.

**[-clientmatch <text>] - Client Match String**

This parameter specifies the client or clients to which the export rule applies.

**[-anonuser <text>] - Anonymous Username or ID**

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to.

**Examples**

The following example shows the contents of the access cache entry for client IP address '1.2.3.4' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1'. This entry has two export policy rules with rule indexes 1 and 2 that matched and are cached in the entry. To examine what the rule settings are in each of these rules we can use the show-rules variant of the command.

```
cluster1::*>vserver export-policy access-cache show -vserver vs1 -node
vsim1 -policy testpol -address 1.2.3.4
Node: vsim1
```

```

                Vserver: vs1
        Policy Name: testpol
        IP Address: 1.2.3.4
    Access Cache Entry Flags: -
        Result Code: 0
        Failure Type Code: 0
    Number of Matched Policy Rules: 2
List of Matched Policy Rule Indexes: 1, 2
        Age of Entry: 5s
```

```
cluster1::*>vserver export-policy access-cache show-rules -vserver vs1
-node vsim1 -policy testpol -address 1.2.3.4
```

| Rule | Access | RO | RW | Super | Anon |
|------|--------|----|----|-------|------|
|------|--------|----|----|-------|------|

| Node  | Address | Policy  | Index | Protocol | Rule  | Rule  | User  | User |
|-------|---------|---------|-------|----------|-------|-------|-------|------|
| ----- | -----   | -----   | ----- | -----    | ----  | ----  | ----- |      |
| vsim1 | 1.2.3.4 | testpol | 1     | any      | any   | any   | none  |      |
| 65534 |         |         |       |          |       |       |       |      |
| vsim1 | 1.2.3.4 | testpol | 2     | nfs3     | never | never | sys   | 123  |

2 entries were displayed.

```
cluster1::*>vserver export-policy access-cache show-rules -vserver vs1
-node vsim1 -policy testpol -address 1.2.3.4 -instance
Vserver: vs1
```

```

## vserver export-policy access-cache show

Display information about the access cache entry

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache show` command can be used to display the contents of an access cache entry of the specified node for a particular client IP address belonging to an export policy in a Vserver.

The command will display information such as the flags of the access cache entry, the age of the entry, any errors that were encountered when looking up the export policy rules from the management gateway, and the number of policy rules from the export policy that matched the specified client IP address. If an error is encountered when looking up the export policy rules from the management gateway process, the first rule index in the export policy that encountered the error is displayed. The client match string or the anon string in the rule that caused the rule evaluation to fail is also displayed. A more detailed view of the output of this command is available if you specify the `-instance` switch to the command.

The command output lists the rule indexes of the policy rules that matched. If you are interested in finding out

the security settings for each policy rule that matched then you can use the [vserver export-policy access-cache show-rules](#) command.

If the client IP address is not cached in the access cache then the command will display an error message stating that the entry does not exist.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-node <nodename> - Node**

This parameter specifies the node on which you want to examine the access cache entry.

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to see the access cache entry.

**-policy <export policy name> - Policy Name**

This parameter specifies the name of the export policy that is in effect on the export path that the client is trying to access.

**-address <IP Address> - IP Address**

This parameter specifies the IP address of the client whose access cache entry you want to examine.

**[-flags {pending|refreshing|is-abandoned|is-queued-for-update|is-updating|has-usable-data}] - Access Cache Entry Flags**

Selects the access cache entries that match the specified flags value. The flags describe the internal state of the access cache entry. The access cache entry could be in 'pending' state. This denotes the initial state of the access cache entry when a client first tries to access the exported mount point and the rules in the export policy are being matched against the IP address of the client. The 'refreshing' state denotes that the access cache entry is being refreshed. The 'abandoned' state denotes that the access cache entry has been cleared as a result of a cache flush operation. If the access cache entry has been successfully evaluated this field will not be set to any value.

**[-result <integer>] - Result Code**

Selects the access cache entries that match the specified result value. This field describes the error code of the error encountered when matching the IP address of the client against the rules specified in the export policy. If all rules were evaluated successfully this field will be set to 0.

**[-first-unresolved-index <integer>] - First Unresolved Rule Index**

Selects the access cache entries that match the specified unresolved rule index value. This field describes the rule index of the first rule in the export policy that could not be evaluated successfully when matching the IP address of the client against the rules specified in the export policy. If all rules were evaluated successfully this field will not be set to any value.

**[-unresolved-clientmatch <text>] - Unresolved Clientmatch**

Selects the access cache entries that match the specified unresolved client match value. This field describes the client match string that caused the rule evaluation to fail at the displayed rule index. Client match strings that denote a netgroup, hostname or a domain name can fail in evaluation if there are problems in contacting the name servers configured to serve them. If all rules were evaluated successfully this field will not be set to any value.

**[-num-rules <integer>] - Number of Matched Policy Rules**

Selects the access cache entries that match the specified number of matched export rules. This field describes the number of rules in the export policy that were matched successfully against the IP address of the client. If the number of matched rules is 0 and the 'result' field is also 0 then the client will experience an access denied error during mount. If the number of matched rules is non-zero and the 'result' field is 0 then access is granted or denied based on the ro, rw, superuser and other security settings in the matched rules. If the number of matched rules is 0 and the 'result' field has a non-zero value in it the client will experience a hang until the error that caused the rule evaluation to fail is resolved. If the number of matched rules is non-zero and the 'result' field has a non-zero value then this represents a situation where an error was encountered that stopped the match of rules in the export policy against the IP address of the client. The rules that have matched so far are used to make access decisions. (Note that the match of rules follows an ordering precedence determined by the rule index). Access may be granted if the security settings in the rules that have matched so far allow access. The security settings in the partial subset of matched rules are never used to deny access because they represent an incomplete set of matched export rules. Instead the client will experience a hang until the error that caused the rule evaluation to fail is resolved.

**[-ruleindex-list <integer>,...] - List of Matched Policy Rule Indexes**

Selects the access cache entries that match the specified list of matched rule indexes. This field describes a comma separated list of the indexes of the rules in the export policy that matched the IP address of the client. If no rules match the IP address of the client or an error was encountered in the client match process then this field will not be set to any value.

**[-age <[<integer>h] [<integer>m] [<integer>s]>] - Age of Entry**

Selects the access cache entries that match the specified age of the entry. This field describes the age of the access cache entry.

**[-polarity {positive|negative|init}] - Access Cache Entry Polarity**

Selects the access cache entries that match the specified polarity of the entry. The polarity of an access cache entry can be positive or negative. A positive polarity denotes that access is granted to the client IP address. A negative polarity denotes that access is denied to the client IP address.

**[-duration-since-last-use <[<integer>h] [<integer>m] [<integer>s]>] - Time Elapsed since Last Use for Access Check**

Selects the access cache entries that match the specified time duration since the entry was last used for access determination.

**[-duration-since-last-update-attempt <[<integer>h] [<integer>m] [<integer>s]>] - Time Elapsed since Last Update Attempt**

Selects the access cache entries that match the specified time duration since the access cache entry was last updated.

**[-last-update-attempt-result <integer>] - Result of Last Update Attempt**

Selects the access cache entries that match the specified result obtained when the access cache entry was last updated.

## **[-clientmatch-list <text>,...] - List of Client Match Strings**

Selects the access cache entries that match the specified list of clientmatch strings that matched the specified client IP address.

### **Examples**

The following example shows the contents of the access cache entry for client IP address '10.22.33.32' in volume 'flex1' having export policy 'testpol' in a Vserver named 'vs1' on node 'vsim1':

```
cluster1::*> vserver export-policy access-cache show -vserver vs1 -policy
testpol -node vsim1 -address 10.22.33.32
Node: vsim1
Vserver: vs1
Policy Name: testpol
IP Address: 10.22.33.32
Access Cache Entry Flags: has-usable-data
Result Code: 0
First Unresolved Rule Index: -
Unresolved Clientmatch: -
Number of Matched Policy Rules: 1
List of Matched Policy Rule Indexes: 20
Age of Entry: 77s
Access Cache Entry Polarity: positive
Time Elapsed since Last Update Attempt: 8s
Time Elapsed since Last Use for Access Check: 3s
Result of Last Update Attempt: 7208
List of Client Match Strings: 0.0.0.0/0
```

## **vserver export-policy access-cache config modify-all-vservers**

Modify exports access cache configuration for all Vservers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vserver export-policy access-cache config modify-all-vservers` command modifies access cache timeout values for all Vservers. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

This command is not supported in a cluster with effective cluster version of ONTAP 9.0.0 or later. The access cache settings are modified on a per-Vserver basis starting ONTAP 9.0.0. See the [vserver export-policy access-cache config modify](#) command.

## Parameters

### **[`-ttl-positive <integer>`] - TTL For Positive Entries (Secs)**

This parameter specifies the duration after which positive access cache entries will be refreshed when the client accesses.

### **[`-ttl-negative <integer>`] - TTL For Negative Entries (Secs)**

This parameter specifies the duration after which negative access cache entries will be refreshed when the client accesses.

### **[`-harvest-timeout <integer>`] - Harvest Timeout (Secs)**

This parameter specifies the time period after which ONTAP deletes unused entries in the access cache.

### **[`-isDnsTTLEnabled {true|false}`] - Is Dns TTL Enabled**

This parameter specifies the dns TTL is enabled or not.

## Examples

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for all Vservers in a cluster where the effective cluster version is earlier than ONTAP 9.0.0.

```
cluster1::*> vserver export-policy access-cache config modify-all-vservers
-ttl-positive 36000 -ttl-negative 3600 -harvest-timeout 43200
-isDnsTTLEnabled false

cluster1::*> vserver export-policy access-cache config show-all-vservers
    TTL For Positive Entries (secs): 36000
    TTL For Negative Entries (secs): 3600
        Harvest Timeout (secs): 43200
            Is Dns TTL Enabled: false
```

- [vserver export-policy access-cache config modify](#)

## vserver export-policy access-cache config modify

Modify exports access cache configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache config modify` command modifies access cache timeout values per Vserver. Modifying these values from any node updates the values on all the nodes in the cluster. The modified values persist across reboots.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver name for which the timeout values need to be modified.

### **[-ttl-positive <integer>] - TTL For Positive Entries (Secs)**

This parameter specifies the duration after which positive access cache entries will be refreshed upon client access. The value is specified in seconds. The default value is 3600 seconds. Valid values range from 300 seconds to 86400 seconds.

### **[-ttl-negative <integer>] - TTL For Negative Entries (Secs)**

This parameter specifies the duration after which negative access cache entries will be refreshed upon client access. The value is specified in seconds. The default value is 3600 seconds. Valid values range from 60 seconds to 86400 seconds.

### **[-harvest-timeout <integer>] - Harvest Timeout (Secs)**

This parameter specifies the time period after which ONTAP deletes unused entries in the access cache. The value is specified in seconds. The default value is 86400 seconds. Valid values range from 60 seconds to 2592000 seconds.

### **[-isDnsTTLEnabled {true|false}] - Is Dns TTL Enabled**

This parameter specifies the dns TTL is enabled or not. If dns TTL is enable then access cache will use ttl returned from dns lookup, in case dns lookup doesn't return TTL then it will use default ttl value.

## Examples

The following command sets the positive TTL value to 36000 seconds, the negative TTL value to 3600 seconds, and the harvest timeout value to 43200 seconds for Vserver 'vs0':

```
cluster1::*> vsriver export-policy access-cache config modify -ttl
-positive 36000 -ttl-negative 3600 -harvest-timeout 43200 -isDnsTTLEnabled
false

cluster1::*> vsriver export-policy access-cache config show -vserver vs0
Vserver: vs0
    TTL For Positive Entries (secs): 36000
    TTL For Negative Entries (secs): 3600
TTL For Entries with Failure (secs): 1
    Harvest Timeout (secs): 43200
    Is Dns TTL Enabled: false
```

## **vsvrrer export-policy access-cache config show-all-vsrrvers**

Display exports access cache configuration for all Vservers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache config show-all-vservers` command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. ONTAP obtains the access cache timeout values from the node where you run the command. The command output displays the following timeout parameters and their values:

- **TTL for Positive Entries:** This is the TTL for positive entries in the access cache. During client access, if the TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.
- **TTL for Negative Entries:** This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.
- **Harvest Timeout:** If ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

This command is not supported in a cluster with effective cluster version of ONTAP 9.0.0 or later. The access cache settings are stored on a per-Vserver basis starting ONTAP 9.0.0. See the [vserver export-policy access-cache config show](#) command.

## Examples

The following command displays the exports access cache timeout values for all Vservers in a cluster where the effective cluster version is earlier than ONTAP 9.0.0:

```
cluster1::*> vserver export-policy access-cache config show-all-vservers
TTL For Positive Entries (secs): 36000
TTL For Negative Entries (secs): 3600
Harvest Timeout (secs): 43200
```

## Related Links

- [vserver export-policy access-cache config show](#)

## vserver export-policy access-cache config show

Display exports access cache configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy access-cache config show` command displays the timeout attributes related to the exports access cache. The access cache maintains export rules applicable to a client that is accessing the volume or qtree. The command output displays the following timeout parameters and their values for each Vserver:

- **TTL for Positive Entries:** This is the TTL for positive entries in the access cache. During client access, if the

TTL for the access cache entry that is allowing access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.

- **TTL for Negative Entries:** This is the TTL for negative entries in the access cache. During client access, if the TTL for the access cache entry that is denying access has expired, that access cache entry will be refreshed. While the refresh is in progress, client access will be evaluated with the existing information in the access cache entry.
- **TTL for Entries with Failure:** This is the TTL for access cache entries for which a failure was encountered while trying to get matching rules.
- **Harvest Timeout:** If ONTAP does not use an entry that is stored in the access cache for this period of time, it deletes the entry.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays the timeout values for the specified Vserver.

**[-ttl-positive <integer>] - TTL For Positive Entries (Secs)**

If this parameter is specified, the command displays the timeout values for Vservers whose `ttl-positive` matches the provided value.

**[-ttl-negative <integer>] - TTL For Negative Entries (Secs)**

If this parameter is specified, the command displays the timeout values for Vservers whose `ttl-negative` matches the provided value.

**[-harvest-timeout <integer>] - Harvest Timeout (Secs)**

If this parameter is specified, the command displays the timeout values for Vservers whose `harvest-timeout` matches the provided value.

**[-isDnsTTLEnabled {true|false}] - Is Dns TTL Enabled**

If this parameter is specified, the command displays the `isDnsTTLEnabled` value.

## Examples

The following command displays the exports access cache timeout values for all Vservers in the cluster:

```
cluster1::*> vserver export-policy access-cache config show
Vserver  TTL Positive  TTL Negative  TTL Failure  Harvest  Timeout
isDnsTTLEnabled
              (secs)      (secs)      (secs)
-----
vs0              300          60          1          3600  false
vs1             36000         3600          5          3600  false
2 entries were displayed.
```

## vserver export-policy cache flush

### Flush the Export Caches

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `vserver export-policy cache flush` command clears out the contents of the export policy caches for a Vserver. You might need to flush the caches to allow the changes to immediately take effect for your NFS clients because of:

- A change to your export policy rules.
- Modifying a host name record in a name server (i.e., local hosts or DNS).
- Modifying a PTR record in a DNS server (i.e., reverse DNS lookup).
- Modifying the entries in a netgroup in a name server (i.e., local netgroup, LDAP, or NIS).
- Recovering from a network outage that resulted in a netgroup being partially expanded.

To flush the caches, you must specify the following items:

- Vserver: either a specific Vserver or use "\*" to flush all of them.

You can optionally specify the following items:

- Node: if flushing the *access* cache, you can also specify which node to flush it on.
- Cache to flush: by default all but *showmount* will be flushed.

Note that the *showmount* cache is not used to determine NFS client access and as such is only flushable explicitly.

#### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver on which you want to flush the caches.

**[-node <nodename>] - Node**

This parameter specifies the node on which you want to flush the *access* cache.

## **[*-cache* {*all*|*access*|*host*|*id*|*name*|*netgroup*|*showmount*|*ip*}] - Cache Name**

This parameter specifies the name of the cache which you want to flush. Possible values include the following:

- *all* - All caches but *showmount* . This is the default.
- *access* - The export-policy rules access cache.
- *host* - The host name to IP cache.
- *id* - The ID to credential cache.
- *ip* - The IP to host name cache.
- *name* - The name to ID cache.
- *netgroup* - The netgroup cache.
- *showmount* - The showmount caches.

### **Examples**

The following example flushes the access cache on a Vserver named vs0:

```
cluster1::> vsriver export-policy cache flush -vsriver vs0 -cache access
```

## **vsriver export-policy config-checker show**

Show the status of export policy configuration checker jobs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vsriver export-policy config-checker show` command displays status information about export policy configuration checker job. This command displays the following information:

- Vserver name
- Export policy name
- Export policy configuration checker job state
- Export policy rule checked count
- Export policy rule being checked rule index
- Export policy rule with issue count

This command output will only be available after running the export policy configuration checker job.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays export policy configuration checker job state information for Vservers that match the specified value.

**[-policy <export policy name>] - Policy Name**

If you specify this parameter, the command displays export policy configuration checker job state information for policy that match the specified value.

**[-rules-checked <integer>] - Number of Rules Checked**

If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-checked count matching.

**[-rule-being-checked <integer>] - Rule Being Checked**

If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rule-being-checked index matching.

**[-rules-with-issues <integer>] - Number of Rules with Issues**

If you specify this parameter, the command displays export policy configuration checker job state information that have the specified rules-with-issues count matching.

**[-state { Initial | Queued | Running | Waiting | Pausing | Paused | Quitting | Success | Failure | Reschedule | Error | Quit | Dead | Unknown | Restart | Dormant } ] - Job State**

If you specify this parameter, the command displays export policy configuration checker job state information that have the specified state matching.

**Examples**

The following example displays an export policy configuration checker job state information for vserver vs2 and policy default:

```
cluster1::> vserver export-policy config-checker show -vserver vs2 -policy default
```

| Job     | Rules   | Rule Index | Rules With |               |        |
|---------|---------|------------|------------|---------------|--------|
| Vserver | Policy  | State      | Checked    | Being Checked | Issues |
| vs2     | default | Running    | 1          | 2             | 1      |

**vserver export-policy config-checker start**

Start export policy configuration checker job

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy config-checker start` command invokes background job, which will check export policy configuration and if issue found in rules then error entry is created for each affected rule in export policy configuration checker error rule list.

Export policy configuration checker only validates hostname, netgroup and anonymous user related configuration.

## Parameters

**-vserver <vserver name> - Vserver**

If you specify this parameter, the export policy configuration checker job will be triggered for specified Vserver.

**[-policy <export policy name>] - Export Policy Name**

If you specify this parameter, the export policy configuration checker job will be triggered for specified policy.

## Examples

The following example start a export policy configuration checker job for vserver vs2 and policy default:

```
cluster1::> vserver export-policy config-checker start -vserver vs2
-policy default
[Job 644] Job is queued: Export Policy configuration checker.
```

## vserver export-policy config-checker stop

Stop export policy configuration checker job

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy config-checker stop` command stops running export policy configuration checker job.

Export policy configuration checker stop command only works if the keys provided are same as the keys provided at the time of starting export policy configuration checker job.

## Parameters

**-vserver <vserver name> - Vserver**

If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified Vserver.

### **`[-policy <export policy name>] - Export Policy Name`**

If you specify this parameter, the command stops export policy configuration checker job, if any export policy configuration checker job is running for the specified policy.

### **Examples**

The following example stop an export policy configuration checker job for Vserver vs2 and policy default:

```
cluster1::> vsserver export-policy config-checker stop -vsserver vs2 -policy default
```

## **vserver export-policy config-checker rule delete**

Delete error entries for rules from export policy configuration checker error rule list

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vserver export-policy config-checker rule delete` command deletes error rule entries from export policy configuration checker error rule list. You can delete a specific error entry rule by specifying its rule index number.

### **Parameters**

#### **`-node {<nodename>|local}` - Node**

This parameter specifies the node on which the export policy configuration error rule entries are stored.

#### **`-vsserver <vsserver name>` - Vserver**

This parameter specifies the Vserver which contains the export policy.

#### **`-policy <export policy name>` - Policy Name**

This parameter specifies the export policy from which you want to delete an error rule entry.

#### **`-rule-index <integer>` - Rule Index**

This parameter specifies the index number of the error rule entry that you want to delete. You can use the [vserver export-policy config-checker rule show](#) command to view a list of rules with their index numbers.

### **Examples**

The following example deletes an error rule entry from config-checker error rule list, with the index number 1 from an export policy named default on a Vserver named vs34:

```
cluster1::>vserver export-policy config-checker rule delete -node node-  
vsim3 -vsserver vs34 -policy test -rule-index 1  
    (vserver export-policy config-checker rule delete)  
1 entry was deleted.
```

## Related Links

## vserver export-policy config-checker rule show

Show error entries for rules in export policy configuration checker job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver export-policy config-checker rule show` command displays information about error related to configuration in export policy rules. If a rule has any issues the configuration checker job will log information about such errors on the node where the job runs. The command displays the following information:

- Node name
- Vserver name
- Export policy name
- Export policy rule index number
- Export policy rule error

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays detailed error information for node that matches the specified value.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays detailed error information for Vservers that match the specified value.

**[-policy <export policy name>] - Policy Name**

If you specify this parameter, the command displays detailed error information for policy that match the specified value.

**[-rule-index <integer>] - Rule Index**

If you specify this parameter, the command displays detailed error information for rule-index that match the specified value.

**[-error <text>] - Error Details**

If you specify this parameter, the command displays rule index information for error that match the specified value. The complete error string needs to be specified within "{}".

Examples

The following example displays information about error related to export rules:

```
cluster1::> vsriver export-policy config-checker rule show -node node-
vsim3 -vsriver vs34 -policy test
(vsvriver export-policy config-checker rule show)
      Rule
Node      Vsvriver      Policy      Index      Error
-----
node-vsim3
      vs34      test      1      DNS lookup for host "h1"
failed
      vs34      test      2      Entry not found for "UserName:
testuser", DNS lookup for host "h2" failed
2 entries were displayed.
```

```
cluster1::> vsriver export-policy config-checker rule show -node node-
vsim3 -vsriver vs34 -policy test -rule-index 1
(vsvriver export-policy config-checker rule show)
Node: node-vsim3
      Vsvriver: vs34
      Policy Name: test
      Rule Index: 1
Error Details: DNS lookup for host "h1" failed
```

```
cluster1::> vsriver export-policy config-checker rule show -node node-
vsim3 -vsriver vs34 -policy test -error {DNS lookup for host "h1" failed}
(vsvriver export-policy config-checker rule show)
      Rule
Node      Vsvriver      Policy      Index      Error
-----
node-vsim3
      vs34      test      1      DNS lookup for host "h1"
failed
```

**vsriver export-policy netgroup check-membership**

Check to see if the client is a member of the netgroup

**Availability:** This command is available to *cluster* and *Vsvriver* administrators at the *admin* privilege level.

## Description

The `vserver export-policy netgroup check-membership` command determines if the client IP address is a member of the netgroup. The netgroup must be configured as `clientmatch` in at least one of the export-policy rules configured in the vserver. ONTAP can determine the membership information only after it has fully loaded the netgroup into the cache. Until then, while the reverse lookup scan algorithm might find a match, both DNS round robin and DNS aliases prevent ruling out non-matches. You can use the [vserver export-policy netgroup queue show](#) command to monitor the loading of the netgroup.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver whose netgroup you want to check for client membership.

### **-netgroup <text> - Name of the Netgroup**

This parameter specifies the name of the netgroup that you want to check for client membership.

### **-client-ip <IP Address> - Client Address**

This parameter specifies the IP address of the client whose netgroup membership you want to check.

## Examples

The following examples of the `vserver export-policy netgroup check-membership` command display various possible results for client membership checks.

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1"
with state "reverse lookup scan".
```

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup mercury -client-ip 172.17.16.72
Client 172.17.16.72 is a member of netgroup "mercury" for Vserver "vs1"
with state "cache".
```

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup mercury -client-ip 172.17.16.14
Client 172.17.16.14 is not a member of netgroup "mercury" for Vserver
"vs1".
```

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup big -client-ip 172.17.16.69
Cannot yet determine the membership of client 172.17.16.69 in netgroup
"big" for Vserver "vs1". Try again when the netgroup is loaded in the
cache.
```

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup big -client-ip 172.17.16.69
Client 172.17.16.72 is a member of netgroup "big" for Vserver "vs1" with
state "cache".
```

```
cluster1:*> vserver export-policy netgroup check-membership -vserver vs1
-netgroup big -client-ip 2002:c65f:e228:0:0:0:0:0
Cannot yet determine the membership of client 2002:c65f:e228:: in netgroup
"big" for Vserver "vs1". Try again when the netgroup is loaded in the
cache.
```

## vserver export-policy netgroup cache show

### Show the Netgroup Cache

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver export-policy netgroup cache show` command displays the contents of the export policy netgroup cache for a Vserver. Entries shown here correspond to the caches used to evaluate client membership in a netgroup. To show the netgroup cache, you must specify the following item:

- **Vserver:** The name of the Vserver whose netgroup cache you want to display.

The following information is displayed per cache entry:

- **Vserver name:** The name of the Vserver.
- **Netgroup name:** The name of the netgroup.
- **State of the cache entry:** The state of the cache entry. There are four possible values:
  - **initializing:** The cache entry is being populated for the first time.
  - **ready:** Processing of the cache entry is complete and it is ready to be used.
  - **not-found:** The netgroup could not be found.
  - **abandoned:** The cache entry has been abandoned.
- **Total number of hosts in the netgroup cache:** The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.
- **How long it took to expand the netgroup:** How long it took to expand the netgroup the last time in the queue.
- **Entry is refreshing:** If the entry is a complete miss or refresh.
- **Next refresh time:** When the next refresh is scheduled to take place.
- **Netgroup by host state:** Boolean state indicating if netgroup-by-host feature is used for resolving netgroup membership check.
- **Number of IP addresses cached:** Number of client IP addresses that are matched for the netgroup. The count includes both positive and negative results.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver**

If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

**[-netgroup <text>] - Name of the Netgroup**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

**[-cache-state {initializing|ready|not-found|abandoned}] - State of the Cache Entry**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup cache state matches the specified value.

**[-total-hosts <integer>] - Total Number of Hosts in the Netgroup**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of host names matches the specified value.

### **[`-expansion-duration` <[ [`<hours>:`] `<minutes>:`] `<seconds>>`]] - Expansion Duration**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record expansion time matches the specified value.

### **[`-is-refreshing` {`true`|`false`}] - Is Entry Refreshing?**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record refreshing state matches the specified value.

### **[`-time-next-refresh` <Date>] - Next Refresh Time**

If you specify this parameter, the command displays the netgroup cache information only if the time of the next scheduled refresh matches the specified value.

### **[`-num-ip-addr-cache` <integer>] - Number of Cached IP Addresses**

If you specify this parameter, the command displays the netgroup cache information only if the number of cached IP addresses matches the specified value.

## **Examples**

The following example displays the netgroup cache for the Vserver `vs1` and the netgroup `netgroup1`:

```
cluster1::> vsriver export-policy netgroup cache show -vsriver vs1
-netgroup netgroup1
Vserver  Netgroup  State
-----  -
vs1      netgroup1  Ready
```

## **vsvrr export-policy netgroup queue show**

### **Show the Netgroup Processing Queue**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vsvrr export-policy netgroup queue show` command displays the ongoing processing of the netgroup cache for a node. Entries shown here are not used to evaluate client membership in a netgroup. The following information is displayed per queue entry:

- Vserver name: The name of the Vserver.
- Netgroup name: The name of the netgroup.
- Age of entry in the queue: How long the entry has been in the queue.
- Queue state: The state of the entry in the queue. There are three possible values:
  - `running`: The entry is currently being processed.
  - `waiting`: The entry is waiting to be processed.
  - `retrying`: The entry is waiting to be reprocessed.

Note that as the ``vserver export-policy netgroup queue show`` command is not atomic. Several queue entries might show up in the 'running' state.

- \* Number of times retried in the queue: The number of times was the entry was taken off of the netgroup processing queue and added back on it.
- \* Total number of hosts in the netgroup: The number of host names retrieved from the name service in mapping the netgroup to a list of hosts.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays the netgroup cache information only if the Vserver name matches the specified value.

**[-netgroup <text>] - Name of the Netgroup**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup name matches the specified value.

**[-queue-state {waiting|running|retrying}] - State of Entry in the Queue**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup queue state matches the specified value.

**[-age <[[<hours>:]<minutes>:]<seconds>>] - Age of Entry in the Queue**

If you specify this parameter, the command displays the netgroup cache information only if the age of when the netgroup record was put on the netgroup processing queue matches the specified value.

**[-retries-on-queue <integer>] - Number of Retries on the Queue**

If you specify this parameter, the command displays the netgroup cache information only if, during a refresh, the number of times the netgroup record has been put back on the netgroup processing queue matches the specified value.

**[-total-hosts <integer>] - Total Number of Hosts in the Netgroup**

If you specify this parameter, the command displays the netgroup cache information only if the netgroup record's count of hosts matches the specified value.

## Examples

The following example displays the netgroup queue:

```
cluster1::> vsriver export-policy netgroup queue show
```

| Vserver | Netgroup   | State    | Age on Queue | Total Hosts |
|---------|------------|----------|--------------|-------------|
| testvs1 | test-netgr | retrying | 0:0:47       | 12441       |
| testvs1 | test       | waiting  | 0:01:35      | -           |

## vsriver export-policy rule add-clientmatches

Add list of clientmatch strings to an existing rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsriver export-policy rule add-clientmatches` command adds a list of strings to the `clientmatch` field of a specified export rule in a policy. This command only operates on the `clientmatch` field; to modify other fields in a rule use the `vsriver export-policy modify` command.

### Parameters

#### **-vsriver <vsriver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

#### **-policyname <export policy name> - Policy Name**

This parameter specifies the name of the export policy containing the export rule to which you want to add additional `clientmatch` strings.

#### **-ruleindex <integer> - Rule Index**

This parameter specifies the index number of the export rule to which you want to add additional `clientmatch` strings. To view a list of rules with their index numbers, use the [vsriver export-policy rule show](#) command.

#### **-clientmatches <text> - List of Clientmatch Strings to Add**

This parameter specifies list of the match strings specifying the client or clients to add to the export rule. Duplicate match strings will not be created and the list may not contain duplicates entries. Match strings from the `clientmatches` list are added to the `clientmatch` field if the match string is not identical to one of the strings already in the `clientmatch` field. The maximum number of `clientmatches` that can be created is 4096. You can specify the match string in any of the following formats:

- As a hostname; for instance, `host1`
- As an IPv4 address; for instance, `10.1.12.24`
- As an IPv6 address; for instance, `fd20:8b1e:b255:4071::100:1`
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, `10.1.12.0/24`
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, `fd20:8b1e:b255:4071::/64`
- As an IPv4 address with a network mask; for instance, `10.1.16.0/255.255.255.0`

- As a netgroup, with the netgroup name preceded by the @ character; for instance, @eng
- As a domain name preceded by the . character; for instance, .example.com

Note: Entering an IP address range, such as 10.1.12.10-10.1.12.70, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

## Examples

The following example adds match strings "2.2.2.2" and "3.3.3.3" to the clientmatch field of the export rule with index number 3 in an export policy named default\_expolicy on a Vserver named vs0.

```
cluster1::> vserver export-policy rule add-clientmatches -vserver vs0
-policyname default_expolicy -ruleindex 3 -clientmatches "2.2.2.2,3.3.3.3"
```

## Related Links

- [vserver export-policy rule show](#)

## vserver export-policy rule create

### Create a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver export-policy rule create` command creates an export rule and adds it to a policy. To create an export rule, you must specify the following items:

- Vserver
- Export policy
- Clients that match the rule
- Read-only access rule
- Read-write access rule

You can optionally specify the following items:

- Index number; that is, the location of the export rule in the policy
- Access protocol
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
- Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
- Whether ownership changes are restricted or not (advanced privilege and higher only)

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

### **-policyname <export policy name> - Policy Name**

This parameter specifies the name of the export policy to which you want to add the new export rule. The export policy must already exist. To create an export policy, see the [vserver export-policy create](#) command.

### **[-ruleindex <integer>] - Rule Index**

This optional parameter specifies the index number of the export rule that you want to create. If you specify an index number that already matches a rule, the index number of the existing rule is incremented, as are the index numbers of all subsequent rules, either to the end of the list or to an open space in the list. If you do not specify an index number, the new rule is placed at the end of the policy's list. Valid values are values from 1 to 4294967295.

### **[-protocol <Client Access Protocol>,...] - Access Protocol**

This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:

- *any* - Any current or future access protocol
- *nfs* - Any current or future version of NFS
- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as *any*, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to *any*. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroup volumes do not support NFSv4 protocol access.

### **-clientmatch <text> - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains**

This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. Duplicate match strings in the same rule are not allowed. The maximum number of clientmatches that can be created is 4096. You can specify the match string in any of the following formats:

- As a hostname; for instance, *host1*
- As an IPv4 address; for instance, *10.1.12.24*
- As an IPv6 address; for instance, *fd20:8b1e:b255:4071::100:1*
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, *10.1.12.0/24*
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, *fd20:8b1e:b255:4071::/64*
- As an IPv4 address with a network mask; for instance, *10.1.16.0/255.255.255.0*
- As a netgroup, with the netgroup name preceded by the *@* character; for instance, *@eng*
- As a domain name preceded by the *.* character; for instance, *.example.com*

Note: Entering an IP address range, such as *10.1.12.10-10.1.12.70*, is not allowed. Entries in this format

are interpreted as a text string and treated as a hostname.

### **-rorule <authentication method>,... - RO Access Rule**

This parameter specifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH\_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes sys.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.
- *any* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume regardless of the security type of that incoming request. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) remains the same as the security type of the incoming request.

If the security type of the incoming request is AUTH\_NONE, read access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume as an anonymous user if the security type of that incoming request is not explicitly listed in the list of values in the rorule. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes none.
- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow any access to the volume regardless of the security type of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria, if the security type doesn't match any of the values listed in rorule (as explained above), access will be denied to that incoming request.

### **-rwrule <authentication method>,... - RW Access Rule**

This parameter specifies the security type for read-write access to volumes that use the export rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH\_SYS.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.
- *any* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

If the effective security type (determined from rorule) of the incoming request is none, write access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria, allow write access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.
- *never* - For an incoming request from a client matching the clientmatch criteria, do not allow write access to the volume regardless of the effective security type (determined from rorule) of that incoming request.

You can specify a comma-separated list of multiple security types for an export rule. If you specify the security type as *any* or *never*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria, if the effective security type (determined by rorule) doesn't match any of the values listed in rwrule (as explained above), write access will be denied to that incoming request.

### **[*-anon <text>*] - User ID To Which Anonymous Users Are Mapped**

This parameter specifies a UNIX user ID or user name that the user credentials are mapped to when evaluation of rorule or superuser parameters result in user being mapped to the anonymous user. The default setting of this parameter is 65534, which is normally associated with the user name "nobody" or "nfsnobody" in Linux environments. NetApp appliances use 65534 as the user "pcuser", which is generally used for multiprotocol operations. Because of this difference, if using local files and NFSv4, the name string for users mapped to 65534 might not match. This discrepancy might cause files to be written as the user specified in the /etc/idmapd.conf file on the client (Linux) or /etc/default/nfs file (Solaris), particularly when using multiprotocol (CIFS and NFS) on the same datasets. The following notes apply to the use of this parameter:

- To disable access by any client with a user ID of 0, specify a value of 65535 which is associated with the user nobody.

### **[*-superuser <authentication method>,...*] - Superuser Security Types**

This parameter specifies a security type for superuser access to files. The default setting of this parameter is *none*. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is AUTH\_SYS.
- *krb5* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5.
- *krb5i* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with integrity service.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is Kerberos v5 with privacy service.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume if the effective security type (determined from rorule) of that incoming request is CIFS NTLM.
- *any* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow superuser access to the volume regardless of the effective security type (determined by rorule) of that incoming request.

If the effective security type (determined from rorule) of the incoming request is none, access will be granted to that incoming request as an anonymous user.

- *none* - For an incoming request from a client matching the clientmatch criteria and with the user ID 0, allow access to the volume as an anonymous user if the effective security type (determined from rorule) of that incoming request is none.

You can specify a comma-separated list of multiple security types for superuser access. If you specify the security type as *any*, you cannot specify any other security types.

For an incoming request from a client matching the clientmatch criteria and with the user ID 0, if the effective security type doesn't match any of the values listed in superuser (as explained above), the user ID is mapped to anonymous user.

#### **`[-allow-suid {true|false}] - Honor SetUID Bits in SETATTR`**

This parameter specifies whether set user ID (suid) and set group ID (sgid) access is enabled by the export rule. The default setting is `true`.

#### **`[-allow-dev {true|false}] - Allow Creation of Devices`**

This parameter specifies whether the creation of devices is enabled by the export rule. The default setting is `true`.

#### **`[-ntfs-unix-security-ops {ignore|fail}] - NTFS Unix Security Options (privilege: advanced)`**

This parameter specifies whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited (fail) or allowed (ignore) when the request originates from an NFS client. The default setting is `fail`.

#### **`[-chown-mode {restricted|unrestricted}] - Change Ownership Mode (privilege: advanced)`**

This parameter specifies who is allowed to change the ownership mode of a file. The default setting is `restricted`. The allowed values are:

- **restricted** - Only root may change the ownership of the file.
- **unrestricted** - Non-root users may change file ownership provided the on-disk permissions allow the operation.

## Examples

The following example creates an export rule with index number 1 in an export policy named `read_only_expolicy` on a Vserver named `vs0`. The rule matches all clients in the domains named `example.com` or `example.net`. The rule enables all access protocols. It enables read-only access by any matching client and requires authentication by `AUTH_SYS`, `NTLM`, or `Kerberos 5` for read-write access. Clients with the UNIX user ID zero are mapped to user ID 65534 (which normally maps to the user name `nobody`). It does not enable `suid` and `sgid` access or the creation of devices.

```
cluster1::> vsriver export-policy rule create -vserver vs0 -policyname
read_only_expolicy -ruleindex 1
-protocol any -clientmatch ".example.com,.example.net" -rorule any -rwrule
"ntlm,krb5,sys" -anon 65534 -allow-suid false
-allow-dev false
```

## vserver export-policy rule delete

### Delete a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver export-policy rule delete` command deletes an export rule from a policy. You can specify the export rule by specifying its index number in the policy. When you delete a rule, the other rules in the policy are not automatically renumbered or reordered. You can use the [vserver export-policy rule setindex](#) command to reorder the rules in a rule set.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver which contains the export policy.

**-policyname <export policy name> - Policy Name**

This parameter specifies the export policy from which you want to delete a rule.

**-ruleindex <integer> - Rule Index**

This parameter specifies the index number of the rule that you want to delete. You can use the [vserver export-policy rule show](#) command to view a list of rules with their index numbers.

## Examples

The following example deletes an export rule with the index number 5 from an export policy named rs1 on a Vserver named vs0:

```
cluster1::> vserver export-policy rule delete -vserver vs0
-policyname read_only_expolicy -ruleindex 5
```

## vserver export-policy rule modify

### Modify a rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver export-policy rule modify` command modifies a specified export rule in a policy. This command cannot change the position of a rule in a policy; to reorder rules in a policy, use the [vserver export-policy rule setindex](#) command. Duplicate match strings in the same rule are not allowed. You can use this command to change the following attributes of an export rule:

- Access protocol
- Client match specification
- Read-only access rule
- Read-write access rule
- Anonymous ID
- Superuser security type
- Whether suid access is enabled
- Whether creation of devices is enabled
- Whether UNIX-type permissions changes on NTFS (Windows) volumes are prohibited or allowed when the request originates from an NFS client (advanced privilege and higher only)
- Whether ownership changes are restricted or not (advanced privilege and higher only)

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver on which the export policy is located.

**-policyname <export policy name> - Policy Name**

This parameter specifies the name of the export policy containing the export rule that you want to modify.

### **-ruleindex <integer> - Rule Index**

This parameter specifies the index number of the export rule that you want to modify. To view a list of rules with their index numbers, use the [vservers export-policy rule show](#) command.

### **[-protocol <Client Access Protocol>,...] - Access Protocol**

This optional parameter specifies the list of access protocols for which you want to apply the export rule. Possible values include the following:

- *any* - Any current or future access protocol
- *nfs* - Any current or future version of NFS
- *nfs3* - The NFSv3 protocol
- *nfs4* - The NFSv4 protocol
- *cifs* - The CIFS protocol

You can specify a comma-separated list of multiple access protocols for an export rule. If you specify the protocol as *any*, you cannot specify any other protocols in the list. If you do not specify this parameter, the value defaults to *any*. If you enable NFSv4, you will not be able to apply the policy to which this rule belongs to a FlexGroup, as FlexGroup volumes do not support NFSv4 protocol access.

### **[-clientmatch <text>] - List of Client Match Hostnames, IP Addresses, Netgroups, or Domains**

This parameter specifies list of the match strings specifying the client or clients to which the export rule applies. The maximum number of clientmatches that can be created is 4096. You can specify the match string in any of the following formats:

- As a hostname; for instance, *host1*
- As an IPv4 address; for instance, *10.1.12.24*
- As an IPv6 address; for instance, *fd20:8b1e:b255:4071::100:1*
- As an IPv4 address with a subnet mask expressed as a number of bits; for instance, *10.1.12.0/24*
- As an IPv6 address with a subnet mask expressed as a number of bits; for instance, *fd20:8b1e:b255:4071::/64*
- As an IPv4 address with a network mask; for instance, *10.1.16.0/255.255.255.0*
- As a netgroup, with the netgroup name preceded by the *@* character; for instance, *@eng*
- As a domain name preceded by the *.* character; for instance, *.example.com*

Note: Entering an IP address range, such as *10.1.12.10-10.1.12.70*, is not allowed. Entries in this format are interpreted as a text string and treated as a hostname.

### **[-rorule <authentication method>,...] - RO Access Rule**

This parameter modifies the security type for read-only access to volumes that use the export rule. Possible values include the following:

- *sys* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is AUTH\_SYS. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes *sys*.
- *krb5* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5. The effective security type of the incoming request (to be used subsequently in evaluation of rrule/superuser) becomes *krb5*.

- *krb5i* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with integrity service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5i.
- *krb5p* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is Kerberos v5 with privacy service. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes krb5p.
- *ntlm* - For an incoming request from a client matching the clientmatch criteria, allow read access to the volume if the security type of that incoming request is CIFS NTLM. The effective security type of the incoming request (to be used subsequently in evaluation of rwrule/superuser) becomes ntlm.
