When disks are zeroed, they can be provisioned directly into aggregates which avoids a lengthy zeroing process.

**`[-is-disk-zeroing {true|false}]` - Is Disk Zeroing?**

Selects the spare disks that match this parameter value.

**`[-zeroing-percent <percent>]` - Zeroing Percentage Completed**

Selects the spare disks that match this parameter value.

**`[-is-sparecore {true|false}]` - Sparecore Disk?**

Selects the spare disks that match this parameter value.

**`[-sparecore-status <Spare core status>] - Sparecore Status`**

Selects the spare disks that match this parameter value.

**`[-sparecore-percent <percent>] - Sparecore Percentage Completed`**

Selects the spare disks that match this parameter value.

**`[-is-disk-shared {true|false}] - Is Disk Shared?`**

Selects the spare disks that match this parameter value.

Shared disks have partitions that allow them to be used in multiple aggregates and between nodes in an HA pair. When set to *true*, this parameter selects shared disks in which the root partition and/or the data partition is a spare. When set to *false* only spare disks without partitions are displayed. When this parameter is not used, all spare disks are displayed.

**`[-is-disk-offline {true|false}] - Is Disk Offline?`**

Selects the spare disks that match this parameter value.

Disk offline events are typically temporary events which allow Data ONTAP to perform background error recovery activity.

**`[-is-disk-sick {true|false}] - Is Disk Sick?`**

Selects the spare disks that match this parameter value.

A sick disk triggers Rapid RAID Recovery to copy data to a spare drive. At the end of the process the sick disk is marked as *broken*.

**`[-is-disk-left-behind {true|false}] - Is Disk Left Behind Spare?`**

Selects the spare disks that match this parameter value.

Disks are left behind if they are not responding during a giveback or switchback event.

**`[-local-usable-data1-size-blks <integer>] - Local Node Data1 Usable Size in 4K blocks`  
(privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

**`[-local-usable-data2-size-blks <integer>] - Local Node Data2 Usable Size in 4K blocks`  
(privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in 4KB blocks.

**`[-local-usable-data1-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Data1 Usable Size (privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data1 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

**`[-local-usable-data2-size {<integer>[KB|MB|GB|TB|PB]}]` - Local Node Data2 Usable Size (privilege: advanced)**

Selects the spare disks that match this parameter value.

Disks that have two partitions can be used for one root aggregate and one data aggregate.

Disks that have three partitions can be used for one root aggregate and one or two data aggregates.

This value describes the data2 partition size of a root-data1-data2 partitioned disk in auto-scaled units.

## Examples

Display spare disks owned by node *node-b*.

```
cluster1::> storage aggregate show-spare-disks -owner-name node-b
```

Original Owner: node-b

Pool0

Spare Pool

Usable Physical

Disk	Type	Class	RPM	Checksum	Size

## storage aggregate show-status

### Display aggregate configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show-status` command displays the RAID layout and disk configuration of aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all aggregates in the cluster.

This command does not use pagination. You can reduce the output by filtering with the parameters below.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

This parameter currently has no effect.

**[-aggregate <text>] - Aggregate Name**

Selects the aggregates that match this parameter value.

**[-node <nodename>] - Node**

Selects the aggregates that match this parameter value.

## **[-aggregate-uuid <UUID>] - Aggregate UUID**

Selects the aggregates that match this parameter value.

### **Examples**

Display the RAID layout of a Flash Pool aggregate.

```
cluster1::> storage aggregate show-status -aggregate nodeB_flashpool_1
```

Owner Node: node-b

Aggregate: nodeB\_flashpool\_1 (online, raid\_dp, hybrid) (block checksums)

Plex: /nodeB\_flashpool\_1/plex0 (online, normal, active, pool0)

RAID Group /nodeB\_flashpool\_1/plex0/rg0 (normal, block checksums)

Usable

Physical

Position	Disk	Pool	Type	RPM	Size
Size	Status

745.2GB	(normal)				

shared	1.0.18	0	SSD	-	186.2GB
745.2GB	(normal)				

shared	1.0.16	0	SSD	-	186.2GB
745.2GB	(normal)				

## storage aggregate show

Display a list of aggregates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate show` command displays information about aggregates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all aggregates:

- Aggregate name
- Size
- Available size
- Percentage used
- State
- Number of volumes
- Node on which the aggregate is located
- RAID status

To display detailed information about a single aggregate, use the `-aggregate` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-checksum ]**

If this parameter is specified, the command displays information about the checksum for all aggregates in the cluster:

- Aggregate name
- Checksum status (active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, upgrading\_phase2)
- Checksum style (none, advanced\_zoned, block, mixed, WAFL, or unknown)

**| [-disk ]**

If this parameter is specified, the command displays disk names for all aggregates in the cluster:

- Aggregate name
- Number and names of disks in the aggregate

**| [-raid-info ]**

If this parameter is specified, the command displays information about RAID groups, RAID type, maximum RAID size, checksum state, checksum style and whether the RAID status is inconsistent.

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all aggregates in the cluster.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays detailed information about the specified aggregate.

**[-storage-type {hdd | hybrid | lun | ssd | vmdisk}] - Storage Type**

If this parameter is specified, the command displays information only about the aggregates with the specified storage type. The possible values are hdd, hybrid, lun, ssd and vmdisk.

**[-chksumstyle <aggrChecksumStyle>] - Checksum Style**

If this parameter is specified, the command displays information only about the aggregates that use the specified checksum style.

**[-diskcount <integer>] - Number Of Disks**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of disks.

**[-m, -mirror <true>] - Mirror**

If this parameter is specified, the command displays information only about the aggregates that have the specified mirrored value.

**[-d, -disklist <disk path name>,...] - Disks for First Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks.

**[-mirror-disklist <disk path name>,...] - Disks for Mirrored Plex**

If this parameter is specified, the command displays information only about the aggregates that have the specified disk or disks present in the mirrored plex.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information only about the aggregates that are located on the specified node.

**[-free-space-realloc {on|off}] - Free Space Reallocation**

If this parameter is specified, the command displays whether free space reallocation is enabled on the specified aggregate.

**[-ha-policy {sfo|cfo}] - HA Policy**

This optionally specifies the high-availability policy to be used in the context of a root recovery procedure. Do not modify this setting unless directed to do so by a customer support representative.

**[-percent-snapshot-space <percent>] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the aggregates that have the specified space reserved for Snapshot copies.

**[-space-nearly-full-threshold-percent <percent>] - Aggregate Nearly Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified nearly full threshold percent.

**[`-space-full-threshold-percent` <percent>] - Aggregate Full Threshold Percent**

If this parameter is specified, the command displays information only about the aggregates that have the specified full threshold percent.

**[`-hybrid-enabled` {`true`|`false`}] - Hybrid Enabled**

If this parameter is specified, the command displays information only about the aggregates that are eligible to contain both SSD and non-SSD RAID groups.

**[`-availsize` {<integer>[`KB`|`MB`|`GB`|`TB`|`PB`] }] - Available Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified available size.

**[`-checksumenabled` {`true`|`false`}] - Checksum Enabled**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum setting.

**[`-checksumstatus` <text>] - Checksum Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified checksum status. The possible values for checksum status include the following: active, off, reverting, none, unknown, initializing, reinitializing, reinitialized, upgrading\_phase1, and upgrading\_phase2.

**[`-cluster` <text>] - Cluster**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the specified cluster. By default, only local cluster aggregates are displayed.

**[`-cluster-id` <UUID>] - Home Cluster ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by nodes in the cluster specified by the cluster UUID. By default, only local cluster aggregates are displayed.

**[`-dr-home-id` <integer>] - DR Home ID**

If this parameter is specified, the command displays information only about the aggregates whose Disaster Recovery home node has the specified system ID.

**[`-dr-home-name` <text>] - DR Home Name**

If this parameter is specified, the command displays information only about the aggregates whose Disaster Recovery home is the specified node.

**[`-inofile-version` <integer>] - Inofile Version (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates whose inode files are at the specified version.

**[`-has-mroot` {`true`|`false`}] - Has Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain their owning node's management root directory.

**[`-has-partner-mroot` {`true`|`false`}] - Has Partner Node Mroot Volume**

If this parameter is specified, the command displays information about only the aggregates that contain the management root directory of their owning node's failover partner.

**[-home-id <integer>] - Home ID**

If this parameter is specified, the command displays information only about the aggregates whose home node has the specified system ID.

**[-home-name <text>] - Home Name**

If this parameter is specified, the command displays information only about the aggregates whose home node is the specified node.

**[-hybrid-cache-size-total {<integer>[KB|MB|GB|TB|PB]}] - Total Hybrid Cache Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified total cache size in a Flash Pool.

**[-hybrid {true|false}] - Hybrid**

If this parameter is specified, the command displays information only about the aggregates that currently contain both SSD and non-SSD RAID groups.

**[-inconsistent {true|false}] - Inconsistent**

If this parameter is specified, the command displays information only about the aggregates that have the specified consistency.

**[-is-home {true|false}] - Is Aggregate Home**

If this parameter is specified, the command displays information only about the aggregates whose home node and owner node have the same system ID.

**[-s, -maxraidsize <integer>] - Max RAID Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified maximum number of disks for RAID groups.

For Flash Pools, this option controls the maximum size of the HDD RAID groups.

**[-cache-raid-group-size <integer>] - Flash Pool SSD Tier Maximum RAID Group Size**

If this parameter is specified, the command displays information about the maximum RAID group size for the SSD tier for Flash Pools.

This parameter is applicable only for Flash Pools.

**[-owner-id <integer>] - Owner ID**

If this parameter is specified, the command displays information only about the aggregates that are owned by the node with the specified system ID.

**[-owner-name <text>] - Owner Name**

If this parameter is specified, the command displays information only about the aggregates that are owned by the specified node.

**[-percent-used <percent>] - Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size, as a percentage.

### **[-plexes <text>,...] - Plexes**

If this parameter is specified, the command displays information only about the aggregates that have the specified plex or plexes.

### **[-raidgroups <text>,...] - RAID Groups**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID group or groups.

### **[-raidstatus <text>] - RAID Status**

If this parameter is specified, the command displays information only about the aggregates that have the specified RAID status. The possible values for RAID status are normal, copying, ironing, degraded, mirror degraded, growing, initializing, invalid, needs check, partial, reconstruct, raid4, raid0, raid\_dp, raid\_tec, redirect, and wafl inconsistent. You can specify multiple values (for example, reconstruct and growing).

### **[-t, -raidtype {raid\_tec|raid\_dp|raid4}] - RAID Type**

If this parameter is specified, the command displays information only about the aggregates that use the specified RAID type. The possible values are *raid0* for RAID 0, *raid4* for RAID4, *raid\_dp* for RAID-DP, *raid\_tec* for RAID-TEC, and *mixed\_raid\_type* for aggregates that include a mix of RAID types.

### **[-resyncsnaptime <integer>] - SyncMirror Resync Snapshot Frequency in Minutes**

If this parameter is specified, the command displays information only about the aggregates whose SyncMirror Resynchronization Snapshot Frequency is the specified value.

### **[-root {true|false}] - Is Root**

If this parameter is specified, the command displays information about only the root aggregates in the cluster.

### **[-sis-metadata-space-used {<integer>[KB|MB|GB|TB|PB]}] - Space Used by Metadata for Volume Efficiency**

If this parameter is specified, the command displays information about only the aggregates with the specified space used by A-SIS metafiles for volume efficiency. This parameter is deprecated in Data ONTAP 8.2 and later. Use the volume-footprint-list-info API for details related to space usage by deduplication metadata

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified size. The size of the aggregate is reported as the size available for use by WAFL, excluding WAFL reserve and aggregate Snapshot reserve capacity. Use the [storage aggregate show-space](#) command to see the details of space utilization within an aggregate.

### **[-state <aggregate state>] - State**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

### **[-usedsize {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified used size.

### **[-uses-shared-disks {true|false}] - Uses Shared Disks**

Selects the aggregates that match this parameter value. This parameter is used to list all the aggregates that use shared HDDs or shared SSDs.

**[-uuid <text>] - UUID String (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate that has the specified UUID. This parameter is available only at the advanced privilege level and higher.

**[-volcount <integer>] - Number Of Volumes**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of volumes.

**[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that are considered by the Auto Balance Aggregate feature.

**[-autobalance-state <Auto Balance Aggregate state>] - State of the aggregate being balanced (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified state.

**[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used size. This differs from *total-used* space by the space that is guaranteed for future writes. The value includes blocks in use by Snapshot copies.

**[-physical-used-percent <percent\_no\_limit>] - Physical Used Percentage**

If this parameter is specified, the command displays information only about the aggregates that have the specified physical used percent.

**[-autobalance-state-change-counter <integer>] - State Change Counter for Auto Balancer (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified number of state change caused by the Auto Balance Aggregate feature.

**[-is-encrypted {true|false}] - (DEPRECATED)-Is Encrypted**

The value *is-encrypted* is deprecated and may be removed in a future release of Data ONTAP. Selects the aggregates that are encrypted.

**[-L, -snaplock-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays information only about the aggregates that have the specified snaplock-type.

**[-encryption-key-id <text>] - (DEPRECATED)-Encryption Key ID**

The value *encryption-key-id* is deprecated and may be removed in a future release of Data ONTAP. Selects the aggregates that are encrypted with the specified key ID.

**[-is-nve-capable {true|false}] - Is NVE Capable**

This parameter indicates whether or not the aggregate is capable of supporting NVE (NetApp volume encryption).

**[-is-cft-precommit {true|false}] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)**

Selects the aggregates that are set with this parameter value. This parameter lists all the aggregates that

are in the precommit phase of a Copy-Free Transition workflow.

**`[-is-transition-out-of-space {true|false}]` - Is a 7-Mode transitioning aggregate that is not yet committed in clustered Data ONTAP and is currently out of space (privilege: advanced)**

Selects the aggregates that match this parameter value. This parameter is used to list all the 7-mode transitioning aggregates that are not yet committed in clustered Data ONTAP, and are currently out of space.

**`[-autobalance-unbalanced-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Unbalanced (%) (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified unbalanced threshold percentage.

**`[-autobalance-available-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Balanced (%) (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregates that have the specified available threshold percentage.

**`[-resync-priority {high(fixed)|high|medium|low}]` - Resynchronization Priority**

This parameter indicates the relative priority that is used to decide whether a mirrored aggregate can start a resynchronization operation or not. This field is not set for unmirrored aggregates.

Use the [storage aggregate resynchronization modify](#) command to modify this field for mirrored aggregates.

The valid values for this field are:

- `high(fixed)`: This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. It cannot be explicitly set on a data aggregate. These aggregates always start their resynchronization operation at the first available opportunity.
- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- `low`: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

**`[-data-compaction-space-saved {<integer>[KB|MB|GB|TB|PB]}]` - Space Saved by Data Compaction**

This parameter indicates the amount of the space saved by Data Compaction in bytes.

**`[-data-compaction-space-saved-percent <percent>]` - Percentage Saved by Data Compaction**

This parameter indicates the percentage of space saved in the aggregate by Data Compaction.

**`[-data-compacted-count {<integer>[KB|MB|GB|TB|PB]}]` - Amount of compacted data**

This parameter indicates the number of bytes occupied by compacted data inside this aggregate.

**`[-creation-timestamp <MM/DD/YYYY HH:MM:SS>]` - Timestamp of Aggregate Creation**

This parameter indicates the date and time the aggregate was created.

**`[-single-instance-data-logging {off|on}]` - Enable SIDL**

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified aggregate.

**`[-composite {true|false}] - Composite`**

If this parameter is specified, the command displays information only about aggregates whose classification as FabricPool matches the specified value. A FabricPool has an external capacity tier attached to it.

**`[-composite-capacity-tier-used {<integer>[KB|MB|GB|TB|PB]}] - Capacity Tier Used Size`**

If this parameter is specified, the command displays the amount of space in use in the attached external capacity tier.

**`[-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Storage Efficiency`**

This parameter indicates the total amount of space saved by storage efficiency in bytes.

**`[-sis-space-saved-percent <percent>] - Percentage of Space Saved by Storage Efficiency`**

This parameter indicates the percentage of space saved by storage efficiency.

**`[-sis-shared-count {<integer>[KB|MB|GB|TB|PB]}] - Amount of Shared bytes count by Storage Efficiency`**

This parameter indicates the number of bytes shared by storage efficiency.

**`[-is-inactive-data-reporting-enabled {true|false}] - Inactive Data Reporting Enabled`**

If this parameter is specified, the command displays whether reporting of inactive user data is enabled. This parameter is not allowed on FabricPools

**`[-azcs-read-optimization-enabled {true|false}] - azcs-read-optimization Enabled`**

If this parameter is specified, the command displays whether azcs-with-compression feature is enabled.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster1::> storage aggregate show
```

Aggregate Status	Size	Available	Used%	State	#Vols	Nodes	RAID
aggr0 raid_dp,	6.21TB	1.78TB	71%	online	49	cluster1-01	normal
aggr1 raid_dp,  mirrored,	56.04MB	55.89MB	0%	online	0	cluster1-02	normal
aggr2 raid_dp,	1.77TB	1.63TB	8%	online	1	cluster1-01	normal
aggr3 raid_dp,	1.77TB	1.73TB	2%	online	2	cluster1-02	normal

4 entries were displayed.

The following example displays information about an aggregate name aggr1:

```
cluster1::> storage aggregate show -aggregate aggr1
```

```

Aggregate: aggr1
Checksum Style: block
Number Of Disks: 6
Mirror: true
Nodes: cluster1-02

## storage aggregate verify

### Verify an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate verify` command verifies the two plexes of an aggregate. It compares the data in the two plexes to ensure that the plexes are identical. It can be used whenever the administrator needs to ensure that the two plexes are completely synchronized with each other. To view any discrepancies, use the following command:

```
event log show -message-name raid.mirror.verify.mismatch
```

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This parameter specifies the aggregate to be verified. If no aggregate is specified then the action specified by the parameter `-action` will be taken on all the aggregates.

#### **-action {start|stop|resume|suspend|status} - Action**

This parameter specifies the action to be taken. The possible actions are:

- `start` - Starts a verify.
- `stop` - Permanently stops a verify. A stopped verify cannot be resumed.
- `resume` - Resumes a suspended verify.
- `suspend` - Suspends a verify.
- `status` - Displays the current status of a verify.

#### **[-plex-to-fix <text>] - Plex to be Corrected in Case of Mismatches**

This parameter specifies the name of a plex to fix in case the two plexes of the aggregate do not match. The default behavior is to log any discrepancies instead of fixing them.

This parameter is only applicable when the command is used to start a verify.

### Examples

The following example starts a verify on an aggregate named `aggr1`.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action start
```

The following example queries the status of a verify on an aggregate named aggr1.

```
cluster1::> storage aggregate verify -aggregate aggr1 -action status
Aggregate:aggr1, Is Suspended:false, Percentage Completed:19.03%
```

The following example starts a verify on all the aggregates.

```
cluster1::> storage aggregate verify -action start
```

## storage aggregate efficiency show

### Display aggregate storage efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage aggregate efficiency show` command displays information about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

- Aggregate
- Node
- Cross-vol-background-dedupe State (Enabled, Disabled)
- Cross-vol-inline-dedupe State (Enabled, Disabled)

#### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-cross-volume-background-dedupe {true|false}] - Cross Volume Background Deduplication**

Displays whether the cross volume background deduplication is enabled/disabled in the aggregate.

### **`[-cross-volume-inline-dedupe {true|false}]` - Cross Volume Inline Deduplication**

Displays whether the cross volume inline deduplication is enabled/disabled in the aggregate.

### **`[-cross-volume-dedupe-savings {true|false}]` - Has Cross Volume Deduplication Savings**

Displays whether the aggregate has savings from cross volume deduplication.

## **Examples**

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency show

Aggregate: aggr0
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:           false
Cross Volume Background Deduplication:            false
Cross Volume Inline Deduplication:                false

Aggregate: aggr1
  Node: vivek6-vsimg2

Has Cross Volume Deduplication Savings:           true
Cross Volume Background Deduplication:            true
Cross Volume Inline Deduplication:                true
2 entries were displayed.
```

## **storage aggregate efficiency cross-volume-dedupe revert-to**

Reverts the cross volume deduplication savings on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `storage aggregate cross-volume-dedupe revert-to` command is used to revert cross volume deduplication savings on an aggregate.

### **Parameters**

#### **`-aggregate <aggregate name>` - Aggregate (privilege: advanced)**

This specifies the aggregate on which cross volume deduplication savings should be reverted. If no aggregate is specified then it will revert the savings on all aggregates

#### **`[-c, -clean-up {true|false}]` - Delete Previously Downgraded Metafiles (privilege: advanced)**

This specifies whether downgrade metafile needs to be removed so that other efficiency operations can start on that aggregate.

## Examples

The following example displays information for reverting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to
-aggregate aggr1
The revert operation started on aggregate "aggr1" successfully.

cluster:::> storage aggregate efficiency cross-volume-dedupe revert-to
-aggregate aggr1 -clean-up true
The revert operation started on aggregate "aggr1" successfully.
```

## storage aggregate efficiency cross-volume-dedupe show

Display aggregate cross volume deduplication efficiency details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate efficiency cross-volume-dedupe show` command displays information in detail about the different storage efficiency of all the aggregates. If no parameters are specified, the command displays the following information for all aggregates:

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Displays the aggregate name. If this parameter is specified, the command displays detailed information about the storage efficiency of the specified aggregate.

**[-node {<nodename>|local}] - Node**

Displays the node which owns the aggregate. If this parameter is specified, the command displays storage efficiency information only about the aggregates that are located on the specified node.

**[-background-progress <text>] - Progress**

Displays the information for the aggregates that match the specified progress.

**[-background-op-status <text>] - Operation Status**

Displays the information for the aggregates that match the specified operation status.

**[`-background-last-op-state <text>`] - Last Operation State**

Displays the information for the aggregates that match the specified last operation state.

**[`-background-last-success-op-begin <Date>`] - Last Success Operation Begin Time**

Displays the information for the aggregates that match the specified last successful operation begin time.

**[`-background-last-success-op-end <Date>`] - Last Success Operation End Time**

Displays the information for the aggregates that match the specified last successful operation end time.

**[`-background-last-op-begin <Date>`] - Last Operation Begin Time**

Displays the information for the aggregates that match the specified last operation begin time.

**[`-background-last-op-end <Date>`] - Last Operation End Time**

Displays the information for the aggregates that match the specified last operation end time.

**[`-background-last-op-error <text>`] - Last Operation Error**

Displays the information for the aggregates that match the specified last operation error.

**[`-background-stage <text>`] - Stage**

Displays the information for the aggregates that match the specified stage.

**[`-background-checkpoint-time <Date>`] - Checkpoint Time**

Displays the information for the aggregates that match the specified checkpoint time.

**[`-background-checkpoint-op-type <text>`] - Checkpoint Operation Type**

Displays the information for the aggregates that match the specified checkpoint operation type.

**[`-background-checkpoint-stage <text>`] - Checkpoint Stage**

Displays the information for the aggregates that match the specified checkpoint stage.

**[`-background-dedupe {true|false}`] - Background State**

Displays the information for the aggregates that match the specified cross volume background dedupe state.

**[`-inline-dedupe {true|false}`] - Inline State**

Displays the information for the aggregates that match the specified cross volume inline dedupe state.

**[`-dedupe-savings {true|false}`] - Has Cross Volume Deduplication Savings**

Displays the information for the aggregates that has some savings from cross volume deduplication.

## Examples

The following example displays information about all aggregates that are owned by nodes in the local cluster:

```
cluster:::> storage aggregate efficiency cross-volume-dedupe show
```

```
Aggregate: aggr0
```

```
Node: vivek6-vsimg2
```

## storage aggregate efficiency cross-volume-dedupe start

Starts the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate cross-volume-dedupe start` command is used to start cross volume background deduplication on an aggregate.

### Parameters

#### **-aggregate <aggregate name> - Aggregate**

This specifies the aggregate on which cross volume background deduplication should be started. If no aggregate is specified then it will start on all aggregates

#### **[-s, -scan-old-data <true>] - Scan Old Data**

This option processes all the existing data on all volumes on the aggregate. It prompts for user confirmation before proceeding. Default value is `false`.

### Examples

The following example displays information for starting cross volume background deduplication on aggregate "aggr1":

```
cluster:::> storage aggregate efficiency cross-volume-dedupe start  
-aggregate aggr1  
The efficiency operation on aggregate "aggr1" has started.  
  
cluster:::> storage aggregate efficiency cross-volume-dedupe start  
-aggregate aggr1 -scan-old-data true  
The efficiency operation on aggregate "aggr1" has started.
```

## storage aggregate efficiency cross-volume-dedupe stop

Stops the cross volume background deduplication on an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate cross-volume-dedupe stop` command is used to stop cross volume

background deduplication on an aggregate.

## Parameters

### **-aggregate <aggregate name> - Aggregate (privilege: advanced)**

This specifies the aggregate on which cross volume background deduplication should be stopped. If no aggregate is specified then it will stop on all aggregates

## Examples

The following example displays information for stopping cross volume background deduplication on aggregate "aggr1":

```
cluster::> storage aggregate efficiency cross-volume-dedupe stop
-aggregate aggr1
The efficiency operation on aggregate "aggr1" is being stopped.
```

## storage aggregate inode-upgrade resume

Resume suspended inode upgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate inode-upgrade resume` command resumes a suspended inode upgrade process. The inode upgrade process might have been suspended earlier due to performance reasons.

## Parameters

### **-node {<nodename>|local} - Node Name (privilege: advanced)**

If this parameter is specified, the command resumes the upgrade process of an aggregate that is located on the specified node.

### **-aggregate <aggregate name> - Aggregate Name (privilege: advanced)**

This specifies the aggregate for which the inode upgrade process is to be resumed.

## Examples

The following example resumes an aggregate upgrade process:

```
cluster1::> storage aggregate inode-upgrade resume -aggregate aggr1
```

## storage aggregate inode-upgrade show

Display inode upgrade progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate inode-upgrade show` command displays information about aggregates undergoing the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all aggregates undergoing the inode upgrade process. The default fields are:

- aggregate
- status
- scan-percent
- remaining-time
- space-needed
- scanner-progress

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name (privilege: advanced)**

If this parameter is specified with the `-node` parameter, the command displays detailed information about the specified aggregate. If only this parameter is specified, the command displays information about all aggregates that match the specified name.

**[-node <nodename>] - Node Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that are located on the specified node.

**[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade status.

**[-scan-percent <percent>] - Upgrade Scan Percent Complete (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates that match the specified inode upgrade progress percentage.

**[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the space needed to complete the upgrade process matches the specified size.

**[-remaining-time [<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the remaining time to complete the inode upgrade process matches the specified time.

**[-scanner-progress <text>] - Scanner Progress (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate or aggregates where the progress of the inode upgrade process matches the input.

**Examples**

The following example displays information about all aggregates undergoing the inode upgrade process:

```
cluster1::> storage aggregate inode-upgrade show
Aggregate Status      %Complete Time Remaining Space Needed Inode Progress
-----
aggr0      pending      0%          -          20.36MB      Public : Inode 0
out of 65562
aggr1      pending      0%          -          19.84MB      Public : Inode 0
out of 63714
```

**storage aggregate object-store attach**

**Attach an object store to an aggregate**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `storage aggregate object-store attach` command attaches an object store to an aggregate to create a FabricPool. This command requires two parameters to create a FabricPool - an aggregate and a configuration to attach an object-store to the aggregate. This command verifies whether the object store is accessible through the intercluster LIF both from the node on which the aggregate is present as well as its High Availability (HA) partner node. The command fails if the object store is not accessible. Once an object store is attached to an aggregate, it cannot be detached.

**Parameters**

**-aggregate <text> - Name of the Aggregate**

This parameter specifies the aggregate to which the object store must be attached to create a FabricPool.

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration that describes the object store to be attached. The object store configuration has information about object store server name, port, access credentials, and provider type.

**[-allow-flexgroup {true|false}] - Allow FlexGroup Constituents in the Aggregate**

This optional parameter allows attaching object store to an aggregate containing FlexGroup constituents. The default value is false. Mixing FabricPools and non-FabricPools within a FlexGroup is not recommended. All aggregates hosting constituents of a FlexGroup should be attached to the object store.

## Examples

The following example attaches an object store to aggregate aggr1:

```
cluster1::>storage aggregate object-store attach -aggregate aggr1 -object
-store-name my-store
```

## storage aggregate object-store modify

Modify attributes of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate object-store modify` command is used to update one or more object store parameters.

### Parameters

**-aggregate <text> - Aggregate Name**

This parameter identifies the aggregate to which the object store to be modified is attached.

**-object-store-name <text> - ONTAP Name for this Object Store Config**

This parameter identifies the configuration name of the object store to be modified.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space (privilege: advanced)**

This optional parameter specifies the usage threshold below which Data ONTAP reclaims unused space from objects in the object store. When Data ONTAP writes data to the object store, it packages multiple file system blocks into one object. Over time, blocks stored in an object can be freed, leaving part of the object unused. When the percentage of used blocks in an object falls below this threshold, a background task moves the blocks which are still used to a new object. Afterwards, Data ONTAP frees the original object to reclaim the unused space. Valid values are between 0% and 99%. The default value depends on the object store's provider type. It is 20% for *AWS\_S3*, 14% for *IBM\_COS*, 15% for *Azure\_Cloud*, and 40% for *SGWS*. Consult the FabricPool best practices guidelines for more information.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering (privilege: advanced)**

This optional parameter specifies the percentage of space in the performance tier which must be used before data is tiered out to the capacity tier.

## Examples

The following example modifies the unreclaimed space threshold of an object store attached to an aggregate named aggr1:

```
cluster1::> storage aggregate object-store modify -aggregate aggr1 -object
-store-name my-store -unreclaimed-space-threshold 20%
```

## storage aggregate object-store show-freeing-status

Show status of background object freeing work after aggregate delete

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage aggregate object-store show-freeing-status` command displays status information about the background work that frees an aggregate's objects from an object store after a [storage aggregate delete](#).

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-bin-uuid <UUID>] - UUID of the Bin (privilege: advanced)**

If this parameter is specified, the command displays information only about the aggregate attached to the specified bin UUID.

**[-object-store-name <text>] - Object Store Configuration Name (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[-aggregate-name <aggregate name>] - Aggregate (privilege: advanced)**

If this parameter is specified, the command displays information only about the specified aggregates that were deleted.

**[-request-state {queued|running|cleaning-up}] - Request State (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified object freeing request state.

**[-num-objects-freed <integer>] - Num Objects Freed (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified number of objects that have been freed.

**[-last-error <text>] - The Last Error Encountered (privilege: advanced)**

If this parameter is specified, the command displays information only about the object stores that have the specified last error encountered.

### Related Links

- [storage aggregate delete](#)

## storage aggregate object-store show-space

Display space utilization of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store show-space` command displays information about the amount of space used in the object store for each of the aggregates in FabricPool. The used space is displayed in both absolute size as well as a percentage of the FabricPool license limit.

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified, the command displays space information only about object stores that are attached to the specified aggregates.

**[-object-store-name <text>] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays space information only about object stores whose configuration name matches the specified names.

**[-object-store-availability <Object Store Availability>] - Availability of the Object Store**

If this parameter is specified, the command displays space information about the object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays space information only about object stores whose space used by the associated aggregate as a percentage of the license limit matches the specified value. If the object store does not require a license, then this field is not set.

**[-unreclaimed-space-threshold <percent>] - Threshold for Reclaiming Unreferenced Space  
(privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**[-tiering-fullness-threshold <percent>] - Aggregate Fullness Threshold Required for Tiering  
(privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose

performance tier fullness threshold for tiering matches the specified value.

## Examples

The following example displays space information about all object stores:

```
cluster1::>storage aggregate object-store show-space
```

## storage aggregate object-store show

Display the details of object stores attached to an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store show` command displays information about all the object stores in the system.

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <text>] - Aggregate Name**

If this parameter is specified, the command displays information only about the object stores that are attached to the specified aggregates.

**[-object-store-name <text>] - ONTAP Name for this Object Store Config**

If this parameter is specified, the command displays information only about object stores whose configuration name matches the specified names.

**[-object-store-availability <object Store Availability>] - Availability of the Object Store**

If this parameter is specified, the command displays information only about object stores whose availability status matches the specified value. Supported values with this parameter are - available and unavailable.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-license-used-percent <percent\_no\_limit>] - License Space Used Percent**

If this parameter is specified, the command displays information only about object stores whose space used by the aggregate as a percentage of the license limit matches the specified value.

**`[-unreclaimed-space-threshold <percent>]` - Threshold for Reclaiming Unreferenced Space (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose threshold for reclaiming unused space from objects in the object store matches the specified value.

**`[-tiering-fullness-threshold <percent>]` - Aggregate Fullness Threshold Required for Tiering (privilege: advanced)**

If this parameter is specified, the command displays information only about object stores whose performance tier fullness threshold for tiering matches the specified value.

## Examples

The following example displays all information about all object stores:

```
cluster1::>storage aggregate object-store show
```

## storage aggregate object-store config create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store config create` command is used by a cluster administrator to tell Data ONTAP how to connect to an object store. Following pre-requisites must be met before creating an object store configuration in Data ONTAP.

- A valid data bucket or container must be created with the object store provider. This assumes that the user has valid account credentials with the object store provider to access the data bucket.
- The Data ONTAP node must be able to connect to the object store. This includes
- Fast, reliable connectivity to the object store.
- An inter-cluster LIF (Logical Interface) must be configured on the cluster. Data ONTAP will verify connectivity prior to saving this configuration information.
- If SSL/TLS authentication is required, then valid certificates must be installed.
- FabricPool license (required for Amazon S3 and Azure object stores).

An object-store configuration once created must not be reassocated with a different object-store or container. See [storage aggregate object-store config modify](#) command for more information. If neither the `access-key` nor the `secret-password` are provided while setting up a configuration for `AWS_S3` object store in Cloud Volumes ONTAP, then the access key (access key ID), the secret password (secret access key), and the session token will be retrieved from EC2 instance metadata for the AWS Identity and Access Management (IAM) role associated with the EC2 instance. If Data ONTAP is unable to create a object store configuration, then the command will fail explaining the reason for failure.

### Parameters

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the name that will be used to identify the object store configuration. The name can contain the following characters: `"`, `-`, `A-Z`, `a-z`, and `0-9`. *The first character must be one of the following: `"`, `A-Z`, or `a-z`.*

**-provider-type <providerType> - Type of the Object Store Provider**

This parameter specifies the type of object store provider that will be attached to the aggregate. Valid options are: `AWS_S3` (Amazon S3 storage), `SGWS` (StorageGrid WebScale), `IBM_COS` (IBM Cloud Object Storage) and `Azure_Cloud` (Microsoft Azure Cloud).

**[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (`AWS_S3` or not). The `keys` value is always applicable, and if selected means that the `access-key` and `secret-password` are provided by the system administrator. In Cloud Volumes ONTAP, the `EC2-IAM` value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the `access-key`, `secret-password` and session token are retrieved from EC2 instance metadata for this IAM role. Note that `-use-iam-role` and `-auth-type` are mutually exclusive, `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`. For the `AWS_S3` provider, the `CAP` (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the `CAP` value is specified, then the `-cap-url` must be specified. See `cap-url`.

**[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when `-auth-type` is `CAP`. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (`access-key`, `secret-pasword` and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mymission=myrole>

**-server <Remote InetAddress> - Fully Qualified Domain Name of the Object Store Server**

This parameter specifies the Fully Qualified Domain Name (FQDN) of the remote object store server. For Amazon S3, server name must be an AWS regional endpoint in the format `s3.amazonaws.com` or `s3-<region>.amazonaws.com`, for example, `s3-us-west-2.amazonaws.com`. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the `-server` is a `"blob.core.windows.net"` or a `"blob.core.usgovcloudapi.net"`, then a value of `-azure-account` followed by a period will be added in front of the server.

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store. The default value is `true`.

**[-port <integer>] - Port Number of the Object Store**

This parameter specifies the port number on the remote server that Data ONTAP will use while establishing connection to the object store.

**-container-name <text> - Data Bucket/Container Name Used in S3 Requests**

This parameter specifies the data bucket or container that Data ONTAP should read and write to.

**{ [-access-key <text>] - Access Key ID for AWS\_S3 and SGWS Provider Types**

This parameter specifies the access key (access key ID) required to authorize requests to the AWS S3, SGWS and IBM COS object stores. For an Azure object store see `-azure-account`.

**[-secret-password <text>] - Secret Access Key for AWS\_S3 and SGWS Provider Types**

This parameter specifies the password (secret access key) to authenticate requests to the AWS S3, SGWS and IBM COS object stores. If the `-access-key` is specified but the `-secret-password` is not, then one will be asked to enter the `-secret-password` without echoing the input. For an Azure object store see `-azure-private-key`.

**| [-azure-account <text>] - Azure Account**

This parameter specifies the account required to authorize requests to the Azure object store. For other object store providers see `access-key`.

**[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing**

If this parameter is true then one will be asked to enter `-azure-private-key` without echoing the input. Default value: `true`.

**[-azure-private-key <text>] - Azure Access Key }**

This parameter specifies the access key required to authenticate requests to the Azure object store. See also `ask-azure-private-key`. For other object store providers see `-secret-password`.

**[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

This optional parameter specifies the ipspace to use to connect to the object store. Default value: `Default`

**[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

This optional parameter is deprecated. Please use `-auth-type` instead. Note, that `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`.

**[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled**

This parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. The default value is `true`. It is recommended to use the default value to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

## Examples

The following example creates an object store configuration in Data ONTAP:

```
cluster1::>storage aggregate object-store config create -object-store-name
my_aws_store -provider-type AWS_S3 -server s3.amazonaws.com
-container-name my-aws-bucket -access-key DXJRXHPXHYXA9X31X3JX
```

## Related Links

- [storage aggregate object-store config modify](#)

## storage aggregate object-store config delete

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store config delete` command removes an existing object store configuration in Data ONTAP. The configuration cannot be deleted if it is used by any aggregates or if the system is still freeing objects from the object store from a previously executed [storage aggregate delete](#) command. The command [storage aggregate object-store show](#) can be used to view the aggregates attached to the object store before issuing the delete command.

The [storage aggregate object-store show](#) command will not display aggregates that have been previously deleted but still has objects in the object store.

### Parameters

**-object-store-name <text> - Object Store Configuration Name**

This parameter specifies the object store configuration to be deleted.

### Examples

The following example deletes an object store configuration named my-store:

```
cluster1::>storage aggregate object-store config delete -object-store-name  
my-store
```

## Related Links

- [storage aggregate delete](#)
- [storage aggregate object-store show](#)

## storage aggregate object-store config modify

Modify object store configuration attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate object-store config modify` command is used to update one or more of object store configuration parameters. This command must not be used to reassociate an existing valid object-store configuration to a new object-store or container. The modifiable parameters include object store name, server name, port, access\_key, secret-password, ipspace and is-ssl-enabled.

## Parameters

### **-object-store-name <text> - Object Store Configuration Name**

This parameter identifies the configuration to be modified.

### **[-new-object-store-name <text>] - Object Store Configuration New Name**

This optional parameter specifies the new name for the object store configuration.

### **[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

This optional parameter specifies where the system obtains credentials for authentication to an object store. The available choices depend on the platform (Cloud Volumes ONTAP or not) and provider-type (AWS\_S3 or not). The *keys* value is always applicable, and if selected means that the *access-key* and *secret-password* are provided by the system administrator. In Cloud Volumes ONTAP, the *EC2-IAM* value is also applicable. It means that the IAM role is associated with the EC2 instance, and that the *access-key*, *secret-password* and session token are retrieved from EC2 instance metadata for this IAM role.

Note that *-use-iam-role* and *-auth-type* are mutually exclusive, *-auth-type EC2-IAM* is an equivalent of *-use-iam-role true*, and *-auth-type key* is an equivalent of *-use-iam-role false*. For the *AWS\_S3* provider, the *CAP* (C2S Authentication Portal) value is also applicable. This should only be used when accessing C2S (Commercial Cloud Services). If the *CAP* value is specified, then the *-cap-url* must be specified. See *cap-url*.

### **[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

This parameter is available only when *-auth-type* is *CAP*. It specifies a full URL of the request to a CAP server for retrieving temporary credentials (*access-key*, *secret-password* and session token) for accessing the object store server. The CAP URL may look like: <https://123.45.67.89:1234/CAP/api/v1/credentials?agency=myagency=mymission=myrole>

### **[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server. For Amazon S3, server name must be an AWS regional endpoint in the format *s3.amazonaws.com* or *s3-<region>.amazonaws.com*, for example, *s3-us-west-2.amazonaws.com*. The region of the server and the bucket must match. For more information on AWS regions, refer to 'Amazon documentation on AWS regions and endpoints'. For Azure, if the *-server* is a "blob.core.windows.net" or a "blob.core.usgovcloudapi.net", then a value of *-azure-account* followed by a period will be added in front of the server.

### **[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

This optional parameter indicates whether a secured SSL/TLS connection will be used during data access to the object store.

### **[-port <integer>] - Port Number of the Object Store**

This optional parameter specifies a new port number to connect to the object store server indicated in the *-server* parameter.

### **[-access-key <text>] - Access Key ID for AWS\_S3 and SGWS Provider Types**

This optional parameter specifies a new access key (access key ID) for the AWS S3, SGWS and IBM COS object stores.

### **[-secret-password <text>] - Secret Access Key for AWS\_S3 and SGWS Provider Types**

This optional parameter specifies a new password (secret access key) for the AWS S3, SGWS and IBM COS object stores. For an Azure object store see *-azure-private-key*. If the *-access-key* is

specified but the `-secret-password` is not then one will be asked to enter the `-secret-password` without echoing the input.

**`[-ask-azure-private-key {true|false}] - Ask to Enter the Azure Access Key without Echoing`**

If this optional parameter is true then one will be asked to enter the `-azure-private-key` without echoing the input.

**`[-azure-private-key <text>] - Azure Access Key`**

This optional parameter specifies a new access key for Azure object store. For other object store providers see `secret-password`. See also `ask-azure-private-key`.

**`[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store`**

This optional parameter specifies new ipspace values for the configuration.

**`[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP`**

This optional parameter is deprecated. Please use `-auth-type` instead. Note, that `-auth-type EC2-IAM` is an equivalent of `-use-iam-role true`, and `-auth-type key` is an equivalent of `-use-iam-role false`.

**`[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled`**

This optional parameter indicates whether an SSL/TLS certificate of an object store server is validated whenever an SSL/TLS connection to an object store server is established. This parameter is only applicable when `is-ssl-enabled` is `true`. It is recommended to keep the default value which is `true` to make sure that Data ONTAP connects to a trusted object store server, otherwise identities of an object store server are not verified.

## Examples

The following example modifies two parameters (port number and `is-ssl-enabled`) of an object store configuration named `my-store`:

```
cluster1::>storage aggregate object-store config modify -object-store-name
my-store -port 1235 -is-ssl-enabled true
```

## storage aggregate object-store config rename

Rename an existing object store configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The ``storage aggregate object-store config rename`` command is used to rename an exiting object store configuration.

## Parameters

### **-object-store-name <text> - Object Store Configuration Name**

This parameter identifies an existing object store configuration.

### **-new-object-store-name <text> - Object Store Configuration New Name**

This parameter specifies the new object store configuration name.

## Examples

The following example renames an object store configuration from my-store to ms1:

```
cluster1:>storage aggregate object-store config rename -object-store-name  
my-store -new-object-store-name ms1
```

## storage aggregate object-store config show

Display a list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate object-store config show` command displays information about all existing object store configurations in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-object-store-name <text>] - Object Store Configuration Name**

If this parameter is specified, the command displays information only about object store configurations whose name matches the specified names.

**[-object-store-uuid <UUID>] - UUID of the Object Store Configuration**

If this parameter is specified, the command displays information only about object store configurations whose UUID matches the specified UUID values.

**[-provider-type <providerType>] - Type of the Object Store Provider**

If this parameter is specified, the command displays information only about object store configurations whose provider type matches the specified value.

**[-auth-type <object\_store\_auth\_type>] - Authentication Used to Access the Object Store**

If this parameter is specified, the command displays information only about object store configurations

whose authentication type matches the specified value.

**[-cap-url <text>] - URL to Request Temporary Credentials for C2S Account**

If this parameter is specified, the command displays information only about object store configurations whose CAP URL matches the specified value.

**[-server <Remote InetAddress>] - Fully Qualified Domain Name of the Object Store Server**

If this parameter is specified, the command displays information only about object store configurations whose server name matches the specified value. The server name is specified as a Fully Qualified Domain Name (FQDN).

**[-is-ssl-enabled {true|false}] - Is SSL/TLS Enabled**

If this parameter is specified, the command displays information only about object store configurations whose status about the use of secured communication over the network matches the specified value.

**[-port <integer>] - Port Number of the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose port numbers matches the specified value.

**[-container-name <text>] - Data Bucket/Container Name Used in S3 Requests**

If this parameter is specified, the command displays information only about object store configurations whose container name matches the specified value. Data ONTAP uses this container name or object store data bucket while accessing data from the object store.

**[-access-key <text>] - Access Key ID for AWS\_S3 and SGWS Provider Types**

If this parameter is specified, the command displays information only about AWS S3, SGWS and IBM COS object store configurations whose access key matches the specified value. Data ONTAP requires the access key for authorized access to the object store.

**[-azure-account <text>] - Azure Account**

If this parameter is specified, the command displays information only about Azure object store configurations whose account matches the specified value. Data ONTAP requires the Azure account for authorized access to the Azure object store.

**[-ipspace <IPspace>] - IPspace to Use in Order to Reach the Object Store**

If this parameter is specified, the command displays information only about object store configurations whose IPspace matches the specified value. Data ONTAP uses the IPspace value to connect to the object store.

**[-use-iam-role {true|false}] - (DEPRECATED)-Use IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM role status flag matches the specified value. The `-iam-role` and ``-use-iam-role`` parameters are relevant only in the context of AWS object store and indicates whether IAM role must be used for accessing it. The IAM credentials can be obtained only through AWS Cloud Volumes ONTAP.

**[-iam-role <text>] - IAM Role for AWS Cloud Volumes ONTAP**

If this parameter is specified, the command displays information only about object store configurations whose IAM (Identity and Access Management) role matches the specified value.

## **`[-is-certificate-validation-enabled {true|false}] - Is SSL/TLS Certificate Validation Enabled`**

If this parameter is specified, the command displays information only about object store configurations whose status about the validation of SSL/TLS certificate matches the specified value.

### **Examples**

The following example displays all available object store configuration in the cluster:

```
cluster1::>storage aggregate object-store config show
```

## **storage aggregate object-store profiler abort**

### **Abort Object Store Profiler**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `storage aggregate object-store profiler abort` command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

### **Parameters**

**`-node {<nodename>|local}` - Node on Which the Profiler Should Run (privilege: advanced)**

This parameter specifies the node on which the object store profiler is running.

**`-object-store-name <text>` - Object Store Configuration Name (privilege: advanced)**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

### **Examples**

The following example aborts the object store profiler :

```
cluster1::>storage aggregate object-store profiler abort -object-store  
-name my-store -node my-node
```

## **storage aggregate object-store profiler show**

### **Show Object Store Profiler Status**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The storage aggregate object-store profiler show command is used to monitor progress and results of the [storage aggregate object-store profiler start](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name (privilege: advanced)**

This parameter specifies the node on which the profiler was started.

**[-object-store-name <text>] - ONTAP Name for this Object Store Configuration (privilege: advanced)**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

**[-profiler-status <text>] - Profiler Status (privilege: advanced)**

Current status of the profiler.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Profiler Start Time (privilege: advanced)**

Time at which profiler run started.

**[-op-name <text>] - Operation Name - PUT/GET (privilege: advanced)**

Name of the operation. Possible values are PUT or GET.

**[-op-size {<integer>[KB|MB|GB|TB|PB] } ] - Size of Operation (privilege: advanced)**

Size of the PUT or GET operation.

**[-op-count <integer>] - Number of Operations Performed (privilege: advanced)**

Number of operations issued to the object store.

**[-op-failed <integer>] - Number of Operations Failed (privilege: advanced)**

Number of operations that failed.

**[-op-latency-minimum <integer>] - Minimum Latency for Operation in Milliseconds (privilege: advanced)**

Minimum latency of the operation in milliseconds, as measured from the filesystem layer.

**[-op-latency-maximum <integer>] - Maximum Latency for Operation in Milliseconds (privilege: advanced)**

Maximum latency of the operation in milliseconds, as measured from the filesystem layer.

**`[-op-latency-average <integer>]` - Average Latency for Operation in Milliseconds (privilege: advanced)**

Average latency of the operation in milliseconds, as measured from the filesystem layer.

**`[-op-throughput {<integer>[KB|MB|GB|TB|PB]}]` - Throughput per Second for the operation (privilege: advanced)**

Throughput per second for the operation.

**`[-op-errors <text>,...]` - Error Reasons and Count (privilege: advanced)**

Error reasons and count for failed operation.

**`[-op-latency-histogram <text>,...]` - Latency Histogram (privilege: advanced)**

Latency histogram for the operation.

## Examples

The following example displays the results of [storage aggregate object-store profiler start](#) :

```
cluster1::>storage aggregate object-store profiler show
```

## Related Links

- [storage aggregate object-store profiler start](#)

## storage aggregate object-store profiler start

Start the object store profiler to measure latency and throughput

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage aggregate object-store profiler start` command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command when the system is under 50% CPU utilization.

## Parameters

**`-node {<nodename>|local}` - Node on Which the Profiler Should Run (privilege: advanced)**

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

**`-object-store-name <text>` - Object Store Configuration Name (privilege: advanced)**

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider

type.

## Examples

The following example starts the object store profiler :

```
cluster1::>storage aggregate object-store profiler start -object-store  
-name my-store -node my-node
```

## storage aggregate plex delete

Delete a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex delete` command deletes the specified plex. The aggregate specified with then `-aggregate` will be unmirrored and contain the remaining plex. The disks in the deleted plex become spare disks.

### Parameters

**-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

## Examples

The following example deletes plex0 of aggregate aggr1:

```
cluster1::> storage aggregate plex delete -aggregate aggr1 -plex plex0
```

## storage aggregate plex offline

Offline a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex offline` command takes the specified plex offline. The aggregate specified with the `-aggregate` parameter must be a mirrored aggregate and both plexes must be online. Prior to taking a plex offline, the system will flush all internally-buffered data associated with the plex and create a snapshot that is written out to both plexes. The snapshot allows for efficient resynchronization when the plex is subsequently brought back online.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

### **-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

## Examples

The following example takes plex0 of aggregate aggr1 offline:

```
cluster1::> storage aggregate plex offline -aggregate aggr1 -plex plex0
```

## storage aggregate plex online

### Online a plex

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate plex online` command brings the specified plex online. The aggregate specified with the `-aggregate` parameter must be an online mirrored aggregate. The system will initiate resynchronization of the plex as part of online processing.

## Parameters

### **-aggregate <aggregate name> - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

### **-plex <text> - Plex**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

## Examples

The following example brings plex0 of aggregate aggr1 online:

```
cluster1::> storage aggregate plex online -aggregate aggr1 -plex plex0
```

## storage aggregate plex show

### Show plex details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate plex show` command displays information for the specified plex. By default, the command displays the following information about all plexes:

- Aggregate Name
- Plex Name
- Is Online
- Is Resyncing
- Resyncing Percentage
- Plex Status

To display detailed information about a single plex, use the `-aggregate` and `-plex` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

Name of an existing aggregate which contains the plex specified with the `-plex` parameter.

**[-plex <text>] - Plex Name**

Name of a plex which belongs to the aggregate specified with the `-aggregate` parameter.

**[-status <text>] - Status**

Displays plex status. Possible values are:

- *normal*
- *failed*
- *empty*
- *invalid*
- *uninitialized*
- *failed assimilation*
- *limbo*
- *active*
- *inactive*
- *resyncing*

These values may appear by themselves or in combination separated by commas, for example, "*normal*

,active".

**[-is-online {true|false}] - Is Online**

Selects the plexes that match this parameter value.

**[-in-progress {true|false}] - Resync is in Progress**

Selects the plexes that match this parameter value.

**[-resyncing-percent <percent>] - Resyncing Percentage**

Selects the plexes that match this parameter value.

**[-resync-level <integer>] - Resync Level**

Selects the plexes that match this parameter value.

**[-pool <integer>] - Pool**

Selects the plexes that match this parameter value.

## Examples

The following example displays information about all the plexes for all the aggregates:

```
cluster1::> storage aggregate plex show
```

Aggregate	Plex	Is Online	Is Resyncing	Resyncing Percent	Status
aggr0	plex0	true	false	-	normal,active
aggr1	plex0	true	false	-	normal,active
aggr1	plex1	true	false	-	normal,active
aggr2	plex0	true	false	-	normal,active
aggr2	plex2	true	false	-	normal,active

5 entries were displayed.

The following example displays information about plex1 of aggregate aggr1:

```
cluster1::> storage aggregate plex show -aggregate aggr1 -plex plex1
```

Aggregate: aggr1

    Plex Name: plex1

        Status: normal,active

    Is Online: true

Resync is in Progress: false

    Resyncing Percentage: -

        Resync Level: -

        Pool: 1

## storage aggregate reallocation quiesce

Quiesce reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [storage aggregate reallocation restart](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced (paused) state.

### Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to temporarily pause the job.

### Examples

```
cluster1::> storage aggregate reallocation quiesce
             -aggregate aggr0
```

Temporarily stops (pauses) any reallocation job running on aggregate aggr0.

### Related Links

- [storage aggregate reallocation restart](#)

## storage aggregate reallocation restart

Restart reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Starts a reallocation job. Use this command to restart a quiesced (temporarily stopped) job or a scheduled scan that is idle for the aggregate.

### Parameters

**-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to restart reallocation scans.

**[-i, -ignore-checkpoint <true>] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it was stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

## Examples

```
cluster1::> storage aggregate reallocation restart
            -aggregate aggr0 -ignore-checkpoint true
```

Restarts reallocation job on aggregate aggr0 from the beginning.

## storage aggregate reallocation schedule

### Modify schedule of reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [storage aggregate reallocation start](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [storage aggregate reallocation start](#) command.

### Parameters

#### **-aggregate <aggregate name> - Aggregate Name**

Specifies the aggregate on which you want to schedule reallocation jobs.

#### **[-d, -del <true>] - Delete**

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

#### **[-s, -cron <text>] - Cron Schedule**

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of week is a value from 0 (Sunday) to 6 (Saturday).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

## Examples

```
cluster1::> storage aggregate reallocation schedule -aggregate aggr0 -cron
"0 23 6 *"
```

Schedules a reallocation job to run at 11:00 p.m. every Saturday on aggr0.

## Related Links

- [storage aggregate reallocation start](#)

## storage aggregate reallocation show

Show reallocate job status for improving free space layout

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Displays the status of a reallocation scan, including the state, schedule, aggregate and scan id. If you do not specify the *id* for a particular reallocation scan, the command displays information about all the existing reallocation scans.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the value of relevant field that you specify for the reallocation scans that are present.

**| [-v ]**

Specify this parameter to display the output in a verbose format.

**| [-instance ] }**

Displays information about reallocation scans on aggregates in a list format.

**[-id <integer>] - Job ID**

Specify this parameter to display the reallocation scan that matches the reallocation job ID that you specify.

**[-aggregate <aggregate name>] - Aggregate Name**

Specify this parameter to display the reallocation scan that matches the aggregate that you specify.

**[-description <text>] - Job Description**

Specify this parameter to display reallocation scans that match the text description that you specify.

**[-state**

**{ Initial | Queued | Running | Waiting | Pausing | Paused | Quitting | Success | Failure | Reschedule | Error | Quit | Dead | Unknown | Restart | Dormant } ] - Job State**

Specify this parameter to display reallocation jobs that match the state that you specify.

### **[-progress <text>] - Execution Progress**

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify "Starting ..." as the text string for the progress option, then the system lists all the jobs that are starting.

### **[-schedule <job\_schedule>] - Schedule Name**

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the [job schedule show](#) command.

### **[-global-status <text>] - Global State of Scans**

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

## **Examples**

```
cluster1::> storage aggregate reallocation show
```

Job ID	Aggregate	Schedule	State
-----	-----	-----	-----
23	aggr0	reallocate_0 23 * 6	Queued

Displays the job ID, aggregate, schedule, and state for the reallocation scans.

## **Related Links**

- [job schedule show](#)

## **storage aggregate reallocation start**

Start reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

Begins a reallocation scan on a specified aggregate.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the aggregate.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [storage aggregate reallocation schedule](#) command to schedule reallocation jobs.

## **Parameters**

### **-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to start a reallocation scan.

### **{ [-i, -interval <text>] - Interval Schedule**

Specified the schedule in a single string with four fields:

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of the month, reallocation scans will not run in any of the months with fewer than 31 days.

- day of the week is a value from 0 (Sunday) to 6 (Saturday).

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

### **| [-o, -once <true>] - Once }**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

## **Examples**

```
cluster1::> storage aggregate reallocation start -aggregate aggr0
-interval "0 23 * 6"
```

Starts a reallocation job on aggregate aggr0 at 11:00 p.m. every Saturday.

## **Related Links**

- [storage aggregate reallocation schedule](#)

## **storage aggregate reallocation stop**

Stop reallocate job on aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

Stops and deletes any reallocation scan running on the specified aggregate. This command stops and deletes in-progress, scheduled, and quiesced scans.

## Parameters

### **-aggregate <aggregate name> - Aggregate Name**

Specify this parameter to specify the target aggregate on which to stop and delete a reallocation scan.

## Examples

```
cluster1::> storage aggregate reallocation stop -aggregate aggr0
```

Stops and deletes the reallocation scan on aggregate aggr0.

## storage aggregate relocation show

Display relocation status of an aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate relocation show` command displays status of aggregates which were relocated in the last instance of relocation operation.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

Selects aggregates from the specified source node.

**[-aggregate <text>] - Aggregate Name**

Selects the aggregates that match this parameter value.

**[-relocation-status <text>] - Aggregates Relocation Status**

Selects the aggregates whose relocation status matches this parameter value.

**[-destination <text>] - Destination for Relocation**

Selects the aggregates that are designated for relocation on the specified destination node.

## Examples

The following example displays the relocation status of aggregates on all nodes in the cluster:

```
cluster1::> storage aggregate relocation show
Source          Aggregate  Destination  Relocation Status
-----
node0
-              -              Not attempted yet
node1
aggr1          node0      Done
aggr2          node0      In progress
aggr3          node0      Not attempted yet
4 entries were displayed.
```

## storage aggregate relocation start

Relocate aggregates to the specified destination

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate relocation start` command initiates the relocation of the aggregates from one node to the partner node in a high-availability (HA) pair.

### Parameters

**-node {<nodename>|local} - Name of the Node that currently owns the aggregate**

This specifies the source node where the aggregates to be relocated reside.

**-destination {<nodename>|local} - Destination node**

This specifies the destination node where aggregates are to be relocated.

**-aggregate-list <aggregate name>,... - List of Aggregates to be relocated**

This specifies the list of aggregate names to be relocated from source node to destination node.

**[-override-vetoes {true|false}] - Override Vetoes**

This specifies whether to override the veto checks for relocation operation. Initiating aggregate relocation with vetoes overridden will result in relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive. The default value is false.

**[-relocate-to-higher-version {true|false}] - Relocate To Higher Version**

This specifies if the aggregates are to be relocated to a node which is running on a higher version of Data ONTAP than the source node. If an aggregate is relocated to this destination then that aggregate cannot be relocated back to the source node till the source is also upgraded to the same or higher Data ONTAP version. This option is not required if the destination node is running on higher minor version, but the same major version. The default value is false.

**[-override-destination-checks {true|false}] - Override Destination Checks**

This specifies if the relocation operation should override the check done on destination node. This option could be used to force a relocation of aggregates even if the destination has outstanding issues. Note that

this could make the relocation dangerous or disruptive. The default value is false.

### **[`-ndo-controller-upgrade {true|false}`] - Relocate Aggregates for NDO Controller Upgrade (privilege: advanced)**

This specifies if the relocation operation is being done as a part of non-disruptive controller upgrade process. Aggregate relocation will not change the home ownerships of the aggregates while relocating as part of controller upgrade. The default value is false.

### **Examples**

The following example relocates aggregates name aggr1 and aggr2 from source node node0 to destination node node1:

```
cluster1::> storage aggregate relocation start -node node0 -destination
node1 -aggregate-list aggr1, aggr2
```

## **storage aggregate resynchronization modify**

### **Modify aggregate resynchronization priorities**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage aggregate resynchronization modify` command can be used to modify the resynchronization priority of an aggregate.

When the number of aggregates pending resynchronization is higher than the maximum number of concurrent resynchronization operations allowed on a node, the aggregates get resynchronized in the order of their "`resync-priority``" values.

For example, let the `max-concurrent-resync` under the `storage aggregate resynchronization options` directory for a node be set to two. If there are three aggregates waiting to be resynchronized, where their respective `resync-priority` values are `high`, `medium`, and `low`, then the third aggregate is not allowed to start resynchronization until one of the first two aggregates has completed resynchronizing.

### **Parameters**

#### **`-aggregate <aggregate name>` - Aggregate**

This parameter specifies the aggregate that is to be modified.

#### **[`-resync-priority {high(fixed)|high|medium|low}`] - Resynchronization Priority**

This parameter specifies the new resynchronization priority value for the specified aggregate. This field cannot be modified for unmirrored or Data ONTAP system aggregates.

Possible values for this parameter are:

- `high`: Mirrored data aggregates with this priority value start resynchronization first.
- `medium`: Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.

- low: Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

## Examples

The following example changes the `resync-priority` of a specified aggregate to `medium`:

```
cluster1::> storage aggregate resynchronization modify -aggregate aggr1
-resync-priority medium
```

## storage aggregate resynchronization show

### Display aggregate resynchronization priorities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage aggregate resynchronization show` command displays the relative resynchronization priority for each aggregate in the cluster. When a particular node restricts how many resync operations can be active concurrently, these priorities are used to prioritize the operations. The maximum concurrent resync operations for a node is displayed in the [storage aggregate resynchronization options show](#) command. If no parameters are specified, the command displays the following information about all the aggregates in the cluster:

- Aggregate name
- Node that owns the aggregate
- Resync priority for the aggregate

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-aggregate <aggregate name>] - Aggregate**

If this parameter is specified, the command displays the resynchronization priority only for the specified aggregate.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays the resynchronization priority only for the aggregates owned by the specified node.

**[-resync-priority {high(fixed)|high|medium|low}] - Resynchronization Priority**

If this parameter is specified, the command displays only the resynchronization priority that matches the specified value. Possible values for this parameter are:

- **high(fixed):** This value is reserved for Data ONTAP system aggregates, which cannot have any other value for this field. These aggregates always start their resynchronization operation at the first available opportunity. This value cannot be assigned to a data aggregate.
- **high:** Mirrored data aggregates with this priority value start resynchronization first.
- **medium:** Mirrored data aggregates with this priority value start resynchronization after all the system aggregates and data aggregates with 'high' priority value have started resynchronization.
- **low:** Mirrored data aggregates with this priority value start resynchronization only after all the other aggregates have started resynchronization.

When the number of aggregates waiting for resynchronization is higher than the maximum number of resynchronization operations allowed on a node, then the `resync-priority` field is used to determine which aggregate starts resynchronization first. This field is not set for unmirrored aggregates.

## Examples

The following command displays the resynchronization priorities for all the aggregates in the cluster:

```
cluster1::> storage aggregate resynchronization show
Aggregate Node           Resync Priority
-----
aggr0_n1 cluster1-01      high(fixed)
aggr0_n2 cluster1-02      high(fixed)
aggr1    cluster1-01      low
aggr2    cluster1-01      high
aggr3    cluster1-01      medium
4 entries were displayed.
```

## Related Links

- [storage aggregate resynchronization options show](#)

## storage aggregate resynchronization options modify

Modify node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate resynchronization options modify` command can be used to modify the options that govern the resynchronization of aggregates on a given cluster node.

Modifying the `max-concurrent-resyncs` option changes the number of aggregates that are allowed to resynchronize concurrently. When the number of aggregates waiting for resynchronization is higher than this value, the aggregates are resynchronized in the order of their `"resync-priority"`. This value can be modified using the [storage aggregate resynchronization modify](#) command while specifying the `-resync-priority` parameter.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node for which the option is to be modified.

### **[-max-concurrent-resync <integer>] - Maximum Concurrent Resynchronizing Aggregates**

This parameter specifies the new value for the maximum number of concurrent resync operations allowed on a node. This option must be specified along with the `-node` parameter. When a node has active resync operations, setting this parameter to a value that is lower than the number of currently resyncing aggregates will trigger a user confirmation.

## Examples

The following example changes the maximum concurrent resync operations for the specified node to `ten` :

```
cluster1::> storage aggregate resynchronization options modify -node node1
-max-concurrent-resyncs 10
```

## Related Links

- [storage aggregate resynchronization modify](#)

## storage aggregate resynchronization options show

Display node specific aggregate resynchronization options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage aggregate resynchronization options show` command displays all the options that govern the resynchronization of aggregates on a given cluster node. If no parameters are specified, the command displays the following information about all nodes:

- Node for which the information is being displayed
- Maximum number of concurrent resynchronizing aggregates allowed

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays resynchronization options only for the specified node.

## **[`-max-concurrent-resync <integer>`] - Maximum Concurrent Resynchronizing Aggregates**

If this parameter is specified, the command displays only the resynchronization option that matches the specified value.

### **Examples**

The following example displays the maximum number of concurrent resyncs allowed for each node in the cluster:

```
cluster1::> storage aggregate resynchronization options show
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
cluster1-02     4
2 entries were displayed.
```

The following example displays the maximum number of concurrent resyncs allowed for a specified node:

```
cluster1::> storage aggregate resynchronization options show -node node1
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

The following example displays all the nodes that allow more than five concurrent resync operations:

```
cluster1::> storage aggregate resynchronization options show -max
-concurrent-resyncs >5
Node           Maximum Concurrent Resynchronizing Aggregates
-----
cluster1-01    15
```

## **storage array commands**

### **storage array modify**

Make changes to an array's profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage array modify` command lets the user change several array parameters.

## Parameters

### **-name <text> - Name**

Storage array name, either generated by Data ONTAP or assigned by the user.

### **[-prefix <text>] - Prefix**

Abbreviation for the named array.

### **[-vendor <text>] - Vendor**

Array manufacturer.

### **[-model <text>] - Model**

Array model number.

### **[-options <text>] - options**

Vendor specific array settings.

### **[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)**

The target port queue depth for all target ports on this array.

### **[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)**

The queue depth assigned to array LUNs from this array.

### **{ [-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)**

Set this parameter to *true* if the array requires additional Data ONTAP resilience for a pending firmware upgrade. Keep this parameter *false* during normal array operation. This value can not be set to *true* if *-path-failover-time* is greater than zero.

### **[-path-failover-time <integer>] - Path Failover Time (sec)**

The time delay (in secs) before switching the I/O path when the path is deleted. The maximum time delay is 30 sec. The default is 0. This value can not be greater than zero if *-is-upgrade-pending* is *true*.

### **[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)**

Use this parameter to increase the delay before Data ONTAP declares an "all path failure" event for an array. Delaying the "all path failure" event allows Data ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes back online within the specified duration. A valid delay is any value between 30 and 90 seconds. A value of 0 will reset the delay, resulting in default actions being taken whenever an "all path failure" event is detected.

## Examples

This command changes the model to FastT.

```
cluster1::> storage array modify -name IBM_1722_1 -model FastT
```

## storage array remove

Remove a storage array record from the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array remove` command discards array profile records for a particular storage array from the cluster database. Upon command completion, if a storage array is still connected to the cluster, the array profile record is re-created with default values.

## Parameters

**-name <text> - Name**

Name of the storage array you want to remove from the database.

## Examples

```
cluster1::> storage array remove IBM_1722_1
```

## storage array rename

Change the name of a storage array in the array profile database.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array rename` command permits substitution of the array profile name which Data ONTAP assigned during device discovery. By default, the name that Data ONTAP assigned to the storage array during discovery is shown in Data ONTAP displays and command output.

## Parameters

**-name <text> - Name**

Storage array name either generated by Data ONTAP or assigned by the user.

**-new-name <text> - The new name to assign to this array profile. (28 chars max)**

New name to assign to the storage array.

## Examples

```
cluster1::> storage array rename -name HITACHI_DF600F_1 -new-name MyArray
```

## storage array show

Display information about SAN-attached storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array show` command displays information about arrays visible to the cluster. If no parameters are specified, the command displays the following information about all storage arrays:

- Prefix
- Name
- Vendor
- Model
- Options

To display detailed information about a single array, use the `-name` parameter. The detailed view adds the following information:

- Serial Number
- Optimization Policy
- Affinity
- Errors
- Path Failover Time
- Extend All Path Failure Event

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

Selects the arrays that match this parameter value.

**[-prefix <text>] - Prefix**

Abbreviation for the named array.

**[-vendor <text>] - Vendor**

Array manufacturer.

**[-model <text>] - Model**

Array model number.

**[-options <text>] - options**

Vendor specific array settings.

**[-serial-number <text>] - Serial Number**

Array product identifier.

**[-max-queue-depth <integer>] - Target Port Queue Depth (privilege: advanced)**

Selects the arrays that match this parameter value.

**[-lun-queue-depth <integer>] - LUN Queue Depth (privilege: advanced)**

Selects the arrays that match this parameter value.

**[-optimization-policy {iALUA|eALUA|symmetric|proprietary|mixed|unknown}] - Optimization Policy**

Selects the arrays that match this parameter value.

**[-affinity {none|aaa|ap|mixed|unknown}] - Affinity**

Selects the arrays that match this parameter value.

**[-error-text <text>,...] - Error Text**

Selects the arrays that match this parameter value.

**[-is-upgrade-pending {true|false}] - Upgrade Pending (privilege: advanced)**

Selects the arrays that match this parameter value.

**[-path-failover-time <integer>] - Path Failover Time (sec)**

Use this parameter to list arrays that have path failover time set to the value you specify.

**[-all-path-fail-delay <integer>] - Extend All Path Failure Event (secs)**

Use this parameter to list arrays that have the all path failure event delay set to the value you specify.

## Examples

The following example displays information about all arrays.

```
cluster1::> storage array show
Prefix                               Name      Vendor      Model Options
-----
                HITACHI_DF600F_1    HITACHI    DF600F
                IBM_1722_1          IBM        1722
2 entries were displayed.
```

The following example displays detailed information about a specific array:

```

cluster1::> storage array show -name HITACHI_DF600F_1
Name: HITACHI_DF600F_1
                                Prefix: abc
                                Vendor: HITACHI
                                Model: DF600F
                                options:
                                Serial Number: 4291000000000000
                                Optimization Policy: iALUA
                                Affinity: aaa
                                Error Text:
                                Path Failover Timeout (sec): 30
                                Extend All Path Failure Event (secs): 50

```

## storage array config show

Display connectivity to back-end storage arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array config show` command displays information about how the storage arrays connect to the cluster, LUN groups, number of LUNS, and more. Use this command to validate the configuration and to assist in troubleshooting.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-switch ]**

If you specify this parameter, switch port information is shown.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller Name**

Selects the arrays that match this parameter value.

**[-group <integer>] - LUN Group**

Selects the arrays that match this parameter value. A LUN group is a set of LUNs that shares the same path set.

**[-target-wwpn <text>] - Array Target Ports**

Selects the arrays that match this parameter value (the World Wide Port Name of a storage array port).

**[-initiator <text>] - Initiator**

Selects the arrays that match this parameter value (the host bus adapter that the clustered node uses to connect to storage arrays).

**[-array-name <array name>] - Array Name**

Selects the arrays that match this parameter value.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Selects the arrays that match this parameter value.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Selects the arrays that match this parameter value.

**[-lun-count <integer>] - Number of array LUNs**

Selects the arrays that match this parameter value.

**[-ownership {all|assigned|unassigned}] - Ownership**

Selects the arrays that match this parameter value.

**Examples**

```
cluster1::> storage array config show
```

## storage array disk paths show

Display a list of LUNs on the given array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array disk paths show` command displays information about disks and array LUNs. Where it appears in the remainder of this document, "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks:

- Disk Unique Identifier
- Controller name
- Initiator Port
- LUN ID
- Failover optimization type
- The Use State of the LUN on this path
- Target Port
- Target IQN
- TPGN
- Port speeds
- Kbytes/sec on Disk (Rolling Average)
- Number IOPS per second on disk (Rolling Average)

To display detailed information about a single disk, use the `-disk` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all disks, in column style output.

**| [-switch ]**

Displays the switch port information for all disks, in column style output.

**| [-instance ] }**

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

**[-uid <text>] - Disk Unique Identifier**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000`

**[-disk <disk path name>] - Disk Name**

Displays detailed information about the specified disks.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-diskpathnames <disk path name>,...] - Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-nodelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks visible to an initiator that is connected to the specified switch port.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-port-speed <text>,...] - Port Speed**

Selects information about disks served by a Host Bus Adapter that is running at the specified port speed.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks visible on target ports that have the specified access state.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks visible on target ports that have reached the specified I/O throughput.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks visible on target ports that have performed the specified number of IOPs.

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link errors.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[`-preferred-target-port {true|false}`] - Whether or not target port group is preferred**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Assymetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[`-vmdisk-device-id <integer>,...`] - Virtual disk device ID**

Selects information about disks that have the specified virtual disk device ID.

**[`-host-adapter <text>`] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[`-primary-port <text>`] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[`-secondary-name <disk path name>`] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[`-secondary-port <text>`] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

## Examples

The following example displays information about all disks:

```
cluster1::> storage array disk paths show

## storage array port modify

Make changes to a target port record.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array port modify` command lets the user change array target port parameters.

### Parameters

**-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

**-wwnn <text> - WWNN**

Selects the array ports that match this parameter value.

**-wwpn <text> - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

The target port queue depth for this target port.

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used in automatically adjusting the queue depth of the target port based on its utilization.

### Examples

This command changes the maximum queue depth for this target port to 32.

```
cluster1::> storage array port modify -name HITACHI_DF600F_1 -wwnn  
50060e80004291c0 -wwpn 50060e80004291c0 -max-queue-depth 32
```

## storage array port remove

Remove a port record from an array profile.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage array port remove` command removes a port from the array database. You might want to remove ports that are no longer connected to the clustered node. Port information can change after hardware replacement, rezoning, or similar configuration activities. The database retains the records about previous ports unless you remove the information.

## Parameters

### **-name <text> - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by Data ONTAP or assigned by the user.

### **{ [-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

### **[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

### **| [-target-qn <text>] - Target IQN**

Selects the array ports that match this parameter value.

### **[-tpgt <integer>] - TPGT }**

Selects the array ports that match this parameter value.

## Examples

This command removes a port record from the array profiles database.

```
cluster1::> storage array port remove -name HITACHI_DF600F_1 -wwnn  
50060e80004291c0 -wwpn 50060e80004291c0
```

## storage array port show

Display information about a storage array's target ports.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage array port show` command displays all the target ports known to the cluster for a given storage array (if an array name is specified) or for all storage arrays if no storage array name is specified. Target ports remain in the database as part of an array profile unless you explicitly remove them from the database.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-name <text>] - Name**

Selects the array ports that match this parameter value. The storage array name is either generated by

Data ONTAP or assigned by the user.

**[-wwnn <text>] - WWNN**

Selects the array ports that match this parameter value.

**[-wwpn <text>] - WWPN**

Selects the array ports that match this parameter value.

**[-max-queue-depth <integer>] - Target Port Queue Depth**

Selects the array ports that match this parameter value.

**[-node {<nodename>|local}] - Controller Name**

Selects the array ports that match this parameter value.

**[-initiator-port <text>,...] - Initiator Port**

Selects the array ports that match this parameter value.

**[-average-dynamic-queue-depth <integer>,...] - Average Dynamic Queue Depth (privilege: advanced)**

The average value of the dynamic target port queue depth.

**[-average-latency-per-iop <integer>,...] - Average Latency Per IOP**

Selects the array ports that match this parameter value (average latency per I/O performed in microseconds).

**[-average-pending <integer>,...] - Average Pending (privilege: advanced)**

Selects the array ports that match this parameter value (average over time of how many commands are on the outstanding queue).

**[-average-waiting <integer>,...] - Average Waiting (privilege: advanced)**

Selects the array ports that match this parameter value (average over time of how many commands are on the waiting queue).

**[-connection-type {direct|fabric|ISCSI}] - Connection Type**

Selects the array ports that match this parameter value (type of connection between the controller and the back end storage).

**[-dynamic-queue-depth <integer>,...] - Dynamic Queue Depth (privilege: advanced)**

Current dynamic target port queue depth, the maximum number of commands allowed outstanding.

**[-max-pending <integer>,...] - Max Pending (privilege: advanced)**

Selects the array ports that match this parameter value (largest number of commands observed on the outstanding queue).

**[-max-waiting <integer>,...] - Max Waiting (privilege: advanced)**

Selects the array ports that match this parameter value (largest number of commands observed on the waiting queue).

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects the array ports that match this parameter value.

**[-percent-busy <integer>,...] - Percent Busy**

Selects the array ports that match this parameter value (percentage of time I/Os are outstanding on the port).

**[-percent-waiting <integer>,...] - Percent Waiting**

Selects the array ports that match this parameter value (percentage of time there are I/Os waiting on the throttle list on the target port).

**[-switch-port <text>] - Switch Port**

Selects the array ports that match this parameter value (for fabric attached connections, the switch port the array target port is connected to; N/A for direct attached).

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects the array ports that match this parameter value.

**[-target-lun-in-use-count <integer>,...] - Target LUN In Use Count**

Selects the array ports that match this parameter value (number of IN-USE disks on this target port).

**[-target-port-speed <text>] - Target Port Speed**

Selects the array ports that match this parameter value (speed that the target port has negotiated with its connected switch port, or initiator port if direct attached).

**[-utilization-policy {normal|defer}] - Utilization Policy**

The policy used when sending I/O to an array target port when it reaches maximum queue depth. Possible values are:

- normal - This policy aggressively competes for target port resources, in effect competing with other hosts. (default)
- defer - This policy does not aggressively compete for target port resources, in effect deferring to other hosts.

## Examples

The example below displays the port information for a single port.

```
cluster1::> storage array port show -wwpn 50060e80004291c0
Array Name: HITACHI_DF600F_1
WWNN: 50060e80004291c0
WWPN: 50060e80004291c0
Connection Type: fabric
Switch Port: vgbr300s89:9
Link Speed: 4 GB/s
Max Queue Depth: 1024
Utilization Policy: normal
```

Link		LUN

## storage automated-working-set-analyzer commands

### storage automated-working-set-analyzer show

Display running instances

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The automated-working-set-analyzer show command displays the Automated Working-set Analyzer running instances.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate-uuid <UUID>] - Uuid of the Aggregate (privilege: advanced)**

This parameter indicates the aggregate uuid that the AWA instance runs on.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[-working-set-size {true|false}] - Working Set Size (privilege: advanced)**

This parameter indicates whether the AWA instance is configured to find the working set size.

**[-start-time <Date>] - Starting Time (privilege: advanced)**

This parameter indicates the time when the AWA instance was started.

**[-total-intervals <integer>] - Total Interval Count (privilege: advanced)**

This parameter indicates the total number of intervals that the AWA instance has covered.

**[-read-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Read Throughput (privilege: advanced)**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks.

**[-write-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Write Throughput (privilege: advanced)**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks

**[-cacheable-read <percent>] - Cacheable Read (privilege: advanced)**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

**[-cacheable-write <percent>] - Cacheable Write (privilege: advanced)**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

**[-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}] - Max Projected Cache Size (privilege: advanced)**

This parameter indicates the projected Flash Pool cache usage.

**[-projected-read-hit <percent>] - Projected Read Hit (privilege: advanced)**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs.

**[-projected-write-hit <percent>] - Projected Write Hit (privilege: advanced)**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs.

**[`-referenced-interval-id <integer>`] - Referenced Interval ID (privilege: advanced)**

This parameter indicates the interval in which the cache size effect information is derived from.

**[`-referenced-interval-time <Date>`] - Referenced Interval Time (privilege: advanced)**

This parameter indicates the time when the referenced interval for the cache size effect information is derived from.

**[`-referenced-interval-cache-size {<integer>[KB|MB|GB|TB|PB]}`] - Referenced Interval Cache Size (privilege: advanced)**

This parameter indicates the cache size at the end of the referenced interval from which the cache size effect information is based on.

**[`-read-hit-20 <percent>`] - 20% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 20% of the referenced cache size.

**[`-read-hit-40 <percent>`] - 40% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 40% of the referenced cache size.

**[`-read-hit-60 <percent>`] - 60% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 60% of the referenced cache size.

**[`-read-hit-80 <percent>`] - 80% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 80% of the referenced cache size.

**[`-read-hit-100 <percent>`] - 100% Cache Read Hit (privilege: advanced)**

This parameter indicates the predicted read hit rate when the cache size is 100% of the referenced cache size.

**[`-write-hit-20 <percent>`] - 20% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 20% of the referenced cache size.

**[`-write-hit-40 <percent>`] - 40% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 40% of the referenced cache size.

**[`-write-hit-60 <percent>`] - 60% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 60% of the referenced cache size.

**[`-write-hit-80 <percent>`] - 80% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 80% of the referenced cache size.

**[`-write-hit-100 <percent>`] - 100% Cache Write Hit (privilege: advanced)**

This parameter indicates the predicted write hit rate when the cache size is 100% of the referenced cache size.

size.

## Examples

The following example shows a running instance of automated-working-set-analyzer on node *node1* for aggregate *aggr0*.

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer show
Node          FC      Aggregate   wss      Intervals Start Time
-----
node1         false aggr0       false      125 Wed Jul 22 13:58:17
2015
```

## storage automated-working-set-analyzer start

Command to start Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The automated-working-set-analyzer start command enables the Automated Workload Analyzer that is capable of doing the following:

- Flash Pool modeling for an aggregate
- Flash Cache modeling for a node - can not specify an aggregate.
- Working set size estimation
- Workload monitoring

### Parameters

**-node <nodename> - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[-working-set-size {true|false}] - Working Set Size (privilege: advanced)**

This parameter indicates whether the AWA instance is configured to find the working set size.

## Examples

```
cluster1::> storage automated-working-set-analyzer start -node vsim1
-aggregate aggr0
```

## storage automated-working-set-analyzer stop

Command to stop Automated Working Set Analyzer on node or aggregate

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The storage automated-working-set-analyzer stop command terminates one or multiple Automated Workload Analyzer running instances.

### Parameters

**-node <nodename> - Node Name (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash cache node-wide modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

### Examples

```
cluster1::> storage automated-working-set-analyzer stop -node vsim1
-aggregate aggr1
```

## storage automated-working-set-analyzer volume show

Displays the Automated Working Set Analyzer volume table

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The automated-working-set-analyzer volume show command displays the volume statistics reported by the corresponding Automated Working-set Analyzer running instances.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node (privilege: advanced)**

This parameter indicates the node name that the AWA instance runs on.

**[-flash-cache {true|false}] - Flash Cache Node-wide Modeling (privilege: advanced)**

This parameter indicates whether the AWA is modeling flash-cache.

**[-vol-uuid <UUID>] - Uuid of the Volume (privilege: advanced)**

This parameter indicates the volume uuid that this command is issued on.

**[-aggregate <aggregate name>] - Aggregate (privilege: advanced)**

This parameter indicates the aggregate name that the AWA instance runs on.

**[-volume <volume name>] - Volume (privilege: advanced)**

This parameter indicates the volume name that this command is issued on.

**[-rank <integer>] - Cache Benefit Rank (privilege: advanced)**

This parameter indicates the rank of this volume among all volumes that would be most benefited by the modeled cache technology based on the AWA prediction.

**[-read-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Read Throughput (privilege: advanced)**

This parameter indicates the maximum read throughput over an interval that AWA has observed from the storage disks for this volume.

**[-write-throughput {<integer>[Bps|KBps|MBps|GBps]}] - Write Throughput (privilege: advanced)**

This parameter indicates the maximum write throughput over an interval that AWA has observed to the storage disks for this volume.

**[-cacheable-read <percent>] - Cacheable Read (privilege: advanced)**

This parameter indicates the maximum percent of cacheable read over an interval that AWA has observed for this volume. Cacheable reads are non-sequential reads, i.e., the percentage of data reads that could have been cached.

**[-cacheable-write <percent>] - Cacheable Write (privilege: advanced)**

This parameter indicates the maximum percent of cacheable write over an interval that AWA has observed. Cacheable writes are random overwrites, percentage of disk writes that could have been cached.

**[-projected-cache-size {<integer>[KB|MB|GB|TB|PB]}] - Max Projected Cache Size (privilege: advanced)**

This parameter indicates the projected Flash Pool cache usage by this volume.

**[-projected-read-hit <percent>] - Projected Read Hit (privilege: advanced)**

This parameter indicates the percentage of blocks that could be read from the Flash Pool cache instead of HDDs for this volume.

### **[`-projected-write-hit <percent>`] - Projected Write Hit (privilege: advanced)**

This parameter indicates the percentage of block overwrites that could go to the Flash Pool cache instead of HDDs for this volume.

### **Examples**

```
cluster1::> cluster-1::*> storage automated-working-set-analyzer volume
show
Node           FC      Aggregate  Volume      Rank  Read Thrupt Write
Thrupt
-----
vsim1          false aggr0       vol0         1    230.47KBps
580.09KBps
```

## **storage bridge commands**

### **storage bridge add**

Add a bridge for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage bridge add` command enables you to add FC-to-SAS bridges for SNMP monitoring in a MetroCluster configuration.

### **Parameters**

#### **`-address <IP Address>` - Bridge Management Port IP Address**

This parameter specifies the IP address of the bridge that is being added for monitoring.

#### **[`-managed-by {SNMP|in-band}`] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge7500 may use either.

#### **[`-name <text>`] - Bridge Name**

This parameter identifies the bridge being added. It is required only when the `managed-by` parameter is set to `in-band`.

#### **[`-snmp-community <text>`] - SNMP Community**

This parameter specifies the SNMP community set on the bridge that is being added for monitoring.

#### **[`-veto-backend-fabric-check {true|false}`] - Veto Backend Fabric Check (privilege: advanced)**

If specified, the `storage bridge add` command will not check if the bridge is present in the MetroCluster's backend fabric. By default, it does not let you add bridges that are not present.

Examples

The following command adds a bridge with IP address '10.226.197.16' for monitoring:

```
cluster1::> storage bridge add -address 10.226.197.16
cluster1::> storage bridge show
```

Managed Monitor	Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored
By	Status					
-----						
-----						
	ATTO_10.226.197.16	Bridge Number 16	Atto	FibreBridge 6500N	2000001086603824	true
SNMP	-					
	ATTO_FibreBridge6500N_2	Not Set	Atto	FibreBridge 6500N	20000010866037e8	false
SNMP	-					
	ATTO_FibreBridge6500N_3	Not Set	Atto	FibreBridge 6500N	2000001086609e0e	false
SNMP	-					
	ATTO_FibreBridge6500N_4	Not Set	Atto	FibreBridge 6500N	2000001086609c06	false
SNMP	-					

4 entries were displayed.

```
cluster1::>
```

storage bridge modify

Modify a bridge's configuration information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage bridge modify` enables you to modify certain parameters for identifying and accessing the FC-to-SAS bridges added for monitoring in a MetroCluster configuration.

Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge.

**[`-address` <IP Address>] - Bridge IP Address**

This parameter specifies the IP address of the bridge.

**[`-snmp-community` <text>] - SNMP Community Set on the Bridge**

This parameter specifies the SNMP community set on the bridge.

**[`-managed-by` {`SNMP`|`in-band`}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge7500 may use either.

**[`-node-visible-list` <text>,...] - Nodes Bridge is Visible To**

List of nodes with FC visibility to the bridge.

**Examples**

The following command modifies 'ATTO\_10.226.197.16' bridge SNMP community to 'public':

```
cluster1::> storage bridge modify -name ATTO_10.226.197.16 -address
10.226.197.16 -snmp-community public
cluster1::>
```

**storage bridge refresh****Refresh storage bridge info**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

The `storage bridge refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [storage switch add](#) and [storage bridge add](#) commands respectively.

**Examples**

The following command triggers a refresh for the SNMP data:

```
cluster1::*> storage bridge refresh
cluster1::*>
```

**Related Links**

- [storage switch add](#)
- [storage bridge add](#)

# storage bridge remove

Remove a bridge from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage bridge remove` enables you to remove FC-to-SAS bridges that were previously added for SNMP monitoring.

## Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge added for monitoring.

## Examples

The following command removes 'ATTO\_10.226.197.16' bridge from monitoring:

```
cluster1::> storage bridge remove -name ATTO_10.226.197.16
cluster1::> storage bridge show
```

Monitor	Bridge	Symbolic Name	Vendor	Model	Bridge WWN	Is Monitored
Status	-----	-----	-----	-----	-----	-----
-----	ATTO_FibreBridge6500N_1	Bridge Number 16	Atto	FibreBridge 6500N	2000001086603824	false
-	ATTO_FibreBridge6500N_2	Not Set	Atto	FibreBridge 6500N	20000010866037e8	false
-	ATTO_FibreBridge6500N_3	Not Set	Atto	FibreBridge 6500N	2000001086609e0e	false
-	ATTO_FibreBridge6500N_4	Not Set	Atto	FibreBridge 6500N	2000001086609c06	false
-	4 entries were displayed.					

## storage bridge run-cli

Execute an ATTO CLI command on a bridge

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage bridge run-cli` command enables you to execute an ATTO bridge command.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the command is to be executed on.

**-command <text> - ATTO CLI command to execute**

This parameter specifies the command to be executed on the named bridge.

### Examples

The following example executes a command on a bridge

```
sti8040mcc-201_siteA::> storage bridge run-cli -name  
ATTO_FibreBridge7500N_1 -command "Help"
```

## storage bridge show

Display bridge information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage bridge show` command displays information about all the storage bridges in the MetroCluster configuration. The bridges must have been previously added for monitoring using the [storage bridge add](#) command. If no parameters are specified, the default command displays the following information about the storage bridges:

- Bridge
- Symbolic Name
- Vendor
- Model
- Bridge WWN
- Is Monitored
- Is Bridge Secure
- Managed By
- Monitor Status

To display detailed profile information about a single storage bridge, use the `-name` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage bridges, in column style output.

**| [-connectivity ]**

Displays the following details about the connectivity from different entities to the storage bridge:

- Node
- Initiator
- Initiator Side Switch Port
- Target Side Switch Port
- Target Port WWN
- Target Port Number

**| [-cooling ]**

Displays the following details about the chassis temperature sensor(s) on the storage bridge:

- Sensor Name
- Reading in degree Celsius °C
- Fan operational status
- Minimum Safe Operating Temperature in degree Celsius °C
- Maximum Safe Operating Temperature in degree Celsius °C
- Sensor Status

**| [-error ]**

Displays the errors related to the storage bridge.

**| [-ports ]**

Displays the following details about the storage bridge FC ports:

- Port number
- Port administrative status
- Port operational status
- Port operating mode
- Port negotiated speed
- Peer world wide name

Displays the following details about the storage bridge SAS ports:

- Port number
- Port negotiated data rate
- Port data rate capability

- Port PHY1 operational status
- Port PHY2 operational status
- Port PHY3 operational status
- Port PHY4 operational status
- Port administrative status
- Port operational status
- Peer world wide name

#### | [**-power** ]

Displays the status of the replaceable power supplies for the FibreBridge 7500 only:

- Power supply name
- Power supply status

#### | [**-sfp** ]

Displays the following details about the storage bridge FC ports Small Form-factor Pluggable (SFP):

- Port number
- SFP vendor
- SFP serial number
- SFP part number
- SFP speed capability

Displays the following details about the storage bridge SAS ports Quad Small Form-factor Pluggable (QSFP):

- Port number
- QSFP vendor
- QSFP serial number
- QSFP type
- QSFP part number

Displays the following details about the storage bridge SAS ports Mini-SAS HD:

- Port number
- Mini-SAS HD vendor
- Mini-SAS HD serial number
- Mini-SAS HD type
- Mini-SAS HD part number

#### | [**-stats** ]

Displays the following details about the storage bridge FC ports:

- Port number

- Port operational status
- Port operational mode
- Port negotiated speed
- Port link failure count
- Port synchronization loss count
- Port CRC error count
- Port operational mode
- Port received word count (Rx)
- Port transmitted word count (Tx)

Displays the following details about the storage bridge SAS ports:

- Port number
- PHY port number
- Port negotiated speed
- Port speed capability
- Port invalid DWORD count
- Port disparity error count
- Port synchronization loss count
- Port PHY reset count
- Port link changed count
- Port CRC error count

**[ `-instance` ] }**

Displays expanded information about all the storage bridges in the system. If a storage bridge is specified, then this parameter displays the same detailed information for the storage bridge you specify as does the `-name` parameter.

**[ `-name <text>` ] - Bridge Name**

Displays information only about the storage bridges that match the name you specify.

**[ `-wwn <text>` ] - Bridge World Wide Name**

Displays information only about the storage bridges that match the bridge wwn you specify.

**[ `-model <text>` ] - Bridge Model**

Displays information only about the storage bridges that match the bridge model you specify.

**[ `-vendor {unknown|Atto}` ] - Bridge Vendor**

Displays information only about the storage bridges that match the bridge vendor you specify.

**[ `-fw-version <text>` ] - Bridge Firmware Version**

Displays information only about the storage bridges that match the bridge firmware version you specify.

**[-serial-number <text>] - Bridge Serial Number**

Displays information only about the storage bridges that match the bridge serial number you specify.

**[-address <IP Address>] - Bridge IP Address**

Displays information only about the storage bridges that match the bridge IP address you specify.

**[-is-monitoring-enabled {true|false}] - Is Monitoring Enabled for Bridge?**

Displays information only about the storage bridges that match the bridge monitoring value you specify.

**[-status {unknown|ok|error}] - Bridge Status**

Displays information only about the storage bridges that match the bridge monitoring status you specify.

**[-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Profile Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the profile data last successful refresh timestamp you specify.

**[-symbolic-name <text>] - Bridge Symbolic Name**

Displays information only about the storage bridges that match the symbolic name you specify.

**[-snmp-community <text>] - SNMP Community Set on the Bridge**

Displays information only about the storage bridges that match the bridge SNMP community you specify.

**[-managed-by {SNMP|in-band}] - Bridge Management Method**

This parameter specifies whether the bridge uses the SNMP or in-band management method. FibreBridge 6500N uses SNMP only; FibreBridge7500 may use either.

**[-is-bridge-secure {true|false}] - Is Security Enabled For Bridge?**

Displays information only about the storage bridges that match the bridge security value you specify.

**[-node-visible-list <text>,...] - Nodes Bridge is Visible To**

This parameter displays the list of nodes which have visibility to the bridge.

**[-error-text-list <text>,...] - Bridge Error Description List**

Displays information only about the storage bridges that have the errors you specify.

**[-temp-sensor-name <text>] - Temperature Sensor Name**

Displays information only about the storage bridges that have the temperature sensor with the name you specify.

**[-min-safe-oper-temp <integer>] - Minimum Safe Operating Temperature in Degree Celsius**

Displays information only about the storage bridges that have the temperature sensor with the minimum safe operating temperature you specify.

**[-max-safe-oper-temp <integer>] - Maximum Safe Operating Temperature in Degree Celsius**

Displays information only about the storage bridges that have the temperature sensor with the maximum safe operating temperature you specify.

**[-temp-reading <integer>] - Chassis Temperature Sensor Reading in Degree Celsius**

Displays information only about the storage bridges that have the temperature sensors with the reading you specify.

**[-temp-sensor-status {normal|warning|critical}] - Chassis Temperature Sensor Status**

Displays information only about the storage bridges that have the temperature sensor with the status you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Chassis Temperature Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the temperature sensor data last successful refresh timestamp you specify.

**[-fc-port-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the storage bridges that have the ports with the indexes you specify.

**[-fc-port-oper-state-list {unknown|online|offline}] - Bridge FC Port Operational State List**

Displays information only about the storage bridges that have the ports with the operational states you specify.

**[-fc-port-admin-state-list {unknown|disabled|enabled}] - Bridge FC Port Admin State List**

Displays information only about the storage bridges that have the ports with the administrative states you specify.

**[-fc-port-negotiated-data-rate-list {unknown|2|4|8|16}] - Bridge FC Port Negotiated Data Rate List**

Displays information only about the storage bridges that have the ports with the negotiated data rates you specify.

**[-fc-port-negotiated-conn-mode-list {unknown|loop|n-port}] - Bridge FC Port Negotiated Connection Mode List**

Displays information only about the storage bridges that have the ports with the negotiated connection modes you specify.

**[-fc-port-wwn-list <text>,...] - Bridge FC Port WWN List**

Displays information only about the storage bridges that have the ports with the world wide names you specify.

**[-fc-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge FC Port Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the FC ports data last successful refresh timestamp you specify.

**[-fc-port-stats-index-list <integer>,...] - Bridge FC Port Index List**

Displays information only about the storage bridges that have the ports with the indexes you specify.

**[-fc-port-tx-words-list <integer>,...] - Bridge FC Port Transmitted Word Count List**

Displays information only about the storage bridges that have the ports with the number of transmitted words you specify.

**`[-fc-port-rx-words-list <integer>,...]` - Bridge FC Port Received Word Count List**

Displays information only about the storage bridges that have the ports with the number of received words you specify.

**`[-fc-port-link-failures-list <integer>,...]` - Bridge FC Port Link Failure Count List**

Displays information only about the storage bridges that have the ports with the number of link failures you specify.

**`[-fc-port-sync-losses-list <integer>,...]` - Bridge FC Port Sync Loss Count List**

Displays information only about the storage bridges that have the ports with the number of synchronization losses you specify.

**`[-fc-port-invalid-crc-list <integer>,...]` - Bridge FC Port Invalid CRC Count List**

Displays information only about the storage bridges that have the ports with the number of invalid CRCs you specify.

**`[-fc-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]` - Bridge FC Port Stats Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the fc port stats data last successful refresh timestamp you specify.

**`[-sas-port-index-list <integer>,...]` - Bridge SAS Port Index List**

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

**`[-sas-port-oper-state-list {unknown|online|offline|degraded}]` - Bridge SAS Port Operational State List**

Displays information only about the storage bridges that have the SAS ports with the operational states you specify.

**`[-sas-port-phy1-oper-state-list {unknown|online|offline}]` - Bridge SAS Port PHY1 Operational State List**

Displays information only about the storage bridges that have the SAS ports with the PHY1 operational states you specify.

**`[-sas-port-phy2-oper-state-list {unknown|online|offline}]` - Bridge SAS Port PHY2 Operational State List**

Displays information only about the storage bridges that have the SAS ports with the PHY2 operational states you specify.

**`[-sas-port-phy3-oper-state-list {unknown|online|offline}]` - Bridge SAS Port PHY3 Operational State List**

Displays information only about the storage bridges that have the SAS ports with the PHY3 operational states you specify.

**`[-sas-port-phy4-oper-state-list {unknown|online|offline}]` - Bridge SAS Port PHY4 Operational State List**

Displays information only about the storage bridges that have the SAS ports with the PHY4 operational states you specify.

**[-sas-port-admin-state-list {unknown|disabled|enabled}] - Bridge SAS Port Administrative State List**

Displays information only about the storage bridges that have the SAS ports with the administrative states you specify.

**[-sas-port-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Data Rate Capability List**

Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

**[-sas-port-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}] - Bridge SAS Port Negotiated Data Rate List**

Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

**[-sas-port-wwn-list <text>,...] - Bridge SAS Port WWN List**

Displays information only about the storage bridges that have the SAS ports with the world wide names you specify.

**[-sas-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port DB Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the SAS ports data last successful refresh timestamp you specify.

**[-sas-port-stats-phy-index-list <integer>,...] - Bridge SAS Port PHY Index List**

Displays information only about the storage bridges that have the SAS ports with the PHY indexes you specify.

**[-sas-port-link-changed-list <integer>,...] - Bridge SAS Port Link Changed Count List**

Displays information only about the storage bridges that have the SAS ports with the link changed count you specify.

**[-sas-port-invalid-crc-list <integer>,...] - Bridge SAS Port Invalid CRC Count List**

Displays information only about the storage bridges that have the SAS ports with the invalid CRCs you specify.

**[-sas-port-phy-reset-list <integer>,...] - Bridge SAS Port PHY Reset Count List**

Displays information only about the storage bridges that have the SAS ports with the PHY reset count you specify.

**[-sas-port-sync-losses-list <integer>,...] - Bridge SAS Port Sync Loss Count List**

Displays information only about the storage bridges that have the SAS ports with the synchronization losses you specify.

**[-sas-port-disparity-count-list <integer>,...] - Bridge SAS Port Disparity Count List**

Displays information only about the storage bridges that have the SAS ports with the disparity count you specify.

**[-sas-port-invalid-dword-list <integer>,...] - Bridge SAS Port Invalid DWORD Count List**

Displays information only about the storage bridges that have the SAS ports with the invalid DWORD count you specify.

**`[-sas-port-stats-index-list <integer>,...]` - Bridge SAS Port Index List**

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

**`[-sas-port-stats-data-rate-capability-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}]` - Bridge SAS Port Data Rate Capability List**

Displays information only about the storage bridges that have the SAS ports with the data rate capabilities you specify.

**`[-sas-port-stats-negotiated-data-rate-list {unknown|1.5Gbps|3Gbps|6Gbps|12Gbps}]` - Bridge SAS Port Negotiated Data Rate List**

Displays information only about the storage bridges that have the SAS ports with the negotiated data rates you specify.

**`[-sas-port-stats-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]` - Bridge SAS Port Statistics Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the SAS port stats data last successful refresh timestamp you specify.

**`[-fc-sfp-port-index-list <integer>,...]` - Bridge FC Port Index List**

Displays information only about the storage bridges that have the FC ports with the indexes you specify.

**`[-fc-port-sfp-vendor-list <text>,...]` - Bridge FC Port SFP Vendor List**

Displays information only about the storage bridges that have the FC ports with the SFP vendors you specify.

**`[-fc-port-sfp-serial-number-list <text>,...]` - Bridge FC Port SFP Serial Number List**

Displays information only about the storage bridges that have the FC ports with the SFP serial numbers you specify.

**`[-fc-port-sfp-part-number-list <text>,...]` - Bridge FC Port SFP Part Number List**

Displays information only about the storage bridges that have the FC ports with the SFP part numbers you specify.

**`[-fc-port-sfp-data-rate-capability-list {2Gb|4Gb|8Gb|16Gb|32Gb}]` - Bridge FC Port SFP Data Rate Capability List**

Displays information only about the storage bridges that have the FC ports with the SFP data rate capabilities you specify.

**`[-fc-port-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]` - Bridge FC Port SFP Data Last Successful Refresh Timestamp**

Displays information only about the storage bridges that match the FC ports SFP data last successful refresh timestamp you specify.

**`[-sas-qsfp-port-index-list <integer>,...]` - Bridge SAS Port Index List**

Displays information only about the storage bridges that have the SAS ports with the indexes you specify.

**`[-sas-port-qsfp-vendor-list <text>,...]` - Bridge SAS Port QSFP Vendor List**

Displays information only about the storage bridges that have the SAS ports with the QSFP vendors you specify.

**`[-sas-port-qsfp-serial-number-list <text>,...] - Bridge SAS Port QSFP Serial Number List`**

Displays information only about the storage bridges that have the SAS ports with the QSFP serial numbers you specify.

**`[-sas-port-qsfp-type-list {unknown|optical|active-copper|passive-copper}] - Bridge SAS Port QSFP Type List`**

Displays information only about the storage bridges that have the SAS ports with the QSFP types you specify.

**`[-sas-port-qsfp-part-number-list <text>,...] - Bridge SAS Port QSFP Part Number List`**

Displays information only about the storage bridges that have the SAS ports with the QSFP part numbers you specify.

**`[-sas-port-qsfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge SAS Port QSFP Data Last Successful Refresh Timestamp`**

Displays information only about the storage bridges that match the SAS ports QSFP data last successful refresh timestamp you specify.

**`[-mini-sas-hd-index-list <integer>,...] - Bridge Mini-SAS HD Index List`**

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD indexes that you specify.

**`[-mini-sas-hd-vendor-list <text>,...] - Bridge Mini-SAS HD Vendor List`**

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD vendors that you specify.

**`[-mini-sas-hd-serial-number-list <text>,...] - Bridge Mini-SAS HD Serial Number List`**

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD serial numbers that you specify.

**`[-mini-sas-hd-type-list <text>,...] - Bridge Mini-SAS HD Type List`**

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD types that you specify.

**`[-mini-sas-hd-part-number-list <text>,...] - Bridge Mini-SAS HD Part Number List`**

Displays information only about the storage bridges that have SAS ports with the Mini-SAS HD part numbers that you specify.

**`[-mini-sas-hd-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Mini-SAS HD Data Last Successful Refresh Timestamp`**

Displays information only about the storage bridges that match the SAS ports Mini-SAS HD data with the last successful refresh timestamp that you specify.

**`[-power-supply-index-list <integer>,...] - Bridge Power Supply Index List`**

Displays information only about the storage bridges that have power supplies with the indexes that you specify.

**`[-power-supply-name-list <text>,...] - Bridge Power Supply Name List`**

Displays information only about the storage bridges that have power supplies with the name that you specify.

**`[-power-supply-status-list {unknown|down|up}] - Bridge Power Supply Status List`**

Displays information only about the storage bridges that have power supplies with the status that you specify.

**`[-power-supply-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Bridge Power Supply Data Last Successful Refresh Timestamp`**

Displays information only about the storage bridges that match the power supply last data with the last successful refresh timestamp that you specify.

**`[-node-list {<nodename>|local}] - Node Name List`**

Displays information only about the storage bridges that are connected to the nodes you specify.

**`[-initiator-list <text>,...] - Initiator List`**

Displays information only about the storage bridges that are connected to the nodes hosting the initiators you specify.

**`[-initiator-side-switch-port-name-list <text>,...] - Initiator Side Switch Port Name List`**

Displays information only about the storage bridges that are connected to the initiator side switch ports you specify.

**`[-target-side-switch-port-name-list <text>,...] - Target Side Switch Port Name List`**

Displays information only about the storage bridges that are connected to the target side switch ports you specify.

**`[-target-port-wwn-list <text>,...] - Target Port WWN List`**

Displays information only about the storage bridges that match the target ports with world wide names you specify.

**`[-target-port-index-list <integer>,...] - Target Port Index List`**

Displays information only about the storage bridges that match the target ports with indexes you specify.

## Examples

The following example displays information about all storage bridges:

```

cluster1::> storage bridge show

## storage bridge config-dump collect

Retrieve and save bridge dumpconfiguration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage bridge config-dump collect` command retrieves a dumpconfiguration file from a storage bridge.

## Parameters

### **-bridge <text> - Bridge Name (privilege: advanced)**

Use this parameter to retrieve a dumpconfiguration file from the specified storage bridge.

## Examples

The following example retrieves a dumpconfiguration file from storage bridge ATTO\_FibreBridge7500N\_1:

```
cluster1::*> storage bridge config-dump collect -bridge
ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the dumpconfiguration file from bridge
"ATTO_FibreBridge7500N_1".

cluster1::*>
```

## storage bridge config-dump delete

Delete a dumpconfiguration file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage bridge config-dump delete` command deletes dumpconfiguration files previously retrieved with the [storage bridge config-dump collect](#) command.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to delete a dumpconfiguration file stored on the specified node.

### **-file <text> - Config File (privilege: advanced)**

Use this parameter to delete the dumpconfiguration file with the specified file name.

## Examples

The following example deletes `dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt` from node1:

```
cluster1::*> storage bridge config-dump delete -node node1 -file
dsbridge_config.FB7500N100001.2017-04-28_14_49_30.txt

cluster1::*>
```

- [storage bridge config-dump collect](#)

## storage bridge config-dump show

Display a list of bridge dumpconfiguration files

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage bridge config-dump show` command displays information about all the dumpconfiguration files previously retrieved with the `storage bridge config-dump collect` command. If no parameters are specified, the default command displays the following information about the dumpconfiguration files:

- Node
- File Name
- Timestamp
- Bridge
- Bridge Serial Number

To display detailed information about a single dumpconfiguration file, use the `-node` and `-file` parameters.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Displays information about the dumpconfiguration files stored on the node that matches the specified node name.

**[-file <text>] - Config File (privilege: advanced)**

Displays information about the dumpconfiguration files that match the specified file name.

**[-bridge <text>] - Bridge Name (privilege: advanced)**

Displays information about the dumpconfiguration files from the storage bridge that matches the specified bridge name.

**[-serial-number <text>] - Serial Number of Bridge (privilege: advanced)**

Displays information about the dumpconfiguration files from the storage bridge that matches the specified serial number.

**[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Collection (privilege: advanced)**

Displays information about the dumpconfiguration files that were collected at the specified time.

## Examples

The following example displays information about all dumpconfiguration files:

```
cluster1::*> storage bridge config-dump show

Bridge: ATTO_FibreBridge7500N_1

Node   File Name                                                    Timestamp

## storage bridge coredump collect

Retrieve and save coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage bridge coredump collect` command retrieves a core file from a storage bridge.

## Parameters

### **-name <text> - Bridge Name**

This parameter specifies the storage bridge name from which the coredump file is to be collected.

## Examples

The following example retrieves a coredump from storage bridge `ATTO_FibreBridge7500N_1`:

```
cluster1::> storage bridge coredump collect -bridge
ATTO_FibreBridge7500N_1
[Job 883] Job is queued: Collect the coredump from bridge
"ATTO_FibreBridge7500N_1".

cluster1::>
```

## storage bridge coredump delete

Delete a saved coredump file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage bridge coredump delete` command deletes a coredump file previously retrieved with the [storage bridge coredump collect](#) command.

### Parameters

**-name <text> - Bridge Name**

This parameter specifies the name of the bridge that the coredump file belongs to.

**-corename <text> - Coredump Filename**

This parameter specifies the name of the coredump file to be deleted.

### Examples

The following example deletes coredump file `core.FB7500N100018.1970-01-05.17_50_30.mem` collected from bridge `ATTO_FibreBridge7500N_1`:

```
cluster1::> storage bridge coredump delete -name ATTO_FibreBridge7500N_1
-corename core.FB7500N100018.1970-01-05.17_50_30.mem

cluster1::>
```

## storage bridge coredump show

Display a list of bridge coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage bridge coredump show` command displays information about all the coredump files previously retrieved with the [storage bridge coredump collect](#) command. If no parameters are specified, the default command displays the following information about the coredump files:

- Bridge Name
- Bridge Serial Number
- Coredump Filename
- Located on Node
- Panic Timestamp
- Panic String

To display detailed information about a single coredump file, use the `-node` and `-corename` parameters.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-serial-number <text>] - Bridge Serial Number**

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge serial number.

**[-corename <text>] - Coredump Filename**

Use this parameter to select the coredump files that matches the specified file name.

**[-name <text>] - Bridge Name**

Use this parameter to select the coredump files from the storage bridge that matches the specified bridge name.

**[-node <nodename>] - Located on Node**

Use this parameter to select the coredump the coredump files that are located on the specified node.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Panic Timestamp**

Use this parameter to select the coredump files that were collected at the specified time.

**[-panic-string <text>] - Panic String**

Use this parameter to select the coredump files that matches the specified panic string.

## Examples

The following example displays information about all coredump files:

```
cluster1::> storage bridge coredump show
Bridge Name: ATTO_FibreBridge7500N_1
Bridge Serial Number: FB7500N100018
  Coredump Filename: core.FB7500N100018.1970-01-05.17_50_30.mem
  Located on Node: stg-8020-6a
  Panic Timestamp: 7/6/2017 11:03:37
  Panic String: CoreDumpGenerate CLI Command

cluster1::>
```

## storage bridge firmware update

Download firmware onto the bridge so it can be updated

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage bridge firmware update` command downloads the firmware onto the bridge. The bridge needs to be rebooted for the firmware update to occur. The firmware file to be used is specified by the `-uri` parameter.

### Parameters

**-bridge <text> - Bridge Name (privilege: advanced)**

This specifies the bridge whose firmware needs to be updated.

**-uri <text> - URI (privilege: advanced)**

This parameter specifies the URI from which the firmware file is downloaded onto the bridge.

**[-skip <true>] - skip checking for port path == 2 (privilege: advanced)**

Use this optional parameter to skip the bridge path checking allowing a firmware file to be downloaded onto the bridge. Note that doing so might cause multiple device failures.

### Examples

The following example updates the firmware on bridge `ATTO_FibreBridge7500N_1`.

```
cluster1::*> storage bridge firmware update -name ATTO_FibreBridge7500N_1
-uri http://10.60.132.97/firmware.zbd
```

# storage disk commands

## storage disk assign

Assign ownership of a disk to a system

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk assign` command is used to assign ownership of an unowned disk or array LUN to a specific node. You can also use this command to change the ownership of a disk or an array LUN to another node. You can designate disk ownership by specifying disk names, array LUN names, wildcards, or all (for all disks or array LUNs visible to the node). For disks, you can also set up disk ownership autoassignment. You can also assign disks to a particular pool. You can also assign disks by copying ownership from another disk.

### Parameters

#### { [-disk <disk path name>] - Disk Path

This specifies the disk or array LUN that is to be assigned. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

A subset of disks or array LUNs can be assigned using the wildcard character (\*) in the `-disk` parameter. Either the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter must be specified with the `-disk` parameter. Do not use the `-node` parameter with the `-disk` parameter.

#### | -disklist <disk path name>,... - Disk list

This specifies the List of disks to be assigned.

### | **-all <true> - Assign All Disks**

This optional parameter causes assignment of all visible unowned disks or array LUNs to the node specified in the `-node` parameter. The `-node` parameter must be specified with the `-all` parameter. When the `-copy-ownership-from` parameter is specified with the `-node` parameter, it assigns disk ownership based on the `-copy-ownership-from` parameter; otherwise it assigns ownership of the disks based on the `-node` parameter. Do not use the `-owner` or the `-sysid` parameter with the `-all` parameter.

### | **[-T, -type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Storage Type**

This optional parameter assigns ownership of a specific type of disk or array LUN (or a set of disks/array LUNs) to a node. The `-count` parameter must be specified with the `-type` parameter.

### **-n, -count <integer> - Disk Count**

This optional parameter assigns ownership of a number of disks or array LUNs specified in the `-count` parameter, to a node.

### | **-auto <true> - Auto Assign }**

This optional parameter causes all visible disks eligible for autoassignment to be immediately assigned to the node specified in the `-node` parameter, regardless of the setting of the `disk.auto_assign` option. Only unowned disks on loops or stacks owned wholly by that system and which have the same pool information will be assigned. The `-node` parameter must be specified with the `-auto` parameter. Do not use the `-owner`, the `-sysid`, or the `-copy-ownership-from` parameter with the `-auto` parameter. When possible, use the `-auto` parameter rather than the `-all` parameter to conform to disk ownership best practices. The `-auto` parameter is ignored for array LUNs.

### | **-p, -pool <integer>] - Pool**

This optional parameter specifies the pool to which a disk must be assigned. It can take values of `Pool0` or `Pool1`.

### { **[-o, -owner <nodename>] - Owner Name**

This optional parameter specifies the node to which the disk or array LUN has to be assigned.

### | **-s, -sysid <nvrleid>] - New Owner ID**

This optional parameter specifies the serial number (NVRAM ID) of the node to which the disk or array LUN has to be assigned.

### | **[-copy-ownership-from <disk path name>] - Disk Name to Copy Ownership }**

This optional parameter specifies the disk name from where the node needs to copy disk ownership information. You can use this parameter for disks to have the same ownership as the provided input disk.

### | **-c, -checksum {block|zoned|advanced\_zoned}] - Checksum Compatibility**

This optional parameter is used to set the checksum type for a disk or an array LUN. The possible values are `block`, `zoned`, and `advanced_zoned`. This operation will fail if the specified disk is incompatible with the specified checksum type. A newly created aggregate with zoned checksum array LUNs is assigned advanced zoned checksum (AZCS) checksum type. AZCS checksum type provides more functionality than the "version 1" zoned checksum type which has been supported in previous Data ONTAP releases. Zoned checksum spare array LUNs added to an existing zoned checksum aggregate continue to be zoned checksum. Zoned checksum spare array LUNs added to an AZCS checksum type aggregate use the AZCS checksum scheme for managing checksums. For some disks (e.g. FCAL, SSD, SAS disks), the checksum type cannot be modified. For more information on modifying the checksum type, refer to the "Physical Storage Management Guide".

### **[*-f*, *-force* <true>] - Force Flag**

This optional parameter forces the assignment of ownership of an already owned disk to a node. This parameter could also be used to assign an array LUN with a redundancy error, for example, if the array LUN is available on only one path. For a disk which is part of a live aggregate, even specification of the *-force* parameter would not force the assignment, since it would be catastrophic.

### **[*-N*, *-node* <nodename>] - Node Name (For Auto Assign)**

This optional parameter is used with either the *-auto* or the *-all* parameter. If used with the *-auto* parameter, all disks which are visible to the node specified in the *-node* parameter and which are eligible for autoassignment would be assigned to it. If used with the *-all* parameter, all unowned disks or array LUNs visible to the node would be assigned to it.

### **{ [*-root* <true>] - Root Partition of Root-Data or Root-Data1-Data2 Partitioned Disk (privilege: advanced)**

This optional parameter assigns the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

### **| [*-data* <true>] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)**

This optional parameter assigns the data partition of a root-data partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

### **| [*-data1* <true>] - Data1 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced)**

This optional parameter assigns the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

### **| [*-data2* <true>] - Data2 Partition of Root-Data1-Data2 Partitioned Disk (privilege: advanced) }**

This optional parameter assigns the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

## **Examples**

```
The following example assigns ownership of an unowned disk named ``_1_``
``_1_`` ``_16_`` to a node named ``_node1_`` :
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
```

The following example assigns all unowned disks or array LUNs visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -all -node node1
```

The following example autoassigns all unowned disks (eligible for autoassignment) visible to a node named *node1* to itself:

```
cluster1::> storage disk assign -auto -node node1
```

The following two examples show the working of the `-force` parameter with a spare disk that is already owned by another system:

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1
Error: command failed: Failed to assign disks. Reason: Disk 1.1.16 is
already owned.
```

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -force
Success.
```

The following example assigns ownership of the set of unowned disks on `<stack>1`, to a node named `node1`:

```
cluster1::> storage disk assign -disk 1.* -owner node1
```

The following example assigns ownership of unowned disk `1.1.16` by copying ownership from disk `1.1.18`:

```
cluster1::> storage disk assign -disk 1.1.16
-copy-ownership-from 1.1.18
```

The following example assigns all unowned disks visible to a node named ```_node1_``` by copying ownership from disk ```_1_`` .``_1_`` .``_18_```:

```
cluster1::> storage disk assign -all -node node1
-copy-ownership-from 1.1.18
```

The following example assigns the root partition of disk `1.1.16` to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -root true
-force true
```

The following example assigns the data partition of root-data partitioned disk `1.1.16` to node1.

```
cluster1::> storage disk assign -disk 1.1.16 -owner node1 -data true
-force true
```

The following example assigns the data1 partition of root-data1-data2 partitioned disk `1.1.24` to node1.

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data1 true
-force true
```

The following example assigns the data2 partition of root-data1-data2 partitioned disk *1.1.24* to node1.z33

```
cluster1::> storage disk assign -disk 1.1.24 -owner node1 -data2 true
-force true
```

## storage disk fail

### Fail the file system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk fail` command can be used to manually force a file system disk to fail. It is used to remove a file system disk that may be logging excessive errors and requires replacement. To unfail a disk, use the [storage disk unfail](#) command.

### Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the disk to be failed.

**[-i, -immediate <true>] - Fail immediately**

This parameter optionally specifies whether the disk is to be failed immediately. It is used to avoid Rapid RAID Recovery and remove the disk from the RAID configuration immediately. Note that when a file system disk has been removed in this manner, the RAID group to which the disk belongs enters degraded mode (meaning a disk is missing from the RAID group). If a suitable spare disk is available, the contents of the disk being removed are reconstructed onto that spare disk.

### Examples

The following example fails a disk named 1.1.16 immediately:

```
cluster1::> storage disk fail -disk 1.1.16 -i true
WARNING: The system will not prefail the disk and its contents will not be
copied to a replacement disk before being failed out. Do you want to
fail out the disk immediately? {y|n}: y
```

## storage disk reassign

(DEPRECATED)-Change the default owner of all disks from one node to another

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk reassign` is deprecated and may be removed in a future release of Data ONTAP. Disk reassignment is no longer required as part of a controller replacement procedure. For further information, see the latest controller or NVRAM FRU replacement flyer for your system. This command changes the ownership of all disks on a node to the ownership of another node. Use this command only when a node has a complete failure (for instance, a motherboard failure) and is replaced by another node. If the node's disks have already been taken over by its storage failover partner, use the `-force` parameter.

### Parameters

**-s, -homeid <nvrmaid> - Current Home ID (privilege: advanced)**

This specifies the serial number of the failed node.

**-d, -newhomeid <nvrmaid> - New Home ID (privilege: advanced)**

This specifies the serial number of the node that is to take ownership of the failed node's disks.

**[-f, -force <>true>] - Force (privilege: advanced)**

This optionally specifies whether to force the reassignment operation. The default setting is `false`.

### Examples

In the following example, a node named `node0` and having serial number 12345678 has failed. Its disks have not been taken over by its storage failover partner. A replacement node with serial number 23456789 was installed and connected to `node0`'s disk shelves. To assign `node0`'s disks to the new node, start the new node and run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and
1.1.24
were reassigned to new owner with serial number 23456789.
```

In the following example, a similar failure has occurred, except that `node0`'s disks have been taken over by its storage failover partner, `node1`. A new node with serial number 23456789 has been installed and configured. To assign the disks that previously belonged to `node0` to this new node, run the following command:

```
cluster::*> storage disk reassign -homeid 12345678 -newhomeid 23456789
-force true
node0's disks 1.1.11, 1.1.12, 1.1.13, 1.1.14, 1.1.15, 1.1.16, 1.1.23 and
1.1.24
were reassigned to new owner with serial number 23456789.
```

## storage disk refresh-ownership

Refresh the disk ownership information on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command updates the disk ownership information for all the disks attached to a node to the latest view for all the nodes in the cluster. During normal operations, disk ownership is kept up to date automatically. In certain circumstances, however, disk ownership must be updated manually. If this is required, EMS messages will indicate that this command should be run. If the `-node` parameter is provided, the disk ownership information is updated only on the node specified.

### Parameters

**[`-node {<nodename>|local}`] - Node (privilege: advanced)**

If this parameter is provided, the disk ownership information is updated only on the node specified.

### Examples

The following example refreshes the disk ownership information for all the nodes in the cluster:

```
cluster1::> storage disk refresh-ownership
```

## storage disk remove-reservation

Removes reservation from an array LUN marked as foreign.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk remove-reservation` command removes persistent reservation from a specified foreign array LUN.

### Parameters

**`-disk <disk path name>` - Disk Name (privilege: advanced)**

This specifies the disk from which persistent reservation is to be removed.

### Examples

The following example removes the persistent reservation from a disk named `node1:switch01:port.126L1`.

```
cluster1::> storage disk remove-reservation -disk  
node1:switch01:port.126L1
```

## storage disk remove

### Remove a spare disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage disk remove` command removes the specified spare disk from the RAID configuration, spinning the disk down when removal is complete.

This command does not remove disk ownership information from the disk. Therefore, if you plan to reuse the disk in a different storage system, you should use the [storage disk removeowner](#) command instead. See the "Physical Storage Management Guide" for the complete procedure.

For systems with multi-disk carriers, it is important to ensure that none of the disks in the carrier are filesystem disks before attempting removal. To convert a filesystem disk to a spare disk, see [storage disk replace](#).

#### Parameters

**-disk <disk path name> - Disk Name**

This parameter specifies the disk to be removed.

#### Examples

The following example removes a spare disk named 1.1.16:

```
cluster1::> storage disk remove -disk 1.1.16
```

#### Related Links

- [storage disk removeowner](#)
- [storage disk replace](#)

## storage disk removeowner

### Remove disk ownership

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage disk removeowner` command removes ownership from a specified disk. Then disk can then be reassigned to a new owner.

#### Parameters

**-disk <disk path name> - Disk Name**

This specifies the disk whose ownership is to be removed.

**{ [-root <true>] - Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk (privilege: advanced)**

This optional parameter removes ownership of the root partition of a root-data/root-data1-data2 partitioned disk. You cannot use this parameter with disks that are part of a storage pool. The default value is *false*.

**| [-data <true>] - Data Partition of Root-Data Partitioned Disk (privilege: advanced)**

This optional parameter removes ownership of the data partition of a root-data partitioned disk. You cannot use this parameter with a root-data1-data2 partitioned disk or disks that are part of a storage pool. The default value is *false*.

**| [-data1 <true>] - Data1 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced)**

This optional parameter removes ownership of the data1 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is *false*.

**| [-data2 <true>] - Data2 Partition of a Root-Data1-Data2 Partitioned Disk (privilege: advanced) }**

This optional parameter removes ownership of the data2 partition of a root-data1-data2 partitioned disk. You cannot use this parameter with a root-data partitioned disk or disks that are part of a storage pool. The default value is *false*.

**Examples**

The following example removes the ownership from a disk named 1.1.27.

```
cluster1::> storage disk removeowner -disk 1.1.27
```

The following example removes ownership of the root partition on disk 1.1.16.

```
cluster1::> storage disk removeowner -disk 1.1.16 -root true
```

The following example removes ownership of the data partition on disk 1.1.16.

```
cluster1::> storage disk removeowner -disk 1.1.16 -data true
```

The following example removes ownership of the data1 partition on disk 1.1.23.

```
cluster1::> storage disk removeowner -disk 1.1.23 -data1 true
```

The following example removes ownership of the data2 partition on disk 1.1.23.

```
cluster1::> storage disk removeowner -disk 1.1.23 -data2 true
```

## storage disk replace

Initiate or stop replacing a file-system disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk replace` command starts or stops the replacement of a file system disk with spare disk. When you start a replacement, Rapid RAID Recovery begins copying data from the specified file system disk to a spare disk. When the process is complete, the spare disk becomes the active file system disk and the file system disk becomes a spare disk. If you stop a replacement, the data copy is halted, and the file system disk and spare disk retain their initial roles.

### Parameters

#### **-disk <disk path name> - Disk Name**

This specifies the file system disk that is to be replaced. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

#### **-action {start | stop} - Action**

This specifies whether to start or stop the replacement process.

#### **[-replacement <disk path name>] - Replacement**

This specifies the spare disk that is to replace the file system disk.

### **`[-allow-same-carrier <true>]` - Allow Same RAID Group Within Carrier**

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you replace a disk in an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can replace a disk in an aggregate with a disk that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, ensure that disks housed in the same carrier are in different RAID groups.

This parameter affects only the disk replace operation. It is not a persistent attribute of the aggregate.

### **`[-m, -allow-mixing <true>]` - Allow Mixing of Disks of Different RPM or Pool**

This optional parameter specifies whether the disk can be replaced with another disk of different RPM or from different Pool. This parameter affects only the current disk replacement operation.

## **Examples**

The following example begins replacing a file system disk named `1.0.16` with a spare disk named `1.1.14`.

```
cluster1::> storage disk replace -disk 1.0.16 -replacement 1.1.14 -action
start
```

## **storage disk set-foreign-lun**

Sets or Unsets an array LUN as foreign

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage disk set-foreign-lun` command sets or unsets a specified array LUN as foreign. This command will enable/disable the feature of importing the data from foreign LUN.

### **Parameters**

#### **`-disk <disk path name>` - Disk Name**

This parameter specifies the array LUN which is to be set or unset as foreign.

#### **`-is-foreign-lun <true>` - Is Foreign LUN**

If the parameter value specified is *true* then array LUN is set as foreign. If the parameter value specified is *false* then array LUN foreignness is cleared.

## **Examples**

The following example shows how to set an array LUN as foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun
true
```

The following example shows how to mark an array LUN as not foreign:

```
cluster1::> storage disk set-foreign-lun -disk EMC-1.1 -is-foreign-lun
false
```

## storage disk set-led

Identify disks by turning on their LEDs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk set-led` command controls the LED of a specified disk.

You can turn an LED on or off, cause it to blink or stop blinking, or test it.

This command is useful for locating a disk in its shelf.

### Parameters

**-action {on|off|blink|blinkoff|testall|resetall} - Action**

This parameter specifies the state to which the LED is to be set. Possible values include the following:

- on - The LED is lit steadily
- off - The LED is not lit
- blink - The LED blinks
- blinkoff - The LED stops blinking and is not lit
- testall - This tests the operation of every disk enclosure's hardware and drivers per node. Do not use this value in normal operation.
- resetall - This resets the LED of every disk on the node and lights up the LED of disks with faults.

**{ [-disk <disk path name>] - Disk Name**

This specifies the disk whose LED is to be set. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`

. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.

- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique identifier (UUID) or serial number.

#### **| [-adapter <text>] - Adapter Name**

The name of the adapter to which the shelves of disks of interest are attached to.

#### **[-node {<nodename>|local}] - Node Name }**

The node for which action is to be taken.

#### **[-duration <integer>] - Duration (minutes)**

This specifies the duration, in minutes, that the LED is to remain in the specified state. Only actions "on" and "blink" are supported.

#### **[-iteration <integer>] - Test iterations**

This specifies the number of iterations to run the action for. Only action "test-all" is supported.

### **Examples**

The following example causes the LEDs on all disks whose names match the pattern Cluster1\* to turn on for 5 minutes:

```
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 5
```

The following example causes the LEDs on all disks attached to adapter 0b on Node2 to turn on for 1 minute:

```
Cluster1::> storage disk set-led -node Node2 -adapter 0b -action on  
-duration 1
```

The following example resets the LEDs on all disks on the local node and causes the LEDs of disks with faults to turn on:

```
Cluster1::> storage disk set-led -action resetall
```

The following example causes the LEDs on all disks whose names match the pattern Cluster1\* to turn on for 2 minutes:

```
Cluster1::> storage disk set-led -disk Cluster1* -action on -duration 2
```

The following example tests the LEDs on all disks owned by the local node for 3 iterations:

```
Cluster1::> storage disk set-led -action testall -iteration 3
```

## storage disk show

Display a list of disk drives and array LUNs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk show` command displays information about disks and array LUNs. Where it appears in the remainder of this document "disk" may refer to either a disk or an array LUN. By default, the command displays the following information about all disks in column style output:

- Disk name
- Usable space on the disk, in human readable units
- Shelf number
- Bay number
- Container type (aggregate, broken, foreign, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, volume, or unsupported)
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Container name
- Owning node name

To display detailed information about a single disk, use the `-disk` parameter.

### Parameters

**{ [-fields <fieldname>, ...]**

Displays the specified fields for all disks, in column style output.

**| [-broken ]**

Displays the following RAID-related information about broken disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage reason
- Host bus adapter
- Shelf number

- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

#### | [**-errors** ]

Displays the following disk information about the disks which have errors.

- Disk Name
- Error Type
- Error Description and corresponding corrective action

#### | [**-longop** ]

Displays the following information about long-running disk operations, in column style output:

- Disk name
- Whether the disk is marked as prefailed
- Whether the disk is being replaced
- Whether the disk is zeroed
- Copy destination
- Percentage of copy complete
- Percentage of zeroing complete
- Percentage of reconstruction complete

#### | [**-maintenance** ]

Displays the following RAID-related information about disks in the maintenance center:

- Original owning node name
- Checksum compatibility
- Disk name
- Outage Reason
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type

- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

#### | **[-ownership ]**

Displays the following ownership-related information:

- Disk name
- Aggregate name
- Home node name
- Owning node name
- Disaster recovery home node name
- Home node system id
- Owning node system id
- Disaster recovery home node system id
- Reservation node system id
- SyncMirror pool

#### | **[-partition-ownership ]**

Displays the following ownership-related information for partitioned disks:

- Disk name
- Aggregate name
- Owner of root partition on a partitioned disk
- Owner system id of root partition on a partitioned disk
- Owner of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner system id of data or data1 partition on a root-data or a root-data1-data2 partitioned disk respectively
- Owner of data2 partition on a root-data1-data2 partitioned disk
- Owner system id of data2 partition on a root-data1-data2 partitioned disk
- Owner of the disk which is partitioned
- Owner system id of the disk which is partitioned

#### | **[-physical ]**

Displays the following information about the disk's physical attributes, in column style output:

- Disk name
- Disk type
- Disk vendor
- Disk model
- Firmware revision level

- RPM (Revolutions per minute)
- BPS (Bytes per sector)

#### | **[-port ]**

Displays the following path-related information:

- Disk name and disk port associated with disk primary path
- Disk name and disk port associated with the disk secondary path, for a multipath configuration
- Type, shelf, and bay information for the disks

#### | **[-raid ]**

Displays the following RAID-related information:

- Disk name
- Container type (aggregate, broken, labelmaint, maintenance, mediator, remote, shared, spare, unassigned, unknown, or volume)
- Outage reason
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- RAID group name
- Aggregate name

#### | **[-raid-info-for-aggregate ]**

Displays the following RAID-related information about the disks used in an aggregate:

- Owning node name
- Aggregate name
- Plex name
- RAID group name
- Position (copy, data, dparity, orphan, parity, pending, present, shared or tparity)
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units

When this parameter is specified, RAID groups that use shared disks are not included. Use [storage aggregate show-status](#) to show information for all RAID groups and aggregates.

## | **[-spare ]**

Displays the following RAID-related information about available spare disks:

- Original owning node name
- Checksum compatibility
- Disk name
- Host bus adapter
- Shelf number
- Bay number
- Primary port / Channel
- Pool
- Disk type
- Disk class
- RPM (Revolutions per minute)
- Usable size in human readable units
- Physical size in human readable units
- Current owner node

## | **[-ssd-wear ]**

Displays the following wear life related information about solid state disks:

- Rated Life Used : An estimate of the percentage of device life that has been used, based on the actual device usage and the manufacturer's prediction of device life. A value greater than 99 indicates that the estimated endurance has been used, but this does not necessarily indicate a device failure. Omitted if value is unknown.
- Spare Blocks Consumed Limit : Spare blocks consumed percentage limit reported by the device. When the Spare Blocks Consumed percentage for the device reaches this read-only value, Data ONTAP initiates a disk copy operation to prepare to remove the device from service. Omitted if value is unknown.
- Spare Blocks Consumed : Percentage of device spare blocks that have been used. Each device has a number of spare blocks that will be used when a data block can no longer be used to store data. This value reports what percentage of the spares have already been consumed. Omitted if value is unknown.

## | **[-virtual-machine-disk-info ]**

Displays information about Data ONTAP virtual disks, their mapped datastores and their specific backing device attributes, such as: disk or LUN, adapter and initiator details (if applicable).

- Disk name.
- Name of the node.
- Data ONTAP-supplied serial number of the system disk.
- Size of the system disk.
- Name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- File name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM

disk file.

- Type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path.
- Size of the disk backing store.
- Full path to the backing store for network-attached storage. This field is valid only for NAS connections.
- Backing adapter PCI device ID for the virtual disk, for example "50:00.0".
- Backing adapter device name, for example "vmhba32".
- Backing adapter model type, for example "LSI1064E".
- Backing adapter driver name of the initiator.
- The iSCSI name of the disk backing target. This field is valid only for iSCSI connections.
- The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections.
- SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1".
- Hypervisor-assigned unique ID of the backing device (disk or LUN).
- Backing disk partition number where the corresponding VM disk file resides.
- Size of the backing device (disk or LUN).
- Backing device manufacturer, for example "FUJITSU" or "IBM".
- Backing device model, for example "MBE2073RC" or "LUN".
- Storage account associated with the VM Disk.
- Container associated with the VM Disk.
- Page blob associated with the VM Disk.
- Error (if any) while retrieving virtual disk details.

#### | **[-vmdisk-backing-info ]**

Displays information about the backing disks on certain Data ONTAP-v models:

- Disk name
- Backing disk vendor
- Backing disk model
- Backing disk serial number
- Backing disk device id

#### | **[-foreign ] (privilege: advanced)**

Displays the following foreign LUN import related information about foreign disks:

- Disk name
- Array name
- Capacity in sectors
- Capacity in mb
- Serial Number

### | **[-physical-location ] (privilege: advanced)**

Displays the following information about disks:

- Disk name
- Container type
- Primary path
- Location
- Home node name
- Physical size in human readable units

### | **[-primary-paths ] (privilege: advanced)**

Displays the following information about disks:

- Disk Name
- Shelf
- Bay
- Container Type
- Primary Path

### | **[-instance ] }**

Displays detailed disk information. If no disk path name is specified, this parameter displays the same detailed information for all disks as does the -disk parameter. If a disk path name is specified, then this parameter displays the same detailed information for the specified disks as does the -disk parameter.

### **[-disk <disk path name>] - Disk Name**

Displays detailed information about the specified disks. Disk names take one of the following forms:

- Disks are named in the form `<stack-id>.<shelf>.<bay>`
- Disks on multi-disk carriers are named in the form `<stack-id>.<shelf>.<bay>.<lun>`
- Virtual disks are named in the form `<prefix>.<number>`, where prefix is the storage array's prefix and number is a unique ascending number.

Disk names take one of the following forms on clusters that are not yet fully upgraded to Data ONTAP 8.3:

- Disks that are not attached to a switch are named in the form `<node>:<host_adapter>.<loop_ID>`. For disks with a LUN, the form is `<node>:<host_adapter>.<loop_ID>L<LUN>`. For instance, disk number 16 on host adapter 1a on a node named node0a is named node0a:1a.16. The same disk on LUN lun0 is named node0a:1a.16Llun0.
- Disks that are attached to a switch are named in the form `<node>:<switch_name>:<switch_port>.<loop_ID>`. For disks with a LUN, the form is `<node>:<switch_name>:<switch_port>.<loop_ID>L<LUN>`. For instance, disk number 08 on port 11 of switch fc1 on a node named node0a is named node0a:fc1:11.08. The same disk on LUN lun1 is named node0a:fc1:11.08Llun1.

Before the cluster is upgraded to Data ONTAP 8.3, the same disk can have multiple disk names, depending on how the disk is connected. For example, a disk known to a node named alpha as alpha:1a.19 can be known to a node named beta as beta:0b.37. All names are listed in the output of queries and are equally valid. To determine a disk's unique identity, run a detailed query and look for the disk's universal unique

identifier (UUID) or serial number.

**[-owner {<nodename>|local}] - Owner**

Selects information about disks that are owned by the specified node.

**[-owner-id <nvrmaid>] - Owner System ID**

Selects the disks that are owned by the node with the specified system ID.

**[-is-foreign {true|false}] - Foreign LUN (privilege: advanced)**

Selects information about array LUNs that have been declared to be foreign LUNs.

**[-uid <text>] - Disk Unique ID**

Selects the disks whose unique id matches this parameter value. A disk unique identifier has the form:

`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000:00000000`

**[-aggregate <aggregate name>] - Aggregate**

Selects information about disks that belong to the specified aggregate.

**[-array-name <array name>] - Array Name**

Selects information about the LUNs presented by the specified storage array.

**[-average-latency <integer>] - Average I/O Latency Across All Active Paths**

Selects information about disks that have the specified average latency.

**[-bay <integer>] - Bay**

Selects information about disks that are located in the carrier within the specified shelf bay.

**[-bps <integer>] - Bytes Per Sector**

Selects information about disks that have the specified number of bytes per sector. Possible settings are 512, 520, 4096, and 4160.

**[-carrier-id <text>] - Carrier ID**

Selects information about disks that are located within the specified multi-disk carrier.

**[-checksum-compatibility {advanced\_zoned | block | none}] - Checksum Compatibility**

Selects information about disks that have the specified checksum compatibility.

**[-class {capacity | performance | archive | solid-state | array | virtual}] - Disk Class**

Selects information about disks that have the specified disk class.

- capacity = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- performance = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- archive = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- solid-state = Solid-state drives. Includes disk type SSD and SSD-NVM.
- array = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.

- virtual = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

**`[-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}] - Container Type`**

Selects information about disks that have the specified container type.

- Aggregate = Disk is used as a physical disk in an aggregate.
- Broken = Disk is in broken pool.
- Foreign = Array LUN has been marked foreign.
- Labelmaint = Disk is in online label maintenance list.
- Maintenance = Disk is in maintenance center.
- Mediator = A mediator disk is a disk used on non-shared HA systems hosted by an external node which is used to communicate the viability of the storage failover between non-shared HA nodes.
- Remote = Disk belongs to the remote cluster.
- Shared = Disk is partitioned or in a storage pool.
- Spare = Disk is a spare disk.
- Unassigned = Disk ownership has not been assigned.
- Unknown = Container is currently unknown. This is the default setting.
- Unsupported = Disk is not supported.

**`[-container-name <text>] - Container Name`**

Selects information about disks that have the specified container name. + If a disk is in an aggregate or storage pool, the container name is the name of the aggregate or storage pool. + Spare disks show the SyncMirror Pool to which they belong. + Partitioned disks could return multiple aggregate names.

**`[-copy-destination <disk path name>] - Copy Destination Name`**

Selects information about disks whose contents are being copied (due to either Rapid RAID Recovery or disk replacement) to the specified spare disk.

**`[-copy-percent <integer>] - Percentage of Copy Complete`**

Selects information about disks that are involved as either a source or destination of a copy operation, (due to either disk replacement or Rapid RAID Recovery) and that have the specified percentage of the copy operation completed.

**`[-data-owner {<nodename>|local}] - Owner of Data Partition of Root-Data Partitioned Disk`**

Selects information about disks that have the specified data partition owner name. Used with root-data partitioned disks.

**`[-data1-owner {<nodename>|local}] - Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk`**

Selects information about disks that have the specified data1 partition owner name. Used with root-data1-data2 partitioned disks.

**`[-data2-owner {<nodename>|local}] - Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk`**

Selects information about disks that have the specified data2 partition owner name. Used with root-data1-

data2 partitioned disks.

**[-data-home {<nodename>|local}] - Home Owner of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner name. Used with root-data partitioned disks.

**[-data1-home {<nodename>|local}] - Home Owner of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data2-home {<nodename>|local}] - Home Owner of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner name. Used with root-data1-data2 partitioned disks.

**[-data-owner-id <nvramid>] - Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition owner system ID. Used with root-data partitioned disks.

**[-data1-owner-id <nvramid>] - Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data2-owner-id <nvramid>] - Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition owner system ID. Used with root-data1-data2 partitioned disks.

**[-data-home-id <nvramid>] - Home Owner System ID of Data Partition of Root-Data Partitioned Disk**

Selects information about disks that have the specified data partition home owner system ID. Used with root-data partitioned disks.

**[-data1-home-id <nvramid>] - Home Owner System ID of Data1 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data1 partition home owner system ID. Used with root-data1-data2 partitioned disks.

**[-data2-home-id <nvramid>] - Home Owner System ID of Data2 Partition of Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified data2 partition home owner system ID. Used with root-data1-data2 partitioned disks.

**[-disk-io-kbps-total <integer>] - Total Disk Throughput in KBPS Across All Active Paths**

Selects information about disks that have attained the specified I/O throughput on all connected paths.

**[-disk-iops-total <integer>] - Total Disk IOPs Across All Active Paths**

Selects information about disks that have achieved the specified number of IOPs per second on all connected paths.

**[-diskpathnames <disk path name>,...] - List of Path-Based Disk Names**

Selects information about disks that have all of the specified path names.

**[-effective-rpm <integer>] - Effective RPM**

Selects information about disks with the specified effective rotational speed.

**[-dr-home {<nodename>|local}] - Disaster Recovery Home**

Selects information about disks that have the specified Disaster home node.

**[-dr-home-id <nvramid>] - Disaster Recovery Home System ID**

Selects information about disks whose Disaster home node has the specified system id.

**[-drawer <integer>] - Drawer**

Selects information about disks that are located in the specified drawer.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Selects information about disks that have the specified error types.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.
- foreign = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- toobig = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- toosmall = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- invalidblocksize = The array LUN is not a valid block size.
- targetasymmap = The array LUN is presented more than once on a single target port.
- deviceasymmap = The array LUN is presented with multiple IDs.
- failovermisconfig = The array LUN is configured with inconsistent failover methods.
- unknown = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- netapp = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- fwdownrev = The disk firmware is a down version.
- qualfail = The disk is not supported.
- diskfail = The disk is in a failed state.
- notallflashdisk = The disk does not match the All-Flash Optimized personality of the system.

**[-firmware-revision <text>] - Firmware Revision**

Selects information about disks that have the specified firmware revision level.

**[-home {<nodename>|local}] - Home**

Selects information about disks that have the specified home node.

**[-home-id <nvramid>] - Home System ID**

Selects information about disks whose home node has the specified system ID.

**[-host-adapter <text>] - Primary Path Host Adapter**

Selects information about disks that are currently using the specified Host Bus Adapter.

**[-hw-minimum-os <text>] - Hardware Minimum Supported Data ONTAP Version**

Selects information about disks that have the specified hardware minimum supported Data ONTAP version.

**[-import-in-progress {true|false}] - Foreign LUN import in progress**

Selects information about the array LUNs that are currently being imported

**[-initiator <text>,...] - Initiator Port**

Selects information about disks that are visible to the initiator specified. Disks that are not currently in use by that initiator are included.

**[-initiator-iops <integer>,...] - Number of IOPS on Initiator (Rolling Average)**

Selects information about disks that are visible to an initiator that has executed the specified number of IOPs.

**[-initiator-io-kbps <integer>,...] - Kbytes of I/O per second on Initiator (Rolling Average)**

Selects information about disks visible to an initiator that has executed I/O at the specified throughput.

**[-initiator-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this initiator**

Selects information about disks with a path through an initiator that has the specified in-use-count.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Selects information about disks that are visible to an initiator connected to the specified switch port.

**[-is-multidisk-carrier {true|false}] - Multi Disk Carrier?**

Selects information about disks that are located within a multi-disk carrier.

**[-is-local-attach {true|false}] - Indicates If the Disk Is Local to This Cluster**

Selects information about disks attached to the local(true) or remote(false) MetroCluster site.

**[-location {<nodename>|local}] - Physical Location**

Selects information about disks attached to the specified node.

**[-location-id <nvramid>] - The system ID of the node where the disk is attached**

Selects information about disks attached to the node with the specified system ID.

**[-lun <integer>,...] - LUN ID**

Selects information about the specified LUNs.

**[-lun-iops <integer>,...] - Number IOPS per second on disk (Rolling Average)**

Selects information about the LUNs that have reached the specified number of IOPs.

**[-lun-io-kbps <integer>,...] - Kbytes/sec on Disk (Rolling Average)**

Selects information about the LUNs that have reached the specified I/O throughput.

**[-lun-path-use-state <text>,...] - The Use State of the LUN on this path**

Selects information about LUNs reporting the specified in-use state.

**[-model <text>] - Model**

Selects information about disks of the specified model.

**[-nodelist {<nodename>|local}] - Controller name**

Selects information about disks that are visible to all of the specified nodes .

**[-outage-reason <text>] - Outage Reason**

Selects information about disks that are not in service for the specified reason. Possible values are: admin failed, admin removed, admin testing, evacuated, bad label, bypassed, failed, init failed, label version, labeled broken, labelmaint, LUN resized, missing, not responding, predict failure, rawsize shrank, recovering, sanitizing, sanitized, SnapLock Disk, testing, unassigned, unknown.

**[-path-error-count <integer>] - Path Error Count**

Selects information about disks that are visible on a path that has incurred the specified number of errors.

**[-path-iops <integer>,...] - Number of IOPS on Path (Rolling Average)**

Selects information about disks on those paths that have reached the specified number of IOPs.

**[-path-io-kbps <integer>,...] - Kbytes of I/O per second on Path (Rolling Average)**

Selects information about disk with paths that have reached the specified I/O throughput

**[-path-link-errors <integer>,...] - Link Error count on path**

Selects information about disks with paths that have incurred the specified number of FC link errors.

**[-path-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this path**

Selects information about disks with paths that have the specified in-use-count.

**[-path-quality <integer>,...] - Percentage of weighted error threshold**

Selects information about disks on paths that have incurred the specified number of errors. The value displayed is a measure of the health of a path expressed as a percentage of an error threshold. Once a path has reached or surpassed the error threshold, another path will be selected for I/O transfer, if there is one available.

**[-physical-size-mb <integer>] - Physical Size (MB)**

Selects information about disks that have the specified physical capacity, in megabytes.

**[-physical-size {<integer>[KB|MB|GB|TB|PB]}] - Physical Size**

Selects information about disks that have the specified physical capacity, in human readable units.

**[`-physical-size-512b <integer>`] - Physical Size in Units of 512 Bytes**

Selects information about disks that have the specified physical capacity, in 512-byte chunks. This parameter is present only for backwards compatibility with Data ONTAP 8.0.

**[`-plex <text>`] - Plex Name**

Selects information about disks that belong to the specified RAID plex.

**[`-pool <text>`] - Assigned Pool**

Selects information about disks that belong to the specified SyncMirror pool (pool0 or pool1).

**[`-port-speed <text>,...`] - Port Speed**

Selects information about disks that are served by a Host Bus Adapter that is running at the specified port speed.

**[`-position <diskPositionType>`] - Disk Position**

Selects information about disks that have the specified position within their disk container.

**[`-power-on-hours <integer>`] - Hours Powered On**

Selects information about disks that have the specified number of hours being powered up.

**[`-prefailed {true|false}`] - Marked for Rapid RAID Recovery?**

Selects information about disks that match the specified parameter value indicating whether the disk is either awaiting or is in process of Rapid RAID Recovery.

**[`-preferred-target-port {true|false}`] - Whether or not target port group is preferred  
(privilege: advanced)**

Selects information about disks that match the specified parameter value indicating whether the backing storage is ALUA (Asymmetric Logical Unit Access) capable and has specified the array target port on this path to be a preferred target port for I/O.

**[`-primary-port <text>`] - Primary Path Disk Port**

Selects information about disks that use the specified primary port.

**[`-raid-group <text>`] - Raid Group Name**

Selects information about disks that belong to the specified RAID group.

**[`-reconstruction-percent <integer>`] - Percentage of Reconstruction Complete**

Selects information about disks that are being reconstructed and that have the specified percentage of the reconstruction operation completed.

**[`-replacing {true|false}`] - Being Replaced?**

Selects information about disks that match the specified boolean value indicating whether the disk is either awaiting or in process of disk replacement.

**[`-reservation-key <text>`] - Reservation Key**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation key.

**[-reservation-type {rs|we|re|ea|sa|wero|earo|wear|eaar|none}] - Reservation Type**

If this parameter is specified, the command displays information only about the disk or disks that have the specified persistent reservation type. Possible values are: rs, we, re, ea, sa, wero, earo, wear, eaar, or none.

**[-reserver-id <integer>] - Reservation System ID**

Selects information about disks that are reserved by the node with the specified system ID.

**[-root-owner {<nodename>|local}] - Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-owner-id <nvramid>] - Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home {<nodename>|local}] - Home Owner of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner name. Used with root-data/root-data1-data2 partitioned disks.

**[-root-home-id <nvramid>] - Home Owner System ID of Root Partition of Root-Data/Root-Data1-Data2 Partitioned Disk**

Selects information about disks that have the specified root partition home owner system ID. Used with root-data/root-data1-data2 partitioned disks.

**[-rpm <integer>] - Revolutions Per Minute**

Selects information about disks that have the specified rotational speed.

**[-secondary-name <disk path name>] - Secondary Path Name**

Selects information about disks that use the specified secondary path name, for multipath configuration.

**[-secondary-port <text>] - Secondary Path Disk Port**

Selects information about disks that use the specified secondary port.

**[-serial-number <text>] - Serial Number**

Selects information about the disk that has the specified serial number.

**[-storage-pool <text>] - Storage Pool Name**

Selects information about disks that belong to the specified SSD storage pool.

**[-shelf <integer>] - Shelf**

Selects information about disks that are located within the specified shelf.

**[-shelf-uid <text>] - Shelf UID**

Selects information about disks that are located within a shelf with the specified Shelf UID.

**[-slot <integer>] - Slot**

Selects information about disks that are located in a drawer with the specified slot.

**[-stack-id <integer>] - Stack ID**

A cluster unique id for a collection of one or more interconnected shelves.

**[-target-iops <integer>,...] - Number of IOPS to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have performed the specified number of IOPs.

**[-target-io-kbps <integer>,...] - Kbytes of I/O per second to Target (Rolling Average)**

Selects information about disks that are visible on target ports that have reached the specified I/O throughput.

**[-target-lun-in-use-count <integer>,...] - Number of LUNs in the in-use state on this target**

Selects information about disks with a path through a target port that has the specified in-use-count.

**[-target-port-access-state <text>,...] - Failover optimization type**

Selects information about disks that are visible on target ports that have the specified access state.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Selects information about disks that are visible on target ports identified by the switch port to which they are connected.

**[-target-wwpn <text>,...] - Target Port**

Selects information about disks that are visible on target ports identified by their World Wide Port Name.

**[-tpgn <integer>,...] - Target Port Group Number**

Selects information about disks that belong to the specified Target Port Group Number.

**[-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type**

Selects information about disks that have the specified disk type.

**[-usable-size-mb <integer>] - Usable Size (MB)**

Selects information about disks that have the specified usable space, in megabytes.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Usable Size**

Selects information about disks that have the specified usable space, in human readable units.

**[-vendor <text>] - Vendor Name**

Selects information about disks that have the specified vendor.

**[-vmdisk-device-id <integer>,...] - Virtual Disk Device ID**

Selects information about disks that have the specified virtual disk device ID.

**[-zeroed {true|false}] - Zeroed?**

Selects information about disks that have (true) or have not (false) been fully pre-zeroed.

**[-zeroing-percent <integer>] - Percentage of Zeroing Complete**

Selects information about disks that are zeroing and have the specified percentage complete.

**[-carrier-serialno <text>] - Carrier Serial Number**

Selects information about disks that are located within the multi-disk carrier specified by the serial number.

**[-vmdisk-target-address <text>] - Target Address of the VM Disk**

Displays the VM Disk's target address either in the form of bus target lun or bus unit.

**Examples**

The following example displays information about all disks:

```
cluster1::> storage disk show
```

Disk Owner	Usable Size	Shelf	Bay	Container Type	Position	Aggregate
-----	-----	-----	---	-----	-----	-----
1.1.1 node1	10GB	1	1	spare	present	-
1.1.4 node1	78.59GB	1	4	spare	present	-

- [storage aggregate show-status](#)

## storage disk unfail

Unfail a broken disk

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage disk unfail` command can be used to unfail a broken disk.

If the attempt to unfail the disk is unsuccessful, the disk remains in the broken state.

The disk unfail command prompts for confirmation unless you specify the `"-quiet"` parameter.

## Parameters

**`-disk <disk path name>` - Disk Name (privilege: advanced)**

This parameter specifies the disk to be unfailed.

**`[-s, -spare <true>]` - Make the Disk Spare (privilege: advanced)**

This parameter specifies whether the unfailed disk will be made a spare disk. The disk is forced to become a spare disk if this parameter is specified.

If this parameter is not specified, the disk is brought back into its parent aggregate. Setting this parameter might result in the aggregate coming back online if it is not complete or online. The default value is false.

**`[-q, -quiet <true>]` - Confirmations off (privilege: advanced)**

You can set this parameter to true to suppress the confirmation messages. However, before proceeding with the command, you should be aware that the confirmation message contains important information about the effect of unfailling a disk. This command cannot be reversed once it is invoked. The default value is false.

## Examples

The following example unfails a disk named 1.1.16 to become a spare disk:

```
cluster1::*> storage disk unfail -disk 1.1.16 -spare
```

Warning: Failed disk "1.1.16" may have aggregate labels and file system data present. In that case use of this command to release this disk as a spare disk, will lead to permanent loss of any file system data that may be on this disk, and may prevent recovery of a failed aggregate. Are you sure you want to continue with disk unfail? {y|n}:

## storage disk updatefirmware

(DEPRECATED) - Update disk firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the `"storage disk firmware update"` command.

The `storage disk updatefirmware` command updates the firmware on one or more disks.

You can download the latest firmware by using the [storage firmware download](#) command.

You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter, or you can update the firmware on all local disks by omitting the `-disk` parameter.

## Parameters

### **[`-disk <disk path name>,...`] - Disk**

This specifies the disk or disks whose firmware is to be updated.

If you do not specify this option, all local disks' firmware is updated.

## Examples

The following example updates the firmware on all disks:

```
cluster1::> storage disk updatefirmware
```

## Related Links

- [storage disk firmware update](#)
- [storage firmware download](#)

## storage disk zerospares

### Zero non-zeroed spare disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage disk zerospares` command zeroes all non-zeroed spare disks in all nodes or a specified node in the cluster. A node must be online to zero disks. This operation must be done before a disk can be reused in another aggregate. This version of ONTAP uses fast zeroing, which converts a spare disk from non-zeroed to zeroed without the long wait times required when physically zeroing a disk.

## Parameters

### **[`-owner {<nodename>|local}`] - Owner**

If this parameter is specified, only non-zeroed spares assigned to the specified node will be zeroed.

Otherwise, all non-zeroed spares in the cluster will be zeroed.

## Examples

The following example zeroes all non-zeroed spares owned by a node named node4, using fast zeroing:

```
cluster1::> storage disk zerospares -owner node4
```

## storage disk error show

Display disk component and array LUN configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk error show` command displays disk component and array LUN configuration errors.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Displays the error information of the disk whose unique ID matches the value you specify. A disk unique identifier has the form:

```
`20000000:875D4C32:00000000:00000000:00000000:00000000:00000000:00000000:00000000:00000000`
```

**[-array-name <array name>] - Array Name**

Displays the errors of the storage array whose name you specified.

**[-node {<nodename>|local}] - Controller Name**

Displays the error information for the disks on the clustered node whose name you specified.

**[-disk <disk path name>] - Disk**

Displays detailed error information about the disk you specified.

**[-serial-number <text>] - Serial Number**

Displays the error information for the disk whose serial number you specified.

**[-error-id <integer>,...] - Error ID**

Displays the error information for the disks whose Error IDs match IDs you specified.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Displays all disk errors of the error types you specified, grouped by type.

- onepath = The array LUN is accessible only via a single path.
- onedomain = The array LUN is accessible only via a single fault domain.
- control = The array LUN cannot be used because it is a control device.

- **foreign** = The array LUN is marked as foreign and has some external SCSI reservations other than those from Data ONTAP.
- **toobig** = The array LUN exceeds the maximum array LUN size that Data ONTAP supports.
- **toosmall** = The array LUN is less than the minimum array LUN size that Data ONTAP supports.
- **invalidblocksize** = The array LUN is not a valid block size.
- **targetasymmap** = The array LUN is presented more than once on a single target port.
- **deviceasymmap** = The array LUN is presented with multiple IDs.
- **failovermisconfig** = The array LUN is configured with inconsistent failover methods.
- **unknown** = The array LUN from a storage array that is not supported by this version of Data ONTAP.
- **netapp** = A SAN front-end LUN from one Data ONTAP system that is presented as external storage to another Data ONTAP system.
- **fwdownrev** = The disk firmware is a down version.
- **qualfail** = The disk is not supported.
- **diskfail** = The disk is in a failed state.
- **notallflashdisk** = The disk does not match the All-Flash Optimized personality of the system.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage disk error show
Disk              Error Type          Error Text
-----
1.02.0            qualfail              This disk failed dynamic disk
qualification. Update the Disk Qualification Package.
```

## storage disk firmware revert

### Revert disk firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk firmware revert` command reverts firmware on all disks or a specified list of disks on a node.

You can specify a list of one or more disks whose firmware is to be reverted by using the `-disk` parameter.

You can revert the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware revert` command. This is particularly true for CIFS sessions that might be terminated when this

command is executed.

If you need to view the current firmware versions, use the [storage disk show](#)-fields`*firmware-revision* command. The following example displays partial output from the [storage disk show](#)-fields`*firmware-revision* command, where the firmware version for the disks is NA02:

```
cluster1::> storage disk show -fields firmware-revision
  disk      firmware-revision
  -----
  1.0.0      NA02
  1.0.1      NA02
  1.0.2      NA02
  1.0.3      NA02
  1.0.4      NA02
  1.0.5      NA02
```

The firmware files are stored in the /mroot/etc/disk\_fw directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225\_ST336704FC and the firmware version is NA01, the file name is X225\_ST336704FC.NA01.LOD. If the node in this example contains disks with firmware version NA02, the /mroot/etc/disk\_fw/X225\_ST336704FC.NA01.LOD file is downloaded to every disk when you execute this command.

#### How to Revert the Firmware for an HA Pair in a Cluster

Use the following procedure to perform a revert on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both nodes by using the [storage firmware download](#) command.
- Revert the disk firmware on Node A's disks by entering the `storage disk firmware revert-node`node-A`` command.
- Wait until the `storage disk firmware revert` command completes on Node A, and then revert the firmware on Node B's disks by entering the `storage disk firmware revert-node`node-B`` command.

#### Parameters

**{ -disk <disk path name>, ... - Disk Name (privilege: advanced) }**

Specifies the disk or disks whose firmware is to be reverted.

**| -node {<nodename>|local} - Node Name (privilege: advanced) }**

Specifies the node name. The disk firmware will be reverted on all the disks owned by the node specified by this parameter.

#### Examples

- The following example reverts the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware revert -node cluster-node-01
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware revert process is complete.

Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware reverts? {y|n}: y

Info: Reverting disk firmware for disks on cluster-node-01.

- The following example reverts the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware revert -disk 1.5.0
```

Warning: Disk firmware reverts can be disruptive to the system. Reverts involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being reverted. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware revert process is complete.

Disk firmware reverts should only be done one node at a time. Disk firmware reverts can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

## storage disk firmware show-update-status

Display disk firmware update status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage disk firmware show-update-status` command displays the state of the background disk firmware update process.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node (privilege: advanced)**

Selects the node that matches this parameter value.

**[-num-waiting-download <integer>] - The Number of Disks Waiting to Download (privilege: advanced)**

Selects the nodes whose number of disks waiting to download by the BDFU process matches this parameter value.

**[-total-completion-estimate <integer>] - Estimated Duration to Completion (mins) (privilege: advanced)**

Selects the nodes whose Background Disk Firmware Update (BDFU) completion time estimate matches this parameter value. This indicates the amount of estimated time required for BDFU to complete the firmware update cycle.

**[-average-duration-per-disk <integer>] - Average Firmware Update Duration per Disk (secs) (privilege: advanced)**

Selects the nodes whose BDFU reports the average time required to update a single disk matches this parameter value. This indicates the average amount of time required by each disk drive.

**[-unable-to-update <disk path name>,...] - List of Disks with a Failed Update (privilege: advanced)**

Selects the nodes whose unable to update disk list matches this parameter value. This is a list of disks that failed to update the firmware.

**[*-update-status* {*off*|*running*|*idle*}] - Background Disk Firmware Update Status (privilege: *advanced*)**

Selects the nodes whose BDFU process status matches this parameter value. Possible values are:

- *off* - The BDFU process is off.
- *running* - The BDFU process is on and currently running.
- *idle* - The BDFU process is on and is currently idle.

**Examples**

```
cluster1::*> storage disk firmware show-update-status
```

		Number	Average	Total	
	Update	Waiting	Duration	Completion	
Node	State	Download	/Disk (Sec)	Est. (Min)	Unable to
Update					
node1	running	2	120	4	1.3.3
node2	idle	0	120	0	-
node3	off	0	120	0	-

**storage disk firmware update**

**Update disk firmware**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

**Description**

Use the `storage disk firmware update` command to manually update firmware on all disks or a specified list of disks on a node. However, the recommended way to update disk firmware in a cluster is to enable automatic background firmware update by enabling the `-bkg-firmware-update` parameter for all of the nodes in the cluster. You can do this by entering the `storage disk option modify-node`*-bkg-firmware-update`on` command.

You can download the latest firmware on the node by using the `storage firmware download` command.

You can specify a list of one or more disks whose firmware is to be updated by using the `-disk` parameter.

You can update the firmware on all the disks owned by a node by using the `-node` parameter.

This command can make the disks inaccessible for up to five minutes after the start of its execution. Therefore, the network sessions that use the concerned node must be terminated before running the `storage disk firmware update` command. This is particularly true for CIFS sessions that might be terminated when this command is executed.

The firmware is automatically downloaded to disks, which report previous versions of the firmware. For information on automatic firmware update downloads, see "Automatic versus Manual Firmware Download".

If you need to view the current firmware versions, use the `storage disk show -fields `firmware-revision`` command. The following example displays partial output from the `storage disk show -fields `firmware-revision`` command, where the firmware version for the disks is NA01:

```
cluster1:> storage disk show -fields firmware-revision
disk      firmware-revision
-----
1.0.0     NA01
1.0.1     NA01
1.0.2     NA01
1.0.3     NA01
1.0.4     NA01
1.0.5     NA01
```

The firmware files are stored in the `/mroot/etc/disk_fw` directory on the node. The firmware file name is in the form of "product-ID.revision.LOD". For example, if the firmware file is for Seagate disks with product ID X225\_ST336704FC and the firmware version is NA02, the filename is X225\_ST336704FC.NA02.LOD. The revision part of the file name is the number against which the node compares each disk's current firmware version. If the node in this example contains disks with firmware version NA01, the `/mroot/etc/disk_fw/X225_ST336704FC.NA02.LOD` file is used to update every eligible disk when you execute this command.

#### Automatic versus Manual Firmware Download

The firmware is automatically downloaded to those disks that report previous versions of firmware following a system boot or disk insertion. Note that:

- A manual download is a disruptive operation that makes disks inaccessible for up to five minutes after the download is started. Network sessions that use the node must be terminated before running the `storage disk firmware update` command.
- The firmware is not automatically downloaded to the node's partner node in an HA pair.
- The firmware is not automatically downloaded to unowned disks on nodes configured to use software-based disk ownership.
- The `bkg-firmware-update` parameter controls how the automatic firmware download feature works:
  - If the `bkg-firmware-update` parameter is set to off, then the `storage disk firmware update` will update the firmware on the drives in parallel.
  - If the `bkg-firmware-update` parameter is set to on, then the `storage disk firmware update` will update spares and filesystem disks in a nondisruptive manner in the background after boot. Firmware downloads for these disks will be done sequentially by temporarily taking them offline one at a time for the duration of the download. After the firmware is updated, the disk will be brought back online and restored to its normal operation.

During an automatic download to an HA environment, the firmware is not downloaded to the disks owned by the HA partner.

When you use the `storage disk firmware update` command, the firmware is:

- Updated on every disk regardless of whether it is on the A-loop, the B-loop, or in an HA environment.

- If the node is configured in a software-based disk ownership system, only disks owned by this node are updated.

During an automatic firmware download in a MetroCluster™ environment, the firmware is not downloaded to the disks owned by the partner cluster. During both manual and automatic firmware download in a MetroCluster-over-IP environment, the firmware is not downloaded to any remote disks located at the partner cluster while Disaster Recovery is in progress.

Follow the instructions in "How to Update the Firmware for an HA Pair in a Cluster" to ensure that the updating process is successful. Data ONTAP supports redundant path configurations for disks in a non-HA configuration. The firmware is automatically downloaded to disks on the A-loop or B-loop of redundant configurations that are not configured in an HA pair and are not configured to use software-based disk ownership.

### Automatic Background Firmware Update

The firmware can be updated in the background so that the firmware update process does not impact the clients. This functionality is controlled with the `bkg-firmware-update` parameter. You can modify the parameter by using the CLI `storage disk option modify -node `node_name` bkg-firmware-update `on|off` command. The default value for this parameter is "on".

When disabled or set to "off", `storage disk firmware update` will update the firmware in automated mode. This means that all disks which had older firmware revision will be updated regardless of whether they are spare or filesystem disks.

When enabled or set to "on", the background `storage disk firmware update` will update firmware in automated mode only on disks that can be successfully taken offline from active filesystem RAID groups and from the spare pool. To ensure a faster boot process, the firmware is not downloaded to spares and filesystem disks at boot time.

This provides the highest degree of safety available, without the cost of copying data from each disk in the system twice. Disks are taken offline one at a time and then the firmware is updated on them. The disk is brought online after the firmware update and a mini/optimized reconstruct happens for any writes, which occurred while the disk was offline. Background disk firmware update will not occur for a disk if its containing RAID group or the volume is not in a normal state (for example, if the volume/plex is offline or the RAID group is degraded). However, due to the continuous polling nature of background disk firmware update, firmware updates will resume after the RAID group/plex/volume is restored to a normal mode. Similarly, background disk firmware updates are suspended for the duration of any reconstruction within the system.

### How to Update the Firmware for an HA Pair in a Cluster

The best way to update the firmware in a cluster with HA pairs is to use automatic background firmware update by enabling the option `bkg-firmware-update` parameter for each node. Enable the `-bkg-firmware-update` parameter on all the nodes by entering the `storage disk option modify -node `node_name` bkg-firmware -update `on` command. Alternatively, use the following procedure to successfully perform a manual update on the disks in an HA environment:

- Make sure that the nodes are not in takeover or giveback mode.
- Download the latest firmware on both the nodes by using the `storage firmware download` command.
- Install the new disk firmware on Node A's disks by entering the `storage disk firmware update -node `node-A`` command.
- Wait until the `storage disk firmware update` command completes on Node A, and then install the new disk firmware on Node B's disks by entering the `storage disk firmware update -node `node-`

B` command.

## Parameters

**{ -disk <disk path name>, ... - Disk (privilege: advanced)**

Specifies the disk or disks whose firmware is to be updated.

**| -node {<nodename>|local} - node (privilege: advanced) }**

Specifies the node name. The disk firmware will be updated on all the disks owned by the node specified by this parameter.

## Examples

- The following example updates the firmware on all disks owned by cluster-node-01:

```
cluster1::*> storage disk firmware update -node cluster-node-01
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability (HA)

group will be delayed until the firmware update process is complete.

Disk firmware updates should only be done one node at a time.

Disk

firmware updates can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

Do you want to continue with disk firmware updates? {y|n}: y

Info: Updating disk firmware for disks on cluster-node-01.

- The following example updates the firmware on disk 1.5.0 which is owned by node cluster-node-04:

```
cluster1::*> storage disk firmware update -disk 1.5.0
```

Warning: Disk firmware updates can be disruptive to the system. Updates involve

power cycling all of the affected disks, as well as suspending disk

I/O to the disks being updated. This delay can cause client disruption. Takeover/giveback operations on a high-availability

(HA) group will be delayed until the firmware update process is complete.

Disk firmware updates should only be done one node at a time.

Disk firmware updates can only be performed when the HA group is healthy;

they cannot be performed if the group is in takeover mode.

## storage disk option modify

### Modify disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk option modify` command modifies the background firmware update setting, automatic copy setting, controls automatic disk assignment of all disks assigned to a specified node, or modifies the policy of automatic disk assignment of unowned disks.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node that owns the disks whose options are to be modified.

**[-bkg-firmware-update {on|off}] - Background Firmware Update**

This parameter specifies whether firmware updates run as a background process. The default setting is `on`, which specifies that firmware updates to spare disks and file system disks is performed nondisruptively via

a background process. If the option is turned off, automatic firmware updates occur at system startup or during disk insertion.

**[`-autocopy {on|off}`] - Auto Copy**

This parameter specifies whether data is to be automatically copied from a failing disk to a spare disk in the event of a predictive failure. The default setting is `on` . It is sometimes possible to predict a disk failure based on a pattern of recovered errors that have occurred. In such cases, the disk reports a predictive failure. If this option is set to `on`, the system initiates Rapid RAID Recovery to copy data from the failing disk to an available spare disk. When data is copied, the disk is marked as failed and placed in the pool of broken disks. If a spare is not available, the node continues to use the disk until it fails. If the option is set to `off`, the disk is immediately marked as failed and placed in the pool of broken disks. A spare is selected and data from the missing disk is reconstructed from other disks in the RAID group. The disk does not fail if the RAID group is already degraded or is being reconstructed. This ensures that a disk failure does not lead to the failure of the entire RAID group.

**[`-autoassign {on|off}`] - Auto Assign**

This parameter specifies whether automatic assignment of unowned disks is enabled or disabled. The default setting is `on` . This parameter is used to set both a node-specific and a cluster-wide disk option.

**[`-autoassign-policy {default|bay|shelf|stack}`] - Auto Assignment Policy**

This parameter defines the granularity at which auto assign should work. This option is ignored if the `-autoassign` option is off. Auto assignment can be done at the stack/loop, shelf, or bay level. The possible values for the option are `default`, `stack`, `shelf`, and `bay`. The default value is platform dependent. It is `stack` for all non-entry platforms and single-node systems, whereas it is `bay` for entry-level platforms.

**Examples**

The following example sets the background firmware update setting to `on` for all disks belonging to a node named `node0`:

```
cluster1::> storage disk option modify -node node0 -bkg-firmware-update on
```

The following example shows how to enable auto assignment for the disks on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign on
cluster1::> storage disk option show
Node           BKg. FW. Upd.  Auto Copy      Auto Assign      Auto Assign
Policy
-----
node1           on              on              on                default
node2           on              on              off               default
2 entries were displayed.
```

The following example shows how to modify the auto assignment policy on `node1`:

```
cluster1::> storage disk option modify -node node1 -autoassign-policy bay
cluster1::> storage disk option show
```

Node	BKg. FW. Upd.	Auto Copy	Auto Assign	Auto Assign Policy
node1	on	on	on	bay
node2	on	on	off	default

2 entries were displayed.

## storage disk option show

Display a list of disk options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage disk option show` command displays the settings of the following disk options:

- Background firmware update
- Automatic copying of data to a spare disk in the event of a predictive failure
- Automatic assignment of disks
- Policy that governs automatic assignment of unowned disks

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the node that owns the disks. If this parameter is not specified, the command displays information about the disk options on all the nodes.

**[-bkg-firmware-update {on|off}] - Background Firmware Update**

Selects the disks that match this parameter value.

**[-autocopy {on|off}] - Auto Copy**

Selects the disks that match this parameter value.

**[-autoassign {on|off}] - Auto Assign**

Displays the auto assignment status of unowned disks. The default value is `on`.

## **[`-autoassign-policy {default|bay|shelf|stack}`]] - Auto Assignment Policy**

Selects the disks that match the automatic assignment policy value:

- Default
- Stack/loop
- Shelf
- Bay

### **Examples**

The following example displays disk-option settings for disks owned by all nodes in the cluster:

```
cluster1::> storage disk option show
Node           BKg. FW. Upd.  Auto Copy      Auto Assign    Auto Assign
Policy
-----
node0          on              on              on             default
node1          on              on              on             stack
node2          on              on              on             bay
node3          on              on              on             bay
4 entries were displayed.
```

## **storage encryption commands**

### **storage encryption disk destroy**

Cryptographically destroy a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

The `storage encryption disk destroy` command cryptographically destroys a self-encrypting disk (SED), making it incapable of performing I/O operations. This command performs the following operations:

- Employs the inherent erase capability of SEDs to cryptographically sanitize the disk
- Permanently locks the disk to prevent further data access
- Changes the data and FIPS authentication keys to random values that are not recorded except within the SED.

Use this command with extreme care. The only mechanism to restore the disk to usability (albeit without the data) is the [storage encryption disk revert-to-original-state](#) operation that is available only on disks that have the physical secure ID (PSID) printed on the disk label.

The destroy command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

Upon command completion, remove the destroyed SED from the system.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the disk you want to cryptographically destroy. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **[-force-all-states <true>] - Destroy All Matching Disks**

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [storage disk show](#) command. When you specify this parameter as *true*, it allows you to cryptographically destroy all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick destroy of all system disks if you use the `-disk` parameter with the asterisk wildcard (\*). If you destroy active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command cryptographically destroys the disk 1.10.20:

```
cluster1::> storage encryption disk destroy 1.10.20
```

```
Warning: This operation will cryptographically destroy 1 spare or broken
self-encrypting disks on 1 node.
```

```
You cannot reuse destroyed disks unless you revert
them to their original state using the PSID value.
```

```
To continue, enter
```

```
destroy disk
```

```
:destroy disk
```

```
Info: Starting destroy on 1 disk.
```

```
View the status of the operation by using the
"storage encryption disk show-status" command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk destroy 1.10.2*
```

Warning: This operation will cryptographically destroy 5 spare or broken self-encrypting disks on 1 node.

You cannot reuse destroyed disks unless you revert them to their original state using the PSID value.

To continue, enter

destroy disk

:yes

No disks destroyed.

```
cluster1::>
```

The following command quickly cryptographically destroys all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk destroy -force-all-states -disk *
```

Warning: This operation will cryptographically destroy 96 self-encrypting disks on 4 nodes.

To continue, enter

destroy disk

:destroy disk

Info: Starting destroy on 96 disks.

View the status of the operation by using the

xref:{relative\_path}storage-encryption-disk-show-status.html[storage encryption disk show-status] command.

```
cluster1::>
```

- [storage encryption disk show-status](#)
- [storage disk show](#)

## storage encryption disk modify

Modify self-encrypting disk parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk modify` command changes the data protection parameters of FIPS-certified self-encrypting disks (FIPS SEDs); it also modifies the FIPS-compliance AK (FIPS AK) of FIPS SEDs. The current data AK and FIPS AK of the device are required to effect changes to the respective AKs and FIPS compliance. The current and new AKs must be available from the key servers or onboard key management.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

To properly protect data at rest on a FIPS SED and place it into compliance with its FIPS certification requirements, set both the Data and FIPS AKs to a value other than the device's default key; depending on the device type, the default may be manufacture secure ID (MSID), indicated by a key ID with the special value `0x0`, or a null key represented by a blank AK. Verify the key IDs by using the [storage encryption disk show](#) and `storage encryption disk show-fips` commands.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SED or FIPS SED that you want to modify.

### **{ [-data-key-id <text>] - Key ID of the New Data Authentication Key**

This parameter specifies the key ID associated with the data AK that you want the SED to use for future authentications. When the provided key ID is the MSID, data at rest on the SED is not protected from unauthorized access. Setting this parameter to a non-MSID value automatically engages the power-on-lock protections of the device, so that when the device is power-cycled, the system must authenticate with the device using the AK to reenable I/O operations. You cannot specify the null default key; use MSID instead.

### **| [-fips-key-id <text>] - Key ID of the New Authentication Key for FIPS Compliance }**

This parameter specifies the key ID associated with the FIPS AK that you want the FIPS SED to apply to SED credentials other than the one that protects the data. When the value is not the MSID, these credentials are changed to the indicated AK, and other security-related items are set to conform to the FIPS certification requirements ("FIPS compliance mode") of the device. You may set the `-fips-key-id` to any one of the key IDs known to the system. The FIPS key ID may, but does not have to, be the same as the data key ID parameter. Setting `-fips-key-id` to the MSID key ID value disables FIPS compliance mode and restores the FIPS-related authorities and other components as required (other than data) to their default settings. A nonMSID FIPS-compliance key may be applied only to a FIPS SED.

## Examples

The following command changes both the AK and the power-cycle protection to values that protect the data at rest on the disk. Note that the `-data-key-id` and `-fips-key-id` parameters require one of the key IDs that appear in the output of the [security key-manager query](#) command.

```
cluster1::> storage encryption disk modify -data-key-id
6A1E21D800000000010000000000000F5A1EB48EF26FD6A8E76549C019F2350 -disk
2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the  
storage encryption disk show-status command.

The following command changes the FIPS AK and sets the device into FIPS-compliance mode. Note that the `-fips-key-id` parameter requires one of the key IDs that appear in the output of the [security key-manager query](#) command.

```
cluster1::> storage encryption disk modify -fips-key-id
6A1E21D8000000000100000000000005A1FB4EE8F62FD6D8AE6754C9019F35A 2.10.*
```

Info: Starting modify on 14 disks.  
View the status of the operation by using the  
storage encryption disk show-status command.

## storage encryption disk revert-to-original-state

Revert a self-encrypting disk to its original, as-manufactured state

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Some self-encrypting disks (SEDs) are capable of an operation that restores them as much as possible to their as-manufactured state. The `storage encryption disk revert-to-original-state` command invokes this special operation that is available only in SEDs that have the physical secure ID (PSID) printed on their labels.

The PSID is unique to each SED, meaning the command can revert only one SED at a time. The disk must be in a "broken" or "spare" state as shown by the output of the [storage disk show](#) command.

The operation in the SED accomplishes the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) and FIPS AK to the default values
- Resets the data locking controls

- Resets the power-on lock state to *false*
- Initializes other vendor-unique encryption-related parameters

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfail](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

The name of the SED to be reverted to its as-manufactured state. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **-psid <text> - Physical Secure ID**

The PSID printed on the SED label.

## Examples

The following command shows a SED being returned to its as-manufactured state:

```
cluster1::> storage encryption disk revert-to-original-state -disk 01.10.0
-psid AC65PYF8CG45YZABUQJKM98WV2VZGRLD
```

## storage encryption disk sanitize

Cryptographically sanitize a self-encrypting disk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk sanitize` command cryptographically sanitizes one or more self-encrypting disks (SEDs), making the existing data on the SED impossible to retrieve. This operation employs the inherent erase capability of SEDs to perform all of the following changes:

- Sanitizes all data by changing the disk encryption key to a new random value
- Sets the data authentication key (AK) to the default AK (manufacture secure ID/MSID or null, depending on the device type)

- Unlocks the data band
- Resets the power-on lock state to *false*

There is no method to restore the disk encryption key to its previous value, meaning that you cannot recover the data on the SED. Use this command with extreme care.

The sanitize command requires you to enter a confirmation phrase before proceeding with the operation.

The command releases the cluster shell after launching the operation. Monitor the output of the [storage encryption disk show-status](#) command for command completion.

When the operation is complete, it is possible to return the SED to service using the [storage disk unfail](#) command in *advanced* privilege mode. To do so, you might also need to reestablish ownership of the SED using the [storage disk assign](#) command.

## Parameters

### **-disk <disk path name> - Disk Name**

This parameter specifies the name of the SEDs you want to cryptographically sanitize. See the man page for the `storage disk modify` command for information about disk-naming conventions.

### **[-force-all-states <true>] - Sanitize All Matching Disks**

When this parameter is *false* or not specified, the operation defaults to spare and broken disks only, as reported in the output of the [storage disk show](#) command. When you specify this parameter as *true*, it allows you to cryptographically sanitize all matching disk names regardless of their state, including those in active use in aggregates. This allows a quick erasure of all system data if you use the `-disk` parameter with the asterisk wildcard (\*). If you sanitize active disks, the nodes might not be able to continue operation, and might halt or panic.

## Examples

The following command sanitizes the disk 1.10.20:

```
cluster1::> storage encryption disk sanitize 1.10.20
```

```
Warning: This operation will cryptographically sanitize 1 spare or broken
self-encrypting disk on 1 node.
```

```
To continue, enter
```

```
sanitize disk
```

```
:sanitize disk
```

```
Info: Starting sanitize on 1 disk.
```

```
View the status of the operation using the
```

```
xref:{relative_path}storage-encryption-disk-show-status.html[storage
encryption disk show-status] command.
```

```
cluster1::>
```

If you do not enter the correct confirmation phrase, the operation is aborted:

```
cluster1::> storage encryption disk sanitize 1.10.2*
```

```
Warning: This operation will cryptographically sanitize 5 spare or broken  
self-encrypting disks on 1 node.
```

```
To continue, enter
```

```
    sanitize disk
```

```
    :yes
```

```
No disks sanitized.
```

```
cluster1::>
```

The following command quickly cryptographically sanitizes all system disks, including those in active use in aggregates and shared devices:

```
cluster1::> storage encryption disk sanitize -force-all-states -disk *
```

```
Warning: This operation will cryptographically sanitize 96  
self-encrypting disks on 4 nodes.
```

```
To continue, enter
```

```
    sanitize disk
```

```
:sanitize disk
```

```
Info: Starting sanitize on 96 disks.
```

```
View the status of the operation by using the
```

```
    xref:{relative_path}storage-encryption-disk-show-status.html[storage  
encryption disk show-status] command.
```

```
cluster1::>
```

## storage encryption disk show-status

Display status of disk encryption operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage encryption disk show-status` command displays the results of the latest destroy ,

modify, or sanitize operation of the storage encryption disk command family. Use this command to view the progress of these operations on self-encrypting disks (SEDs).

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node Name**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter.

**[-is-fips-support {true|false}] - Node Supports FIPS Disks**

If you specify this parameter, the command displays disk encryption status for the nodes that match this parameter (*true* means the node supports FIPS-certified self-encrypting drives).

**[-latest-op <Storage Disk Encryption Operation>] - Latest Operation Requested**

If you specify this parameter, the command displays disk encryption status for the nodes with a most recent storage encryption disk operation that matches this parameter (one of `destroy`, `modify`, `revert-to-original-state`, `sanitize`, or `unknown`).

**[-op-start-time <MM/DD/YYYY HH:MM:SS>] - Operation Start Time**

Selects the nodes with operation start times that match this parameter.

**[-op-execute-time <integer>] - Execution Time in Seconds**

If you specify this parameter, the command displays disk encryption status for the nodes with operation execution time that matches this parameter. The operation may be partial or completed.

**[-disk-start-count <integer>] - Number of Disks Started**

If you specify this parameter, the command displays disk encryption status for the nodes that started this number of SEDs in their latest operation.

**[-disk-done-count <integer>] - Number of Disks Done**

Selects the nodes that report this number of SEDs having completed the latest operation, successfully or not.

**[-disk-success-count <integer>] - Number of Disks Successful**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that successfully completed the latest operation. When the operation is finished, if the success count is not the same as the started count, some additional detail is available using the `-instance` or `-node` parameters.

**[-disk-no-key-id-count <integer>] - Number of Disks with Key ID Not Found**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because Data ONTAP could not find the Key IDs associated with the required authentication key of the SED.

### **[-disk-no-authent-count <integer>] - Number of Disks Not Authenticated**

If you specify this parameter, the command displays disk encryption status for the nodes that report this number of SEDs that failed the latest operation because the identified Authentication Key could not authenticate with the SED.

### **Examples**

When no operation has been requested since node boot, the status for that node is empty. If you enter a node name, the output is in the same format as for the `-instance` parameter.

```
cluster1::> storage encryption disk show-status -node node
Node Name: node
  Node Supports FIPS-certified Self-Encrypting Disks: true
    Latest Operation Requested: unknown
      Operation Start Time: -
        Execution Time in Seconds: -
          Number of Disks Started: -
            Number of Disks Done: -
              Number of Disks Successful: -
                Number of Disks with Key ID Not Found: -
                  Number of Disks Not Authenticated: -
```

Once an operation begins, the status is dynamic until all devices have completed. When disks are modified, sanitized, or destroyed, sequential executions of `storage encryption disk show-status` appear as in this example that shows the progress of a modify operation on three SEDs on each node of a two-node cluster:

```
cluster1::> storage encryption disk show-status
```

	SED	Latest	Start	Execution	Disks	Disks
Disk						
Node	Support	Request	Timestamp	Time (sec)	Begun	Done
Successful						
node0	true	modify	9/22/2014 13:58:53	4	3	0
node10	true	modify	9/22/2014 13:58:53	4	3	0

```
cluster1::> storage encryption disk show-status
```

	SED	Latest	Start	Execution	Disks	Disks
Disk						
Node	Support	Request	Timestamp	Time (sec)	Begun	Done
Successful						
node3	true	modify	9/22/2014 13:58:53	7	3	3
node13	true	modify	9/22/2014 13:58:53	7	3	3

## storage encryption disk show

### Display self-encrypting disk attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage encryption disk show` command displays information about self-encrypting disks (SEDs), including FIPS-certified SEDs. By default, the command displays the following information about all SEDs:

- Disk name
- The protection mode of the SED
- The key ID associated with the data authentication key (data AK)

You can use the following parameters together with the `-disk` parameter to narrow the selection of displayed SEDs or the information displayed about them.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **[`-fips`] ]**

If you specify this parameter, the command displays the key ID associated with the FIPS-compliance authentication key ("FIPS AK") instead of the data key ID.

### **[`-instance`] }**

If you specify this parameter, the command displays detailed disk information about all disks, or only those specified by a `-disk` parameter.

### **[`-disk <disk path name>`] - Disk Name**

If you specify this parameter, the command displays information about the specified disks. If you specify a single disk path name, the output is the same as when you use the `-instance` parameter. See the man page for the `storage disk modify` command for information about disk-naming conventions. Default is all self-encrypting disks.

### **[`-container-name <text>`] - Container Name**

This parameter specifies the container name associated with a SED. If you specify an aggregate name or other container name, only the SEDs in that container are displayed. See the man page for the [storage disk show](#) command for a description of the container name. Use the [storage aggregate show-status](#) and [storage disk show](#) commands to determine which aggregates the SEDs are in.

### **[`-container-type {aggregate | broken | foreign | labelmaint | maintenance | mediator | remote | shared | spare | unassigned | unknown | unsupported}`] - Container Type**

This parameter specifies the container type associated with a SED. If you specify a container type, only the SEDs with that container type are displayed. See the man page for the [storage disk show](#) command for a description of the container type.

### **[`-data-key-id <text>`] - Key ID of the Current Data Authentication Key**

This parameter specifies the key ID associated with the data AK that the SED requires for authentication with the data-protection authorities in the SED. The special key ID `0x0` indicates that the current data AK of the SED is the default manufacture secure ID (MSID) that is not secret. Some devices employ an initial null default AK that appears as a blank data-key-id; you cannot specify a null data-key-id value. To properly protect data at rest on the device, modify the data AK using a key ID that is not the MSID. When you modify the data AK with a non-MSID key ID, the system automatically sets the device's power-on lock enable control so that authentication with the data AK is required after a device power-cycle. Use [storage encryption disk modify-data-key-id`key-id](#) to protect the data. Use [storage encryption disk modify-fips-key-id`key-id](#) to place the SED into FIPS-compliance mode.

### **[`-fips-key-id <text>`] - Key ID of the Current FIPS Authentication Key**

This parameter specifies the key ID associated with the FIPS authentication key ("FIPS AK") that the system must use to authenticate with FIPS-compliance authorities in FIPS-certified SEDs. This parameter may not be set to a non-MSID value in SEDs that are not FIPS-certified SED.

### **[`-is-power-on-lock-enabled {true|false}`] - Is Power-On Lock Protection Enabled?**

This parameter specifies the state of the SED control that determines whether the SED requires authentication with the data AK after a power-cycle. The system enables this control parameter automatically when you use the [storage encryption disk modify-data-key-id](#) command to set the data AK to a value other than the MSID. Data is protected only when this parameter is `true` and the data AK is not the MSID. Compare with the values of the `-protection-mode` parameter below.

## **[`-protection-mode <text>`] - Mode of SED Data and FIPS-Compliance Protection**

The protection mode that the drive is in:

- open - data is unprotected; SED is not in FIPS-compliance mode
- data - data is protected; SED is not in FIPS-compliance mode
- part - data is unprotected; SED is in FIPS-compliance mode
- full - data is protected; SED is in FIPS-compliance mode

## **[`-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}`] - Disk Type**

This parameter selects the drive type to include in the output.

## **Examples**

The following command displays information about all SEDs:

```
cluster1::> storage encryption disk show
Disk      Mode Data Key ID
-----
-----
0.0.0     open 0x0
0.0.1     part 0x0
0.0.2     data
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.0    open
0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1    part
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2    full
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note in the example that only disk 1.10.2 is fully protected with FIPS mode, power-on-lock enable, and an AK that is not the default MSID.

The following command displays information about the protection mode and FIPS key ID for all SEDs:

```
cluster1::> storage encryption disk show -fips
Disk      Mode FIPS-Compliance Key ID
-----
-----
0.0.0     open 0x0
0.0.1     part
0A53ED2A000000000100000000000000C1B27AD3F0DB8891375AED2F34D0BBED
0.0.2     data 0x0
1.10.0    open
0A53ED2A000000000100000000000000BEDC1B27AD3F0DB8891375AED2F34D0B
1.10.1    part
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
1.10.2    full
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
[...]
```

Note again that only disk 1.10.2 is fully protected with FIPS-compliance mode set, power-on-lock enabled, and a data AK that is not the default MSID.

The following command displays the individual fields for disk 1.10.1:

```
cluster1::> storage encryption disk show -disk 1.10.1
Disk Name: 1.10.1
                                Container Name: aggr0
                                Container Type: shared
                                Is SED FIPS-certified?: true
Key ID of the Current Data Authentication Key:
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
Key ID of the Current FIPS Authentication Key:
0A9C9CFC000000000100000000000000345CFD1BAD310CA8EDB377D439FB5C9A
                                Is Power-On Lock Protection Enabled?: true
Mode of SED Data and FIPS-Compliance Protection: open
```

## storage errors commands

### storage errors show

Display storage configuration errors.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage errors show` command displays configuration errors with back end storage arrays.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-uid <text>] - UID**

Selects the disks that match this parameter value.

**[-array-name <array name>] - Array Name**

Selects the disks that have the specified name for the storage array that is connected to the cluster.

**[-node {<nodename>|local}] - Controller Name**

Selects the disks that match this parameter value.

**[-disk <disk path name>] - Disk**

Selects the disks that match this parameter value.

**[-serial-number <text>] - Serial Number**

Selects the disks that match this parameter value.

**[-error-id <integer>,...] - Error ID**

Selects the disks with error-id values that match this parameter value.

**[-error-type**

**{onepath|onedomain|control|foreign|toobig|toosmall|invalidblocksize|targetasymmap|deviceasymmap|failovermisconfig|unknown|netapp|fwdownrev|qualfail|diskfail|notallflashdisk}] - Error Type**

Selects the disks with error types values that match this parameter value.

## Examples

The following example displays configuration errors seen in the system:

```
cluster1::> storage errors show
Disk: vnv3070f20b:vnci9124s54:1-24.126L23
-----
vnci9124s54:1-24.126L23 (600a0b800019e999000036b24bac3983): This array LUN
reports an invalid block size and is not usable. Only a block size of 512
is supported.
```

## storage failover commands

### storage failover giveback

Return failed-over storage to its home node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage failover giveback` command returns storage that has failed over to a node's partner back to the home node. This operation fails if other resource-intensive operations (for instance, system dumps) are running and make the giveback operation potentially dangerous or disruptive. Some options are available only at the advanced privilege level and higher. Run the [storage failover show-giveback](#) command to check the status of giveback operations.

#### NOTE:

- If the system ID of the partner has changed while the node is in takeover mode, the `storage failover giveback` command updates the ownership of the partner's disks to the new system ID while giving back.
- If the giveback operation fails due to the operation being vetoed by a subsystem, check the syslog or EMS output for a subsystem-specific reason for the abort. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `override-vetoes` option in the `storage failover giveback` command to force the giveback.
- If the giveback operation fails because the node cannot communicate with its partner, check the EMS output for the corrective action. Follow the corrective action and then reissue the `storage failover giveback` command. If you cannot perform the corrective action, then use the `-require-partner -waiting false` option in the `storage failover giveback` command to force the giveback. This parameter is available only at the advanced privilege level and higher.
- If the node does not receive notification that the partner has brought online the given-back aggregate and its volumes, the [storage failover show-giveback](#) command displays the giveback status for the aggregate as failed. A possible reason for this failure is that the partner is overloaded and slow in bringing the aggregate online. Run the [storage aggregate show](#) command to verify that the aggregate and its volumes are online on the partner node. The node will not attempt the giveback operation for remaining aggregates. To force the giveback, use the `-require-partner-waiting false` option in the `storage failover giveback` command. This parameter is available only at the advanced privilege level and higher.

## Parameters

### **{ -ofnode {<nodename>|local} - Node to which Control is Givenback**

Specifies the node whose storage is currently taken over by its partner and will be given back by the giveback operation.

### **| -fromnode {<nodename>|local} - Node Initiating Giveback }**

Specifies the node that currently holds the storage that is to be returned to the partner node.

### **[-require-partner-waiting {true|false}] - Require Partner in Waiting (privilege: advanced)**

If this optional parameter is used and set to false, the storage is given back regardless of whether the partner node is available to take back the storage or not. If this parameter is used and set to true, the storage will not be given back if the partner node is not available to take back the storage. If this parameter is not used, the behavior defaults to the setting of the `-check-partner` option set with the [storage failover modify](#) command.

### **[-override-vetoes <true>] - Override All Vetoes**

If this optional parameter is used, the system overrides veto votes during a giveback operation. If this parameter is not used, the system does not proceed with a giveback if it is vetoed. This parameter, if used, can only be set to true.

### **[-only-cfo-aggregates <true>] - Giveback Only CFO Aggregates**

If this optional parameter is used, giveback of only the CFO aggregates (root aggregate and CFO style data aggregates) will be attempted. If this parameter is not used, giveback of all the aggregates (CFO and SFO aggregates) will be attempted. This parameter, if used, can only be set to true.

## Examples

The following example gives back storage that is currently held by a node named node1. The partner must be available for the giveback operation to occur.

```
node::> storage failover giveback -fromnode node1
```

The following example gives back only the CFO aggregates to a node named node2 (the aggregates are currently held by a node named node1). The partner must be available for the giveback operation to occur, and the veto-giveback process can be overridden.

```
node::> storage failover giveback -ofnode node2  
-override-vetoes true -only-cfo-aggregates true
```

- [storage aggregate show](#)
- [storage failover modify](#)

## storage failover modify

### Modify storage failover attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage failover modify` command changes the storage-failover options for a node. Some options are available only at the advanced privilege level and higher.

#### Parameters

**-node {<nodename>|local} - Node**

This specifies the node whose storage-failover options are to be modified.

**{ [-enabled {true|false}] - Takeover Enabled**

This optionally specifies whether storage failover is enabled. The default setting is `true`.

**[-mode {ha|non\_ha}] - HA Mode }**

This specifies whether the node is set up in high-availability mode or stand-alone mode. If the node is a member of a high-availability configuration, set the value to `ha`. If the node is stand-alone, set the value to `non_ha`. Before setting the HA mode, you must complete the platform dependent steps to set up the system in a stand-alone or HA configuration as shown in the documentation for your platform.

**[-auto-giveback {true|false}] - Auto Giveback Enabled**

This optionally specifies whether automatic giveback operations are enabled. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation. The default setting is `false`, except for two-node clusters where the default setting is `true`.

**[-detection-time <integer>] - Takeover Detection Time (secs)**

This optionally specifies the amount of time, in seconds, that a node remains unresponsive before its partner initiates a takeover operation. Possible values range from 10 to 180 seconds. The default setting is 15 seconds.

**[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)**

This optionally specifies whether the node automatically takes over for its partner node if the partner node fails. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

**[-onpanic {true|false}] - Takeover on Panic Enabled**

This optionally specifies whether the node automatically takes over for its partner node if the partner node panics. The default setting is `true`. Changing this parameter on one node automatically makes the same change on its partner node.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**

This optionally specifies whether the node takes over for its partner node if the partner node fails within 60 seconds of starting up; the time period is modifiable by using the `-short-uptime` parameter. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

**[`-short-uptime <integer>`] - Short Uptime (secs) (privilege: advanced)**

This optionally specifies the time period used by the `-onshort-uptime` parameter. The default setting is 60 seconds. This parameter is available only at the advanced privilege level and higher.

**[`-attempts <integer>`] - Number of Giveback Attempts (privilege: advanced)**

This optionally specifies the number of times the node attempts an automatic giveback operation within 60 minutes; the time period is modifiable by using the `-attempts-time` parameter. The default setting is 2 attempts. This parameter is available only at the advanced privilege level and higher.

**[`-attempts-time <integer>`] - Giveback Attempts Period (minutes) (privilege: advanced)**

This optionally specifies the time period used by the `-attempts` parameter. The default setting is 60 minutes. This parameter is available only at the advanced privilege level and higher.

**[`-propagate {true|false}`] - Propagate Status via Mailbox (privilege: advanced)**

This optionally specifies whether storage-failover status is communicated via mailbox disks. The default setting is `true`. This parameter is available only at the advanced privilege level and higher.

**[`-read-interval <integer>`] - Node Status Read Interval (secs) (privilege: advanced)**

This optionally specifies, in seconds, how frequently the node reads its partner node's status from the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**[`-write-interval <integer>`] - Node Status Write Interval (secs) (privilege: advanced)**

This optionally specifies, in seconds, how frequently the node writes its status to the mailbox disks. The default setting is 5 seconds. This parameter is available only at the advanced privilege level and higher.

**[`-onreboot {true|false}`] - Takeover on Reboot Enabled**

This optionally specifies whether the node automatically takes over for its partner if the partner reboots. The default setting is `true`. Takeover can occur if the partner exceeds the expected time to reboot even when this option is set to `false`. The expected time to reboot is different for different platforms. The minimum expected time to reboot is 180 seconds. The `-inhibit-takeover` option of the [system node reboot](#) command overrides this option: if a node is rebooted with `-inhibit-takeover` set to `true` then takeover does not occur, even if the `takeover on reboot` option is `true`. If a node does takeover due to the partner rebooting, then it will automatically giveback after the reboot, even if the `-auto-giveback` option is set to `false`. This is non-persistent behavior: if the node does takeover due to partner reboot and then itself reboots (prior to giveback) then it will not automatically giveback if the `-auto-giveback` option is set to `false`.

**[`-delay-seconds <integer>`] - Delay Before Auto Giveback (secs)**

This optionally specifies the minimum time that a node will stay in takeover state prior to performing an automatic giveback. If the taken over node recovers quickly (for example, if the takeover was due to a reboot), by delaying the giveback for a few minutes the outage during the takeover and giveback can be reduced to two short outages instead of one longer one. The allowed range is 0 to 600, inclusive. The default setting is 600 seconds. This option affects all types of auto-giveback. This parameter is available only at the advanced privilege level and higher.

This delay does not affect manual giveback.

**[`-hwassist {true|false}`] - Hardware Assist Enabled**

This optionally specifies whether the hardware assist feature is enabled. If set to `true` this feature helps in

fast takeover detection times in certain cases.

**`[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP`**

This optionally specifies the Ip address on which the partner node receives hardware assist alerts. For the hardware assist feature to be active, the value of this option should be equal to partner's node management Ip address.

**`[-hwassist-partner-port <integer>] - Partner's Hwassist Port`**

This optionally specifies the port number on which partner node listens to hardware assist alerts. It is recommended to have this value to be between 4000-4500. The default value is 4444.

**`[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)`**

This optionally specifies, in seconds, how frequently the hardware assist hardware on a node sends a heartbeat to its partner. The default value is 180.

**`[-hwassist-retry-count <integer>] - Hwassist Retry Count`**

This optionally specifies the number of times we repeat sending an hardware assist alert. The default value is 2.

**`[-auto-giveback-after-panic {true|false}] - Auto Giveback After Takeover On Panic`**

This optionally specifies whether a node should attempt automatic giveback operations if takeover was because of a disruption in the partner's operation. An automatic giveback operation is invoked when one node of a failover pair is in takeover mode and the failed node is repaired and restarts. When the repaired node boots, the node in takeover mode detects this and initiates a giveback operation automatically. The default setting is `true`.

**`[-aggregate-migration-timeout <integer>] - Aggregate Migration Timeout (secs) (privilege: advanced)`**

This optionally specifies the amount of time, in seconds, the source node has to wait for the destination node to complete the aggregate migration before declaring the migration as failed. The default setting is 120 seconds.

## Examples

The following example enables the storage-failover service on a node named node0:

```
node::> storage failover modify -node node0 -enabled true
```

The following examples enable storage-failover takeover on a short uptime of 30 seconds on a node named node0:

```
node::*> storage failover modify -node node0 -onshort-uptime true -short-uptime 30
```

## storage failover show-giveback

### Display giveback status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage failover show-giveback` command displays information about the giveback status of high-availability (HA) partner aggregates. The command displays the following information when no parameters are specified:

- Node name
- Partner aggregate name
- Giveback Status

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular aggregate, run the command with the `-aggregate aggregate_name`` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is used, the command displays information about the giveback status of the aggregates belonging to the HA partner of the specified node.

**[-aggregate <text>] - Aggregate**

If this parameter is used, the command displays information about the giveback status of the specified aggregate.

**[-giveback-status <text>,...] - Aggregates Giveback State**

If this parameter is used, the command displays information about the aggregates with the specified giveback status.

**[-destination <text>] - Destination for Giveback**

If this parameter is used, the command displays information about the giveback status of the aggregates whose destination after the giveback is the specified node.

## Examples

The following example displays information about giveback status on all nodes:

```
node::> storage failover show-giveback
           Partner
Node      Aggregate      Giveback Status
-----
node0     -              No aggregates to give back
node1     -              No aggregates to give back
node2     -              No aggregates to give back
node3     -              No aggregates to give back
4 entries were displayed.
```

## storage failover show-takeover

### Display takeover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover show-takeover` command displays information about the takeover status of nodes in a cluster. The command also displays the takeover status of aggregates being taken over. During each phase of takeover, the takeover node and the node being taken over display their takeover status and the status of the aggregates being taken over. The command displays the following information when no parameters are specified:

- Node name
- Node takeover status - This contains a descriptive information about the phase of takeover.
- Aggregate
- Aggregate takeover status - This contains the following information:
  - Takeover status of the aggregate, such as "Done", "Failed", "In progress" and "Not attempted yet".
  - Reason for an aggregate takeover failure.
  - Corrective action, in case of an aggregate takeover failure.

You can specify additional parameters to display only the information that matches those parameters. For example, to display information only about a particular node, run the command with the ``-node` `_node_name_`` parameter.

Parameters

**{ [-fields <fieldname>,...]**

If this parameter is specified, the command displays the specified fields for all nodes, in column style output.

**| [-instance ] }**

If this parameter is specified, the command displays the same detailed information as for the -node parameter, but for all nodes.

**[-node {<nodename>|local}] - Node Name**

If this parameter is specified, the command displays information about the takeover status of the specified node, and the takeover status of the aggregates being taken over.

**[-node-takeover-status <text>] - Node's Takeover Status**

If this parameter is specified, the command displays information about the takeover status of the nodes with the specified node-takeover-status. The command also displays the takeover status of the aggregates belonging to the node being taken over.

**[-aggregate <text>] - Aggregate Being Taken Over**

If this parameter is specified, the command displays information about the takeover status of the specified aggregate, and the takeover status of the nodes containing the specified aggregate.

**[-aggregate-takeover-status <text>] - Aggregate's Takeover Status**

If this parameter is specified, the command displays information about the takeover status of the aggregates with the specified aggregate takeover status, and the takeover status of the nodes containing those aggregates.

Examples

The following example shows the takeover status of two nodes, nodeA and nodeB, in an High Availability (HA) pair, when both are in normal mode; neither node has taken over its HA partner. In this case, there is no takeover status for the aggregates.

```
cluster1::> storage failover show-takeover
Node           Node Status           Aggregate           Takeover Status
-----
nodeA           Takeover not
                  attempted.
                  -
nodeB           Takeover not
                  attempted.
                  -
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA is in the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
```

Node	Node Status	Aggregate	Takeover Status
-----			
nodeA	Optimized takeover of partner in progress. Partner, ("nodeB"), is relocating its SFO aggregates. Run the command "storage failover show-takeover -node nodeB" to display the relocation status of the partner.		
	-	-	
nodeB	Being taken over.		
	aggr1	In progress, Module: backup.	
	aggr2	Not attempted yet	
	CFO aggregates	Not attempted yet.	

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO phase of an optimized takeover of nodeB (but has not completed the CFO phase of the optimized takeover). In this case, nodeA has information about the takeover status of nodeB's aggregates.

```
cluster1::> storage failover show-takeover
```

ode	Node Status	Aggregate	Takeover Status
-----			
odeA	Partner has relocated its aggregates. Takeover in progress.		
	aggr1	Done	
	aggr2	Done	
	CFO aggregates	In progress.	
odeB	Relocated aggregates to partner. Waiting for partner to takeover.		
	aggr1	Done	
	aggr2	Done	
	CFO aggregates	Not attempted yet.	

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has completed the SFO and CFO phases of an optimized takeover of nodeB. In this case, nodeA has information about the takeover status of nodeB's aggregates. Since nodeB is not operational, an Remote Procedure Call(RPC) error is indicated in the command output.

```
cluster1::> storage failover show-takeover
ode      Node Status      Aggregate      Takeover Status
-----
odeA      Partner has
           relocated its
           aggregates. In
           takeover.
           aggr1          Done
           aggr2          Done
           CFO aggregates Done.
Warning: Unable to list entries on node nodeB. RPC: Port mapper failure -
RPC:
           Timed out
```

The following example shows the takeover status of two nodes, nodeA and nodeB, in an HA pair, when nodeA has aborted the SFO phase of an optimized takeover of nodeB. In this case, nodeA does not have information about the takeover status of nodeB's aggregates.

```

cluster1::> storage failover show-takeover
ode      Node Status      Aggregate      Takeover Status
-----
odeA      Optimized takeover
of partner aborted.
Run the command
"storage failover
show-takeover -node
nodeB" to display the
relocation status of
the partner.
-
odeB      Optimized takeover
by partner aborted.
aggr1      Failed: Destination node did
not online the aggregate on
time. To takeover the
remaining aggregates, run the
"storage failover takeover
-ofnode nodeB
-bypass-optimization true"
command. To giveback the
relocated aggregates, run the
"storage failover giveback
-ofnode nodeB" command.
aggr2      Not attempted yet
CFO aggregates Not attempted yet.

```

## storage failover show

### Display storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover show` command displays information about storage-failover configurations. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether storage failover is possible.
- The current state of storage failover. If the takeover is disabled the appropriate reason would be displayed.

To display detailed information about storage failover on a specific node, run the command with the `-node`

parameter. The detailed view adds the following information:

- Node NVRAM ID.
- Partner NVRAM ID.
- Whether storage failover is enabled.
- Whether the storage-failover interconnect is available.
- Status of individual storage-failover interconnect links.
- Type and vendor of the storage-failover interconnect.
- Partner State
- Status codes from the takeover-by-partner process. Possible values include:
  - NVRAM\_DOWN
  - OPERATOR\_DISABLE\_NVRAM
  - PARTNER\_RESET
  - FM\_TAKEOVER
  - NVRAM\_MISMATCH
  - OPERATOR\_DENY
  - CLUSTER\_DISABLE
  - VERSION
  - SHELF\_HOT
  - REVERT\_IN\_PROGRESS
  - HALT\_NOTKOVER
  - TAKEOVER\_ON\_PANIC
- Reasons why takeover is not possible, if applicable. Possible values include:
  - NOT\_INIT
  - DISABLED
  - DEGRADED
  - MBX\_UNKNOWN
  - FM\_VERSION
  - PARTNER\_DISABLED
  - OPERATOR\_DENY
  - NVRAM\_MISMATCH
  - VERSION
  - IC\_ERROR
  - BOOTING
  - SHELF\_HOT
  - PARTNER\_REVERT\_IN\_PROGRESS
  - LOCAL\_REVERT\_IN\_PROGRESS
  - PARTNER\_TAKEOVER

- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER
- Time until takeover, in seconds.
- Time until auto giveback, in seconds.
- Delay for auto giveback, in seconds.
- List of local mailbox disks.
- List of partner mailbox disks.
- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover.

You can specify additional parameters to select the displayed information. For example, to display information only about storage-failover configurations whose interconnect is down, run the command with ``-interconnect-up false``.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-options ]**

Displays the following information:

- Node name
- Whether automatic giveback operations are enabled
- Whether long-running operations are terminated when an automatic giveback operation is initiated
- Whether the node checks its partner's readiness before initiating a giveback operation
- The time, in seconds, that the node remains unresponsive before its partner initiates a takeover operation
- Whether the node automatically takes over for its partner if the partner fails
- Whether the node automatically takes over for its partner if the partner panics
- Whether the node automatically takes over for its partner if the partner reboots
- whether Hardware Assisted Takeover is enabled
- Ip address on which the partner node listens to the Hardware Assist alerts
- Port number on which the partner node listens to the Hardware Assist alerts

- Whether operator-initiated planned takeover will be optimized for performance by relocating SFO (non-root) aggregates serially to the partner prior to takeover

If this parameter is specified when the privilege level is set to advanced or higher, the command displays the information in the previous list and the following additional information:

- Whether the node takes over for its partner if its partner fails after a period of time, which is listed in the following field
- The number of seconds before the node takes over for its partner
- The number of times the node attempts an automatic giveback operation within a period of time
- The number of minutes in which the automatic giveback attempts can occur
- Whether storage-failover status is communicated via mailbox disks
- The interval at which the node reads its partner node's status from the mailbox disks
- The interval at which the node writes its status to the mailbox disks
- '
  - The interval at which Hardware assist h/w sends a heartbeat
  - The number of times the Hardware assist alert is sent

#### | **[ -takeover-status ]**

Displays the following information:

- Node name
- Partner name
- Takeover enabled
- Takeover possible
- Interconnect up
- State
- Node NVRAM ID
- Partner NVRAM ID
- Reason Takeover Not Possible By Partner
- Reason Takeover Not Possible
- Time Until Takeover

#### | **[ -advanced ] (privilege: advanced)**

Displays the following information:

- Node name
- Whether kill messages are issued during a takeover operation
- Whether the node controls its partner's storage aggregates
- The time when firmware notification was received
- The time when booting notification was received
- The time at which the last takeover or giveback operation occurred, in microseconds

- The number of times the failover log was unsynchronized

| **[-iotime ] (privilege: advanced)**

Displays the following information:

- Node name
- Primary normal I/O time
- Primary transition I/O time
- Backup normal I/O time
- Backup transition I/O time

| **[-mailbox-status ] (privilege: advanced)**

Displays the following information:

- Node name
- Primary mailbox status
- Backup mailbox status

| **[-more-options ] (privilege: advanced)**

Displays the following information:

- Node name
- Whether takeover on short uptime is enabled
- Short uptime, in seconds
- Number of giveback attempts
- Interval of giveback attempts, in minutes
- Whether the primary mailbox is online
- Mailbox status read interval, in seconds
- Mailbox status write interval, in seconds

| **[-progress ] (privilege: advanced)**

Displays the following information:

- Node name
- Maximum resource-table index number
- Current resource-table index number
- Current resource-table entry

| **[-timeout ] (privilege: advanced)**

Displays the following information:

- Node name
- Fast timeout
- Slow timeout

- Mailbox timeout
- Connection timeout
- Operator timeout
- Firmware timeout
- Dump-core timeout
- Booting timeout
- Reboot timeout

**| [-transit ] (privilege: advanced)**

Displays the following information:

- Node name
- Transit Timer Enabled
- Transit Timeout

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes whose name matches this parameter value.

**[-partner-name <text>] - Partner Name**

Selects the nodes that have the specified partner-name setting.

**[-nvramid <integer>] - Node NVRAM ID**

Selects the nodes that have the specified NVRAM ID setting.

**[-partner-nvramid <integer>] - Partner NVRAM ID**

Selects the nodes that have the specified partner NVRAM ID setting.

**[-enabled {true|false}] - Takeover Enabled**

Selects the nodes that have the specified takeover-enabled setting.

**[-mode {ha|non\_ha}] - HA Mode**

Selects the nodes that have the specified HA-mode setting. If the value is set to *ha* then the node is a member of a storage-failover configuration. If it is set to *non-ha* then it is in a stand alone configuration.

**[-possible {true|false}] - Takeover Possible**

Selects the nodes that have the specified failover-possible setting.

**[-reason <text>, ...] - Reason Takeover not Possible**

Selects the nodes that have the specified reason-not-possible setting. Possible values include:

- NOT\_INIT
- DISABLED
- DEGRADED

- MBX\_UNKNOWN
- FM\_VERSION
- PARTNER\_DISABLED
- OPERATOR\_DENY
- NVRAM\_MISMATCH
- VERSION
- IC\_ERROR
- BOOTING
- SHELF\_HOT
- PARTNER\_REVERT\_IN\_PROGRESS
- LOCAL\_REVERT\_IN\_PROGRESS
- PARTNER\_TAKEOVER
- LOCAL\_TAKEOVER
- HALT\_NOTKOVER
- LOG\_UNSYNC
- UNKNOWN
- WAITING\_FOR\_PARTNER
- LOW\_MEMORY
- HALTING
- MBX\_UNCERTAIN
- NO\_AUTO\_TKOVER

**`[-interconnect-up {true|false}] - Interconnect Up`**

Selects the nodes that have the specified interconnect-up setting.

**`[-interconnect-links <text>] - Interconnect Links`**

Selects the nodes that have the specified interconnect-links setting.

**`[-interconnect-type <text>] - Interconnect Type`**

Selects the nodes that have the specified interconnect-type setting.

**`[-state-description <text>] - State Description`**

Selects the nodes that have the specified state-description setting.

**`[-partner-state <text>] - Partner State`**

Selects the nodes that have the specified partner-state setting. Possible values include:

- OPERATOR COMPLETED
- DEBUGGUER COMPLETED
- PROGRESS COUNTER
- I/O ERROR

- BAD CHECKSUM
- RESERVED
- UNKNOWN
- INITIALIZING
- IN POWER-ON SELF TEST
- BOOTING
- BOOT FAILED
- WAITING
- KERNEL LOADED
- UP
- IN DEBUGGER
- WAITING FOR OPERATOR INPUT
- DUMPING CORE
- HALTED
- REBOOTING
- WAITING FOR GIVEBACK (DISK RESERVATIONS)
- WAITING FOR GIVEBACK (HA MAILBOXES)
- DUMPING SPARECORE
- MULTI-DISK PANIC
- IN TAKEOVER

**[`-time-until-takeover <integer>`] - Time Until Takeover**

Selects the nodes that have the specified time-until-takeover setting.

**[`-partner-reason <text>,...`] - Reason Takeover not Possible by Partner**

Selects the nodes that have the specified partner-reason text setting.

**[`-killpackets {true|false}`] - Issue Kill Packets (privilege: advanced)**

Selects the nodes that have the specified kill packets setting.

**[`-partner-aggregates {true|false}`] - Control Partner Aggregates (privilege: advanced)**

Selects the nodes that have the specified partner aggregates setting.

**[`-current-index <integer>`] - Current Progress Index (privilege: advanced)**

Selects the nodes that have the specified current-progress index setting.

**[`-current-entry <text>`] - Current Progress Entry (privilege: advanced)**

Selects the nodes that have the specified current-progress entry setting.

**[`-maximum-index <integer>`] - Maximum Progress Index (privilege: advanced)**

Selects the nodes that have the specified maximum-progress index setting.

**`[-pmbox-status <text>, ...]` - Primary Mailbox Status (privilege: advanced)**

Selects the nodes that have the specified primary mailbox status setting. Possible values include:

- MBX\_STATUS\_NODISKS
- MBX\_STATUS\_UNCERTAIN
- MBX\_STATUS\_STALE
- MBX\_STATUS\_CONFLICTED
- MBX\_STATUS\_OLD\_VERSION
- MBX\_STATUS\_NOT\_FOUND
- MBX\_STATUS\_WRONG\_STATE
- MBX\_STATUS\_BACKUP

**`[-bmbox-status <text>, ...]` - Backup Mailbox Status (privilege: advanced)**

Selects the nodes that have the specified backup-mailbox status setting. See the description of the `-pmbox -status` parameter for a list of possible values.

**`[-major-seq-num-local <integer>]` - Local Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the local node.

**`[-minor-seq-num-local <integer>]` - Local Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the local node.

**`[-major-seq-num-partner <integer>]` - Partner Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat major sequence number on the partner node.

**`[-minor-seq-num-partner <integer>]` - Partner Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified mailbox heartbeat minor sequence number on the partner node.

**`[-local-mbx-node-status <Mailbox Status>]` - Local Mailbox Node Status (privilege: advanced)**

Selects the nodes that have the specified local mailbox node status. Possible values include:

- MBX\_UNKNOWN - Local node is up, mailbox uninitialized
- MBX\_TAKEOVER\_DISABLED - Local node is up but takeover is disallowed
- MBX\_TAKEOVER\_ENABLED - Local node is up and takeover is allowed
- MBX\_TAKEOVER\_ACTIVE - Partner node has taken over
- MBX\_GIVEBACK\_DONE - Giveback completed, but local node has not yet restarted

**`[-mbx-abs-time-local <integer>]` - Local Mailbox Absolute Time (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**`[-mbx-sk-time-local <integer>]` - Local Mailbox Kernel Time (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel Kernel Time.

**[-mbx-sk-cycles-local <integer>] - Local Mailbox CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified local mailbox channel CPU Cycle count.

**[-ic-abs-time-local <integer>] - Local IC Absolute Time (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-local <integer>] - Local IC Kernel Time (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel Kernel Time.

**[-ic-sk-cycles-local <integer>] - Local IC CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified local Interconnect channel CPU Cycle count.

**[-partner-mbx-node-status <Mailbox Status>] - Partner Mailbox Node Status (privilege: advanced)**

Selects the nodes that have the specified partner mailbox node status. Possible values include:

- MBX\_UNKNOWN
- MBX\_TAKEOVER\_DISABLED
- MBX\_TAKEOVER\_ENABLED
- MBX\_TAKEOVER\_ACTIVE
- MBX\_GIVEBACK\_DONE

**[-mbx-abs-time-partner <integer>] - Partner Mailbox Absolute Time (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-mbx-sk-time-partner <integer>] - Partner Mailbox Kernel Time (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel Kernel Time.

**[-mbx-sk-cycles-partner <integer>] - Partner Mailbox CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel CPU Cycle count.

**[-mbx-major-seq-num-partner <integer>] - Partner Mailbox Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel major sequence number.

**[-mbx-minor-seq-num-partner <integer>] - Partner Mailbox Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner mailbox channel minor sequence number.

**[-ic-abs-time-partner <integer>] - Partner IC Absolute Time (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel absolute time. This time is measured in msec since 1/1/1970 (epoch).

**[-ic-sk-time-partner <integer>] - Partner IC Kernel Time (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel Kernel Time.

**`[-ic-sk-cycles-partner <integer>]` - Partner IC CPU Cycles (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel CPU Cycle count.

**`[-ic-major-seq-num-partner <integer>]` - Partner IC Major Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel major sequence number.

**`[-ic-minor-seq-num-partner <integer>]` - Partner IC Minor Sequence Number (privilege: advanced)**

Selects the nodes that have the specified partner Interconnect channel minor sequence number.

**`[-local-takeover-info <text>]` - Local Takeover Info (privilege: advanced)**

Selects the nodes that have the specified local node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover
- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled
- NOTKOVER\_VERSION - Version mismatch
- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Enable takeover on reboot
- TKOVER\_ON\_PANIC - Enabled takeover on panic
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

**`[-partner-takeover-info <text>]` - Partner Takeover Info (privilege: advanced)**

Selects the nodes that have the specified partner node takeover information. This includes the type of negotiated failover request, or if takeover is not possible, the reason why takeover is disabled. Possible values include:

- NOTKOVER\_NVRAM\_DOWN - NVRAM mirror is down
- NOTKOVER\_OPERATOR\_DISABLE\_NVRAM - Operator disabled
- NOTKOVER\_PARTNER\_RESET - A link reset is in progress
- NOTKOVER\_FM\_TAKEOVER - The failover monitor has declared takeover

- NOTKOVER\_NVRAM\_MISMATCH - NVRAM sizes mismatch
- NOTKOVER\_OPERATOR\_DENY - Operator denies takeover
- NOTKOVER\_CLUSTER\_DISABLE - Cluster is disabled
- NOTKOVER\_VERSION - Version mismatch
- NOTKOVER\_SHELF\_HOT - Disk shelf is too hot
- NOTKOVER\_REVERT\_IN\_PROGRESS - Revert is in progress
- NOTKOVER\_HALT\_NOTKOVER - Node halted in no-takeover mode
- TKOVER\_ON\_REBOOT - Takeover on reboot is enabled
- TKOVER\_ON\_PANIC - Takeover on panic is enabled
- TKOVER\_ON\_STUTTER\_DISABLED - Disable takeover on short uptime
- NFO\_DISK\_SHELF\_ENABLED - Negotiated failover for disk shelf module is enabled
- NFO\_ISCSI\_ENABLED - Negotiated failover for network interfaces module is enabled
- NFO\_FCP\_TARGET\_ENABLED - Negotiated failover for fcp target module is enabled

**[-local-headswap-state <Headswap State>] - Local Head Swap State (privilege: advanced)**

Selects the nodes that have the specified local node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started
- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-partner-headswap-state <Headswap State>] - Partner Head Swap State (privilege: advanced)**

Selects the nodes that have the specified partner node headswap state. Possible values are:

- HEADSWAP\_NONE - head swap not in progress
- HEADSWAP\_START - head swap started
- HEADSWAP\_CFO\_START - CFO phase of head swap started
- HEADSWAP\_CFO\_END - CFO phase of head swap completed
- HEADSWAP\_SFO\_START - SFO phase of head swap started

**[-fast-timeout <integer>] - Fast Timeout (privilege: advanced)**

Selects the nodes that have the specified fast-timeout configuration setting.

**[-slow-timeout <integer>] - Slow Timeout (privilege: advanced)**

Selects the nodes that have the specified slow-timeout setting.

**[-mailbox-timeout <integer>] - Mailbox Timeout (privilege: advanced)**

Selects the nodes that have the specified mailbox-timeout setting.

**[-connect-timeout <integer>] - Connect Timeout (privilege: advanced)**

Selects the nodes that have the specified connect-timeout setting.

**[-operator-timeout <integer>] - Operator Timeout (privilege: advanced)**  
Selects the nodes that have the specified operator-timeout setting.

**[-firmware-timeout <integer>] - Firmware Timeout (privilege: advanced)**  
Selects the nodes that have the specified firmware-timeout setting.

**[-dumpcore-timeout <integer>] - Dumpcore Timeout (privilege: advanced)**  
Selects the nodes that have the specified dump-core timeout setting.

**[-booting-timeout <integer>] - Booting Timeout (privilege: advanced)**  
Selects the nodes that have the specified booting-timeout setting.

**[-transit-timer {true|false}] - Transit Timer Enabled (privilege: advanced)**  
Selects the nodes that have the specified transit-timer setting.

**[-transit-timeout <integer>] - Transit Timeout (privilege: advanced)**  
Selects the nodes that have the specified transit timeout.

**[-firmware-received <integer>] - Firmware Received (privilege: advanced)**  
Selects the nodes that have the specified firmware-reception time.

**[-firmware-received-cycles <integer>] - Firmware Received in CPU Cycles (privilege: advanced)**  
Selects the nodes that have the specified firmware-reception time in CPU Cycles.

**[-booting-received <integer>] - Booting Received (privilege: advanced)**  
Selects the nodes that have the specified booting-reception time.

**[-transit-time <integer>] - Transit Event Time (privilege: advanced)**  
Selects the nodes whose last failover event occurred at the specified time.

**[-pnormal <integer>] - Primary Normal IO Time (privilege: advanced)**  
Selects the nodes that have the specified normal primary-mailbox I/O time.

**[-ptransition <integer>] - Primary Transition IO Time (privilege: advanced)**  
Selects the nodes that have the specified transitional primary-mailbox I/O time.

**[-bnormal <integer>] - Backup Normal IO Time (privilege: advanced)**  
Selects the nodes that have the specified normal backup-mailbox I/O time.

**[-btransition <integer>] - Backup Transition IO Time (privilege: advanced)**  
Selects the nodes that have the specified transitional backup-mailbox I/O time.

**[-logs-unsynched <integer>] - Logs Unsynched Count (privilege: advanced)**  
Selects the nodes that have the specified count of unsynchronized logs.

**[-auto-giveback {true|false}] - Auto Giveback Enabled**  
Selects the nodes that have the specified auto-giveback setting.

**[-detection-time <integer>] - Takeover Detection Time (secs)**  
Selects the nodes that have the specified detection-time setting.

**[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)**  
Selects the nodes that have the specified takeover-on-failure setting.

**[-onpanic {true|false}] - Takeover on Panic Enabled**  
Selects the nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**  
Selects the storage-failover configurations that match this parameter value.

**[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)**  
Selects the nodes that have the specified short-uptime value.

**[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)**  
Selects the nodes that have the specified number of giveback attempts.

**[-attempts-time <integer>] - Giveback Attempts Period (minutes) (privilege: advanced)**  
Selects the nodes that have the specified time setting for giveback attempts.

**[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)**  
Selects the nodes that have the specified propagate-status-via-mailbox setting.

**[-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)**  
Selects the nodes that have the specified read interval.

**[-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)**  
Selects the nodes that have the specified write interval.

**[-onreboot {true|false}] - Takeover on Reboot Enabled**  
Selects the nodes that have the specified takeover-on-reboot setting.

**[-delay-seconds <integer>] - Delay Before Auto Giveback (secs)**  
Selects the nodes that have the specified delay (in seconds) for the auto giveback.

**[-hwassist {true|false}] - Hardware Assist Enabled**  
Selects the nodes that have the specified hwassist setting.

**[-hwassist-partner-ip <IP Address>] - Partner's Hwassist IP**  
Selects the nodes that have the specified hwassist-partner-ip setting.

**[-hwassist-partner-port <integer>] - Partner's Hwassist Port**  
Selects the nodes that have the specified hwassist-partner-port setting.

**[-hwassist-health-check-interval <integer>] - Hwassist Health Check Interval (secs)**  
Selects the nodes that have the specified hwassist health check interval, in seconds.

**`[-hwassist-retry-count <integer>]` - Hwassist Retry Count**

Selects the nodes that have the specified hwassist retry count, in seconds.

**`[-hwassist-status <text>]` - Hwassist Status**

Selects the nodes that have the specified hwassist-status setting.

**`[-time-until-autogiveback <integer>]` - Time Until Auto Giveback (secs)**

Selects the nodes that have the specified time(in seconds) until auto giveback.

**`[-local-mailbox-disks <text>]` - Local Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the local node.

**`[-partner-mailbox-disks <text>]` - Partner Mailbox Disks**

Selects the nodes that have the specified mailbox disks on the partner node.

**`[-local-firmware-state <text>]` - Local Firmware State (privilege: advanced)**

Selects the nodes that have the specified firmware state on the local node.

**`[-local-firmware-progress <integer>]` - Local Firmware Progress Counter (privilege: advanced)**

Selects the nodes that have the specified firmware progress counter for the local node.

**`[-partner-firmware-state <text>]` - Partner Firmware State (privilege: advanced)**

Selects the nodes that have the specified firmware state of the partner node.

**`[-partner-firmware-progress <integer>]` - Partner Firmware Progress Counter (privilege: advanced)**

Selects the nodes that have the specified firmware progress counter for the partner node.

**`[-local-missing-disks <text>]` - Missing Disks on Local Node**

Selects the nodes that have the specified missing disks on the local node.

**`[-partner-missing-disks <text>]` - Missing Disks on Partner Node**

Selects the nodes that have the specified missing disks on the partner node.

**`[-reboot-timeout <integer>]` - Reboot Timeout (privilege: advanced)**

Selects the nodes that have the specified reboot timeout.

**`[-time-since-takeover <text>]` - Time Since Takeover**

Selects the nodes that have been in takeover mode for the specified amount of time.

**`[-auto-giveback-after-panic {true|false}]` - Auto Giveback After Takeover On Panic**

Selects the nodes that have the specified auto-giveback-after-panic setting. If *true* then an automatic giveback operation is invoked when the failover node of an HA pair is repaired and rebooted. The takeover node of the HA pair detects this and initiates a giveback operation automatically.

**`[-is-giveback-requested {true|false}]` - Giveback Requested (privilege: advanced)**

Selects the nodes that have the specified is-giveback-requested setting. If *true*, a deferred giveback request has been made by the local node.

**`[-auto-giveback-last-veto-check <integer>]` - Auto Giveback Last Veto Check (privilege: advanced)**

Selects the nodes that have the specified auto-giveback-last-veto-check time. This setting indicates the time, in milliseconds, when the local node made the most recent giveback veto check.

**`[-is-auto-giveback-attempts-exceeded {true|false}]` - Auto Giveback Attempts Exceeded (privilege: advanced)**

Selects the nodes that have the specified is-auto-giveback-attempts-exceeded setting. If *true*, the local node has exceeded the maximum number of allowed auto giveback attempts.

**`[-was-auto-giveback-done {true|false}]` - Was Auto Giveback Done (privilege: advanced)**

Selects the nodes that have the specified was-auto-giveback-done setting. If *true*, the last giveback was automatic (as opposed to a manual giveback).

**`[-is-cifs-auto-giveback-stopping {true|false}]` - Is CIFS Auto Giveback Stopping (privilege: advanced)**

Selects the nodes that have the specified is-cifs-auto-giveback-stopping setting. If *true*, the local node has initiated CIFS termination as part of an automatic giveback.

**`[-aggregate-migration-timeout <integer>]` - Aggregate Migration Timeout (secs) (privilege: advanced)**

Selects the nodes that have the specified aggregate migration timeout.

**`[-is-mirror-enabled {true|false}]` - Is NVRAM Mirroring Enabled (privilege: advanced)**

Selects the nodes that have the specified is-mirror-enabled setting. If *true*, then NVRAM mirroring is enabled.

**`[-is-mirror-consistency-required {true|false}]` - Is Mirror Consistency Required (privilege: advanced)**

Selects the nodes that have the specified is-mirror-consistency-required setting. If *true*, then NVRAM mirror consistency is required.

**`[-is-memory-insufficient {true|false}]` - Is Memory Insufficient To Takeover (privilege: advanced)**

Selects the nodes that have the specified is-memory-insufficient setting. If *true*, the local node does not have enough memory to perform a takeover.

**`[-memio-state <memio status>]` - Current State of Memio Link (privilege: advanced)**

Selects the nodes that have the specified memio layer link current state. Possible values are:

- UNINIT - Uninitialized
- CLOSED - Closed
- HB\_LISTEN - Listening for connect
- SYN\_SENT - Sent generation information
- ESTABLISHED - Connection established

**`[-is-degraded {true|false}]` - Are Partner Mailbox Disks Not Known (privilege: advanced)**

Selects the nodes that have the specified is-degraded setting. If *true*, takeovers are deferred because partner mailbox disks are not known.

**`[-reserve-policy <reserve policy>]` - FM Reservation Policy (privilege: advanced)**

Selects the nodes that have the specified disk reservation policy. Possible values are:

- `RESERVE_NO_DISKS` - no disk reservations made during takeover, nor are disk reservations released during giveback
- `RESERVE_LOCK_DISKS_ONLY` - only mailbox disks are released during takeover and released during giveback
- `RESERVE_ONLY_AT_TAKEOVER` - reservations are issued only at takeover time. All disks are reserved. All reservations are released at giveback
- `RESERVE_ALWAYS_AFTER_TAKEOVER` - reservations are issued at takeover. When disks are subsequently added, they are also reserved. All disks are released at giveback

**`[-reset-disks {true|false}]` - Issue Disk Resets during Failover (privilege: advanced)**

Selects the nodes that have the specified reset-disks setting. If `true`, disks are reset during takeover/giveback.

**`[-total-system-uptime <integer>]` - Total System Uptime (privilege: advanced)**

Selects the nodes that have the specified total system uptime, in milliseconds.

**`[-current-time <integer>]` - Current System Time (privilege: advanced)**

Selects the nodes that have the specified current time on the node.

**`[-fm-takeover-state <FM Takeover/Giveback Transition>]` - FM Takeover State (privilege: advanced)**

Selects the nodes that have the specified takeover state. Possible values are:

- `FT_NONE` - Not in takeover
- `FT_TAKEOVER_STARTED` - Local node has initiated takeover
- `FT_TAKEOVER_COMMITTED` - Takeover has been committed
- `FT_TAKEOVER_DONE_OK` - Local node successfully completed takeover
- `FT_TAKEOVER_DONE_FAILED` - Takeover failed

**`[-fm-giveback-state <FM Takeover/Giveback Transition>]` - FM Giveback State (privilege: advanced)**

Selects the nodes that have the specified giveback state. Possible values are:

- `FT_NONE` - Not in giveback
- `FT_GIVEBACK_READY` - Partner node is ready for giveback
- `FT_GIVEBACK_STARTED` - Local node has initiated giveback
- `FT_GIVEBACK_COMMITTED` - Giveback has been committed
- `FT_GIVEBACK_DONE_OK` - Giveback completed successfully

**`[-takeover-reason <FM Takeover Reason>]` - Reason why takeover triggered (privilege: advanced)**

Selects the nodes that have the specified takeover reason. Possible values are:

- `TAKEOVER_NONE` - Not in takeover

- TAKEOVER\_IMMEDIATE - Operator initiated forced takeover
- TAKEOVER\_NDU - Takeover initiated as part of NDU
- TAKEOVER\_FORCED - Operator initiated forced takeover, possible data loss
- TAKEOVER\_EARLY - Takeover occurred during the boot process
- TAKEOVER\_OPERATOR\_EXP - Takeover occurred after the operator timeout expired
- TAKEOVER\_POST\_FAILED - Takeover occurred on POST failure
- TAKEOVER\_PANIC - Takeover on panic
- TAKEOVER\_SHORTUPTIME - Takeover after rapid toggling between up and down states
- TAKEOVER\_SPARECORE\_EXP - Takeover on panic timeout expiration
- TAKEOVER\_REBOOT\_EXP - Takeover on reboot timer expiration
- TAKEOVER\_BOOTING\_EXP - Takeover on booting timer expiration
- TAKEOVER\_FIRMWARE\_EXP - Takeover on firmware timer expiration
- TAKEOVER\_NFO\_SHUTDOWN - Takeover on negotiated failover shutdown
- TAKEOVER\_NFO\_TIMER - Takeover on negotiated failover timer expiration
- TAKEOVER\_MDP - Takeover on multi-disk panic
- TAKEOVER\_REBOOT - Takeover on reboot
- TAKEOVER\_HALT - Takeover on halt
- TAKEOVER\_CLAM - CLAM-triggered takeover
- TAKEOVER\_HWASSIST - Hardware-assisted takeover
- TAKEOVER\_NORMAL - Operator initiated takeover

#### **[`-ha-type {none|shared_storage|non_shared_storage}`] - HA Type**

If this parameter is specified, the command selects the nodes that have the specified HA-type setting. If the value is set to *shared\_storage*, then the node is in a storage-failover configuration using the shared storage. If it is set to *non\_shared\_storage*, then the node is in a storage-failover configuration using the unshared storage. If it is set to *none*, then the node is not part of a storage-failover configuration.

### **Examples**

The following example displays information about all storage-failover configurations:

```
cluster1::> storage failover show
```

Node	Partner	Takeover Possible	State
node0	node1	true	Connected to node1
node2	node3	true	Connected to node3
node1	node0	true	Connected to node0
node3	node2	true	Connected to node2

4 entries were displayed.

## storage failover takeover

Take over the storage of a node's partner

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover takeover` command initiates a takeover of the partner node's storage.

### Parameters

#### { `-ofnode` {<nodename>|local} - Node to Takeover

This specifies the node that is taken over. It is shut down and its partner takes over its storage.

#### | `-bynode` {<nodename>|local} - Node Initiating Takeover }

This specifies the node that is to take over its partner's storage.

#### [`-option` <takeover option>] - Takeover Option

This optionally specifies the style of takeover operation. Possible values include the following:

- `normal` - Specifies a normal takeover operation; that is, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. This is the default value.
- `immediate` - Specifies an immediate takeover. In an immediate takeover, the takeover operation is initiated before the partner is given the time to close its storage resources gracefully. The use of this option results in an immediate takeover which does not do a clean shutdown. In case of NDU this can result in a NDU failure.

If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass -optimization` option is set to false.

If this option is specified, migration of data LIFs from the partner will be delayed even if the `-skip-lif-migration-before-takeover` option is not specified. If possible, migrate the data LIFs to another node prior to specifying this option.

- `allow-version-mismatch` - If this value is specified, the takeover operation is initiated even if the partner is running a version of software that is incompatible with the version running on the node. In this case, the partner is given the time to close its storage resources gracefully before the takeover operation proceeds. However, the takeover operation will not be allowed if the partner has higher WAFL or RAID label versions. Use this value as part of a nondisruptive upgrade or downgrade procedure.
- `force` - If this value is specified, the takeover operation is initiated even if the node detects an error that normally prevents a takeover operation from occurring. This value is available only at the advanced privilege level and higher.

If this option is specified, negotiated takeover optimization is bypassed even if the `-bypass -optimization` option is set to false.

The use of this option can potentially result in data loss. If the HA interconnect is detached or inactive, or the contents of the failover partner's NVRAM cards are unsynchronized, takeover is normally disabled. Using the `-force` option enables a node to take over its partner's storage despite the unsynchronized NVRAM, which can contain client data that can be lost upon storage takeover.

#### **`[-bypass-optimization {true|false}]` - Bypass Takeover Optimization (privilege: advanced)**

If this is an operator-initiated planned takeover, this parameter specifies whether the takeover optimization is bypassed. This parameter defaults to `false`.

This parameter is ignored and negotiated takeover optimization automatically bypassed if the `-immediate` option, the `-force` option, or the `-allow-disk-inventory-mismatch` parameter is specified as part of the same `storage failover takeover` command.

#### **`[-allow-disk-inventory-mismatch {true|false}]` - Disk inventory**

If this parameter is specified, the takeover operation is initiated even if the local node cannot see the partner's filesystem disks.

If this parameter is specified, negotiated takeover optimization is bypassed even if the `-bypass-optimization` parameter is set to `false`.

The use of this parameter can potentially result in client outage.

#### **`[-skip-lif-migration-before-takeover <true>]` - Skip Migrating LIFs Away from Node Prior to Takeover**

This parameter specifies that LIF migration prior to takeover is skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the takeover has occurred. Without this parameter, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to its takeover. If the migration fails or times out, the takeover is aborted.

#### **`[-ignore-quorum-warnings <true>]` - Skip Quorum Check Before Takeover**

If this parameter is specified, quorum checks will be skipped prior to the takeover. The operation will continue even if there is a possible data outage due to a quorum issue.

#### **`[-override-vetoes <true>]` - Override Vetoes**

If this is an operator-initiated planned takeover, this parameter specifies whether the veto should be overridden. If this parameter is not specified, its value is set to `false`.

If this parameter is specified, negotiated takeover will override any vetos to continue with takeover.

The use of this parameter might result in the takeover proceeding even if the node detects issues that can potentially make the takeover dangerous or disruptive.

### **Examples**

The following example causes a node named `node0` to initiate a negotiated optimized takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0
```

The following example causes a node named node0 to initiate an immediate takeover of its partner's storage:

```
cluster1::> storage failover takeover -bynode node0 -option immediate
```

## storage failover hwassist show

Display hardware-assisted storage failover status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage failover hwassist show` command displays information about the hardware-assisted storage failover status on each node. By default, the command displays the following information:

- Node name.
- Partner node name.
- Whether hardware-assisted failover is enabled.
- IP address on which the local node receives hardware-assisted failover alerts.
- Port on which the local node receives hardware-assisted failover alerts.
- Hardware-assisted failover status.
- If the monitor is inactive, the reason it is inactive.
- If the monitor is inactive, the corrective action to make it active.
- Status of keep-alive alerts on the local node.

Hardware-assisted failover establishes a notification channel from each respective node's service processor to the other (HA partner) node. If a node becomes unresponsive, its service processor notifies the HA partner of this condition, accelerating storage failover. By default, hwassist is enabled and configured automatically to use each node's node-mgmt LIF. To modify or show the hardware-assisted storage failover configuration, use the [storage failover modify](#) and [storage failover show](#) commands.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays information only about hwassist on the specified nodes.

**[`-partner-name` {<nodename>|local}] - Name of the Partner Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified partner node.

**[`-enabled` {true|false}] - Local Hardware Assist Enabled**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified enabled state.

**[`-local-status` <text>] - Local Node's Hwassist Status**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local status (*active* or *inactive*).

**[`-local-ip` <text>] - IP Address on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local IP address.

**[`-local-port` <integer>] - Port on Which Local Node is Listening**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified local UDP port.

**[`-local-inactive` <text>] - Local Node's Hwassist Inactive Status Reason**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified inactive reason.

**[`-local-action` <text>] - Corrective Action on Local Node**

If you specify this parameter, the command displays information only about hwassist on nodes with the specified corrective action.

## Examples

The following example displays the hardware-assisted failover information for node cluster1-01 and its HA partner node cluster1-02:

```

cluster1::> storage failover hwassist show
Node
-----
cluster1-01
                Partner: cluster1-02
        Hwassist Enabled: true
                Hwassist IP: 10.225.248.19
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
        Keep-Alive Status: healthy

cluster1-02
                Partner: cluster1-01
        Hwassist Enabled: true
                Hwassist IP: 10.225.248.21
                Hwassist Port: 4444
                Monitor Status: active
                Inactive Reason: -
                Corrective Action: -
        Keep-Alive Status: healthy

```

## Related Links

- [storage failover modify](#)
- [storage failover show](#)

## storage failover hwassist test

Test the hwassist functionality

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist test` command tests the Hardware Assist h/w connectivity between the two nodes in a HA pair. The test result can be one of the following.

- Hardware Assist is not initialized.
- HW assist is not supported.
- Partner is throttling alerts.
- Resource is busy.
- Hardware Assist h/w returned an error.
- No response from partner.Timed out.
- Unexpected abort.

- Partner has taken over.
- Interconnect is down between nodes.
- Partner is not booted up yet.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node from which a test alert is initiated.

## Examples

The following command issues a test alert from the node cluster1-01:

```
cluster1::> storage failover hwassist test -node cluster1-01
Info: Operation successful.
```

## storage failover hwassist stats clear

Clear the hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats clear` command clears the statistics information maintained by Hardware Assist functionality.

## Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which the statistics are to be cleared.

## Examples

The following example clears the hwassist statistics on the node cluster1-01:

```
cluster1::> storage failover hwassist stats clear -node cluster1-01
```

## storage failover hwassist stats show

Display hwassist statistics

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage failover hwassist stats show` command displays statistics about the hardware assist alerts processed by a node. The command displays the following information for each alert:

- Locally enabled.
- Partner Inactive Reason.
- Alert type.
- Event that triggered the alert.
- The number of times the alert has been received.
- Whether takeover was possible on receiving the alert.
- The last time at which the alert was received.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the hwassist statistics for the specified node.

## Examples

The following example displays the hwassist statistics for the node ha1:

```

cluster1::> storage failover hwassist stats show -node ha1
Node: ha1
        Local Enabled: true
        Partner Inactive Reason: -
Alert Type  Alert Event                Count Takeover  Last Received
-----
-----
system_down power_loss                0 Yes         ---
system_down l2_watchdog_reset        0 Yes         ---
system_down power_off_via_rlm        0 Yes         ---
system_down power_cycle_via_rlm      0 Yes         ---
system_down reset_via_rlm            0 Yes         ---
system_down power_off_via_sp         0 Yes         ---
system_down power_cycle_via_sp       0 Yes         ---
system_down reset_via_sp             0 Yes         ---
system_down post_error               0 No          ---

```

## storage failover internal-options show

Display the internal options for storage failover

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage failover internal-options show` command displays the following information about the storage failover configuration:

- Node name
- Whether automatic giveback is enabled
- Whether partner checking is enabled
- Takeover detection time, in seconds
- Whether takeover on failover is enabled
- Whether takeover on panic is enabled
- Whether takeover on reboot is enabled
- Whether hardware-assisted takeover is enabled
- IP address on which the partner node listens to the hardware-assisted takeover alerts
- Port on which the partner node listens to the hardware-assisted takeover alerts
- Whether takeover on short uptime is enabled (detailed view only)
- Short uptime interval, in seconds (detailed view only)
- Number of giveback attempts (detailed view only)
- Giveback attempt interval, in minutes (detailed view only)
- Whether status is propagated through SFO mailboxes (detailed view only)
- Status read interval, in seconds (detailed view only)
- Status write interval, in seconds (detailed view only)
- Hardware-assisted takeover retry count (detailed view only)
- Hardware-assisted takeover heartbeat period (detailed view only)
- Whether operator-initiated planned takeover is optimized

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-more ] (privilege: advanced)**

This parameter displays the following additional information: :

- Node name
- Whether takeover on short uptime is enabled
- Short uptime interval, in seconds
- Number of giveback attempts
- Giveback attempt interval, in minutes
- Whether status is propagated through SFO mailboxes
- Status read interval, in seconds

- Status write interval, in seconds
- Hardware-assisted takeover retry count
- Hardware-assisted takeover heartbeat period

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects configuration information for the specified node.

**[-auto-giveback {true|false}] - Auto Giveback Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified automatic giveback setting.

**[-check-partner {true|false}] - Check Partner Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified partner-checking setting.

**[-detection-time <integer>] - Takeover Detection Time (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover detection time setting.

**[-onfailure {true|false}] - Takeover on Failure Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-failure setting.

**[-onpanic {true|false}] - Takeover on Panic Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-panic setting.

**[-onshort-uptime {true|false}] - Takeover on Short Uptime Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-short-uptime setting.

**[-short-uptime <integer>] - Short Uptime (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-short-uptime time setting.

**[-attempts <integer>] - Number of Giveback Attempts (privilege: advanced)**

Selects configuration information for nodes that have the specified number of giveback attempts setting.

**[-attempts-time <integer>] - Giveback Attempts Minutes (privilege: advanced)**

Selects configuration information for nodes that have the specified giveback attempt time setting.

**[-propagate {true|false}] - Propagate Status via Mailbox (privilege: advanced)**

Selects configuration information for nodes that have the specified setting for propagation of status through Storage Failover mailboxes.

**[-read-interval <integer>] - Node Status Read Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified status read interval setting.

**[-write-interval <integer>] - Node Status Write Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified status write interval setting.

**[`-onreboot {true|false}`] - Takeover on Reboot Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified takeover-on-reboot setting.

**[`-delay-seconds <integer>`] - Delay Before Auto Giveback (secs) (privilege: advanced)**

If this parameter is specified, the command displays information only about the node or nodes that have the specified delay for auto giveback.

**[`-hwassist {true|false}`] - Hwassist Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified hardware-assisted takeover setting.

**[`-hwassist-partner-ip <text>`] - Partner's Hwassist IP (privilege: advanced)**

Selects configuration information for nodes that have the specified partner IP setting for hardware-assisted takeovers.

**[`-hwassist-partner-port <integer>`] - Partner's Hwassist Port (privilege: advanced)**

Selects configuration information for nodes that have the specified partner port setting for hardware-assisted takeovers.

**[`-hwassist-health-check-interval <integer>`] - Hwassist Health Check Interval (secs) (privilege: advanced)**

Selects configuration information for nodes that have the specified health check interval setting for hardware-assisted takeovers

**[`-hwassist-retry-count <integer>`] - Hwassist Retry Count (privilege: advanced)**

Selects configuration information for nodes that have the specified retry count (in seconds) for hardware-assisted takeovers.

**[`-mode {ha|non_ha}`] - HA Mode (privilege: advanced)**

If this parameter is specified, the command displays information only about the node or nodes that have the specified HA mode.

**[`-bypass-takeover-optimization {true|false}`] - Bypass Takeover Optimization Enabled (privilege: advanced)**

Selects configuration information for nodes that have the specified setting for bypass takeover optimization ( `_true_` means that optimized operator-initiated planned takeover is bypassed, `false` means that it is enabled). Operator-initiated planned takeover is optimized when SFO aggregates are relocated serially to the partner prior to takeover. This reduces client outage.

## Examples

The following example displays detailed information about the internal options for storage failover on a node named node2:

```

cluster1::*> storage failover internal-options show -node node2
Node: node2

Auto Giveback Enabled: false
Check Partner Enabled: true
Takeover Detection Time (secs): 15
Takeover On Failure Enabled: true
Takeover On Panic Enabled: false
Takeover On Short Uptime Enabled: true
Short Uptime (secs): -
Number of Giveback Attempts: 3
Giveback Attempts Minutes: 10
Propagate Status Via Mailbox: true
Node Status Read Interval (secs): 5
Node Status Write Interval (secs): 5
Failover the Storage when Cluster Ports Are Down: -
Failover Interval when Cluster Ports Are Down (secs): -
Takeover on Reboot Enabled: true
Delay Before Auto Giveback (secs): 300
Hardware Assist Enabled: true
Partner's Hw-assist IP:
Partner's Hw-assist Port: 4444
Hw-assist Health Check Interval (secs): 180
Hw-assist Retry count: 2
HA mode: ha
Bypass Takeover Optimization Enabled: true

```

## storage failover mailbox-disk show

Display information about storage failover mailbox disks

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage failover mailbox-disk show` command lists the mailbox disks that are used by storage failover. The command displays the following information:

- Node name
- Whether the mailbox disk is owned by the local node or by its partner
- Disk name
- Disk universal unique identifier (UUID)

This command is available only at the advanced privilege level and higher.

## Parameters

**{ [-fields <fieldname>,...]**

If -fields <fieldname>,... is used, the command displays only the specified fields.

**| [-instance ] }**

If this parameter is used, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects the mailbox disks that are associated with the specified node.

**[-location {local|partner|tertiary}] - Mailbox Owner (privilege: advanced)**

Selects the mailbox disks that have the specified relationship to the node.

**[-diskindex <integer>] - Mailbox Disk Index (privilege: advanced)**

Selects the mailbox disk that has the specified index number.

**[-diskname <text>] - Mailbox Disk Name (privilege: advanced)**

Selects the mailbox disks that match the specified disk name.

**[-diskuuid <text>] - Mailbox Disk UUID (privilege: advanced)**

Selects the mailbox disks that match the specified UUID.

**[-physical-location {local|partner|mediator}] - Mailbox Disk Physical Location (privilege: advanced)**

Selects the mailbox disks that match the specified physical location.

**[-location-id <nvramid>] - System ID of the Node where the Disk is Attached (privilege: advanced)**

Selects the mailbox disks that match the specified location-id.

**[-location-name <text>] - Mailbox Disk Location (privilege: advanced)**

Selects the mailbox disks that match the specified location-name.

## Examples

The following example displays information about the mailbox disks on a node named node1:

```
cluster1::*> storage failover mailbox-disk show -node node1
Node      Location  Index Disk Name      Physical Location  Disk UUID
-----
node1
      local      0 1.0.4      local      20000000:8777E9D6:[...]
      local      1 1.0.6      partner     20000000:8777E9DE:[...]
      partner    0 1.0.1      local      20000000:877BA634:[...]
partner   1 1.0.2      partner     20000000:8777C1F2:[...]
```

## storage failover progress-table show

Display status information about storage failover operations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage failover progress-table show` displays status information about storage-failover operations. This information is organized in a resource table. The command displays the following information:

- Node name
- Resource-entry index number
- Resource-entry name
- Resource-entry state
- Resource-entry failure code
- Resource-entry time delta

This command is available only at the advanced privilege level and higher.

### Parameters

**{ [-fields <fieldname>,...]**

If `-fields <fieldname>`, ... is used, the command will only displays only the specified fields.

**| [-instance ] }**

If this parameter is used, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects the status information for the specified node.

**[-index <integer>] - Resource Table Index (privilege: advanced)**

Selects the status information for the specified index number.

**[-entryname <text>] - Resource Table Entry Name (privilege: advanced)**

Selects the status information for the specified entry name.

**[-state <text>] - Resource Table Entry State (privilege: advanced)**

Selects the status information for the specified state. Possible values include UP, START\_RUNNING, START\_DONE, START\_FAILED, STOP\_RUNNING, STOP\_FAILED, TAKEOVER\_BARRIER, and ONLY\_WHEN\_INITD.

**[-failurecode <text>] - Entry Failure Code (privilege: advanced)**

Selects the status information for the specified failure code. Possible values include OK, FAIL, FAIL\_ALWAYS, HANG, PANIC, and VETO.

**[-timedelta <integer>] - Entry Time Delta (privilege: advanced)**

Selects the status information for the specified time delta.

## Examples

The following example displays the entire storage-failover resource table:

```
cluster1::*> storage failover progress-table show
```

Node	Entry Name	State	Time Delta
-----			
node0			
	Pre-rsrctbl: fmdisk_resumePartnerDi	start_done	6
	Pre-rsrctbl: coredump_get_busy_spar	start_done	107
	Pre-rsrctbl: raid_preread_labels_be	start_done	1
	Pre-rsrctbl: fmdisk_reserve_all	start_done	84
	rsrctbl: fmrsrc_giveback_done	start_done	0
	rsrctbl: fmic	start_done	0
	rsrctbl: fmdisk_reserve	start_done	171
	rsrctbl: fm_partnerSlowTimeout	start_done	1
	rsrctbl: fmdisk_inventory	start_done	0
	rsrctbl: fmfsm_reserve	start_done	0
Press <space> to page down, <return> for next line, or 'q' to quit...			
Node	Entry Name	State	Time Delta
-----			
node0			
	rsrctbl: rdb-ha	start_done	36
	rsrctbl: giveback_cleanup_wait	start_done	0
	rsrctbl: priority_ha	start_done	0
	rsrctbl: raid	start_done	113
	rsrctbl: raid_disaster_early	start_done	0
	rsrctbl: wafl_nvram_replay	start_done	0
	rsrctbl: takeover_test_1	start_done	0

## storage firmware commands

### storage firmware download

Download disk, ACP processor and shelf firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage firmware download` command downloads the ACP processor, disk, and shelf module firmware to a specified node. This command can also be used to download the disk qualification package (DQP).

Use the [storage disk firmware update](#) command to install downloaded disk firmware.

Use the [storage shelf firmware update](#) command to install downloaded shelf module firmware.

Use the [system node run`](#) local storage download acp` command to install downloaded ACP processor firmware.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node to which the firmware is to be downloaded.

### **-package-url <text> - Package URL (privilege: advanced)**

This specifies the path to the firmware package.

The packaged ACP processor, disk, and shelf firmware files need to have ".AFW", ".LOD", and ".SFW" file extensions, respectively.

The following URL protocols are supported: ftp, http, tftp and file. The file URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>*. The package must be present in the root directory of the USB mass storage device.

## Examples

The following example downloads a disk firmware package with the path *ftp://example.com/fw/disk-fw-1.2.LOD.zip* to a node named *node1*:

```
cluster1::> storage firmware download -node node1 -package-url
ftp://example.com/fw/disk-fw-1.2.LOD.zip
```

## storage firmware acp delete

Delete an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware acp delete` command deletes the specified ACP processor firmware file from all nodes that are currently part of the cluster.

## Parameters

### **-filename <text> - Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

## Examples

The following example deletes the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF on each node:

```
cluster1::*> storage firmware acp delete -filename ACP-IOM3.0150.AFW.FVF
```

## storage firmware acp rename

Rename an ACP firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware acp rename` command renames the specified ACP processor firmware file on each node.

### Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the ACP processor firmware file with the name ACP-IOM3.0150.AFW.FVF to ACP-IOM3.AFW.FVF on each node:

```
cluster1::*> storage firmware acp rename -oldname ACP-IOM3.0150.AFW.FVF  
-newname ACP-IOM3.AFW.FVF
```

## storage firmware acp show

Display the list of ACP firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage firmware acp show` command displays the ACP processor firmware files present on each node.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the ACP processor firmware files on each node:

```
cluster1::> storage firmware acp show
Node: Node1
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
Node: Node2
ACP Firmware Files
-----
ACP-IOM3.0150.AFW.FVF
ACP-IOM3.AFW
ACP-IOM6.0210.AFW
ACP-IOM6.0210.AFW.FVF
8 entries were displayed.
```

## storage firmware disk delete

Delete a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware disk delete` command deletes the specified disk firmware file on each node.

### Parameters

**-filename <text> - Storage Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

### Examples

The following example deletes the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD on each node:

```
cluster1::*> storage firmware disk delete -filename  
X262_SMOOST25SSX.NA06.LOD
```

## storage firmware disk rename

Rename a disk firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware disk rename` command renames the specified disk firmware file on each node.

### Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

### Examples

The following example renames the disk firmware file with the name X262\_SMOOST25SSX.NA06.LOD to X262\_SMOOST25SSX.LOD on each node:

```
cluster1::*> storage firmware disk rename -oldname  
X262_SMOOST25SSX.NA06.LOD -newname X262_SMOOST25SSX.LOD
```

## storage firmware disk show

Display the list of disk firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage firmware disk show` command displays the disk firmware files present on each node.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the disk firmware files on each node:

```
cluster1::> storage firmware disk show
Node: Node1
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
Node: Node2
Disk Firmware Files
-----
X262_SMOOST25SSX.NA06.LOD
X262_SMOOST25SSX.NA06.LOD.FVF
X267_SMOOST50SSX.NA06.LOD
X267_SMOOST50SSX.NA06.LOD.FVF
8 entries were displayed.
```

## storage firmware shelf delete

### Delete a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage firmware shelf delete` command deletes the specified shelf firmware file from all nodes that are currently part of the cluster.

## Parameters

**-filename <text> - Storage Firmware Filename (privilege: advanced)**

Specifies the firmware file to delete.

## Examples

The following example deletes the shelf firmware file with the name IOM12.0210.SFW on each node:

```
cluster1::*> storage firmware shelf delete -filename IOM12.0210.SFW
```

## storage firmware shelf rename

Rename a shelf firmware file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage firmware shelf rename` command renames the specified shelf firmware file on each node.

## Parameters

**-oldname <text> - Old Filename (privilege: advanced)**

This parameter specifies the firmware file to rename.

**-newname <text> - New Filename (privilege: advanced)**

This parameter specifies the new name of the firmware file.

## Examples

The following example renames the shelf firmware file with the name IOM12.0210.SFW to IOM12.000.SFW on each node:

```
cluster1::*> storage firmware shelf rename -oldname IOM12.0210.SFW  
-newname IOM12.000.SFW
```

## storage firmware shelf show

Display the list of shelf firmware files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage firmware shelf show` command displays the shelf firmware files present on each node.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the files that match the specified node name.

**[-filename <text>] - Storage Firmware File**

Selects the files that match the specified filename.

## Examples

The following example displays the shelf firmware files on each node:

```
cluster1::> storage firmware shelf show
Node: Node1
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
Node: Node2
Shelf Firmware Files
-----
AT-FCX.3800.SFW
AT-FCX.3800.SFW.FVF
ESH4.1400.SFW
ESH4.1400.SFW.FVF
8 entries were displayed.
```

# storage iscsi-initiator commands

## storage iscsi-initiator add-target

Add an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator add-target` command adds an iSCSI target to a node's list of targets.

This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the Data ONTAP node to which the iSCSI target will be added.

### **-label <text> - User Defined Identifier (privilege: advanced)**

Specifies a label for the target to be added.

### **-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner} - Target Type (privilege: advanced)**

Specifies the type of the target. It is used by the node to determine how to use the LUNs. There are five target types:

- partner - The partner target should belong to the node's HA partner. This allows the node to access its partner's disks.
- mailbox - A mailbox target's LUNs are used exclusively as HA mailboxes.
- external - External targets' LUNs can be used by the node but do not play a role in HA.
- dr\_auxiliary - The DR auxiliary target for MetroCluster over IP. Not a valid target type for the add-target command.
- dr\_partner - The DR partner target for MetroCluster over IP. Not a valid target type for the add-target command.

### **-target-portal <text> - Target Portal (privilege: advanced)**

Specifies the target's IP address and listening TCP port. The port is not required if it is the default iSCSI port (3260). Examples of correct target portals are `10.0.0.2` and `10.0.0.2:860`.

### **-target-name <text> - iSCSI Name (privilege: advanced)**

Specifies the iSCSI target name such as an IQN (iSCSI qualified name).

### **[-status-admin {down|up}] - Administrative Status (default: up) (privilege: advanced)**

Use to specify whether the initial administrative status of the connection is up or down. The default setting is `up`.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator add-target -node node1
               -label target1 -target-type external
               -target-portal 10.0.0.2:860
               -target-name iqn.2012-06.com.bsdctl:target0
```

## storage iscsi-initiator connect

Connect to an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator connect` command connects a node to the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the Data ONTAP node to which the iSCSI target will be connected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to connect to.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator connect -node node1
                    -label target1
```

## storage iscsi-initiator disconnect

Disconnect from an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage iscsi-initiator disconnect` command disconnects a node from the specified target. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the Data ONTAP node from which the iSCSI target will be disconnected.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to disconnect from.

## Examples

The following example adds and connects to an iSCSI target from the specified node.

```
cluster1::*> storage iscsi-initiator disconnect -node node1
                    -label target1
```

## storage iscsi-initiator remove-target

Remove an iSCSI target

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage iscsi-initiator remove-target` command removes an iSCSI target from a node's list of targets. This command is only supported on high-availability shared-nothing virtualized platforms.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the name of the Data ONTAP node from which the iSCSI target will be removed.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**-label <text> - User Defined Identifier (privilege: advanced)**

Specifies the label of the target to be removed.

## Examples

The following example adds and connects to an iSCSI target from the specified *node*.

```
cluster1::*> storage iscsi-initiator remove-target -node node1
                    -label target1
```

## storage iscsi-initiator show

Display the iSCSI targets

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage iscsi-initiator show` displays the list of iSCSI targets configured for each Data ONTAP node in the cluster. This command is only supported on high-availability shared-nothing virtualized platforms.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Represents the name of the Data ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-target-type {external|mailbox|partner|partner2|dr\_auxiliary|dr\_partner}] - Target Type (privilege: advanced)**

Selects targets with the specified target type.

**[-label <text>] - User Defined Identifier (privilege: advanced)**

Selects targets with the specified label.

**[-target-portal <text>] - Target Portal (privilege: advanced)**

Selects targets with the specified portal.

**[-target-name <text>] - iSCSI Name (privilege: advanced)**

Selects targets with the specified target name.

**[-status-admin {down|up}] - Administrative Status (privilege: advanced)**

Selects targets with the specified administrative status.

**[-status-oper {down|up}] - Operational Status (privilege: advanced)**

Selects targets with the specified operational status.

**[-failure-reason <text>] - Failure Reason (privilege: advanced)**

Selects targets with the specified failure reason.

## Examples

The following example displays the list of iSCSI targets for each node in the cluster.

```
cluster1::*> storage iscsi-initiator show

Status
Node Type Label      Target Portal      Target Name
Admin/Op
-----
node1
  mailbox
    mediator 10.235.14.141      iqn.2012-05.local:mailbox.group.1

```

## storage load commands

### storage load balance

Balance storage I/O across controller's initiator ports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command is obsolete. I/O load is balanced automatically every five minutes.

#### Parameters

**-node {<nodename>|local}** - Node to balance on

The name of the clustered node for which information is being displayed.

#### Examples

This command has no effect.

## storage load show

Display I/O statistics to array LUNs, grouped by initiator port.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is obsolete. The `storage load show` command displays the load distribution of I/O on the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-switch ]**

The `switch` parameter adds switch information to the display.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator-port <text>] - Initiator Port**

The initiator port of the array LUN for which I/O stats are being displayed.

**[-wwpn <text>] - Target Port WWPN**

The World Wide Port Name of the array LUN for which I/O stats are being displayed.

**[-serialnumber <text>] - Serial Number**

The serial number of the array LUN for which I/O stats are being displayed.

**[-lun <integer>] - LUN**

The array LUN for which I/O stats are being displayed.

**[-pct-io <text>] - %I/O**

Percent of I/O bandwidth consumed by this array LUN.

**[-io-blocks <integer>] - I/O (blocks)**

Number of I/O blocks transferred.

**[-switch-port <text>] - Switch Port**

The initiator side switch port for this array LUN.

**[-target-side-switch-port <text>] - Target Side Switch Port**

The target side switch port for this array LUN.

## Examples

```
cluster1::> storage load show -switch
```

```
Initiator port: 0a connected to vnbr3850s4:7.
```

LUN	Serial #		Target Port	Target Side Switch Port
%I/O	I/O (blocks)			
---	-----	-----	-----	-----
1	D600020C00D3		50060e80004291c0	vnbr3850s5:12

## storage path commands

### storage path quiesce

Quiesce I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage path quiesce` command quiesces I/O on one path to a LUN. It also quiesces the given entire path immediately or can monitor the given path for error threshold before quiesce. After the I/O has been quiesced, no new I/O is sent on the path unless the [storage path resume](#) command is issued to continue I/O.

#### Parameters

**-node {<nodename>|local} - Node name**

The name of the clustered node for which information is being displayed.

**-initiator <initiator name> - Initiator Port**

Initiator port that the clustered node uses.

**-target-wwpn <wwpn name> - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**{ [-lun-number <integer>] - LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

**[`-path-failure-threshold <integer>`] - Max Number of Path Failures Acceptable During wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

**[`-wait-duration <integer>`] - Wait Duration in minutes }**

The time duration(minutes) in which path is monitored for path failures.

## Examples

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example suspends I/O immediately between node vbv3170f1b, port 0a and the array port 50001fe1500a8669.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

The following example suspends I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669 after reaching 10 or more errors in duration of 5 mins.

```
node::> storage path quiesce -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -path-failure-threshold 10 -wait-duration 5
```

## Related Links

- [storage path resume](#)

## storage path resume

Resume I/O on a path to array

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path resume` command continues I/O flow to an array LUN on a path or the entire path that was previously quiesced. It also disables the path failures monitoring feature, if it was enabled using the [storage path quiesce](#) `-path-failure-threshold`count` command.

## Parameters

**-node {<nodename>|local} - Node name**

The name of the clustered node for which information is being displayed.

**-initiator <initiator name> - Initiator Port**

Initiator port that the clustered node uses.

**-target-wwpn <wwpn name> - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-lun-number <integer>] - LUN Number**

Logical Unit number. The range is: [0...65535]. If this parameter is not specified, Data ONTAP resumes the entire path to an array.

## Examples

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669, LUN 1

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669 -lun-number 1
```

The following example resumes I/O between node vbv3170f1b, port 0a and the array port 50001fe1500a8669

```
node::> storage path resume -node vbv3170f1b -initiator 0a -target-wwpn
50001fe1500a8669
```

## storage path show-by-initiator

Display a list of paths to attached arrays from the initiator's perspective

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path show-by-initiator` command displays path based statistics. The output is similar to the [storage path show](#) command but the output is listed by initiator.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the array.

**[-array-name <array name>] - Array Name**

Name of the storage array that is connected to the cluster.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

## Related Links

- [storage path show](#)

## storage path show

Display a list of paths to attached arrays.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage path show` command displays path based statistics. The default command shows:

- Node name
- Initiator port
- Target port
- Target IQN
- TPGN
- Port speeds
- Path I/O in Kbytes/sec
- IOPs

## Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

#### | [-array ]

Using this option displays:

- Array name
- Target port
- Target IQN
- Target I/O in Kbytes/sec
- Target side switch port
- Path I/O in Kbytes/sec
- Initiator side switch port
- Initiator I/O in Kbytes/sec
- Initiator port

#### | [-by-target ]

Using this option displays the same information as the array option, but grouped by target port.

#### | [-detail ]

Using this option displays the same information as the array and by-target options, but adds the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

#### | [-switch ]

Using this option adds switch port information to the default display.

#### | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### **[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

#### **[-array-name <array name>] - Array Name**

Name of the storage array that is connected to the cluster.

#### **[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage array that is being used.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the path.

**[-path-iops <integer>] - Number of IOPS on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the path

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of IOPS on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-iops <integer>] - Number of IOPS to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the array.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

**[-vmdisk-device-id <integer>] - Virtual disk device ID**

Common device identifier, shared by a VM and its hypervisor, of a virtual disk. On ESX servers, this is the Disk ID component of a virtual device node, with a value of 0 to 15.

**[-path-failure-threshold <integer>] - Max number of path failures acceptable in wait-duration**

The path failure count, exceeding this value within wait duration will quiesce the path.

**[-wait-duration <integer>] - Wait Duration in minutes**

The time duration(minutes) in which path is monitored for path failures.

## Examples

The following example shows the default display.

```
vbv3170f2a::> storage path show
```

Path I/O		Initiator	Array Target	Port	TPGN	Speed
Node	IOPS					
(KB/s)						
vbv3170f2a-01		0b	50001fe1500a866c		2	2 Gb/S
6	2					
vbv3170f2a-01		0b	50001fe1500a866d		2	2 Gb/S
0	0					
vbv3170f2a-01		0c	50001fe1500a866e		4	4 Gb/S
0	0					
vbv3170f2b-03		0a	50001fe1500a866d		1	2 Gb/S
3	1					
vbv3170f2b-03		0c	50001fe1500a866f		4	4 Gb/S
3	1					

5 entries were displayed.

The following example shows how the information is displayed with the array option.

```
vnv3070f20b::> storage path show -array
```

```
Node: vnv3070f20b
```

## storage pool commands

### storage pool add

#### Add disks to a storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage pool add` command increases the total capacity of an existing storage pool by adding the specified SSDs to the storage pool. The disks are split into four equal partitions and added to each of the allocation units of the storage pool. If any allocation units from the storage pool have already been allocated to an aggregate, the cache or usable capacity of that aggregate is increased depending on whether it is a Flash Pool or an All-Flash aggregate .

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice-versa.

For provisioning storage pool capacity into All-Flash aggregates, the Vserver option `raid.storagepool.data.enable` must be set to `true` . The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

For example, if an SSD with a usable size of 745 GB is added to a storage pool that is part of four aggregates, each aggregate will grow its cache or usable capacity by 186.2 GB. If a different allocation is desired, create a new storage pool using the [storage pool create](#) command.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool to which disks are to be added.

### **{ [-disk-count <integer>] - Number of Disks to Add in Storage Pool**

This parameter specifies the number of disks that are to be added to the storage pool. The disks to be added come from the pool of spare disks.

### **[-nodes {<nodename>|local}] - Nodes From Which Spares Should be Selected**

This parameter specifies a list of nodes from which SSD disks are selected for addition to the storage pool. If this parameter is not specified, disks to be added to the storage pool can be selected from both the nodes sharing the storage pool. Use this parameter to restrict the selection of spare disks to one particular node.

### **[-disk-list <disk path name>,...] - List of Spare Disks }**

This parameter specifies a list of disks to be added to the storage pool. In an HA configuration, SSDs being added to a storage pool can be owned by either node in the HA pair.

### **{ [-quiet <true>] - Confirmations off (privilege: advanced)**

When set to *true*, this parameter specifies the operation should be executed without pausing for confirmation.

### **[-simulate <true>] - Simulate Storage Pool Addition**

When set to *true*, this parameter specifies the operation should be performed as a simulation. The command reports which aggregates would grow automatically as a result of adding the disks to the storage pool. The disks are not added to the storage pool.

## Examples

In this example, the user requests a report detailing the changes that would occur if a new disk is added to the storage pool *SP1*. In this case, 186.2 GB of cache is added to the Flash Pool aggregates *nodeA\_flashpool\_1* and *nodeB\_flashpool\_1*. There are two unprovisioned allocation units in the storage pool and therefore the storage pool available capacity also grows by 372.5 GB.

```
cluster1::> storage pool add -storage-pool SP1 -disk-list 1.0.23 -simulate
```

This operation will result in capacity being allocated in the following way:

Container Name	Capacity To Be Added	Current Size	New Size
nodeA_flashpool_1	186.2GB	558.7GB	744.9GB
nodeB_flashpool_1	186.2GB	558.7GB	744.9GB
(Available Capacity)	372.5GB	1.09TB	1.45TB

The following example adds one disk to a storage pool named *SP1*. The spare disks are selected from either local node or its partner or both based on spare availability.

```
cluster-1::> storage pool add -storage-pool SP1 -disk-count 1

Info: The following disks will be added to storage pool "SP1":
Disk                Size  Type  Owner
-----
1.0.12              744.9GB SSD    cluster-1-01
New Allocation Unit Size: 744.8GB
Capacity will be allocated in the following way:
Container           Capacity  Current      New
Name               To Be Added      Size      Size
-----
nodeA_flashpool_1   186.2GB    558.7GB    744.9GB
nodeB_flashpool_1   186.2GB    558.7GB    744.9GB
(Available Capacity) 372.5GB    1.09TB     1.45TB
Are you sure you want to continue with this operation?

## storage pool create

Create a new storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage pool create` command creates an SSD storage pool using a given list of spare SSDs.

When a storage pool is created, Data ONTAP splits the capacity provided by the SSDs into four equally-sized allocation units. In an HA configuration, two allocation units (containing 50% of the total capacity) are assigned to each node in the HA pair. This assignment can be modified using the [storage pool reassign](#) command.

After the storage pool is created, its allocation units can be provisioned into Flash Pool or All-Flash aggregates using the [storage aggregate add-disks](#) command and the `-storage-pool` parameter.

If capacity from a storage pool is already provisioned into a Flash Pool aggregate, the same storage pool cannot be used to provision an All-Flash aggregate and vice versa.

For provisioning storage pool capacity into All-Flash aggregates, the `vserver` option `raid.storagepool.data.enable` must be set to `true`. The storage pool data enabled mode of operation is not currently supported by OnCommand management software.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the name of the storage pool that is to be created. The SSDs are partitioned and placed into the new storage pool.

### **{ [-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

This parameter specifies a list of nodes from which SSD disks are selected to create the storage pool. If two nodes are specified then they need to be in HA configuration. Spare disks are selected from either node or its partner or both. If this parameter is not specified, storage pool will be created by selecting disks from either the node or its partner or both from where command is run.

### **-disk-count <integer> - Number of Disks in Storage Pool**

This parameter specifies the number of disks that are to be included in the storage pool. The disks in this newly created storage pool come from the pool of spare disks. The smallest disks in this pool are added to the storage pool first, unless you specify the `-disk-size` parameter.

### **[-disk-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Size**

This parameter specifies the size of the disks on which the storage pool is to be created. Disks with a usable size between 95% and 105% of the specified size are selected.

### **[-disk-list <disk path name>,... - Disk List for Storage Pool Creation }**

This parameter specifies a list of SSDs to be included in the new storage pool. The SSDs must be spare disks and can be owned by either node in an HA pair.

### **[-simulate <true>] - Simulate Storage Pool Creation**

This option simulates the storage pool creation and prints the allocation unit size that would be used for the storage pool.

## Examples

The following example creates a storage pool named SP1. The storage pool contains 3 SSD disks, the spare disks selected are from either local node, or its partner or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP1 -disk-count 3
```

The following example creates a storage pool named SP2. The storage pool contains 3 SSD disks, the spare disks selected are from either node0, or its partner node1 or both based on spare availability.

```
cluster1::> storage pool create -storage-pool SP2 -disk-count 3 -nodes  
node0,node1
```

The following example creates a storage pool named SP3 from four SSDs using disk list.

```
cluster1::> storage pool create -storage-pool SP3 -disk-list 1.0.13,  
1.0.15, 1.0.17, 1.0.19
```

## storage pool delete

Delete an existing storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage pool delete` command deletes an existing SSD storage pool. At the end of the operation, the SSDs are converted back to spare disks.

### Parameters

#### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool that you want to delete. You can delete the storage pool only if all of the allocation units in the storage pool are available.

### Examples

Verify that storage pool *SP3* is ready for deletion by confirming it has four available allocation units and then delete it.

```
cluster1::> storage pool show-available-capacity -storage-pool SP3
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP3	SSD	Pool0	372.5GB	2	744.9GB
node-b	SP3	SSD	Pool0	372.5GB	2	744.9GB

2 entries were displayed.

```
cluster1::> storage pool delete -storage-pool SP3
```

```
Warning: Are you sure you want to delete storage pool "SP3"? {y|n}: y
[Job 313] Job succeeded: storage pool delete job for "SP3" completed
successfully
```

## storage pool reassign

Reassign capacity from one node to another node in storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool reassign` command changes the ownership of unprovisioned (available) storage pool allocation units from one HA partner to the other for an existing storage pool.

## Parameters

### **-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool within which available capacity is reassigned from one node to another.

### **-from-node {<nodename>|local} - Reassign Available Capacity from This Node**

This parameter specifies the name of the node that currently owns the allocation units.

### **-to-node {<nodename>|local} - Reassign Available Capacity to This Node**

This parameter specifies the name of the node that will now own the allocation units.

### **-allocation-units <integer> - Allocation Units**

This parameter specifies the number of allocation units to be reassigned.

## Examples

Move an available allocation unit from node-b to node-a in preparation for provisioning the allocation units on node-a.

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Count	Total Usable Size
node-a	SP2	SSD	Pool0	744.9GB	2	1.45TB
node-b	SP2	SSD	Pool0	744.9GB	1	744.9GB

2 entries were displayed.

```
cluster1::*> storage pool reassign -storage-pool SP2 -from-node node-b -to  
-node node-a -allocation-units 1  
[Job 310] Job succeeded: storage pool reassign job for "SP2" completed  
successfully
```

```
cluster1::*> storage pool show-available-capacity -storage-pool SP2
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Count	Total Usable Size
node-a	SP2	SSD	Pool0	744.9GB	3	2.18TB
node-b	SP2	SSD	Pool0	744.9GB	0	0B

2 entries were displayed.

## storage pool rename

### Rename storage pool

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage pool rename` command changes the name of the storage pool.

#### Parameters

**-storage-pool <storage pool name> - Storage Pool Name**

This parameter specifies the storage pool name.

**-new-name <storage pool name> - New Name of the Storage Pool**

This parameter specifies the new name of the storage pool.

#### Examples

Renaming storage pool "sp1" to "sp2"

```
cluster-1::> storage pool show
Storage
Storage Pool      Type      #Disks  Nodes              Total Size
-----
sp1                SSD           4  node-a,            10.44GB
                   node-b

cluster-1::> storage pool rename -storage-pool sp1 -new-name sp2

cluster-1::> storage pool show
Storage
Storage Pool      Type      #Disks  Nodes              Total Size
-----
sp2                SSD           4  node-a,            10.44GB
                   node-b
```

## storage pool show-aggregate

### Display aggregates provisioned from storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage pool show-aggregate` command displays allocation information for SSD storage pools in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about allocations of all storage pools in the

cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[-aggregate <aggregate name>] - Aggregate**

Selects the storage pools that match this parameter value.

**[-capacity {<integer>[KB|MB|GB|TB|PB] } ] - Capacity**

Selects the storage pools that match this parameter value.

Capacity includes space provided by data and parity portions of each allocation unit. Only the data portions of each allocation unit contribute to the cache or usable capacity of Flash Pool or All-Flash aggregates respectively .

**[-allocated-unit-count <integer>] - Number of AU's Assigned to This Aggregate**

Selects the storage pools that match this parameter value.

**[-original-owner <text>] - Original Owner Name**

Selects the storage pools that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the storage pools that match this parameter value.

## Examples

Display information about the aggregate or aggregates using a storage pool called *SP2* :

```
cluster1::> storage pool show-aggregate -storage-pool SP2 -instance
Name of Storage Pool: SP2
                        Aggregate: node2_flashpool_1
                        Capacity: 744.9GB
Number of AU's Assigned to This Aggregate: 1
                        Original Owner Name: node2
                        Node: node2
```

## storage pool show-available-capacity

Display available capacity of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool show-available-capacity` command displays information about available capacity in SSD storage pools on each node in the cluster. The command output depends upon the parameter or parameters specified with the command. If no parameters are specified, the command displays information about available capacities in all shared pools in the cluster.

Storage pool available capacity is data storage space that has not yet been provisioned into Flash Pool or All-Flash aggregates. Allocation units might be provisioned into aggregates using the [storage aggregate add-disks](#) command and the `-storage-pool` parameter.

All storage pool available capacity can be provisioned into aggregates. Available capacity within a storage pool is not used to protect against a disk failure. In the case of an SSD failure or predicted failure, Data ONTAP moves a suitable whole SSD spare disk from outside the storage pool into the storage pool and begins the recovery process (using either reconstruction or Rapid RAID Recovery, whichever is appropriate).

## Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the available capacities that match this parameter value.

**[-node {<nodename>|local}] - Node**

Selects the available capacities that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates.

**[-storage-type <SSD>] - Type of Storage Pool**

Selects the available capacities that match this parameter value. Only the *SSD* type is supported for this version of Data ONTAP.

**[-allocation-unit-count <integer>] - Number of Allocation Units Available**

Selects the available capacities that match this parameter value.

Allocation units are the units of storage capacity that are available to be provisioned into aggregates. Each allocation unit is one minimum unit of allocation (MUA) and its capacity is given as `allocation-unit-size`.

### **`[-syncmirror-pool <text>]` - Syncmirror Pool**

Selects the available capacities that match this parameter value.

The SyncMirror pool of an allocation unit must match the SyncMirror pool of the disks of the aggregate when adding allocation units into an aggregate.

Mirroring of aggregates that are provisioned from SSD storage pools is not supported.

### **`[-available-size {<integer>[KB|MB|GB|TB|PB] }]` - Total Usable Available Size**

Selects the available capacities that match this parameter value.

The `available-size` is the sum of the capacities of the allocation units that are assigned but not yet provisioned. The amount of `available-size` that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

## **Examples**

In this example, two nodes of an HA pair share available capacity from two storage pools, *SP1* and *SP2*. There are a total of 5 allocation units that have not yet been provisioned.

```
cluster1::> storage pool show-available-capacity
```

Node	Storage Pool	Storage Type	SyncMirror Pool	Allocation Unit size	Unit Count	Total Usable Size
node-a	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-b	SP1	SSD	Pool0	558.7GB	1	558.7GB
node-a	SP2	SSD	Pool0	744.9GB	2	1.45TB
node-b	SP2	SSD	Pool0	744.9GB	1	744.9GB

## **Related Links**

- [storage aggregate add-disks](#)

## **storage pool show-disks**

Display disks in storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `storage pool show-disks` command displays information about disks in storage pools in the cluster. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays information about all disks in all storage pools in the cluster.

## **Parameters**

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Name of Storage Pool**

Selects the storage pools that match this parameter value.

**[-disk <disk path name>] - Name of the disk**

Selects the storage pools with the disks that match this parameter value.

**[-disk-type {ATA | BSAS | FCAL | FSAS | LUN | MSATA | SAS | SSD | VMDISK | SSD-NVM}] - Disk Type**

Selects the storage pools with the disks that match this parameter value. Only the `SSD` type is supported for this version of Data ONTAP.

**[-usable-size {<integer>[KB|MB|GB|TB|PB]}] - Disk Usable Size**

Selects the storage pools with the disks that match this parameter value.

In this command, `usable-size` refers to the sum of the capacities of all of the partitions on the disk.

**[-total-size {<integer>[KB|MB|GB|TB|PB]}] - Total Size**

Selects the storage pools with the disks that match this parameter value.

**[-node-list <nodename>,...] - List of Nodes**

Selects the storage pools with the disks that are visible to all of the specified nodes.

## Examples

Show information about SSDs in a storage pool called `SP2`.

```
cluster1::> storage pool show-disks -storage-pool SP2
```

Storage Pool Name: SP2

Storage

Disk	Type	Usable Size	Total Size
-----	-----	-----	-----
1.0.16	SSD	745.0GB	745.2GB
1.0.18	SSD	745.0GB	745.2GB
1.0.20	SSD	745.0GB	745.2GB
1.0.22	SSD	745.0GB	745.2GB

## storage pool show

Display details of storage pools

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage pool show` command displays information about SSD storage pools in the cluster. By default, the command displays information about all storage pools in the cluster. You can specify parameters to limit the output to a specific set of storage pools.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-storage-pool <storage pool name>] - Storage Pool Name**

Selects the storage pools that match this parameter value.

**[-storage-pool-uuid <UUID>] - UUID of Storage Pool**

Selects the storage pools that match this parameter value.

**[-nodes {<nodename>|local}] - Nodes Sharing the Storage Pool**

Selects the storage pools that match this parameter value.

In an HA pair, either node name may be specified.

**[-disk-count <integer>] - Number of Disks in Storage Pool**

Selects the storage pools that match this parameter value.

**[-allocation-unit-size {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Size**

Selects the storage pools that match this parameter value.

Allocation units represent the unit of storage allocated to aggregates from this storage pool.

**[-allocation-unit-data-size-raid4 {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID4**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid4`.

**[-allocation-unit-data-size-raid-dp {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-DP**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_dp`.

**[-allocation-unit-data-size-raid-tec {<integer>[KB|MB|GB|TB|PB]}] - Allocation Unit Data Size for RAID-TEC**

This parameter shows the amount of additional data capacity provided if an allocation unit from this storage pool was added to an aggregate with `-raidtype` as `raid_tec`.

### **[`-storage-type <SSD>`] - Storage Type**

Selects the storage pools that match this parameter value.

Only the `SSD` type is supported for this version of Data ONTAP.

### **[`-pool-usable-size {<integer>[KB|MB|GB|TB|PB]}`] - Storage Pool Usable Size**

Selects the storage pools that match this parameter value.

The `pool-usable-size` is the sum of the capacities of the allocation units that are assigned to nodes but not yet provisioned. The amount of `pool-usable-size` that is contributed to the cache or usable capacity of an aggregate depends upon the RAID type used when provisioning the allocation units.

### **[`-pool-total-size {<integer>[KB|MB|GB|TB|PB]}`] - Storage Pool Total Size**

Selects the storage pools that match this parameter value.

The `pool-total-size` is the sum of the capacities of allocation units belonging to this storage pool.

### **[`-is-healthy {true|false}`] - Is Pool Healthy?**

Selects the storage pools that match this parameter value.

For storage pools with `is-healthy`false` , the ``unhealthy-reason` parameter provides more information.

`is-healthy` must be `true` to provision allocation units from a storage pool into an aggregate.

### **[`-pool-state <State of the Storage Pool>`] - State of the Storage Pool**

Selects the storage pools that match this parameter value. Possible states are:

- `normal` - the storage pool is operating normally.
- `degraded` - the storage pool has one or more failed disks.
- `creating` - the storage pool is being created.
- `deleting` - the storage pool is being deleted.
- `reassigning` - allocation units are being reassigned from one node to another.
- `growing` - allocation units in the storage pool are expanding due to the addition of new capacity into the storage pool.

### **[`-unhealthy-reason <text>`] - Reason for Storage Pool Being Unhealthy**

Selects the storage pools that match this parameter value.

The message provided gives additional details about why the storage pool is unhealthy.

### **[`-current-operation-job-id <integer>`] - Job ID of the Currently Running Operation**

Selects the storage pools that match this parameter value.

Long-running operations associated with storage pools will be managed via jobs. For example, if you provision allocation units from a storage pool into an aggregate and the disks associated with the storage pool need to be zeroed, the operation will be completed via a job.

## Examples

Display the storage pools in the cluster.

```
cluster1::> storage pool show
Storage Pool      Type  #Disks  Nodes              Total Size
-----
LargeSP           SSD    10  noda-a,node-b      7.27TB
SmallSP           SSD     2  noda-a,node-b      1.45TB
2 entries were displayed.
```

The following example displays the details of a storage pool named SmallSP. Only one of its four allocation unit has been provisioned, so 75% of its size is available (usable).

```
cluster1::> storage pool show -storage-pool SmallSP
Storage Pool Name: SmallSP
                UUID of Storage Pool: 60f2f1b9-e60f-11e3-a5e7-
00a0981899a2
        Nodes Sharing the Storage Pool: node-a, node-b
        Number of Disks in Storage Pool: 2
                Allocation Unit Size: 372.5GB
                        Storage Type: SSD
                Storage Pool Usable Size: 1.09TB
                Storage Pool Total Size: 1.45TB
                        Is Pool Healthy?: true
                State of the Storage Pool: normal
        Reason for storage pool being unhealthy: -
        Job ID of the Currently Running Operation: -
```

## storage port commands

### storage port disable

Disable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage port disable` command disables a specified storage port.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

### **-port <text> - Port**

Use this parameter to specify the port that needs to be disabled.

### **[-force <true>] - Force (privilege: advanced)**

Use this optional parameter to force the disabling of the storage port. The parameter can be used to disable the specified port even if some devices can only be accessed using this port. Note that doing so might cause multiple device failures.

## **Examples**

The following example disables port 0a on node node1:

```
cluster1::> storage port disable -node node1 -port 0a
```

## **storage port enable**

Enable a storage port

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage port enable` command enables a specified storage port.

### **Parameters**

#### **-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the port resides.

#### **-port <text> - Port**

Use this parameter to specify the port that needs to be enabled.

## **Examples**

The following example enables port 0a on node node1:

```
cluster1::> storage port enable -node node1 -port 0a
```

## **storage port rescan**

Rescan a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `storage port rescan` command rescans a specified storage port.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port that needs to be rescanned.

## Examples

The following example rescans port 0a on node node1:

```
cluster1::> storage port rescan -node node1 -port 0a
```

## storage port reset-device

Reset a device behind a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `storage port reset-device` command resets a device behind a port. If the device is behind a SAS port, you need to specify the shelf name and bay ID where the device resides. If the device is behind a FC port, you need to specify the loop ID of the device.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port used to reset the device.

**{ -shelf-name <text> - Shelf Name (privilege: advanced)**

Use this parameter to specify the shelf where the device resides.

**-bay-id <integer> - Bay ID (privilege: advanced)**

Use this parameter to specify the bay where the device resides.

**| -loop-id <integer> - Loop ID (privilege: advanced) }**

Use this parameter to specify the loop ID of the device.

## Examples

The following example resets a device behind SAS port 0a on node node1:

```
cluster1::> storage port reset-device -node node1 -port 0a -shelf-name 1.0  
-bay-id 10
```

The following example resets a device behind FC port 1b on node node1:

```
cluster1::> storage port reset-device -node node1 -port 1b -loop-id 20
```

## storage port reset

Reset a storage port

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage port reset` command resets a specified storage port.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which the port resides.

**-port <text> - Port (privilege: advanced)**

Use this parameter to specify the port that needs to be reset.

### Examples

The following example resets port 0a on node node1:

```
cluster1::> storage port reset -node node1 -port 0a
```

## storage port show

Show storage port information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage port show` command displays information about the storage ports in the cluster. If no parameters are specified, the default command displays the following information about the storage ports:

- Node
- Port
- Type

- Speed
- State
- Status

To display detailed profile information about a single storage port, use the `-node` and `-port` parameters.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage ports, in column style output.

**| [-errors ]**

Displays the following error status information about the storage ports which have errors:

- Error type
- Error severity
- Error description

**| [-instance ] }**

Displays expanded information about all the storage ports in the system. If a storage port is specified, then this parameter displays detailed information for that port only.

**[-node {<nodename>|local}] - Node**

Displays detailed information about the storage ports on the specified node.

**[-port <text>] - Port**

Selects the ports with the specified port name.

**[-port-type {Unknown|SAS|FC}] - Port Type**

Selects the ports of the specified type.

**[-port-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}] - Port Speed**

Selects the ports with the specified speed.

**[-state {enabled|disabled}] - Port State**

Selects the ports with the specified state.

**[-status {unknown|online|online-degraded|offline|link-down}] - Port Status**

Selects the ports with the specified operational status.

**[-description <text>] - Description**

Selects the ports with the specified description.

**[-firmware-rev <text>] - Firmware Revision**

Selects the ports with the specified firmware revision.

**[-serial-number <text>] - Serial Number**

Selects the ports with the specified serial number.

**[-connection-mode {Unknown|Loop|Point-to-point}] - Connection Mode**

Selects the ports with the specified connection mode.

**[-wwnn <FC WWN>] - World Wide Node Name**

Selects the ports with the specified World Wide Node Name.

**[-wwpn <FC WWN>] - World Wide Port Name**

Selects the ports with the specified World Wide Port Name.

**[-board-name <text>] - Board Name**

Selects the ports with the specified board name.

**[-connector-capabilities <integer>,...] - Connector Capabilities**

Selects the ports with the specified list of connector capabilities.

**[-wwn <FC WWN>] - Base World Wide Name**

Selects the ports with the specified World Wide Name.

**[-mfg-part-number <text>] - MFG Part Number**

Selects the ports with the specified manufacturer part number.

**[-nvdata-rev <text>] - NVDATA Revision**

Selects the ports with the specified NVDATA revision.

**[-part-number <text>] - Part Number**

Selects the ports with the specified part number.

**[-date-code <text>] - Date Code**

Selects the ports with the specified date code.

**[-cable-length <text>] - Cable Length**

Selects the ports with the specified cable length.

**[-cable-identifier <text>] - Cable Identifier**

Selects the ports with the specified cable identifier.

**[-cable-end-id {end\_0|end\_1}] - Cable End Identifier**

Selects the ports with the specified cable end identifier.

**[-connector-technology {active-copper|passive-copper|optical}] - Connector Technology**

Selects the ports with the specified connector technology.

**[-phy-id <integer>,...] - Phy ID**

Selects the ports that have phys with the specified phy ID.

**[-phy-state {enabled|disabled}] - Phy State**

Selects the ports that have phys with the specified state.

**`[-phy-status {unknown|online|offline|speed-negotiation-failed|sata-oob-failed}] -`**

#### **Phy Status**

Selects the ports that have phys with the specified status.

**`[-phy-speed {0|1|1.5|2|3|4|6|8|10|12|16|32}] -`** **Phy Speed**

Selects the ports that have phys with the specified speed.

**`[-error-type {unknown|online|online-degraded|offline|link-down}] -`** **Error Type**

Selects the ports with the specified error type.

**`[-error-severity {unknown|notice|warning|error|critical}] -`** **Error Severity**

Selects the ports with the specified error severity.

**`[-error-text <text>] -`** **Error Text**

Selects the ports with the specified error text.

**`[-corrective-action <text>] -`** **Corrective Action**

Selects the ports with the specified corrective action.

**`[-connector-type {QSFP|QSFP+|Mini-SAS HD|SFP}] -`** **Connector Type**

Selects the ports with the specified connector type.

**`[-connector-vendor <text>] -`** **Connector Vendor**

Selects the ports with the specified connector vendor.

**`[-connector-part-number <text>] -`** **Connector Part Number**

Selects the ports with the specified connector part number.

**`[-connector-serial-number <text>] -`** **Connector Serial Number**

Selects the ports with the specified connector serial number.

#### **Examples**

The following example displays information about all storage ports in the cluster:

```
cluster1::> storage port show
Speed
Node          Port Type (Gb/s) State      Status
-----
node1
              0a  SAS      0 disabled offline
              0b  SAS      6 enabled  online
              1a  FC       0 disabled offline
              1b  FC       2 enabled  online
node2
              0a  SAS      6 enabled  online
              0b  SAS      6 enabled  online-degraded
              1a  FC       2 enabled  online
              1b  FC       2 enabled  online
```

The following example displays detailed information about port 0a on node node1:

```
cluster1::> storage port show -node node1 -port 0b
Node: node1
      Port: 0b
      Description: SAS Host Adapter 0b (PMC-Sierra PM8001 rev. C)
      Firmware Revision: 01.12.06.00
      Base WWN: 50:0a:09:80:00:82:47:b4
      Connector Type: qsfp
      Connector Vendor: Molex Inc.
      Connector Part Number: 112-00177+A0
      Connector Technology: passive_copper
      Connector Serial Number: 017920547
      Cable Length: 2m
      Cable End Identifier: end_1
      Cable Identifier: 500a09800082847f-500a0980008247b4
      Port Speed: 6 Gb/s
      Port State: enabled
      Port Status: online
      Phy State: [0]  enabled,  online,  6 Gb/s
                  [1]  enabled,  online,  6 Gb/s
                  [2]  enabled,  online,  6 Gb/s
                  [3]  enabled,  online,  6 Gb/s
```

## storage raid-options commands

## storage raid-options modify

Modify a RAID option

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage raid-options modify` command is used to modify the available RAID options for each node in a cluster. The options are described in the `storage raid-options` manual page.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the RAID option is to be modified.

**-name <text> - Option Name**

This parameter specifies the RAID option to be modified. To see the list of RAID options that can be modified, use the [storage raid-options show](#) command.

**[-value <text>] - Option Value**

This parameter specifies the value of the selected RAID option.

### Related Links

- [storage raid-options show](#)

## storage raid-options show

Display RAID options

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage raid-options show` command displays information about all the RAID options in a cluster. The options are described in the `storage raid-options` manual page.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about all the RAID options on the specified node.

### **[`-name <text>`] - Option Name**

Selects information about the RAID options that have the specified name.

### **[`-value <text>`] - Option Value**

Selects information about all the RAID options that have the specified value.

### **[`-constraint <text>`] - Option Constraint**

Selects information about all the RAID options that have the specified constraint. The 'constraint' field indicates the expected setting for a RAID option across both nodes of an HA pair. The possible values are:

- *none* - no constraint on the value of this RAID option; nodes can have different values
- *same\_preferred* - the same value should be used on both nodes of an HA pair, otherwise the next takeover may not function correctly
- *same\_required* - the same value must be used on both nodes of an HA pair, otherwise the next takeover will not function correctly
- *only\_one* - the same value should be used on both nodes of an HA pair. If the values are different and a takeover is in progress, the value of the RAID option on the node that is taking over will be used
- *unknown* - no information about constraints for this RAID option

## **Examples**

The following example shows the raid scrub settings for a node named node1:

```
cluster1::> storage raid-options show -node node1 -name raid.scrub*
Node      Option                                     Value      Constraint
-----
node1     raid.scrub.perf_impact                    low        only_one
node1     raid.scrub.schedule                       none
3 entries were displayed.
```

# **storage shelf commands**

## **storage shelf show**

Display a list of storage shelves

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage shelf show` command displays information about all the storage shelves in the storage system. If no parameters are specified, the default command displays the following information about the storage shelves:

- Shelf Name
- Shelf ID

- Serial Number
- Model
- Module Type
- Status

To display detailed profile information about a single storage shelf, use the `-shelf` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage shelves, in column style output.

**| [-bay ]**

Displays the following details about the disk bays in the storage shelf:

- The unique positional identifier of the disk bay
- Whether a disk drive is installed in the bay
- Bay type
- Operational status of the disk bay

**| [-connectivity ]**

Displays the following details about the connectivity from the node to the storage shelf:

- Node name
- Initiator side switch port
- Target side switch port
- World wide port name
- Target Port Group Number (TPGN)

**| [-cooling ]**

Displays the following details about the cooling elements and temperature sensors of the storage shelf:

- Element ID of the cooling fan
- The current speed of the cooling fan in revolutions per minute (rpm)
- Operational status of the cooling fan
- Sensor ID of the temperature sensor element
- Temperature at the sensor in degrees Celsius
- Whether the current temperature at the sensor is the ambient temperature
- Low critical threshold value for the temperature sensor
- Low warning threshold value for the temperature sensor
- High critical threshold value for the temperature sensor
- High warning threshold value for the temperature sensor
- Operational status for the temperature sensor

### | [-errors ]

Displays the following error status information about the storage shelves which have errors:

- Error type
- Error description

### | [-module ]

Displays the following details about the I/O modules attached to the storage shelf:

- Module ID
- Module Part number
- Serial number of the Enclosure Services Controller Electronics element
- Whether monitoring is enabled on this module
- Whether this module is the SAS expander master module
- Whether this module is the element reporting
- Version of the firmware installed on the module
- Latest firmware revision
- Number of times, since last boot, that this module has been swapped
- Operational status of the module

### | [-port ]

Displays the following details about the storage shelf ports:

- Expander phy element identifier
- SAS shelf port type
- World Wide Port Name of the SAS port
- Operational physical link rate of the SAS port in Gb/s
- Negotiated physical link rate of the SAS port in Gb/s
- Power status of the SAS port
- Status of the SAS port
- Fibre Channel shelf port ID
- Fibre Channel shelf port type
- Fibre Channel shelf port status

### | [-power ]

Displays the following details about the power supplies, voltage sensors and current sensors of the storage shelf:

- Power Supply Unit (PSU) number
- PSU type
- PSU part number
- PSU serial number

- PSU power rating in watts
- PSU crest factor
- Power drawn from the PSU in watts
- Whether the PSU can be reset via software control
- Whether the auto power reset of the PSU is enabled
- PSU firmware revision
- Operational status of the PSU
- Voltage sensor number
- Voltage detected by the voltage sensor, in volts (V)
- Operational status of the voltage sensor
- Current sensor number
- Current detected by the current sensor, in milliamps (mA)
- Operational status of the current sensor

**[`-instance`] }**

Displays expanded information about all the storage shelves in the system.

**[`-node` {<nodename>|local}] - Node**

Displays information only about the storage shelves that are attached to the node you specify.

**[`-shelf` <text>] - Shelf Name**

Displays information only about the storage shelves that match the names you specify.

**[`-shelf-uid` <text>] - Shelf UID**

Displays information only about the storage shelf that matches the shelf UID you specify. Example:

``50:05:0c:c0:02:10:64:26``

**[`-stack-id` {<integer>|-}] - Stack ID**

Displays information only about the storage shelves that are attached to the stack that matches the stack ID you specify

**[`-shelf-id` <text>] - Shelf ID**

Displays information only about the storage shelves that match the shelf ID you specify.

**[`-module-type`**

**{unknown|atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12f|psm3e|iom12b}] - Shelf Module Type**

Displays information only about the storage shelves that match the module-type you specify.

**[`-connection-type` {unknown|fc|sas|nvme}] - Shelf Connection Type**

Displays information only about the storage shelves that match the connection type you specify. Example: FC or SAS.

**[`-is-local-attach` {true|false}] - Is the Shelf Local to This Cluster?**

Displays information only about the storage shelves that are local (TRUE) or remote (FALSE) to this cluster.

**[-vendor <text>] - Shelf Vendor**

Displays information only about the storage shelves that match the vendor you specify.

**[-product-id <text>] - Shelf Product Identification**

Displays information only about the storage shelves that match the product ID you specify.

**[-serial-number <text>] - Shelf Serial Number**

Displays information only about the storage shelf that matches the serial number you specify.

**[-disk-count {<integer>|-}] - Disk Count**

Displays information only about the storage shelves that have the disk count you specify.

**[-state {unknown|no-status|init-required|online|offline|missing}] - Shelf State**

Displays information only about the storage shelves that are in the state you specify.

**[-op-status {unknown|normal|warning|error|critical|standby-power}] - Shelf Operational Status**

Displays information only about the storage shelves that are currently operating under the status condition you specify.

**[-bay-id {<integer>|-}] - Bay ID**

Displays information only about the storage shelves that have bays that match the bay ID you specify.

**[-bay-type {unknown|single-disk|multi-lun}] - Bay Type**

Displays information only about the storage shelves that have bays that match the type of bay you specify.

**[-bay-has-disk {true|false}] - Bay Has Disk**

Displays information only about the storage shelves that have bays with disk drives inserted in them (true) or empty bays (false).

**[-bay-op-status {unknown|normal|error}] - Bay Operational Status**

Displays information only about the storage shelves that have bays that match the operational state you specify.

**[-controller {<nodename>|local}] - Controller Name**

Displays information only about the storage shelves that are connected to the node you specify.

**[-controller-uuid <text>,...] - Controller UUID**

Displays information only about the storage shelves that are connected to the node UUID you specify.

**[-initiator <text>,...] - Initiator**

Displays information only about the storage shelves that are visible to the initiator you specify.

**[-initiator-wwpn <text>,...] - Initiator WWPN**

Displays information only about the storage shelves that are visible to the initiator WWPN you specify.

**[-initiator-side-switch-port <text>,...] - Initiator Side Switch Port**

Displays information only about the storage shelves that are visible to an initiator connected to the switch port you specify.

**[-target-side-switch-port <text>,...] - Target Side Switch Port**

Displays information only about the storage shelves visible on target ports identified by the switch port to which they are connected.

**[-target-port <text>,...] - Target Port**

Displays information only about the storage shelves visible on the specified target ports identified by their World Wide Port Name (WWPN).

**[-tpgn {<integer>|-}] - Target Port Group Number**

Displays information only about the storage shelves that belong to the Target Port Group Name (TPGN) you specify.

**[-port-speed {<integer>|-}] - Port Speed**

Displays information only about the storage shelves with ports that match the port speed you specify.

**[-io-kbps {<integer>|-}] - Kbytes/sec on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed I/O at the throughput you specify.

**[-iops {<integer>|-}] - Number IOPS per Second on Storage Shelf**

Displays information only about the storage shelves visible to an initiator that has executed the number of IOPs you specify.

**[-current-sensor-id {<integer>|-}] - Current Sensor ID**

Displays information only about the storage shelves with current sensor that matches the current sensor ID you specify.

**[-current-sensor-location <text>,...] - Current Sensor Location**

Displays information only about the storage shelves with current sensors installed at the location you specify.

**[-current-sensor-reading {<integer>|-}] - Current Sensor Reading**

Displays information only about the storage shelves with current sensors that match the current reading you specify.

**[-current-op-status {unknown|normal|over-current-critical|under-current-critical|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with current sensors that match the operational status you specify.

**[-fan-id {<integer>|-}] - Fan ID**

Displays information only about the storage shelves with a cooling fans that match the fan IDs you specify.

**[-fan-location <text>,...] - Fan Location**

Displays information only about the storage shelves with cooling fans installed.

**[-fan-rpm {<integer>|-}] - Fan Rotation Per Minute**

Displays information only about the storage shelves with cooling fans that match the rpm you specify.

**[`-fan-op-status {unknown|normal|off|error|not-supported|not-installed}`] - Fan Operational Status**

Displays information only about the storage shelves with cooling fans that match the operational status you specify.

**[`-module-id <text>,...`] - Module ID**

Displays information only about the storage shelves with an I/O module that matches the module ID you specify.

**[`-module-location <text>,...`] - Module Location**

Displays information only about the storage shelves with I/O modules in the specified shelf module slots.

**[`-module-part-number <text>,...`] - Module Part Number**

Displays information only about the storage shelves with I/O modules that match the module part numbers you specify.

**[`-is-sas-master-module {true|false}`] - Is SAS Expander Master Module?**

Displays information only about the storage shelves with a SAS master I/O module (true) or an I/O module that is not a SAS master (false). This parameter applies only to SAS shelves.

**[`-is-monitor-active {true|false}`] - Is Monitor Active?**

Displays information only about the storage shelves whose monitoring is enabled (true) or disabled (false).

**[`-enclosure-type <text>,...`] - Module Enclosure Type**

Displays information only about the storage shelves that match the enclosure types you specify.

**[`-es-serial-number <text>,...`] - ES Electronics Element Serial Number**

Displays information only about the storage shelves with I/O modules that match the electronics serial numbers you specify.

**[`-module-fru-id <text>,...`] - Field Replaceable Unit ID**

Displays information only about the storage shelves with I/O modules that match the field replaceable unit (FRU) IDs you specify.

**[`-module-is-reporting-element {true|false}`] - Is Reporting Element?**

Displays information only about the storage shelves with element reporting I/O modules (true) or not (false).

**[`-module-fw-revision <text>,...`] - Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the firmware revision you specify.

**[`-module-latest-fw-revision <text>,...`] - Latest Firmware Revision**

Displays information only about the storage shelves with I/O modules that match the latest firmware revision you specify.

**[`-module-fw-progress {not-available|ready|in-progress|failed}`] - Module Firmware Progress**

Displays information only about the storage shelves with I/O modules that match the specified firmware update progress.

**[-module-swap-count {<integer>|-}] - Module Swap Count**

Displays information only about the storage shelves whose I/O modules have been swapped the specified number of times.

**[-module-op-status {unknown|normal|warning|error}] - Module Operational Status**

Displays information only about the storage shelves with I/O modules that match the operational status you specify.

**[-sas-port-id <text>,...] - Port ID**

Displays information only about the storage shelves with SAS Ports that match the port IDs you specify.

**[-sas-port-type**

**{unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi\_ho|a\_to\_b|b\_to\_a}] - Port Type**

Displays information only about the storage shelves with SAS Ports that match the SAS port type you specify.

**[-sas-port-wwpn <text>,...] - Port World Wide Port Name**

Displays information only about the storage shelves with SAS Ports that match the World Wide Port Names you specify.

**[-sas-port-speed <text>,...] - Port Speed**

Displays information only about the storage shelves with SAS Ports that match the port speed you specify.

**[-sas-negotiated-port-speed <text>,...] - Negotiated Port Speed**

Displays information only about the storage shelves with SAS Ports that match the negotiated port speed you specify.

**[-sas-port-power-status <text>,...] - Port Power Status**

Displays information only about the storage shelves with SAS Ports that match the power status you specify.

**[-sas-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp\_clk\_thr|byp\_comma\_los|byp\_crc\_brst\_thr|byp\_data\_timeout|byp\_drv\_fault|byp\_drv\_pcycle|byp\_drv\_pwr|byp\_drv\_self|byp\_gen|byp\_init|byp\_lip\_brst\_thr|byp\_lip\_f8|byp\_lip\_rate\_thr|byp\_lipf7|byp\_ltb|byp\_man|byp\_no\_drive|byp\_osc|byp\_other\_thr|byp\_rec\_los|byp\_rport|byp\_stall\_thr|byp\_wrd\_brst\_thr|byp\_wrd\_rate\_thr|byp\_xmit\_fault|diag\_transmit|inserted|loopback|status\_unknown|warn\_high\_clk\_delta|warn\_high\_crc\_rate|warn\_high\_lip|warn\_high\_wrd\_rate|term|phy\_dis\_clk\_fault|phy\_dis\_crc\_err|phy\_dis\_crc\_err\_burst|phy\_dis\_disparity|phy\_dis\_disparity\_burst|phy\_dis\_emulate\_reserve|phy\_dis\_inval\_dword|phy\_dis\_inval\_dword\_burst|phy\_dis\_loss\_dword|phy\_dis\_loss\_dword\_burst|phy\_dis\_man\_smp|phy\_dis\_manual|phy\_dis\_mirrored|empty|phy\_dis\_phy\_change|phy\_dis\_phy\_change\_burst|phy\_dis\_phy\_reset|phy\_dis\_phy\_reset\_burst|phy\_dis\_phy\_unused|phy\_ena|phy\_ena\_not\_attach|phy\_ena\_unknown|phy\_unknown|phy\_dis\_illegal}] - Port Operational Status**

Displays information only about the storage shelves with SAS Ports that match the operational status you specify.

**[-sas-port-module-id {A|B}] - Port Module ID**

Displays information only about the storage shelves with SAS Ports that match the module ID you specify.

#### **[-fc-port-id <text>,...] - Fibre Channel Port ID**

Displays information only about the storage shelves with FC Ports that match the port IDs you specify.

#### **[-fc-port-mode**

**{unknown|circle|square|sil|disk|in|out|unused|host|dcm|aux1|aux2|hi\_ho|a\_to\_b|b\_to\_a}} - Fibre Channel Port Mode**

Displays information only about the storage shelves with FC Ports that match the port modes you specify.

**[-fc-port-op-status {error|normal|off|unknown|byp-bad-term|bad-zone-recovery|byp\_clk\_thr|byp\_comma\_los|byp\_crc\_brst\_thr|byp\_data\_timeout|byp\_drv\_fault|byp\_drv\_pcycle|byp\_drv\_pwr|byp\_drv\_self|byp\_gen|byp\_init|byp\_lip\_brst\_thr|byp\_lip\_f8|byp\_lip\_rate\_thr|byp\_lipf7|byp\_ltbi|byp\_man|byp\_no\_drive|byp\_osc|byp\_other\_thr|byp\_rec\_los|byp\_rport|byp\_stall\_thr|byp\_wrd\_brst\_thr|byp\_wrd\_rate\_thr|byp\_xmit\_fault|diag\_transmit|inserted|loopback|status\_unknown|warn\_high\_clk\_delta|warn\_high\_crc\_rate|warn\_high\_lip|warn\_high\_wrd\_rate|term|phy\_dis\_clk\_fault|phy\_dis\_crc\_err|phy\_dis\_crc\_err\_burst|phy\_dis\_disparity|phy\_dis\_disparity\_burst|phy\_dis\_emulate\_reserve|phy\_dis\_inval\_dword|phy\_dis\_inval\_dword\_burst|phy\_dis\_loss\_dword|phy\_dis\_loss\_dword\_burst|phy\_dis\_man\_smp|phy\_dis\_manual|phy\_dis\_mirrored|empty|phy\_dis\_phy\_change|phy\_dis\_phy\_change\_burst|phy\_dis\_phy\_reset|phy\_dis\_phy\_reset\_burst|phy\_dis\_phy\_unused|phy\_ena|phy\_ena\_not\_attach|phy\_ena\_unknown|phy\_unknown|phy\_dis\_illegal}} - Fibre Channel Port Operational Status**

Displays information only about the storage shelves with FC Ports that match the operational status you specify.

#### **[-psu-id {<integer>|-}] - Power Supply Unit ID**

Displays information only about the storage shelves with power supply units (PSU) that match the unit IDs you specify.

#### **[-psu-location <text>,...] - Power Supply Unit Location**

Displays information only about the storage shelves with PSUs that are located at the specified location inside the shelf.

#### **[-psu-type <text>,...] - Power Supply Unit Type**

Displays information only about the storage shelves with PSUs that match the PSU types you specify.

#### **[-psu-part-number <text>,...] - Power Supply Unit Part Number**

Displays information only about the storage shelves with PSUs that match the PSU part number you specify.

#### **[-psu-serial-number <text>,...] - Power Supply Unit Serial Number**

Displays information only about the storage shelves with PSUs that match the PSU serial numbers you specify.

#### **[-psu-reset-capable {true|false}] - Power Supply Unit Reset Capability**

Displays information only about the storage shelves with reset capable PSUs (true) or reset incapable PSUs (false).

#### **[-psu-is-enabled {true|false}] - Power Supply Unit Enable/Disable Status**

Displays information only about the storage shelves with PSUs that are enabled (true) or disabled (false).

**[-psu-fw-version <text>,...] - Power Supply Unit Firmware Version**

Displays information only about the storage shelves with PSUs that have the firmware version you specify.

**[-psu-op-status {unknown|normal|error|dc-over-voltage|dc-under-voltage|dc-over-current|over-temperature-error|failed|off|not-supported|not-installed}] - Operational Status**

Displays information only about the storage shelves with PSUs that match the operational status you specify.

**[-psu-power-rating {<integer>|-}] - Power Supply Power Ratings In Watts**

Displays information only about the storage shelves with PSUs that match the power rating you specify.

**[-psu-crest-factor {<integer>|-}] - Power Supply Crest Factor**

Displays information only about the storage shelves with PSUs that match the crest factor value you specify.

**[-psu-power-drawn {<integer>|-}] - Power Drawn From PSU In Watts**

Displays information only about the storage shelves with PSUs that match the drawn power you specify.

**[-temp-sensor-id {<integer>|-}] - Sensor Name**

Displays information only about the storage shelves with temperature sensors that match the sensor IDs you specify.

**[-temp-sensor-location <text>,...] - Sensor Location**

Displays information only about the storage shelves with temperature sensors that match the specified sensor locations inside the shelf.

**[-temp-sensor-reading {<integer>|-}] - Temperature Reading**

Displays information only about the storage shelves with temperature sensors that match the temperature reading you specify.

**[-temp-is-ambient {true|false}] - Temperature Reading at Ambient Value**

Displays information only about the storage shelves with temperature sensors whose current temperature reading is ambient (true) or not (false).

**[-temp-high-critical-threshold {<integer>|-}] - High Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the high critical threshold you specify.

**[-temp-high-warning-threshold {<integer>|-}] - High Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the high warning threshold you specify.

**[-temp-low-warning-threshold {<integer>|-}] - Low Warning Threshold**

Displays information only about the storage shelves with temperature sensors that match the low warning threshold you specify.

**[-temp-low-critical-threshold {<integer>|-}] - Low Critical Threshold**

Displays information only about the storage shelves with temperature sensors that match the low critical threshold you specify.

**`[-temp-op-status {unknown|normal|under-temperature|over-temperature|error|not-supported|not-installed}] - Operational Status`**

Displays information only about the storage shelves with temperature sensors that match the operational status you specify.

**`[-voltage-sensor-id {<integer>|-}] - Voltage Sensor ID`**

Displays information only about the storage shelves with voltage sensors that match the sensor IDs you specify.

**`[-voltage-sensor-location <text>,...] - Voltage Sensor Location`**

Displays information only about the storage shelves with voltage sensors that match the specified sensor locations inside the shelf.

**`[-voltage-sensor-reading <text>,...] - Voltage Current Reading`**

Displays information only about the storage shelves with voltage sensors that match the voltage reading you specify.

**`[-voltage-op-status {unknown|normal|over-voltage-critical|under-voltage-critical|not-supported|not-installed|not-recoverable}] - Operational Status`**

Displays information only about the storage shelves with voltage sensors that match the operational status you specify.

**`[-error-type {unknown|acpp|bay|configuration|current|disk|internal|fan|module|port|power|temperature|voltage}] - Error Type`**

Displays information only about the storage shelves with errors that match the error type you specify.

**`[-error-severity {unknown|notice|warning|error|critical}] - Error Severity`**

Displays information only about the storage shelves with errors that match the error severity you specify.

## Examples

The following example displays information about all storage shelves:

```

cluster1::> storage shelf show
Module Operational
      Shelf Name  Shelf ID  Serial Number  Model  Type
Status
-----
Critical          1.1         1  6000832415    DS2246  IOM6
Normal            1.2         2  6000647652    DS2246  IOM6

```

The following example displays error information about the storage shelves that have errors:

```
cluster1::> storage shelf show -errors
Shelf Name: 1.1
    Shelf UID: 50:0a:09:80:01:cb:d6:84
    Serial Number: 6000832415
Error Type      Description
-----
Power           Critical condition is detected in storage shelf
power supply unit "1". The unit might fail.
Temperature      Critical over temperature failure for temperature
sensor "1". Current temperature: "75" C ("167" F).
```

## storage shelf acp configure

### Configure alternate control path (ACP)

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Configure the ACP connectivity on the cluster.

#### Parameters

##### **-is-enabled {true|false} - Is Enabled?**

Configures the connectivity to the specified state.

##### **[-subnet <IP Address>] - Subnet**

Configures the connectivity to the specified subnet.

##### **[-netmask <IP Address>] - Netmask**

Configures the connectivity to the specified netmask.

##### **[-channel {out-of-band|in-band}] - Channel**

Configures the connectivity to the specified channel.

#### Examples

The following example configures out-of-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel out-of-
band -subnet 192.168.0.1 -netmask 255.255.255.0
```

The following example configures in-band ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled true -channel in-band
```

The following example disables ACP connectivity on each node:

```
cluster1::> storage shelf acp configure -is-enabled false
```

## storage shelf acp show

Show connectivity information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays information about the ACP connectivity on each node

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <field-name> ", ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-errors ]**

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

**[-is-enabled {true|false}] - Is Enabled?**

Selects the nodes that are enabled or disabled.

**[-port <text>] - Port**

Selects the nodes that match the specified port on which ACP is configured.

**[-address <IP Address>] - IP Address**

Selects the nodes with the specified IP address.

**[-subnet <IP Address>] - Subnet**

Selects the nodes with the specified subnet.

**[-netmask <IP Address>] - Netmask**

Selects the nodes with the specified netmask.

**[-connection-status {no-connectivity|partial-connectivity|full-connectivity|additional-connectivity|unknown-connectivity|not-available|connection-disabled}] - Connection Status**

Selects the nodes with the specified connection status.

**[-error-id <integer>] - Error ID**

Selects the node with the specified error ID.

**[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

The error type, in case of a connection error.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

The error severity, in case of a connection error.

**[-error-text <text>] - Error Text**

Selects the node with the specified error text.

**[-corrective-action <text>] - Corrective Action**

Selects the node with the specified corrective action.

**[-channel {unknown|out-of-band|in-band}] - Channel**

Selects the nodes that has channel configured out-of-band or in-band.

## Examples

The following example displays ACP connectivity on each node:

```
cluster1::> storage shelf acp show
```

Node	Channel	Connectivity
-----	-----	-----
stor-8020-1	in-band	active
stor-8020-2	in-band	active
stor-8060-1	out-of-band	full-connectivity
stor-8060-2	out-of-band	full-connectivity
4 entries were displayed.		

The following example displays the -instance output of the storage acp show. More details on the connectivity and configuration can be seen [here](#).

```

cluster1::> storage shelf acp show -instance
Node: stor-8020-1
    Channel: out-of-band
    Enable Status: enabled
    Port: e0P
    IP Address: 192.168.1.74
    Subnet: 192.168.0.1
    Netmask: 255.255.252.0
    Connection Status: full-connectivity
Node: stor-8020-1
    Channel: in-band
    Enable Status: enabled
    Connection Status: active
2 entries were displayed.

```

## storage shelf acp module show

Show modules connected to the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays information about the modules connected to each node

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the -fields <field-name> ", ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify

**| [-errors ]**

If you specify the -errors parameter, the command displays detailed information about all modules with errors.

**| [-instance ] }**

If you specify the -instance parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the modules that match this parameter value.

**[-mac-address <text>] - MAC Address**

Selects the module that match the specified MAC address.

**[-module-name <text>] - Module name**

Selects the module that match the specified module name.

**[-module-address <IP Address>] - IP Address**

Selects the module that match the specified IP address.

**[-protocol-version <text>] - Protocol Version**

Selects the modules that match the specified protocol version.

**[-firmware-version <text>] - Firmware Version**

Selects the modules that match the specified firmware version.

**[-acpa-id <integer>] - ACPA assigner ID**

Selects the modules that match the specified ACPA ID.

**[-shelf-serial-number <text>] - Shelf Serial Number**

Selects the modules that match the specified shelf serial number.

**[-iom-type {Unknown|iom3|iom6|iom6e|iom12|iom12e|iom12f|iom12b}] - IOM Type**

Selects the modules that match the specified IOM type (IOM3/IOM6/IOM6E).

**[-last-contact <integer>] - Last Contact (secs)**

Selects the modules that match the specified last contact.

**[-state {unknown|initializing|discovery-complete|awaiting-inband|no-inband|active|awaiting-bootp|updating-firmware|connection-error|firmware-update-required|rebooting|fail|unsupported|degraded|shelf-off}] - Local Node State**

Selects the modules that match the specified state.

**[-stack-id {<integer>|-}] - Stack ID**

Selects the modules that match the specified stack ID.

**[-shelf-id <text>] - Shelf ID**

Selects the modules that match the specified shelf ID.

**[-adapter-name <text>] - Adapter Name**

Selects the modules that match the specified adapter name.

**[-error-id <integer>,...] - Error ID**

Selects the modules that match the specified error ID.

**[-error-text <text>,...] - Error Text**

The error text, in case of a module error.

**[-corrective-action <text>,...] - Corrective Action**

The corrective action, in case of a module error.

**[-error-type {No-Error|Connection-Issue|Connection-Activity|Module-Error|Shelf-Error}] - Error Type**

Selects the modules that match the specified error type.

**[-error-severity {unknown|notice|warning|error|critical}] - Error Severity**

Selects the modules that match the specified error severity.

**[-power-cycle-count <integer>] - Power Cycle count**

Number of times a shelf power cycle has been performed on a shelf

**[-power-off-count <integer>] - Power Off count**

Number of times a shelf power off has been performed on a shelf

**[-power-on-count <integer>] - Power On count**

Number of times a shelf power on has been performed on a shelf

**[-expander-reset-count <integer>] - Expander reset count**

Number of times an expander reset has been performed on a module

**[-expander-power-cycle-count <integer>] - Expander power cycle count**

Number of times an expander power cycle has been performed on a module

## Examples

The following example displays the ACP modules connected to each node:

```
cluster1::> storage shelf acp module show
Node           Module Name      State
-----
stor-v4-1a-1b-01  1.10.A          Active
                  1.10.B          Active
                  1.254.B         Active
                  1.254.A         Active

stor-v4-1a-1b-02  1.10.A          Active
                  1.10.B          Active
                  1.254.B         Active
                  1.254.A         Active

8 entries were displayed.
```

The following example displays the -instance output of the storage shelf acp module show. More details on each module can be seen [here](#).

```
cluster1::> storage shelf acp module show -instance

## storage shelf drawer show-phy

Display a list of PHYs per drawer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage shelf drawer show-phy` command displays information for drawer PHYs in the storage system. If no parameters are specified, the default command displays the following information about PHYs:

- Shelf Name
- Drawer Number
- PHY Number
- Type
- SAS Address
- State

To display detailed information about a single PHY, use the `-shelf`, `-drawer`, and `-phy` parameters.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all drawer PHYs, in column style output.

**| [-instance ]**

Displays expanded information for all drawer PHYs in the system. If a shelf, drawer, and PHY are specified, then this parameter displays the same detailed information for the PHY you specify as does the -shelf, -drawer, and -phy parameters.

**[-shelf <text>] - Shelf Name**

Displays the PHYs in the storage shelf that matches the specified shelf name.

**[-drawer <integer>] - Drawer Number**

Displays the PHYs in the drawers that match the specified drawer number.

**[-phy <integer>] - PHY Number**

Displays the PHYs that match the specified PHY number.

**[-node {<nodename>|local}] - Node Name**

Displays the PHYs that are present for the specified node.

**[-type {unknown|disk|virtual|input}] - Type**

Displays the PHYs with the specified type.

**[-physical-id <integer>] - Physical ID**

Displays the PHYs that match the specified physical-id.

**[-sas-address <text>] - Attached SAS Address**

Displays the PHYs with the specified attached sas address.

**[-state-a {unknown|enabled|disabled}] - State Module A**

Displays the PHYs for which module A has the specified state.

**[-state-b {unknown|enabled|disabled}] - State Module B**

Displays the PHYs for which module B has the specified state.

**[-status-a <Drawer PHY Status>] - Status Module A**

Displays the PHYs with module A currently operating under the specified status.

**[-status-b <Drawer PHY Status>] - Status Module B**

Displays the PHYs with module B currently operating under the specified status.

## Examples

The following example displays information about all drawer PHYs:

```
cluster1::> storage shelf drawer show-phy
Shelf Drawer PHY #   Type        SAS Address          PHY State A/B
```

## storage shelf drawer show-slot

Display a map between bay number and drawer/slot number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage shelf drawer show-slot` command maps each drawer and slot number to the corresponding bay number.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields in column style output.

**| [-instance ]**

Displays all slot information.

**[-shelf <text>] - Shelf Name**

Displays the slots in the shelf that matches the specified shelf name.

**[-bay <integer>] - Bay Number**

Displays the slots that have the specified bay number.

**[-node {<nodename>|local}] - Node Name**

Displays the slots that are present for the specified node.

**[-drawer <integer>] - Drawer Number**

Displays the slots in the drawers that match the specified drawer number.

**[-slot <integer>] - Slot Number**

Displays the slots that match the specified slot number.

**[-is-installed {yes|no}] - Is Disk Installed**

Displays the slots that have a disk installed.

**Examples**

The following example displays the mapping from drawer and slot number to bay number:

```
cluster1::> storage shelf drawer show-slot

## storage shelf drawer show

Display a list of drawers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage shelf drawer show` command displays information for storage shelf drawers in the storage system. If no parameters are specified, the default command displays the following information for the drawers:

- Shelf Name
- Drawer Number
- Status
- Closed/Open
- Disk Count
- Firmware

To display detailed information for a single drawer, use the `-shelf` and `-drawer` parameters.

## Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all drawers, in column style output.

**| [-errors ]**

Displays the following error status information about the drawers that have errors:

- Status
- Error Description

**| [-instance ]**

Displays expanded information for all drawers in the system. If a shelf and drawer are specified, then this parameter displays the same detailed information for the specified drawer as does the `-shelf` and `-drawer` parameters.

**[-shelf <text>] - Shelf Name**

Displays the drawers in the storage shelf that matches the specified shelf name.

**[-drawer <integer>] - Drawer Number**

Displays the drawers that match the specified drawer number.

**[-node {<nodename>|local}] - Node Name**

Displays the drawers that are present for the specified node.

**[-disk-count <integer>] - Drawer Disk Count**

Displays the drawers that have the specified disk count.

**[-part-number <text>] - Part Number**

Displays the drawers that have the specified part number.

**[-serial-number <text>] - Serial Number**

Displays the drawer that matches the specified serial number.

**`[-is-closed {open|closed}] - Drawer is Closed?`**

Displays the drawers that are closed or open.

**`[-firmware-a <text>] - Firmware A`**

Displays the drawers for which module A has the specified firmware version.

**`[-firmware-b <text>] - Firmware B`**

Displays the drawers for which module B has the specified firmware version.

**`[-path-a {unknown|ok|degraded|none}] - Path A`**

Displays the drawers for which module A has the specified path status.

**`[-path-b {unknown|ok|degraded|none}] - Path B`**

Displays about drawers for which module B has the specified path status.

**`[-is-supported {yes|no}] - Drawer is Supported?`**

Displays the drawers that are supported (TRUE) or not supported (FALSE).

**`[-vendor <text>] - Vendor Name`**

Displays the drawers that match the specified vendor.

**`[-mfg-date <text>] - Mfg. Date`**

Displays the drawers that match the specified manufactured date.

**`[-fru-type <text>] - FRU Type`**

Displays the drawers that match the specified FRU type.

**`[-status-a {unknown|normal|warning|error|critical}] - Status A`**

Displays the drawers with module A currently operating under the specified status.

**`[-status-b {unknown|normal|warning|error|critical}] - Status B`**

Displays the drawers with module B currently operating under the specified status.

**`[-error <text>] - Error`**

Displays the drawers that match the specified error description.

## Examples

The following example displays information about all drawers:

```
cluster1::> storage shelf drawer show
Drawer  Disk
Shelf Drawer      Status A/B      Closed? Count      Firmware A/B
-----
2.5
      1  normal/normal  closed        4  00000634/00000634
      2  normal/normal  closed        4  00000634/00000634
      3  normal/normal  closed        4  00000634/00000634
      4  normal/normal  closed        5  00000634/00000634
      5  normal/normal  closed        4  00000634/00000634
5 entries were displayed.
cluster1::>
```

The following example displays expanded information about drawer 1 in shelf 2.5:

```
cluster1::> storage shelf drawer show -shelf 2.5 -drawer 1
Shelf: 2.5
      Drawer ID: 1
      Part Numer: 111-03071
      Serial Number: 021604008153
Drawer is Closed?: closed
      Disk Count: 4
      Firmware A: 00000634
      Firmware B: 00000634
      Path A: ok
      Path B: ok
      Status A: normal
      Status B: normal
Drawer is Supported?: yes
      Vendor Name: NETAPP
      Mfg. Date: 02/2016
      FRU Type: SASDRWR
      Error Description: -
cluster1::>
```

The following example displays error information about the drawers that have errors:

```
cluster1::> storage shelf drawer show -errors
Shelf Drawer      Status A/B      Error Description
-----
2.5
                2  warning/warning  Drawer open.
cluster1::>
```

## storage shelf firmware show-update-status

Display the Shelf Firmware Update (SFU) Status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage shelf firmware show-update-status` command displays the state of the Shelf Firmware Update process.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node (privilege: advanced)**

Selects the node that matches this parameter value.

**[-update-status {running|idle}] - Disk Shelf Firmware Update Status (privilege: advanced)**

Selects the nodes whose SFU process status matches this parameter value. Possible values are:

- running - Disk shelf firmware update is in progress.
- idle - Disk shelf firmware update is not in progress.

**[-in-progress-count <integer>] - Number of Shelves with Earlier Revisions Being Updated (privilege: advanced)**

Selects the nodes that matches the number of shelves the SFU process is updating to this parameter value. This specifies the number of shelves with earlier revisions that are being updated.

### Examples

```
cluster1::*> storage shelf firmware show-update-status
```

	Update	In-Progress
Node	Status	Count
-----	-----	-----
cluster-n1	running	10
cluster-n2	idle	-
cluster-n3	running	7

## storage shelf firmware update

### Update Shelf Firmware

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage shelf firmware update` command updates the firmware on one or more shelves. You can download the latest firmware by using the [storage firmware download](#) command. You can specify a shelf whose firmware is to be updated by using the `-shelf` parameter. You can update the firmware on all the shelves by not providing the `-shelf` parameter. All the shelves of a specific module type can be updated by providing a value to the `-module-type` parameter.

#### Parameters

**{ [-shelf <text>] - Shelf Name (privilege: advanced)**

This specifies the name of the shelf whose firmware is to be updated.

**| [-module-type {atfcx|esh4|iom3|iom6|iom6e|iom12|iom12e|iom12b}] - Shelf Module Type (privilege: advanced) }**

Update the firmware on the shelves that match the module-type you specify.

**[-refresh <true>] - Refresh (privilege: advanced)**

Forces an update on the shelf with the highest revision of the applicable firmware, resulting in a refresh of the firmware image already present on the shelf.

#### Examples

The following example updates the firmware on all the shelves in the cluster:

```
cluster1::*> storage shelf firmware update
```

The following example updates the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -module-type IOM6
```

The following example updates the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -shelf 1.2
```

The following example refreshes the firmware on all shelves with the IOM6 module type:

```
cluster1::*> storage shelf firmware update -refresh -module-type IOM6
```

The following example refreshes the firmware on shelf 1.2:

```
cluster1::*> storage shelf firmware update -refresh -shelf 1.2
```

## storage shelf location-led modify

Modify the state of the shelf Location LED

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage shelf location-led modify` command modifies the on/off state of the shelf location LED.

## Parameters

**-shelf-name <text> - Shelf Name**

This parameter specifies the shelf whose LED is to be turned on or turned off.

**[-led-status {on|off}] - Location LED**

This parameter specifies whether the shelf location LED needs to be turned on or turned off.

## Examples

The following example turns on the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0  
-led-status on
```

```
Info: Shelf locate request successful for shelf "1.0".
```

The following example turns off the shelf location LED of the specified shelf.

```
cluster1::> storage shelf location-led modify -node node1 -shelf-name 1.0
-led-status off
```

Info: Shelf locate request successful for shelf "1.0".

## storage shelf location-led show

Display the Location LED status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage shelf location-led show` command displays the state of shelf location LED.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-shelf-name <text>] - Shelf Name**

Selects the shelves whose shelf-name matches this parameter value.

**[-node {<nodename>|local}] - Node Name**

Selects the nodes that match this parameter value.

**[-stack-id <integer>] - Stack ID**

Selects the shelves whose stack-id matches this parameter value.

**[-shelf-id <integer>] - Shelf ID**

Selects the shelves whose shelf-id matches this parameter value.

**[-led-status {on|off}] - Location LED**

Shows the state of the shelf location LED.

### Examples

The following example shows the state of the shelf location LED for each shelf.

```
cluster1::> storage shelf location-led show
Shelf Name Stack ID Shelf ID LED Status
-----
      8.2         8         2 off
      8.3         8         3 off
      6.0         6         0 unsupported
      8.1         8         1 off
4 entries were displayed.
```

## storage switch commands

### storage switch add

Add a back-end switch for monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage switch add` command enables you to add FC switches for SNMP monitoring in a MetroCluster configuration. Front end switches should not be added for monitoring and will result in a Monitor Status Error condition.

#### Parameters

##### **-address <IP Address> - FC Switch Management IP Address**

This parameter specifies the IP address of the back-end switch that is added for monitoring.

##### **[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - Supported SNMP Version**

This parameter specifies the SNMP version that Data ONTAP uses to communicate with the back-end switch that is added for monitoring. The default SNMP version is SNMPv2c.

##### **{ [-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

##### **[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username }**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch that is added for monitoring.

##### **[-veto-backend-fabric-check {true|false}] - Veto Back-end Fabric Check? (privilege: advanced)**

If specified, the `storage switch add` command will not check if the switch is present in the MetroCluster's back-end fabric. By default, it does not let you add switches that are not present.

## **[-blades <integer>,...] - Cisco Director Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the back-end switch that is added for monitoring. It is only applicable to director-class switches.

### **Examples**

The following command adds a back-end switch with IP Address 10.226.197.34 for monitoring:

```
cluster1::> storage switch add -address 10.226.197.34 -snmp-community-or
-username public
cluster1::> storage switch show
```

Monitor	Symbolic	Is				
Switch	Name	Vendor	Model	Switch WWN	Monitored	
Status						
	Cisco_10.226.197.34					
	mcc-cisco-8Gb-fab-4	Cisco	DS-C9148-16P-K9	2000547fee78f088	true	ok
	mcc-cisco-8Gb-fab-1					
	mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
	mcc-cisco-8Gb-fab-2					
	mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
	mcc-cisco-8Gb-fab-3					
	mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed.

```
cluster1::>
```

The following command adds a Cisco Director Class switch for monitoring. Data ONTAP uses SNMPv3 and 'snmpuser1' username to communicate with this switch.

```
cluster1::> storage switch add -address 10.228.56.208 -snmp-version SNMPv3
-snmp-community-or-username snmpuser1 -blades 3,4
```

### **storage switch modify**

Modify information about a back-end switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage switch modify` enables you to modify certain parameters for identifying and accessing the FC back-end switches added for monitoring in a MetroCluster configuration.

## Parameters

### **-switch-name <text> - FC Switch Name**

This parameter specifies the name of the switch.

### **[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

This parameter specifies the SNMP version that Data ONTAP uses to communicate with the switch.

### **[-switch-ipaddress <IP Address>] - Switch IP Address**

This parameter specifies the IP address of the switch.

### **{ [-snmp-community <text>] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

### **[-snmp-community-or-username <text>] - SNMPv2c Community or SNMPv3 Username }**

This parameter specifies the SNMPv2c community set or SNMPv3 username on the switch.

### **[-blades <integer>,...] - Director-Class Switch Blades to Monitor**

This parameter specifies the blades to monitor on the switch. It is only applicable to director-class switches.

## Examples

The following command modifies Cisco\_10.226.197.34 switch SNMP community to 'public':

```
cluster1::> storage switch modify -switch-name Cisco_10.226.197.34 -switch
-ipaddress 10.226.197.34 -snmp-community-or-username public
cluster1::>
```

The following command modifies the blades monitored on a director-class switch:

```
cluster1::> storage switch modify -switch-name Cisco_10.228.56.208 -blades
3,4
cluster1::>
```

The following command modifies Brocade 6505 switch SNMP version to SNMPv3 and SNMPv3 username to 'snmpuser1':

```
cluster1::> storage switch modify -switch-name Brocade6505 -switch
-ipaddress 10.226.197.34 -snmp-version SNMPv3 -snmp-community-or-username
snmpuser1
cluster1::>
```

## storage switch refresh

### Refresh storage switch info

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `storage switch refresh` command triggers a refresh of the SNMP data for the MetroCluster FC switches and FC-to-SAS bridges. It does not do anything if the refresh is already going on. The FC switches and FC-to-SAS bridges must have been previously added for monitoring by using the [storage switch add](#) and [storage bridge add](#) commands respectively.

#### Examples

The following command triggers a refresh for the SNMP data:

```
cluster1::*> storage switch refresh
cluster1::*>
```

#### Related Links

- [storage switch add](#)
- [storage bridge add](#)

## storage switch remove

### Remove a back-end switch from monitoring

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `storage switch remove` enables you to remove FC back-end switches that were previously added for SNMP monitoring.

#### Parameters

**-switch-name <text> - FC Switch Name**

This parameter specifies the name of the back-end switch added for monitoring.

## Examples

The following command removes 'Cisco\_10.226.197.34' switch from monitoring:

```

cluster1::> storage switch show

```

Monitor	Switch	Name	Vendor	Model	Switch WWN	Is Monitored	Status
		Cisco_10.226.197.34					
		mcc-cisco-8Gb-fab-4	Cisco	DS-C9148-16P-K9	2000547fee78f088	true	ok
		mcc-cisco-8Gb-fab-1					
		mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
		mcc-cisco-8Gb-fab-2					
		mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
		mcc-cisco-8Gb-fab-3					
		mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed.

```

cluster1::> storage switch remove -switch-name Cisco_10.226.197.34
cluster1::> storage switch show

```

Monitor	Switch	Name	Vendor	Model	Switch WWN	Is Monitored	Status
		mcc-cisco-8Gb-fab-4					
		mcc-cisco-8Gb-fab-4	Cisco	-	-	false	-
		mcc-cisco-8Gb-fab-1					
		mcc-cisco-8Gb-fab-1	Cisco	-	-	false	-
		mcc-cisco-8Gb-fab-2					
		mcc-cisco-8Gb-fab-2	Cisco	-	-	false	-
		mcc-cisco-8Gb-fab-3					
		mcc-cisco-8Gb-fab-3	Cisco	-	-	false	-

4 entries were displayed

```

cluster1::>

```

## storage switch show

### Display switch information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage switch show` command displays information about all the storage switches in the MetroCluster configuration. The back-end switches must have been previously added for monitoring using the [storage switch add](#) command. If no parameters are specified, the default command displays the following information about the storage switches:

- Switch
- Symbolic Name
- Vendor
- Model
- Switch WWN
- Is Monitored
- Monitor Status

To display detailed profile information about a single storage switch, use the `-switch-name` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Displays the specified fields for all the storage switches, in column style output.

**| [-connectivity ]**

Displays the following details about the connectivity from the storage switch to connected entities:

- Port name
- Port operating mode
- Port world wide name
- Peer port world wide name
- Peer type
- Additional information about peer

Displays the following details about the connectivity from the node to the storage switch:

- Node name
- Adapter name
- Switch port name
- Switch port speed
- Adapter type

### | [**-cooling** ]

Displays the following details about the fans and temperature sensors on the storage switch:

- Fan name
- Fan speed in rotations per minute (RPM)
- Fan operational status
- Temperature sensor name
- Temperature sensor reading in Celsius °C
- Temperature sensor status

### | [**-error** ]

Displays the errors related to the storage switch.

### | [**-port** ]

Displays the following details about the storage switch ports:

- Port name
- Port world wide name
- Port administrative status
- Port operational status
- Port operating mode
- Whether SFP is present in the port
- Port speed in gigabits per second (Gbps)
- Port BB credit
- Peer port world wide name

### | [**-power** ]

Displays the following details about the storage switch power supplies:

- Power supply name
- Power supply serial number
- Power supply operational status

### | [**-san-config** ]

Displays the following details about the Virtual Storage Area Networks (VSAN) and Zones of the storage switch:

- VSAN identifier
- VSAN name
- VSAN operational status
- Type of load balancing configured for the VSAN
- Whether in-order-delivery set for the VSAN
- Whether the auto power reset of the PSU is enabled

- VAN member switch name and port
- Zone name
- VSAN ID of the zone
- Zone member switch name and port
- Zone member port id
- Zone member port world wide name

#### | [-sfp ]

Displays the following details about the storage switch ports Small Formfactor Pluggable (SFP):

- Port name
- Type of SFP
- SFP transmitter type
- SFP vendor
- SFP part number
- SFP serial number

#### | [-stats ]

Displays the following details about the storage switch ports:

- Port name
- Frames received through the port (Rx Frames)
- Frames transmitted through the port (Tx Frames)
- Octets received through the port (Rx Octets)
- Octets transmitted through the port (Tx Octets)
- Port error frames

#### | [-instance ] }

Displays expanded information about all the storage switches in the system. If a storage switch is specified, then this parameter displays the same detailed information for the storage switch you specify as does the -switch-name parameter.

#### [-switch-name <text>] - FC Switch Name

Displays information only about the storage switches that match the name you specify.

#### [-switch-wwn <text>] - Switch World Wide Name

Displays information only about the storage switches that match the switch wwn you specify.

#### [-switch-symbolic-name <text>] - Switch Symbolic Name

Displays information only about the storage switches that match the switch symbolic name you specify.

#### [-switch-fabric-name <text>] - Fabric Name

Displays information only about the storage switches that match the switch fabric you specify.

**[`-domain-id <integer>`] - Switch Domain ID**

Displays information only about the storage switches that match the switch domain id you specify.

**[`-switch-role {unknown|primary|subordinate}`] - Switch Role in Fabric**

Displays information only about the storage switches that match the switch role you specify.

**[`-snmp-version {SNMPv1|SNMPv2c|SNMPv3}`] - SNMP Version**

Displays information only about the storage switches that match the switch SNMP version you specify.

**[`-switch-model <text>`] - Switch Model**

Displays information only about the storage switches that match the switch model you specify.

**[`-switch-vendor {unknown|Brocade|Cisco}`] - Switch Vendor**

Displays information only about the storage switches that match the switch vendor you specify.

**[`-fw-version <text>`] - Switch Firmware Version**

Displays information only about the storage switches that match the switch firmware version you specify.

**[`-serial-number <text>`] - Switch Serial Number**

Displays information only about the storage switches that match the switch serial number you specify.

**[`-switch-ipaddress <IP Address>`] - Switch IP Address**

Displays information only about the storage switches that match the switch IP address you specify.

**[`-switch-status {unknown|ok|error}`] - Switch Status**

Displays information only about the storage switches that match the switch status you specify.

**[`-snmp-community <text>`] - (DEPRECATED)-SNMPv2c Community or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-snmp-community-or-username` instead.

Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

**[`-snmp-community-or-username <text>`] - SNMPv2c Community or SNMPv3 Username**

Displays information only about the storage switches that match the switch SNMPv2c community or SNMPv3 username you specify.

**[`-profile-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}`] - Switch Profile Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the profile data last successful refresh timestamp you specify.

**[`-is-monitoring-enabled {true|false}`] - Is Monitoring Enabled for Switch**

Displays information only about the storage switches that match the switch monitoring value you specify.

**[`-blades <integer>,...`] - Director-Class Switch Blades to Monitor**

Displays information only about the storage switches that match the blade value you specify.

**[-engine-id <Hex String>] - Engine ID of SNMPv3 Capable Switch**

Displays information only about the storage switches that match the SNMPv3 engine-id you specify.

**[-psu-name-list <text>,...] - Switch Power Supply Name List**

Displays information only about the storage switches that have the power supply units with the names you specify.

**[-psu-serial-number-list <text>,...] - Switch Power Supply Serial Number List**

Displays information only about the storage switches that have the power supply units with the serial numbers you specify.

**[-psu-status-list {unknown|normal|warning|faulty|not-present}] - Switch Power Supply Status List**

Displays information only about the storage switches that have the power supply units with the statuses you specify.

**[-psu-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Power Supply Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the power supply unit data last successful refresh timestamp you specify.

**[-temp-sensor-name-list <text>,...] - Switch Temperature Sensor Name List**

Displays information only about the storage switches that have the temperature sensors with the names you specify.

**[-temp-sensor-reading-list <integer>,...] - Switch Temperature Sensor Reading © List**

Displays information only about the storage switches that have the temperature sensors with the readings you specify.

**[-temp-sensor-status-list {unknown|normal|warning|critical}] - Switch Temperature Sensor Status List**

Displays information only about the storage switches that have the temperature sensors with the statuses you specify.

**[-temp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Temperature Sensor Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the temperature sensor data last successful refresh timestamp you specify.

**[-fan-name-list <text>,...] - Switch Fan Name List**

Displays information only about the storage switches that match the fans with the names you specify.

**[-fan-rpm-list <integer>,...] - Switch Fan Speed (RPM) List**

Displays information only about the storage switches that match the fans with the RPM speeds you specify.

**[-fan-status-list {unknown|operational|failed|not-operational|not-present}] - Switch Fan Operational Status List**

Displays information only about the storage switches that match the fans with the statuses you specify.

**`[-fan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Fan Data Last Successful Refresh Timestamp`**

Displays information only about the storage switches that match the fan data last successful refresh timestamp you specify.

**`[-vsan-index-list <integer>,...] - Switch VSAN Index List`**

Displays information only about the storage switches that have the VSANs with the indexes you specify.

**`[-vsan-name-list <text>,...] - Switch VSAN Name List`**

Displays information only about the storage switches that have the VSANs with the names you specify.

**`[-vsan-oper-status-list {up|down}] - Switch VSAN Operational Status List`**

Displays information only about the storage switches that have the VSANs with the operational statuses you specify.

**`[-vsan-load-balancing-type-list {src-id-dest-id|src-id-dest-id-ox-id}] - Switch VSAN Load balancing Type List`**

Displays information only about the storage switches that have the VSANs with the load balancing types you specify.

**`[-is-vsan-iod-list {true|false}] - Is In-order Delivery Set for VSAN List`**

Displays information only about the storage switches that have the VSANs with the IOD setting you specify.

**`[-vsan-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch VSAN Data Last Successful Refresh Timestamp`**

Displays information only about the storage switches that match the VSAN data last successful refresh timestamp you specify.

**`[-member-switch-name-list <text>,...] - Member Switch List`**

Displays information only about the storage switches that have the VSANs with the member switch names you specify.

**`[-member-switch-port-name-list <text>,...] - Member Switch Port Name List`**

Displays information only about the storage switches that have the VSANs with the member switch port names you specify.

**`[-vsan-id-list <integer>,...] - Zone VSAN ID List`**

Displays information only about the storage switches that have the VSANs with the IDs you specify.

**`[-zone-name-list <text>,...] - Switch Zone Name List`**

Displays information only about the storage switches that have the zones with the names you specify.

**`[-zone-member-sw-domain-id-list <integer>,...] - Zone Member Switch Port Domain ID List`**

Displays information only about the storage switches that have the zones with the member switch domain ids you specify.

**`[-zone-member-port-name-list <text>,...] - Zone Member Port List`**

Displays information only about the storage switches that have the zones with the port names you specify.

**[-zone-member-port-wwn-list <text>,...] - Zone Member WWPN List**

Displays information only about the storage switches that have the zones with the port WWNs you specify.

**[-zone-member-port-switch-name-list <text>,...] - Zone Member Switch WWN List**

Displays information only about the storage switches that have the zones with the member port hosting switch names you specify.

**[-zone-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]**

**- Switch Zone Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the zone data last successful refresh timestamp you specify.

**[-zone-member-wwn-list <text>,...] - Zone Member WWN List**

Displays information only about the storage switches that have the zones with the member WWNs you specify.

**[-zone-member-port-id-list <text>,...] - Zone Member Port ID List**

Displays information only about the storage switches that have the zones with the member port ids you specify.

**[-port-wwn-list <text>,...] - Switch Port World Wide Name (WWPN) List**

Displays information only about the storage switches that have the ports with the WWNs you specify.

**[-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the storage switches that have the ports with the names you specify.

**[-port-admin-status-list {unknown|enabled|disabled}] - Switch Port Admin Status List**

Displays information only about the storage switches that have the ports with administrative statuses you specify.

**[-port-oper-status-list {unknown|online|offline}] - Switch Port Operational Status List**

Displays information only about the storage switches that have the ports with operational statuses you specify.

**[-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}] - Switch Port Mode List**

Displays information only about the storage switches that have the ports with the operating modes you specify.

**[-port-oper-speed-list <integer>,...] - Switch Port Current Speed (in Gbits/sec) List**

Displays information only about the storage switches that have the ports with the operational speeds you specify.

**[-port-bb-credit-list <integer>,...] - Switch Port BB Credit List**

Displays information only about the storage switches that have the ports with the BB credits you specify.

**[-port-sfp-present-list {true|false}] - Switch Port Is SFP Present List**

Displays information only about the storage switches that have the ports with the SFP present values you specify.

**[-port-peer-wwpn-list <text>,...] - Switch Port Peer WWPN List**

Displays information only about the storage switches that have the ports with the peer port WWPNs you specify.

**[-port-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the port data last successful refresh timestamp you specify.

**[-port-stat-name-list <text>,...] - Switch Port Name List**

Displays information only about the storage switches that have the ports with the names you specify.

**[-port-tx-frames-list <integer>,...] - Switch Port Transmitted Frame Count List**

Displays information only about the storage switches that have the ports with the transmitted frames values you specify.

**[-port-rx-frames-list <integer>,...] - Switch Port Received Frame Count List**

Displays information only about the storage switches that have the ports with the received frames values you specify.

**[-port-tx-octets-list <integer>,...] - Switch Port Total Transmitted Octets List**

Displays information only about the storage switches that have the ports with the transmitted octets values you specify.

**[-port-rx-octets-list <integer>,...] - Switch Port Total Received Octets List**

Displays information only about the storage switches that have the ports with the received octets values you specify.

**[-port-frame-error-list <integer>,...] - Switch Port Frame Error Count List**

Displays information only about the storage switches that have the ports with the error frame values you specify.

**[-port-stat-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port Stat Data Last Update Timestamp**

Displays information only about the storage switches that match the port statistics data last successful refresh timestamp you specify.

**[-sfp-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the storage switches that have the ports with the names you specify.

**[-sfp-type-list {unknown|other|gbic|embedded|glm|gbic-with-serial-id|gbic-without-serial-id|sfp-with-serial-id|sfp-without-serial-id|xfp|x2-short|x2-medium|x2-tall|xpak-short|xpak-medium|xpak-tall|xenpak|sfp-dw-dm|qsfp|x2-dw-dm|gbic-not-installed|small-form-factor}] - Switch Port SFP Type List**

Displays information only about the storage switches that have the ports with the SFP types you specify.

**[-sfp-tx-type-list {unknown|long-wave-laser|short-wave-laser|long-wave-laser-cost-reduced|electrical|ten-gig-base-sr|ten-gig-base-lr|ten-gig-base-er|ten-gig-base-lx4|ten-gig-base-sw|ten-gig-base-lw|ten-gig-base-ew}] - Switch Port SFP Transmitter Type List**

Displays information only about the storage switches that have the ports with the SFP transmitter types you specify.

**`[-sfp-vendor-list <text>,...] - Switch Port SFP Vendor List`**

Displays information only about the storage switches that have the ports with the SFP vendors you specify.

**`[-sfp-part-number-list <text>,...] - Switch Port SFP Part Number List`**

Displays information only about the storage switches that have the ports with the SFP part numbers you specify.

**`[-sfp-serial-number-list <text>,...] - Switch Port SFP Serial Number List`**

Displays information only about the storage switches that have the ports with the SFP serial numbers you specify.

**`[-sfp-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Port SFP Data Last Successful Refresh Timestamp`**

Displays information only about the storage switches that match the port SFP data last successful refresh timestamp you specify.

**`[-switch-error-text-list <text>,...] - Switch Error Text List`**

Displays information only about the storage switches that have the errors you specify.

**`[-conn-switch-port-name-list <text>,...] - Switch Port Name List`**

Displays information only about the storage switches that have the ports with the names you specify.

**`[-conn-switch-port-mode-list {unknown|auto|F-port|FL-port|E-port|TE-port|U-port|G-port}] - Switch Port Operating Mode List`**

Displays information only about the storage switches that have the ports with the operating modes you specify.

**`[-conn-switch-port-wwn-list <text>,...] - Switch Port WWN List`**

Displays information only about the storage switches that have the ports with the WWNs you specify.

**`[-conn-switch-port-peer-port-wwn-list <text>,...] - Switch Port Peer Port WWN List`**

Displays information only about the storage switches that have the ports with the peer port WWNs you specify.

**`[-conn-switch-port-peer-info-list <text>,...] - Switch Port Peer Host & Port Name List`**

Displays information only about the storage switches that have the ports with the peer information values you specify.

**`[-conn-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Switch Connectivity Data Last Successful Refresh Timestamp`**

Displays information only about the storage switches that match the switch connectivity data last successful refresh timestamp you specify.

**`[-conn-switch-port-peer-type-list {unknown|bridge|switch|fcp-adapter|fcvi-adapter}] - Switch Port Peer Type List`**

Displays information only about the storage switches that have the ports connected to the peer types you specify.

**[-switch-port-name-list <text>,...] - Switch Port Name List**

Displays information only about the storage switches that have the ports with the names you specify.

**[-switch-port-speed-list <integer>,...] - Switch Port Speed (in Gbps) List**

Displays information only about the storage switches that have the ports with the speeds you specify.

**[-node-name-list <nodename>,...] - Node Name List**

Displays information only about the storage switches that are connected to the nodes you specify.

**[-adapter-name-list <text>,...] - Node Adapter Name List**

Displays information only about the storage switches that are connected to the adapters you specify.

**[-adapter-port-name-list <text>,...] - Node Adapter Port Name List**

Displays information only about the storage switches that are connected to the adapter ports you specify.

**[-adapter-type-list {unknown|FCP-Initiator|FC-VI|FCP-Target}] - Node Adapter Type List**

Displays information only about the storage switches that are connected to the types of adapters you specify.

**[-path-data-last-successful-refresh-timestamp {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}]**

**- Switch Path Data Last Successful Refresh Timestamp**

Displays information only about the storage switches that match the node to switch path data last successful refresh timestamp you specify.

**[-name-list <text>,...] - Switch Name List**

Displays information only about the storage switches that match the names you specify.

**[-domain-id-list <integer>,...] - Switch Domain ID List**

Displays information only about the storage switches that match the domain ids you specify.

**[-wwn-list <text>,...] - Switch WWN List**

Displays information only about the storage switches that match the switch WWNs you specify.

**[-role-list {unknown|primary|subordinate}] - Switch Role in Fabric List**

Displays information only about the storage switches that match the switch roles you specify.

**[-address-list <IP Address>,...] - Switch IP Address List**

Displays information only about the storage switches that match the switch IP addresses you specify.

## Examples

The following example displays information about all storage switches:

```

cluster::>storage switch show

# storage tape commands

## storage tape offline

Take a tape drive offline

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command takes the specified tape drive offline.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive that needs to be taken offline. The format of the device `-name` name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**| -device-id <text> - Tape Drive Device ID }**

Use this parameter to specify the device ID of the tape drive that needs to be taken offline.

## Examples

The following example takes the tape drive with device name 'nrst8m' offline. This tape drive is attached to cluster1-01.

```
cluster1::> storage tape offline -node cluster1-01 -name nrst8m
```

## storage tape online

Bring a tape drive online

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command brings a specified tape drive online.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -device-id <text> - Tape Drive Device ID**

Use this parameter to specify the device ID of the tape drive that needs to be brought online.

**| -name <text> - Tape Drive Device Name }**

Use this parameter to specify the device name of the tape drive that needs to be brought online. The format of the device `-name` name includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload

and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

## Examples

The following example brings the tape drive with device id sw4:2.126L4 attached to the node, cluster1-01, online.

```
cluster1::> storage tape online -node cluster1-01 -device-id sw4:2.126L4
```

## storage tape position

### Modify a tape drive cartridge position

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command changes the tape drive cartridge position.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**-name <text> - Tape Drive Device Name**

Use this parameter to specify the device name of the tape drive whose cartridge position needs to be changed. The format of the device `-name` includes a prefix to specify how the tape cartridge is handled and a suffix to describe the density of the tape. The prefix suggests 'r', 'nr' or 'ur' for rewind, no rewind, or unload/reload and a suffix shows density of 'l', 'm', 'h' or 'a'. For example, a tape device name for this operation might have the form "nrst8m" where 'nr' is the 'no rewind' prefix, 'st8' is the alias-name and 'm' is the tape density. You can use the 'storage tape show -device-names' command to find more information about device names of tape drives attached to a node.

**-operation {weof|fsf|bsf|fsr|bsr|rewind|erase|eom} - Tape Position Operation**

Use this parameter to specify the tape positioning operation. The possible values for `-operation` are:

- weof - Write end-of-file marks
- fsf - Forward space end-of-file marks
- bsf - Backward space end-of-file marks
- fsr - Forward space records
- bsr - Backward space records
- rewind - Rewind the tape
- erase - Erase then entire tape media from current position
- eom - Position the tape at end of data (end of media if full)

### **[-count <integer>] - Count for Positioning**

Use this parameter to specify the count for a tape positioning operation. You can specify this parameter only with the following operations: weof, fsf, bsf, fsr, and bsr. The default value of this parameter is one.

### **Examples**

The following example specifies a rewind operation on a tape device. Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst8m
-operation rewind
```

The following example specifies an fsf (forward space filemark) operation on a tape device. Note the -count parameter specifies 5 forward space filemarks for this operation.

```
cluster1::> storage tape position -node cluster1-01 -name nrst1a
-operation fsf -count 5
```

The following example specifies an eom (end-of-media) operation on a tape device. The 'eom' positions a tape at end of data (end of media if full). Note the -count parameter does not need to be specified for this type of operation.

```
cluster1::> storage tape position -node cluster1-01 -name rst0h -operation
eom
```

## **storage tape reset**

### **Reset a tape drive**

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

This command resets a specified tape drive.

### **Parameters**

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node to which the tape drive is attached.

**-device-id <text> - Tape Drive Device ID (privilege: advanced)**

Use this parameter to specify the device ID of the tape drive is to be reset.

### **Examples**

The following example resets the tape drive with device ID sw4:2.126L3 attached to the node, cluster1-01.

```
cluster1::> storage tape reset -node cluster1-01 -device-id sw4:2.126L3
```

## storage tape show-errors

### Display tape drive errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape show-errors` command displays error information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive
- Type of device(tape drive)
- Description of the tape drive
- Alias name of the tape drive
- Tape drive errors

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-device-type <text>] - Device Type**

Selects the devices with the specified type of tape drive.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[`-wwpn <text>`] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[`-serial-number <text>`] - Serial Number**

Selects the tape drive with the specified serial number.

**[`-error <text>`] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[`-initiator <text>`] - Initiator Port**

Selects the tape drives with the specified initiator port.

**Examples**

The following example shows error information for all tape drives attached to cluster1.

```
cluster1::> storage tape show-errors
Node: node1
Device ID: 0d.125
Device Type: tape drive
Description: Hewlett-Packard LTO-5
Alias: st0
Errors: hardware error; repair or replace tape drive
Node: node1
Device ID: 2d.0
Device Type: tape drive
Description: IBM LTO-6 ULT3580
Alias: st2
Errors: -
```

The following example shows error information for tape drive sw4:2.126L1 attached to the node, node1.

```
cluster1::> storage tape show-errors -device-id sw4:2.126L1 -node node1
Node: node1
Device ID: sw4:2.126L1
Device Type: tape drive
Description: Hewlett-Packard LTO-3
Alias: st3
Errors: -
```

**storage tape show-media-changer**

Display information about media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This storage tape `show-media-changer` command displays information about media changers attached to the cluster. By default, this command displays the following information about all media changers:

- Device ID of media changer
- Description of media changer
- World Wide Node Name of media changer
- World Wide Port Name of media changer
- Serial number of media changer
- Media changer errors
- Node to which the media changer is attached
- Initiator port which hosts the media changer
- Alias name of media changer
- Operational state of media changer
- Functional status of media changer

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the media changer with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about media changers on the specified node.

**[-description <text>] - Description**

Selects the media changers with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the media changer with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

>Selects the media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the media changer with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the media changers with the specified operational state.

**[-error <text>] - Media Changer Error Description**

Selects the media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the media changers with the specified initiator port.

## Examples

The following example displays information about all media changers attached to the cluster:

```
cluster1::> storage tape show-media-changer
```

```
Media Changer: sw4:10.11L1
```

```
Description: PX70-TL
```

```
WWNN: 2:00a:000e11:10b919
```

```
WWPN: 2:00b:000e11:10b919
```

```
Serial Number: 00FRU7800000_LL1
```

```
Errors: -
```

```
Paths:
```

Node	Initiator	Alias	Device State
cluster1-01	2b	mc0	in-use

```
Media Changer: sw4:12.4L1
```

```
Description: NEO-TL
```

```
WWNN: 2:001:000e11:10b919

```

```
Errors: -
```

```
Paths:
```

Node	Initiator	Alias	Device State
cluster1-01	5a	mc1	available

## storage tape show-supported-status

Displays the qualification and supported status of tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the supported and qualification status of all tape drives recognized by Data ONTAP attached to a node in the cluster. This includes nonqualified tape drives. Such tape drives do not have a Tape Configuration File (TCF) on the storage system. A nonqualified tape drive can be used if the tape drive emulates a qualified tape drive or if the appropriate TCF for the nonqualified tape drive is downloaded from the NetApp Support Site to the storage system.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the tape drives that match this parameter value.

**[-tape-drive <text>] - Tape Drive Name**

Selects the tape drives that match this parameter value.

**[-is-supported {true|false}] - Tape Drive Supported**

Selects the tape drives that match this parameter value.

**[-status <text>] - Supported Status**

Selects the tape drives that match this parameter value.

## Examples

The following example displays support and qualification status of tape drives recognized by Data ONTAP. The command also identifies tape drives attached to the node that are nonqualified (not supported).

```
cluster1::> storage tape show-supported-status
```

```
Node: Node1
```

Tape Drive	Is Supported	Support Status
sw4:2.126L6	false	Nonqualified tape drive
Hewlett-Packard C1533A	true	Qualified
Hewlett-Packard C1553A	true	Qualified
Hewlett-Packard Ultrium 1	true	Qualified
Sony SDX-300C	true	Qualified
Sony SDX-500C	true	Qualified
StorageTek T9840C	true	Dynamically Qualified
StorageTek T9840D	true	Dynamically Qualified
Tandberg LTO-2 HH	true	Dynamically Qualified

The following example displays support and qualification status of tape drives selected by `□tape-drive`. The command identifies the supported status of the selected tape drive.

```
cluster1::> storage tape show-supported-status -tape-drive "Sony SDX-300C"
```

```
Node: Node1
```

Tape Drives	Is Supported	Support Status
Sony SDX-300C	true	Qualified

## storage tape show-tape-drive

Display information about tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This `storage tape show-tape-drive` command displays information about tape drives attached to the cluster. By default, this command displays the following information about all tape drives:

- Device ID of tape drive
- Description of tape drive
- World Wide Node Name of tape drive
- World Wide Port Name of tape drive
- Serial Number of tape drive
- Tape drive errors
- Node to which the tape drive is attached

- Initiator port which hosts the tape drive
- Alias name of tape drive
- Operational state of tape drive
- Functional status of tape drive

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-device-id <text>] - Device ID**

Selects the tape drive with the specified device ID.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-description <text>] - Description**

Selects the tape drives with the specified description.

**[-alias-name <text>] - Alias Name**

Selects the tape drive with the specified alias name.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive with the specified serial number.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device If Type**

Selects the tape drives with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives with the specified operational state.

**[-error <text>] - Tape Drive Error Description**

Selects the tape drives with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives with the specified initiator port.

## **[*-resv-type* {*off*|*persistent*|*scsi*}] - Reservation type for device**

Selects the tape drives with the specified type.

### **Examples**

The following example displays information about all tape drives attached to the cluster:

```
cluster1::> storage tape show-tape-drive
Tape Drive: sw4:11.126
  Description: StorageTek T10000C
    WWNN: 5:001:04f000:b39ec8
    WWPN: 5:001:04f000:b39ec9
  Serial Number: 576004000041
  Errors: -

  Paths:

## **storage tape show**

Display information about tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `storage tape show` command displays information about tape drives and media changers attached to the cluster. Where it appears in the remainder of this document "device" may refer to either a tape drive or a

media changer. By default, this command displays the following information about all tape drives and media changers:

- Node to which the tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Description of the tape drive/media changer
- Type of device: tape drive or media changer
- Functional status of the tape drive/media changer

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-alias ]**

Displays the tape drive/media changer alias with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Alias name of the tape drive/media changer
- Alias mapping for tape drive/media changer

**| [-connectivity ]**

Displays the connectivity from the node to the tape drive/media changer with the following details:

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Type of device: tape drive or media changer
- Interface type for the tape drive/media changer
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Tape drive/media changer errors
- Initiator port which hosts the tape drive/media changer
- Alias name of the tape drive/media changer
- Operational state of tape drive/media changer
- Functional status of tape drive/media changer

**| [-device-names ]**

Displays the tape drive names for used tape positioning using the following details: rewind, no rewind, unload/reload and density

- Node to which tape drive/media changer is attached
- Device ID of the tape drive/media changer
- Tape drive/media changer description
- Device Names that include Rewind, no Rewind, Unload/Reload

#### | [-status ]

Displays the status of tape drive/media changer with the following details:

- Device ID of the tape drive/media changer
- Tape drive/media changer description
- World Wide Node Name of tape drive/media changer
- World Wide Port Name of tape drive/media changer
- Serial Number of tape drive/media changer
- Alias name of the tape drive/media changer
- Format used for tape cartridge mounted by tape drive
- Tape drive/media changer errors
- Node to which tape drive/media changer is attached
- Operational state of tape drive/media changer
- File number following last tape drive I/O operation
- Block number following last tape drive I/O operation
- Residual count following last tape drive I/O operation

#### | [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### [-device-id <text>] - Device ID

Selects the tape drive/media changer with the specified device ID.

#### [-node {<nodename>|local}] - Node

Displays detailed information about tape drives or media changers on the specified node.

#### [-device-type <text>] - Device Type

Selects the devices with the specified type of tape drive or media changer.

#### [-description <text>] - Description

Selects the tape drives/media changers with the specified description.

#### [-alias-name <text>] - Alias Name

Selects the tape drive/media changer with the specified alias name.

#### [-alias-mapping <text>] - Alias Mapping

Selects the tape drive/media changer with the specified alias mapping.

**[-wwnn <text>] - World Wide Node Name**

Selects the tape drives/media changers with the specified World Wide Node Name.

**[-wwpn <text>] - World Wide Port Name**

Selects the tape drive/media changer with the specified World Wide Port Name.

**[-serial-number <text>] - Serial Number**

Selects the tape drive/media changer with the specified serial number.

**[-functional-status {unknown|normal|error}] - Functional Status**

Selects the tape drives/media changers with the specified functional status of the device.

**[-device-if-type {unknown|fibre-channel|SAS|pSCSI}] - Device Interface Type**

Selects the tape drives/media changers with the specified interface type.

**[-device-state {unknown|available|ready-write-enabled|ready-write-protected|offline|in-use|error|reserved-by-another-host|normal}] - Operational State of Device**

Selects the tape drives/media changers with the specified operational state.

**[-format <text>,...] - Tape Cartridge Format**

Selects the tape drives with the specified tape format.

**[-error <text>] - Tape Error**

Selects the tape drives/media changers with the specified error string.

**[-initiator <text>] - Initiator Port**

Selects the tape drives/media changers with the specified initiator port.

**[-file-number <integer>] - File Number**

Selects the tape drives/media changers with the specified file number. The file number is the number of file marks between the beginning of media and current logical position. File number gets modified on write file mark, and forward or backward space file operations. A value of -1 indicates unknown position on the tape media or tape not loaded in the tape drive.

**[-block-number <integer>] - Block Number**

Selects the tape drives/media changers with the specified block number. The block number is the number of logical blocks between the beginning of tape media or the prior file mark and the current logical position on the tape media. Block number gets modified on writes, reads, and forward or backward space over records (blocks). The block number also gets reset to zero when a file mark is crossed or another file mark is written that designates a new file. If the tape is back spaced to a prior file mark, the block number might be zeroed. A value of -1 indicates unknown position on the tape media or that a tape not loaded in the tape drive.

**[-residual-count <integer>] - Residual Count of Last I/O Operation**

Selects the tape drives with the specified residual count.

**[-device-name-r <text>,...] - Device Name for Rewind**

Selects the tape drives with the specified device name for rewind.

**[-device-name-nr <text>,...] - Device Name for No Rewind**

Selects the tape drives with the specified device name for no rewind.

**[-device-name-ur <text>,...] - Device Name for Unload Reload**

Selects the tape drives with the specified device name for unload/reload.

**[-resv-type {off|persistent|scsi}] - Reservation Type for device**

Selects the tape drives with the specified type.

## Examples

The following example displays information about all tape drives and media changers attached to the cluster:

```
cluster1::> storage tape show
```

```
Node: cluster1-01
```

Device ID	Device Type	Description
-----------	-------------	-------------

Status		
--------	--	--

-----	-----	-----
-----		

sw4:10.11	tape drive	HP LTO-3
-----------	------------	----------

-------	--	--

## storage tape trace

Enable/disable tape trace operations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command enables or disables diagnostic tape trace operations for all tape drives attached to the node you have specified.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which the tape trace feature is enabled or disabled.

**[-is-trace-enabled {true|false}] - Tape Trace Enabled or Disabled**

Use this parameter to enable or disable the tape trace feature. By default, the tape trace feature is enabled.

## Examples

The following example enables tape trace operation on the node, cluster1-01.

```
cluster1::> storage tape trace -node cluster1-01 -is-trace-enabled true
```

## storage tape alias clear

### Clear alias names

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command clears alias names for a tape drive or media changer.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**{ -name <text> - Alias Name That Is to Be Cleared**

Use this parameter to specify the alias name that is to be cleared. You can use the 'storage tape show -alias' command to find more information about alias names of tape drives and media changers attached to a node. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-name` parameter, a single alias name is cleared.

**| -clear-scope {tape|media-changer|all} - Scope of Alias Clear Operation }**

Use this parameter to specify the scope of the alias clear operation. The `-clear-scope` and `-name` parameters are mutually exclusive. If you specify the `-clear-scope` parameter, multiple aliases are cleared depending upon the value of the parameter.

The possible values for `-clear-scope` are as follows:

- `tape` - Clear all tape drive aliases

- media-changer - Clear all media-changer aliases
- all - Clear both tape drive and media-changer aliases

## Examples

The following example clears an alias name 'st3' attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -name st3
```

The following example clears all tape drive alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope tape
```

The following example clears all media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope media-  
changer
```

The following example clears both tape and media changer alias names attached to the node, cluster1-01.

```
cluster1::> storage tape alias clear -node cluster1-01 -clear-scope all
```

## storage tape alias set

Set an alias name for tape drive or media changer

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command sets an alias name for a tape drive or media changer.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node to which the tape drive is attached.

**-name <text> - Alias Name for Tape Drive or Media Changer**

Use this parameter to specify the alias name for tape drive or media changer. For a tape drive alias name, the format is 'st' followed by one or more digits. For a media changer alias name, the format is 'mc' followed by one or more digits.

**-mapping <text> - Mapping for Alias Name**

Use this parameter to specify the mapping for an alias name. Use the format 'SN[<serial-number>]'. Valid mapping for serial numbers are in the format 'SN[<serial-number>]' where the <serial-

*number*> is from 2 to 90 characters long and includes the following characters: 0-9, a-z, and A-Z.

## Examples

The following example sets an alias name 'st3' for a tape drive with serial number SN[123456]L4 attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name st3 -mapping  
SN[123456]L4.
```

The following example sets an alias name 'mc1' for a media changer with serial number SN[65432] attached to the node, node1.

```
cluster1::storage tape alias> set -node node1 -name mc1 -mapping  
SN[65432].
```

## storage tape alias show

Displays aliases of all tape drives and media changers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays aliases of all tape drives and media changers attached to every node in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## Examples

The following example shows the aliases of all tape drives and media changers attached to every node in the cluster:

```
cluster1::> storage tape alias show
```

Node: node1

Alias	Mapping
mc0	SN[00FRU7800000_LL0]L1
mc1	SN[00FRU7800000_LL1]L1
mc2	SN[aa6a64c69360a0980248c8]
mc3	SN[c940abe8b0c3a0980248c8]
mc4	SN[fba082e6b335a0980248c8]L5
st0	SN[HU19487T7N]
st1	SN[1068000230]
st10	SN[fba0c508b335a0980248c8]L7

Node: node2

Alias	Mapping
mc1	SN[c940982fc48c8]
st3	SN[ST456HT8N]L3
st2	SN[HG68000230]L2
st11	SN[aba673980248c8]L7

## storage tape config-file delete

### Delete a tape config file

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `storage tape config-file delete` command deletes the specified tape drive configuration file from all nodes that are currently part of the cluster.

### Parameters

**-filename <text> - Config File Filename (privilege: advanced)**

This parameter specifies the name of the tape configuration file that will be deleted from all nodes that are currently part of the cluster.

### Examples

The following example deletes the specified tape drive configuration files on every node that is currently part of the cluster:

```
cluster1::> storage tape config-file delete -filename XYZ_LTO-6.TCF
```

## storage tape config-file get

Get a tape drive configuration file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape config-file get` command uploads a specified tape drive configuration file to each node that is currently part of the cluster.

### Parameters

#### **-url <text> - Config File URL**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP and TFTP, are accepted.

### Examples

The following example uploads the specified tape drive configuration file to each node that is currently part of the cluster:

```
cluster1::> storage tape config-file get -url  
http://example.com/~tapeconfigfile/XYZ_LTO-6.TCF
```

## storage tape config-file show

Display the list of tape drive configuration files on the given node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape config-file show` command lists the tape drive configuration files loaded onto each node in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[*-node* {<nodename>|local}] - Node**

Selects information about tape drive configuration files for the specified node.

### **[*-config-file* <text>] - Tape Config File**

Selects information about the tape drive configuration file specified.

## **Examples**

The following example lists the tape drive config files loaded onto each node in the cluster:

```
cluster1::> storage tape config-file show

Node: node1

Tape Config Files
-----
CERTANCE_LTO2_ULTRIUM.TCF
CERTANCE_LTO3_ULTRIUM.TCF
HP_LT09.TCF

IBM_LTO2_ULTRIUM.TCF
```

## **storage tape library config show**

Display connectivity to back-end storage tape libraries.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays information such as how the storage tape libraries connect to the cluster, LUN groups, number of LUNs, WWPN, and switch port information. Use this command to verify the cluster's storage tape library configuration or to assist in troubleshooting.

### **Parameters**

**{ [*-fields* <fieldname>, ...]**

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

| **[-switch ]**

If you specify this parameter, switch port information is shown.

| **[-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller Name**

The name of the clustered node for which information is being displayed.

**[-group <integer>] - LUN Group**

A LUN group is a set of LUNs that shares the same path set.

**[-target-wwpn <text>] - Library Target Ports**

The World Wide Port Name of a storage tape library port.

**[-initiator <text>] - Initiator**

The host bus adapter that the clustered node uses to connect to storage tape libraries.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

This identifies the switch port that connects to the tape library's target port.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

This identifies the switch port that connects to the node's initiator port.

**[-lun-count <integer>] - Number of LUNS**

This is a command-line switch (`-lun-count`) used to restrict what LUN groups are displayed in the output.

## Examples

The following example displays the storage tape library configuration information.

```
cluster1::> storage tape library config show
      LUN   LUN
Node      Group Count      Library Name      Library Target
Port Initiator
-----
cluster1-01
              0       2              TAPE_LIB_1
50050763124b4d6f      3d

cluster1::>
```

## storage tape library path show-by-initiator

Display a list of LUNs on the given tape library

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays path information for every initiator port connected to a tape library. The output is similar to the storage library path show command but the output is listed by initiator.

### Parameters

**{ [-fields <fieldname>,...]**

fields used to be used in this display

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage tape library that is being used.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the cluster.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path (Rolling Average)**

Rolling average of Kbytes of I/O per second on the library path.

**[-path-iops <integer>] - Number of I/O per second on Path (Rolling Average)**

Rolling average of I/O per second on the library path.

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator (Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator (Rolling Average)**

>Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target (Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-iops <integer>] - Number of I/O per second to Target (Rolling Average)**

Rolling average of I/O per second on the target port.

## Examples

The following example displays the path information by initiator for a storage tape library.

```
cluster1::> storage tape library path show-by-initiator
Node: cluster1-01

Initiator I/O      Initiator Side      Path I/O      Target
Side  Target I/O
Initiator      (KB/s)      Switch Port      (KB/s)      Switch
Port      (KB/s)      Target Port Library Name
-----
0b      0 sw_tape:6      0
sw_tape:0      0 510a09800000412d TAPE_LIB_1

sw_tape:1      0 510a09820000412d TAPE_LIB_1
3d      0 N/A      0
N/A      0 50050763124b4d6f TAPE_LIB_2
3 entries were displayed.
```

## storage tape library path show

Display a list of Tape Libraries on the given path

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays path information for a tape library and has the following parameters by default:

- Node name
- Initiator port
- Target port
- TPGN (Target Port Group Number)

- Port speeds
- Path I/O in Kbytes/sec
- IOPs

## Parameters

**{ [-fields <fieldname>,...]**

fields used to be used in this display

**| [-detail ]**

Using this option displays the following:

- Target IOPs
- Target LUNs
- Path IOPs
- Path errors
- Path quality
- Path LUNs
- Initiator IOPs
- Initiator LUNs

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Controller name**

The name of the clustered node for which information is being displayed.

**[-array-name <array name>] - Library Name**

Name of the storage tape library that is connected to the cluster.

**[-target-wwpn <text>] - Target Port**

Target World Wide Port Name. Port on the storage tape library that is being used.

**[-initiator <text>] - Initiator Port**

Initiator port that the clustered node uses.

**[-initiator-side-switch-port <text>] - Initiator Side Switch Port**

Switch port connected to the clustered node.

**[-tpgn <integer>] - Target Port Group Number**

TPGN refers to the target port group to which the target port belongs. A target port group is a set of target ports which share the same LUN access characteristics and failover behaviors.

**[-port-speed <text>] - Port Speed**

Port Speed of the specified port.

**[-path-io-kbps <integer>] - Kbytes of I/O per second on Path(Rolling Average)**

Rolling average of Kbytes of I/O per second on the library path.

**[-path-iops <integer>] - Number of I/O per second on Path(Rolling Average)**

Rolling average of I/O per second on the library path.

**[-initiator-io-kbps <integer>] - Kbytes of I/O per second on Initiator(Rolling Average)**

Rolling average of Kbytes of I/O per second on the initiator port.

**[-initiator-iops <integer>] - Number of I/O per second on Initiator(Rolling Average)**

>Rolling average of I/O per second on the initiator port.

**[-target-io-kbps <integer>] - Kbytes of I/O per second to Target(Rolling Average)**

Rolling average of Kbytes of I/O per second on the target port.

**[-target-iops <integer>] - Number of I/O per second to Target(Rolling Average)**

Rolling average of I/O per second on the target port.

**[-target-side-switch-port <text>] - Target Side Switch Port**

Switch port connected to the tape library.

**[-path-link-errors <integer>] - Link Error count on path**

Fibre Channel link error count.

**[-path-quality <integer>] - Percentage of weighted error threshold**

A number representing the threshold of errors that is allowed on the path. Path quality is a weighted error value. When the error weight of a path exceeds the threshold, I/O is routed to a different path.

**[-path-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this path**

Number of LUNs on this path.

**[-initiator-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this initiator**

Number of LUNs on this initiator.

**[-target-lun-in-use-count <integer>] - Number of LUNs in the in-use state on this target**

Number of LUNs on this target.

## Examples

The following example displays the path information for a storage tape library

```
cluster1::> storage tape library path show
```

Node	Initiator	Target	Port	TPGN	Speed
(KB/s)	IOPs				
cluster1-01	3d	50050763124b4d6f		61	4 Gb/S
0	0				
cluster1-01	0b	510a09800000412d		35	4 Gb/S
0	0				
cluster1-01	0b	510a09820000412d		1	4 Gb/S
0	0				

3 entries were displayed.

## storage tape load-balance modify

Modify the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `storage tape load-balance modify` command modifies the tape load balance setting for a specified node in the cluster.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node on which the tape load balance setting is to be modified.

**[-is-enabled {true|false}] - Is Tape Load Balance Enabled**

This parameter specifies whether tape load balancing is enabled on the node. The default setting is false.

### Examples

The following example modifies the tape load balance setting on node1 in the cluster:

```
cluster1::> storage tape load-balance modify -node node1 -is-enabled true
```

## storage tape load-balance show

Displays the tape load balance configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `storage tape load-balance show` command displays tape load balance settings for each node in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about tape load balancing for the specified node.

**[-is-enabled {true|false}] - Is Tape Load Balance Enabled**

Selects information about load balance configuration as specified by enabled or disabled setting.

## Examples

The following example shows the load balance setting for each node in the cluster:

```
cluster1::> storage tape load-balance show
```

Node	Enabled
-----	-----
node1	false
node2	false

2 entries were displayed.

# system commands

## system chassis commands

### system chassis show

Display all the chassis in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system chassis show` command displays information about all the chassis in the cluster. By default, the command displays the following information about all the chassis in the cluster:

- Chassis ID
- Status
- List of nodes in the chassis

To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about all the chassis in the cluster.

**[-chassis-id <text>] - Chassis ID**

Selects information about the specified chassis.

**[-member-nodes {<nodename>|local}] - List of Nodes in the Chassis**

Selects information about the chassis with the specified member node list.

**[-num-nodes <integer>] - Number of Nodes in the Chassis**

Selects information about the chassis with the specified number of nodes.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the chassis with the specified status.

#### Examples

The following example displays information about all the chassis in the cluster:

```
cluster1::> system chassis show
```

Chassis ID	Status	List of Nodes
4591227214	ok	node1,node2
4591227000	ok	node1,node2

The following example displays detailed information about a specific chassis:

```
cluster1::> system chassis show -chassis-id 4591227214 -instance
```

```
                Chassis ID: 4591227214
List of Nodes in the Chassis: node1,node2
Number of Nodes in the Chassis: 2
                Status: ok
```

## system chassis fru show

Display the FRUs in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system chassis fru show` command displays information about all the major chassis specific FRUs in the cluster. By default, the command displays the following information about all the FRUs in the cluster:

- Chassis ID
- FRU name
- FRU type
- FRU state
- Nodes sharing the FRU

To display more details, use the `-instance` parameter.

### Parameters

```
{ [-fields <fieldname>,...]
```

Selects the fields that you specify.

```
| [-instance ] }
```

Displays detailed information about FRUs.

**[-node {<nodename>|local}] - Node**

Specifies the primary node name in the cluster on which Chassis health monitor is running.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about all the FRUs with the specified FRU type.

**[-name <text>] - FRU ID**

Selects information about the FRU with the specified FRU unique name.

**[-state <text>] - FRU State**

Selects information about all the FRUs with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about all the FRUs with the specified status.

**[-display-name <text>] - Display Name for the FRU**

Selects information about all the FRUs with the specified FRU display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name**

Selects information about all the FRUs with the specified monitor name.

**[-model <text>] - Model Type**

Selects information about all the FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the FRUs in the specified chassis.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the FRUs with the specified additional information.

**[-connected-nodes {<nodename>|local}] - List of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified node list.

**[-num-nodes <integer>] - Number of Nodes Sharing the FRU**

Selects information about all the FRUs with the specified number of connected nodes.

## Examples

The following example displays information about all major chassis specific FRUs in the cluster:

```
cluster1::> system chassis fru show
```

Chassis ID	FRU	Type	State	Nodes Sharing the FRU
4591227214	node1	controller	ok	node1
4591227214	node2	controller	ok	node2
4591227214	PSU1 FRU	psu	GOOD	node1,node2
4591227214	PSU2 FRU	psu	GOOD	node1,node2

The following example displays detailed information about a specific FRU:

```
cluster1::> system chassis fru show -instance -fru-name "PSU1 FRU"
```

```
Node: node1
```

```
FRU Serial Number: XXT122737891
```

```
FRU Name: PSU1 FRU
```

```
FRU Type: psu
```

```
FRU Name: XXT122737891
```

```
FRU State: GOOD
```

```
Status: ok
```

```
Display Name for the FRU: PSU1 FRU
```

```
Monitor Name: chassis
```

```
Model Type: none
```

```
Shared Resource: shared
```

```
Chassis ID: 4591227214
```

```
Additional Information About the FRU: Part Number: 114-00065+A0
```

```
Revision: 020F
```

```
Manufacturer: NetApp
```

```
FRU Name: PSU
```

```
List of Nodes Sharing the FRU: node1,node2
```

```
Number of Nodes Sharing the FRU: 2
```

## system cluster-switch commands

### system cluster-switch configure-health-monitor

Cluster-switch health-monitor no-ontap-dependency(NOD) configuration setup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system cluster-switch configure-health-monitor` command downloads non-legacy cluster-switch's no-ontap-dependency(NOD) configuration file in the zip format, where it contains the XML file and a signed version. After download, ONTAP will do security signing check. If passed, cluster-switch health-monitor restarts to use the new cluster-switch configuration file.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node or nodes on which the NOD configuration file is to be updated.

**-package-url <text> - Package URL (privilege: advanced)**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, HTTPS, FTP and FILE, are accepted.

## Examples

The following example downloads NOD configuration file to node1 from a web server and enables cshmd to process it:

```
cluster1::*> system cluster-switch configure-health-monitor -node node1
-package-url
http://example.com/nod_config.zip
```

## system cluster-switch create

Add information about a cluster switch or management switch

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch create` command adds information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the health of the switch.

Use this command if ONTAP cannot automatically discover a cluster or management switch. ONTAP relies on the Cisco Discovery Protocol (CDP) to discover the switches. CDP is always enabled on all cluster ports of a node by default, disabled on all non-cluster ports of a node. If the CDP is also enabled on your cluster switches, they will be automatically discovered.

If you want ONTAP to discover and monitor management switches, the CDP must be enabled on non-cluster ports. To verify whether the CDP is enabled or disabled, use the command `system node run -node <node_name> command`options cdpd.enable`.`

Use the `system cluster-switch show` command to identify switches that the cluster switch health monitor is monitoring.

## Parameters

**-device <text> - Device Name**

Specifies the device name of the switch that you want to monitor. Data ONTAP uses the device name of the switch to identify the SNMP agent with which it wants to communicate.

**-address <IP Address> - IP Address**

Specifies the IP address of switch's management interface.

**-snmp-version {SNMPv1|SNMPv2c|SNMPv3} - SNMP Version**

Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

**{ -community <text> - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is cshm1!.

**| -community-or-username <text> - Community String or SNMPv3 Username }**

Specifies the community string for SNMPv2 authentication or SNMPv3 user name for SNMPv3 security. The default community string for SNMPv2 authentication is cshm1!.

**-model**

**{NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C} - Model Number**

Specifies the model number of the switch. You should not set this parameter to OTHER. Data ONTAP does not monitor switches that match this value. Data ONTAP sets this parameter to OTHER if a switch that it automatically discovers is not supported for health monitoring.

**-type {cluster-network|management-network} - Switch Network**

Specifies the switch type.

**[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Specifies the switch admin monitoring status.

## Examples

```
cluster1::> system cluster-switch create -device SwitchA -address 1.2.3.4
-snmpp-version SNMPv2c -community-or-username cshm1! -model NX55596 -type
cluster-network
```

Creates a new switch configuration for a switch named SwitchA.

```
cluster2::> system cluster-switch create -device SwitchB -address 5.6.7.8
-snmpp-version SNMPv3 -community-or-username snmpv3u1 -model CN1601 -type
management-network
```

Creates a new switch configuration for a switch named SwitchB.

## Related Links

- [system node run](#)
- [system cluster-switch show](#)

## system cluster-switch delete

Delete information about a cluster switch or management switch.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch delete` command disables switch health monitoring for a cluster or management switch.

## Parameters

**-device <text> - Device Name**

Specifies the name of the switch.

**[-force <true>] - Force Delete (privilege: advanced)**

Specifies if force delete or not.

## Examples

```
cluster1::> system cluster-switch delete -device SwitchA
```

Disables monitoring for the switch named SwitchA.

```
cluster1::> system cluster-switch delete -device SwitchA -force
```

Forcefully disables monitoring for the switch named SwitchA. (privilege: advanced)

## system cluster-switch modify

Modify information about a switch's configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch modify` command modifies information about a cluster switch or management switch. The cluster switch health monitor uses this information to monitor the switch.`

## Parameters

### **-device <text> - Device Name**

Specifies the device name of switch that you want to monitor.

### **[-address <IP Address>] - IP Address**

Specifies the IP address of switch's management interface.

### **[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Specifies the SNMP version that Data ONTAP uses to communicate with the switch. The default is SNMPv2c.

### **{ [-community <text>] - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

### **[-community-or-username <text>] - Community String or SNMPv3 Username }**

Specifies the community string for SNMPv2 authentication or SNMPv3 username for SNMPv3 security.

### **[-type {cluster-network|management-network}] - Switch Network**

Specifies the switch type.

### **[-is-monitoring-enabled-admin {true|false}] - Enable Switch Monitoring**

Specifies the switch admin monitoring status.

## Examples

```
cluster1::> system cluster-switch modify -device SwitchA -address 2.3.4.5
```

Modifies the IP address for the switch named SwitchA.

```
cluster1::> system cluster-switch modify -device SwitchB -snmp-version  
SNMPv3 -community-or-username snmpv3u1
```

Modifies the SNMP parameters for the switch named SwitchB.

## **system cluster-switch prepare-to-downgrade**

Remove unsupported switches in preparation for downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

The `system cluster-switch prepare-to-downgrade` command changes switch information, so that it

is compatible with older versions of ONTAP. When executed, it removes cluster switch entries that are not supported in versions earlier than ONTAP 9.1.

## Examples

```
cluster1::> system cluster-switch prepare-to-downgrade
```

## system cluster-switch show-all

Displays the list of switches that were added and deleted

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system cluster-switch show-all` command displays configuration details for discovered monitored cluster switches and management switches, including switches that are user-deleted. From the list of deleted switches, you can delete a switch permanently from the database to re-enable automatic discovery of that switch.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-instance ] }**

Selects detailed information for all the switches.

**[-device <text>] - Device Name (privilege: advanced)**

Selects the switches that match the specified device name.

**[-address <IP Address>] - IP Address (privilege: advanced)**

Selects the switches that match the specified IP address.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version (privilege: advanced)**

Selects the switches that match the specified SNMP version.

**[-community <text>] - DEPRECATED-Community String or SNMPv3 Username (privilege: advanced)**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Selects the switches that match the specified community string or SNMPv3 username.

**[-community-or-username <text>] - Community String or SNMPv3 Username (privilege: advanced)**

Selects the switches that match the specified community string or SNMPv3 username.

**[-discovered {true|false}] - Is Discovered (privilege: advanced)**

Selects the switches that match the specified discovery setting.

**[-type {cluster-network|management-network}] - Switch Network (privilege: advanced)**

Selects the switches that match the specified switch type.

**[-sw-version <text>] - Software Version (privilege: advanced)**

Selects the switches that match the specified software version.

**[-is-monitoring-enabled-operational {true|false}] - Switch Monitoring Status (privilege: advanced)**

Selects the switches that match the specified operational monitoring status.

**[-reason <text>] - Reason For Not Monitoring (privilege: advanced)**

Selects the switches that match the specified reason.

**[-version-source <text>] - Source Of Switch Version (privilege: advanced)**

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

**[-serial-number <text>] - Serial Number of the Device (privilege: advanced)**

Selects the switches that match the specified serial number.

**[-model <text>] - Model to display (privilege: advanced)**

Selects the switches that match the specified model number.

## Examples

```
cluster1::> system cluster-switch show-all
Switch                                     Type                                     Address                                     Model
-----
SwitchA                                  cluster                                  1.2.3.4
Nexus5010

      Is Monitored: yes
      Reason:
Software Version: Cisco IOS 4.1N1
Version Source: CDP
```

The example above displays the configuration of all cluster switches and management switches.

## system cluster-switch show

Display the configuration for cluster and management switches

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch show` command displays configuration details for the monitored cluster switches and management switches.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-snmp-config ]**

Displays the following information about a switch:

- Device Name
- SNMPv2c Community String or SNMPv3 Username
- SNMP Version

**| [-status ]**

Displays the following status information about a switch:

- Is Discovered
- SNMPv2c Community String or SNMPv3 Username
- Model Number
- Switch Network
- Software Version
- Reason For Not Monitoring
- Source Of Switch Version
- Is Monitored ?

**| [-instance ] }**

Selects detailed information for all the switches.

**[-device <text>] - Device Name**

Selects the switches that match the specified device name.

**[-address <IP Address>] - IP Address**

Selects the switches that match the specified IP address.

**[-snmp-version {SNMPv1|SNMPv2c|SNMPv3}] - SNMP Version**

Selects the switches that match the specified SNMP version.

**[-is-discovered {true|false}] - Is Discovered**

Selects the switches that match the specified discovery setting.

**[-community <text>] - DEPRECATED-Community String or SNMPv3 Username**

This parameter is deprecated and may be removed in a future release of Data ONTAP. Use `-community-or-username` instead.

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

**[-community-or-username <text>] - Community String or SNMPv3 Username**

Selects the switches that match the specified SNMPv2c community string or SNMPv3 username.

**[-model**

**{NX5010|NX5020|CAT2960|OTHER|NX5596|CN1610|CN1601|NX3132|NX5548|NX3132V|OT9332|NX3132XL|NX3232C}] - Model Number**

Selects the switches that match the specified model number.

**[-type {cluster-network|management-network}] - Switch Network**

Selects the switches that match the specified switch type.

**[-sw-version <text>] - Software Version**

Selects the switches that match the specified software version.

**[-reason <text>] - Reason For Not Monitoring**

Selects the switches that match the specified reason.

**[-version-source <text>] - Source Of Switch Version**

Selects the switches that match the specified version source (for example, from SNMP, CDP or ISDP).

**[-is-monitoring-enabled-operational {true|false}] - Is Monitored ?**

Selects the switches that match the specified operational monitoring status.

**[-serial-number <text>] - Serial Number of the Device**

Selects the switches that match the specified serial number.

**Examples**

```
cluster1::> system cluster-switch show
```

Switch	Type	Address	Model
cn1610-143--234	cluster-network	10.238.143.234	CN1610
Serial Number: 20211200007			
Is Monitored: true			
Reason:			
Software Version: 1.1.0.1			
Version Source: ISDP			
cn1601--143-230	management-network	10.238.143.230	CN1601
Serial Number: 20210200019			
Is Monitored: false			
Reason: Monitoring Disabled by Default			
Software Version: 1.1.0.1			
Version Source: ISDP			
cn1601--143-232	management-network	10.238.143.232	CN1601
Serial Number: 20210200017			
Is Monitored: false			
Reason: Monitoring Disabled by Default			
Software Version: 1.1.0.1			
Version Source: ISDP			
cn1610-143--231	cluster-network	10.238.143.231	CN1610
Serial Number: 20211200002			
Is Monitored: true			
Reason:			
Software Version: 1.1.0.1			
Version Source: ISDP			

The example above displays the configuration of all cluster switches and management switches.

```
cluster1::> system cluster-switch show -snmp-config
```

Switch	SNMPv2c Community or SNMPv3 Username	SNMP Version
SwitchA	public	SNMPv2c

The example above displays the SNMPv2c community string or SNMPv3 username and SNMP version for all cluster switches and management switches.

## system cluster-switch log collect

Collect cluster switch log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch log collect` command initiates the collection of a cluster switch log for the specified cluster switch.

## Parameters

### **-device <text> - Switch Name**

Specifies the cluster switch device for which the log collection is being made.

## Examples

```
cluster1::> system cluster-switch log collect -device cluster-sw1
```

## system cluster-switch log disable-collection

Disable cluster switch log collection

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch log disable-collection` command disables the collection of cluster switch logs.

## Examples

```
cluster1::> system cluster-switch log disable-collection
```

## system cluster-switch log enable-collection

Enable cluster switch log collection

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch log enable-collection` command enables the collection of cluster switch logs.

## Examples

```
cluster1::> system cluster-switch log enable-collection
```

## system cluster-switch log modify

Modify the cluster switch log request

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch log modify` command modifies the log request of the specified cluster switch.

## Parameters

### **-device <text> - Switch Name**

Specifies the cluster switch device for which the log request is being made. Note, that the device must be one of the devices listed as a cluster switch from the `system cluster-switch show` command. The full device name from the `system cluster-switch show` command must be used.

### **[-log-request {true|false}] - Requested Log**

Specifies the initiation of a switch log retrieval for the specified cluster switch if set to true.

## Examples

```
cluster1::> system cluster-switch log modify -device switch-  
name01(Switch---SN) -log-request true
```

Modifies the log request for the specified cluster switch. Setting the log-request to true initiates a cluster switch log retrieval for the specified switch.

## system cluster-switch log setup-password

### Obtain cluster switch admin passwords

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system cluster-switch log setup-password` command allows the user to enable the cluster switch health monitor to setup access to certain cluster switches so that the switch logs can be collected.

## Examples

```
cluster1::> system cluster-switch log setup-password  
      Enter the switch name: (use full name from system cluster-  
switch show)  
      Enter the password: (Enter admin password of switch)  
      Enter the password again: (Enter admin password of switch)  
cluster1::>
```

Enables setup of switch logging for the specified cluster switch.

## system cluster-switch log show

Displays cluster switch log information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system cluster-switch log show` command displays the status and requests for cluster switch logs.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Specifies an instance of the cluster switch devices log status.

**[-device <text>] - Switch Name**

Specifies the name of the cluster switch device to display log status on.

**[-log-request {true|false}] - Requested Log**

Specifies the state of the log request for a cluster switch device. Values: true, false.

**[-log-status <text>] - Log Status**

Specifies the status of the log request for a cluster switch device.

**[-log-timestamp <MM/DD/YYYY HH:MM:SS>] - Log Timestamp**

Specifies the completion timestamp of the log request for a cluster switch device.

**[-idx <integer>] - Index**

Specifies the index of the cluster switch device.

**[-filename <text>] - Filename**

Specifies the full filename of the cluster switch log.

**[-filenode <text>] - File Node**

Specifies the name of the controller on which the cluster switch log resides.

### Examples

```
cluster1::> system cluster-switch log show
Log Collection Enabled: true
Index Switch                               Log Timestamp                               Status
-----
1 switch-name01 (Switch---SN)              -                               -
2 switch-name02 (Switch---SN)              -                               -
```

Displays the cluster switches, their last log timestamp, and the status of the last log request.

## system cluster-switch polling-interval modify

Modify the polling interval for monitoring cluster and management switch health

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system cluster-switch polling-interval modify` command modifies the interval in which the cluster switch health monitor polls cluster and management switches.

### Parameters

#### **[-polling-interval <integer>] - Polling Interval**

Specifies the interval in which the health monitor polls switches. The interval is in minutes. The default value is 5. The allowed range of values is 2 to 120.

### Examples

```
cluster1::> system cluster-switch polling-interval modify -polling
-interval 41
```

Modifies the polling interval of the switches.

## system cluster-switch polling-interval show

Display the polling interval for monitoring cluster and management switch health

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system cluster-switch polling-interval show` command displays the polling interval used by the health monitor.

## Examples

```
cluster1::> system cluster-switch polling-interval show
Polling Interval (in minutes): 40
```

The example above displays the polling interval period for the switches.

## system cluster-switch threshold show

Display the cluster switch health monitor alert thresholds

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system cluster-switch threshold show` command displays thresholds used by health monitor alerts.

## Examples

```
cluster1::> system cluster-switch threshold show
Per 0.10% values: 1 = 0.10%, 5 = 0.50%
Entity-alert Threshold is the count needed to raise entity warning
alert
In Errors Threshold (%) Out Errors Threshold (%) Entity-alert Threshold
-----
1 1 2
```

Displays the inbound and outbound switch interface packet error thresholds are set at 0.1%. Also, displays threshold value for entity warning alerts. The node platform health monitor also shares the same thresholds in monitoring packet errors of cluster ports on the node.

## system configuration commands

### system configuration backup copy

Copy a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup copy` command copies a configuration backup from one node in the cluster to another node in the cluster.

Use the [system configuration backup show](#) command to display configuration backups to copy.

## Parameters

### **-from-node {<nodename>|local} - Source Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

### **-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to copy.

### **-to-node {<nodename>|local} - Destination Node (privilege: advanced)**

Use this parameter to specify the name of the destination node where the configuration backup copy is created.

## Examples

The following example copies the configuration backup file `node1.special.7z` from the node `node1` to the node `node2`.

```
cluster1::*> system configuration backup copy -from-node node1 -backup
node1.special.7z -to-node node2
[Job 295] Job is queued: Copy backup job.
```

## Related Links

- [system configuration backup show](#)

## system configuration backup create

Create a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup create` command creates a new configuration backup file.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the node on which to create the backup file.

### **[-backup-name <text>] - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the backup file to create. The backup name cannot contain a space or any of the following characters: `* ? /`

### **[-backup-type {node|cluster}] - Backup Type (privilege: advanced)**

Use this parameter to specify the type of backup file to create.

## Examples

The following example creates a new cluster configuration backup file called `node1.special.7z` on the node `node1`.

```
cluster1::*> system configuration backup create -node node1 -backup-name
node1.special.7z -backup-type cluster
[Job 194] Job is queued: Cluster Backup OnDemand Job.
```

## system configuration backup delete

Delete a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup delete` command deletes a saved configuration backup.

Use the [system configuration backup show](#) command to display saved configuration backups.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to delete.

## Examples

The following example shows how to delete the configuration backup file `node1.special.7z` from the node `node1`.

```
cluster1::*> system configuration backup delete -node node1 -backup
node1.special.7z
```

## system configuration backup download

Download a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup download` command copies a configuration backup from a source URL to a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the node to which the configuration backup is downloaded.

**-source <text> - Source URL (privilege: advanced)**

Use this parameter to specify the source URL of the configuration backup to download.

**[-backup-name <text>] - Backup Name (privilege: advanced)**

Use this parameter to specify a new local file name for the downloaded configuration backup.

## Examples

The following example shows how to download a configuration backup file from a URL to a file named `exampleconfig.download.7z` on the node `node2`.

```
cluster1::*> system configuration backup download -node node2 -source
http://www.example.com/config/download/nodeconfig.7z -backup-name
exampleconfig.download.7z
```

## system configuration backup rename

### Rename a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup rename` command changes the file name of a configuration backup file.

Use the [system configuration backup show](#) command to display configuration backups to rename.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the source node where the configuration backup currently exists.

**-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of the configuration backup file to rename.

**-new-name <text> - New Name (privilege: advanced)**

Use this parameter to specify a new name for the configuration backup file.

## Examples

The following example renames the saved configuration file `download.config.7z` on the node `node1` to `test.config.7z`.

```
cluster1::*> system configuration backup rename -node node1 -backup
download.config.7z -new-name test.config.7z
```

## system configuration backup show

Show configuration backup information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup show` command displays information about saved configuration backups.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects configuration backups that are saved on the node you specify.

**[-backup <text>] - Backup Name (privilege: advanced)**

Selects configuration backups that have the backup name you specify.

**[-backup-type {node|cluster}] - Backup Type (privilege: advanced)**

Selects configuration backups of the type you specify.

**[-time <MM/DD HH:MM:SS>] - Backup Creation Time (privilege: advanced)**

Selects configuration backups that were saved on the date and time you specify.

**[-cluster-name <text>] - Cluster Name (privilege: advanced)**

Selects configuration backups that were saved in the cluster that has the name you specify.

**[`-cluster-uuid <UUID>`] - Cluster UUID (privilege: advanced)**

Selects configuration backups that were saved in the cluster that has the UUID you specify.

**[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Size of Backup (privilege: advanced)**

Selects configuration backups that have the file size you specify.

**[`-nodes-in-backup {<nodename>|local}`] - Nodes In Backup (privilege: advanced)**

Selects configuration backups that include the configuration of the nodes you specify.

**[`-version <text>`] - Software Version (privilege: advanced)**

Selects configuration backups that have the software version you specify.

**[`-is-auto {true|false}`] - Backup Created from Schedule (true or false) (privilege: advanced)**

A value of true selects configuration backups that were created from a schedule. A value of false selects configuration backups that were created manually.

**[`-schedule <text>`] - Name of Backup Schedule (privilege: advanced)**

Selects configuration backups that were created by the schedule you specify.

## Examples

The following example shows typical output for this command.

```
cluster1::*> system configuration backup show
Node      Backup Tarball                                     Time
Size
-----
node1      cluster1.8hour.2011-02-22.18_15_00.7z                02/22 18:15:00

```

## system configuration backup upload

### Upload a configuration backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup upload` command copies a configuration backup from a node in the cluster to a remote URL.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

Use this parameter to specify the name of the node from which the configuration backup is uploaded.

### **-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the file name of the configuration backup to upload.

### **-destination <text> - Destination URL (privilege: advanced)**

Use this parameter to specify the destination URL of the configuration backup.

## Examples

The following example show how to upload the configuration backup file `testconfig.7z` from the node `node2` to a remote URL.

```
cluster1::*> system configuration backup upload -node node2 -backup
testconfig.7z -destination
ftp://www.example.com/config/uploads/testconfig.7z
```

## system configuration backup settings modify

### Modify configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup settings modify` command changes settings for configuration backup.

## Parameters

### **[-destination <text>] - Backup Destination URL (privilege: advanced)**

Use this parameter to specify the destination URL for uploads of configuration backups. Use the value `""` to remove the destination URL.

### **[-username <text>] - Username for Destination (privilege: advanced)**

Use this parameter to specify the user name to use to log in to the destination system and perform the upload. Use the [system configuration backup settings set-password](#) command to change the password used with this user name.

### **[-numbackups1 <integer>] - Number of Backups to Keep for Schedule 1 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup schedule 1 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

**[`-numbackups2 <integer>`] - Number of Backups to Keep for Schedule 2 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup schedule 2 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

**[`-numbackups3 <integer>`] - Number of Backups to Keep for Schedule 3 (privilege: advanced)**

Use this parameter to specify the number of backups created by backup schedule 3 to keep on the destination system. If the number of backups exceeds this number, the oldest backup is removed.

## Examples

The following example shows how to set the destination URL and user name used for uploads of configuration backups.

```
cluster1::*> system configuration backup settings modify -destination
ftp://www.example.com/config/uploads/ -username admin
```

## Related Links

- [system configuration backup settings set-password](#)

## system configuration backup settings set-password

Modify password for destination URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration backup settings set-password` command sets the password used for uploads of configuration backups. This password is used along with the username you specify using the [system configuration backup settings modify](#) command to log in to the system and perform the upload. Enter the command without parameters. The command prompts you for a password, and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Use the [system configuration backup settings show](#) command to display the destination URL for configuration backups. Use the [system configuration backup settings modify](#) command to change the destination URL and remote username for configuration backups.

## Parameters

## Examples

The following example shows successful execution of this command.

```
cluster1::*> system configuration backup settings set-password

Enter the password:
Confirm the password:
```

- [system configuration backup settings modify](#)
- [system configuration backup settings show](#)

## system configuration backup settings show

### Show configuration backup settings

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration backup settings show` command displays current settings for configuration backup. These settings apply to backups created automatically by schedules. By default, the command displays the URL to which configuration backups are uploaded, and the user name on the remote system used to perform the upload.

Use the [system configuration backup settings set-password](#) command to change the password used with the user name on the destination. Use the [system configuration backup settings modify](#) command to change the destination URL and username for uploads of configuration backups, and to change the number of backups to keep for each schedule.

### Parameters

#### **`[-instance ]`**

Use this parameter to display detailed information about configuration backup settings, including the number of backups to keep for each backup schedule.

### Examples

The following example displays basic backup settings information.

```
cluster1::*> system configuration backup settings show
Backup Destination URL                               Username
-----
ftp://www.example.com/config/uploads/                jdoe
```

The following example shows detailed output using the `-instance` parameter.

```
cluster1::*> system configuration backup settings show -instance
Backup Destination URL:
ftp://www.example.com/config/uploads/
Username for Destination: admin
Schedule 1: 8hour
Number of Backups to Keep for Schedule 1: 2
Schedule 2: daily
Number of Backups to Keep for Schedule 2: 2
Schedule 3: weekly
Number of Backups to Keep for Schedule 3: 2
```

## system configuration recovery cluster modify

### Modify cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration recovery cluster modify` command modifies the cluster recovery status. This command should be used to end the cluster recovery after all recovery procedures are applied.

### Parameters

**`[-recovery-status {complete|in-progress|not-in-recovery}]` - Cluster Recovery Status (privilege: advanced)**

Use this parameter with the value `complete` to set the cluster recovery status after the cluster has been recreated and all of the nodes have been rejoined to it. This enables each node to resume normal system operations. The `in-progress` and `not-in-recovery` values are not applicable to this command.

### Examples

The following example modifies the cluster recovery status.

```
source::> system configuration recovery cluster modify -recovery-status
complete
```

## system configuration recovery cluster recreate

### Recreate cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster recreate` command re-creates a cluster, using either the current node or a configuration backup as a configuration template. After you re-create the cluster, rejoin nodes to the cluster using the [system configuration recovery cluster rejoin](#) command.

## Parameters

### **-from {node|backup} - From Node or Backup (privilege: advanced)**

Use this parameter with the value `node` to re-create the cluster using the current node as a configuration template. Use this parameter with the value `backup` to re-create the cluster using a configuration backup as a configuration template.

### **[-backup <text>] - Backup Name (privilege: advanced)**

Use this parameter to specify the name of a configuration backup file to use as a configuration template. If you specified the `-from` parameter with the value `backup`, you must use this parameter and specify a backup name. Use the [system configuration backup show](#) command to view available configuration backup files.

## Examples

The following example shows how to re-create a cluster using the node `node1` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from node
```

The following example shows how to re-create a cluster using the configuration backup `siteconfig.backup.7z` as a configuration template.

```
cluster1::*> system configuration recovery cluster recreate -from backup  
-backup siteconfig.backup.7z
```

## Related Links

- [system configuration recovery cluster rejoin](#)
- [system configuration backup show](#)

## system configuration recovery cluster rejoin

### Rejoin a cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster rejoin` command rejoins a node to a new cluster created earlier using the [system configuration recovery cluster recreate](#) command. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

## Parameters

**-node {<nodename>|local}** - Node to Rejoin (privilege: advanced)

Use this parameter to specify the node to rejoin to the cluster.

## Examples

This example shows how to rejoin the node `node2` to the cluster.

```
cluster1::*> system configuration recovery cluster rejoin -node node2

Warning: This command will rejoin node "node2" into the local cluster,
        potentially overwriting critical cluster configuration files.
This
        command should only be used to recover from a disaster. Do not
perform
        any other recovery operations while this operation is in
progress.
        This command will cause node "node2" to reboot.
Do you want to continue? {y|n}: y
```

## Related Links

- [system configuration recovery cluster recreate](#)

## system configuration recovery cluster show

Show cluster recovery status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery cluster show` command displays the cluster recovery status. Cluster recovery status is "not-in-recovery" under normal operations, and it becomes "in-progress" if a new cluster is created using the [system configuration recovery cluster recreate](#) command with the `-from backup` parameter. When cluster recovery status is "in-progress", wait until the output of the "Is Recovery Status Persisted" field is true before using the [system configuration recovery cluster rejoin](#) command to recover other nodes in the cluster.

## Examples

The following example displays the cluster recovery status.

```
source:::> system configuration recovery cluster show
        Recovery Status: in-progress
Is Recovery Status Persisted: true
```

## Related Links

- [system configuration recovery cluster recreate](#)
- [system configuration recovery cluster rejoin](#)

## system configuration recovery cluster sync

Sync a node with cluster configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system configuration recovery cluster sync` command synchronizes a node with the cluster configuration. Only use this command to recover a node from a disaster. Because this synchronization can overwrite critical cluster information, and will restart the node you specify, you are required to confirm this command before it executes.

### Parameters

**-node {<nodename>|local} - Node to Synchronize (privilege: advanced)**

Use this parameter to specify the name of the node to synchronize with the cluster.

### Examples

The following example shows the synchronization of the node `node2` to the cluster configuration.

```
cluster1::*> system configuration recovery cluster sync -node node2

Warning: This command will synchronize node "node2" with the cluster
configuration, potentially overwriting critical cluster
configuration
files on the node. This feature should only be used to recover
from a
disaster. Do not perform any other recovery operations while this
operation is in progress. This command will cause all the cluster
applications on node "node2" to restart, interrupting
administrative
CLI and Web interface on that node.
Do you want to continue? {y|n}: y
All cluster applications on node "node2" will be restarted. Verify that
the cluster applications go online.
```

## system configuration recovery node restore

Restore node configuration from a backup

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system configuration recovery node restore` command restores the configuration of the local node from a configuration backup file.

Use the [system configuration backup show](#) command to view available configuration backup files.

## Parameters

### **-backup <text> - Backup Name (privilege: advanced)**

Use this parameter to specify the name of a configuration backup file to use as the configuration template.

### **[-nodename-in-backup <text>] - Use Backup Identified by this Nodename (privilege: advanced)**

Use this parameter to specify a node within the configuration backup file to use as a configuration template. Only specify this parameter if you are specifying a name other than the name of the local node.

### **[-force <>true>] - Force Restore Operation (privilege: advanced)**

Use this parameter with the value `true` to force the restore operation and overwrite the current configuration of the local node. This overrides all compatibility checks between the node and the configuration backup. The configuration in the backup is installed even if it is not compatible with the node's software and hardware.

Use this parameter with the value `false` to be warned of the specific dangers of restoring and be prompted for confirmation before executing the command. This value also assures that the command performs compatibility checks between configuration stored in the backup and the software and hardware of the node. The default is `false`.

## Examples

The following example shows how to restore the configuration of the local node from the configuration backup of `node3` that is stored in the configuration backup file `example.backup.7z`.

```
cluster1::*> system configuration recovery node restore -backup
example.backup.7z
Warning: This command overwrites local configuration files with files
contained
        in the specified backup file. Use this command only to recover
from a
        disaster that resulted in the loss of the local configuration
files.
        The node will reboot after restoring the local configuration.
Do you want to continue? {y|n}: y
```

# system controller commands

## system controller show

Display the controller information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller show` command displays information about all the controllers in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the controllers in the cluster:

- Controller name
- System ID
- System serial number
- Controller model name
- Health monitor status

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-system-id <text>] - System ID**

Selects information about the controller with the specified System ID.

**[-model <text>] - Model Name**

Selects information about the controllers with the specified model name.

**[-part-number <text>] - Part Number**

Selects information about the controllers with the specified part number.

**[-revision <text>] - Revision**

Selects information about the controllers with the specified revision.

**[-serial-number <text>] - Serial Number**

Selects information about the controller with the specified system serial number.

### **[-controller-type <text>] - Controller Type**

Selects information about the controllers with the specified controller type.

### **[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the controllers with the specified health monitor status.

### **[-chassis-id <text>] - Chassis ID**

Selects information about the controllers with the specified chassis ID.

## **Examples**

The below example displays information about all controllers in the cluster.

```
cluster1::> system controller show
      Controller Name      System ID      Serial Number      Model
Status
-----
node1      140733730268652  700001456939      FAS2520
ok
node2      140733730268667  700001456941      FAS2520
ok
2 entries were displayed.
```

The example below displays detailed information about specified controller in the cluster.

```
cluster1::> system controller show -instance -node node1
      Node: node1
      System ID: 140733730268652
      Model Name: FAS2520
      Part Number: 111-01316
      Revision: 21
      Serial Number: 700001456939
      Controller Type: none
      Status: ok
      Chassis ID: 4591227214
```

## **system controller bootmedia show-serial-number**

Display the Boot Media Device serial number

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller bootmedia show-serial-number` command displays the Boot Media Device

serial number. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Serial Number
- Size
- Bootmedia state
- Status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the bootmedia devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[-usbmon-status {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[-device-state {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

### **[-size <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

### **[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

## **Examples**

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show-serial-number
```

Node	Display Name	Serial Number	(MB)	State
or-12-01	BootMedia/SAMSUNG	S2J4NXAGA08186	122104	good
ok	MZVLV128HCGR-00000			
	BootMedia-2/SAMSUNG	S2J4NXAGA08198	122104	good
ok	MZVLV128HCGR-00000			

2 entries were displayed.

The following example displays the detailed information about the bootmedia present in a node:

```
cluster1::> system controller bootmedia show-serial-number -instance -node
node1
Node: node1
Vendor ID: 8086
Device ID: 8d02
Display Name: TOSHIBA THNSNJ060GMCU
Unique Name: /dev/ad4s1 (TOSHIBA THNSNJ060GMCU)
Health Monitor Name: controller
Bootmedia Health Monitor: present
Bootmedia State: good
Max memory size(in MB): 16367
Status: ok
Serial number: Y4IS104FTNEW
```

## **system controller bootmedia show**

Display the Boot Media Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller bootmedia show` command displays details of the bootmedia devices present in all the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the bootmedia:

- Node name
- Display name
- Vendor ID
- Device ID
- Memory size
- Bootmedia state
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the bootmedia devices.

**[-node {<nodename>|local}] - Node**

Selects the bootmedia device that is present on the specified node.

**[-serial-num <text>] - Serial Number**

Selects the bootmedia devices with the specified serial number.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the bootmedia devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the bootmedia devices with the specified device ID.

**[-display-name <text>] - Display Name**

Selects the bootmedia devices with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the bootmedia device with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the bootmedia devices with the specified health monitor.

**[-usbmon-status {present|not-present}] - Bootmedia Health Monitor**

Selects the bootmedia devices with the specified USBMON status.

**[-device-state {good|warn|bad}] - Bootmedia State**

Selects the bootmedia devices with the specified device state.

**[-size <integer>] - Max Memory Size (MB)**

Selects the bootmedia devices with the specified memory size.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the bootmedia devices with the specified health monitor status.

## Examples

The following example displays the information of the bootmedia devices present in all the nodes in a cluster:

```
cluster1::> system controller bootmedia show
Size Bootmedia
Node          Display Name          Vendor ID Device ID    (MB) State
Status
-----
node1         Micron Technology      634      655      1929 good
ok
              0x655
node2         Micron Technology      634      655      1929 good
ok
              0x655
```

The example below displays the detailed information about the bootmedia present in a node.

```
cluster1::> system controller bootmedia show -instance -node node1
Node: node1
      Vendor ID: 634
      Device ID: 655
      Display Name: Micron Technology 0x655
      Unique Name: Micron Technology 0x655 (ad.0)
      Health Monitor Name: controller
      USBMON Health Monitor: present
      Bootmedia State: good
      Max memory size(in MB): 1929
      Status: ok
```

## system controller clus-flap-threshold show

Display the controller cluster port flap threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller clus-flap-threshold show` command allows the display of the threshold for link flapping counts for all nodes. This threshold would be the number of times the cluster port links for a given node can flap (go down) within a polling period before triggering an alert.

## system controller config show-errors

Display configuration errors

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller config show-errors` displays configuration errors.

- node
- description

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the PCI devices.

**[-node {<nodename>|local}] - Node**

Displays configuration errors on the specified node.

**[-verbose <true>] - Verbose Output?**

The `-verbose` parameter enables verbose mode, resulting in the display of more detailed output.

**[-description <text>] - Error Description**

Displays the node with the specified configuration error.

### Examples

The example below displays configuration errors on all the nodes in the cluster.

```

cluster1::> system controller config show-errors

Configuration Info and Errors for Node: cluster1-01
-----
----
Chelsio T320E 2x10G NIC card (PN X1008A) in slot 1 is not supported on
model FAS3210

Configuration Info and Errors for Node: cluster1-02
-----
----
PCI-E Dual 10/100/1000 Ethernet G20 card (PN X1039A) in slot 2 is not
supported on model FAS3210

cluster1::>

cluster1::> system controller config show-errors -verbose

Configuration Info and Errors for Node: cluster1-01
-----
----
sysconfig: Card in slot 2 (7-1275-0008-46848) is not supported.
sysconfig: slot 12 OK: X2067: Proprietary embedded SAS HBA

cluster1::>

```

## system controller config show

### Display System Configuration Information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller config show` command displays system configuration information for the devices present in the controller. To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value.

**[-device <text>] - Device**

Selects the configuration information that matches the specified device.

**[-slot <integer>] - Slot Number**

Selects the configuration information that matches the specified slot.

**[-subslot <integer>] - Subslot Number**

Selects the configuration information that matches the specified subslot.

**[-info <text>] - Device Info**

Selects the configuration information that matches the specified device information.

## Examples

The following example displays configuration information for slot 1 of the controller:

```
cluster1::> system controller config show -slot 1

Node: node1
Sub- Device/
Slot slot Information
----
-----
1      - NVRAM10 HSL
      Device Name:      Interconnect HBA: Generic OFED Provider
      Port Name:        ib1a
      Default GID:      fe80:0000:0000:0000:0000:0000:0000:0104
      Base LID:         0x104
      Active MTU:       8192
      Data Rate:        0 Gb/s (8X)
      Link State:       DOWN
      QSFP Vendor:      Amphenol
      QSFP Part Number: 112-00436+A0
      QSFP Type:        Passive Copper 1m ID:00
      QSFP Serial Number: APF16130066875
      QSFP Vendor:      Amphenol
      QSFP Part Number: 112-00436+A0
      QSFP Type:        Passive Copper 1m ID:00
      QSFP Serial Number: APF16130066857

cluster1::>
```

## system controller config pci show-add-on-devices

Display PCI devices in expansion slots

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller config pci show-add-on-devices` command displays information about the PCIe devices in I/O expansion slots. The command displays the following information about the PCIe devices:

- Node
- Model
- Type
- Slot
- Device
- Vendor
- Sub-device ID

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-model <text>] - Model String**

Selects the PCI devices that are present on the system with the specified model name.

**[-type <integer>] - Device Type**

Selects the PCI devices with the specified device type.

**[-slot-and-sub <text>] - PCI Slot Number**

Selects the PCI devices present in the specified slot or slot-subslot combination.

**[-device <text>] - Device**

Selects the PCI devices with the specified device ID.

**[-vendor <text>] - Vendor Number**

Selects the PCI devices with the specified vendor ID.

**`[-sub-device-id <integer>]` - Sub Device ID**

Selects the PCI devices with the specified sub-device ID.

**Examples**

The example below displays information about PCI devices found in I/O expansion slots of all the nodes in the cluster.

```
cluster1::> system controller config pci show-add-on-devices
```

Node ID	Model	Slot	Type	Device	Vendor	Sub-Device

```

## system controller config pci show-hierarchy

### Display PCI hierarchy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller config pci show-hierarchy` command displays the PCI Hierarchy of all PCI devices found in a controller. The command displays the following information about the PCI devices:

- Node
- Level
- Device
- Link Capability
- Link Status

To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for PCI devices.

**[-node {<nodename>|local}] - Node**

Displays the PCI hierarchy of the specified node.

**[-level <integer>] - PCI Device Level**

Displays the PCI devices that match the specified level within the PCI hierarchy.

**[-pci-device <text>] - PCI Device**

Displays the PCI devices that match the specified device description.

**[-link-cap <text>] - Link Capability**

Displays the PCI devices that match the specified link capability.

**[-link-status <text>] - Link Status**

Displays the PCI devices that match the specified link status.

#### Examples

The example below displays the PCI hierarchy for all of the nodes in the cluster.

```
cluster1::> system controller config pci show-hierarchy
PCI Hierarchy
```

Node: cluster1-01

## system controller environment show

Display the FRUs in the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller environment show` displays information about all environment FRUs in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the environment FRUs in the cluster:

- Node
- FRU name

- FRU state

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the environment FRUs.

**[-node {<nodename>|local}] - Node**

Selects information about all the environment FRUs that the specified node owns.

**[-serial-number <text>] - FRU Serial Number**

Selects information about all the environment FRUs with the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects information about the environment FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdimm}] - FRU Type**

Selects information about all the environment FRUs with the specified FRU type.

**[-name <text>] - Name**

Selects information about all the environment FRUs with the specified unique name.

**[-state <text>] - FRU State**

Selects information about all the environment FRUs with the specified FRU state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about all the environment FRUs with the specified health monitor status.

**[-display-name <text>] - Display Name for the FRU**

Selects information about all the environment FRUs with the specified display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name**

Selects information about all the environment FRUs with the specified monitor.

**[-model <text>] - Model Type**

Selects information about all the environment FRUs with the specified FRU model.

**[-shared {shared|not\_shared}] - Shared Resource**

Selects information about all the environment FRUs with the specified sharing type.

**[-chassis-id <text>] - Chassis ID**

Selects information about all the environment FRUs in the specified chassis.

### **[-additional-info <text>] - Additional Information About the FRU**

Selects information about all the environment FRU with specified additional information.

### **[-seq-state-cnt <integer>] - Count of Same State**

Selects information about all the environment FRU with specified sequential state count.

## **Examples**

The following example displays information about all major environment FRUs in the cluster:

```
cluster1::> system controller environment show
```

Node	FRU Name	State
-----	-----	-----
node1	PSU1 FRU	GOOD
node1	PSU2 FRU	GOOD
node2	PSU1 FRU	GOOD
node2	PSU2 FRU	GOOD

The following example displays detailed information about a specific environment FRU:

```
cluster1::> system controller environment show -node node1 -fru-name "PSU1  
FRU" -instance
```

```
Node: node1
```

```
FRU Serial Number: XXT122737891
```

```
FRU Name: PSU1 FRU
```

```
FRU Type: psu
```

```
Name: XXT122737891
```

```
FRU State: GOOD
```

```
Status: ok
```

```
Display Name for the FRU: PSU1 FRU
```

```
Monitor Name: controller
```

```
Model Type: none
```

```
Shared Resource: shared
```

```
Chassis ID: 4591227214
```

```
Additional Information About the FRU: Part Number: 114-00065+A0
```

```
Revision: 020F
```

```
Manufacturer: NetApp
```

```
FRU Name: PSU
```

## **system controller flash-cache show**

Display the Flash Cache device status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache show` command displays the current Flash Cache device information.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, only status information for the matching node is displayed.

**[-slot <integer>] - Slot**

If this parameter is specified, only status information for the matching slot is displayed.

**[-subslot <integer>] - Subslot**

If this parameter is specified, only status information for the matching subslot is displayed.

**[-slot-string <text>] - Slot String**

If this parameter is specified, only status information for the matching slot is displayed. Format can be slot or slot-subslot.

**[-device-state**

**{ok|erasing|erased|failed|removed|online|offline\_failed|degraded|offline\_threshold}] - Device State**

If this parameter is specified, only status information for the matching device-state is displayed.

**[-model-number <text>] - Model Number**

If this parameter is specified, only status information for the matching model-number is displayed.

**[-part-number <text>] - Part Number**

If this parameter is specified, only status information for the matching part-number is displayed.

**[-serial-number <text>] - Serial Number**

If this parameter is specified, only status information for the matching serial-number is displayed.

**[-firmware-version <text>] - Firmware Version**

If this parameter is specified, only status information for the matching firmware-version is displayed.

**[-firmware-file <text>] - Firmware Filename**

If this parameter is specified, `firmware-file` is the base name of the firmware file located in `disk_fw` to update the device firmware.

**[-hardware-revision <text>] - Hardware Revision**

If this parameter is specified, only status information for the matching hardware-revision is displayed.

**[-capacity <integer>] - Capacity**

If this parameter is specified, only status information for the matching capacity is displayed.

**[-last-change-time <integer>] - Time Last State Change**

If this parameter is specified, only status information for the matching last-change-time is displayed.

**[-service-time <integer>] - Service Time**

If this parameter is specified, only status information for the matching service-time is displayed.

**[-percent-online <integer>] - Percent Online**

If this parameter is specified, only status information for the matching percent-online is displayed.

**[-average-erase-cycle-count <integer>] - Avg Erase Cycle Count**

If this parameter is specified, only status information for the matching average-erase-cycle-count is displayed.

**[-threshold-profile <text>] - Threshold Profile**

If this parameter is specified, only status information for the matching threshold-profile is displayed.

**Examples**

The following example displays the current state of all Flash Cache devices:

```
cluster1::> system controller flash-cache show
```

Device	Model	Part	Serial	Firmware	Capacity
Node	Slot	Number	Number	Version	(GB)
State					
-----					
node1					
	6-1	X9172A	119-00209	A22P7061550000004	NA00 4096 ok
	6-2	X9170A	119-00207	A22P5061550000135	NA00 1024 ok
node2					
	6-1	X9172A	119-00209	A22P7061550000007	NA00 4096 ok
	6-2	X9170A	119-00207	A22P5061550000091	NA00 1024 ok

4 entries were displayed.

**system controller flash-cache secure-erase run**

Perform a secure-erase operation on the targeted devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache secure-erase run` command securely erases the given Flash Cache device.

## Parameters

### **-node {<nodename>|local} - Node**

Selects the node of the specified Flash Cache devices.

### **-slot <text> - Slot**

Selects the slot or slot-subslot of the specified Flash Cache devices.

## Examples

The following example securely erases the selected Flash Cache device:

```
cluster1::> system controller flash-cache secure-erase -node node1 -slot 0-1
```

## system controller flash-cache secure-erase show

Display the Flash Cache card status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller flash-cache secure-erase show` command displays the current Flash Cache device secure-erase status.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

If this parameter is specified, only status information for the matching node is displayed.

### **[-slot <text>] - Slot**

If this parameter is specified, only status information for the matching slot is displayed. Slot can have a format of slot or slot-subslot.

### **[-device-state {ok|erasing|erased|failed|removed}] - Device State**

If this parameter is specified, only status information for the matching device-state is displayed.

## Examples

The following example displays the current state of all the Flash Cache devices:

```
cluster1::> system controller flash-cache secure-erase show
Node          Slot Device State
-----
node1
        6-1  ok
        6-2  erasing
node2

## system controller fru show-manufacturing-info

Display manufacturing information of FRUs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller fru show-manufacturing-info` command displays manufacturing information for field replaceable units (FRUs) installed in the system. The information includes FRU-description, serial number, part number, and revision number. To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays detailed information about the installed FRUs in the system.

**[-node {<nodename>|local}] - Node**

Selects a specific node's installed FRUs.

**[-system-sn <text>] - System Serial Number**

Selects information about installed FRUs with the specified system serial number.

**[-model-name <text>] - Model Name**

Selects information about installed FRUs with the specified model name.

**[-system-id <text>] - System ID**

Selects information about installed FRUs with the specified system ID.

**[-kernel-version <text>] - Kernel Version**

Selects information about installed FRUs with the specified kernel version.

**[-firmware-release <text>] - Firmware Release**

Selects information about installed FRUs with the specified firmware release.

**[-description <text>] - FRU Description**

Selects information about installed FRUs with the specified FRU description.

**[-fru-subtype <text>] - FRU Sub-type**

Selects information about the FRU with the specified FRU subtype.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-part-number <text>] - FRU Part Number**

Selects information about the FRU with the specified part number.

**[-revision <text>] - FRU Revision of Part Number**

Selects information about the FRU with the specified revision.

**[-manufacturer <text>] - FRU Manufacturer**

Selects information about the FRU with the specified manufacturer.

**[-manufacture-date <text>] - FRU Manufacturing Date**

Selects information about the FRU with the specified manufacture date.

**[-product-id <text>] - FRU Product Identifier**

Selects information about the FRU with the specified product ID.

**[-firmware-version <text>] - FRU Firmware Version**

Selects information about the FRU with the specified firmware version.

## Examples

The following example displays all installed FRUs in the system:

```
cluster1::> system controller fru show-manufacturing-info
Node: platsw-lodi-1-01
System Serial Number: 791541000047
      Model Name: FAS9040
      System ID: 0537024373
Firmware release: 10.0X18
      Kernel Version: NetApp Release sysMman_3887886_1608151712: Mon Aug
15
                        15:54:00 PDT 2016
FRU Description          FRU Serial Number          FRU Part Number          FRU
Rev.
```

## system controller fru show

### Display Information About the FRUs in the Controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system controller fru show` command displays information about all the controller specific Field Replaceable Units (FRUs) in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the FRUs in the cluster:

- Node
- FRU name
- Health monitor subsystem
- Health monitor status

To display more details, use the `-instance` parameter.

#### Parameters

**{ [-fields <fieldname>, ...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the controller specific FRUs in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the FRUs in the specified node.

**[-subsystem <Subsystem>] - Subsystem**

Selects information about the FRUs of the specified subsystem.

**[-serial-number <text>] - FRU Serial Number**

Selects information about the FRU with the specified serial number.

**[-fru-name <text>] - Name of the FRU**

Selects information about the FRU with the specified FRU name.

**[-type {controller|psu|fan|dimm|bootmedia|ioxm|nvram|nvdim}] - FRU Type**

Selects information about the FRU with the specified FRU type.

**[-name <text>] - FRU Name**

Selects information about the FRU with the specified unique name.

**[-state <text>] - FRU State**

Selects information about the FRU with the specified state.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the FRU with the specified health monitor status.

**[-display-name <text>] - Display Name for the Fru**

Selects information about the FRU with the specified display name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Monitor Name**

Selects information about the FRU with the specified health monitor type.

**[-model <text>] - Model Type**

Selects information about the FRU with the specified model.

**[-chassis-id <text>] - Chassis ID**

Selects information about the FRU with the specified chassis ID.

**[-location <text>] - Location of the FRU**

Selects information about the FRU with the specified FRU location.

**[-additional-info <text>] - Additional Information About the FRU**

Selects information about the FRU with the specified additional information.

## Examples

The example below displays information about all controller specific FRUs in the cluster.

```

cluster1::> system controller fru show
      Node          FRU Name          Subsystem
Status -----
-----
ok      node1          PSU1 FRU          Environment
ok      node1          PSU2 FRU          Environment
ok      node1          DIMM-NV1          Memory
ok      node1          DIMM-1          Memory
ok      node1          Micron Technology 0x655 (ad.0) Motherboard
ok
node2      PSU1 FRU          Environment      ok
      node2          PSU2 FRU          Environment
ok      node2          DIMM-NV1          Memory
ok      node2          DIMM-1          Memory
ok      node2          Micron Technology 0x655 (ad.0) Motherboard
ok
      10 entries were displayed.

```

The example below displays information about the specific FRU.

```

cluster1::> system controller fru show -instance -serial-number AD-01-
1306-2EA01E9A
      Node: node1
      Subsystem: Memory
      FRU Serial Number: AD-01-1306-2EA01E9A
      Name of the FRU: DIMM-1
      FRU Type: dimm
      FRU Name: DIMM-1
      FRU State: ok
      Status: ok
      Display Name for the Fru: DIMM-1
      Monitor Name: controller
      Model Type: none
      Chassis ID: 4591227214
      Location of the FRU: Memory Slot: 1
      Additional Information About the FRU: Part No: HMT82GV7MMR4A-H9

```

## system controller fru led disable-all

Turn off all the LEDs Data Ontap has lit

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller fru led disable-all` command turns off all the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

### Examples

Turn off all FRU fault LEDs.

```
cluster1::*> system controller fru led disable-all
14 entries were modified.
```

## system controller fru led enable-all

Light all the LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller fru led enable-all` command turns on all the controller and IOXM FRU fault

LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Examples

Turn on all FRU fault LEDs.

```
cluster1::*> system controller fru led enable-all
14 entries were modified.
```

## system controller fru led modify

Modify the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller fru led modify` command modifies the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on. Only the controller and IOXM internal FRU fault LEDs can be controlled by the end-user. The summary fault LEDs

are turned on and off based on the simple policy described above. If you want to turn off the summary fault LED, you must turn off all internal FRU fault LEDs.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis. In addition, internal FRU fault LEDs will remain on until explicitly turned off by the end-user, even after a FRU has been replaced.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the [system controller fru led show](#) command matches that specified on the FRU map label.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Selects FRU fault LEDs on the specified nodes.

**-fru-id <FRU LED key> - FRU ID (privilege: advanced)**

Selects the FRU fault LEDs that match the specified FRU type.

**-fru-slot <integer> - FRU Slot (privilege: advanced)**

Selects the FRU fault LEDs that match the specified slot.

**[-fru-state {on|off|unknown}] - FRU State (privilege: advanced)**

Specifies the target state for the FRU fault LED.

## Examples

Turn off DIMM 3's FRU fault LED.

```
cluster1::*> system controller fru led modify -node node1 -fru-id dimm
-fru-slot 3 -fru-state on
```

The example below turns on all PCI FRU fault LEDs.

```
cluster1::*> system controller led modify -node node1 -fru-id pci -fru
-slot * -fru-state on
```

## system controller fru led show

Display the status of FRU LEDs

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller fru led show` command displays information about the current state of the controller and IOXM FRU fault LEDs.

A FRU (Field Replaceable Unit) is any piece of the system that is designed to be easily and safely replaced by a field technician.

Both the controller and IOXM FRUs have a number of internal FRUs for which there are corresponding fault LEDs. In addition, there is a summary FRU fault LED on the external face-plate of both the controller and IOXM; labeled with a "!". A summary fault LED will be on when any of the internal FRU fault LEDs are on.

All FRU fault LEDs are amber in color. However, not all amber LEDs in the system are FRU fault LEDs. Externally visible fault LEDs are labeled with a "!" and internal FRU fault LEDs remain on, even when the controller or IOXM is removed from the chassis.

FRUs are identified by a FRU ID and slot tuple. FRU IDs include: DIMMs, cards in PCI slots, boot media devices, NV batteries and coin cell batteries. For each FRU ID, the FRUs are numbered 1 through N, where N is the number of FRUs of that particular type that exist in the controller or IOXM. Both controller and IOXM have a FRU map label for use in physically locating internal FRUs. The FRU ID/slot tuple used by the `system controller fru led show` command matches that specified on the FRU map label.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects FRU fault LEDs on the specified nodes.

**[-fru-id <FRU LED key>] - FRU ID (privilege: advanced)**

Selects the FRU fault LEDs that match the specified FRU type.

**[-fru-slot <integer>] - FRU Slot (privilege: advanced)**

Selects the FRU fault LEDs that match the specified slot.

**[-fru-bay <text>] - FRU Bay (privilege: advanced)**

Selects the FRU fault LEDs that match the specified bay.

**[-fru-state {on|off|unknown}] - FRU State (privilege: advanced)**

Selects the FRU fault LEDs that match the specified status.

**[-lit-by <text>] - Lit By (privilege: advanced)**

Selects the FRU fault LEDs that were lit by the specified source.

## Examples

List the current state of all FRU fault LEDs.

```
cluster1::*> system controller fru led show
```

Node	FRU Type	Bay	Slot	State	Lit By

5 entries were displayed.

The example below displays the status of only a specific FRU.

```
cluster1::*> system controller fru led show -node host1 -fru-id controller
-fru-slot 1
```

Node	FRU Type	Bay	Slot	State	Lit By
host1	controller	A	1	off	-

## system controller ioxm show

Displays IOXM Device Health Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller ioxm show` command displays the details of the IO expansion modules (IOXMs) that are connected to the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the IOXMs:

- Node name
- Display name
- Is IOXM present?
- Power status
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all the IOXMs.

**[-node {<nodename>|local}] - Node**

Selects the IOXM that is connected to the specified node.

**[-chassis-config {c-i|c-c|c-b}] - Controller-IOXM or Controller-Controller or Controller-Blank**

Selects the IOXMs with the specified chassis configuration.

**[-is-present {present|not-present}] - IOXM Presence**

Selects the IOXMs that are connected and detected (`present` ) or connected but not detected (`not-present` ).

**[-power {good|bad}] - Power to IOXM**

Selects the IOXMs with the specified power state.

**[-display-name <text>] - Display Name**

Selects the IOXMs with the specified display name.

**[-unique-name <text>] - Unique Name**

Selects the IOXM with the specified unique name.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the IOXMs with the specified health monitor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - IOXM Health**

Selects the IOXMs with the specified health monitor status.

## Examples

The example below displays the information of all the IOXMs that are connected to the nodes in a cluster.

```
cluster1::> system controller ioxm show
```

Node	Display Name	Is-Present?	Power	Status
node1	IOXM	present	good	ok
node2	IOXM	present	good	ok

The example below displays detailed information of an IOXM that is connected to a node.

```
cluster1::> system controller ioxm show -instance -node node1
Node: node1
Controller-IOXM or Controller-Controller or Controller-Blank: c-i
  IOXM Presence: present
  Power to IOXM: good
  Display Name: node1/IOXM
  Unique Name: 8006459930
Health Monitor Name: controller
  IOXM Health: ok
```

## system controller location-led modify

Modify the location LED state of a controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller location-led modify` command modifies the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

### Parameters

**-node {<nodename>|local} - Node**

Selects the location LED on the specified filers.

**[-state {on|off}] - LED State**

Modifies the state of the location LED on the filer.

### Examples

The following example turns on the location LED:

```
cluster1::*> system controller location-led modify -node node1 -state on
```

Turn off Location LED.

```
cluster1::*> system controller location-led modify -node node1 -state off
```

## system controller location-led show

Display the location LED state on controllers

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller location-led show` command shows the current state of the location LED. When lit, the location LED can help you find the controller in the data center.

There is a blue location LED on every controller and on the front of the chassis. When you turn on the location LED for either controller, the chassis location LED automatically turns on. When both controller location LEDs are off, the chassis location LED automatically turns off.

After the location LED is turned on, it stays illuminated for 30 minutes and then automatically shuts off.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the location LED on the specified filers.

**[-state {on|off}] - LED State**

Displays the location LED's status.

### Examples

The following example lists the current state of the location LED:

```
cluster1::*> system controller location-led show
Node                Location LED State
-----
node1               Off
node2               Off
```

## system controller memory dimm show

### Display the Memory DIMM Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller memory dimm show` command displays information about the DIMMs in all the nodes in the cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about all the DIMMs in the cluster:

- Node
- DIMM name
- Uncorrectable ECC error count
- Correctable ECC error count
- CECC Alert Method
- CPU socket
- Channel
- Slot number
- Health monitor status

To display more details, use the `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information about the DIMMs in all the controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the DIMMs in the specified node.

**[-pds-id <integer>] - DIMM ID**

Selects information about the DIMMs with the specified DIMM ID.

**[-slotname <text>] - Slot Name**

Selects information about the DIMMs with the specified slot name.

**[-socket <integer>] - CPU Socket**

Selects information about the DIMMs with the specified socket ID.

**[-channel <integer>] - Channel**

Selects information about the DIMMs with the specified channel number.

**[-slot-no <integer>] - Slot Number on a Channel**

Selects information about the DIMMs with the specified slot number.

**[-serial <text>] - Serial Number**

Selects information about the DIMMs with the specified serial number.

**[-part-no <text>] - Part Number**

Selects information about the DIMMs with the specified part number.

**[-cecc-count <integer>] - Correctable ECC Error Count**

Selects information about the DIMMs with the specified correctable ECC error count.

**[-uecc-count <integer>] - Uncorrectable ECC Error Count**

Selects information about the DIMMs with the specified uncorrectable ECC error count.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects information about the DIMMs with the specified health monitor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects information about the DIMMs with the specified health monitor status.

**[-name <text>] - Unique Name of DIMM**

Selects information about the DIMMs with the specified unique name.

**[-display-name <text>] - Display Name for the DIMM**

Selects information about the DIMMs with the specified display name.

**[-alt-cecc-method <text>] - CECC Alert Method**

Selects information about the DIMMs with the specified CECC error alert method.

**[-alt-cecc-dimm {true|false}] - Replace DIMM**

Selects information about the DIMMs with the specified replace DIMM value.

## Examples

The example below displays information about the DIMMs in all the nodes in the cluster.

```
cluster1::> system controller memory dimm show
```

		DIMM	UECC	CECC	Alert	CPU	
Slot		Name	Count	Count	Method	Socket	Channel
Number	Status						
-----							
	node1	DIMM-1	0	0	bucket	0	0
0	ok						
		DIMM-NV1	0	0	bucket	0	1
1	ok						
	node2	DIMM-1	1	0	bucket	0	0
0	ok						
	node3	DIMM-NV1	0	0	bucket	0	1
1	ok						

4 entries were displayed.

The example below displays detailed information about a specific DIMM in a specific controller.

```
cluster1::> system controller memory dimm show -instance -node node1 -pds
-id 1
```

```

Node: node1
DIMM ID: 1
Slot Name: DIMM-1
CPU Socket: 0
Channel: 0
Slot Number on a Channel: 0
Serial Number: AD-01-1306-2EA01E9A
Part Number: HMT82GV7MMR4A-H9
Correctable ECC Error Count: 0
Uncorrectable ECC Error Count: 0
Health Monitor Name: controller
Status: ok
Unique Name of DIMM: DIMM-1
Display Name for the DIMM: DIMM-1
CECC Alert Method: bucket
Replace DIMM: false

```

## system controller nvram-bb-threshold show

Display the controller NVRAM bad block threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller nvram-bb-threshold show` command displays the threshold for the NVRAM bad block counts for a node.

## system controller pci show

Display the PCI Device Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller pci show` command displays details of the PCI devices present in all of the nodes in a cluster. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported. By default, the command displays the following information about the PCI devices:

- Node name
- Display name
- Correctable error count
- Functional link width
- Functional link speed
- Health monitor status

To display more details, use the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed information for all of the PCI devices.

**[-node {<nodename>|local}] - Node**

Selects the PCI devices that are present in the specified node.

**[-bus-number <integer>] - Bus Number**

Selects the PCI devices with the specified bus number.

**[-device-number <integer>] - Device Number**

Selects the PCI devices with the specified device number.

**[-function-number <integer>] - Function Number**

Selects the PCI devices with the specified function number.

**[-slot-number <integer>] - Slot Info**

Selects the PCI devices with the specified slot number.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the PCI devices monitored by the specified health monitor.

**[-vendor-id <Hex Integer>] - Vendor ID**

Selects the PCI devices with the specified vendor ID.

**[-device-id <Hex Integer>] - Device ID**

Selects the PCI devices with the specified device ID.

**[-physical-link-width <integer>] - Physical Link Width**

Selects the PCI devices with the specified physical link width.

**[-functional-link-width <integer>] - Functional Link Width**

Selects the PCI devices with the specified functional link width.

**[-physical-link-speed <text>] - Physical Link Speed(GT/s)**

Selects the PCI devices with the specified physical link speed.

**[-functional-link-speed <text>] - Functional Link Speed(GT/s)**

Selects the PCI devices with the specified functional link speed.

**[-unique-name <text>] - Unique Name**

Selects the PCI devices with the specified unique name.

**[-corr-err-count <integer>] - Correctable Error Count**

Selects the PCI devices with the specified correctable error count.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the PCI devices with the specified health monitor status.

**[-display-name <text>] - Display Name**

Selects the PCI devices with the specified display name.

**[-cerr-diff <integer>] - Correctable Error Difference**

Selects the PCI devices with the specified difference in correctable error count.

## Examples

The example below displays the information about the PCIe devices present in all of the nodes in the cluster.

```
cluster1::> system controller pci show
```

Node	Display Name	Correctable Error Count	Functional Link Width	Functional Link Speed
cluster1-01	Ontap PCI Device 0	0	4	5GT/s
ok				
cluster1-02	Ontap PCI Device 4	0	4	5GT/s
ok				

The example below displays detailed information about a PCIe device in a node.

```
cluster1::> system controller pcie show -instance -node cluster1-01 -bus
-number 1
Node: cluster1-01
    Bus Number: 1
    Device Number: 0
    Function Number: 0
    Slot Info: 0
    Health Monitor Name: controller
    Vendor ID: 11f8
    Device ID: 8001
    Physical Link Width: 4
    Functional Link Width: 4
    Physical Link Speed(GT/s): 5GT/s
    Functional Link Speed(GT/s): 5GT/s
    Unique Name: ontap0@pci0:1:0:0
    Correctable Error Count: 0
    Status: ok
    Display Name: Ontap PCI Device 0
    Correctable Error Difference: 0
```

## system controller pcicerr threshold modify

### Modify the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system controller pcicerr threshold modify` command modifies node-wide PCIe correctable error threshold counts in the cluster.

## Parameters

### **[-pcie-cerr-threshold <integer>] - Corr. Error Limit**

The PCIe error threshold count that would trigger an alert if exceeded.

### **[-nvram-bb-threshold <integer>] - NVRAM Bad Block limit**

The NVRAM bad block threshold count that would trigger an alert if exceeded.

## Examples

The example below displays the information about setting node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller threshold modify -pcie-cerr-threshold 100
```

## **system controller pcicerr threshold show**

Display the Node PCIe error alert threshold

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller pcicerr threshold show` command displays information about node-wide PCIe correctable error threshold counts in the cluster.

## Examples

The example below displays the information about node-wide PCIe error threshold count in the cluster:

```
cluster1::> system controller pcicerr threshold show

PCIe Error Threshold
-----
                        200
```

## **system controller platform-capability show**

Display platform capabilities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller platform-capability show` command displays information about all platform capabilities for each controller in the cluster. By default, the command displays the following information about all controllers in the cluster:

- Controller Name

- Capability ID
- Capability Supported?
- Capability Name

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays detailed information about all controllers in the cluster.

**[-node {<nodename>|local}] - Node**

Selects information about the specified controller.

**[-capability-id <integer>] - Capability ID**

Selects the desired capability ID.

**[-supported <text>] - Supported?**

Selects the desired capability support state (true or false).

**[-name <text>] - Capability Name**

Selects the desired capability name.

## Examples

The following example displays platform capability information for the controller:

```
cluster1::> system controller platform-capability show
Node          Capability ID Supported? Capability Name
-----
or-099-diag-01
                0          false    CAP_CMCI_ENABLED
                1          false    CAP_HA_CONFIG_ONLY
                2          true     CAP_SUPPORT_CARD_FRU
                3          true     CAP_SCORPIO_EN
                4          false    CAP_NVD_EN
                5          false    CAP_ENABLE_HPET
                6          false    CAP_VERIFY_ACPI_TABLE
7 entries were displayed.
```

## system controller replace cancel

Cancel ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace cancel` command is used to cancel a controller replacement that is in a paused state (paused-on-request, paused-on-error or paused-for-intervention). The update cannot be canceled if it is not in a paused state.

## Examples

The following example displays a cancel operation:

```
cluster1::> system controller replace cancel
Warning: The controller replacement will be canceled and any changes will
have to be reverted manually.
Do you want to continue? {y|n}: y
Controller replacement canceled successfully.
```

## system controller replace pause

### Pause ongoing controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace pause` command is used to pause a currently running replacement. The operation pauses at the next predefined update stage (for example, after finishing the current task it will pause the next restartable task) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-on-request state.

## Examples

The following example displays pause operation:

```
cluster1::> system controller replace pause

A pause requested for Controller Replacement operation.
The current task will continue and the next restartable task will be
paused.
```

## system controller replace resume

### Resume paused controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system controller replace resume` command is used to resume an update that is currently in one

of paused-on-request, paused-on-error or paused-for-intervention states. If the update is not paused then an error is returned.

## Examples

The following example shows a resume operation:

```
cluster1::> system controller replace resume

Controller replacement resumed successfully.
```

## system controller replace show-details

Display detailed status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace show-details` command displays detailed information about the currently running and previously run non-disruptive controller replacement operations. The command displays the following information:

- Phase
- Node
- Task name
- Task status
- Error message

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-operation-identifier {None|Controller-replacement}] - Operation Identifier (privilege: advanced)**

Specifies the NDO operation identifier.

**[-task-identifier <integer>] - Task Identifier (privilege: advanced)**

Specifies the identification number of the task.

**[-node <nodename>] - Node That Performs Operation (privilege: advanced)**

Specifies the node that is to be replaced.

**[-task-phase {None|Initialization|Precheck|Commit|Collect-info|Preop|Resource-release|Verification|Resource-regain|Postop|Uncommit|Postcheck|Cleanup}] - Task Phase (privilege: advanced)**

Specifies the phase of the operation.

**[-task-name <text>] - Name of the Task (privilege: advanced)**

Specifies the name of the task.

**[-task-status {None|Ready-to-start|In-progress|Waiting|Paused-on-error|Paused-for-intervention|Paused-on-request|Completed-on-first-node|Completed|Failed|Pause\_req|Canceled}] - Status of the Task (privilege: advanced)**

Specifies the status of the task.

**[-task-error <text>] - Error During the Task Execution (privilege: advanced)**

Specifies the error occurred.

**[-task-recovery-action <text>] - Action to Recover from Error (privilege: advanced)**

Specifies the action to be taken in case of error.

## Examples

The following example displays detailed information about the non-disruptive replacement operation:

```

cluster1::*> system controller replace show-details
Task Phase      Node      Task Name      Operation-State
-----
Precheck        node1      Cluster Health Check Completed
                MCC Cluster Check Completed
                Aggr Relocation Completed
                Status Check
                Model Name Check Completed
                Cluster Quorum Check Completed
                Image Version Check Completed
                HA Status Check Completed
                Aggregate Status Completed
                Check
                Disk Status Check Completed
                Data LIF Status Check Completed
                Cluster LIF Status Completed
                Check
                ASUP Status Check Completed
                CPU Utilization Check Completed
                Aggr Reconstruction Completed
                Check
                Node Affinity Job Completed
                Check
Collect-info     node1      Verify Details  Paused-for-
intervention
                node2      Verify Details  Paused-for-
intervention
17 entries were displayed.

```

## system controller replace show

Display status of controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace show` command displays overall information about the currently running, or previously run controller replacement operation. The command displays the following information:

- Operation Status
- Error message
- Recommended action

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

## Examples

The following example displays information about automated nondisruptive operation:

```
cluster1::*> system controller replace show
Node           Status           Error-Action
-----
node1          Paused-for-intervention  Follow the instructions given
in
node2          None
Step Details:
-----
Controller replacement operation has been paused for user intervention.
Collect the following info from the current node:
  1. vserver services name-service dns show
  2. service-processor show -node * -instance
  3. network port ifgrp show
  4. network port vlan show
  5. network interface failover-groups show
  6. storage array config show -switch switchname
  7. storage encryption disk show
2 entries were displayed.
```

## system controller replace start

### Start controller replacement

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system controller replace start` command is used to initiate a controller-replacement operation. The update is preceded by a validation of the HA pair to ensure that any issues that might affect the update are identified.

There are predefined points in the update when the update can be paused (either requested by the user or by the operation in case of an error or for manual intervention).

## Parameters

**-nodes <nodename>,...** - Nodes for Controller Replacement (privilege: advanced)

Specifies the nodes that are to be replaced.

**[-simulate <true>]** - Simulate Controller Replacement (privilege: advanced)

Dry run the operation. Checks for all validations.

## Examples

The following example shows the replacement operation:

```
cluster1::> system controller replace start -nodes node1,node2 -simulate
true
```

Warning: 1. Current version of node is 9.4.0

Before starting controller replacement, please ensure that the new controllers are in the version 9.4.0

2. Verify that NVMEM or NVRAM batteries of the new nodes are charged, and charge them if they are not. You need to physically check the new nodes to see if

the NVMEM or NVRAM batteries are charged. You can check the battery status either by connecting to a console or using SSH, logging into the Service Processor

(SP) for your system, and use the system sensors to see if the battery has a sufficient charge.

Attention: Do not try to clear the NVRAM contents. If there is a need to clear the contents of NVRAM, contact NetApp technical support.

3. If you are replacing the controllers with an used one, please ensure to run wipeconfig before controller replacement

4. Current model name is FAS8040

Before starting the operation, please ensure that the new controller model is supported for controller replacement.

Do you want to continue? {y|n}: y

Controller replacement: Prechecks in progress.....

Controller replacement has been paused for user intervention.

Please collect the following info from the current node:

vserver services name-service dns show

network interface show -curr-node node -role cluster,intercluster,node-  
mgmt,cluster-mgmt

network port ifgrp show

network port vlan show

system node show -instance -node node

run -node node sysconfig

storage aggregate show -node node

volume show -node node

network interface failover-groups show

storage array config show -switch switchname

system license show -owner node

storage encryption disk show

# system controller service-event delete

Manually clear a selected service event

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller service-event delete` command removes the service event from the list and extinguishes all related FRU attention LEDs.

In some cases, where the underlying fault condition remains, the service event might be reported again, causing it to reappear in the list. In such cases, it is necessary to remedy the underlying fault condition in order to clear the service event.

## Parameters

**-node {<nodename>|local} - Node**

Selects service events on the specified nodes.

**-event-id <integer> - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row to delete. Use the [system controller service-event show](#) command to find the event identifier for the service event to delete.

## Examples

The following example lists the currently active service events. Then, using the listed Service Event ID, the service event is deleted:

```
cluster1::> system controller service-event show
```

Node	ID	Event Location	Event Description
plata4-1a	1	DIMM in slot 1 on Controller A	Uncorrectable ECC

```
cluster1::> system controller service-event delete -event-id 1
```

## Related Links

- [system controller service-event show](#)

# system controller service-event show

Display the active service events causing attention LEDs to be lit

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller service-event show` command displays one or more events that have been detected by the system for which a physical service action might be required. Physical service actions sometimes involve replacing or re-seating misbehaving FRUs. In such cases FRU attention LEDs will be illuminated to assist in physically locating the FRU in need of attention. When the FRU in question is contained within another FRU, both the inner and outer FRU attention LEDs will be lit. It creates a path of LEDs that starts at the chassis level and leads to the FRU in question. For example, if a DIMM is missing from the controller motherboard, the storage OS will detect this and log a service event whose location is the DIMM slot on the controller. The DIMM slot LED, controller LED and chassis LED will all be lit to create a path of LEDs to follow.

FRU Attention LEDs that are not visible from outside of the system (e.g. those on the controller motherboard such as DIMMs, boot device etc.) will remain on for a few minutes, even after power is removed from the containing FRU. As such, when the controller is removed from the chassis, a DIMM slot FRU attention LED will remain on, helping to locate the FRU in need of attention.

Generally, service events are cleared automatically when the issue is resolved. The corresponding FRU attention LEDs are extinguished accordingly. In cases where the service event request is caused by an environmental issue, it might be necessary to manually remove the service event from the list. This can be done using the [system controller service-event delete](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects service events on the specified nodes.

**[-event-id <integer>] - Service Event ID**

Selects the service events that match the specified event identifier. Together with the node, this field uniquely identifies the row for use with the [system controller service-event delete](#) command

**[-event-loc <text>] - Location**

Selects the service events that match the specified event location.

**[-event-desc <text>] - Description**

Selects the service events that match the specified event description.

**[-event-timestamp <text>] - Timestamp**

The time that the event occurred, recorded by the Service Processor

## Examples

The following example lists the currently active service events.

```
cluster1::> system controller service-event show
```

Node	ID	Event Location	Event Description
plata4-1a	1	DIMM in slot 1 on Controller A	Uncorrectable ECC

## system controller slot module insert

Add a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system controller slot module insert` command adds a module on the controller.

## Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

## Examples

The following example adds a module in the local node:

```
p2i030::> system controller slot module insert -node local -slot 1
```

```
Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be  
powered
```

```
on and initialized.
```

```
Do you want to continue? {y|n}:y
```

```
The module has been successfully powered on, initialized and placed into  
service.
```

```
p2i030::>
```

## system controller slot module remove

Remove a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller slot module remove` command removes a module on the controller.

### Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

**-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

### Examples

The following example removes a module in the local node:

```
p2i030::> system controller slot module remove -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
        powered off for removal.
Do you want to continue? {y|n}: y
The module has been successfully removed from service and powered off. It
can now be safely removed.

p2i030::>
```

## system controller slot module replace

Power off a module on the controller for replacement

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system controller slot module replace` command powers off a module on the controller for replacement.

### Parameters

**-node {<nodename>|local} - Node**

Selects the PCIe modules that are present in the specified node.

### **-slot <text> - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

### **Examples**

The following example powers off a module in the local node:

```
p2i030::> system controller slot module replace -node local -slot 1

Warning: IO_CARRIER_NIANTIC_NIC module in slot 1 of node p2i030 will be
powered
        off for replacement.
Do you want to continue? {y|n}: y
The module has been successfully powered off. It can now be safely
replaced. After the replacement module is inserted, use the "system
controller slot module insert" command to place the module into service.

p2i030::>
```

## **system controller slot module show**

Display hotplug status of a module on the controller

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller slot module show` command displays hotplug status of a module on the controller. The command displays the following information about the PCIe modules:

- Node
- Slot
- Module
- Status

To display more details, use the `-instance` parameter.

### **Parameters**

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node` {<nodename>|local}] - Node**

Selects the PCIe modules that are present in the specified node.

**[`-slot` <text>] - Slot Number**

Selects the PCIe modules present in the specified slot or slot-subslot combination.

**[`-status` <text>] - Module Status**

Selects hotplug status for PCIe modules.

**[`-card` <text>] - Module Name**

Selects module name for PCIe modules.

**Examples**

The following example displays hotplug status of PCI modules found in the local node:

```
::> system controller slot module show -node local
```

Node	Slot	Module	Status
localhost	1	IO_CARRIER_NIANTIC_NIC	powered-on
localhost	2	IO_4X_10GBT_INTL_NIC	powered-on
localhost	3	IO_4X_12Gb_PMC_SAS	powered-on
localhost	4	IO_4X_10GBE_16GFC_QLGC_CNA	powered-on
localhost	5	IO_4X_12Gb_PMC_SAS	powered-on
localhost	6	NVRAM10	hotplug-not-
supported			
localhost	6-1		empty
localhost	6-2		empty
localhost	7	IO_4X_12Gb_PMC_SAS	powered-on
localhost	8	IO_4X_10GBT_INTL_NIC	powered-on
localhost	9	IO_4X_12Gb_PMC_SAS	powered-on
localhost	10	IO_4X_12Gb_PMC_SAS	powered-on
localhost	11	IO_4X_12Gb_PMC_SAS	powered-on

13 entries were displayed.

```

**system controller sp config show**

Display the Service Processor Config Table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system controller sp config show` command displays the following configuration information of

the service processor for all nodes in the cluster:

- Node name
- Service processor status
- Service processor firmware version
- Booted firmware version
- Service processor configuration status
- Physical Ethernet link status of service processor
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

## Parameters

**{ [-fields <fieldname>, ...]**

Selects the field that you specify.

**| [-instance ] }**

Displays detailed configuration information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the service processor configuration of the specific node.

**[-version <text>] - Firmware Version**

Selects the service processor configuration with the specified firmware version.

**[-boot-version {primary|backup}] - Booted Version**

Selects the service processor configuration with the specified version of the currently booted partition.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the service processor configuration with the specified monitor name.

**[-sp-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - SP Status**

Selects the service processor configuration with the specified status of service processor.

**[-sp-config {true|false}] - Auto Update Configured**

Selects information about the service processor with the specified configuration status of the service processor.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the service processor configuration information with the specified service processor status.

**[-link-status {up|down|disabled|unknown}] - Public Link Status**

Selects the service processor configuration with the specified physical ethernet link status.

### **[-name <text>] - Display Name**

Selects the service processor configuration with the specified unique name.

### **Examples**

The example below displays configuration of the service processor in all the nodes in the cluster:

```
cluster1::> system controller sp config show
```

Node	Firmware Version	Booted Version	Auto Update Configured	SP Status	Link Status	Status
node1	2.2.2	primary	true	online	up	ok
node2	2.2.2	primary	true	online	up	ok

The example below displays configuration of the service processor of a particular node in detail:

```
cluster1::> system controller sp config show -instance -node node1
```

Node: node1  
Firmware Version: 2.2.2  
Booted Version: primary  
Health Monitor Name: controller  
SP Status: online  
Auto Update Configured: true  
Status: ok  
Public Link Status: up  
Display Name: SP Config

## **system controller sp upgrade show**

### **Display the Service Processor Upgrade Table**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system controller sp upgrade show` command displays the following information about the service processor firmware of all the nodes in the cluster:

- Node name
- Is new firmware available?
- Is autoupdate enabled?
- Status of autoupdate
- Health monitor status

To display more details, use the `-instance` parameter. These commands are available for 80xx, 25xx and later systems. Earlier models are not supported.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays detailed upgrade information of the service processor.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the upgrade information of the service processor on the specified node.

**[-new-fw-avail {true|false}] - New Firmware Available**

Selects the information of the service processors which have new firmware available.

**[-new-fw-version <text>] - New Firmware Version**

Selects the information about service processors with the specified firmware version.

**[-auto-update {true|false}] - Auto Update**

Selects the information about service processors with the specified state.

**[-auto-update-stat {installed|corrupt|updating|auto-updating|none}] - Auto Update Status**

Selects the information about service processors with the specified auto update status.

**[-auto-update-sttime <MM/DD/YYYY HH:MM:SS>] - Auto Update Start Time**

Selects the information about service processors with the specified start time.

**[-auto-update-entime <MM/DD/YYYY HH:MM:SS>] - Auto Update End Time**

Selects the information about service processors with the specified end time.

**[-auto-update-per <integer>] - Auto Update Percent Done**

Selects the information about service processors with the specified auto update percentage completed.

**[-auto-update-maxret <integer>] - Auto Update Maximum Retries**

Selects the information about service processors with the specified maximum number of retries.

**[-auto-update-curret <integer>] - Auto Update Current Retries**

Selects the information about service processors with the specified number of current retries.

**[-auto-update-prevstat {failed|passed}] - Previous AutoUpdate Status**

Selects the information about service processors with the specified automatic update status.

**[-monitor {node-connect|system-connect|system|controller|chassis|cluster-switch|example}] - Health Monitor Name**

Selects the information about service processors with the specified monitor name.

**[-status {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Status**

Selects the information about service processors with the specified health monitor status.

### **[-name <text>] - Display Name**

Selects the information about service processors with the specified display name.

### **Examples**

The example below displays service processor upgrade information for all nodes in the cluster:

```
cluster1::> system controller sp upgrade show
New    Firmware      Auto Update   Auto Update
Node   Available          Feature      Status        Status
----  -
node1  false              true         installed      ok
node2  false              true         installed      ok
2 entries were displayed.
```

The example below displays the detailed service processor upgrade information for a specific node:

```
cluster1::> system controller sp upgrade show -instance -node node1
Node: node1
    New Firmware Available: false
    New Firmware Version: Not Applicable
    Auto Update: true
    Auto Update Status: installed
    Auto Update Start Time: Thu Oct 20 20:06:03 2012 Etc/UTC
    Auto Update End Time: Thu Oct 20 20:09:19 2012 Etc/UTC
    Auto Update Percent Done: 0
    Auto Update Maximum Retries: 5
    Auto Update Current Retries: 0
    Previous AutoUpdate Status: passed
    Health Monitor Name: controller
    Status: ok
    Display Name: SP Upgrade
```

## **system feature-usage commands**

### **system feature-usage show-history**

#### **Display Feature Usage History**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

Display feature usage information in the cluster on a per-node and per-week basis.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays feature usage information for the specified node name.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays feature usage information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays feature usage information for the specified feature name.

**[-week-number <Sequence Number>] - Week Number**

Displays feature usage information for the specified week number.

**[-usage-status {not-used|configured|in-use|not-available}] - Usage Status**

Displays feature usage information that matches the specified usage status.

**[-date-collected <MM/DD/YYYY HH:MM:SS>] - Collection Date**

Displays feature usage information that is collected on the day matching the specified date.

**[-owner <text>] - Owner**

Displays feature usage information for the specified owner name.

**[-feature-message <text>] - Feature Message**

Displays feature usage information that contains the specified feature message.

## Examples

The following example displays a usage output filtered by the serial number and feature name:

```
cluster1::> system feature-usage show-history -serial-number 1-81-
00000000000000001122334455 -feature-name NFS
Node Serial Number: 1-81-00000000000000001122334455
Feature Name: NFS
Owner: node1
Week # Usage Status          Date Collected          Feature Message
-----
      4 in-use              01/22/13 10:00:00
      3 in-use              01/15/13 10:00:00
      2 not-used            01/08/13 10:00:00
      1 configured          01/01/13 10:00:00

4 entries were displayed.
```

## system feature-usage show-summary

### Display Feature Usage Summary

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Display usage summary information about features in the cluster on a per-node basis. The summary information includes counter information such as the number of weeks the feature was in use and the last date and time the feature was used. Additional information can also be displayed by using the *-instance* parameter.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the *-fields <fieldname>, ...* parameter, the command output also includes the specified field or fields. You can use *'-fields ?'* to display the fields to specify.

**| [-instance ] }**

If you specify the *-instance* parameter, the command displays detailed information about all fields.

**[-serial-number <Node Serial Number>] - Node Serial Number**

Displays usage summary information for the specified serial number.

**[-feature-name <Managed Feature>] - Feature Name**

Displays usage summary information for the specified feature name.

**[-weeks-in-use <integer>] - Weeks In-Use**

Displays usage summary information for features matching the number of weeks in use.

**[-last-used <MM/DD/YYYY HH:MM:SS>] - Date last used**

Displays usage summary information for features last used on the specified date.

### **[-owner <text>] - Owner**

Displays usage summary information for the specified owner name.

### **[-weeks-not-used <integer>] - Weeks Not Used**

Displays usage summary information for features matching the number of weeks not in use.

### **[-weeks-configured <integer>] - Weeks Configured**

Displays usage summary information for features matching the number of weeks that the feature was in configuration.

### **[-weeks-not-available <integer>] - Weeks Data Not Available**

Displays usage summary information for features matching the number of weeks when usage data was not available.

## **Examples**

The following example displays a usage summary output for a cluster of two nodes:

```
cluster1::> system feature-usage show-summary
Node Serial Number: 1-81-0000000000000001122334455
Owner: node1
Feature Name   Weeks In Use   Date Last Used
-----
CIFS           10 1/1/2013 23:27:49
NFS            15 1/8/2013 23:48:03

Node Serial Number: 1-81-0000000000000001122334466
Owner: node2
Feature Name   Weeks In Use   Date Last Used
-----
CIFS           10 1/1/2013 23:26:38
NFS            20 1/8/2013 23:46:48
4 entries were displayed.
```

## **system fru-check commands**

### **system fru-check show**

#### **Display Information About the FRUs in the Controller**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### **Description**

The `system fru-check show` command checks and displays the results of quick diagnostic tests done for certain FRUs of each controller in the cluster. The tests are not intended to be exhaustive, but simply to do a quick check of certain FRUs especially after replacement.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that have the specified name.

**| [-instance ] }**

Selects detailed information (if available) for all the FRUs.

**[-node {<nodename>|local}] - Node**

Selects the FRUs that belong to the node that has the specified name.

**[-serial-number <text>] - FRU Serial Number**

Selects the FRU matching the specified serial number.

**[-fru-name <text>] - FRU Name**

Selects the FRU matching the specified fru-name.

**[-fru-type {controller|dimm|bootmedia|nvram|nvdim}] - FRU Type**

Selects the FRUs of the specified type.

**[-fru-status {pass|fail|unknown}] - Status**

Selects the FRUs whose FRU check status matches that specified. "pass" indicates the FRU is operational. "fail" indicates the FRU is not operating correctly. "unknown" indicates a failure to obtain FRU information during the check.

**[-display-name <text>] - Display Name**

Selects the FRU matching the specified display name.

**[-location <text>] - Location**

Selects the FRUs whose location matches that specified. Example: Memory Slot: 1

**[-additional-info <text>] - Additional Info**

Selects the FRUs whose additional information matches that specified. Example: Part No: 69003140-I00-NTA-T

**[-reason <text>] - Details**

Selects the FRUs whose failure reason matches that specified.

## system ha commands

### system ha interconnect config show

Display the high-availability interconnect configuration information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

#### Description

The `system ha interconnect config show` command displays the high-availability interconnect device basic configuration information.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[-instance ] }**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[-transport <text>] - Interconnect Type (privilege: advanced)**

Selects the nodes that match this HA interconnect transport type.

**[-local-sysid <integer>] - Local System ID (privilege: advanced)**

Selects the nodes that match this local system unique identifier.

**[-partner-sysid <integer>] - Partner System ID (privilege: advanced)**

Selects the nodes that match this partner system unique identifier.

**[-initiator {local|partner}] - Connection Initiator (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the initiator of the connection request.

**[-port-name <text>,...] - Port (privilege: advanced)**

Selects the nodes that match this port name.

**[-ipaddress <text>,...] - IP Address (privilege: advanced)**

Selects the nodes that match this IP address.

**[-interface {backplane|external}] - Interface (privilege: advanced)**

Selects the nodes that match this parameter value. *external* means the HA interconnect links between partner nodes are connected externally. *backplane* means the HA interconnect links between partner nodes are connected over the backplane.

## Examples

The following example displays the HA interconnect configuration information on FAS8000 series nodes in the cluster:

```

cluster1::*> system ha interconnect config show
Node: ic-f8040-01
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875713
    Partner System ID: 536875678
    Connection Initiator: local
    Interface: backplane

Port    IP Address      Flags
----    -
ib0a    192.0.3.236      0x0
ib0b    192.0.3.237      0x0
Node: ic-f8040-02
    Interconnect Type: Infiniband (Mellanox ConnectX)
    Local System ID: 536875678
    Partner System ID: 536875713
    Connection Initiator: partner
    Interface: backplane

Port    IP Address      Flags
----    -
ib0a    192.0.3.96       0x0
ib0b    192.0.3.97       0x0

2 entries were displayed.

```

The following example displays the HA interconnect configuration information on FAS2500 series nodes in the cluster:

```
cluster1::*> system ha interconnect config show
Node: ic-f2554-03
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1781036608
    Partner System ID: 1780360209
    Connection Initiator: local
    Interface: backplane
```

Port	IP Address	Flags
----	-----	-----
ib0a	ib0a	-

```
Node: ic-f2554-04
    Interconnect Type: Infiniband (Mellanox Sinai)
    Local System ID: 1780360209
    Partner System ID: 1781036608
    Connection Initiator: partner
    Interface: backplane
```

Port	IP Address	Flags
----	-----	-----
ib0a	ib0a	-

2 entries were displayed.

## system ha interconnect link off

Turn off the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect link off` command turns off the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn off the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn off the link.

### Parameters

#### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies the node on which the interconnect link is to be turned off. The value "local" specifies the current node.

#### **-link {0|1} - Link (privilege: advanced)**

This mandatory parameter specifies the interconnect link number (0-based) to turn off.

## Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

Error: command failed: Invalid link value 0. Specify 1.

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 0

cluster1::*> system ha interconnect link off -node ic-f3250-02 -link 1
```

## system ha interconnect link on

Turn on the interconnect link

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect link on` command turns on the specified link on the high-availability interconnect device. For the nodes in the cluster with two external high-availability interconnect links, you must specify the link number (0-based) to turn on the specified link. For the nodes in the cluster with interconnect links over the backplane, you must specify the link number 1 to turn on the link.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies the node on which the interconnect link is to be turned on. The value "local" specifies the current node.

**-link {0|1} - Link (privilege: advanced)**

This mandatory parameter specifies the interconnect link number (0-based) to turn on.

## Examples

The following example displays output of the command on the nodes with a single interconnect link or nodes with interconnect links over the backplane:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0

Error: command failed: Invalid link value 0. Specify 1.

cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

The following example displays output of the command on the nodes with two interconnect links connected externally:

```
cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 0

cluster1::*> system ha interconnect link on -node ic-f3250-02 -link 1
```

## system ha interconnect ood clear-error-statistics

### Clear error statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect ood clear-error-statistics` command enables you to clear all the error statistics collected for the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the error statistics cleared. The value "local" specifies the current node.

### Examples

```
cluster1::*> system ha interconnect ood clear-error-statistics -node ic-
f2554-03
```

## system ha interconnect ood clear-performance-statistics

### Clear performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect ood clear-performance-statistics` command enables you to clear all the performance statistics collected for the out-of-order delivery-capable high-availability interconnect

device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the performance statistics cleared. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood clear-performance-statistics -node  
ic-f2554-03
```

## **system ha interconnect ood disable-optimization**

Disable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood disable-optimization` command disables the optimization capability on the high-availability interconnect device. The command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the optimization disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-optimization -node ic-  
f2554-03
```

## **system ha interconnect ood disable-statistics**

Disable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood disable-statistics` command disables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the statistics collection disabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood disable-statistics -node ic-f2554-03
```

## **system ha interconnect ood enable-optimization**

Enable coalescing work requests

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood enable-optimization` command enables you to turn on optimization (coalescing out-of-order delivery requests) on the high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the optimization enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-optimization -node ic-f2554-03
```

## **system ha interconnect ood enable-statistics**

Enable detailed statistics collection

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood enable-statistics` command enables collection of the statistics on the out-of-order delivery-capable high-availability interconnect device. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will have the statistics collection enabled. The value "local" specifies the current node.

## Examples

```
cluster1::*> system ha interconnect ood enable-statistics -node ic-f2554-03
```

## **system ha interconnect ood send-diagnostic-buffer**

Send diagnostic buffer to partner

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood send-diagnostic-buffer` command enables you to run a short out-of-order delivery diagnostic test. The command sends a buffer to the partner controller over the high-availability interconnect. This command is only supported on FAS2500 series nodes in the cluster.

## Parameters

### **-node <nodename> - Node (privilege: advanced)**

This mandatory parameter specifies which node will send the diagnostic buffer to its partner. The value "local" specifies the current node.

## Examples

The following example demonstrates how to use this command to send a diagnostic buffer to the partner:

```
cluster1::*> system ha interconnect ood send-diagnostic-buffer -node ic-f2554-03
```

## **system ha interconnect ood status show**

Display the high-availability interconnect device out-of-order delivery (OOD) information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system ha interconnect ood status show` command displays configuration information of the out-of-order delivery-capable high-availability interconnect devices. This command is supported only on FAS2500 series nodes in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**| [-instance ] }**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[-is-ood-enabled {true|false}] - Is OOD Enabled (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-is-coalescing-enabled {true|false}] - Is Coalescing Enabled (privilege: advanced)**

Selects the nodes that match this parameter value.

## Examples

The following example displays the HA interconnect device out-of-order delivery configuration information on FAS2500 series nodes in the cluster.

```
cluster1::*> system ha interconnect ood status show
Node: ic-f2554-03
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
Node: ic-f2554-04
    NIC Used: 0
    Is OOD Enabled: true
    Is Coalescing Enabled: true
2 entries were displayed.
```

## system ha interconnect port show

Display the high-availability interconnect device port information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect port show` command displays the high-availability interconnect device port physical layer and link layer status information.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**| [-instance ] }**

Use this parameter to display all the fields from all nodes in the cluster.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[-link-monitor {on|off}] - Link Monitor Detection (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port <integer>,...] - Port Number (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-phy-layer-state {invalid|sleep|polling|disabled|port-configuration-testing|linkup|link-error-recovery|phytest|reserved}] - Physical Layer State (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-link-layer-state {invalid|down|initialize|armed|active|reserved}] - Link Layer State (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-phy-link-up-count <integer>,...] - Physical Link Up Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned up.

**[-phy-link-down-count <integer>,...] - Physical Link Down Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is total number of times the link on a given port is transitioned down.

**[-is-active-link {true|false}] - Is the Link Active (privilege: advanced)**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

## Examples

The following example displays the HA interconnect device port information on FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect port show
```

	Link		Physical Layer	Link Layer	Physical	Physical
Active						
Node	Monitor	Port	State	State	Link Up	Link Down
Link						
-----	-----	----	-----	-----	-----	-----
-----						
ic-f8040-01	on					
		0	linkup	active	1	0
true		1	linkup	active	1	0
false						
ic-f8040-02	on					
		0	linkup	active	1	0
true		1	linkup	active	1	0
false						

2 entries were displayed.

## system ha interconnect statistics clear-port-symbol-error

Clear the high-availability interconnect port symbol errors

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics clear-port-symbol-error` command clears the high-availability interconnect device port symbol errors. This command is supported only on FAS2500 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics show -object ic\\_hw\\_port\\_stats](#) command.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

Selects the nodes that match this parameter value.

### Examples

```
cluster1::*> system ha interconnect statistics clear-port-symbol-error
-node ic-f2554-03
```

## Related Links

- [statistics show](#)

## system ha interconnect statistics clear-port

Clear the high-availability interconnect port counters

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics clear-port` command clears the high-availability interconnect device port statistics. This command is supported only on FAS2500 series and FAS8000 series nodes in the cluster.

To display the high-availability interconnect device port statistics, use the [statistics show -object ic\\_hw\\_port\\_stats](#) command.

### Parameters

**-node <nodename> - Node (privilege: advanced)**

Selects the nodes that match this parameter value.

### Examples

```
cluster1::*> system ha interconnect statistics clear-port -node ic-f8040-01
```

## Related Links

- [statistics show](#)

## system ha interconnect statistics show-scatter-gather-list

Display the high-availability interconnect scatter-gather list entry statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics show-scatter-gather-list` command displays the high-availability interconnect device scatter-gather list entry statistics. Out of all possible 32 entries in a scatter-gather list, the command displays only the entries that have valid data.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**[ -instance ] }**

Use this parameter to display all the fields from all nodes in cluster.

**[ -node {<nodename>|local} ] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[ -sge <integer>,... ] - Scatter-Gather Entry (privilege: advanced)**

Selects the nodes that match this scatter-gather element index value.

**[ -total-count <integer>,... ] - Total Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times a particular scatter-gather list element is used.

**[ -total-size <integer>,... ] - Total Size (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of bytes written by the high-availability interconnect device using a particular scatter-gather list element.

## Examples

```
cluster1::*> system ha interconnect statistics show-scatter-gather-list
Node: ic-f8040-01
```

Entry	Count	Size
1	410925	77344493
2	988	1246987
3	72	747325
4	93264	1527155579
8	9	294912
9	9	294912

```
Node: ic-f8040-02
```

Entry	Count	Size
1	1544405	310004390
2	6217	16779908
3	1222	12003411
4	338606	5543436659

## system ha interconnect statistics performance show

Display the high-availability interconnect device performance statistics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect statistics performance show` command displays the high-availability interconnect device performance statistics.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**| [-instance ] }**

Use this parameter to display all the fields from all nodes in cluster.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields from the specified node in the cluster.

**[-elapsed <integer>] - Elapsed Time (secs) (privilege: advanced)**

Selects the nodes that match this parameter value. Displays the total elapsed time between statistics collection start time to end time. During the initialization stage, statistics collection starts when the partner node is up and ready. After the initialization stage, the statistics collection start time is reset after every execution of this command. This means that after the initialization stage, elapsed time represents the time between current command execution and previous command execution.

**[-qmax-wait <integer>] - Maximum Queue Wait Count (privilege: advanced)**

Selects the nodes that match this wait value. The queue maximum wait value is the total number of times the interconnect device waited to post requests on the send queue.

**[-qmax-wait-time <integer>] - Average Queue Wait Time (usecs) (privilege: advanced)**

Selects the nodes that match this average wait time value. The queue maximum wait time is the average amount of time the interconnect device waited to post requests on the send queue.

**[-qmax-timeout <integer>] - Maximum Queue Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The queue maximum timeout value is the total number of times the interconnect device timed out waiting to post requests on the send queue.

**[-preempt-timeout <integer>] - Preempt Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID is preempted.

**[-nonpreempt-timeout <integer>] - Non-Preempt Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times polling on the given transfer ID stopped due to interconnect device read/write timeout.

**[-notify-timeout <integer>] - Notify Timeouts (privilege: advanced)**

Selects the nodes that match this parameter value. The timeout value is the total number of times data transfer on the HA interconnect timed out.

**[-avg-rnv-msgs-time <integer>] - Remote NV Messages Average Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time between remote NV messages.

**[-rnv-transfers <integer>] - Total Remote NV Transfers (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of remote NV transfers attempted.

**[-avg-rnv-transfer-size <integer>] - Remote NV Average Transfer Size (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average remote NV message transfer size.

**[-avg-rnv-transfer-time <integer>] - Remote NV Transfers Average Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average transfer time taken by remote NV messages.

**[-ic-waits <integer>] - Total Count of IC waits for Given ID (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waits until the transfer of a given ID is successful.

**[-ic-waitdone-time <integer>] - Average IC Waitdone Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent waiting for the IDs to be transferred successfully.

**[-ic-isdone <integer>] - Total IC isdone Checks (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect client checked for the completion of a given transfer ID.

**[-ic-isdone-pass <integer>] - Total IC isdone Checks Success (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is successful.

**[-ic-isdone-fail <integer>] - Total IC isdone Checks Failed (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the check for the completion of a given transfer ID is not successful.

**[-ic-small-writes <integer>] - IC Small Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of <4K size writes performed by the interconnect device.

**[-ic-4k-writes <integer>] - IC 4K Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 4K size writes performed by the interconnect device.

**[-ic-8k-writes <integer>] - IC 8K Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 8K size writes performed by the interconnect device.

**[-ic-16k-writes <integer>] - IC 16K+ Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of 16K or more size writes performed by the interconnect device.

**[-ic-xorder-writes <integer>] - IC XORDER Writes (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of out-of-order writes performed by the interconnect device.

**[-ic-xorder-reads <integer>] - IC XORDER Reads (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of out-of-order reads performed by the interconnect device.

**[-rdma-read <integer>] - RDMA Reads Count (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of RDMA reads performed by the interconnect device.

**[-rdma-read-waitdone-time <integer>] - Average IC Waitdone RDMA-READ Time (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time the interconnect device spent polling for transfer IDs on the RDMA-read channel.

**[-avg-mbytes-second <text>] - Average MegaBytes Transferred per second (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average megabytes (MB) transferred per second.

**[-avg-bytes-transfer <integer>] - Average Bytes per Transfer (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average amount of bytes sent per transfer.

**[-total-transfers <integer>] - Total Transfers (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of transfers made through the interconnect device.

**[-avg-nvlog-sync-time <integer>] - Average Time for NVLOG Sync (msecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average time taken to sync NVLOG between HA partner nodes.

**[-max-nvlog-sync-time <integer>] - Maximum Time for NVLOG Sync (msecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the maximum time taken to sync NVLOG between HA partner nodes.

**[-max-sgl-length <integer>] - Maximum Scatter-Gather Elements in a List (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the maximum length of the scatter-gather list supported by the interconnect device.

**[-ic-recq-waits <integer>] - Total Receive Queue Waits to Post Buffer (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the total number of times the interconnect device waited to post an empty buffer into the receive queue.

**[-avg-recq-wait-time <integer>] - Average Time Receive Queue Waited (usecs) (privilege: advanced)**

Selects the nodes that match this parameter value. The value is the average amount of time the interconnect device waited to post an empty buffer into the receive queue.

## Examples

The following example displays the HA interconnect device performance statistics for FAS8000 series nodes in the cluster:

```
cluster1::*> system ha interconnect statistics performance show

## system ha interconnect status show

Display the high-availability interconnect connection status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system ha interconnect status show` command displays the high-availability interconnect connection status. Connection status information displayed by this command varies by controller model. For nodes with two HA interconnect links over the backplane or connected externally, this command displays the following information:

- Node
- Link status on the first port
- Link status on the second port
- Is the link on first port active?
- Is the link on second port active?
- Interconnect RDMA status

For nodes with a single HA interconnect link, this command displays following the information:

- Node
- Link status
- Interconnect RDMA status

Running the command with the `-instance` or `-node` parameter displays detailed information about the interconnect device and its ports.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

**| [-instance ] }**

Use this parameter to display all the fields for the specified node or all the nodes.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display all the fields for the specified node.

**[-link-status {up|down}] - Link Status (privilege: advanced)**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-link0-status {up|down}] - Link 0 Status (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-link1-status {up|down}] - Link 1 Status (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means link is online.

**`[-ic-rdma {up|down}] - IC RDMA Connection (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *up* means active interconnect connection with its partner.

**`[-is-link0-active {true|false}] - Is Link 0 Active (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

**`[-is-link1-active {true|false}] - Is Link 1 Active (privilege: advanced)`**

Selects the nodes that match this parameter value. The value *true* means the interconnect data channels are established on this link.

**`[-slot <integer>] - Slot Number (privilege: advanced)`**

Selects the nodes that match this PCI slot number.

**`[-driver-name <text>] - Driver Name (privilege: advanced)`**

Selects the nodes that match this interconnect device driver name.

**`[-firmware <text>] - Firmware Revision (privilege: advanced)`**

Selects the nodes that match this firmware version.

**`[-version <text>] - Version Number (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-device-type <text>] - Device Type (privilege: advanced)`**

Selects the nodes that match this interconnect device type.

**`[-serial-number <text>] - Serial Number (privilege: advanced)`**

Selects the nodes that match this interconnect device serial number.

**`[-debug-firmware {yes|no}] - Debug Firmware (privilege: advanced)`**

Selects the nodes that match this parameter value.

**`[-command-revision <integer>] - Command Revision (privilege: advanced)`**

Selects the nodes that match this interconnect device command revision.

**`[-hardware-revision <integer>] - Hardware Revision (privilege: advanced)`**

Selects the nodes that match this interconnect device hardware revision.

**`[-port1 <integer>] - Port Number 1 (privilege: advanced)`**

Selects the nodes that match this parameter value.

**[-port1-port-name <text>] - Port Name (privilege: advanced)**

Selects the nodes that match this port name.

**[-port1-gid <text>] - Global Identifier (privilege: advanced)**

Selects the nodes that match this global identifier value.

**[-port1-base-lid <text>] - Base Local Identifier (privilege: advanced)**

Selects the nodes that match this base local identifier value.

**[-port1-rm-lid <text>] - Remote Local Identifier (privilege: advanced)**

Selects the nodes that match this remote local identifier value.

**[-port1-mtu <integer>] - Maximum Transmission Unit (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port1-data-rate <text>] - Data Rate (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port1-link-info <text>] - Link Information (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port1-qsfp-vendor <text>] - QSFP Vendor (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[-port1-qsfp-part-number <text>] - QSFP Part Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part-number.

**[-port1-qsfp-type <text>] - QSFP Type (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[-port1-qsfp-serial-number <text>] - QSFP Serial Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

**[-port2 <integer>] - Port Number 2 (privilege: advanced)**

Selects the nodes that match this parameter value.

**[-port2-port-name <text>] - Port Name (privilege: advanced)**

Selects the nodes that match this port name.

**[-port2-gid <text>] - Global Identifier (privilege: advanced)**

Selects the nodes that match this global identifier value.

**[-port2-base-lid <text>] - Base Local Identifier (privilege: advanced)**

Selects the nodes that match this base local identifier value.

**[-port2-rm-lid <text>] - Remote Local Identifier (privilege: advanced)**

Selects the nodes that match this remote local identifier value.

**[`-port2-mtu <integer>`] - Maximum Transmission Unit (privilege: advanced)**

Selects the nodes that match this parameter value.

**[`-port2-data-rate <text>`] - Data Rate (privilege: advanced)**

Selects the nodes that match this parameter value.

**[`-port2-link-info <text>`] - Link Information (privilege: advanced)**

Selects the nodes that match this parameter value.

**[`-port2-qsfp-vendor <text>`] - QSFP Vendor (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) vendor name.

**[`-port2-qsfp-part-number <text>`] - QSFP Part Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) part number.

**[`-port2-qsfp-type <text>`] - QSFP Type (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) type.

**[`-port2-qsfp-serial-number <text>`] - QSFP Serial Number (privilege: advanced)**

Selects the nodes that match this QSFP (Quad Small Form-factor Pluggable) serial number.

## Examples

The following example displays status information about the HA interconnect connection on FAS8000 series nodes with two HA interconnect links in the cluster:

```
cluster1::*> system ha interconnect status show
Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
Node: ic-f8040-02
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
2 entries were displayed.
```

The following example displays status information about the HA interconnect connection on FAS2500 series nodes with a single HA interconnect link in the cluster:

```

cluster1::*> system ha interconnect status show
Node: ic-f2554-01
    Link Status: up
    IC RDMA Connection: up
Node: ic-f2554-02
    Link Status: up
    IC RDMA Connection: up
2 entries were displayed.

```

The following example displays detailed information about the HA interconnect link when parameters like `-instance`, `-node` are used with the ``system ha interconnect status show`` command

```

cluster1::*> system ha interconnect status show -instance -node ic-f8040-01
Node: ic-f8040-01
    Link 0 Status: up
    Link 1 Status: up
    Is Link 0 Active: true
    Is Link 1 Active: false
    IC RDMA Connection: up
        Slot: 0
        Driver Name: IB Host Adapter i0 (Mellanox ConnectX MT27518
rev. 0)
        Firmware: 2.11.534
        Debug Firmware: no

Interconnect Port 0 :
    Port Name: ib0a
        GID: fe80:0000:0000:0000:00a0:9800:0030:33ec
        Base LID: 0x3ec
        MTU: 4096
        Data Rate: 40 Gb/s (4X) QDR
    Link Information: ACTIVE

Interconnect Port 1 :
    Port Name: ib0b
        GID: fe80:0000:0000:0000:00a0:9800:0030:33ed
        Base LID: 0x3ed
        MTU: 4096
        Data Rate: 40 Gb/s (4X) QDR
    Link Information: ACTIVE

```

# system health commands

## system health alert delete

Delete system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health alert delete` command deletes all the alerts on the cluster with the specified input parameters.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to delete alerts generated on a cluster only on the node you specify.

**-monitor <hm\_type> - Monitor**

Use this parameter to delete alerts generated on a cluster only on the monitor you specify.

**-alert-id <text> - Alert ID**

Use this parameter to delete alerts generated on a cluster only on the alert ID you specify.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to delete alerts generated on a cluster on the alerting resource you specify.

### Examples

This example shows how to delete an alert with the specified alert-id:

```
cluster1::> system health alert delete -alert-id DualPathToDiskShelf_Alert
-alerting-resource *
```

## system health alert modify

Modify system health alert

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health alert modify` command suppresses alerts generated on the cluster and sets the acknowledgement state for an alert.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to change the state.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name on which you want to change the state.

**-alert-id <text> - Alert ID**

Use this parameter to specify the alert ID on which you want to change the state.

**-alerting-resource <text> - Alerting Resource**

Use this parameter to specify the alerting resource name on which you want to change the state.

**[-acknowledge {true|false}] - Acknowledge**

Use this parameter to set the acknowledgement state to true or false.

**[-suppress {true|false}] - Suppress**

Use this parameter to set the suppress state to true or false.

**[-acknowledger <text>] - Acknowledger**

Use this parameter to set the acknowledged as the filter for setting state.

**[-suppressor <text>] - Suppressor**

Use this parameter to set the suppressor as the filter for setting state.

**Examples**

This example modifies the alert field states on the cluster:

```
cluster1:> system health alert modify -node * -alert-id
DualPathToDiskShelf_Alert -suppress true
```

**system health alert show****View system health alerts**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system health alert show` command displays information about all the alerts generated on the system. Using `-instance` will add detailed information.

**Parameters**

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Displays the following additional information about each alert:

- Node name

- Resource name
- Severity of the alert
- Time of alert generation
- Suppress state of the alert
- Acknowledge state of the alert
- Probable cause for the alert
- Possible effect due to the alert
- Recommended corrective actions to follow

**[-node {<nodename>|local}] - Node**

Selects the alerts generated for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alerts with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Selects the alerts with the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Selects the alerts with the specified alerting resource name.

**[-subsystem <hm\_subsystem>] - Subsystem**

Selects the alerts generated on the monitoring subsystem.

**[-indication-time <Date>] - Indication Time**

Selects the alerts with the specified indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Selects the alerts with the perceived severity level.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alerts that contain the specified probable cause.

**[-probable-cause-description <text>] - Description**

Selects the alerts containing the specified probable cause description.

**[-corrective-actions <text>] - Corrective Actions**

Selects the alerts with the specified recommended corrective action.

**[-possible-effect <text>] - Possible Effect**

Selects the alerts with the specified possible effect.

**[-acknowledge {true|false}] - Acknowledge**

Selects the alerts with the specified acknowledgement status.

**[-suppress {true|false}] - Suppress**

Selects the alerts with the specified suppressor field status of true or false.

**[-policy <text>] - Policy**

Selects the alerts with the specified policy name.

**[-acknowledger <text>] - Acknowledger**

Selects the alerts with the specified acknowledger field.

**[-suppressor <text>] - Suppressor**

Selects the alerts with the specified suppressor field.

**[-additional-info <text>,...] - Additional Information**

Selects the alerts with the specified additional information.

**[-alerting-resource-name <text>] - Alerting Resource Name**

Selects the alerts with the specified alerting resource name.

**[-tags <hm\_alert\_type>,...] - Additional Alert Tags**

Selects the alerts with the specified keywords.

**Examples**

The example below displays information about all the alerts generated in the cluster:

```
cluster1::> system health alert show
Node: node1
    Resource: Shelf ID 2
    Severity: Major
    Suppress: false
    Acknowledge: false
    Tags: quality-of-service, nondisruptive-upgrade
    Probable Cause: Disk shelf 2 does not have two paths to controller
                    node1.
    Possible Effect: Access to disk shelf 2 via controller node1 will be
                    lost with a single hardware component failure (e.g.
                    cable, HBA, or IOM failure).
    Corrective Actions: 1. Halt controller node1 and all controllers attached
                        to disk shelf 2.
                        2. Connect disk shelf 2 to controller node1 via two
                        paths following the rules in the Universal SAS and ACP Cabling Guide.
                        3. Reboot the halted controllers.
                        4. Contact support personnel if the alert persists.
```

The example below displays additional information about a specific alert generated in the cluster:

```

cluster1::> system health alert show -monitor node-connect -alert-id
DualPathToDiskShelf_Alert -instance
Node: node1
    Monitor: node-connect
    Alert ID: DualPathToDiskShelf_Alert
    Alerting Resource: 50:05:0c:c1:02:00:0f:02
    Subsystem: SAS-connect
    Indication Time: Mon Mar 21 10:26:38 2011
    Perceived Severity: Major
    Probable Cause: Connection_establishment_error
    Description: Disk shelf 2 does not have two paths to controller
node1.
    Corrective Actions: 1. Halt controller node1 and all controllers
attached to disk shelf 2.
                        2. Connect disk shelf 2 to controller node1 via
two paths following the rules in the Universal SAS and ACP Cabling Guide.
                        3. Reboot the halted controllers.
                        4. Contact support personnel if the alert
persists.
    Possible Effect: Access to disk shelf 2 via controller node1 will
be lost with a single hardware component failure (e.g. cable, HBA, or IOM
failure).
    Acknowledge: false
    Suppress: false
    Policy: DualPathToDiskShelf_Policy
    Acknowledger: -
    Suppressor: -
    Additional Information: Shelf uuid: 50:05:0c:c1:02:00:0f:02
                        Shelf id: 2
                        Shelf Name: 4d.shelf2
                        Number of Paths: 1
                        Number of Disks: 6
                        Adapter connected to IOMA:
                        Adapter connected to IOMB: 4d
    Alerting Resource Name: Shelf ID 2
    Additional Alert Tags: quality-of-service, nondisruptive-upgrade

```

## system health alert definition show

Display system health alert definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system health alert definition show` command displays information about the various alerts defined in the system health monitor policy file. Using `-instance` will display additional details.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields that you specify.

**| [-instance ] }**

Use this parameter to display additional information on each alert definition.

- Node name
- Monitor name
- Subsystem identifier
- Alert ID
- Severity of the alert
- Probable cause
- Probable cause description
- Possible effect due the error state
- Recommended corrective actions to be followed
- Any additional information
- Additional alert tags

**[-node {<nodename>|local}] - Node**

Selects the alert definitions for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects the alert definitions with the specified monitor name.

**[-alert-id <text>] - Class of Alert**

Selects the alert definitions with the specified alert identifier.

**[-perceived-severity <hm\_perceived\_sev>] - Severity of Alert**

Selects the alert definitions with the specified perceived severity.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Selects the alert definitions with the specified probable cause of the alert.

**[-probable-cause-description <text>] - Probable Cause Description**

Selects the alert definitions with the specified probable cause description.

**[-possible-effect <text>] - Possible Effect**

Selects the alert definitions with the specified possible effect.

### **[-corrective-actions <text>] - Corrective Actions**

Selects the alert definitions with the specified corrective action.

### **[-subsystem <hm\_subsystem>] - Subsystem Name**

Selects the alert definitions with the specified subsystem.

### **[-additional-information <text>] - Additional Relevant Data**

Selects the alert definitions with the specified additional information.

### **[-tags <hm\_alert\_type>,...] - Additional Alert Tags**

Selects the alert definitions with the specified keywords.

## **Examples**

The example below displays information about all the definitions in the alert definition file:

```
cluster1::> system health alert definition show
Node           Monitor           Subsystem           Alert ID
-----
node-01        system-connect       SAS-connect
DualControllerNonHa_

Alert
Severity: Major
Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected
to
two controllers
$(sschm_shelf_info.connected-nodes)) that are
not an HA pair.
Possible Effect: Access to disk shelf $(sschm_shelf_info.id)
may
be lost with a single controller failure.
Corrective Actions: 1. Halt all controllers that are connected to
disk shelf $(sschm_shelf_info.id).
2. Connect disk shelf $(sschm_shelf_info.id)
to both HA controllers following the rules in the Universal SAS and ACP
Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert
persists.
Additional Info: -
Tags: quality_of_service, nondisruptive-upgrade
```

The example below displays detailed information about the definitions in the alert definition file:

```

cluster1::> system health alert definition show -instance
Node: krivC-01
        Monitor: system-connect
        Class of Alert: DualControllerNonHa_Alert
        Severity of Alert: Major
        Probable Cause: Configuration_error
Probable Cause Description: Disk shelf $(sschm_shelf_info.id) is connected
to two controllers ($(sschm_shelf_info.connected-nodes)) that are not an
HA pair.
        Possible Effect: Access to disk shelf $(sschm_shelf_info.id)
may be lost with a single controller failure.
        Corrective Actions: 1. Halt all controllers that are connected to
disk shelf $(sschm_shelf_info.id).
        2. Connect disk shelf $(sschm_shelf_info.id) to both HA
controllers following the rules in the Universal SAS and ACP Cabling
Guide.
        3. Reboot the halted controllers.
        4. Contact support personnel if the alert persists.
        Subsystem Name: SAS-connect
Additional Relevant Data: -
        Additional Alert Tags: quality_of_service, nondisruptive-upgrade

```

## system health autosupport trigger history show

### View system health alert history

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system health autosupport trigger history show` command displays all the alert triggers in the cluster that generated the AutoSupport messages. The following fields are displayed in the output:

- Node name
- Monitor name
- Subsystem
- Alert identifier
- Alerting resource
- Severity
- If an AutoSupport has been sent due to this alert

#### Parameters

**{ [-fields <fieldname>,...]**

Use this parameter to display only the fields you specify.

**| [-instance ] }**

Use this parameter to display additional information about all of the alerts that were generated.

**[-node {<nodename>|local}] - Node**

Use this parameter to display AutoSupport trigger history on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display AutoSupport trigger history with the specified monitor name.

**[-alert-id <text>] - Alert ID**

Use this parameter to display the AutoSupport message that was triggered by the specified alert ID.

**[-alerting-resource <text>] - Alerting Resource**

Use this parameter to display the AutoSupport message that was triggered by the specified alerting resource.

**[-subsystem <hm\_subsystem>] - Subsystem**

Use this parameter to display the AutoSupport message that was triggered by the specified subsystem.

**[-indication-time <Date>] - Indication Time**

Use this parameter to display the AutoSupport message that was triggered at the indicated time.

**[-perceived-severity <hm\_perceived\_sev>] - Perceived Severity**

Use this parameter to display the AutoSupport message that was triggered by alerts with the specified perceived severity.

**[-autosupport-triggered {true|false}] - AutoSupport Triggered**

Use this parameter to display the alerts that generated AutoSupport messages.

**[-probable-cause <hm\_probable\_cause>] - Probable Cause**

Use this parameter to display the alerts that were generated with the specified probable cause.

**[-corrective-actions <text>] - Corrective Actions**

Use this parameter to display the AutoSupport alerts with the specified corrective actions.

**[-asup-enable {true|false}] - Enable Asup for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

**[-alert-clear-time <Date>] - Alert Clear Time**

Use this parameter to display the alerts that were cleared at a given time.

## Examples

This example displays information about the AutoSupport trigger history

```
cluster1::> system health autosupport trigger history show
```

Node	Monitor	Subsystem	Alert ID
node1	node-connect	SAS-connect	
DualPathToDiskShelf_			Alert
Resource: 50:05:0c:c1:02:00:0f:02			
Severity: Major			
AutoSupport sent: true			

This example displays info about the autosupport trigger history in detail

```
cluster1::> system health autosupport trigger history show -instance
```

```

Node: node1
Monitor: node-connect
Alert ID: DualPathToDiskShelf_Alert
Alerting Resource: 50:05:0c:c1:02:00:0f:02
Subsystem: SAS-connect
Indication Time: Thu Mar 17 11:59:09 2011
Perceived Severity: Major
AutoSupport Triggered: true
Probable Cause: Connection_establishment_error
Corrective Actions: 1. Halt controller node1 and all controllers
attached to disk shelf 2.
2. Connect disk shelf 2 to controller node1 via two paths following the
rules in the Universal SAS and ACP Cabling Guide.
3. Reboot the halted controllers.
4. Contact support personnel if the alert persists.
Enable asup for this alert: true
Alert Clear Time: Wed May 29 16:10:13 2013

```

## system health config show

Display system health configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health config show` command displays the configuration and status of each health monitor in the cluster. The command shows a health status for each health monitor. The health status is an aggregation of the subsystem health for each subsystem that the health monitor monitors. For example, if a health monitor monitors two subsystems and the health status of one subsystem is "ok" and the other is "degraded", the health status for the health monitor is "degraded".

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to list the health monitors present on the specified node.

**[-monitor <hm\_type>] - Monitor**

Use this parameter to display the health monitors with the specified monitor name.

**[-subsystem <hm\_subsystem>,...] - Subsystem**

Selects the health monitors with the specified subsystems.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects the health monitors with the specified health status.

**[-mon-version <text>] - Monitor Version**

Selects the health monitors with the specified monitor version.

**[-pol-version <text>] - Policy File Version**

Selects the health monitors with the specified health monitor policy version.

**[-context {Node |Cluster}] - Context**

Selects the health monitors with the specified running context.

**[-aggregator <hm\_type>] - Aggregator**

Selects the health monitors with the specified aggregator.

**[-resources <text>,...] - Resource**

Selects the health monitors with the specified resource name.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Subsystem Initialization Status**

Selects the health monitors with the specified subsystem initialization state.

**[-sub-pol-versions <text>] - Subordinate Policy Versions**

Selects the health monitors with the specified subordinate policy version.

## Examples

The example below displays information about health monitor configuration:

```
cluster1::> system health config show
```

Node	Monitor	Subsystem	Health
node1	node-connect	SAS-connect	degraded
node1	system-connect	SAS-connect	degraded
node1	system	SAS-connect	degraded

The example below displays detailed information about health monitor configuration:

```
cluster1::> system health config show -instance
Node: node1
Monitor: node-connect
Subsystem: SAS-connect
Health: degraded
Monitor Version: 1.0
Policy File Version: 1.0
Context: node_context
Aggregator: system-connect
Resource: SasAdapter, SasDisk, SasShelf
Subsystem Initialization Status: initialized
Subordinate Policy Versions: 1.0 SAS, 1.0 SAS multiple adapters
```

## system health policy definition modify

### Modify system health policy definition

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system health policy definition modify` enables or disables health monitoring policies based on input parameters the user provides.

#### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which you want to enable or disable the policy.

**-monitor <hm\_type> - Monitor**

Use this parameter to specify the monitor name for which you want to be enable or disable the policy.

**-policy-id <text> - Policy**

Use this parameter to specify the policy identifier that you want to enable or disable.

### **[`-enable {true|false}`] - Policy Status**

Use this parameter with the value "true" to enable the policy. Set the value to "false" to disable the policy.

### **[`-asup-enable {true|false}`] - Enable AutoSupport for This Alert**

Use this parameter to enable or disable an AutoSupport message for this alert.

## **Examples**

This example modifies policy state on the cluster:

```
cluster1::> system health policy definition modify -node node1
               -policy-id ControllerToShelfIomA_Policy -enable false -monitor *
```

## **system health policy definition show**

Display system health policy definitions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system health policy definition show` command lists the health monitor policy definitions as described by the health monitor policy file. The command displays the following fields:

- Node name
- Monitor name
- Policy name
- Policy rule expression
- Expression for joining two tables
- Policy status
- Alert identifier
- Responsible resource name

### **Parameters**

**{ [`-fields <fieldname>`,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

**| [`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

Selects policy definitions for the specified node.

**[-monitor <hm\_type>] - Monitor**

Selects policy definitions with the specified monitor name.

**[-policy-id <text>] - Policy**

Selects policy definitions with the specified policy identifier.

**[-rule-expression <ArithExpr>] - Rule Expression**

Selects policy definitions with the specified rule of expression.

**[-where <ArithExpr>] - Variable Equivalence**

Selects rules that match the provided expression. This expression is part of the alert definition. It is shown for reference only and cannot be changed.

**[-enable {true|false}] - Policy Status**

Use this parameter with the value set to "true" to select policy definitions that are enabled. Set the value to "false" to select policy definitions that are disabled.

**[-alert-id <text>] - Alert ID**

Selects all policy definitions of the specified alert identifier.

**[-responsible-resource-info <text>] - Table and ID of Resource at Fault**

Selects all policy definitions with the specified responsible resource.

**[-asup-enable {true|false}] - Enable AutoSupport for This Alert**

Selects policy definitions for which AutoSupport messages are either enabled or disabled.

**Examples**

The example below displays information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show
Node           Monitor           Policy
-----
node1          node-connect        ControllerToShelfIomA_Policy
Policy Rule Expression: nschm_shelf_info.num-paths == 2
                        nschm_shelf_info.iomb-adapter == NULL
                Where: -
                Enable: true
                Alert ID: ControllerToShelfIomA_Alert
                Number of Alerts: -
                Responsible Resource: nschm_shelf_info.name
```

The example below displays detailed information about all the policy definitions present in the cluster:

```
cluster1::> system health policy definition show -instance
Node: node1
Monitor: node-connect
Policy: ControllerToShelfIomA_Policy
Rule Expression: nschm_shelf_info.num-paths == 2
nschm_shelf_info.iomb-adapter == NULL
Variable Equivalence: -
Policy Status: true
Alert ID: ControllerToShelfIomA_Alert
Table and ID of Resource at Fault: nschm_shelf_info.name
```

## system health status show

Display system health monitoring status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health status show` command displays the health monitor status. The possible states are:

- ok
- ok-with-suppressed
- degraded
- unreachable

### Examples

This example displays information about health monitoring status:

```
cluster1::> system health status show
Status
-----
degraded
```

## system health subsystem show

Display the health of subsystems

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system health subsystem show` command displays the health status of each subsystem for which health monitoring is available. This command aggregates subsystem health status from each node in the cluster. A subsystem's health status changes to "degraded" when a health monitor raises an alert. You can use

the [system health alert show](#) command to display information about generated alerts.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-subsystem <hm\_subsystem>] - Subsystem**

Selects the specified subsystem.

**[-health {ok|ok-with-suppressed|degraded|unreachable|unknown}] - Health**

Selects subsystems that have the specified health status.

**[-init-state {Invalid|Initailizing|Initialized|Starting\_Discovery|Starting\_Re-Discovery|Discovery\_Done\_Partially|Discovery\_Done}] - Initialization State**

Selects subsystems that have the specified initialization state.

**[-outstanding-alert-count <integer>] - Number of Outstanding Alerts**

Selects subsystems that have the specified number of outstanding alerts.

**[-suppressed-alert-count <integer>] - Number of Suppressed Alerts**

Selects subsystems that have the specified number of suppressed alerts.

**[-node {<nodename>|local}] - Node**

Selects subsystems for the specified node.

**[-refresh-interval <[<integer>h] [<integer>m] [<integer>s]>,...] - Subsystem Refresh Interval**

The refresh interval is in minutes. A value of zero disables the sub-system refresh until a reboot or restart of the subsystem process.

## Examples

The example below displays the health status of each subsystem:

```
cluster1::> system health subsystem show
Subsystem      Health
-----
SAS-connect    degraded
Switch-Health  OK
CIFS-NDO       OK
```

The example below displays detailed information about the health status of each subsystem:

```
cluster1::> system health subsystem show -instance

Subsystem: SAS-connect
Health: degraded
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1,node2
Subsystem Refresh Interval: 30m, 30m
Subsystem: Switch-Health
Health: ok
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1
Subsystem Refresh Interval: 5m
Subsystem: CIFS-NDO
Health: OK
Initialization State: initialized
Number of Outstanding Alerts: 0
Number of Suppressed Alerts: 0
Node: node1
Subsystem Refresh Interval: 5m
```

# system license commands

## system license add

Add one or more licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command adds a license to a cluster. To add a license you must specify a valid license key, which you can obtain from your sales representative.

## Parameters

**-license-code <License Code V2>,... - License Code V2**

This parameter specifies the key of the license that is to be added to the cluster. The parameter accepts a list of 28 digit upper-case alphanumeric character keys.

## Examples

The following example adds a list of licenses with the keys AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA and BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB to the cluster

```
cluster1::> system license add -license-code AAAAAAAAAAAAAAAAAAAAAAAAAAAAAA,  
BBBBBBBBBBBBBBBBBBBBBBBBBBBBBBB
```

## system license clean-up

### Remove unnecessary licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command manages licenses in the cluster that have no effect, and so can be removed. Licenses that have expired or are not affiliated with any controller in the cluster are deleted by this command.

### Parameters

#### **[-unused <true>] - Remove unused licenses**

If you use this parameter, the command removes licenses in the cluster that are not affiliated with any controller in the cluster.

#### **[-expired <true>] - Remove expired licenses**

If you use this parameter, the command removes licenses in the cluster that have expired.

#### **[-n, -simulate <true>] - Simulate Only**

If you use this parameter, the command will not remove the licenses. Instead it will display the licenses that will be removed if this parameter was not provided.

## Examples

The following example simulates and displays the licenses that can be cleaned up:

```

cluster1::> system license clean-up -n -unused -expired
Serial number: 1-80-000011
Owner: cluster1
Package                                Reason
-----
-----
SnapLock                               Demo License has expired
SnapProtectApps                        Demo License has expired

Serial number: 1-81-0000000000000004062522917
Owner: none
Package                                Reason
-----
-----
NFS                                    Serial number is not used by any node in the
cluster
CIFS                                    Serial number is not used by any node in the
cluster

```

The following example deletes the expired licenses:

```

cluster1::> system license clean-up -expired
2 demo licenses deleted.

```

The following example deletes the unused licenses:

```

cluster1::> system license clean-up -unused
2 unused licenses deleted.

```

## system license delete

### Delete a license

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes a license from a cluster.

### Parameters

#### **-serial-number <text> - Serial Number**

This parameter specifies the serial number of the license that is to be deleted from the cluster. If this parameter is not provided, the default value is the serial number of the cluster.

### **-package <Licensable Package> - Package**

This parameter specifies the name of the package that is to be deleted from the cluster.

### **Examples**

The following example deletes a license named CIFS and serial number 1-81-00000000000000000000123456 from the cluster:

```
cluster1::> system license delete -serial-number 1-81-  
00000000000000000000123456 -package CIFS
```

## **system license show-aggregates**

Display status of aggregates leases and license used.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays the status of all ONTAP aggregates.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you use this parameter, the command displays information only about aggregates that match the given node.

**[-aggr-name <text>] - Aggregate Name**

If you use this parameter, the command displays information only about aggregate that match the given aggregate.

**[-aggr-size {<integer>[KB|MB|GB|TB|PB]}] - Aggregate Size**

If you use this parameter, the command displays information only about aggregates that match the given physical size of an aggregate.

**[-licensed-size {<integer>[KB|MB|GB|TB|PB]}] - Licensed Size**

If you use this parameter, the command displays information only about aggregates that match the given licensed-size.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Lease Expiration**

If you use this parameter, the command displays information only about aggregates that match the given lease expiration.

### **[-status <AggrLicStatus>] - Aggregate Status**

If you use this parameter, the command displays information only about aggregates that match the given status.

### **[-compliant {true|false}] - Is Aggregate Compliant**

If you use this parameter, the command displays information only about aggregates that match the given state of compliance.

## **Examples**

The following example displays the license status of the cluster:

```
cluster1::> system license show-aggregates

## system license show-status

### Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the status of all Data ONTAP licenses.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-status {not-compliant|eval|partially-installed|valid|not-installed|not-applicable|not-known}] - Current state**

If you use this parameter, the command displays information only about licenses that match the given status.

**`[-license <Licensable Package>] - License`**

If you use this parameter, the command displays information only about licenses that match the given license.

**`[-scope {site|cluster|node|pool}] - License Scope`**

If you use this parameter, the command displays information only about licenses that match the given scope.

**`[-detailed-status <text>,...] - Detailed Status`**

If you use this parameter, the command displays information only about licenses that match the given detailed-status.

## Examples

The following example displays the license status of the cluster:

```

cluster1::> system license show-status
Status      License                Scope      Detailed Status
-----
partially-installed
      CIFS                node      License missing on: Node2-
Cluster1.

20 entries were displayed.

```

## system license show

### Display licenses

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system license show` command displays the information about licenses in the system.

### Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

#### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

#### **[-serial-number <text>] - Serial Number**

If you use this parameter, the command displays information only about the licenses that matches the serial number you specify.

#### **[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the specified package.

#### **[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the packages that matches the owner name you specify.

#### **[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

#### **[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that matches the description you specify.

#### **[-type {license|site|demo|subscr|capacity|capacity-per-term}] - Type**

If you use this parameter, the command displays information only about the licenses that have the license type you specify.

#### **[-legacy {yes|no}] - Legacy**

If you use this parameter, the command displays information only about the licenses that matches the legacy field you specify.

#### **[-customer-id <text>] - Customer ID**

If you use this parameter, the command displays information only about the licenses that have the customer-id you specify.

## **Examples**

The following example displays default information about all licensed packages in the cluster:

```
cluster1::> system license show
Serial Number: 1-80-123456
Owner: cluster1
Package           Type      Description           Expiration
-----
Base              site     Cluster Base License -
NFS               site     NFS License           -
iSCSI             site     iSCSI License         -

Serial Number: 1-81-0000000000000001122334455
Owner: node1
Package           Type      Description           Expiration
-----
NFS               license  NFS License           -
SnapRestore       license  SnapRestore License   -
5 entries were displayed.
```

## system license update-leases

### Begin lease reconciliation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system license update-leases` command attempts to update (that is, renew) any capacity pool leases that have expired.

### Parameters

#### **[-node {<nodename>|local}] - Nodes to Attempt Renewal**

This optional parameter directs the system to update leases for only the specified nodes.

#### **[-force {true|false}] - Force Renewal of Valid Leases**

This optional parameter, if set with a value of "true", directs the system to update all leases for a node, not just those that have expired.

### Examples

The following example updates all leases on a node:

```
cluster1::*> system license update-leases -node node1 -force true
Number of Leases Updated: 3
Number of Leases Not Updated: 0 (error), 0 (already up-to-date)
```

## system license capacity show

### (DEPRECATED)-Show license capacity status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[system license show-status](#)" command.

The `system license capacity show` command displays the information about the licenses in the system that are specifically related to storage capacity limits.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-serial-number <Node Serial Number>] - Serial Number**

If you use this parameter, the command displays information only about the capacity-related licenses that matches the serial number you specify.

**[-package <Licensable Package>] - Package**

If you use this parameter, the command displays information only about the package you specify.

**[-owner <text>] - Owner**

If you use this parameter, the command displays information only about the capacity-related licenses that have the owner you specify.

**[-max-capacity {<integer>[KB|MB|GB|TB|PB] } ] - Maximum Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that have the maximum amount of attached storage capacity you specify.

**[-current-capacity {<integer>[KB|MB|GB|TB|PB] } ] - Current Capacity**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node with the current attached capacity you specify.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the capacity-related licenses that have the expiration date you specify.

**[-reported-state {evaluation|warning|missing|enforcement|installed}] - Reported State**

If you use this parameter, the command displays information only about the capacity-related licenses that have the reported state you specify.

## **[`-node {<nodename>|local}`]] - Node Name**

If you use this parameter, the command displays information only about the capacity-related licenses that apply to the node you specify.

### **Examples**

The following example displays information about all capacity-related licensed packages in the cluster, for a hypothetical cluster of four nodes:

Note that for some nodes below, the maximum capacity is displayed as "-" (meaning "unlimited"). This happens when there is no capacity license for the node - the node is operating with a limited-time temporary capacity license.

```
cluster1::> system license capacity show

Node:          node1
Serial Number: 1-81-00000000000001234567890123456
               Max  Current
Package        Capacity Capacity Expiration
-----
Select                2TB   15.81GB 4/11/2016 00:00:00
Node:          node2
Serial Number: 1-81-000000000000000000000123456788
               Max  Current
Package        Capacity Capacity Expiration
-----
Select                -    10.40TB 4/11/2016 00:00:00
Node:          node3
Serial Number: 1-81-000000000000000000000123456789
               Max  Current
Package        Capacity Capacity Expiration
-----
Select                -    10.40TB 4/11/2016 00:00:00
Node:          node4
Serial Number: 1-81-00000000000001234567890123456
               Max  Current
Package        Capacity Capacity Expiration
-----
Select                2TB   15.81GB 4/11/2016 00:00:00
```

- [system license show-status](#)

## **system license entitlement-risk show**

Display Cluster License Entitlement Risk

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays information about license entitlement risk of the cluster for each license package. The command displays license package name, entitlement risk, corrective action to reduce the entitlement risk for each package, and the names and serial numbers for the nodes that do not have a node-locked license for a given package. If command is used with the "-detail" parameter, the output displays the names and serial numbers for all nodes in the cluster instead of only the nodes missing a node-locked license. It also displays whether each node has a license and if the features corresponding to the package are used in the past week.

License entitlement risk does not apply to base license. If a node has a site or a valid demo license for the given package, the entitlement risk will be shown as "medium" and the nodes missing a node-locked license will be displayed. The corrective action, if the cluster has a site license for the given package is, "Verify all controllers are entitled". If the entitlement risk is high, the corrective action is "Acquire node-locked license". For the low entitlement risk and if the cluster is unlicensed for a given package, the corrective action is "None". If the license entitlement risk cannot be computed because of infrastructure issues, the entitlement risk is shown as "unknown" and the corrective action is displayed as "Verify system health". For more information regarding license entitlement risk, see + <http://mysupport.netapp.com/licensing/ontapentitlementriskstatus>

## Parameters

**{ [-fields <fieldname>,...]**

With this parameter, you can specify which fields should be displayed by the command. License package names and node serial numbers are always displayed.

**| [-detail ]**

If you use this parameter, the command displays the license package name, entitlement risk, corrective action, all nodes' names, their serial numbers, whether a node-locked license is present and whether a given license package has been in use in the past week for each node in the cluster.

**| [-instance ] }**

If this parameter is used, the command displays values for all fields for each license package and each node in the cluster individually.

**[-package <Licensable Package>] - Package Name**

If you use this parameter, the command displays information only for the specified license package.

**[-serial-number <text>] - Node Serial Number**

If you use this parameter, the command displays information only for the node with the specified serial number. The displayed entitlement risk and corrective action apply to the entire cluster.

**[-node-name <text>] - Node Name**

If you use this parameter, the command displays information only for the node with the specified name. The displayed entitlement risk and corrective action apply to the entire cluster.

**[-risk {high|medium|low|unlicensed|unknown}] - Entitlement Risk**

If you use this parameter, the command displays information only for the license packages that have the specified license entitlement risk.

### **[-action <text>] - Corrective Action**

If you use this parameter, the command displays information only for the license packages which need the specified corrective action to reduce entitlement risk.

### **[-is-licensed {true|false}] - Is Node-Locked License Present**

If you use this parameter, the command displays information only for the license packages for which at least one node in the cluster has a node-locked license. It also displays the nodes in the cluster which do not have a node-locked license.

### **[-in-use {true|false}] - Usage Status**

If you use this parameter, the command displays information only for the license packages with corresponding features in use.

### **[-missing-serial-numbers <text>,...] - Serial Numbers Missing a Node-Locked License**

If you use this parameter, the command displays the packages for which the node with the specified serial number does not have a node-locked license.

### **[-missing-node-names <text>,...] - Node Names Missing a Node-Locked License**

If you use this parameter, the command displays all the packages for which the node with the specified name does not have a node-locked license.

### **[-action-code {acquire-license|adjust-capacity|verify-entitlement|verify-system-health|none}] - Corrective Action Code**

If you use this parameter, the command displays information only for the license packages which need specified corrective action code to reduce entitlement risk. This parameter is same as the parameter "action".

## **Examples**

The following example displays the information for license package NFS. NFS is unlicensed in the cluster and no action is necessary to reduce the entitlement risk. The nodes, cluster1-01 and cluster-02, are missing a node-locked license. The serial numbers for both nodes are also displayed.

```
cluster1::> system license entitlement-risk show
Package                Entitlement Risk Corrective Action
-----
NFS                    unlicensed          None
Nodes Without a Node-Locked License
-----
cluster1-01            1-81-00000000000000004073806282
cluster1-02            1-81-00000000000000004073806283
```

The following example displays the information for license package CIFS. The cluster has high entitlement risk for CIFS. The command displays serial numbers for all nodes in the cluster. Both nodes are missing a node-locked CIFS license. Node with serial number 1-81-00000000000000004073806282 has used CIFS feature in the past week, and the node with serial number 1-81-00000000000000004073806283 has not used this feature in the past week.

```
cluster1::> system license entitlement-risk show -detail
Package                Entitlement Risk Corrective Action
-----
CIFS                    high                Acquire a node-locked license
                        Serial Numbers                Licensed Usage
                        -----
                        1-81-00000000000000004073806282 false      true
1-81-00000000000000004073806283 false      false
```

## system license license-manager check

### Display license manager status

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system license license-manager check` checks the connectivity status of a node to the License Manager that the node was configured to use.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

This parameter directs the system to display results for the License Manager configured for the specified node.

**[-status <text>] - Status (privilege: advanced)**

This parameter directs the system to display results for the given status message.

### Examples

The following example checks the status of the configured License Manager:

```
cluster1::*> system license license-manager check -node node1
Node: node1
LM status: License Manager (1.2.3.4:5678) is accessible.
```

```
cluster1::*> system license license-manager check
```

Node	Status
node1	License Manager (1.2.3.4:5678) is accessible.
node2	License Manager (1.2.3.4:5678) is accessible.

2 entries were displayed.

## system license license-manager modify

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``system license license-manager modify`` command modifies the configuration information for the License Manager the system is using.

### Parameters

**[-host <text>] - License Manager Host (privilege: advanced)**

Sets the specified host, which can either be a fully qualified domain name (FQDN) or an IP address.

### Examples

The following example modifies information about the License Manager configuration:

```
cluster1::*> system license license-manager modify -host
myhost.mycompany.com
```

## system license license-manager show

Display license manager information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The ``system license license-manager show`` command displays the information about the current License Manager configuration.

## Examples

The following example displays information about current License Manager configuration:

```
cluster1::*> system license license-manager show

License Manager Host: 1.2.3.4
```

## system license status show

(DEPRECATED)-Display license status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and may be removed in a future release of Data ONTAP. Use the "[system license show-status](#)" command.

This command displays the list of licensable packages in the system and their current licensing status.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-package <Licensable Package>] - Package Name**

If you use this parameter, the command displays information only about the specified package.

**[-method {none|license|site|demo|subscr|capacity}] - Licensed Method**

If you use this parameter, the command displays information only about the packages with the specified licensed method.

**[-expiration <MM/DD/YYYY HH:MM:SS>] - Expiration Date**

If you use this parameter, the command displays information only about the licenses that have the expiration date you specify.

**[-description <text>] - Description**

If you use this parameter, the command displays information only about the licenses that match the description you specify.

**[-status-details <text>] - Additional Information About Status**

This option displays additional information regarding the cluster-level license status for license methods.

## Examples

The following example displays the license status of the cluster:

```
cluster1::> system license status show
```

Package	Licensed Method	Expiration	Status Details
Base	site	-	-
NFS	site	-	-
CIFS	demo	12/7/2015 00:00:00	Demo expires on
given date			
iSCSI	none	-	-
FCP	none	-	-
SnapRestore	none	-	-
SnapMirror	none	-	-
FlexClone	none	-	-
SnapVault	none	-	-

# system node commands

## system node halt

Shut down a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node halt` command stops all activity on a node. You may supply a reason for the shutdown, which will be stored in the audit log. You may also keep partner nodes from performing storage takeover during the shutdown.

## Parameters

### **-node {<nodename>|local} - Node**

Use this mandatory parameter to specify the node that you want to shut down. The value `local` specifies the current node.

### **[-reason <text>] - Reason for Shutdown**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

### **[-f, -inhibit-takeover <true>] - Disallow Storage Takeover by Partner**

This parameter optionally forces the shutdown and prevents storage failover. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover.

If `-inhibit-takeover` is set to `true`, the default behavior as seen with command `storage failover show -fields onreboot` is ignored.

If you enter this command without using this parameter, its effective value is `false` and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to `true` and storage takeover is disabled during reboot.

### **[-d, -dump <true>] - Create a Core Dump**

If this parameter is set to `true`, it forces a dump of the kernel core when halting the node.

### **[-skip-lif-migration-before-shutdown <true>] - Skip Migrating LIFs Away from Node Prior to Shutdown**

If this parameter is specified, LIF migration prior to the shutdown will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the shutdown has occurred. The default is to migrate LIFs prior to the shutdown. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to shutdown. If the migration fails or times out, the shutdown will be aborted.

### **[-ignore-quorum-warnings <true>] - Skip Quorum Check Before Shutdown**

If this parameter is specified, quorum checks will be skipped prior to the shutdown. The operation will continue even if there is a possible data outage due to a quorum issue.

### **[-ignore-strict-sync-warnings <true>] - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous relationships with policy of type `strict-sync-mirror` will be skipped. The operation will continue even if there is a possible data outage due to not being able to fully sync data.

## Examples

The following example shuts down the node named `cluster1` for hardware maintenance:

```
cluster1::> system halt -node cluster1 -reason 'hardware maintenance'
```

## system node migrate-root

Start the root aggregate migration on a node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node migrate-root` command migrates the root aggregate of a node to a different set of disks. You need to specify the node name and the list of disks on which the new root aggregate will be created. The command starts a job that backs up the node configuration, creates a new aggregate, set it as new root aggregate, restores the node configuration and restores the names of original aggregate and volume. The job might take as long as a few hours depending on time it takes for zeroing the disks, rebooting the node and restoring the node configuration.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that owns the root aggregate that you wish to migrate. The value *local* specifies the current node.

**{ -disklist <disk path name>,... - List of Disks for New Root Aggregate (privilege: advanced)**

Specifies the list of disks on which the new root aggregate will be created. All disks must be spares and owned by the same node. Minimum number of disks required is dependent on the RAID type.

**-raid-type {raid\_tec|raid\_dp|raid4} - RAID Type for the New Root Aggregate (privilege: advanced)**

Specifies the RAID type of the root aggregate. The default value is *raid-dp*.

**| -resume <true> - Resume a Failed Migrate Operation (privilege: advanced) }**

Resumes a failed migrate-root operation if the new\_root aggregate is created and the old root aggregate is in the retracted state.

### Examples

The command in the following example starts the root aggregate migration on node node1:

```
cluster1::> system node migrate-root -node node1 -disklist
1.11.8,1.11.9,1.11.10,1.11.11,1.11.12 -raid-type raid-dp
```

## system node modify

Modify node attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node modify` command sets the attributes of a node.

The owner, location, and asset tag attributes are informational only, and do not affect the operation of the node or the cluster. The cluster eligibility attribute marks a node as eligible to participate in a cluster. The epsilon attribute marks a node as the tie-breaker vote if the cluster has an even number of nodes.

Any field of type `<text>` may be set to any text value. However, if the value contains spaces or other special characters, you must enter it using double-quotes as shown in the example below.

Use the `system node show` command to display the field values that this command modifies.

## Parameters

### **-node {<nodename>|local} - Node**

This mandatory parameter specifies which node will have its attributes modified. The value "local" specifies the current node.

### **[-owner <text>] - Owner**

This optional text string identifies the node's owner. Fill it in as needed for your organization.

### **[-location <text>] - Location**

Use this text string to identify the physical location of the node. This text string is optional; fill it in as needed for your organization.

### **[-assettag <text>] - Asset Tag**

If your organization uses asset tags to track equipment, you can use this text string to store that tag's value.

### **[-eligibility {true|false}] - Eligibility (privilege: advanced)**

This parameter specifies whether the node is eligible to participate in a cluster. If you modify another node's eligibility to false, it will no longer be visible from other nodes in the cluster. If you modify the local node's eligibility to false, the node will no longer be active in the cluster and you will not be able to see any cluster nodes from it.

### **[-epsilon {true|false}] - Epsilon (privilege: advanced)**

If specified as true for a node, this value designates the specified node as epsilon for this cluster. In a cluster, only one node can be designated as epsilon at any given time. A node can be designated as Epsilon to add weight to its voting in a cluster with an even number of nodes.

### **[-skip-quorum-check-before-eligible <true>] - Skip Quorum Check Before Setting Node Eligible (privilege: advanced)**

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

### **[-skip-quorum-check-before-ineligible <true>] - Skip Quorum Check Before Setting Node Ineligible (privilege: advanced)**

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

## **`[-is-diff-svcs {true|false}] - Differentiated Services`**

If set to `true` this means that the specified node and its HA partner is part of differentiated services storage infrastructure. The default value for this setting is `false`.

## **Examples**

The following example modifies the attributes of a node named `node0`. The node's owner is set to "IT" and its location to "Data Center 2."

```
cluster1::> system node modify -node node0 -owner "IT" -location "Data Center 2"
```

## **Related Links**

- [system node show](#)

## **system node reboot**

Reboot a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

The `system node reboot` command restarts a node. You can supply a reason for the reboot, which is stored in the audit log. You can also keep partner nodes from performing storage takeover during the reboot and instruct the rebooted node to create a core dump.

## **Parameters**

### **`-node {<nodename>|local}` - Node**

Specifies the node that is to be restarted. The value "local" specifies the current node.

### **`[-f, -inhibit-takeover <true>]` - Disallow Storage Takeover by Partner**

If set to `true`, this parameter specifies that the node's failover partner is not allowed to take over for the node when the node is rebooted. In a two-node MetroCluster configuration, this parameter prevents automatic unplanned switchover. If you enter this command without using this parameter, its effective value is `false` and storage takeover is allowed. If you enter this parameter without a value, it is automatically set to `true` and storage takeover is disabled during reboot.

### **`[-reason <text>]` - Reason for Reboot**

Use this parameter to enter a brief note to indicate the reason for the restart, which will be stored in the audit log. Providing this information assists support personnel with troubleshooting efforts.

### **`[-d, -dump <true>]` - Create a Core Dump**

If you would like the node to create a core dump before restarting, specify the `true` value with this parameter. If you enter this command without using this parameter, its effective value is `false` and the node doesn't create a core dump. If you enter this parameter without a value, it is automatically set to `true` and the node creates a core dump.

### **`[-skip-lif-migration-before-reboot <true>]` - Skip Migrating LIFs Away from Node Prior to Reboot**

If this parameter is specified, LIF migration prior to the reboot will be skipped. However if LIFs on this node are configured for failover, those LIFs may still failover after the reboot has occurred. The default is to migrate LIFs prior to the reboot. In the default case, the command attempts to synchronously migrate data and cluster management LIFs away from the node prior to reboot. If the migration fails or times out, the reboot will be aborted.

### **`[-ignore-quorum-warnings <true>]` - Skip Quorum Check Before Reboot**

If this parameter is specified, quorum checks will be skipped prior to the reboot. The operation will continue even if there is a possible data outage due to a quorum issue.

### **`[-ignore-strict-sync-warnings <true>]` - Skip SnapMirror Synchronous Strict Sync Check Before Reboot**

If this parameter is specified, the check for volumes that are in SnapMirror Synchronous relationships with policy of type strict-sync-mirror will be skipped. The operation will continue even if there is a possible data outage due to not being able to fully sync data.

## **Examples**

The command in the following example restarts the node named `cluster1` for a software upgrade:

```
cluster1::> system node reboot -node cluster1 -reason "software upgrade"
```

## **system node rename**

### **Rename a node**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system node rename` command changes a node's name. Both the node to be modified and the new name of that node must be specified with the following parameters. This command is best executed from the node that is being renamed, using the `-node local` parameter.

Use the [system node show](#) command to display the names of all the nodes in the current cluster.

### **Parameters**

#### **`-node {<nodename>|local}` - Node**

This parameter specifies which node you are renaming. The value `local` specifies the current node.

#### **`-newname <text>` - New Name**

Use this parameter to specify the new name of the node.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "\_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.

- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

## Examples

The following example changes the name of the node named node3 to node4.

```
cluster1::> system node rename -node node3 -newname node4
```

## Related Links

- [system node show](#)

## system node restore-backup

Restore the original backup configuration to the HA target node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node restore-backup` command restores the backup configuration file that is stored on the partner node to the specified target node in an HA pair. The backup configuration file is restored after Data ONTAP has been installed on the target node.

The backup configuration file is stored on the HA partner node while the target node is down. After the target node has been installed, the partner node sends this backup configuration file to the target node through the management network by using the `system node restore-backup` command to restore the original configuration. This procedure is commonly used when replacing the target node's boot device.

The target IP address should be the address of the target node used for netboot installation.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the partner node that sends the backup configuration file to the target node. The value "local" specifies the current node.

**-target-address <Remote InetAddress> - HA Partner IP Address (privilege: advanced)**

Specifies the IP address for the target node.

## system node revert-to

Revert a node to a previous release of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node revert-to` command reverts a node's cluster configuration to the given version. After

the `system node revert-to` command has finished, the `revert_to` command must be run from the nodeshell. The `revert_to` command reverts the filesystem on individual nodes to the target release. Before running `revert-to` in the cluster shell, the target release must be installed on the node.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that is to be reverted. The value `local` specifies the current node.

**-version <revert version> - Data ONTAP Version (privilege: advanced)**

Specifies the version of Data ONTAP to which the node is to be reverted.

**[-check-only <true>] - Capability Check (privilege: advanced)**

If set to `true`, this parameter specifies that the cluster configuration revert should perform checks to verify all of the preconditions necessary for `revert-to` to complete successfully. Setting the parameter to `true` does not run through the actual revert process. By default this option is set to `false`.

## Examples

The command in the following example reverts cluster configuration of a node named `node1` to Data ONTAP version 9.4

```
cluster1::*> system node revert-to -node node1 -version 9.4
```

## system node run-console

### Access the console of a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command allows you to access the console of any remote node on the same cluster. The remote access is helpful in situations where the node cannot be booted up or has network issues. This command establishes an SSH session with the Service Processor of a remote node and accesses that node's console over the serial channel. This command works even if Data ONTAP is not booted up on the remote node. You can get back to the original node by pressing Ctrl+D. This command works only on SSH sessions and not on physical console sessions.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose physical console you want to access.

### Examples

The following example accesses the console of `node2` in the same cluster.

```

cluster1::> system node run-console -node node2
Pressing Ctrl-D will end this session and any further sessions you might
open on top of this session.
Type Ctrl-D.
SP-login: admin
Password:
*****
* This is an SP console session. Output from the      *
* serial console is also mirrored on this session.  *
*****
node2::>
node2::> Connection to 192.168.1.202 closed.

cluster1::>

```

## system node run

Run interactive or non-interactive commands in the nodeshell

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use the `system node run` command to run certain commands from the nodeshell CLI on a specific node in the cluster. You can run a single nodeshell command from the clustershell that returns immediately, or you can start an interactive nodeshell session from which you can run multiple nodeshell commands.

Nodeshell commands are useful for root volume management and system troubleshooting. Commands that are available through the nodeshell are scoped to a single node in the cluster. That is, they affect only the node specified by the value of the `-node` parameter and do not operate on other nodes in the cluster. To see a list of available nodeshell commands, type `'?'` at the interactive nodeshell prompt. For more information on the meanings and usage of the available commands, use the `man` command in the nodeshell.

Only one interactive nodeshell session at a time can be run on a single node. Up to 24 concurrent, non-interactive sessions can be run at a time on a node.

When running the nodeshell interactively, exit the nodeshell and return to the clustershell by using the `exit` command. If the nodeshell does not respond to commands, terminate the nodeshell process and return to the clustershell by pressing Ctrl-D.

The `system node run` command is not available from the GUI interface.

An alternate way to invoke the `system node run` command is by typing the `run` as a single word.

### Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the name of the node on which you want to run the nodeshell command. If you specify only this parameter, the command starts an interactive nodeshell session that lasts indefinitely. You can exit the nodeshell to the clustershell by pressing Ctrl-D or by typing the `exit` command.

### **{ [-command <text>,...] - Command to Run**

This optionally specifies the name of a single nodeshell command to run on the specified node. To see a list of available nodeshell commands, type '?' at an interactive nodeshell prompt.

### **| [-reset <true>] - Reset Existing Connection }**

If this parameter is specified with the `true` value, it terminates any existing interactive nodeshell session on the specified node. The default value is `false`.

## **Examples**

The following example runs the nodeshell command `sysconfig -V` on a node named `node1`:

```
cluster1::> system node run -node node1 -command sysconfig -V
volume node1_aggr0 (1 RAID group):
    group 0: 3 disks
```

The following example starts a nodeshell session on a node named `node2` and then runs the nodeshell `sysconfig -V` command. The system remains in the nodeshell after running the `sysconfig -V` command.

```
cluster1::> run -node node2
Type 'exit' or 'Ctrl-D' to return to the CLI
node2> sysconfig -V
volume node2_aggr0 (1 RAID group):
    group 0: 3 disks
node2>
```

The following example starts a nodeshell session on a node named `node1` and then runs two nodeshell commands, `aggr status` first and `vol status` second. Use quotation marks and semicolons when executing multiple nodeshell commands with a single `run` command.

```
cluster1::> run -node node1 -command "aggr status; vol status"

      Aggr State           Status           Options
aggr0 online             raid_dp, aggr    root
                           parity uninit'd!
                           32-bit
      aggr1 online         raid_dp, aggr    parity uninit'd!
                           32-bit

      Volume State         Status           Options
      vol0 online          raid_dp, flex    root, nvfail=on
                           parity uninit'd!
      root_vs0 online      raid_dp, flex    create_ucose=on,
                           cluster          convert_ucose=on,
                           parity uninit'd! maxdirsiz=102400
```

## system node show-discovered

Display all nodes discovered on the local network

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node show-discovered` command displays information about all the detectable nodes on the local cluster network. This includes both nodes in a cluster and nodes that do not belong to a cluster. You can filter the output to show only nodes that do not belong to a cluster or nodes that are in a cluster.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If the `-instance` parameter is specified, the command displays detailed information about each node.

**[-node <text>] - Node Name**

This parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all discovered nodes.

**[-is-in-cluster {true|false}] - Is in a Cluster**

If this parameter is set to `false`, the command lists only nodes that do not belong to a cluster.

**[-cluster-uuid <UUID>] - Cluster UUID**

Displays information about nodes belonging to the cluster that has the UUID you specify.

**[`-cluster-name <text>`] - Cluster Name**

Displays information about nodes belonging to the cluster that has the name you specify.

**[`-serial-number <text>`] - Node Serial Number**

Displays information about the node that has the serial number you specify.

**[`-addresses <IP Address>,...`] - Cluster IP Addresses**

Displays information about the node that has the cluster IP addresses you specify.

**[`-netmask <IP Address>`] - Cluster Address Mask**

Displays information about the nodes that have the netmask address you specify.

**[`-nvramid <nvramid>`] - Node NVRAM ID**

Displays information about the node that has the NVRAM ID you specify.

**[`-partner-nvramid <nvramid>`] - Partner NVRAM ID**

Displays information about the node that has an HA partner with the NVRAM ID you specify.

**[`-model <text>`] - Model**

Displays the nodes that have the specified model number.

**[`-version <text>`] - Software Version**

Displays the nodes that have the specified version of Data ONTAP.

## Examples

The following example displays information about all discovered nodes in the cluster network:

```
cluster1::*> system node show-discovered
```

Node	Cluster	Addresses	NVRAM ID	Partner NVRAM
4069114-60-0	-	169.254.232.178	4069114600	-
4069114-60-2	-	169.254.79.38	4069114602	-
4069114-60-3	-	169.254.195.76	4069114603	-
cluster1-01	cluster1	169.254.140.39	4069114628	4069114629
cluster1-02	cluster1	169.254.138.137	4069114629	4069114628

## system node show

Display the list of nodes in the cluster

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node show` command displays information about the nodes in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view. Use the [system node modify](#) command to change some of the field values that this command displays.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-inventory ]**

Use this parameter to display inventory information such as serial numbers, asset tags, system identifiers, and model numbers.

**| [-messages ]**

Use this parameter to display system messages for each node.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for node names that match this parameter value.

**[-owner <text>] - Owner**

Selects nodes that have owner values that match this parameter value.

**[-location <text>] - Location**

Selects nodes at specific physical locations that match this parameter value.

**[-model <text>] - Model**

Selects nodes that have model numbers that match this parameter value.

**[-serialnumber <text>] - Serial Number**

Selects nodes that have serial numbers that match this parameter value.

**[-assettag <text>] - Asset Tag**

Selects nodes that have asset tags that match this parameter value.

**[-uptime {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Uptime**

Selects nodes that have uptimes that match this parameter value. This parameter is most useful when used with a range indicator such as less than or greater than, as in:

```
show -uptime >"30 days 00:00"
```

**[-nvramid <nvrmaid>] - NVRAM System ID**

Selects nodes that have NVRAM system IDs that match this parameter value.

**[-systemid <text>] - System ID**

Selects nodes that have system IDs that match this parameter value.

**[-vendor <text>] - Vendor**

Selects nodes that have vendor names that match this parameter value.

**[-health {true|false}] - Health**

Selects nodes that have health values that match this parameter value. Specify `true` to display healthy nodes, and `false` to display unhealthy nodes.

**[-eligibility {true|false}] - Eligibility**

Selects nodes that have voting eligibility values that match this parameter value.

**[-epsilon {true|false}] - Epsilon (privilege: advanced)**

Selects nodes that have epsilon holding designations that match this parameter value. This is useful to find out which node, if any, in the current cluster has been designated as epsilon. Specify `true` to display the node holding epsilon, and `false` to display nodes not holding epsilon.

**[-uuid <UUID>] - UUID (privilege: advanced)**

Selects nodes that have the specified universal unique identifiers that match this parameter value.

**[-is-diff-svcs {true|false}] - Differentiated Services**

If `true`, the corresponding node is considered to be part of differentiated services storage infrastructure.

**[-is-all-flash-optimized {true|false}] - All-Flash Optimized**

Selects nodes that have "All-Flash Optimized" personality values that match this parameter value. Specify `true` to display nodes which support only SSD drives, and `false` to display nodes which support all kinds of drives.

**[-is-capacity-optimized {true|false}] - Capacity Optimized**

Selects nodes that have "Capacity Optimized" personality values that match this parameter value. Specify `true` to display nodes which support only SSD drives with Capacity Optimized personality enabled and set `false` otherwise.

**[-sas2-sas3-mixed-stack-support {all|direct-attached|bridge-attached|none}] - SAS2/SAS3 Mixed Stack Support**

Selects nodes that have "SAS2/SAS3 Mixed Stack Support" values that match this parameter value. The possible values are:

- `all` : SAS2/SAS3 mixing supported on all stacks
- `direct-attached` : SAS2/SAS3 mixing supported on direct-attached stacks
- `bridge-attached` : SAS2/SAS3 mixing supported on bridge-attached stacks
- `none` : SAS2/SAS3 mixing not supported

**Examples**

The following example displays information about all nodes in the cluster:

```
cluster1::> system node show
```

Node	Health	Eligibility	Uptime	Model	Owner	Location
node0	true	true	89 days 23:47	MODELXX	IT	Data Center 2
node1	true	true	15 days 22:37	MODELXX		Data Center 2
node2	true	true	15 days 23:00	MODELXX		Data Center 2
node3	true	true	15 days 22:37	MODELXX		Data Center 2

4 entries were displayed.

This example displays the locations and model numbers of all nodes that are in physical locations that have names beginning with "Lab":

```
cluster1::> system node show -location lab* -fields location, model
```

node	location	model
node5	Lab 1	MODELXX
node7	Lab 3	MODELXX
node9	Lab 5	MODELXX

## system node autosupport invoke-core-upload

Generate and send an AutoSupport message with an existing core file.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke-core-upload` command sends two AutoSupport messages. The first AutoSupport message contains the content relevant to this core upload. This AutoSupport message has subject line with prefix "CORE INFO:". The second Autosupport message contains the core file specified by the "-core-filename" option. This AutoSupport message has subject line with prefix "CORE UPLOAD:". The command requires that the specified file be present while the AutoSupport message is being transmitted.

## Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. Defaults to localhost.

**[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[`-uri <text>`] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "http" and "https" protocols are supported. If this parameter is omitted, the message is sent to all the recipients defined by the [system node autosupport modify](#) command.

### **[`-force <true>`] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[`-case-number <text>`] - Case Number for This Core Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **`-core-filename <text>` - The Existing Core Filename to Upload**

Use this parameter to specify the core file to be included in the AutoSupport message. Use the [system node coredump show](#) command to list the core files by name.

## **Examples**

Use this command to list the core files from a node:

```
cluster1::> system node coredump show -node local
Node:Type Core Name                               Saved Panic Time
-----
node:kernel
      core.4073000068.2013-09-11.15_05_01.nz      true  9/11/2013
15:05:01
```

Use this command to invoke an AutoSupport message with the corefile core.4073000068.2013-09-11.15\_05\_01.nz:

```
cluster1::> system node autosupport invoke-core-upload -core-filename
core.4073000068.2013-09-11.15_05_01.nz -node local
```

## **system node autosupport invoke-performance-archive**

Generate and send an AutoSupport message with performance archives.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The system node `autosupport invoke-performance-archive` command sends an AutoSupport message with the performance archives from a node. The command requires that the performance archives in the specified date range be present while the AutoSupport message is being transmitted.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent. The default setting is localhost.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify the text in the subject line of the AutoSupport message.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to all of the recipients defined by the system node `autosupport modify` command.

### **[-force <true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### **[-case-number <text>] - Case Number for This Performance Archive Upload**

Use this parameter to specify the optional case number to be associated with this AutoSupport message.

### **-start-date <MM/DD/YYYY HH:MM:SS> - Start Date for Performance Archive Dataset**

Use this parameter to specify the start date for the files in the performance archive dataset to be included in the AutoSupport message.

### **{ -end-date <MM/DD/YYYY HH:MM:SS> - End Date for Performance Archive Dataset**

Use this parameter to specify the end date for the files in the performance archive dataset to be included in the AutoSupport message. The end date should be within six hours of the start date.

### **[-duration <[<integer>h][<integer>m][<integer>s]> - Duration of Performance Archive Dataset }**

Use this parameter with start-date to specify the duration of the performance archive dataset to be included in the AutoSupport message. The maximum duration limit is six hours from the start date.

## Examples

Use this command to invoke an AutoSupport message to include the performance archives in the given date range:

```
cluster1::> system node autosupport invoke-performance-archive -node local
-start-date 9/12/2013 19:37:24 -end-date 9/12/2013 22:37:24
cluster1::> system node autosupport invoke-performance-archive -node local
-start-date 11/21/2013 13:42:09 -duration 6h
```

## system node autosupport invoke-splog

Generate and send an AutoSupport message with collected service-processor log files

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport invoke-splog` command sends an AutoSupport message with the Service Processor log files from a specified node in the cluster.

### Parameters

**-remote-node {<nodename>|local} - Node**

Use this parameter to specify the node from which Service Processor log files are to be collected.

**[-log-sequence <integer>] - Log File Sequence Number**

Use this parameter to specify the sequence number of the Service Processor log files to be collected. If this parameter is omitted, the latest Service Processor log files are collected.

**[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to an alternate destination. Only "file," "http," and "https" protocols are supported. If this parameter is omitted, the message is sent to all of the recipients defined by the [system node autosupport modify](#) command.

**[-force <true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the AutoSupport message even if AutoSupport is disabled on the node.

### Examples

Use this command to invoke an AutoSupport message to include the Service Processor log files collected from node cluster1-02.

```
cluster1::> system node autosupport invoke-splog -remote-node cluster1-02
[Job 777] Job succeeded: Log files from the service processor have been
transferred to "/mroot/etc/log/sp/ondemand" on node cluster1-01, and
AutoSupport message has been triggered.
```

```
cluster1::>
```

## system node autosupport invoke

Generate and send an AutoSupport message

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport invoke` command sends an AutoSupport message from a node.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

### **[-message <text>] - Message Included in the AutoSupport Subject**

Use this parameter to specify text sent in the subject line of the AutoSupport message. This parameter is not available when the `-type` parameter is set to `performance`.

### **-type {test|performance|all} - Type of AutoSupport Collection to Issue**

Use this parameter to specify the type of AutoSupport collection to issue. There is no default; you must specify a `-type`.

- `test` - The message contains basic information about the node. When the AutoSupport message is received by technical support, an e-mail confirmation is sent to the system owner of record. This enables you to confirm that the message is being received by technical support.
- `all` - The message contains all collected information about the node.
- `performance` - The message contains only performance information about the node. This parameter has effect only if performance AutoSupport messages are enabled, which is controlled by the `-perf` parameter of the [system node autosupport modify](#) command.

### **[-uri <text>] - Alternate Destination for This AutoSupport**

Use this parameter to send the AutoSupport message to the destination you specify instead of the configured destination. Only "file", "mailto", "http", and "https" protocols are supported. If this parameter is omitted, the message is sent to the all of the recipients defined by the [system node autosupport modify](#) command.

### **[-force <true>] - Generate and Send Even if Disabled**

Use this parameter to generate and send the message even if AutoSupport is disabled on the node.

## Examples

The following example sends a test AutoSupport message from a node named `node0` with the text "Testing ASUP":

```
cluster1::> system node autosupport invoke -node node0 -type test -message "Testing ASUP"
```

## Related Links

- [system node autosupport modify](#)

## system node autosupport modify

Modify AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport modify` command modifies the AutoSupport configuration of all the nodes in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The AutoSupport configuration will be modified on all nodes in the cluster, even if this parameter is specified.

This parameter is ignored, but retained for CLI backward compatibility.

**[-state {enable|disable}] - State**

Use this parameter to specify whether AutoSupport is enabled or disabled. The default setting is `enable`. When AutoSupport is disabled, messages are not sent to anyone, including the vendor's technical support, your internal support organization, or partners.

**[-mail-hosts <text>,...] - SMTP Mail Hosts**

Use this parameter to specify up to five SMTP mail hosts through which AutoSupport messages are sent out. This parameter is required if you specify e-mail addresses in the `-to`, `-noteto`, or `-partner-address` parameters or if you specify `smtp` in the `-transport` parameter. Separate multiple mail hosts with commas and do not use spaces in between. The AutoSupport delivery engine attempts to use these hosts for delivery in the order that you specify.

You can optionally specify a port value for each mail server. A port value can be specified on none, all, or some of the mail hosts. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, `mymailhost.example.com:5678`). The default port value is `25`.

Also, you can optionally prepend a user name and password combination for authentication to each mail server. The format of the username and password pair is `user1:pwd@mymailhost.example.com`. The username and password can be specified on none, all, or some of the mail hosts.

The default value for this parameter is `mailhost`.

**[-from <mail address>] - From Address**

Use this parameter to specify the e-mail address from which all the nodes in the cluster send AutoSupport messages. The default is Postmaster. If you require node-specific "from" addresses, enable the `node-specific-from` (privilege: advanced) parameter.

**[-to <mail address>,...] - List of To Addresses**

Use this parameter to specify up to five e-mail addresses to receive AutoSupport messages that are most relevant for your internal organization. Separate multiple addresses with commas with no spaces in between. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-to` parameter of the `system node autosupport trigger modify` command. By default, no list is defined.

### **[-noteto <mail address>,...] - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification destination create](#) command to create an email destination and the [event notification create](#) command to map the `important-events` system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the [event filter rule add](#) command. This newly created filter has to be mapped to the event destination.

Use this parameter to specify up to five addresses to receive a short-note version of AutoSupport messages that are most relevant for your internal organization. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. Individual trigger events can change the default usage of this parameter using the `-noteto` parameter of the [system node autosupport trigger modify](#) command. By default, no list is defined.

### **[-partner-address <mail address>,...] - List of Partner Addresses**

Use this parameter to specify up to five e-mail addresses to receive all AutoSupport messages including periodic messages. This parameter is typically used for support partners. For this parameter to have effect, the `-mail-hosts` parameter must be configured correctly. By default, no list is defined.

### **[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support**

Use this parameter to specify whether to send all AutoSupport messages to your vendor's technical support. (Destination information is pre-defined and does not require configuration.) When `-state` is enabled and `-support` is disabled, messages are sent to the addresses specified in the `-to`, `-noteto`, or `-partner-address` parameters but are not sent to your vendor's technical support. The default is `enable`.

### **[-transport {smtp|http|https}] - Protocol to Contact Support**

Use this parameter to specify the protocol used to deliver AutoSupport messages to your vendor's technical support. This parameter applies only when the `-support` parameter is set to `enable`. If you specify `http` or `https` and your network uses a proxy, you must also set the `-proxy-url` parameter. If you specify `smtp`, you must also configure the `-mail-hosts` parameter.

### **[-proxy-url <text>] - Support Proxy URL**

Use this parameter to specify an HTTP or HTTPS proxy if the `-transport` parameter is set to `HTTP` or `HTTPS` and your organization uses a proxy. Enter the URL without an `http://` or `https://` prefix. If authentication is required, use the format `"[username]@[host][:port]"`. You will be prompted for the password. The default is an empty string. To specify a proxy that contains a question mark, press ESC followed by the `"?"`. This field can be cleared by setting the value to an empty string using two double quotes (`""`).

### **[-hostname-subj {true|false}] - Hostname Subject**

Use this parameter to specify whether the hostname of the node is included in the subject line of the AutoSupport message. The default is `false`. This parameter applies only if the `-remove-private-data` parameter is `true`.

### **[-nht {true|false}] - NHT Enable**

Use this parameter to specify whether NHT disk drive health data is sent to technical support and addresses specified in the `-partner-address` parameter when disk drives fail. The default is `true`.

### **`[-perf {true|false}] - Performance Data Enable`**

Use this parameter to specify whether performance data is sent to technical support and addresses specified in the `-partner-address` parameter. The default is `true`.

### **`[-retry-interval [<integer>h [<integer>m [<integer>s]]] - Retry Interval`**

Use this parameter to specify the amount of time to delay before trying to send an AutoSupport message again after a sending failure. Values may end with "s", "m", or "h" to indicate seconds, minutes, or hours, respectively. The minimum interval is 30 seconds and the maximum is 1 day. The default is 4 minutes.

### **`[-retry-count <integer>] - Retry Count`**

Use this parameter to specify the number of times to try resending mail before dropping it. The minimum number is 5 and the maximum is 30. The default is 15 times.

### **`[-reminder {true|false}] - Reminder Enable`**

Use this parameter to enable or disable a reminder message that is sent when AutoSupport is not configured to send messages to technical support. This reminder is logged as an EMS event called "autosupport.general.reminder" every 24 hours. The default is `true`.

### **`[-max-http-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum HTTP Size`**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for HTTP and HTTPS transfers. This parameter applies only to messages sent to technical support and only if the `-transport` parameter is set to HTTP or HTTPS. Setting the value to 0 disables the delivery size budget. The default is 50 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the `-instance` parameter.

### **`[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum SMTP Size`**

Use this parameter to specify the maximum file size (in bytes by default, but can also be specified in KB, MB, TB or PB) for SMTP (e-mail) transfers. This parameter applies to messages sent to the addresses specified in the `-to`, `-noteto`, and `-partner-address` parameters. If the `-transport` parameter is set to `smtp`, this parameter also applies to messages sent to the vendor's technical support. Setting the value to 0 disables the delivery size budget. The default is 5 MB and the minimum supported size is 2 MB.

If the size of the AutoSupport message exceeds this value, AutoSupport will deliver as much of the message as possible. You can use the "system node autosupport manifest show" command to identify the sections of the message that AutoSupport sent. AutoSupport collects and sends the content in order of priority. The priority is predefined for each AutoSupport message. To identify the collection order for an AutoSupport trigger, use the "system node autosupport trigger show" command with the `-instance` parameter.

### **`[-remove-private-data {true|false}] - Remove Sensitive Data`**

Use this parameter with the value `true` to remove, encode, or mask sensitive data from AutoSupport attachments and headers. Use this feature to eliminate private data from all AutoSupport messages.

Eliminated data might include: IP addresses, MAC addresses, URIs, DNS names, e-mail addresses, port numbers, node names, Vserver names, cluster names, aggregate names, volume names, junction paths, policy names, user IDs, group IDs, LUNs, NVMe namespaces and qtree names.

The default is `false`.

Changing this value from `false` to `true` deletes the AutoSupport history and all files associated with it.

#### **`[-validate-digital-certificate {true|false}]` - Validate Digital Certificate Received**

Use this parameter with the value `true` to force each node to validate digital certificates that it receives. The default is `true`. When this value is `true`, the certificate might be validated by OCSP. The OCSP validation for these certificates is controlled by `security config ocsp enable -app autosupport` and `security config ocsp disable -app autosupport`.

#### **`[-ondemand-state {enable|disable}]` - AutoSupport OnDemand State (privilege: advanced)**

Use this parameter to specify whether the AutoSupport OnDemand feature is enabled or disabled. The default is `enable`. When AutoSupport OnDemand is enabled, support personnel can remotely trigger new AutoSupport messages, re-send existing AutoSupport messages and decline the delivery of unwanted AutoSupport messages. When this option is disabled, this node will not respond to any AutoSupport OnDemand requests from support personnel.

#### **`[-ondemand-remote-diagnostics-state {enable|disable}]` - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)**

Use this parameter to specify whether the AutoSupport OnDemand Remote Diagnostics feature is enabled or disabled. The default is `enable`. When AutoSupport OnDemand Remote Diagnostics is enabled, support personnel can remotely trigger new AutoSupport messages on this node to gather information during troubleshooting scenarios. When this option is disabled, support personnel will still be able to re-send existing AutoSupport messages that may not have been transmitted correctly.

#### **`[-node-specific-from {enable|disable}]` - Node-Specific From Address (privilege: advanced)**

Use this parameter to specify whether the "from" e-mail address needs to be node-specific. If enabled, the node-specific "from" e-mail address is generated by prepending the node name and "-" to the configured "from" address. For example, if the node name is "cluster-01" and the "from" parameter is "`prod@company.com`", the generated "from" e-mail address is "`cluster-01-prod@company.com`".

## **Examples**

The following example enables AutoSupport on all nodes in the cluster with the following settings:

- SMTP mail host named `smtp.example.com`.
- E-mail "from" address of `alerts@example.com`
- E-mail "to" address of `support@example.com`
- AutoSupport messages sent to support personnel
- HTTPS set as transport protocol
- If sending fails, the system will wait 23 minutes before retrying.

```
cluster1::> system node autosupport modify -state enable -mail-hosts
smtp.example.com -from alerts@example.com -to support@example.com -support
enable -transport https -retry-interval 23m
```

The following examples show how to modify AutoSupport URLs when using IPv6 address literals:

```
cluster1::> system node autosupport modify -mail-hosts  
[2620:10a:4002:6004::bbbb]:25
```

```
cluster1::> system node autosupport modify -proxy-url  
username:password@[2620:10a:4002:6004::bbbb]:8080
```

## system node autosupport show

Display AutoSupport configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport show` command displays the AutoSupport configuration of one or more nodes.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-config ]**

Use this parameter to display the retry interval, retry count, throttle, and reminder settings of all nodes in the cluster.

**| [-nht-performance ]**

Use this parameter to display NHT and performance information about all nodes in the cluster.

**| [-recent ]**

Use this parameter to display the subject and time of the last AutoSupport message generated by each node in the cluster.

### **| [-support-http ]**

Use this parameter to display whether HTTP support is enabled in the cluster, and identify the transport protocol and the support proxy URL used.

### **| [-support-smtp ]**

Use this parameter to display whether SMTP (e-mail) support is enabled in the cluster, and identify the transport protocol and the "to" e-mail address used.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node**

The AutoSupport configuration is identical for all nodes in the cluster.

Use this parameter to display detailed information about the node you specify.

### **[-state {enable|disable}] - State**

Use this parameter to display information only about nodes that have the AutoSupport state you specify.

### **[-mail-hosts <text>,...] - SMTP Mail Hosts**

Use this parameter to display information only about nodes that use the mail hosts you specify.

### **[-from <mail address>] - From Address**

Use this parameter to display information only about nodes that have the "from" e-mail address you specify.

### **[-to <mail address>,...] - List of To Addresses**

Use this parameter to display information only about nodes that have the "to" e-mail addresses you specify.

### **[-noteto <mail address>,...] - (DEPRECATED) List of Noteto Addresses**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes that send short-note e-mail messages to the e-mail addresses you specify. Short-note e-mails contain only the subject line of the AutoSupport message, which is easier to view on a mobile device.

### **[-partner-address <mail address>,...] - List of Partner Addresses**

Use this parameter to display information only about nodes that have the "partner-address" e-mail addresses you specify. These addresses are not subject to the delivery limitations configured for the "-to" addresses of AutoSupport triggers.

### **[-support {enable|disable}] - Send AutoSupport Messages to Vendor Support**

Use this parameter with the value "enable" to display information only about nodes that send AutoSupport messages to your vendor's technical support. Use this parameter with the value "disable" to display information only about nodes that do not send AutoSupport messages to your vendor's technical support.

### **[-transport {smtp|http|https}] - Protocol to Contact Support**

Use this parameter to display information only about nodes that use the protocol you specify to send AutoSupport messages.

**[-url <text>] - Support URL for HTTP/HTTPS**

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP and HTTPS POST operations.

**[-put-url <text>] - Support URL for HTTP/S PUT**

Use this parameter to display information only about nodes that use the URL you specify to send messages through HTTP PUT operations.

**[-proxy-url <text>] - Support Proxy URL**

Use this parameter to display information only about nodes that use the proxy URL you specify.

**[-support-address <mail address>,...] - Support Address**

Use this parameter to display information only about nodes that use the external support address you specify.

**[-hostname-subj {true|false}] - Hostname Subject**

Use this parameter to display information only about nodes that include their hostname in the "Subject:" line of AutoSupport messages. If the parameter "remove-private-data" is *false*, this parameter has no effect.

**[-nht {true|false}] - NHT Enable**

Use this parameter with the value "true" to display information only about nodes that send NHT disk drive data. Use this parameter with the value "false" to display information only about nodes that do not send NHT data.

**[-perf {true|false}] - Performance Data Enable**

Use this parameter with the value "true" to display information only about nodes that send periodic performance AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not send periodic performance messages.

**[-retry-interval [<integer>h [<integer>m [<integer>s]>] - Retry Interval**

Use this parameter to display information only about nodes that use the retry interval you specify.

**[-retry-count <integer>] - Retry Count**

Use this parameter to display information only about nodes that use the retry count you specify.

**[-reminder {true|false}] - Reminder Enable**

Use this parameter with the value "true" to display information only about nodes that send messages reminding administrators to enable AutoSupport if AutoSupport is not enabled. Use this parameter with the value "false" to display information only about nodes that do not send reminder messages.

**[-last-subject <text>] - (DEPRECATED) Last Subject Sent**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message had the "Subject:" line you specify.

**[-last-time <MM/DD/YYYY HH:MM:SS>] - (DEPRECATED) Last Time Sent**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter to display information only about nodes whose last AutoSupport message was sent at the date and time you specify. Specify the date and time in the format "MM/DD/YYYY HH:MM:SS".

**`[-max-http-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum HTTP Size**

Use this parameter to display information only about nodes that limit the maximum size of HTTP transfers to the file size you specify.

**`[-max-smtp-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum SMTP Size**

Use this parameter to display information only about nodes that limit the maximum size of SMTP (e-mail) transfers to the file size you specify.

**`[-remove-private-data {true|false}]` - Remove Sensitive Data**

Use this parameter with the value "true" to display information only about nodes that remove sensitive data from AutoSupport messages. Use this parameter with the value "false" to display information only about nodes that do not remove sensitive data.

**`[-validate-digital-certificate {true|false}]` - Validate Digital Certificate Received**

Use this parameter with the value "true" to display information only about nodes that validate digital certificates they receive. Use this parameter with the value "false" to display information only about nodes that do not validate digital certificates.

**`[-ondemand-state {enable|disable}]` - AutoSupport OnDemand State (privilege: advanced)**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand state you specify.

**`[-ondemand-remote-diagnostics-state {enable|disable}]` - AutoSupport OnDemand Remote Diagnostics State (privilege: advanced)**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Remote Diagnostics state you specify.

**`[-ondemand-server-url <text>]` - AutoSupport OnDemand Server URL**

Use this parameter to display information only about nodes that have the AutoSupport OnDemand Server URL you specify.

**`[-node-specific-from {enable|disable}]` - Node-Specific From Address (privilege: advanced)**

Use this parameter to display information that matches the specified value - enabled or disabled.

## Examples

The following example displays the AutoSupport configuration for a node named node3:

```

cluster1::> system node autosupport show -node node3
Node: node3
State: enable
SMTP Mail Hosts: smtp.example.com
From Address: alerts@example.com
List of To Addresses: support@example.com
List of Noteto Addresses: -
List of Partner Addresses: support@partner.com
Send AutoSupport Messages to Vendor Support: enable
Protocol to Contact Support: https
Support Proxy URL: support.proxy.example.com
Hostname Subject: true
NHT Enable: true
Performance Data Enable: true
Retry Interval: 4m
Retry Count: 15
Reminder Enable: true
The Transmission Window: 1h
Last Subject Sent: WEEKLY
Last Time Sent: 3/1/2019 06:00:03
Maximum HTTP Size: 50MB
Maximum SMTP Size: 5MB
Remove Sensitive Data: false
Validate Digital Certificate Received: true
Continue Local Collection while Disabled: true

```

## system node autosupport check show-details

Display detailed status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport check show-details` command displays the detailed status of the AutoSupport subsystem. This includes verifying connectivity to your vendor's AutoSupport destinations by sending test messages and providing a list of possible errors in your AutoSupport configuration settings.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node <nodename>`] - Node**

Selects the check results that match this parameter value. This parameter specifies the node whose status is being displayed.

**[`-check-type <Type of AutoSupport Check>`] - AutoSupport Check Type**

Selects the check results that match this parameter value. This parameter specifies the type of AutoSupport check being performed.

**[`-status {ok|warning|failed|not-run}`] - Status of the Check**

Selects the check results that match this parameter value. This parameter specifies the result of this AutoSupport check.

**[`-error-detail <text>`] - Detailed Description of Error**

Selects the check results that match this parameter value. This parameter specifies the detailed error message for this AutoSupport check.

**[`-corrective-action <text>`] - Corrective Action**

Selects the check results that match this parameter value. This parameter specifies a description of how to correct any errors seen as part of this AutoSupport Check

**Examples**

The following example displays the detailed status of the AutoSupport subsystem for a node named node2:

```
cluster1::> system node autosupport check show-details -node node2
```

```
Node: node2

Category: http-https
  Component: http-put-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/put".
  Component: http-post-destination
    Status: ok
    Detail: Successfully connected to "support.netapp.com/post".

Category: smtp
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "mailhost.netapp.com".
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "sendmail.domain.com".
  Component: mail-server
    Status: ok
    Detail: Successfully connected to "gmail.domain.com".

Category: on-demand
  Component: ondemand-server
    Status: ok
    Detail: Successfully connected to "support.netapp.com/aods".

Category: configuration
  Component: configuration
    Status: ok
    Detail: No configuration issues found.
```

## system node autosupport check show

Display overall status of AutoSupport subsystem

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport status check show` command displays the overall status of the AutoSupport subsystem.

### Parameters

```
{ [-fields <fieldname>,...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

**[ -instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[ -node <nodename> ] - Node**

Selects the nodes that match this parameter value. This parameter specifies the node whose status is being displayed.

**[ -http-status {ok|warning|failed|not-run} ] - Overall Status of AutoSupport HTTP/HTTPS Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport HTTP destination was established.

**[ -aod-status {ok|warning|failed|not-run} ] - Overall Status of AutoSupport OnDemand Server**

Selects the nodes that match this parameter value. This parameter specifies the detailed description of the connectivity status to the AutoSupport OnDemand Server.

**[ -smtp-status {ok|warning|failed|not-run} ] - Overall Status of AutoSupport SMTP Destinations**

Selects the nodes that match this parameter value. This parameter specifies whether connectivity to the AutoSupport mailhost was established.

**[ -config-status {ok|warning|failed|not-run} ] - Overall Status of AutoSupport Configuration**

Selects the nodes that match this parameter value. This parameter specifies whether the AutoSupport configuration check succeeded or not.

**[ -warning-text <text> ] - Conditional Warning Message**

Selects the nodes that match this parameter value. This parameter specifies how to get more details regarding the status of the AutoSupport subsystem, in case of any errors.

## Examples

The following example displays the overall status of the AutoSupport subsystem on a node named node2:

```
cluster1::> system node autosupport check show -node node2
```

On Demand Server	SMTP	Configuration
-----	-----	-----
ok	ok	ok

## system node autosupport destinations show

Display a summary of the current AutoSupport destinations

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport destinations show` command displays a list of all message destinations used by AutoSupport. The command provides you with a quick summary of all addresses and URLs that receive AutoSupport messages from all nodes in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display only destinations that receive AutoSupport messages from the node you specify.

**[-destinations <text>,...] - Destinations**

Use this parameter to display only destination lists for nodes that send AutoSupport messages to the destinations you specify.

## Examples

This example displays all of the destinations in use by the current cluster. Each node uses the same destination for HTTP POST, HTTP PUT, and e-mail notifications.

```
cluster1::> system node autosupport destinations show
Node
    Destinations
-----
----
node1
    https://asuppost.example.com/cgi-bin/asup.cgi
    https://asupput.example.com/cgi-bin/asup.cgi
    support@example.com

node2
    https://asuppost.example.com/cgi-bin/asup.cgi
    https://asupput.example.com/cgi-bin/asup.cgi
    support@example.com
```

## system node autosupport history cancel

Cancel an AutoSupport Transmission.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history cancel` command cancels an active AutoSupport transmission. This command is used to pause or abandon a long running delivery of an AutoSupport message. The cancelled AutoSupport message remains available for retransmission using the [system node autosupport history retransmit](#) command.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to cancel the AutoSupport message. The default setting is localhost.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message you want to cancel.

### **[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

Use this parameter to specify the destination type for the AutoSupport message you want to cancel.

## Examples

Use this command to cancel the AutoSupport message delivery with seq-num 10 to all destinations.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10
```

Use this command to cancel the AutoSupport message delivery with seq-num 10 via HTTP only.

```
cluster1::> system node autosupport history cancel -node local -seq-num 10  
-destination http
```

## Related Links

- [system node autosupport history retransmit](#)

## system node autosupport history retransmit

Selectively retransmit a previously collected AutoSupport.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history retransmit` command retransmits a locally stored AutoSupport message.

Support personnel might ask you to run this command to retransmit an AutoSupport message. You might also retransmit an AutoSupport message if you run the [system node autosupport history show](#) command and notice that a message was not delivered.

If you retransmit an AutoSupport message, and if support already received that message, the support system will not create a duplicate case. If, on the other hand, support did not receive that message, then the AutoSupport system will analyze the message and create a case, if necessary.

Use the [system node autosupport history show](#) command to display the 50 most recent AutoSupport messages, which are available for retransmission.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node from which the AutoSupport message is sent.

### **-seq-num <Sequence Number> - AutoSupport Sequence Number**

Use this parameter to specify the sequence number of the AutoSupport message to retransmit.

### **-uri <text> - Destination to Send this AutoSupport**

Use this parameter to specify the HTTP, HTTPS, FILE, or MAILTO uniform resource indicator (URI) to which the AutoSupport message is sent.

### **[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Transmit Size Limit for this AutoSupport.**

Use this parameter to specify a size limit for the retransmitted AutoSupport message. If the message information exceeds this limit, it will be trimmed to fit the limit you specify. Omit the size limit or set it to 0 to disable it, which is useful to retransmit an AutoSupport message that was truncated by a mail or Web server due to the default size limits.

## Examples

The following example retransmits the AutoSupport message with sequence number 45 on the node "node1" to a support address by e-mail.

```
cluster1::> system node autosupport history retransmit -node node1 -seq
-num 45 -uri mailto:support@example.com
```

## Related Links

- [system node autosupport history show](#)

## system node autosupport history show-upload-details

Display upload details of recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport history show-upload-details` command displays upload details of the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport Sequence Number

- Destination
- Compressed Size
- Percentage Complete
- Rate of upload
- Time Remaining

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Use this parameter to display the following detailed information about all entries:

- AutoSupport Sequence Number
- Destination
- Compressed Size
- Percentage Complete
- Rate of Upload
- Time Remaining

**[-node {<nodename>|local}] - Node**

Use this parameter to display details of AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display details of AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for this AutoSupport**

Use this parameter to display details of AutoSupport messages that were sent to the destination type you specify.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Autosupport Compressed Size**

Use this parameter to display details of AutoSupport messages of the compressed size you specify.

**[-percent-complete <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

**[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[-time-remaining <[<integer>h][<integer>m][<integer>s]>] - Time remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

## Examples

The following example shows the first three results output by the history show-upload-details command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show-upload-details -node
node1
```

Node	Seq Num	Destination	Size	Percent Complete	Rate	Time Remaining
-----						
node1						
	13					
		smtp	755.9KB	100	142.88KBps	0s
		http	755.8KB	80	125.97KBps	10s
		noteto	-	-	-	-
	12					
		smtp	-	-	-	-
		http	316.4KB	100	158.22KBps	0s
		noteto	201B	100	201Bps	0s
	11					
		smtp	-	-	-	-
		http	626.1MB	100	649.56KBps	0s
		noteto	-	-	-	-

Press <space> to page down, <return> for next line, or 'q' to quit... q  
9 entries were displayed.

## system node autosupport history show

Display recent AutoSupport messages

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport history show` command displays information about the 50 most recent AutoSupport messages sent by nodes in the cluster. By default, it displays the following information:

- AutoSupport sequence number
- Destination type, such as smtp
- Status of delivery, such as sent-successful
- Attempt count
- Time of last update

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-delivery ]**

Use this parameter to display destination information about each AutoSupport message.

**| [-detail ]**

Use this parameter to display trigger and subject information about each AutoSupport message.

**| [-instance ] }**

Use this parameter to display the following detailed information about all entries:

- Trigger event
- Subject of the message
- Delivery URI
- Last error
- Compressed Size
- Decompressed Size
- Total Collection Time (in ms)

**[-node {<nodename>|local}] - Node**

Use this parameter to display only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display only AutoSupport messages with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-destination {smtp|http|noteto|retransmit}] - Destination for This AutoSupport**

Use this parameter to display only AutoSupport messages that were sent to the destination type you specify.

**[-trigger <Message Name>] - Trigger Event**

Use this parameter to display only AutoSupport messages that match the trigger event you specify.

**[-last-update <MM/DD/YYYY HH:MM:SS>] - Time of Last Update**

Use this parameter to display only AutoSupport messages that were updated most recently at the time you specify. Specify time in "MM/DD/YYYY HH:MM:SS" format.

**[-status <AutoSupport general status>] - Status of Delivery**

Use this parameter to display only AutoSupport messages with the status you specify. Possible statuses are:

- initializing - The AutoSupport message request is being processed.
- collection-failed - The AutoSupport collection failed. View the 'Last Error' field of this message for more information.

- collection-in-progress - The AutoSupport collection is in progress.
- queued - The AutoSupport message is queued for delivery.
- transmitting - The AutoSupport message transmission is in progress.
- sent-successful - The AutoSupport message was sent successfully.
- ignore - The AutoSupport message was processed successfully, but the trigger event is not configured for delivery to the current destination type.
- re-queued - The AutoSupport message transmission failed, has been re-queued, and will be retried.
- transmission-failed - The AutoSupport message transmission failed, and the retry limit was exceeded.
- ondemand-ignore - The AutoSupport message was processed successfully, but the AutoSupport On Demand server chose to ignore it.

**[-attempt-count <integer>] - Delivery Attempts**

Use this parameter to display only AutoSupport messages that the system has attempted to send the number of times you specify. This parameter is most useful when given a range, such as ">5".

**[-subject <text>] - AutoSupport Subject**

Use this parameter to display only AutoSupport messages of the type you specify.

**[-uri <text>] - Delivery URI**

Use this parameter to display only AutoSupport messages sent to the destination URI you specify.

**[-error <text>] - Last Error**

Use this parameter to display only AutoSupport messages that failed with the "Last Error" description you specify.

**[-generated-on <MM/DD/YYYY HH:MM:SS>] - Time of Generation**

Use this parameter to display only AutoSupport messages that were generated (collected) at a particular time.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Compressed Size**

Use this parameter to display only AutoSupport messages of the compressed size you specify.

**[-percent-complete <integer>] - Percent Complete**

Use this parameter to display the percentage completed for any active (incomplete) AutoSupport message.

**[-upload-rate {<integer>[Bps|KBps|MBps|GBps]|unlimited}] - Rate of Upload**

Use this parameter to display the rate in bytes per second that upload is using currently, otherwise zero when not active.

**[-time-remaining [<integer>h][<integer>m][<integer>s]>] - Time Remaining for Upload**

Use this parameter to display the estimated time for the transmission of the AutoSupport message to complete.

**[-decompressed-size {<integer>[KB|MB|GB|TB|PB]}] - AutoSupport Decompressed Size**

Use this parameter to display only AutoSupport messages of the decompressed size you specify.

### **[-total-time <integer>] - Total Collection Time (ms)**

Use this parameter to display only AutoSupport messages of total collection time you specify. A value is only shown when the collection has completed.

### **Examples**

The following example shows the first three results output by the history command. Note that "q" was pressed at the prompt.

```
cluster1::> system node autosupport history show -node node1
```

Node	Seq Num	Destination	Status	Attempt Count	Last Update
-----					
node1	56				
		smtp	ignore	1	11/18/2010
01:10:01		http	re-queued	2	11/18/2010
02:50:07		noteto	transmitting	1	11/18/2010
01:10:01					
	55				
		smtp	ignore	1	11/18/2010
00:53:59		http	sent-successful	3	11/18/2010
01:50:03		noteto	sent-successful	1	11/18/2010
00:53:59					
	54				
		smtp	ignore	1	11/17/2010
12:18:58		http	sent-successful	4	11/17/2010
16:07:22		noteto	sent-successful	1	11/17/2010
12:18:58					

Press <space> to page down, <return>> for next line, or 'q' to quit... q  
9 entries were displayed.

### **system node autosupport manifest show**

Display AutoSupport content manifest

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node autosupport manifest show` command reports what information is contained in AutoSupport messages. The name and size of each file collected for the message is reported, along with any errors.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-content ]**

Use this parameter to display detailed information about the content of the files contained in the report.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display information about only AutoSupport messages sent from the node you specify.

**[-seq-num <Sequence Number>] - AutoSupport Sequence Number**

Use this parameter to display information about only AutoSupport message content with the sequence number you specify. Sequence numbers are unique to a node. Use this parameter with the `-node` parameter to display information about an individual message.

**[-prio-num <integer>] - Priority Order of Collection**

Use this parameter to display information about only AutoSupport message content with the collection priority you specify. Content is collected in order, by priority number.

**[-sysys <sysys1,sysys2,...>] - Subsystem**

Use this parameter to display information about only AutoSupport message content collected by the AutoSupport subsystem you specify.

**[-cmd-tgt <Execution domain of AutoSupport content>] - Execution Domain for Command**

Use this parameter to display information about only AutoSupport message content produced in the execution domain you specify.

**[-body-file <text>] - The AutoSupport Content Filename for this Data**

Use this parameter to display information about only AutoSupport message content stored in the body file with the file name you specify.

**[-cmd <text>] - Actual Data Being Collected**

Use this parameter to display information about only AutoSupport message content produced by the D-Blade command, BSD command, file, or XML table you specify.

**[-query <text>] - Table Query for XML Collection**

Use this parameter to display information about only AutoSupport message content produced by the table query you specify.

**[-size-collected {<integer>[KB|MB|GB|TB|PB] }] - Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the file size you specify.

**[-time-collected <integer>] - Collection Time for this Data Item (ms)**

Use this parameter to display information about only AutoSupport message content collected in the amount of time you specify, in milliseconds.

**[-status <AutoSupport manifest collection status>] - Status of this Data Item**

Use this parameter to display information about only AutoSupport message content with the collection status you specify. Possible statuses are:

- requested - The AutoSupport request has been added to the queue and is waiting processing by the collector.
- working - The AutoSupport collector is actively gathering the needed data.
- file-not-found - AutoSupport data collection failed because a necessary file is missing.
- no-such-table - The AutoSupport collector was unable to find the requested SMF table.
- collection-truncated-size-limit - AutoSupport data was truncated due to size limits, but partial data is available.
- collection-truncated-file-size-limit - AutoSupport data for a particular data item or file was truncated due to file size limits, but partial data is available.
- collection-skipped-size-limit - AutoSupport data was skipped due to size limits, and no data is available.
- collection-truncated-time-limit - AutoSupport data was truncated due to time limits, but partial data is available.
- collection-skipped-time-limit - AutoSupport data was skipped due to time limits, and no data is available.
- delivery-skipped-size-limit - AutoSupport data was skipped at delivery time due to size limits.
- general-error - AutoSupport data collection failed. Additional information (if any) is in the Error String field.
- completed - AutoSupport data collection is complete, and the AutoSupport message is ready for delivery.
- content-not-collected-precheck - AutoSupport content was not collected due to pre-check function violation.
- content-not-collected-privacy - AutoSupport content was not collected because the operation is disabled in privacy mode.
- content-empty - AutoSupport content was collected successfully, but the output was empty.
- collection-aborted - AutoSupport data collection was aborted.

**[-error <text>] - Textual Description of Error**

Use this parameter to display information about only AutoSupport message content with the error text you specify. If data collection has failed, the error text contains a description of the failure. If data collection completes successfully, this field is empty.

### **[`-content-type` <Type of AutoSupport content>] - AutoSupport Content Type for this Data**

Use this parameter to display information about only AutoSupport message content of the type you specify. Types supported are:

- basic - Configuration data about this subsystem
- troubleshooting - Detailed diagnostic data about this subsystem

### **[`-orig-size-collected` {<integer>[KB|MB|GB|TB|PB]}] - Initial Number of Bytes Collected**

Use this parameter to display information about only AutoSupport message content collected in files with the original file size you specify.

### **[`-size-compressed` {<integer>[KB|MB|GB|TB|PB]}] - Compressed Size**

Use this parameter to display information about only AutoSupport message content collected in files with the compressed file size you specify.

## **Examples**

This example displays the content of AutoSupport message number 372 on the node "node1".

```
cluster1::> system node autosupport manifest show -node node1 -seq-num 372
```

Node	Sequence	AutoSupport Body Filename	Collected Size	Status	Error
node1	372	SYSCONFIG-A.txt	1.73KB	completed	
		OPTIONS.txt	29.44KB	completed	
		software_image.xml	7.56KB	completed	
		CLUSTER-INFO.xml	3.64KB	completed	
		autosupport.xml	12.29KB	completed	
		autosupport_budget.xml	7.01KB	completed	
		autosupport_history.xml	46.52KB	completed	
		X-HEADER-DATA.TXT	717.00B	completed	
		SYSTEM-SERIAL-NUMBER.TXT	35.00B	completed	
		cluster_licenses.xml	3.29KB	completed	
		cm_hourly_stats.gz	151.4KB	completed	
		boottimes.xml	56.86KB	completed	
		rdb_txn_latency_stats_hrly.xml	39.31KB	completed	
		rdb_voting_latency_stats_hrly.xml	3.43KB	completed	

14 entries were displayed.

This example shows how you can use parameters to limit output to specific fields of a specific AutoSupport message. This is helpful when troubleshooting.

```
cluster1::> system node autosupport manifest show -node node5 -seq-num 842
-fields body-file,status,size-collected,time-collected,cmd,cmd-tgt,subsys

```

## system node autosupport trigger modify

### Modify AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use the `system node autosupport trigger modify` command to enable and disable AutoSupport messages for individual triggers, and to specify additional subsystem reports to include if an individual trigger sends an AutoSupport message.

## Parameters

### **-node {<nodename>|local} - Node**

Use this parameter to specify the node whose AutoSupport trigger configuration is modified.

### **-autosupport-message <Autosupport Message> - EMS Message**

Use this parameter to specify the AutoSupport trigger to modify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command, "callhome." is implied, does not need to be entered, and will not be displayed in command output.

### **[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses**

Use this parameter with the value "enabled" to enable sending AutoSupport messages to the configured "to" addresses.

### **[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses**

This parameter has been deprecated and might be removed in a future version of ONTAP. Instead, use the [event notification destination create](#) command to create an email destination and the [event notification create](#) command to map the `important-events` system filter to the newly created event destination. This will send an email notification for all events with a severity of ERROR, ALERT, or EMERGENCY. For events with other severity values, a new event filter needs to be created using the [event filter create](#) command. Filter rules can be added to the filter using the [event filter rule add](#) command. This newly created filter has to be mapped to the event destination.

Use this parameter with the value "enabled" to enable sending short notes to the configured "noteto" addresses.

### **[-basic-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Basic Info**

Use this parameter to include *basic* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

### **[-troubleshooting-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Troubleshooting Info**

Use this parameter to include *troubleshooting* content from the additional subsystems you specify. Content is collected from these subsystems in addition to the default list of subsystems.

### **[-suppress {true|false}] - Suppress all occurrences of this trigger**

Use this parameter with the value "true" to suppress the collection when the AutoSupport message is triggered.

## Examples

The following example enables messages to the configured "to" addresses from the `battery.low` trigger on the node `node1`.

```
cluster1::> system node autosupport trigger modify -node node1
-autosupport-message battery.low -to enabled
```

## system node autosupport trigger show

### Display AutoSupport trigger configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node autosupport trigger show` command displays what system events trigger AutoSupport messages. When a trigger event occurs, the node may send an AutoSupport message to a predefined destination, and a short note to another destination. The full AutoSupport message contains detail for troubleshooting. The short message is meant for short pager or SMS text messages.

Use the [system node autosupport destinations show](#) command to view available destinations.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-basic ]**

Use this parameter to display which subsystem information is included as *basic* content when the AutoSupport message is triggered.

**| [-troubleshooting ]**

Use this parameter to display which subsystem information is included as *troubleshooting* content when the AutoSupport message is triggered.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to display AutoSupport triggers only on the node you specify.

**[-autosupport-message <Autosupport Message>] - EMS Message**

Use this parameter to display only AutoSupport triggers with the name you specify. AutoSupport triggers are EMS messages whose names begin with "callhome.". However, for the purposes of this command,

"callhome." is implied, does not need to be entered, and will not be displayed in command output.

### **[-to {enabled|disabled}] - Deliver to AutoSupport -to Addresses**

Use this parameter with the value "enabled" to display only AutoSupport messages that send full messages to the "to" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send full messages.

### **[-noteto {enabled|disabled}] - (DEPRECATED) Deliver to AutoSupport -noteto Addresses**

This parameter has been deprecated and might be removed in a future version of Data ONTAP.

Use this parameter with the value "enabled" to display only AutoSupport messages that send short notes to the "noteto" address when triggered. Use this parameter with the value "disabled" to display only AutoSupport messages that do not send short notes.

### **[-basic-default <subsys1,subsys2,...>,...] - Default Subsystems Reporting Basic Info**

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *basic* content from the subsystems you specify.

### **[-troubleshooting-default <subsys1,subsys2,...>,...] - Default Subsystems Reporting Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that include in their messages, by default, *troubleshooting* content from the subsystems you specify.

### **[-additional-content <Type of AutoSupport content>,...] - Additional Content Flag**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* or *troubleshooting* content.

### **[-basic-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Basic Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *basic* content from the subsystems you specify.

### **[-troubleshooting-additional <subsys1,subsys2,...>,...] - Additional Subsystems Reporting Troubleshooting Info**

Use this parameter to display only AutoSupport triggers that have been configured to include additional *troubleshooting* content from the subsystems you specify.

### **[-suppress {true|false}] - Suppress all occurrences of this trigger**

Use this parameter with the value "true" to display only AutoSupport messages that have been suppressed.

## **Examples**

This example shows the first page of output from the command. Note that "q" was pressed at the prompt to quit.

```
cluster1::> system node autosupport trigger show
```

Node	AutoSupport Message	To	Note To	Additional Content
node1	aggr.offline	enabled	enabled	-
node1	aggr.restricted	disabled	enabled	-
node1	aggr.wafliron	disabled	enabled	-

## system node coredump delete-all

Delete all coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump delete-all` command deletes either all unsaved core dumps or all saved core files on a node. You can specify whether saved core files or unsaved core dumps are deleted by using the optional `-saved` parameter. If the command is issued while a core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

### **-node <nodename> - Node That Owns the Coredump**

This specifies the node from which core files or core dumps are to be deleted.

### **[-type {unsaved-kernel|saved-kernel|kernel|application|all}] - Type of Core to delete**

This parameter specifies the type of core file to be deleted. If the type is `unsaved`, all unsaved core dumps will be deleted. If the type is `saved`, all saved core files will be deleted. If the type is `kernel`, all kernel core files and kernel core dumps will be deleted. If the type is `application`, all application core files will be deleted. If the type is `all`, all core files will be deleted. The default setting is to delete only unsaved kernel core dumps and core files.

## Examples

The following example deletes all unsaved kernel core dumps on a node named `node0`:

```
cluster1::> system node coredump delete-all -node node0
```

## system node coredump delete

### Delete a coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node coredump delete` command deletes a specified core dump. If the command is issued while the specified core dump is being saved, the command prompts you before stopping the save operation and deleting the core dump.

## Parameters

### **-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node from which core files are to be deleted.

### **[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This specifies the type of core file to be deleted. If the type is `kernel`, the specified kernel core file will be deleted. If the type is `application`, the specified application core file will be deleted.

### **-corename <text> - Coredump Name**

This specifies the core file that is to be deleted.

## Examples

The following example deletes a core dump named `core.101268397.2010-05-30.19_37_31.nz` from a node named `node0`:

```
cluster1::> system node coredump delete -node node0 -corename
core.101268397.2010-05-30.19_37_31.nz
```

## system node coredump save-all

Save all unsaved kernel coredumps owned by a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump save-all` saves all unsaved core dumps on a specified node. If the node has already attempted to save the core dump by the value set by the `-save-attempts` parameter, the command prompts you before continuing. The `save-attempts` parameter is set by invoking the command `system node coredump config modify`.

### Parameters

**-node <nodename> - Node That Owns the Coredump**

This specifies the node on which unsaved core dumps are to be saved.

### Examples

The following example saves all unsaved core dumps on a node named node0:

```
cluster1::> system node coredump save-all -node node0
```

## system node coredump save

Save an unsaved kernel coredump

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump save` command saves a specified core dump. If the node has already attempted to save the core dump by the value specified by the `-save-attempts` parameter, the command prompts you before continuing. The `-save-attempts` parameter is set by invoking the command [system node coredump config modify](#). A saved core dump can be uploaded to a remote site for support analysis; see the [system node coredump upload](#) command man page for more information.

### Parameters

**-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the core dump is located.

**-corename <text> - Coredump Name**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on a node named `node0`:

```
cluster1::> system node coredump save -node node0 -corename
core.101268397.2010-05-30.19_37_31.nz
```

## system node coredump show

Display a list of coredumps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump show` command displays basic information about core dumps, such as the core dump name, time of panic that triggered the core dump and whether the core file is saved. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of kernel core files, run the command with `-type kernel`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-system ]**

If you specify this parameter, the command displays the following information:

- Node name
- Core dump name
- Core dump ID
- Node that panicked and generated the core
- System ID of the node that panicked and generated the core
- Version of the core

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node That Owns the Coredump**

If you specify both this parameter and the `-corename` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays

information about the core files on the specified node.

### **[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This parameter specifies the type of core files to be displayed. If the type is kernel and the system supports segmented core files, the command displays information about primary kernel core segment files. If the type is kernel and the system does not support segmented core files, the command displays information about full core files. If the type is ancillary-kernel-segment, the command displays information about ancillary kernel core segment files. If the type is application, the command displays information about application core files. If no type is specified, the command displays information about core files of type kernel or application.

### **[-corename <text>] - Coredump Name**

If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified core. If you specify this parameter by itself, the command displays information about the core files that match the specified name.

### **[-panic-node <text>] - Node That Generated Core**

If you specify this parameter with a node name, the command displays information only about the core files that were generated when the specified node panicked.

### **[-panic-systemid <integer>] - System ID of Node That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated when the node with the specified system ID panicked.

### **[-version <text>] - Data ONTAP Version of Core**

If you specify this parameter, the command displays information only about the core files that match the specified version.

### **[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

If you specify this parameter, the command displays information only about the core files that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS` `[- HH:MM]_` ``. You can use ``_[- HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+- HH:MM]` is relative to UTC.

### **[-panic-string <text>] - Panic String**

If you specify this parameter, the command displays information only about the core files that match the specified panic string.

### **[-is-saved {true|false}] - Saved Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not saved yet to a core file.

### **[-is-partial {true|false}] - Partial Core**

If you specify this parameter, the command displays information only about the core dumps that are or are not partially saved.

### **[-save-attempts <integer>] - Number of Attempts to Save Core**

If you specify this parameter, the command displays information only about the core dumps that have the specified number of successful or failed save attempts.

**[-space-needed {<integer>[KB|MB|GB|TB|PB] }] - Space Needed To Save Core**

If you specify this parameter, the command displays information only about the core dumps that need the specified amount of disk space to save into a core file.

**[-size <text>] - Size of Core (bytes)**

If you specify this parameter, the command displays information only about the saved core files that are of the specified size.

**[-md5-data-chksum <text>] - MD5 Checksum of the Compressed Data of Core**

If you specify this parameter, the command displays information only about the saved core files that have the specified MD5 checksum for compressed data of the core.

**[-ancillary-segment-directory <text>] - Directory Holding Ancillary Kernel Core Segments**

If you specify this parameter, the command displays information only about the saved core files that have the specified ancillary segment directory.

## Examples

The following examples display information about the core files:

```
cluster1::> system node coredump show
Node   Core Name                               Saved   Panic Time
-----
node0
  core.101182345.2010-02-01.14_19_08.nz      false   2/1/2010 09:19:08
  Partial Core: false
  Number of Attempts to Save Core: 2
  Space Needed To Save Core: 4.45GB
node1
  core.101268397.2010-05-30.19_37_31.nz      true    5/30/2010 15:37:31
node2
  core.101270930.2010-09-06.18_40_03.nz      true    9/6/2010 14:40:03
node3
  core.101271326.2010-09-06.19_06_18.nz      true    9/6/2010 15:06:18
  core.101271326.2010-09-06.19_09_49.nz      true    9/6/2010 15:09:49
4 entries were displayed.
```

```
cluster1::> system node coredump show -panic-time 9/6/2010 15:00:00+3:00
Node   Core Name                               Saved   Panic Time
-----
node3
      core.101271326.2010-09-06.19_06_18.nz    true   9/6/2010 15:06:18
      core.101271326.2010-09-06.19_09_49.nz    true   9/6/2010 15:09:49
2 entries were displayed.
```

## system node coredump status

### Display kernel coredump status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump status` command displays status information about core dumps. The command output depends on the parameters specified with the command. If a core dump is in the process of being saved into a core file, the command also displays its name, the total number of blocks that are to be saved, and the current number of blocks that are already saved.

You can specify additional parameters to display only information that matches those parameters. For example, to display coredump status information about the local node, run the command with the parameter `-node local`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-disks ]**

If you specify this parameter, the command displays the following information:

- Node name
- Total number of disks
- Number of spare disks
- Number of disks used
- Number of disks with partial cores

**| [-spraycore ]**

If you specify this parameter, the command displays the following information:

- Node name
- Whether spray cores are supported
- Number of spray-core disks

- Number of spray-core blocks
- Number of disks needed for spray core
- Estimated number of blocks needed for spray core

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the following information:

- Node name
- State of the core-dump process
- Space available on the internal file system
- Name of the core being saved, if applicable
- Total number of blocks in the core being saved, if applicable
- Number of blocks currently saved, if applicable
- Type of core dump
- Number of unsaved complete cores on the node
- Number of unsaved partial cores on the node
- Whether spray cores are supported on the node
- Whether any spare disks are available on the node
- Number of disks that have cores
- Number of unsaved cores
- Number of disks that have partial cores
- Number of partial cores
- Number of unused spray-core disks
- Number of spray-core blocks
- Number of disks available for core dumps
- Estimated number of blocks needed for spray core
- Number of disks needed for spray core

**[-state <text>] - State**

If you specify this parameter, the command displays information only about the nodes that are in the specified core dump state. Possible values include: `nocore`, `idle`, `init`, `saving`, and `waitdump`.

**[-space-available {<integer>[KB|MB|GB|TB|PB] } ] - Space Available On Internal Filesystem**

If you specify this parameter, the command displays information only about the nodes that have the specified amount of available space, in bytes, on their internal file systems.

**[-corename <text>] - Name of Core Being Saved**

If you specify this parameter, the command displays information only about the node that is currently saving the specified core file name.

**[`-total-blocks` <integer>] - Total Number of Blocks in Core Being Saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks in the core dump being saved.

**[`-blocks-saved` <integer>] - Number of Blocks saved**

If you specify this parameter, the command displays information only about the nodes that have the specified number of blocks saved.

**[`-type` <text>] - Type of Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified core dump type. Possible values include zipped, sprayed, and spare.

**[`-spraycore-supported` {true|false}] - Spray Core Supported on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not support the spray method of dumping core.

**[`-spares-available` {true|false}] - Spare Disk(s) Available on Node**

If you specify this parameter, the command displays information only about the nodes that do or do not have spare disks available.

**[`-disks-used` <integer>] - Number of Disks with Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks that contain core dumps.

**[`-unsaved-cores` <integer>] - Number of Unsaved Complete Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of complete core dumps that are not yet saved into a core file.

**[`-partial-disks` <integer>] - Number of Disks with Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks with partial core dumps.

**[`-partial-cores` <integer>] - Number of Unsaved Partial Cores**

If you specify this parameter, the command displays information only about the nodes that have the specified number of partial core dumps that are not yet saved into a core file.

**[`-spraycore-disks` <integer>] - Number of Unused Spray Core Disks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of unused spray-core disks.

**[`-spraycore-blocks` <integer>] - Number of Spray Core Blocks**

If you specify this parameter, the command displays information only about the nodes that have the specified number of spray-core blocks.

**[`-numdisks` <integer>] - Total Number of Disks Available for Core Dump**

If you specify this parameter, the command displays information only about the nodes that have the specified total number of disks available for core dump.

**[`-blocks-needed` <integer>] - Estimated Number of Blocks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the

specified number of estimated blocks needed for the spray method of dumping core.

**[`-disks-needed <integer>`] - Number of Disks Needed for Spray Core**

If you specify this parameter, the command displays information only about the nodes that have the specified number of disks needed for the spray method of dumping core.

**[`-space-needed {<integer>[KB|MB|GB|TB|PB]}`] - Space Needed to Save All Unsaved Cores**

If you specify this parameter, the command displays information only about the nodes that require the specified amount of disk space to save all unsaved core dumps.

**[`-min-free {<integer>[KB|MB|GB|TB|PB]}`] - Minimum Free Bytes on Root Filesystem**

If you specify this parameter, the command displays information only about the nodes that need to have the specified number of bytes available on the root filesystem after a core dump is saved.

## Examples

The following example displays core dump information about the node named node0:

```
cluster1:> system node coredump status -node node0 -instance
Node: node0

                                State: idle
    Space Available On Internal Filesystem: 132.1GB
              Name of Core Being Saved: -
Total Number of Blocks in Core Being Saved: -
              Number of Blocks saved: -
              Type of core dump: spray
    Number of Unsaved Complete Cores: 0
    Number of Unsaved Partial Cores: 1
    Space Needed To Save All Unsaved Cores: 4.81GB
    Minimum Free Bytes On Internal Filesystem: 250MB
```

## system node coredump trigger

Make the node dump system core and reset

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command triggers a Non-maskable Interrupt (NMI) on the specified node via the Service Processor of that node, causing a dirty shutdown of the node. This operation forces a dump of the kernel core when halting the node. LIF migration or storage takeover occurs as normal in a dirty shutdown. This command is different from the `-dump` parameter of the `system node shutdown`, [system node halt](#), or [system node reboot](#) command in that this command uses a control flow through the Service Processor of the remote node, whereas the `-dump` parameter uses a communication channel between Data ONTAP running on the nodes. This command is helpful in cases where Data ONTAP on the remote node is hung or does not respond for some reason. If the panic node reboots back up, then the generated coredump can be seen by using the [system node coredump show](#) command. This command works for a single node only and the full name of the node must be entered exactly.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node for which you want to trigger a coredump.

## Examples

The following example triggers a NMI via the Service Processor and causes node2 to panic and generate a coredump. Once node2 reboots back up, the command [system node coredump show](#) can be used to display the generated coredump.

```
cluster1::> set advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.

Do you want to continue? {y|n}: y

```
cluster1::*> system node coredump trigger -node node2
```

Warning: The Service Processor is about to perform an operation that will cause

a dirty shutdown of node "node2". This operation can cause data loss. Before using this command, ensure that the

cluster

will have enough remaining nodes to stay in quorum. To reboot or

halt

a node gracefully, use the "system node reboot" or "system node

halt"

command instead. Do you want to continue? {yes|no}: yes

Warning: This operation will reboot the current node. You will lose this login

session. Do you want to continue? {y|n}: y

```
cluster1::*>
```

```
cluster1::> system coredump show
```

Node:	Type	Core Name	Saved	Panic Time
-------	------	-----------	-------	------------

-----	-----	-----	-----	-----
-----	-----	-----	-----	-----

node2:	kernel			
--------	--------	--	--	--

	core.1786429481.2013-10-04.11_18_37.nz	false	10/4/2013	
--	--	-------	-----------	--

11:18:37

Partial Core: false

Number of Attempts to Save Core: 0

Space Needed To Save Core: 3.60GB

1 entries were displayed.

```
cluster1::>
```

## system node coredump upload

(DEPRECATED)-Upload a coredump to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command is deprecated and might be removed in a future release of Data ONTAP. Use "[system node autosupport invoke-core-upload](#)" instead.

The `system node coredump upload` command uploads a saved core file to a specified URL. You should use this command only at the direction of technical support.

### Parameters

**-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node on which the core file is located.

**[-type {kernel|ancillary-kernel-segment|application}] - Coredump Type**

This specifies the type of core files to be uploaded. If the type is `kernel`, kernel core files will be uploaded. If the type is `application`, application core file will be uploaded.

**-corename <text> - Coredump Name**

This specifies the name of the core file that is to be uploaded.

**[-location <text>] - URL for Coredump Upload Directory**

This specifies the URL to which the core file is to be uploaded. If this parameter is not specified, the command uploads the core file to the location specified by the `-upload-location` parameter of the [system node coredump config modify](#) command. The following protocols are supported: `ftp` and `http`. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

**[-casenum <integer>] - Case Number**

This specifies the support case number that will be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

### Examples

The following example uploads a core file named `core.07142005145732.2010-10-05.19_03_41.nz` on a node named `node0` to the default location. The support case number is `2001234567`.

```
cluster1::> system node coredump upload -node node0 -corename
core.07142005145732.2010-10-05.19_03_41.nz -casenum 2001234567
```

## system node coredump config modify

### Modify coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump config modify` command modifies the cluster's core dump configuration.

### Parameters

**-node {<nodename>|local} - Node**

This parameter specifies the node whose coredump configuration you want to modify.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you set this parameter to true, the command enables sparse cores. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays the number of bytes that need to be made available in the root file system after saving the core dump. If the minimum number of bytes cannot be guaranteed, core dumps are not generated. The default setting is 250 MB.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays the maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures. The default setting is 2.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays the maximum number of times the system will attempt to save a core dump. The default setting is 2.

**[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you set this parameter to true, the system will automatically start saving the core dump after reboot.

**[-upload-location <text>] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" command instead.

If you specify this parameter, the system uploads the core dumps to the specified URL. The following protocols are supported: ftp and http. (The default setting is <ftp://ftp.netapp.com/to-ntap/>.)

### Examples

The following example sets the maximum number of core dump attempts to 5 and the maximum number of save attempts to 5:

```
cluster1::> system node coredump config modify -coredump-attempts 5 -save
-attempts 5
```

## Related Links

- [system node autosupport invoke-core-upload](#)

## system node coredump config show

### Display coredump configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump config show` command displays basic information about a cluster's core dump configuration, such as whether sparse cores are enabled, minimum number of free bytes on the root volume file system that need to be available after saving the core files, maximum number of times the process attempts to generate a core dump when encountering repeated disk failures, maximum number of times the process attempts to save a core dump, the URL to which core dumps are uploaded, and whether core dumps are automatically saved when a node restarts.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the coredump configuration information of the specified node.

**[-sparsecore-enabled {true|false}] - Enable Sparse Cores**

If you specify this parameter, the command displays only the coredump information that matches the specified sparse core setting. A sparse core omits all memory buffers that contain only user data.

**[-min-free {<integer>[KB|MB|GB|TB|PB]}] - Minimum Free Bytes On Root Filesystem**

If you specify this parameter, the command displays only the core dump information that matches the specified number of bytes that need to be made available in the root file system after saving the core dump.

**[-coredump-attempts <integer>] - Maximum Number Of Attempts to Dump Core**

If you specify this parameter, the command displays only the core dump information that matches the specified maximum number of times the system will attempt to generate a core dump when encountering repeated disk failures.

**[-save-attempts <integer>] - Maximum Number Attempts to Save Core**

If you specify this parameter, the command displays only the coredump information that matches the maximum number of times the system will attempt to save a core dump.

**[-save-onstartup {true|false}] - Enable Auto Save of Coredumps on Startup**

If you specify this parameter, the command displays only the coredump information that matches the

specified configuration of whether the system will automatically start saving the core dump after reboot.

### **[`-upload-location <text>`] - URL for Coredump Upload Directory**

This option is deprecated and might be removed in a future release of Data ONTAP. Use the `-uri` parameter of the "[system node autosupport invoke-core-upload](#)" command instead.

If you specify this parameter, the command displays only the core dump information that matches the specified URL where core dumps are uploaded.

### **Examples**

The following example displays information about the cluster's core dump configuration:

```
cluster1::> system node coredump config show
      Sparse      Min      Max      Max On
      Core      Free      Dump      Save Startup
Node  Enabled      Bytes Attempts Attempts Enabled Coredump Location
-----
node0
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node1
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node2
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
node3
      true      250MB      2      2 true      ftp://ftp.example.com/to-
example/
4 entries were displayed.
```

## **system node coredump external-device save**

Save a coredump to an external USB device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

The `system node coredump external-device save` command saves a specified core dump to an external USB device plugged into the port specified by the `-device` parameter.

External USB device requirements:

- A device formatted as FAT32 can be used to save a core dump smaller than 4GB.
- To save a core dump larger than 4GB, format the device with the ext2 filesystem with the largefile flag set.
  - + This can be done using the following command on a Linux host: `mkfs.ext2 -T largefile <device_name>`
- The command `system node coredump show` can be used to determine the size of the core dump.

## Parameters

**-node {<nodename>|local} - Node That Owns the Coredump (privilege: advanced)**

This specifies the node on which the core dump is located.

**-device {usb0|usb1} - Device (privilege: advanced)**

This specifies the port on the node to which the external USB device is connected, for example: usb0.

**-corename <text> - Coredump Name (privilege: advanced)**

This specifies the core dump that is to be saved.

## Examples

The following example saves a core dump named `core.101268397.2010-05-30.19_37_31.nz` on node1 to an external USB device in port usb0:

```
cluster1::> system node coredump external-device save -node node1 -device
usb0 -corename core.101268397.2010-05-30.19_37_31.nz
```

## Related Links

- [system node coredump show](#)

## system node coredump external-device show

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node coredump external-device show` command displays basic information about files on an external USB device, such as the filename and size.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-node {<nodename>|local} - Node That Owns the Coredump (privilege: advanced)**

This parameter selects the node that has files that are to be displayed on the external USB device.

**[-device {usb0|usb1}] - Device (privilege: advanced)**

This parameter specifies the name of the external device, for example: usb0.

**[-corename <text>] - Coredump Name (privilege: advanced)**

This parameter specifies the core dump file for which the information is displayed.

**[-size {<integer>[KB|MB|GB|TB|PB]}] - Size of Core (privilege: advanced)**

If specified, the command displays information only about the core files that are of the specified size.

## Examples

The following example displays information about core files stored on external USB devices:

```
cluster1::> system node coredump external-device show
Node                               Device  Coredump Name
-----
node1                             usb0    core.537051938.2017-10-26.23_52_15.nz
                                         Size: 13074695581 bytes (12.18) GB
```

## system node coredump reports delete

Delete an application core report

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump reports delete` command deletes the specified application core report.

### Parameters

**-node {<nodename>|local} - Node That Owns the Coredump**

This specifies the node from which reports are to be deleted.

**-reportname <text> - Report Name**

This specifies the report that is to be deleted.

## Examples

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report` is deleted from a node named `node0`:

```
cluster1::> system node coredump reports delete -node node0 -reportname
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report
```

## system node coredump reports show

Display a list of application core reports

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node coredump reports show` command displays basic information about application core reports, such as the report name and time of the panic that triggered the application core dump. You can specify optional parameters to display information that matches only those parameters. For example, to display the list of reports in the local node, run the command with `-node local`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node That Owns the Coredump**

Selects information about all the reports on the specified node. If you specify both this parameter and the `-reportname` parameter, the command displays detailed information about the specified report.

**[-reportname <text>] - Report Name**

Selects information about the reports that match the specified name. If you specify both this parameter and the `-node` parameter, the command displays detailed information about the specified report.

**[-panic-node <text>] - Node That Generated Core**

Selects information about the reports that were generated by the specified node.

**[-panic-systemid <integer>] - System ID of Node That Generated Core**

Selects information about the reports that were generated by the node with the specified system ID.

**[-version <text>] - Data ONTAP Version of Core**

Selects information about the reports that match the specified version.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the reports that were generated by a panic at the specified time. Specify time in the format of `MM/DD/YYYY HH:MM:SS [- HH:MM]_```. You can use ```[- HH:MM]` to specify the time range within which all core files triggered by a panic are displayed. `[+- HH:MM]` is relative to UTC.

### **`[-panic-string <text>]` - Panic String**

Selects information about the reports that match the specified panic string.

### **Examples**

The following example displays information about the reports:

```
cluster1::> system node coredump reports show
Node      Report Name                                     Panic Time
-----
node0     notifyd.1894.80335005.2011-03-25.09_59_43.ucore.report  3/25/2011
09:59:43
```

## **system node coredump reports upload**

(DEPRECATED)-Upload an application core report to a remote site

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command is deprecated and might be removed in a future release of Data ONTAP. See core report information in the SmartSoft tool.

The `system node coredump reports upload` command uploads an application report to a specified URL. You should use this command only at the direction of technical support.

### **Parameters**

#### **`-node {<nodename>|local}` - Node That Owns the Coredump**

This specifies the node on which the report is located.

#### **`-reportname <text>` - Report Name**

This specifies the name of the report that is to be uploaded.

#### **`[-location <text>]` - URL for Coredump Upload Directory**

This specifies the URL to which the report is to be uploaded. The following protocols are supported: ftp and http. (By default, the location is set to <ftp://ftp.netapp.com/to-ntap/>)

#### **`[-casenum <integer>]` - Case Number**

This specifies the support case number that is be prefixed to the core file name at the destination. The case number is critical information for quick and automated processing of the received core file.

### **Examples**

The following example shows how a report named `notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2` is uploaded on a node named `node0` to the default location. The support case number is `2001234567`.

```
cluster1::> system node coredump reports upload -node node0 -corename  
notifyd.1894.80335005.2011-03-25.09_59_43.ucore.bz2 -casenum 2001234567
```

## system node coredump segment delete-all

Delete all core segments on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes all the core segments on a node.

### Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

### Examples

This deletes all the core segments for *node1* .

```
cluster1::> system node coredump segment delete-all -node node1
```

## system node coredump segment delete

Delete a core segment

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command deletes a core segment.

### Parameters

**-node {<nodename>|local} - Node**

This specifies the node on which to delete the core segments.

**-segment <text> - Core Segment**

This specifies the core segment to delete. The pathname is relative to the coredump directory. If a directory is specified, all core segment files within it are deleted. If the directory is empty, it is deleted.

**[-owner-node <text>] - Node That Owns the Core Segment File**

This specifies the node that owns the core segment. Use this parameter only in takeover mode to delete a partner's coredump segment.

## Examples

This deletes all core segments in the directory, `core.151708240.2012-01-11.05_56_52`.

```
cluster1::> system node coredump segment delete -node node1 -segment
core.151708240.2012-01-11.05_56_52
```

## system node coredump segment show

Display a list of core segments

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the following information about core segments:

- name of the core segment directory
- time of the panic that generated the core segment
- total number of core segment files
- core segment file name

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

Displays the following details:

- Core segment file name
- Node that owns the core segment file
- System ID of the node that generated the core
- MD5 checksum of the compressed data of the core segment file
- Name of the core segment
- Total number of core segments for the core file
- Timestamp of the panic that triggered the core segment

**[-node {<nodename>|local}] - Node**

Selects information about the core segments on the specified node.

**[-segment <text>] - Core Segment**

Selects information about the specified core segment. If segment is a directory, the command displays the information for the first core segment file. If segment is a file, the command displays the file information.

**[-owner-node <text>] - Node That Owns the Core Segment File**

Selects information about the core segments owned by the specified node. This parameter should only be used in takeover mode to display information about the partner's core segments.

**[-panic-system-id <integer>] - System ID of Node That Generated Core**

Selects information about the core segments that were generated when the node with the specified system ID panicked.

**[-md5-data-chksum <text>] - Md5 Checksum of the Compressed Data of the Core Segment**

Selects information about the core segments whose data segment's MD5 checksum matches the specified checksum.

**[-segment-name <text>] - Name of the Core Segment**

Selects information about the core segments with the specified name.

**[-total-segment-count <integer>] - Number of Segments Generated**

Selects information about the core segments with the specified name.

**[-panic-time <MM/DD/YYYY HH:MM:SS>] - Time of Panic That Generated Core**

Selects information about the core segments that were generated by a panic at the specified time.

**[-size <text>] - Size of Core Segment (bytes)**

Selects information about the core segments that are of the specified size.

**[-panic-string <text>] - Panic String of Panic That Generated Core**

Selects information about the core segments that match the specified panic string.

## Examples

The example below displays the core segments on *node1*.

```
cluster1:> system node coredump segment show -node node1
Node: node1
Segment Directory: core.118049106.2012-01-05.17_11_11
                  Panic Time: 1/5/2012 12:11:11
                  Number of Segments: 2
                  Segment File Name:
                                core.118049106.2012-01-05.17_11_11.nvram.nz
                                core.118049106.2012-01-05.17_11_11.ontap.nz
2 entries were displayed.
```

The example below displays detailed information a specific core segment file on *node1*.

```

cluster1::> system node coredump segment show -node node1 -segment
core.118049106.2012-01-05.17_11_11.ontap.nz -instance
Node: node1
Core Segment: core.118049106.2012-
01-05.17_11_11.ontap.nz
Node That Owns the Core Segment File: node1
System ID of Node That Generated Core: 118049106
Md5 Checksum of the Compressed Data of the Core Segment:
1a936d805dcd4fd5f1180fa6464fdee4
Name of the Core Segment: ontap
Number of Segments Generated: 2
Time of Panic That Generated Core: 1/5/2012 12:11:11

```

## system node environment sensors show

Display the sensor table

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node environment sensors show` command displays the following information:

- Node name
- Sensor name
- Sensor state
- Sensor value
- Sensor units
- Critically Low threshold for the sensor
- Warning Low threshold for sensor
- Warning High threshold for sensor
- Critically High threshold for the sensor
- FRU name (detailed view only)

### Parameters

**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about the sensors on the specified node. If this parameter is specified with the -name parameter, the command displays information only about the specified sensor.

**[-name <text>] - Sensor Name**

Selects information about the sensors that have the specified name. If this parameter is specified with the -node parameter, the command displays information only about the specified sensor.

**[-fru <text>] - FRU**

Selects information about the sensors associated with the specified Field Replaceable Unit (FRU).

**[-type {fan|thermal|voltage|current|battery-life|discrete|fru|nvram|counter|minutes|percent|agent|unknown}] - Sensor Type**

Selects information about the sensors that have the specified sensor type. Possible values vary among platforms but may include *fan*, *temperature*, *thermal* and *voltage*.

**[-units <text>] - Value Units**

Selects information about the sensors that have readings displayed in the specified units of measure. Possible values vary among platforms but may include *RPM*, *C* and *mV*.

**[-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Sensor State**

Selects information about the sensors that have the specified state. Possible values vary among platforms but may include *normal*, *warn\_lo*, *warn\_hi*, *crit\_lo*, *crit\_hi* and *failed*.

**[-discrete-state {normal|warn-low|warn-high|crit-low|crit-high|disabled|uninitialized|init-failed|not-available|invalid|retry|bad|not-present|failed|ignored|fault|unknown}] - Discrete Sensor State**

Selects information about the discrete-valued sensors that are in the specified state. A discrete-valued sensor has a set of possible discrete values rather than a range of possible values. For example, a presence sensor which has the discrete values PRESENT and NOT\_PRESENT is a discrete-valued sensor. Possible values vary among platforms but may include *normal* and *failed*.

**[-value <integer>] - Last Sensor Value**

Selects information about the sensors that have the specified sensor value.

**[-discrete-value <text>] - Discrete Sensor Value**

Selects information about the discrete-valued sensors that have the specified discrete value. Possible values vary among sensors but may include *PRESENT*, *NOT\_PRESENT*, *ON*, *OFF*, *OK* and *FAULT*.

**[-crit-low <integer>] - Critical Low Threshold**

Selects information about the sensors that have the specified critically low threshold.

**[-warn-low <integer>] - Warning Low Threshold**

Selects information about the sensors that have the specified warning-low threshold.

**[-warn-hi <integer>] - Warning Hi Threshold**

Selects information about the sensors that have the specified warning-high threshold.

### **[-crit-hi <integer>] - Critical Hi Threshold**

Selects information about the sensors that have the specified critically high threshold.

### **[-inactive {true|false}] - Show Inactive Sensors**

Specify *true* to include inactive sensors in the output. By default, only sensors with the value *false* are shown.

### **[-hidden {true|false}] - Show Hidden Sensors**

Specify *true* to include hidden sensors in the output. By default, only sensors with the value *false* are shown.

## **Examples**

The following example displays information about all sensors on a cluster named cluster1:

```
cluster1::> system node environment sensors show

system node external-cache modify

Modify external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node external-cache modify` command can be used to modify the following attributes of external-cache for a node:

- `is-enabled`
- `is-rewarm-enabled`
- `is-mbuf-inserts-enabled`
- `pcs-size`
- `is-hya-enabled`

## Parameters

**`-node {<nodename>|local}` - Node**

This specifies the node on which the modifications need to be made.

**`[-is-enabled {true|false}] - Is Enabled?`**

Enables external-cache module (Flash Cache Family) on the storage system. Valid values for this option are true and false. If external-cache hardware is present, then this option will enable external-cache functionality in WAFL. If no hardware is present, this option will enable external-cache pcs (Predictive Cache Statistics). The default value for this option is false.

**`[-is-rewarm-enabled {true|false}] - Is Rewarm On?`**

Specifies whether an external-cache module should attempt to preserve data across reboots. Valid values for this option are true and false. This option applies only to cache hardware with persistent media. It does not apply to Predictive Cache Statistics (PCS). Enabling this option will marginally increase the duration of system boot and shutdown, but it will reduce or eliminate the time required for cache warming. The default value for this option is determined by the cache hardware type. The option is disabled by default.

**`[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf Inserts On?`**

Specifies whether the external-cache module allows insert of mbuf data as part of a network write. In rare cases, inserting mbuf data may cause excessive CPU usage. We provide this workaround to disable the behavior, if necessary. Do not change the value of this option unless directed to do so by technical support. The data from the mbuf network writes can still be stored in the external cache, but only after a subsequent disk read of that data.

**`[-pcs-size <integer>] - PCS Size`**

Controls the size of the cache emulated by external-cache PCS. Valid values for this option are integers between 16 and 16383. This option is only used when PCS is enabled. The default value for this option is chosen automatically based on the amount of memory in the controller, and the upper limit is further restricted on controllers with smaller amounts of memory.

**`[-is-hya-enabled {true|false}] - Is HyA Caching Enabled?`**

Specifies whether the external-cache module allows caching of blocks targeted for hybrid aggregates. This option is set to true by default when the external-cache is enabled.

## Examples

```
cluster::> system node external-cache modify -node node1 -is-enabled true
```

The command enables the external-cache feature on `node1` .

## system node external-cache show

Display external cache settings.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node external-cache show` command displays external-cache information for each of the nodes available.

### Parameters

**{ [-fields <fieldname>,...]**

Valid values for this option are {node|is-enabled|is-rewarm-enabled|is-mbuf-inserts-enabled|pcs-size|is-hya-enabled} . Specifying the value will display all entries that correspond to it.

**| [-instance ] }**

This option does not need an input value. Specifying this option will display the information about all the entries.

**[-node {<nodename>|local}] - Node**

Specify this parameter to display external-cache parameters that match the specified node.

**[-is-enabled {true|false}] - Is Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-rewarm-enabled {true|false}] - Is Rewarm On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-is-mbuf-inserts-enabled {true|false}] - Is Mbuf Inserts On?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

**[-pcs-size <integer>] - PCS Size**

Valid values for this option are integers between 16 and 16383. Specifying the value will display all entries that correspond to it.

**[-is-hya-enabled {true|false}] - Is HyA Caching Enabled?**

Valid values for this option are true and false. Specifying the value will display all entries that correspond to it.

### Examples

```
cluster1::> system node external-cache show -node node1
Node: node1
      Is Enabled: false
      Is rewarm on: false
      Is Mbuf inserts on: true
      PCS size: 256
      Is hya caching enabled: true
```

Displays the external-cache information about `node1` in a list format.

## system node firmware download

Download motherboard firmware and system diagnostics

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node firmware download` command downloads new system firmware to the boot device. A reboot followed by the 'update\_flash' command at the firmware prompt is required for the firmware to take effect.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node or nodes on which the firmware is to be updated.

**-package <text> - Package URL (privilege: advanced)**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

### Examples

The following example downloads firmware to node-01 from a web server:

```
cluster1::*> system node firmware download -node node-01 -package
http://example.com/serviceimage.zip
```

## system node hardware nvram-encryption modify

Configure NVRAM device encryption

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node hardware nvram-encryption modify` command configures the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

This feature might be restricted in some countries due to local regulations concerning encrypted data.

## Parameters

**-node {<nodename>|local} - Node**

Specifies the node containing the NVRAM or NVMEM subsystem.

**[-is-enabled {true|false}] - Is Encryption Enabled**

Specifies whether the NVRAM or NVMEM encryption is disabled or enabled.

## Examples

The following commands enable or disable the NVRAM encryption:

```
cluster1::> system node hardware nvram-encryption modify -node node1 -is
-enabled false
cluster1::> system node hardware nvram-encryption modify -node
node1 -is-enabled true
```

## system node hardware nvram-encryption show

Show NVRAM device encryption information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node hardware nvram-encryption show` command displays the configuration of the encryption feature for the NVRAM or NVMEM data that is destaged to non-volatile flash storage.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the NVRAM encryption configuration on the specified node.

### **[-nvram-device-name <text>] - NVRAM Device Name**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the specified NVRAM device. Current platforms only support one device - NVRAM.0.

### **[-is-supported {true|false}] - Is Encryption Support**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for platforms that support it.

### **[-is-enabled {true|false}] - Is Encryption Enabled**

If this parameter is specified, the command displays information about the NVRAM encryption configuration for the NVRAM or NVMEM devices where the device has the specified enabled value.

### **[-key-id <text>] - Key ID of the Encryption Key**

If this parameter is specified, the command displays information about the NVRAM encryption configuration with the specified encryption Key ID used to encrypt the NVRAM or NVMEM data on flash storage.

## **Examples**

The following example displays information about the NVRAM encryption configuration on all nodes of the cluster:

```
cluster1::> system node hardware nvram-encryption show
      Node: node1
NVRAM-Device: NVRAM.0
      Supported: true
      Enabled: true
      Key-ID:
0000000000000000000000000000000000000000000000000000000000000000
      Node: node2
NVRAM-Device: NVRAM.0
      Supported: true
      Enabled: true
      Key-ID:
0000000000000000000000000000000000000000000000000000000000000000
2 entries are displayed.
```

## **system node hardware tape drive show**

Displays information about tape drives

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command displays the following information about tape drives:

- Node to which the tape drive is attached
- Device ID of the tape drive

- Description of the tape drive
- NDMP path of the tape drive

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Displays detailed information about tape drives on the specified node.

**[-device-id <text>] - Device ID**

Selects information about the tape drive that has the specified device ID.

**[-description <text>] - Description**

Selects information about the tape drive or drives that have the specified description.

**[-wwn <text>] - World Wide Name**

Selects information about the tape drive that has the specified worldwide name.

**[-serial-number <text>] - Serial Number**

Selects information about the tape drive that has the specified serial number.

**[-ndmp-path <text>,...] - NDMP Path**

Selects information about the tape drive or drives that have the specified NDMP path.

## Examples

The following example displays information about all tape drives in the cluster:

```
cluster1::> system node hardware tape drive show
Node   Device Id Drive Description      NDMP Path

5 entries were displayed.
```

## system node hardware tape library show

Display information about tape libraries

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the following information about tape libraries:

- Node to which the tape library is attached
- Device ID of the tape library
- Description of the tape library
- NDMP path of the tape library

### Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] }

If you specify the -instance parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

Displays detailed information about tape libraries on the specified node.

**[`-device-id <text>`] - Device ID**

Selects information about the tape library that has the specified device ID.

**[`-description <text>`] - Description**

Selects information about the tape library or libraries that have the specified description.

**[`-wwn <text>`] - World Wide Name**

Selects information about the tape library that has the specified worldwide name.

**[`-serial-number <text>`] - Serial Number**

Selects information about the tape library that has the specified serial number.

**[`-ndmp-path <text>`] - NDMP Path**

Selects information about the tape library or libraries that have the specified NDMP path.

**Examples**

The following example displays information about all tape libraries attached to the cluster:

```
cluster1::> system node hardware tape library show
Node   Device Id Drive Description      NDMP Path
-----
cluster1-00
        0b.125L1  HP      MSL G3      mc1
              Series
        0c.125L1  HP      MSL G3      mc0
              Series
2 entries were displayed.
```

**system node hardware unified-connect modify**

Modify the Fibre Channel and converged networking adapter configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system node hardware unified-connect modify` command changes the adapter configuration. Any changes to the adapter mode or type will require a reboot for the changes to take effect. The adapter must also be offline before you can make any changes.

The adapter argument is in the form `Xy` where `X` is an integer and `y` is a letter. For example: `4a`

For a target adapter, use the [network fcp adapter modify](#) command to bring the adapter offline.

For an initiator adapter, use the `system node run local storage disable adapter` command to take the adapter offline.

The `-mode` parameter refers to the mode of the adapter and can be either `fc` or `cna`.

The `-type` parameter refers to the FC-4 type of the adapter and can be `initiator`, `target`, or `fcvi`.

The `-force` parameter suppresses confirmation prompts.

The adapter type `fcvi` is supported only on platforms with FCVI adapters.

## Parameters

**`-node {<nodename>|local}` - Node**

Specifies the node of the adapter.

**`-adapter <text>` - Adapter**

Specifies the adapter.

**`[-m, -mode {fc|cna}]` - Configured Mode**

Specifies the mode.

**`[-t, -type {initiator|target|fcvi}]` - Configured Type**

Specifies the FC-4 type.

**`[-f, -force <true>]` - Force**

Suppresses warnings and confirmation prompts.

## Examples

```
cluster1::> system node hardware unified-connect modify -node node1
            -adapter 0d -mode cna
```

Configures the mode of adapter 0d on node1 to CNA.

## Related Links

- [network fcp adapter modify](#)

## system node hardware unified-connect show

Displays information about Fibre Channel and converged networking adapters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command manages Fibre Channel and converged networking adapters used by the storage subsystem. Use the command to show the current mode and FC-4 type of adapters or the capabilities of adapters.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-capability ]**

If this parameter is specified, the command displays the capabilities of the adapters.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about Fibre Channel and converged networking adapters on the specified node.

**[-adapter <text>] - Adapter**

If this parameter is specified, the command displays information about the specified adapter.

**[-current-mode {fc|cna}] - Current Mode**

If this parameter is specified, the command displays adapters configured to the specified mode.

**[-current-type {initiator|target|fcvi}] - Current Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4 type.

**[-pending-mode {fc|cna}] - Pending Mode**

If this parameter is specified, the command displays adapters configured to the specified mode on the next reboot.

**[-pending-type {initiator|target|fcvi}] - Pending Type**

If this parameter is specified, the command displays adapters configured to the specified FC-4 on the next reboot.

**[-status-admin <text>] - Administrative Status**

If this parameter is specified, the command displays adapters with the specified status.

**[-supported-modes {fc|cna}] - Supported Modes**

The list of modes that the adapter supports.

**[-supported-fc-types {initiator|target|fcvi}] - Supported FC Types**

The list of FC-4 types the adapter supports when configured into fc mode.

**[-supported-cna-types {initiator|target|fcvi}] - Supported CNA Types**

The list of FC-4 types the adapter supports when configured into cna mode.

## Examples

The following example displays information about all Fibre Channel and converged networking adapters in the cluster:

```
cluster1::> system node hardware unified-connect show
```

Node	Adapter	Current Mode	Current Type	Pending Mode	Pending Type	Admin Status
node1	0c	fc	initiator	-	-	online
node1	0d	fc	initiator	-	-	online
node1	3a	fc	target	-	-	online
node1	3b	fc	target	-	-	online
node1	4a	cna	target	-	-	online
node1	4b	cna	target	-	-	online
node1	6a	fc	target	-	-	online
node1	6b	fc	target	-	-	online
node2	0c	fc	initiator	-	-	online
node2	0d	fc	initiator	-	-	online
node2	3a	fc	target	-	-	online
node2	3b	fc	target	-	-	online
node2	4a	cna	target	-	-	online
node2	4b	cna	target	-	-	online
node2	6a	cna	target	-	-	online
node2	6b	cna	target	-	-	online

```
16 entries were displayed.
```

## system node image abort-operation

Abort software image 'update' or 'get' operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node image abort-operation` command aborts software installation ("update") or download ("get") operation on the specified node.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node on which to abort the operation.

### Examples

The following example aborts the software installation operation on a node named `node1`.

```
cluster1::> system node image abort-operation -node node1
```

## system node image get

Fetch a file from a URL

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command fetches a file from the specified URL and stores it in the `/mroot/etc/software` directory.

### Parameters

#### **[`-node` <nodename>|local}] - Node (privilege: advanced)**

This parameter specifies the node that fetches and stores the package.

#### **`-package` <text> - Package URL (privilege: advanced)**

This parameter specifies the URL that provides the location of the package to be fetched. Standard URL schemes, including HTTP, FTP and FILE, are accepted. The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as `file://usb0/<filename>`. Typically, the file name is `image.tgz`. The package must be present in the root directory of the USB mass storage device.

#### **[`-replace-package` <true>] - Replace the Local File (privilege: advanced)**

Specifies whether an existing package is deleted and replaced with a new package. If you enter this command without using this parameter, its effective value is false and an existing package is not replaced with the new one. If you enter this parameter without a value, it is set to true and an existing package is replaced with the new one.

#### **[`-rename-package` <text>] - Rename the File (privilege: advanced)**

Use this parameter to enter a package name that is different than the file name in the URL.

#### **[`-background` <true>] - Run in the background (privilege: advanced)**

This parameter allows the operation to run in the background. The progress of the operation can be checked with the command `system image show-update-progress`. If this command is entered without using this parameter, its effective value is false and the operation runs in the foreground. If this parameter is used without a value, it is set to true.

### Examples

```
system image get http://example.com/image.tgz -rename-package image2.tgz
-replace-package
```

## system node image modify

Modify software image configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node image modify` command sets the default software image on a specified node. The default software image is the image that is run when the node is started. A node holds two software images; when you set one as the default image, the other image is automatically unset as the default. Conversely, if you unset a software image as the default, the other image is automatically set as the default.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node on which the software image is located.

**-image {image1|image2|remote} - Image Name (privilege: advanced)**

This specifies the software image that is to be set or unset as the default.

**[-isdefault {true|false}] - Is Default Image (privilege: advanced)**

This optionally specifies whether the specified image is the default.

## Examples

The following example sets the software image named `image2` as the default image on a node named `node0`.

```
node::> system node image modify -node node0 -image image2 -isdefault true
Default Image Changed.
```

## system node image show-update-progress

Show progress information for a currently running update

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node image show-update-progress` command displays the progress of a software-image update initiated by using the [system node image update](#) command. The command displays progress until the update completes; you can also interrupt it by pressing Ctrl-C.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This optionally specifies the name of a node whose image-update progress is to be displayed.

**[-follow <true>] - Follow the Progress in the Foreground (privilege: advanced)**

Do use not use background processing for this command. If you do not use this parameter, the value is *true*.

## Examples

The following example displays image-update progress:

```
node::> system node image show-update-progress
```

```
ERROR: command failed: There is no update/install in progress
```

## system node image show

Display software image information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node image show` command displays information about software images. By default, the command displays the following information:

- Node name
- Image name
- Whether the image is the default image
- Whether the image is the current image
- Software version
- Installation date

To display detailed information about a specific software image, run the command with the `-node` and `-image` parameters. The detailed view adds information about the kernel image path, and the root file system image path.

You can specify additional parameters to select specific information. For example, to display information only about software images that are currently running, run the command with the `-iscurrent true` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects information about the software images on the specified node. If this parameter and the `-image` parameter are both used, the command displays detailed information about the specified software image.

**[`-image {image1|image2|remote}`] - Image Name (privilege: advanced)**

Selects information about the software images that match the specified name. If this parameter and the `-node` parameter are specified, the command displays detailed information about the specified software image.

**[`-isdefault {true|false}`] - Is Default Image (privilege: advanced)**

Selects information about the software images with the specified default setting.

**[`-iscurrent {true|false}`] - Is Current Image (privilege: advanced)**

Selects information about the software images that have the specified currency value.

**[`-kernel-path <text>`] - Kernel Image Path (privilege: advanced)**

Selects information about the software images that have the specified kernel image path.

**[`-rootfs-path <text>`] - Root Filesystem Image Path (privilege: advanced)**

Selects information about the software images that have the specified root file system image path.

**[`-version <text>`] - Software Version (privilege: advanced)**

Selects information about the software images that have the specified root file system image path.

**[`-installdate <MM/DD/YYYY HH:MM:SS>`] - Install Date (privilege: advanced)**

Selects information about the software image that have the specified installation date. Specify the date in the format MM/DD/YYYY HH:MM:SS [+ HH:MM].

## Examples

The following example displays information about the software images on a node named node1:

```
cluster1::> system node image show -node node1
```

Node	Image	Is Default	Is Current	Version	Install Date
node1	image1	true	true	8.0	8/20/2009 17:42:42
	image2	false	false	8.0	6/26/2009 17:44:50

2 entries were displayed.

## system node image update

Perform software image upgrade/downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node image update` command downloads the software image from a specified location and updates the alternate software image (that is, the image that is not currently running on the node). By default, validation of the software image is not performed. Use the `"-validate-only"` parameter to validate the software

image first, before performing the update on the cluster nodes.

At the advanced privilege level, you can specify whether to disable version-compatibility checking.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node on which the software image is located.

### **-package <text> - Package URL (privilege: advanced)**

This specifies the location from which the software image is to be downloaded. The location can be specified in any of the following ways:

- As an HTTP URL in the form *http://host\_name[:port]/path\_to\_file* . For instance, *http://example.com/downloads/image.tgz* . The management utility prompts you for a user name and password before beginning the download.

If you use HTTP to transfer software images, be aware that the management utility does not check whether the Web server is password protected; if it is not, press Enter at the prompt for user name and password.

- As an FTP URL in the form *ftp://host\_name[:port]/path\_to\_file* . For instance, *ftp://example.com/downloads/image.tgz* . If required, the management utility prompts you for a user name and password before beginning the download.
- As a filename of a package left behind by a previous installation, or a package fetched using [system node image get](#) . For example, *image.tgz* . Available packages can be displayed using [system node image package show](#) .
- As a path to a package in a mounted file system in the form *file://localhost/path\_to\_file* . For example, *file://localhost/mroot/etc/software/image.tgz* .
- The FILE URL scheme can be used to specify the location of the package to be fetched from an external device connected to the storage controller. Currently, only USB mass storage devices are supported. The USB device is specified as *file://usb0/<filename>* . Typically, the file name is *image.tgz* . The package must be present in the root directory of the USB mass storage device.

### **[-replace {image1|image2}] - Image to Replace (privilege: advanced)**

This optionally specifies the image that is to be replaced when the node is booted from the network.

### **[-setdefault <true>] - Set Newly Updated Image as Default (privilege: advanced)**

This optionally specifies whether to set the newly updated image as the default image (that is, the image that runs the next time the node is restarted). Note that for this parameter to work correctly, the cluster must be in quorum when the image is updated.

### **[-replace-package <true>] - Replace the Local File (privilege: advanced)**

Specifies whether an existing package is deleted and replaced with a new package. If this command is entered without using this parameter, its effective value is false and an existing package is not replaced with the new one. If this parameter is used without a value, it is set to true and an existing package is replaced with the new one.

### **[-rename-package <text>] - Rename the File (privilege: advanced)**

Use this parameter to enter a package name that is different than the file name in the URL.

### **[`-background <true>`] - Run in the Background (privilege: advanced)**

This parameter will allow the operation to run in the background. The progress of the operation can be checked with the command [system node image show-update-progress](#) . If this command is entered without using this parameter, its effective value is false and the operation will run in the foreground. If this parameter is used without a value, it is set to true.

### **[`-validate-only <true>`] - Validate the Package before Installation (privilege: advanced)**

Use this parameter to validate the package. Validation consists of verifying whether there is enough space on the system to install the package, verifying the checksum for each component within the package and so on. Validation usually takes from 30 to 60 minutes. If you specify this parameter, the package will be validated only, not installed.

## **Examples**

The following example updates the software image on a node named node0 from a software package located at <ftp://ftp.example.com/downloads/image.tgz>:

```
node::> system node image update -node node0 -package
ftp://ftp.example.com/downloads/image.tgz -setdefault true
```

## **system node image package delete**

Delete a software package

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

The delete command will delete the specified software package.

## **Parameters**

### **`-node {<nodename>|local}` - Node (privilege: advanced)**

The package will be deleted from the repository belonging to the node specified with this parameter. The local node is used as the default if this parameter is omitted.

### **`-package <text>` - Package File Name (privilege: advanced)**

This parameter specifies the package to be deleted.

## **Examples**

```
::> system image package delete image.tgz
1 entry was deleted.
```

## system node image package show

Display software package information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The package show command displays details of the software packages residing on the storage controller.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects which node's packages are displayed. The local node is the default if this parameter is omitted.

**[-package <text>] - Package File Name (privilege: advanced)**

This parameter specifies which package's information will be displayed.

### Examples

```
cluster1::> system image package show
Package
Node Repository Package File Name
-----
node-01
    mroot
        image.tgz
1 entries were displayed.
```

## system node image package external-device delete

Delete file on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The delete command deletes the specified file on the external device.

## Parameters

### **-node {<nodename>|local} - Node (privilege: advanced)**

The file is deleted from the external device of the node specified with this parameter. If this parameter is omitted, then the local node is used as the default node.

### **-package <text> - File Name (privilege: advanced)**

This parameter specifies the file to be deleted.

### **-device {usb0|usb1} - Device (privilege: advanced)**

This parameter specifies the name of the external device. Currently, only usb0 is supported.

## Examples

```
::> system image package external delete -package image.tgz
```

## system node image package external-device show

Display file listing on external device

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The external-device show command displays files residing on the external storage device.

## Parameters

### **{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

### **| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-node {<nodename>|local}] - Node (privilege: advanced)**

This parameter selects the node that has files that are to be displayed on the external storage device. If this parameter is omitted, then the local node is the default node.

### **[-package <text>] - File Name (privilege: advanced)**

This parameter specifies the file for which the information is displayed.

### **[-device {usb0|usb1}] - Device (privilege: advanced)**

This parameter specifies the name of the external device. Currently, only usb0 is supported.

## Examples

```
cluster1::> system image package external-device show
Node                               Device           Package File Name
-----
node-01                           usb0            image.tgz
node-01                           usb0            netboot.tgz
2 entries were displayed.
```

## system node internal-switch show

Display onboard switch attributes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node internal-switch show` command is used to display the internal switch state information and the link status.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Use this parameter to specify the node the switch resides on.

**[-switch-id <integer>] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[-port-id <integer>] - Port**

Use this parameter to specify the port id. For example, 0.

**[-port-name <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.

**[-auto-admin <Auto-negotiation setting>] - Auto-Negotiation Administrative**

Use this parameter to show the auto-negotiation administrative setting. 'enable' or 'disable'.

**[-auto-op <Auto-negotiation setting>] - Auto-Negotiation Operational**

Use this parameter to show the auto-negotiation operational setting. 'unknown', 'complete', 'incomplete', 'failed' or 'disabled'.

**[-duplex-admin <Duplex>] - Duplex Mode Administrative**

Use this parameter to show the duplex mode administrative setting. 'half' or 'full'.

**[-duplex-op <Duplex>] - Duplex Mode Operational**

Use this parameter to show the duplex mode operational setting. 'half' or 'full'.

**[-speed-admin <Link speed>] - Speed Administrative**

Use this parameter to show the speed administrative setting. '10', '100' or '1000'.

**[-speed-op <Link speed>] - Speed Operational**

Use this parameter to show the speed operational setting. '10', '100' or '1000'.

**[-link <Link Status>] - Link State**

Use this parameter to show the link state, 'up' or 'down'.

**[-up-admin <Link Status>] - Up Administrative**

Use this parameter to show the up administrative setting, 'up' or 'down'.

**[-fc-op <Flow control>] - Flow Control Operational**

Use this parameter to show the flow control operational setting, 'full', 'send', 'receive' or 'none'.

**Examples**

The example shows the attributes of the internal switch 0 on the node Node1.

```
cluster1::> system node internal-switch show -node Node1 -switch-id 0
```

Port	Role	Link	Auto-Negot Admin/Oper	Duplex Admin/Oper	Speed (Mbps) Admin/Oper
---	-----	-----	-----	-----	-----
Node: Node1, Switch: 0					
0	sw-wrench	up	enable/complete	full/full	1000/1000
1	sw-locked-wrench	down	enable/incomplete	full/half	100/10
2	sw-e0M	up	enable/complete	full/full	1000/1000
3	sw-e0P	down	enable/incomplete	full/half	100/10
4	sw-midplane-1	down	enable/incomplete	full/half	100/10
5	sw-expander-1	up	enable/unknown	full/full	100/100
6	sw-sp-1	up	enable/unknown	full/full	100/100
7 entries were displayed.					

**system node internal-switch dump stat**

Display onboard switch port statistics counter

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node internal-switch dump stat` command is used to display the counter information of the internal switch ports.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node**

Use this parameter to specify the node the switch resides on.

**[-switch-id <integer>] - Switch**

Use this parameter to specify the switch id. For example, 1.

**[-port-id <integer>] - Port**

Use this parameter to specify the port id. For example, 0.

**[-stat-id <text>] - Counter Name**

Use this parameter to specify the counter name.

**[-valued <integer>] - Counter Value**

Use this parameter to show the value of specified counter.

**[-port-name <text>] - Port Name**

Use this parameter to specify the port name. For example, e0M.

## Examples

The following example shows partial counter information of the internal switch 0 on Node1

```
cluster1::> system node internal-switch dump stat -node Node1 -switch-id 0
Port  Port Name          Counter              Value
----  -
Node: Node1          , Switch: 0
0      sw-wrench          1024ToMaxOctets      22480201
0      sw-wrench          128To255Octets       119552
0      sw-wrench          256To511Octets       345587
0      sw-wrench          512To1023Octets      1250437
0      sw-wrench          64Octets              803025
```

## system node nfs usage show

Show NFS usage in the local node

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node nfs usage show` command displays the NFS usage information in the local node. The display output shows the number of RPC calls received per protocol on the local node. Usage is collected whenever there is any NFS traffic. These values are not persistent and will reset when the node reboots. This command is used in conjunction with the `system node nfs usage reset` command in the NFS licensing callback.

### Examples

The following example displays the NFS usage information that does not have any NFS usage.

```
::*> system node nfs usage show
Node: raghasri-vsrm5
v3: 0
v4: 0
```

The following example displays the NFS usage information with v3 usage.

```
::*> system node nfs usage show
Node: raghasri-vsrm5
v3: 5
v4: 0
```

The following example displays the NFS usage information with v4 usage.

```
::*> system node nfs usage show
Node: raghasri-vsrm5
v3: 0
v4: 14
```

## system node power on

Power nodes on

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command switches on the power of the main controller of the specified node. This command works for a single node only and the full name of the node must be entered exactly.

## Parameters

**-node {<nodename>|local}** - Node (privilege: advanced)

This parameter specifies the node whose power you want to switch on.

## Examples

The following example switches on the power of node2.

```
cluster1::> set advanced

Warning: These advanced commands are potentially dangerous; use them only
when
        directed to do so by NetApp personnel.
Do you want to continue? {y|n}: y

cluster1::*>
cluster1::*> system node power on -node node2

cluster1::*>
```

## system node power show

Display the current power status of the nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays the power status of the main controller in each node across the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter specifies the name of a node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-status {on|off}] - Current Power Status**

If the `-status` parameter is specified, the command only lists information about the node with the power status value you enter.

## Examples

The following example displays power status of all the nodes in cluster1.

```
cluster1::> system node power show
```

Node	Status
node1	on
node2	on

2 entries were displayed.

```
cluster1::>
```

## system node root-mount create

Create a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node root-mount create` command produces a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate creation by a background task. Use the [system node root-mount show](#) command to view the current status of root-mount or verify task completion.

### Parameters

**-node <nodename> - Owner of the Root-mount**

The node name where the root-mount will be created.

**-root-node <nodename> - Root-mount Destination Node**

The node name that the root-mount will access.

## Examples

The following example shows the creation of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the successful completion.

```
cluster1::> system node root-mount show
This table is currently empty.

cluster1::> system node root-mount create -node nodeA -root-node nodeB

cluster1::> system node root-mount show
Node                Root Node                State                Last Error
-----
nodeA                nodeB                      ready
```

## Related Links

- [system node root-mount show](#)

## system node root-mount delete

Delete a mount from one node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node root-mount delete` command removes a root-mount from one node in the cluster to another node's root volume. The root-mount is marked for immediate deletion by a background task. Use the [system node root-mount show](#) command to view the current status of root-mount or verify task completion.

## Parameters

**-node <nodename> - Owner of the Root-mount**

The node which has the mount.

**-root-node <nodename> - Root-mount Destination Node**

The node accessed by the mount.

## Examples

This example shows the deletion of a root-mount from `cluster1::nodeA` to `cluster1::nodeB` and the verification of the command's successful completion.

```
cluster1::> system node root-mount show
Node           Root Node           State           Last Error
-----
nodeA           NodeB                       ready

cluster1::> system node root-mount delete -node nodeA -root-node nodeB

cluster1::> system node root-mount show
This table is currently empty.
```

## Related Links

- [system node root-mount show](#)

## system node root-mount show

Show the existing mounts from any node to another node's root volume.

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system node root-mount show` command displays the status of current root-mounts from any node to another node's root volume. These root-mounts are used by cluster services to access data on other nodes in the cluster. These root-mounts are not pre-created, but are created as they are needed. They can also be manually created or deleted.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Owner of the Root-mount**

Selects information about root-mounts that exist on the specified node.

**[-root-node <nodename>] - Root-mount Destination Node**

Selects information about root-mounts that connect to the specified node.

**[-create-time <MM/DD/YYYY HH:MM:SS>] - Mount Creation Time**

Selects information about root-mounts that were created at the specified time.

**[-state <Mount State>] - State of the Root-Mount**

Selects information about root-mounts that have the specified state. The states are:

- *unknown* : The state of the root-mount is being determined.
- *initializing* : A root-mount was found and needs testing to determine the correct state.
- *mount-requested* : The root-mount has been requested, but is not ready.
- *mounting* : The root-mount is being created, but is not ready.
- *ready* : The root-mount is ready to be used.
- *not-responding* : The root-mount exists but is not responding.
- *does-not-exist* : No root-mount is possible to this node's root volume.
- *ha-busy* : The root-mount is busy pending completion of an HA event.
- *clean-up-requested* : The root-mount is being deleted.
- *cleaning-up* : The root-mount is being deleted.
- *create-error* : The root-mount could not be created.

### **[*-last-error* <text>] - Last Error**

Selects information about root-mounts that have the specified last-error value.

### **Examples**

+ The following example shows the default state of the root-mounts on a cluster that is not using root-node services:

```
cluster1::> system node root-mount show
This table is currently empty.
```

+ The following example displays the root-mounts that exist for a cluster that has ``\_nodeA\_`` mounted to ``\_nodeB\_``, and ``\_nodeB\_`` mounted to ``\_nodeA\_`` :

```
cluster1::> system node root-mount show
Node                Root Node          State          Last Error
-----
nodeA                nodeB                ready
nodeB                nodeA                ready
2 entries were displayed.
```

### **system node upgrade-revert show**

Display upgrade/revert node status.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node upgrade-revert show` command displays information about the status of upgrades or reversions. If an upgrade has failed, this command enables you to determine which phase of the upgrade contains the failed upgrade task and the reason for the failure.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Use this parameter to display status information only about upgrades or reversions that are slated to occur on the nodes you specify.

**[-upgrade-version <integer>] - Cluster Upgrade Version (privilege: advanced)**

Selects status information about upgrades or reversions that are to the version number you specify.

**[-startup-phase {pre-root|pre-apps|post-apps}] - Startup Phase (privilege: advanced)**

Selects status information about upgrades or reversions that are slated to occur during the startup phase you specify. Startup phases are:

- pre-root - Upgrade is applied before mroot is mounted
- pre-apps - Upgrade is applied before other cluster apps are started
- post-apps - Upgrade is applied after all RDB apps are online

**[-status <Upgrade/Revert Execution Status>] - Execution Status (privilege: advanced)**

Selects status information about upgrades or reversions that have the execution status you specify. Execution statuses are:

- prepared - Ready to upgrade
- applied - Successful upgrade
- reverted - Successful reversion
- failed - Unsuccessful upgrade or reversion
- aborted - Unsuccessful upgrade or reversion
- skipped - Upgrade or reversion was skipped for that phase
- locked - Upgrading or reverting

**[-status-msg <text>] - Status Message (privilege: advanced)**

Selects status information about upgrades or reversions that have the status message you specify. The status message displays the current status of the phase with which it appears.

### **[`-direction {upgrade|revert}`] - Upgrade/Revert Direction (privilege: advanced)**

Use this parameter with the value `upgrade` to select status information about upgrades. Use this parameter with the value `revert` to select status information about reversions.

### **[`-node-status {reverting|complete|not-needed|aborted|failed|waiting|in-progress|stopped}`] - Node Status (privilege: advanced)**

Selects status information about upgrades or reversions that have the status you specify on nodes where they are slated to occur. Node statuses are:

- `aborted` - Upgrade process aborted. Contact support personnel.
- `failed` - Upgrade process failed. Contact support personnel.
- `stopped` - Upgrade process stopped due to node or management application restart. Use the [system node upgrade-revert upgrade](#) command to complete the upgrade manually.
- `complete` - Upgrade process completed successfully.
- `waiting` - Upgrade process is waiting the replication database to come online or for applications to be stable. If the RDB is not online, check network connectivity using [cluster show](#) and [cluster ping-cluster](#) to ensure that all nodes are healthy and in communication.

### **[`-node-status-msg <text>`] - Node Status Message (privilege: advanced)**

Selects status information about upgrades or reversions that have the node status message you specify. The node status message displays the upgrade or reversion status of the node with which it appears. If the upgrade or reversion fails, this message provides information that helps to diagnose the cause of the failure.

## **Examples**

The following example shows typical output for a cluster with two nodes. Status messages for each phase display information about the tasks in that phase.

```
cluster1::*> system node upgrade-revert show
```

```
Node: node1                                     Status: complete
```

```
Status Message: The upgrade is complete.

## system node upgrade-revert upgrade

Run the upgrade at a specific phase.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system node upgrade-revert upgrade` command manually executes an upgrade. Use this command to execute an upgrade after issues that caused an upgrade failure are resolved. If the upgrade is successful, no messages display.

Before the command executes upgrades, it checks the configuration of the nodes in the cluster. If no upgrades are needed, the command displays a message and does not execute any upgrades.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

Specifies the node that is to be upgraded. The value `local` specifies the current node.

## Examples

This example shows command output of a node named `node0` if node configuration is current.

```
cluster1::*> system node upgrade-revert upgrade -node node0
The node configuration is up-to-date. No upgrade is needed.
```

## system node virtual-machine show-network-load-balancer

Display network load balancer information

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine show-network-load-balancer` displays the list of network load balancer probe ports for each ONTAP node in the cluster.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - Node (privilege: advanced)**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-vserver-name <text>] - Vserver Name (privilege: advanced)**

Vserver name.

**[-lif-name <text>] - ONTAP LIF Name (privilege: advanced)**

ONTAP logical interface name.

**[-probe-port <integer>] - Probe Port (privilege: advanced)**

A TCP port which is regularly probed by the network load balancer. When the TCP port is healthy and open, the network load balancer will continue sending traffic to an associated network route. When unhealthy, the network load balancer will redirect all traffic intended for this route to an alternate route.

**[-last-probe-time <MM/DD/YYYY HH:MM:SS>] - Last Probe Time (privilege: advanced)**

The timestamp of the most recent health probe request on this TCP port.

**[`-remove-listener {true|false}`] - Remove listener for This LIF (privilege: advanced)**

Whether or not ONTAP has programmatically told the network load balancer to stop listening on the health probe associated with this LIF.

**[`-active {true|false}`] - Actively receiving Health Probes (privilege: advanced)**

Whether or not the network load balancer has received a health probe request on this TCP port, within the expected timeframe.

## Examples

The following example displays probe ports for each node in the cluster.

```
cluster1::*> system node virtual-machine show-network-load-balancer
```

Node	Vserver	Logical Interface	Probe Port	Last Probe
node1	vserver0	data_lif1	63002	5/8/2018
node2	vserver0	data_lif2	63003	5/8/2018
	vserver0	svm_mgmt	63004	5/8/2018

## system node virtual-machine disk-object-store create

Define the configuration for an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store create` command adds an object store container to a node's configuration. All objects within the container will be added as disks to the specified node.

### Parameters

**`-node <nodename>` - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node to which the object store container will be added.

**`-object-store-name <object store name>` - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**-server <text> - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

Specifies the object store server where the container is hosted.

**-port <integer> - Port Number of the Object Store (privilege: advanced)**

Specifies the port number to connect to the object store server.

**-container-name <text> - Container Name (privilege: advanced)**

Specifies the name of the container to be added.

**-azure-account <text> - Azure Storage Account (privilege: advanced)**

Specifies the Azure storage account.

**-azure-private-key <text> - Azure Storage Account Access Key (privilege: advanced)**

Specifies the access key required to authenticate requests to the Azure object store.

**[-update-partner <true>] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example adds a container to the specified node.

```
cluster1::*> system node virtual-machine disk-object-store create
               -node node1 -object-store-name objstore1 -server
storageaccount1.blob.core.windows.net
               -container-name container1 -azure-account storageaccount1
               -azure-private-key
XpSUcS/f1sl4sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDoWYnsf/8JBhlHImH/RP9IO6maKL
YqEXAMPLEKEY== -update-partner
```

## system node virtual-machine disk-object-store delete

Delete the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store delete` command removes an object store container from a node's configuration.

### Parameters

**-node <nodename> - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node from which the object store container will be removed.

**-object-store-name <object store name> - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**[~~-update-partner~~ {true|false}] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example removes a container from the specified node.

```
cluster1::*> system node virtual-machine disk-object-store delete
               -node node1 -object-store-name objstore1 -update-partner
```

## system node virtual-machine disk-object-store modify

Modify the configuration of an object store

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store modify` command updates one or more object store configuration parameters.

### Parameters

**~~-node~~ <nodename> - ONTAP Node Name (privilege: advanced)**

Specifies the name of the ONTAP node for which the object store configuration will be modified.

**~~-object-store-name~~ <object store name> - ONTAP Name for this Object Store Config (privilege: advanced)**

Specifies the name that will be used to identify the object store configuration.

**[~~-server~~ <text>] - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

This optional parameter specifies the new Fully Qualified Domain Name (FQDN) of the same object store server.

**[~~-azure-private-key~~ <text>] - Azure Storage Account Access Key (privilege: advanced)**

This optional parameter specifies a new access key for the storage account.

**[~~-update-partner~~ <true>] - Update HA Partner (privilege: advanced)**

Specify this parameter when the system is running in an HA configuration.

## Examples

The following example updates the stored private key for an Azure container on the specified node.

```
cluster1::*> system node virtual-machine disk-object-store modify
               -node node1 -object-store-name objstore1
               -azure-private-key
XpSUcS/f1sl4sHfDuzYeyU3Yz9dNqVEsxDv48/P8Zk8j0uDOWYnsf/8JBhlHImH/RP9IO6maKL
YqEXAMPLEKEY== -update-partner
```

## system node virtual-machine disk-object-store show

Display the list of object store configurations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system node virtual-machine disk-object-store show` command displays the list of object store containers that contain each node's disks.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node <nodename>] - ONTAP Node Name (privilege: advanced)**

Represents the name of the ONTAP node for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-object-store-name <object store name>] - ONTAP Name for this Object Store Config (privilege: advanced)**

Selects object store configurations with the specified name.

**[-server <text>] - Fully Qualified Domain Name of the Object Store Server (privilege: advanced)**

Selects containers on the specified server.

**[-port <integer>] - Port Number of the Object Store (privilege: advanced)**

Selects containers attached on the specified port.

**[-container-name <text>] - Container Name (privilege: advanced)**

Selects containers with the specified name.

**[-azure-account <text>] - Azure Storage Account (privilege: advanced)**

Selects containers in the specified Azure storage account.

**[-alive {true|false}] - Is Server Alive (privilege: advanced)**

Selects containers based on their aliveness state, as seen from the ONTAP node.

### Examples

The following example displays the list of containers for each node in the cluster.

```
cluster1::*> system node virtual-machine disk-object-store show
                        Object Store
Node      Name      Azure Storage Account  Container Name
Alive
-----
node1
      objstore1    storageaccount1        container1
true
node2
      objstore1    storageaccount1        container1
true
      2 entries were displayed.
```

### system node virtual-machine hypervisor modify-credentials

Modify hypervisor IP address and its credentials

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system node virtual-machine hypervisor modify-credentials` command is used to set the *IP address* of the hypervisor on which the node is running or vSphere credentials (i.e. `-new-username` or `-new-password`).

#### Parameters

**-node {<nodename>|local} - Node**

Name of the Data ONTAP node running in a virtual machine. It is a required field and the node must exist in the cluster.

**[-new-server <text>] - New Hypervisor IP Address**

New vSphere server controlling this virtual machine. It can be either an IP address or (if name resolution is enabled) a hostname.

**[-new-username <text>] - New Hypervisor Username**

New vSphere username for the `-new-server` specified above.

**[-new-password <text>] - New Hypervisor Password**

New vSphere password for the `-new-server` specified above.

## Examples

The following example sets the IP address and the credentials of the vSphere server on which the node is running.

```
cluster1::> system node virtual-machine hypervisor modify-credentials
  -node node1 -new-server 192.168.0.1 -new-username admin -new-password
  pass123
```

## system node virtual-machine hypervisor show-credentials

Display hypervisor IP address and its credentials

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node virtual-machine hypervisor show-credentials` command displays the current vSphere authentication information (except the password). This consists of the vSphere server and username. The vSphere password is not displayed for security reasons. vSphere authentication information is required to use (`system node virtual-machine hypervisor show -node <node>` , `system node virtual-machine instance show-system-disks-node <node>` and `storage disk show -virtual-machine-disk -info-node <node>` ) to be able to gather information about the physical host machine. It also attempts to verify the current vSphere authentication information with the vSphere host. If the check succeeds and the credentials are correct, the command displays the following information. If you want to see details about a single node, use the `-node` parameter.

- Node
- Hypervisor name or IP Address
- vSphere Username
- Credentials Correct?: *true*

If the check fails or credentials are incorrect, the command displays an additional *Error*.

- Node
- Hypervisor name or IP Address
- vSphere Username
- Credentials Correct?: *false*
- Error:

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**[`-instance` ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[`-node {<nodename>|local}`] - Node**

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[`-server <text>`] - Hypervisor IP Address or Hostname**

Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere server matches this value.

**[`-username <text>`] - Hypervisor Username**

Use this parameter to only display the Data ONTAP nodes in the cluster whose vSphere username matches this value.

**[`-are-credentials-correct {true|false}`] - Credentials Correct?**

Get a list of Data ONTAP nodes running with either incorrect (false) or correct (true) vSphere credentials.

**[`-error <text>`] - Error**

Get a list of nodes with the specified error. This parameter is most useful when entered with wildcards.

## Examples

The following example shows the vSphere server and vSphere username. It also displays whether the server address or its credentials are correct and displays an error if they are not.

```
cluster1::> system node virtual-machine hypervisor show-credentials
                Node: node1
Hypervisor IP Address: 192.168.0.1
        vSphere Username: administrator
        Credentials Correct?: true
Node: node2
Hypervisor IP Address:
        vSphere Username: admin
        Credentials Correct?: false
Error: [13166] could not find IP addr for host.
Correct the vSphere credentials with the
"system node virtual-machine hypervisor modify-credentials -node" command.

2 entries were displayed.
```

## system node virtual-machine hypervisor show

Display hypervisor information about Data ONTAP-v nodes

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node virtual-machine hypervisor show` command displays information for each hypervisor that is hosting a Data ONTAP virtual machine. The output contains the hypervisor-specific information, such as host name and IP address, as well as network configuration details. The command only scans hypervisors on which Data ONTAP virtual machines are installed. To filter command output, specify any number of optional fields listed below.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

**[-vm-uuid <UUID>] - UUID of the Virtual Machine**

The hypervisor-supplied unique ID for this virtual machine. This optional parameter selects information about the hypervisor on which the Data ONTAP virtual machine is running with the specified UUID. Since UUID is unique per host, an alternative and easier way is to use `-node` to filter out the same information.

**[-vmhost-bios-release-date <text>] - Release Date for the Hypervisor BIOS**

The release date for the currently running hypervisor BIOS. This optional parameter selects information about the hypervisors that have the specified BIOS release date.

**[-vmhost-bios-version <text>] - Current BIOS Version of the Hypervisor Physical Chassis**

The current BIOS version of the hypervisor physical chassis. This optional parameter selects information about the hypervisors that are running with the specified BIOS version.

**[-vmhost-boot-time <text>] - Time When Hypervisor was Last Booted**

The time when the hypervisor was last booted. This optional parameter selects information about the hypervisors which were last booted at the specified boot time.

**[-vmhost-cpu-clock-rate <integer>] - Speed of the Hypervisor CPU Cores (MHz)**

The speed of the hypervisor CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU clock rate.

**[-vmhost-cpu-core-count <integer>] - Number of Physical CPU Cores on the Hypervisor**

The number of physical CPU cores on the hypervisor. Physical CPU cores are the processors contained by a CPU package. This optional parameter selects information about the hypervisors that are running with the

specified CPU cores.

**[-vmhost-cpu-socket-count <integer>] - Number of Physical CPU Packages on the Hypervisor**

The number of physical CPU packages on the hypervisor. Physical CPU packages are chips that contain one or more processors. Processors contained by a package are also known as CPU cores. For example, one dual-core package is comprised of one chip that contains two CPU cores. This optional parameter selects information about the hypervisors that are running with the specified CPU sockets.

**[-vmhost-cpu-thread-count <integer>] - Number of Physical CPU Threads on the Hypervisor**

The number of physical CPU threads on the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified CPU threads.

**[-vmhost-gateway <text>] - Default Gateway for the Hypervisor**

The default gateway for the hypervisor. This optional parameter selects information about the hypervisors with the specified gateway address.

**[-vmhost-hardware-vendor <text>] - Hardware Vendor of the Hypervisor**

The name of hypervisor hardware manufacturer. This optional parameter selects information about the hypervisors with the specified hardware vendor.

**[-vmhost-hypervisor <text>] - Complete Product Name, including the Version Information for the Hypervisor**

The complete product name, including the version information for the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified hypervisor version.

**[-vmhost-ip-address <text>] - Primary IP Address Assigned to the Hypervisor**

The primary IP address assigned to the hypervisor. This optional parameter selects information about the hypervisors with the specified IP address.

**[-vmhost-memory <integer>] - Physical Memory Size of the Hypervisor (Bytes)**

The physical memory size of the hypervisor in bytes. This optional parameter selects information about the hypervisors that are running with the specified physical memory.

**[-vmhost-model <text>] - Hypervisor Manufacturer-Supplied Hardware Model Name**

The hypervisor manufacturer-supplied hardware model name. This optional parameter selects information about the hypervisors with the specified hardware model.

**[-vmhost-name <text>] - Hostname of the Hypervisor**

The host name assigned to the hypervisor. This optional parameter selects information about the hypervisor with the specified host name.

**[-vmhost-netmask <text>] - Subnet Mask Address for the Hypervisor**

The subnet mask address for the hypervisor. This optional parameter selects information about the hypervisors with the specified netmask address.

**[-vmhost-processor-id <text>] - Processor ID of the Hypervisor**

The processor ID of the hypervisor. This optional parameter selects information about the hypervisors with the specified processor ID.

**[`-vmhost-processor-type` <text>] - CPU Model of the Hypervisor**

The CPU model of the hypervisor. This optional parameter selects information about the hypervisors that are running with the specified processor type.

**[`-vmhost-software-vendor` <text>] - Name of the Virtual Machine Software Manufacturer**

The name of the virtual machine software manufacturer. This optional parameter selects information about the hypervisors with the specified software vendor.

**[`-vmhost-uuid` <UUID>] - UUID of the Hypervisor**

A unique ID for the hypervisor. This optional parameter selects information about the hypervisor with the specified UUID.

**[`-vmhost-error` <text>] - Error in case Hypervisor Info Retrieval Fails**

Displays a list of nodes on which the hypervisor has received the specified error. This parameter is most useful when entered with wildcards.

**[`-vm-custom-max-capacity` <integer>] - Maximum Storage Capacity of the Virtual Machine (in TB)**

The maximum system capacity (in TB) that can be configured on the VM. This optional parameter selects information about the node's storage capacity.

## Examples

The following example shows typical output from the `system node virtual-machine hypervisor show` command for the Data ONTAP virtual machines running in the cluster.

```

cluster1::> system node virtual-machine hypervisor show

## system node virtual-machine instance show-system-disks

(DEPRECATED) Display information about Data ONTAP-v system disks

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command is deprecated and may be removed in a future release of Data ONTAP.

The `system node virtual-machine instance show-system-disks` command displays the system disks information of the Data ONTAP node running on the virtual machine. There are three types of Data ONTAP-v system disks - boot, core and log. The details contain the physical properties of the disk and its backing information (e.g. backing store name, iSCSI Lun UUID, etc). To filter command output, specify any number of optional fields listed below.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name**

The name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this optional parameter is not specified, the command displays information about all nodes in the cluster.

**[-vmdisk-type <text>] - Type of the System Disk**

The type of the system disk, for example "Boot", "Core" or "Log". This optional parameter selects the information about the system disk with the specified type.

**[-vmdisk-name <text>] - Data ONTAP Supplied Name of the System Disk**

The Data ONTAP-supplied name of the system disk. This optional parameter selects the information about the system disk with the specified name.

**[-vmdisk-serial-number <text>] - Data ONTAP Supplied Serial Number of the System Disk**

The Data ONTAP-supplied serial number of the system disk. This optional parameter selects the information about system disk with the specified serial number.

**[-vmdisk-capacity {<integer>[KB|MB|GB|TB|PB] } ] - Size of the System Disk**

The size of the system disk. This optional parameter selects the information about system disks with the specified size.

**[-vmdisk-area-name <text>] - Name of the System Disk Backing Store**

The name of the disk backing store. A backing store represents a storage location for virtual machine files. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that reside on the specified backing store.

**[-vmdisk-file-name <text>] - File Name of the System Disk Used By the Hypervisor**

The file name of the virtual disk used by the hypervisor. Each Data ONTAP disk is mapped to a unique VM disk file. This optional parameter selects the information about the system disk mapped to the specified file name.

**[`-vmdisk-backing-store-type <text>`] - Type of the System Disk Backing Store**

The type of the disk backing store. It can be a VMFS volume, a directory on network-attached storage, or a local file system path. This optional parameter selects the information about the system disks that are backed by the specified type.

**[`-vmdisk-backing-store-capacity {<integer>[KB|MB|GB|TB|PB] }`] - Size of the System Disk Backing Store**

The size of the disk backing store. This optional parameter selects the information about the system disks that are backed by stores with the specified capacity.

**[`-vmdisk-backing-store-nas-path <text>`] - Full Path to the Backing Store for NAS**

The full path to the backing store for network-attached storage. This optional parameter selects the information about the system disks with the specified NAS path.

**[`-vmdisk-backing-adapter-pci <text>`] - Backing Adapter PCI Device ID**

The backing adapter PCI device ID for the virtual disk. This optional parameter selects the information about the system disks that have the specified ID as their backing adapter PCI ID.

**[`-vmdisk-backing-adapter-device <text>`] - Name of the Backing Adapter Device**

The name of the backing adapter device. This optional parameter selects the information about the system disks that have the specified name as their backing adapter device name.

**[`-vmdisk-backing-adapter-model <text>`] - Type of the Backing Adapter Model**

The type of the backing adapter model. This optional parameter selects the information about the system disks that have the specified type as their backing adapter model type.

**[`-vmdisk-backing-adapter-driver <text>`] - Backing Adapter Driver Name of the Initiator**

The backing adapter driver name of the initiator. This optional parameter selects the information about the system disks that have the specified name as their initiator's backing adapter driver name.

**[`-vmdisk-backing-target-iscsi-name <text>`] - iSCSI Name of the System Disk Backing Target**

The iSCSI name of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified name as their backing device iSCSI target name.

**[`-vmdisk-backing-target-iscsi-address <text>`] - iSCSI IP Address of the System Disk Backing Target**

The iSCSI IP address of the disk backing target. This field is valid only for iSCSI connections. This optional parameter selects the information about the system disks that have the specified IP as their backing device iSCSI target IP address.

**[`-vmdisk-backing-device-address <text>`] - SCSI Device Name (target-id:lun-id) for the Backing Disk**

The SCSI device name for the backing disk. It takes the form target-id:lun-id, for example "2:1". This optional parameter selects the information about the system disks that have the specified backing device address.

**[`-vmdisk-backing-device-uuid <text>`] - Hypervisor-Assigned Unique ID of the Backing Device**

The hypervisor-assigned unique ID of the backing device (disk or LUN). This optional parameter selects the information about system disks that are backed by a device with the specified UUID.

**[`-vmdisk-backing-device-partition <integer>`] - Backing Disk Partition Number for the VM Disk File**

The backing disk partition number where the corresponding VM disk file resides. This optional parameter selects the information about the system disks that reside on the specified partition number on any disk.

**[`-vmdisk-backing-device-capacity {<integer>[KB|MB|GB|TB|PB]}`] - Size of the Backing Device (Disk or LUN)**

The size of the backing device (disk or LUN) in bytes. This optional parameter selects the information about the system disks that have backing devices with the specified capacity.

## Examples

The following example shows typical output from the `system node virtual-machine instance show-system-disks` command for the Data ONTAP node running on a virtual machine.

```
cluster1::> system node virtual-machine instance show-system-disks
```

	Disk	Disk	Disk	Store	
Node	Type	Name	Capacity	Name	VM Disk File Name
-----					
node1					
	Boot	ad0	1.032 GB	store1	store1/node1/DataONTAP.vmdk
	Core	ad1	1.505 GB	store2	store2/node1/DataONTAP-var.vmdk
	Log	ad2	5.001 GB	store3	store3/node1/DataONTAP-nvram.vmdk

Warning: Unable to list entries on node node2. Failed to connect to the vSphere server. Reason: Either the server hostname or IP address is not set or there are network issues. Correct the vSphere credentials using the "system node virtual-machine hypervisor modify-credentials" command.

3 entries were displayed.

## system node virtual-machine instance show

Display virtual machine instance information per node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system node virtual-machine instance show` command displays virtual machine information. With this information you can determine the relationship between a Data ONTAP *node* and its associated virtual machine instance running within a cloud provider. Several other details about the virtual machine can be extracted as well, such as the cloud provider account ID to which it belongs. To filter command output, specify any number of optional fields listed below.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This optional parameter represents the name of the Data ONTAP node running in a virtual machine for which information is to be displayed. If this parameter is not specified, the command displays information about all nodes in the cluster.

**[-instance-id <text>] - ID of This Instance**

A cloud provider-supplied unique instance ID for this virtual machine, for example "i-a9d42f89" or "db00a7755a5e4e8a8fe4b19bc3b330c3.1".

**[-account-id <text>] - ID of This Account**

The cloud provider-associated account ID for this virtual machine. This parameter is usually associated with a cloud provider login ID and password.

**[-image-id <text>] - ID Of the Image in Use on This Instance**

The image ID installed on this virtual machine instance. It identifies a pre-defined template of a computing device's software environment. It contains the operating system and can also include application software, such as database servers, middleware, and web servers. In this case, the ID refers to an image that contains everything required to run Data ONTAP in the cloud.

**[-instance-type <text>] - Specifies System Attributes and Use Cost**

A specification (as defined by the cloud provider) that defines the memory, CPU, storage capacity and usage cost for a virtual machine instance. Some instance types are designed for standard applications, whereas others are designed for CPU-intensive or memory-intensive applications and so on.

**[-region <text>] - Set of Resources in the Same Geographic Area**

A named set of resources in the same geographical area. For example "us-east-1" might be the name for a collection of compute and storage resources on the eastern coast of the United States. Typically, a region contains multiple availability zones.

**[-version <text>] - Version of This VM Instance Information**

The version of the Instance Metadata or Agent Wire Protocol as defined by the cloud provider.

**[-availability-zone <text>] - Distinct Location within a Region**

A distinct location within a *region* that is insulated from failures in other availability zones. It provides low-latency network connectivity to other availability zones in the same region.

**[-primary-ip <text>] - Primary IP Address Assigned to this Instance**

The primary IP address assigned to this virtual machine instance.

**[-deployment-id <text>] - Deployment ID of This Instance**

A cloud provider-supplied unique deployment ID for this virtual machine, for example "2831c724-97ca-4395-b8d3-a65c2a65b502".

**[`-fault-domain <integer>`] - Fault Domain of This Instance**

A cloud provider-assigned numerical fault domain ID for this virtual machine within an Availability Set.

**[`-update-domain <integer>`] - Update Domain of This Instance**

A cloud provider-assigned numerical update domain ID for this virtual machine within an Availability Set.

**[`-provider <text>`] - Provider on which this instance is running.**

The provider on which this instance is running.

**[`-offer <text>`] - Marketplace Offer for This Image**

A Marketplace is an online store that offers applications and services either built on or designed to integrate with a particular cloud provider. A virtual machine offer corresponds to a class of product offering from a publisher. An offer is a collection of SKUs. Every offer appears as its own entity in the provider Marketplace.

**[`-sku <text>`] - Marketplace SKU for This Image**

A SKU is the smallest purchasable unit of an offer. While within the same product class (offer), SKUs allow you to differentiate between different features supported, VM image types and billing models supported.

**[`-sku-version <text>`] - Marketplace Version of a SKU**

The version for this virtual machine SKU.

**[`-resource-group-name <text>`] - Resource Group Name of This Instance**

Resource group for the instance.

## Examples

The following examples illustrate typical output from the `system node virtual-machine instance show` command for a virtual machine running in a cloud provider environment.

```

cluster1::> system node virtual-machine instance show
      Node:  node1
      Instance ID:  i-b9c42e97
      Account ID:  751083215869
      Image ID:  ami-7fb4a1c6
      Instance Type:  m3.xlarge
      Region:  us-east-1
      Version:  2010-08-31
      Availability Zone:  us-east-1d
      Primary IP:  192.168.0.1
      Provider:  AWS

cluster1::> system node virtual-machine instance show
      Node:  node1
      Instance ID:  090556da-d4fa-764f-a9f1-63614eda019a
      Deployment ID:  2831c724-97ca-4395-b8d3-a65c2a65b502
      Version:  2012-11-30
      Availability Set:  Fault Domain:  0
                       Update Domain:  0
      Primary IP:  192.168.0.1
      Provider:  Azure
      Offer:  netapp-ontap-cloud
      SKU:  ontap_cloud_pgo_sn
      SKU Version:  9.4.20180510
      Resource Group Name:  resourcegroup1
      Account ID:  228e471c-3b42-4ae7-9b59-df5bb5e6228d

```

## system script commands

### system script delete

Delete saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system script delete` command deletes files that contain CLI session records. Use the [system script show](#) command to display saved CLI sessions.

#### Parameters

##### **-username <text> - Log Owner Username**

Use this parameter to specify the name of the user whose CLI session record files are deleted. The default is the username is that of the logged in user.

### **-filename <text> - Log Filename**

Use this parameter to specify the names of CLI session record files to delete.

### **Examples**

The following example shows how to delete the files named `sessionlog2` and `sessionlog3`.

```
cluster1::> system script delete -filename sessionlog2,sessionlog3
```

The following example deletes all saved script files.

```
cluster1::> system script delete *
```

### **Related Links**

- [system script show](#)

## **system script show**

Display saved CLI session logs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system script show` command displays information about files that contain records of CLI sessions.

For security reasons, the command normally displays only the script files created by the logged in user. Administrative users can display all log files using the `-user` parameter.

### **Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-user ]**

Use this parameter to display all script files created by all users, along with the username associated with each file.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-username <text>] - Log Owner Username**

Use this parameter to display information only about files saved by the user you specify. The default username is that of the logged in user.

### **[-filename <text>] - Log Filename**

Use this parameter to display information only about files that have the file name you specify.

### **[-size-limit {<integer>[KB|MB|GB|TB|PB]}] - Logfile Size Limit**

Use this parameter to display information only about files that have the size limit you specify.

### **[-state <State of CLI session log>] - Current State**

Use this parameter to display information only about files that have the state you specify. Valid values for this parameter are `open-and-logging`, `file-full`, and `file-closed`.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Current Logfile Size**

Use this parameter to display information only about files that are the size you specify.

### **[-mtime <MM/DD/YYYY HH:MM:SS>] - Last Modification Time**

Use this parameter to display information only about files that were last modified at the date and time you specify.

### **[-this-session {yes|no}] - Session is Logging**

Use this parameter with the value `yes` to display information only about files that are recording the current CLI session. Use this parameter with the value `no` to display information only about files that are not recording the current CLI session.

## **Examples**

The following example displays typical system script information.

```
cluster1::> system script show
          This
FileName  Sess State          Size    Last Mod Date
-----
sessionlog1    no    file-closed      435B    12/2/2008 10:51:12
sessionlog2    yes    open-and-logging 193B    12/2/2008 10:51:29
2 entries were displayed.
```

## **system script start**

Start logging all CLI I/O to session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system script start` command starts creating a record of your CLI session. The record is stored in a file. Use the `system script show -this-session yes` command to display files that are recording the current CLI session. Use the `system script stop` command to stop recording the current CLI session.

## Parameters

### **-filename <text> - Filename to Log To**

Use this parameter to specify the file name to which the CLI session record is saved.

### **-size-limit {<integer>[KB|MB|GB|TB|PB] } - Logfile Size Limit Max:2GB**

Use this parameter to specify the maximum size of the file that contains the CLI session record. When the file size reaches this limit, recording stops. The default file size limit is 1 MB . The maximum file size limit is 2 GB .

## Examples

The following example shows how to start creating a record of the CLI session in a file named `sessionlog3` . The size limit of this file is 20 MB .

```
cluster1::> system script start -filename sessionlog3 -size-limit 20MB
```

## Related Links

- [system script show](#)
- [system script stop](#)

## system script stop

Stops logging CLI I/O

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system script stop` command stops creating a record of your CLI session, if you started creating the record by using the `system script start` command. Use the `system script show -this-sessionyes` command to display files that are recording the current CLI session.

## Examples

The following example shows how to stop creating a record of your CLI session.

```
cluster1::> system script stop
```

## Related Links

- [system script start](#)
- [system script show](#)

## system script upload

Upload the selected CLI session log

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system script upload` command uploads a CLI session record file to a remote location. Specify the remote location using an FTP or HTTP URI. Use the [system script show](#) command to display saved CLI sessions. Use the [system script start](#) command to record a CLI session and save it to a file.

## Parameters

### **-username <text> - Username If Not Your Own**

Use this parameter to specify the name of the user who owns the file to upload. By default, this is the user who is logged in.

### **-filename <text> - Filename to Log To**

Use this parameter to specify the name of a file to be uploaded.

### **-destination {(ftp|http)://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to Send File To**

Use this parameter to specify the FTP or HTTP destination of the file.

## Examples

The following example shows how to upload the file named `sessionlog3` to the destination [ftp://now.example.com/cli\\_sessions](ftp://now.example.com/cli_sessions).

```
cluster1::> system script upload -filename sessionlog3 -destination
ftp://now.example.com/cli_sessions
```

# system service-processor commands

## system service-processor reboot-sp

Reboot the Service Processor on a node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor reboot-sp` command reboots the Service Processor of the specified node.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor is to be rebooted.

### **[-image {primary|backup}] - Image to Boot with After Reboot**

This parameter specifies the image that the Service Processor uses after the reboot. By default, the `primary` image is used. Avoid booting the SP from the backup image. Booting from the backup image is reserved for troubleshooting and recovery purposes only. It might require that the SP automatic firmware update be disabled, which is not a recommended setting. You should contact technical support before attempting to boot the SP from the backup image.

## Examples

The following command reboots the Service Processor of node "node1" into the `primary` image.

```
cluster1::> system service-processor reboot-sp -node node1 -image primary

NOTE : If your console connection is through the SP, it will be
disconnected.
      Do you want to reboot the SP ? {y|n}: y

cluster1::>
```

The following command reboots the Service Processors of all nodes. Since `-image` is not specified, the Service Processors will boot into the `primary` image.

```
cluster1::> system service-processor reboot-sp -node *

NOTE : If your console connection is through the SP, it will be
disconnected.
      Do you want to reboot the SP ? {y|n}: y
2 entries were acted on.

cluster1::>
```

## system service-processor show

Display the Service Processor information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor show` command displays information about the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information for the Service Processor of the specified node.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects information for the Service Processors whose status matches the specified value.

**[-ip-configured {true|false}] - Is Network Configured**

Selects information for the Service Processors whose network is configured (`true`) or not configured (`false`).

**[-address <IP Address>,...] - Public IP Address**

Selects information for the Service Processors that use the specified IP address or addresses.

**[-mac <MAC Address>] - MAC Address**

Selects information for the Service Processors that use the specified MAC address.

**[-fw-version <text>] - Firmware Version**

Selects information for the Service Processors that are running the specified firmware version.

**[-part-num <text>] - Part Number**

Selects information for the Service Processors that have the specified part number.

**[-serial-num <text>] - Serial Number**

Selects information for the Service Processors that have the specified serial number.

**[-dev-rev <text>] - Device Revision**

Selects information for the Service Processors that have the specified device revision.

**[-autoupdate-enabled {true|false}] - Is Firmware Autoupdate Enabled**

Selects information for the Service Processors that have the specified status for firmware automatic update.

## Examples

The following example displays basic information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show
```

Node	Type	Status	IP Configured	Firmware Version	IP Address
node1	SP	online	true	2.2X5	192.168.1.201
node2	SP	online	true	2.2X5	192.168.1.202

2 entries were displayed.

```
cluster1::>
```

The following example displays all available information for the Service Processors of all the nodes.

```
cluster1::> system service-processor show -instance
```

Node: node1

- Type of Device: SP
- Status: online
- Is Network Configured: true
- Public IP Address: 192.168.1.201
- MAC Address: ab:cd:ef:fe:ed:01
- Firmware Version: 2.2X5
- Part Number: Not Applicable
- Serial Number: Not Applicable
- Device Revision: Not Applicable
- Is Firmware Autoupdate Enabled: true

Node: node2

- Type of Device: SP
- Status: online
- Is Network Configured: true
- Public IP Address: 192.168.1.202
- MAC Address: ab:cd:ef:fe:ed:02
- Firmware Version: 2.2X5
- Part Number: Not Applicable
- Serial Number: Not Applicable
- Device Revision: Not Applicable
- Is Firmware Autoupdate Enabled: true

2 entries were displayed.

```
cluster1::>
```

The following example displays only the type, status and firmware version for the Service Processors of all the

nodes.

```
cluster1::> system service-processor show -fields type,status,fw-version
node           type status fw-version
-----
node1          SP   online 2.2X5
node2          SP   online 2.2X5
2 entries were displayed.

cluster1::>
```

## system service-processor api-service disable-installed-certificates

Disable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command disables user-installed certificates for secure communication with the service processor API service. Default certificates are then auto-generated.

### Examples

The following example disables user-installed certificates for the service processor API service.

```
cluster1::> system service-processor api-service disable-installed-
certificates
```

## system service-processor api-service enable-installed-certificates

Enable user-installed certificates for the service processor API service

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command enables user-installed certificates for secure communication with the service processor. Use the [security certificate install](#) command to install client, server and CA certificates.

### Parameters

**-vserver <Vserver Name> - Vserver**

Use this parameter to specify the Vserver on which certificates are installed.

**-server-cert <text> - Name of the Server Certificate**

Use this parameter to specify the unique name of the server certificate.

### **-client-cert <text> - Name of the Client Certificate**

Use this parameter to specify the unique name of the client certificate.

### **-rootca-cert <text> - Names of the Root CA Certificates**

Use this parameter to specify the unique names of server-ca or client-ca certificate.

## **Examples**

The following example installs server, client and rootca certificates and then enables those certificates for secure communication with the service processor.

```
cluster1::> security certificate install -vserver cluster1 -type server
cluster1::> security certificate install -vserver cluster1 -type client
cluster1::> security certificate install -vserver cluster1 -type server-ca
cluster1::> security certificate show-user-installed
```

Vserver	Serial Number	Certificate Name	Type
cluster1	1533F133482E800F	xxx-ca	server-ca
Certificate Authority: xxx-ca			
Expiration Date: Sat Jun 01 05:11:41 2019			
cluster1	1533F273AA311FDB	xxx-client	client
Certificate Authority: xxx-ca			
Expiration Date: Fri May 31 05:34:37 2019			
cluster1	1533F1B321E55242	xxx-server	server
Certificate Authority: xxx-ca			
Expiration Date: Fri May 31 05:20:50 2019			

```
cluster1::> system service-processor api-service enable-installed-
certificates -vserver cluster1 -server-cert xxx-server -client-cert xxx-
client -rootca-cert xxx-ca
```

## **Related Links**

- [security certificate install](#)

## **system service-processor api-service modify**

Modify service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system service-processor api-service modify` command modifies SP API service configuration. The SP API is a secure network API that enables Data ONTAP to communicate with the Service Processor over the network.

## Parameters

### **`[-is-enabled {true|false}] - Is SP API Service Enabled (privilege: advanced)`**

This parameter enables or disables the API service of the Service Processor. When the API service is disabled, features like network-based firmware updates and network-based down filer log collection will not be available, and the slower serial-interface will be used for firmware updates and down filer log collections.

### **`[-port <integer>] - SP API Service Port (privilege: advanced)`**

This parameter specifies the port number on the Service Processor used for the API service. By default, port 50000 is used.

## Examples

The following example modifies the port number used for the SP API service and then disables the SP API service.

```
cluster1::*>system service-processor api-service modify -port 50001

cluster1::*>system service-processor api-service show
  Service Processor API service configuration
is-enabled: true
  port: 50001
```

```
cluster1::*>system service-processor api-service modify -is-enabled false

cluster1::*>system service-processor api-service show
  Service Processor API service configuration
is-enabled: false
  port: 50001
```

## **system service-processor api-service renew-internal-certificates**

Renew SSL and SSH certificates used for secure communication with the service processor

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The ``system service-processor api-service renew-internal-certificates`` command generates the certificates used for secure communication with the service processor API service. This command is not allowed if user-installed certificates are enabled.

## Examples

The following example generates new default host and root-ca certificates.

```
cluster1::*> system service-processor api-service renew-internal-  
certificates
```

## system service-processor api-service show

Display service processor API service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system service-processor api-service show` command displays the service processor API service configuration.

## Examples

The following example displays the service processor API service configuration:

```
cluster1::*> system service-processor api-service show  
Service Processor API service configuration  
    Enabled: true  
    Port: 50000  
Server Certificate: -internal-  
Client Certificate: -internal-  
CA Certificate: -internal-
```

## system service-processor image modify

Enable/Disable automatic firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor image modify` command enables or disables automatic firmware update on the Service Processor of specified node or nodes.

### Parameters

**-node {<nodename>|local} - Node**

The parameter specifies the node on which automatic Service Processor firmware update is to be enabled or disabled.

### **`[-autoupdate {true|false}] - Firmware Autoupdate`**

Setting this parameter to `true` enables automatic firmware update. Setting this parameter to `false` disables automatic firmware update. This is a mandatory parameter.

### **Examples**

The following command enables automatic firmware update for the Service Processor on the local node.

```
cluster1::> system service-processor image modify -node local -autoupdate true
```

The following command enables automatic firmware update for the Service Processors on all the nodes.

```
cluster1::> system service-processor image modify -node * -autoupdate true
2 entries were modified.
```

## **system service-processor image show**

Display the details of currently installed Service Processor firmware image

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system service-processor image show` command displays information about the currently installed firmware images on the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

### **Parameters**

**`{ [-fields <fieldname>,...]`**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**`| [-instance ] }`**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**`[-node {<nodename>|local}] - Node`**

Selects firmware image information for the Service Processor of the specified node.

**`[-image {primary|backup}] - Image`**

Selects firmware image information for the Service Processors that are running the primary or backup image as specified.

**`[-type {SP|NONE|BMC}] - Type`**

Selects firmware image information for the Service Processors of the specified type.

**[`-status {installed|corrupt|updating|auto-updating|none}`] - Image Status**

Selects firmware image information for the Service Processors whose image status matches the specified value.

**[`-is-current {true|false}`] - Is Image Current**

Selects firmware image information for the SP whose current image matches the specified status. This parameter indicates the partition (primary or backup) that the SP is currently booted from, not whether the installed firmware version is most current.

**[`-version <text>`] - Firmware Version**

Selects firmware image information for the Service Processors running the specified firmware version.

**[`-autoupdate {true|false}`] - Firmware Autoupdate**

Selects firmware image information for the Service Processors whose automatic update matches the specified configuration.

**[`-last-update-status {failed|passed}`] - Last Update Status**

Selects firmware image information for the Service Processors whose last update is of the specified status.

## Examples

The following command displays basic firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show
Node      Type  Image  Status  Is      Version
-----  ---  -
node1     SP    primary installed true    2.2X8
          backup installed false   2.2X5
node2     SP    primary installed true    2.2X8
          backup installed false   2.2X5
4 entries were displayed.

cluster1::>
```

The following command displays all available firmware information for the Service Processors of all the nodes.

```
cluster1::> system service-processor image show -instance
Node: node1
    Image: primary
    Type: SP
    Image Status: installed
    Is Image Current: true
    Firmware Version: 2.2X8
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node1
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: primary
    Type: SP
    Image Status: installed
    Is Image Current: true
    Firmware Version: 2.2X8
    Firmware Autoupdate: true
    Last Update Status: passed
Node: node2
    Image: backup
    Type: SP
    Image Status: installed
    Is Image Current: false
    Firmware Version: 2.2X5
    Firmware Autoupdate: true
    Last Update Status: passed
4 entries were displayed.

## system service-processor image update

### Update Service Processor firmware

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image update` command installs a new firmware version on the Service Processor of specified node in a cluster. If this command fails, it will display and log an appropriate error message and abort. No automatic command retries will be performed. This command also specifies which firmware image is to be installed on the Service Processor and how.

You can use the command `system service-processor image update-progress show` to check the progress of the update.

The following parameter combinations are not supported for this command:

- `-update-type`differential`` with `-clear-logs`true``
- `-baseline`true`` with `-package`<text>``

## Parameters

### **`-node {<nodename>|local}` - Node**

This parameter specifies the node whose Service Processor's firmware is to be updated.

### **`[-package <text>]` - Firmware Package**

This parameter specifies the package that will be installed. You can find the package file in the SP Update Repository field of the `system node image package show` command. If you do not specify this parameter, the Service Processor is updated to the most recent version of the firmware that is available in the update repository. You must specify this parameter if `baseline` is false or omitted.

### **`[-baseline {true|false}]` - Install Baseline**

If you set this parameter to true, the command installs the Service Processor firmware version that is bundled with the currently running release of Data ONTAP. This is a safety mechanism that allows you to revert the SP firmware to the version that was qualified and bundled with the currently running version of Data ONTAP on your system. If not specified, this parameter defaults to false.

### **`[-clear-logs {true|false}]` - Clear Logs After Update**

If you set this parameter to `true`, the command resets log settings to factory default and clears contents of all logs maintained by the Service Processor, including:

- Event logs
- IPMI logs
- Forensics logs

## Examples

The following command reverts the firmware on the Service Processor of the local node to the version that was packaged with the currently running release of Data ONTAP. A complete install will be performed, clearing all logs maintained by the Service Processor. The second command displays the status of the in-progress firmware install.

```
cluster1::> system service-processor image update -node local -update-type
full -baseline true -clear-logs true
```

```

cluster1::>

cluster1::> system service-processor image update-progress show

```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

```

2 entries were displayed.

## system service-processor image update-progress show

Display status for the latest Service Processor firmware update

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor image update-progress show` command displays the progress information of firmware updates on the Service Processor of the specified nodes. The "in-progress" field displays "no" if no update is in progress. This command does not display the progress of an SP firmware update that is triggered from the SP CLI.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

This parameter displays the status of Service Processor firmware update for the specified node.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update Start Timestamp**

This parameter displays the status of the Service Processor whose firmware update start time matches the specified value.

### **[-percent-done <integer>] - Latest SP Firmware Update Percentage Done**

This parameter displays the status of the Service Processor whose update completion percentage matches the specified value.

### **[-end-time <MM/DD/YYYY HH:MM:SS>] - Latest SP Firmware Update End Timestamp**

This parameter displays the status of the Service Processor whose firmware update end time matches the specified value.

### **[-in-progress {yes|no}] - Is Update in Progress**

This parameter displays the update status of the Service Processor that matches the specified in-progress status.

## **Examples**

The following example starts a firmware update on the local node and then uses the command `system service-processor image update-progress show` to display progress of firmware updates on Service Processors of all nodes in the system.

```
cluster1::> system service-processor image update -node local -update-type
full -baseline true -clear-logs true

cluster1::>

cluster1::> system node service-processor image update-progress show
```

Node	In Progress	Start Time	Percent Done	End Time
node1	yes	8/28/2012 20:00:34	99	-
node2	no	-	0	-

```
2 entries were displayed.

cluster1::>

## **system service-processor log show-allocations**

Display the Service Processor log allocation map

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system service-processor log show-allocations` command displays the allocation map of the Service Processor logs collected in the cluster. The Service Processor logs of a node are archived in the `mroot` directory of the collecting node. This command displays the sequence numbers for the Service Processor log files that reside in each collecting node.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that the specified node has collected.

**[-remote-node <text>] - Remote Node**

If you specify this parameter, the command displays the sequence numbers of Service Processor log files that have been collected from the specified remote node.

**[-seqList <integer>,...] - Log File Sequence Numbers**

If you specify this parameter, the command displays information about Service Processor log files with the specified sequence number.

## Examples

The following example displays the allocation map of the Service Processor log files in the cluster.

```
cluster1::> system service-processor log show-allocation
Node                From Which Node      Log File Sequence
-----
cluster1-01
                    cluster1-01      10, 11, 12, 13, 15
                    cluster1-02      14, 15, 16, 17
cluster1-02
                    cluster1-01      14
                    cluster1-02      11, 12, 13
4 entries were displayed.

## system service-processor network modify

Modify the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network modify` command modifies the network configuration of the Service Processor of specified node or nodes in a cluster.

If the SP automatic network configuration has been enabled, the `system service-processor network modify` command allows you to only enable or disable the SP IPv4 or Ipv6 network interface.

## Parameters

### **-node {<nodename>|local} - Node**

This parameter specifies the node whose Service Processor's network configuration is to be modified.

### **-address-family {IPv4|IPv6} - Address Family**

This parameter specifies whether the IPv4 or the IPv6 configuration is to be modified.

### **[-enable {true|false}] - Interface Enabled**

This parameter enables or disables the underlying network interface for the specified `address-family`. This is a mandatory parameter.

### **[-dhcp {v4|none}] - DHCP Status**

If this parameter is set to `v4`, the Service Processor uses network configuration from the DHCP server. Otherwise, the Service Processor uses the network address you specify. If this parameter is not set to `v4` or is not specified, you must specify the IP address, netmask, prefix-length, and gateway in the command. DHCP is not supported for IPv6 configuration.

### **[-ip-address <IP Address>] - IP Address**

This parameter specifies the public IP address for the Service Processor. You must specify this parameter when the `-dhcp` parameter is not set to `v4`.

### **[-netmask <IP Address>] - Netmask**

This parameter specifies the netmask for a Service Processor that uses an IPv4 address. This parameter has no effect if the IP address family is set to IPv6. You must specify this parameter when DHCP is not `v4` and the address family is IPv4.

### **[-prefix-length <integer>] - Prefix Length of Subnet Mask**

This parameter specifies the network prefix-length of the Service Processor if the address family is set to IPv6. The parameter has no effect when the address family is set to IPv4. You must specify this parameter when DHCP is not set to `v4` and when the address family is set to IPv6.

### **[-gateway <IP Address>] - Gateway IP Address**

This parameter specifies network gateway of the Service Processor. You must specify this parameter when DHCP is not set to `v4`.

## Examples

The following example enables the network interface for IPv4 on the Service Processor of the local node. It first displays the current network configuration information of the local node to show the network interface is initially disabled, and then enables it with IP address 192.168.1.202, netmask as 255.255.255.0 and gateway as 192.168.1.1. It displays the interim state with SP Network Setup Status field showing "in-progress". It finally displays the network configuration again to confirm the specified values took effect.

## system service-processor network show

### Display the network configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network show` command displays the network configuration of the Service Processor of each node in a cluster. You can limit output to specific types of information and specific nodes in the cluster, or filter output by specific field values.

In case a node is offline or its Service Processor management daemon is down, the command displays the last known IP address of its Service Processor. Only the IP address is displayed in such cases.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects network configuration information for the Service Processor of the specified node.

**[-address-family {IPv4|IPv6}] - Address Family**

Selects network configuration information for the Service Processors that have the specified IP address family.

**[-enable {true|false}] - Interface Enabled**

Selects network configuration information for the Service Processors whose network interface for the given `address-family` is enabled or disabled as specified.

**[-type {SP|NONE|BMC}] - Type of Device**

Selects network configuration information for the Service Processors of the specified type.

**[-status {online|offline|sp-daemon-offline|node-offline|degraded|rebooting|unknown|updating}] - Status**

Selects network configuration information for the Service Processors whose status matches the specified value.

**[-link-status {up|down|disabled|unknown}] - Link Status**

Selects network configuration information for the Service Processors whose link status matches the specified value.

**[-dhcp {v4|none}] - DHCP Status**

Selects network configuration information for the Service Processors whose DHCP status matches the specified value.

**[-ip-address <IP Address>] - IP Address**

Selects network configuration information for the Service Processors that use the specified IP address.

**[-mac <MAC Address>] - MAC Address**

Selects network configuration information for the Service Processors that use the specified MAC address.

**[-netmask <IP Address>] - Netmask**

This parameter displays information only for the Service Processors that use the specified netmask.

**[-prefix-length <integer>] - Prefix Length of Subnet Mask**

Selects network configuration information for the Service Processors whose prefix length of subnet mask matches the specified value.

**[-router-ip <IP Address>] - Router Assigned IP Address**

Selects network configuration information for the Service Processors whose router-assigned IP address matches the specified value.

**[-link-local-ip <IP Address>] - Link Local IP Address**

Selects network configuration information for the Service Processors whose link local IP address matches the specified value.

**[-gateway <IP Address>] - Gateway IP Address**

Selects network configuration information for the Service Processors whose gateway IP address matches the specified value.

**[-time-last-updated <text>] - Time Last Updated**

Selects network information for the Service Processors that have the specified time stamp showing when configuration was last updated.

**[-subnet-name <text>] - Subnet Name**

Selects network information for the Service Processors that use the specified subnet-name for SP automatic configuration.

**[-is-ipv6-ra-enabled {true|false}] - Enable IPv6 Router Assigned Address**

Selects network information for the Service Processors that have the specified status for IPv6 router-assigned address.

**[-setup-status {not-setup|succeeded|in-progress|failed}] - SP Network Setup Status**

Selects network information for the Service Processors that have the specified status for network interface setup.

**[-setup-failure-reason {success|subnet-out-of-address|invalid-subnet|other-error}] - SP Network Setup Failure Reason**

Selects network information for the Service Processors that have the specified reason for network interface setup failure.

## Examples

The following example displays basic network configuration information for the Service Processors of all the nodes.

```

cluster1::> system service-processor network show

```

Node	Status	Type	Link State	IP Address
node1	online	IPv4	up	192.168.1.201

## system service-processor network auto-configuration disable

### Disable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `system service-processor network auto-configuration disable` command disables the SP's use of subnet resource for the automatic configuration of its networking port. This command is a cluster-wide configuration. When you disable the SP automatic network configuration, all SPs in the cluster will be configured to use IPv4 DHCP. Any addresses previously allocated from the subnet to the SP will be released. If the SP fails to obtain an IPv4 IP address from the DHCP server, an EMS message warns you about the failure. The IPv6 interface will be disabled.

Parameters

**-address-family {IPv4|IPv6} - Subnet Address Family**

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be disabled for the SP.

Examples

The following example disables the automatic configuration for IPv4 on the SP. It first displays the current network configuration and then disables the SP IPv4 automatic network configuration.

```
cluster1::>system service-processor network show
      Address
Node      Status      Family      Link State      IP Address
-----
node1
      online      IPv4      up      192.168.1.2
      DHCP: none

```

## system service-processor network auto-configuration enable

### Enable Service Processor Auto-Configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system service-processor network auto-configuration enable` command enables the automatic network configuration for the SP. This is a cluster-wide configuration. Every node in the cluster will use the specified subnet to allocate IP address, subnet mask and gateway address for the SP configuration. When the SP automatic network configuration is enabled, you do not need to manually manage the SP network of individual nodes. A node that subsequently joins the cluster uses the specified subnet to configure its SP network automatically.

Prior to running this command, the subnet you want to use for the SP automatic network configuration must already be defined in the cluster and must have no resource conflicts with the SP network interface.

#### Parameters

##### **-address-family {IPv4|IPv6} - Subnet Address Family**

This parameter specifies whether the IPv4 or the IPv6 automatic configuration is to be enabled for the SP.

##### **-subnet-name <text> - Subnet Name**

This parameter specifies the network subnet that the SP will use for automatic network configuration.

#### Examples

The following example enables the automatic network configuration for IPv4 on the SP. It first displays the current SP network configuration, displays available network subnet in the cluster, and then enable the SP to use the subnet for IPv4 automatic configuration.

```
cluster1::>system service-processor network show
```

Node	Status	Address Family	Link State	IP Address
node1	online	IPv4	up	192.168.1.201

DHCP: v4

MAC Address: ab:cd:ef:fe:ed:01

Network Gateway: 192.168.1.1

Network Mask (IPv4 only): 255.255.255.0

Prefix Length (IPv6 only): -

IPv6 RA Enabled: -

Subnet Name: -

SP Network Setup Status: succeeded

```
cluster1::> network subnet show
```

IPspace: Default

Subnet Name	Subnet	Broadcast Domain	Gateway	Avail/Total	Ranges
ipv4_test	192.168.1.0/24	Default	192.168.1.1	3/5	192.168.1.2-192.168.1.6

```
cluster1::>system service-processor network auto-configuration enable
-address-family ipv4 -subnet-name ipv4_test
```

```
cluster1::system service-processor network> show
```

Node	Status	Address Family	Link State	IP Address
-----				
-----				
node1	online	IPv4	up	192.168.1.2

DHCP: none

MAC Address: ab:cd:ef:fe:ed:01

Network Gateway: 192.168.1.1

Network Mask (IPv4 only): 255.255.255.0

Prefix Length (IPv6 only): -

IPv6 RA Enabled: -

Subnet Name: ipv4\_test

SP Network Setup Status: succeeded

## system service-processor network auto-configuration show

### Display Service Processor Auto-Configuration Setup

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system service-processor network auto-configuration show` command displays the names of the IPv4 and IPv6 network subnet objects configured in the cluster that the SP uses for automatic configuration.

### Examples

The following example shows that the SP is configured to use the "ipv4\_test" IPv4 subnet in the cluster for the SP automatic network configuration.

```
cluster1::>system service-processor network auto-configuration show
Cluster Name      SP IPv4 Subnet Name      SP IPv6 Subnet Name
-----
cluster1         ipv4_test                -
```

## system service-processor ssh add-allowed-addresses

Add IP addresses to the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh add-allowed-addresses` command grants IP addresses access to the Service Processor.

## Parameters

### **-allowed-addresses <IP Address/Mask>, ... - Public IP Addresses**

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs. If "0.0.0.0/0, ::/0" is specified in the parameter, any IP address is allowed to access the Service Processor.

## Examples

The following examples grant the specified IP addresses access to the Service Processor and display the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh add-allowed-addresses -allowed
-addresses 192.168.1.202/24, 192.168.10.201/24
Warning: The default "allow all" setting (0.0.0.0/0, ::/0) will be
replaced
        with your changes. Do you want to continue? {y|n}: y

cluster1::> system service-processor ssh show
Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

The following example enables all IP addresses to access the Service
Processor.
cluster1::> system service-processor ssh add-allowed-addresses -allowed
-addresses 0.0.0.0/0, ::/0

cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0
cluster1::>
```

## **system service-processor ssh remove-allowed-addresses**

Remove IP addresses from the list that is allowed to access the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh remove-allowed-addresses` command blocks the specified IP address from accessing the Service Processor. If all IP addresses are removed from the access list, then the Service Processor is not accessible from any IP address.

## Parameters

### **-allowed-addresses <IP Address/Mask>,... - Public IP Addresses**

Use this parameter to specify one or more IP addresses with corresponding netmasks. The value should be specified in the format of address/netmask, for example, 10.98.150.10/24, fd20:8b1e:b255:c09b::/64. Use commas to separate multiple address/netmask pairs.

## Examples

The following example prevents the specified IP addresses from accessing the Service Processor. It also displays the list of public IP addresses that are allowed to access the Service Processor.

```
cluster1::> system service-processor ssh show
  Allowed Addresses: 192.168.1.202/24, 192.168.10.201/24

cluster1::> system service-processor ssh remove-allowed-addresses -allowed
-addresses 192.168.1.202/24, 192.168.10.201/24

Warning: If all IP addresses are removed from the allowed address list,
all IP
        addresses will be denied access. To restore the "allow all"
default,
        use the "system service-processor ssh add-allowed-addresses
        -allowed-addresses 0.0.0.0/0, ::/0" command. Do you want to
continue?
        {y|n}: y

cluster1::> system service-processor ssh show
  Allowed Addresses: -

cluster1::>
```

## system service-processor ssh show

Display SSH security information about the Service Processor

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system service-processor ssh show` command displays the IP addresses that are allowed to access the Service Processor by using SSH.

## Examples

The following example displays SSH security information about the Service Processor.

```
cluster1::> system service-processor ssh show
Allowed Addresses: 0.0.0.0/0, ::/0

cluster1::>
```

# system services commands

## system services firewall modify

Modify firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services firewall modify` command modifies a node's firewall configuration.

### Parameters

**-node {<nodename>|local} - Node**

Use this parameter to specify the node on which to modify firewall configuration.

**[-enabled {true|false}] - Service Enabled**

Use this parameter to specify whether firewall protection is enabled ("*true*") or disabled ("*false*") for the node's network ports. The default setting is *true*.

**[-logging {true|false}] - (DEPRECATED)-Enable Logging**

This parameter is deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to specify whether logging is enabled ("*true*") or disabled ("*false*") for the firewall service. The default setting is *false*.

## Examples

The following example enables firewall protection and logging for a node named node1:

```
cluster1::> system services firewall modify -node node1 -enabled true
-logging true
```

## system services firewall show

Show firewall status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

The `system services firewall show` command displays firewall configuration and logging information. If the command is issued without any parameters, it displays information about all nodes in the cluster. You can also query specific nodes for their firewall information by running the command with the `-node` parameter.

**Parameters**

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects information about the firewall settings on the node you specify.

**[-enabled {true|false}] - Service Enabled**

Selects information about the nodes with the firewall enabled ("*true*") or disabled ("*false*").

**[-logging {true|false}] - (DEPRECATED)-Enable Logging**

This parameter is deprecated and may be removed in a future version of Data ONTAP.

Selects information about the nodes with firewall logging enabled ("*true*") or disabled ("*false*").

**Examples**

The following example displays information about firewall configuration for all nodes in the cluster:

```
cluster1::> system services firewall show
Node           Enabled Logging
-----
node0          true      false
node1          true      false
node2          true      false
node3          true      false
4 entries were displayed.
```

**system services firewall policy clone**

Clone an existing firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services firewall policy clone` command creates a new firewall policy that is an exact copy of an existing policy, but has a new name.

## Parameters

### **-vserver <text> - Vserver owning the Policy**

Use this parameter to specify the name of the Vserver owning the existing policy to copy.

### **-policy <text> - Firewall Policy to be Cloned**

Use this parameter to specify the name of the existing policy to copy.

### **[-destination-vserver <text>] - Vserver owning the New Firewall Policy**

Use this parameter to specify the name of the Vserver that will own the new policy to create.

### **-destination-policy <text> - Name of New Firewall Policy**

Use this parameter to specify the name of the new policy to create.

## Examples

This example creates a new firewall policy named "data2" on Vserver "vs0" from an existing firewall policy named "data" on Vserver "vs1".

```
cluster1::> system services firewall policy clone -vserver vs0 -policy  
data -destination-vserver vs1 -destination-policy data2
```

## system services firewall policy create

Create a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services firewall policy create` command creates a firewall policy entry with the specified name and network service. This command is used both to create the first network service associated with a new firewall policy, or to add to an existing firewall policy by associating another network service with an existing policy. You can optionally specify one or more IP addresses with corresponding netmasks that are allowed to use the firewall policy entry.

You can use the [network interface modify](#) command with the `-firewall-policy` parameter to put a firewall policy into effect for a given logical interface by modifying that logical interface to use the specified firewall policy.

## Parameters

### **-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver on which the policy is to be created.

**-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy that is to be created.

**-service <service> - Service**

Use this parameter to specify the network service that is associated with the policy. Possible values include:

- default - The default protocol or protocols for the port to which the firewall is applied
- http - The HTTP protocol
- https - The HTTPS protocol
- ntp - The NTP protocol
- rsh - The RSH protocol
- snmp - The SNMP protocol
- ssh - The SSH protocol
- telnet - The Telnet protocol

**-allow-list <IP Address/Mask>, ... - Allowed IPs**

Use this parameter to specify one or more IP addresses with corresponding netmasks that are to be allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

**Examples**

The following example creates a firewall policy named data that uses the SSH protocol and enables access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service  
ssh -allow-list 192.0.2.128/25
```

The following example adds an entry to the firewall policy named data, associating the HTTPS protocol with that policy and enabling access from all IP addresses on the 192.0.2.128/25 subnet:

```
cluster1::> system services firewall policy create -policy data -service  
https -allow-list 192.0.2.128/25
```

**Related Links**

- [network interface modify](#)

**system services firewall policy delete**

Remove a service from a firewall policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services firewall policy delete` command deletes a firewall policy. You cannot delete a policy that is being used by a logical interface. Use the [network interface modify](#) command with the `-firewall-policy` parameter to change a network interface's firewall policy.

## Parameters

### **-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver of the policy to delete.

### **-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy to delete.

### **-service <service> - Service**

Use this parameter to specify the policy's network service to delete.

## Examples

The following example deletes a firewall policy that uses the Telnet protocol on the policy named data:

```
cluster1::> system services firewall policy delete -policy data -service telnet
```

Use wildcards to delete entire policies at once, or particular services from every policy. This example deletes the entire intercluster policy.

```
cluster1::> system services firewall policy delete -policy intercluster -service *
```

This example deletes the telnet service from every policy.

```
cluster1::> system services firewall policy delete -policy * -service telnet
```

- [network interface modify](#)

## system services firewall policy modify

Modify a firewall policy entry for a network service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The [system services firewall modify](#) command enables you to modify the list of IP addresses and netmasks associated with a firewall policy.

## Parameters

### **-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver of the policy to modify.

### **-policy <textpolicy\_name> - Policy**

Use this parameter to specify the name of the policy to modify.

### **-service <service> - Service**

Use this parameter to specify the policy's network service to modify.

### **[-allow-list <IP Address/Mask>, ...] - Allowed IPs**

Use this parameter to specify one or more IP addresses with corresponding netmasks that are allowed by this firewall policy. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25".

Multiple address/netmask pairs should be separated with commas. Use the value 0.0.0.0/0 for "any".

## Examples

The following example modifies the firewall policy named data that uses the SSH protocol to enable access from all addresses on the 192.0.2.128 subnet:

```
cluster1::> system services firewall policy modify -policy data -service  
ssh -allow-list 192.0.2.128/25
```

- [system services firewall modify](#)

## system services firewall policy show

Show firewall policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `system services firewall policy show` command displays information about firewall policies.

## Parameters

### **{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

**[ -instance ] }**

Use this parameter to display all the fields for the specified policies.

**[ -vserver <vserver> ] - Vserver Name**

Use this parameter to display information only about the Vserver you specify.

**[ -policy <textpolicy\_name> ] - Policy**

Use this parameter to display information about the policy you specify.

**[ -service <service> ] - Service**

Use this parameter to display information about the services you specify.

**[ -allow-list <IP Address/Mask>, ... ] - Allowed IPs**

Use this parameter to display information about the firewall policies that match the list of allowed IP addresses and netmasks you specify. The correct format for this parameter is address/netmask, similar to "192.0.2.128/25". Multiple address/netmask pairs should be separated with commas.

**[ -ipspace <text> ] - IPspace**

Use this parameter to display information only about the IPspace you specify.

## Examples

The following example displays information about all firewall policies:

```
cluster1::> system services firewall policy show
Vserver Policy      Service      Allowed
-----
cluster1
  data
    dns           0.0.0.0/0, ::/0
    ndmp          0.0.0.0/0, ::/0
    ndmps         0.0.0.0/0, ::/0
cluster1
  intercluster
    ndmp          0.0.0.0/0, ::/0
    ndmps         0.0.0.0/0, ::/0
cluster1
  mgmt
    dns           0.0.0.0/0, ::/0
    http          0.0.0.0/0, ::/0
    https         0.0.0.0/0, ::/0
    ndmp          0.0.0.0/0, ::/0
    ndmps         0.0.0.0/0, ::/0
    ntp           0.0.0.0/0, ::/0
    snmp          0.0.0.0/0, ::/0
    ssh           0.0.0.0/0, ::/0
```

# system services manager install show

Display a list of installed services

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services manager install show` command displays information about installed services.

## Parameters

`{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-service <text>] - Service`

Selects information about installed services that have the name you specify.

`[-version <service version>] - Version`

Selects information about installed services that have the version number you specify.

`[-constituent <text>] - Constituent`

Selects information about installed services that have the constituent process you specify.

`[-nodes {<nodename>|local}] - Nodes`

Selects information about services that are installed on the nodes you specify.

`[-description <text>] - Description`

Selects information about installed services that match the description you specify.

## Examples

The following example shows typical output from a two-node cluster.

```
cluster1::> system services manager install show
Service          Version Constituent Nodes
-----
diagnosis
                1.0      schmd      node1, node2
                1.0      shmd      node1, node2
2 entries were displayed.
```

## system services manager policy add

Add a new service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager policy add` command adds a new service policy to the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

### Parameters

**-service <text> - Service**

Use this parameter to specify the name of the service for which to add a policy.

**-version <service version> - Version**

Use this parameter to specify the minimum version number of the service to run.

### Examples

This example adds a service manager policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy add -service diagnosis -version 1.0
```

## system services manager policy remove

Remove a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager policy remove` command removes a policy from the services manager. Policies determine which versions of a service can run on the nodes of the cluster.

### Parameters

**-service <text> - Service**

Use this parameter to specify the name of the service from which to remove a policy.

**-version <service version> - Version**

Use this parameter to specify the version number that is configured by the policy to remove.

### Examples

The following example shows the removal of the service policy for version 1.0 of the diagnosis service.

```
cluster1::> system services manager policy remove -service diagnosis
-version 1.0
```

## system services manager policy setstate

Enable/disable a service policy

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager policy setstate` command enables or disables services manager policies. Use the [system services manager policy show](#) command to display information about configured policies.

### Parameters

**-service <text> - Service**

Use this parameter to set the state of the policy you specify.

**-version <service version> - Version**

Use this parameter to set the state of the policy with the version number you specify.

**-state {on|off} - State**

Use this parameter with the value "on" to enable the policy. Use this parameter with the value "off" to disable the policy.

### Examples

The following example sets the policy for version 1.0 of the diagnosis service to off.

```
cluster1::> system services manager policy setstate -service diagnosis
-version 1.0 -state off
```

### Related Links

- [system services manager policy show](#)

## system services manager policy show

Display service policies

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager policy show` command displays information about policies that determine which versions of a service can run on the nodes of the cluster.

Use the `system services manager status show` command to view information about services that are configured to run in the cluster.

**Parameters**

- { [-fields <fieldname>,...]**  
If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.
- | [-instance ] }**  
If you specify the `-instance` parameter, the command displays detailed information about all fields.
- [-service <text>] - Service**  
Selects policies that apply to the service you specify.
- [-version <service version>] - Version**  
Selects policies that have the version number you specify.
- [-constituent <text>] - Constituent**  
Selects policies that have the constituent process you specify.
- [-state {on|off}] - State**  
Use this parameter with the value "on" to select information about policies that are currently active. Use this parameter with the value "off" to select information about policies that are not currently active.
- [-num-active <integer>] - Number Active**  
Selects policies that have the number of active (running) instances you specify.
- [-target-nodes <service affinity>,...] - Target Nodes**  
Selects policies that are configured to run on the nodes you specify.
- [-tag <UUID>] - Tag (privilege: advanced)**  
Selects policies that have the UUID you specify. Use this parameter with the `-fields` parameter to display a list of the UUIDs of configured services.

**Examples**

The following example shows typical output for this command.

```
cluster1::> system services manager policy show
Service          Version State Constituent Number Target
                  Active Nodes
-----
diagnosis
                1.0    on    schmd      1      any
                1.0    on    shmd      1      any
2 entries were displayed.
```

## Related Links

- [system services manager status show](#)

## system services manager status show

Display the status of a service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services manager status show` command displays the status of system services that are configured to run in the cluster.

System services run on the nodes of the cluster based on policies. Policies determine which versions of a service can run on the nodes of the cluster. Use the [system services manager policy show](#) command to view existing policies.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-service <text>] - Service**

Selects information about services that match the service name you specify.

**[-version <service version>] - Version**

Selects information about services that are configured to run the version number you specify. The configured version is the minimum version that is allowed to run in the cluster according to a policy. Use the [system services manager policy show](#) command to view information about service policies.

**[-constituent <text>] - Constituent**

Selects information about services that have the constituent process you specify.

**[-actual-version <service version>] - Actual Version**

Selects information about services that are running the version number you specify. This number can be higher than the configured version if a more recent version is installed on the node that is running the service.

**[-node <nodename>] - Node**

Selects information about services that the services manager has assigned to run on the nodes you specify. If the service state is "running", the service is running on these nodes.

**[-state <svc\_state>] - State**

Selects information about services that are in the state you specify.

### **`[-is-running {true|false}] -ls Running`**

Use this parameter with the value "true" to select information about services that are currently running. Use this parameter with the value "false" to select information about services that are not currently running.

### **Examples**

The example below shows typical output for a simple cluster.

```
cluster1::> system services manager status show
Service          Version Constituent Actual  Node          State
                  Version
-----
diagnosis
                1.0      schmd      1.0    cluster1-01   running
                1.0      shmd      1.0    cluster1-01   running
2 entries were displayed.
```

### **Related Links**

## **system services ndmp kill-all**

Kill all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `system services ndmp kill-all` command is used to terminate all NDMP sessions on a particular node in the cluster.

### **Parameters**

**`-node {<nodename>|local}` - Node**

Node on which all NDMP sessions needs to be terminated.

### **Examples**

The following example shows how all NDMP sessions on the node named node1 can be terminated:

```
cluster1::> system services ndmp kill-all -node node1
```

## **system services ndmp kill**

Kill the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services ndmp kill` command is used to terminate a specific NDMP session on a particular node in the cluster.

## Parameters

### <integer> - Session Identifier

Session ID of the NDMP session.

## Examples

The following example shows how a specific NDMP session on the node named `node1` can be terminated:

```
cluster1::> system services ndmp kill 4323 -node node1
```

## system services ndmp modify

(DEPRECATED)-Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp modify](#)" command.

The `system services ndmp modify` command allows you to modify the NDMP configurations for a node in the cluster. One or more of the following configurations can be modified:

- Enable/disable NDMP service
- Enable/disable sending the NDMP password in clear text. Note that MD5 authentication mode is always enabled.
- NDMP user ID

## Parameters

### `-node {<nodename>|local}` - Node

This specifies the node whose NDMP configuration is to be modified.

### `[-enable {true|false}]` - NDMP Service Enabled

This optionally specifies whether NDMP is enabled on the node. The default setting is `true`.

### `[-clear-text {true|false}]` - Allow Clear Text Password

This optionally specifies whether the NDMP password can be sent in clear text. The default setting is `true`.

### **[-user-id <text>] - NDMP User ID**

This optionally specifies the ID of the NDMP user.

### **Examples**

The following example modifies the NDMP configuration on a node named node1. The configuration enables NDMP, disables sending the password in clear text, and specifies an NDMP user named ndmp:

```
cluster1::> system services ndmp modify -node node1 -enable true  
-clear-text false -user-id ndmp
```

## **system services ndmp off**

(DEPRECATED)-Disable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp off](#)" command.

The `system services ndmp off` command is used to disable the NDMP service on any node in the cluster.

### **Parameters**

#### **-node {<nodename>|local} - Node**

The specific node on which NDMP service is to be disabled.

### **Examples**

The following example is used to turn off the NDMP service on node named node1:

```
cluster1::> system services ndmp off -node node1
```

### **Related Links**

- [vserver services ndmp off](#)

## **system services ndmp on**

(DEPRECATED)-Enable NDMP service

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp on](#)" command.

The `system services ndmp on` command is used to enable the NDMP service across any node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node on which the NDMP service is to be enabled.

## Examples

The following example is used to turn on the NDMP service on node named node1:

```
cluster1::> system services ndmp on -node node1
```

## Related Links

- [vserver services ndmp on](#)

## system services ndmp password

(DEPRECATED)-Change the NDMP password for the node

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp generate-password](#)" command.

The `system services ndmp password` command is used to change the NDMP password for a node in the cluster.

## Parameters

**-node {<nodename>|local} - Node**

The specific node for which the password is to be changed.

## Examples

The following example is used to change the NDMP password for the node named node1:

```
cluster1::> system services ndmp password -node node1
```

```
Please enter password:
```

```
Confirm password:
```

## system services ndmp probe

Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `system services ndmp probe` command displays diagnostic information about all the NDMP sessions in the cluster. The following fields are displayed for each of the sessions:

- Node
- Session identifier
- NDMP version
- Session authorized
- Data state
- Data operation
- Data server halt reason
- Data server connect type
- Data server connect address
- Data server connect port
- Data bytes processed
- Mover state
- Mover mode
- Mover pause reason
- Mover halt reason
- Mover record size
- Mover record number
- Mover bytes moved
- Mover seek position
- Mover bytes left to read
- Mover window offset

- Mover window length
- Mover position
- Mover SetRecordSize flag
- Mover SetWindow flag
- Mover connect type
- Mover connect address
- Mover connect port
- Effective host
- NDMP client address
- NDMP client port
- SCSI device ID
- SCSI hostadapter
- SCSI target ID
- SCSI LUN ID
- Tape device
- Tape mode
- Is Secure Control Connection
- Data Backup Mode
- Data Path
- NDMP Source Address

## Parameters

### **[`-node {<nodename>|local}`] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

### **[`-session-id <integer>`] - Session Identifier**

If this parameter is specified, the command displays information only about the specified session.

### **[`-ndmp-version <integer>`] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

### **[`-session-authorized {true|false}`] - Session Authorized**

This parameter indicates whether an NDMP session is authenticated or not.

### **[`-data-state <component state>`] - Data State**

This parameter identifies the current state of the data server's state machine.

### **[`-data-operation <data operation>`] - Data Operation**

This parameter identifies the data server's current operation.

**[-data-halt-reason <halt reason>] - Data Server Halt Reason**

This parameter identifies the event that caused the data server state machine to enter the HALTED state.

**[-data-con-addr-type <address type>] - Data Server Connect Type**

This parameter specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[-data-con-addr <text>] - Data Server Connect Address**

This parameter specifies the connection endpoint information for the data server's data connection.

**[-data-con-port <integer>] - Data Server Connect Port**

This parameter specifies the TCP/IP port that the data server will use when establishing a data connection.

**[-data-bytes-processed <integer>] - Data Bytes Processed**

This parameter represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[-mover-state <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[-mover-mode <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This parameter identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This parameter represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This parameter represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This parameter represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This parameter represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This parameter represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[`-mover-window-offset` <integer>] - Mover Window Offset**

This parameter represents the absolute offset of the first byte of the mover window within the overall data stream.

**[`-mover-window-length` <integer>] - Mover Window Length**

This parameter represents the length of the current mover window in bytes.

**[`-mover-position` <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[`-mover-setrecordsize-flag` {true|false}] - Mover SetRecordSize Flag**

This parameter is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[`-mover-setwindow-flag` {true|false}] - Mover SetWindow Flag**

This parameter represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[`-mover-con-addr-type` <address type>] - Mover Connect Type**

This parameter specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[`-mover-con-addr` <text>] - Mover Connect Address**

This parameter specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[`-mover-con-port` <integer>] - Mover Connect Port**

This parameter specifies the TCP/IP port that the mover will use when establishing a data connection.

**[`-eff-host` <host type>] - Effective Host**

This parameter indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[`-client-addr` <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[`-client-port` <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[`-spt-device-id` <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[`-spt-ha` <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[`-spt-scsi-id` <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays diagnostic information about all the sessions in the cluster:

```

cluster1::> system services ndmp probe
Node: cluster1-01
    Session identifier: 4952
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
Data server connect type: LOCAL
....
...

Node: cluster1-02
    Session identifier: 5289
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
Data server connect type: LOCAL
....
...

```

The following example displays diagnostic information of sessions running on the node cluster1-01 only:

```

cluster1::> system services ndmp probe -node cluster1-01
Node: cluster1-01
    Session identifier: 4952
        NDMP version: 4
    Session authorized: true
        Data state: IDLE
            Data operation: NOACTION
    Data server halt reason: NA
Data server connect type: LOCAL
....
...

```

## system services ndmp show

(DEPRECATED)-Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp show](#)" command.

The `system services ndmp show` command displays the following information about the NDMP configuration across all the nodes in the cluster:

- Node name
- Whether NDMP is enabled on the node
- Whether sending the NDMP password in clear text is enabled on the node
- NDMP user ID

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

## Parameters

**{ [-fields <fieldname>,...]**

If this parameter is specified, the command displays only the fields that you specify.

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all entries.

**[-node {<nodename>|local}] - Node**

Selects information about the specified node.

**[-enable {true|false}] - NDMP Service Enabled**

Selects information about the nodes where NDMP is enabled/disabled.

**[-clear-text {true|false}] - Allow Clear Text Password**

Selects information about the nodes whose clear-text setting matches the specified value.

**[-user-id <text>] - NDMP User ID**

Selects information about the nodes that have the specified NDMP user ID.

## Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp show
Node          Enabled   Clear Text  User ID
-----
node0         true      true        ndmp
node1         true      true        ndmp
node2         true      true        ndmp
node3         true      true        ndmp
4 entries were displayed.
```

## system services ndmp status

Display list of NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system services ndmp status` command lists all the NDMP sessions in the cluster. By default it lists the following details about the active sessions:

- Node
- Session ID

A combination of parameters can be optionally supplied so as to list only those sessions which match specific conditions. A short description of each of the parameter is provided in the parameters section.

### Parameters

{ [-fields <fieldname>,...]

This optional parameter specifies which all additional fields to display. Any combination of the following fields are valid:

- ndmp-version
- session-authorized
- data-state
- data-operation
- data-halt-reason
- data-con-addr-type
- data-con-addr
- data-con-port
- data-bytes-processed
- mover-state
- mover-mode
- mover-pause-reason
- mover-halt-reason
- mover-record-size
- mover-record-num
- mover-bytes-moved
- mover-seek-position
- mover-bytes-left-to-read

- mover-window-offset
- mover-window-length
- mover-position
- mover-setrecordsize-flag
- mover-setwindow-flag
- mover-con-addr-type
- mover-con-addr
- mover-con-port
- eff-host
- client-addr
- client-port
- spt-device-id
- spt-ha
- spt-scsi-id
- spt-scsi-lun
- tape-device
- tape-modes
- is-secure-control-connection
- data-backup-mode
- data-path
- source-addr

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about all the active sessions.

**[-node {<nodename>|local}] - Node**

If this parameter is specified, the command displays information about the sessions running on the specified node only. Node should be a valid node name.

**[-session-id <integer>] - Session Identifier**

If this parameter is specified, the command displays information about specific NDMP session. A session-id is a number used to identify a particular NDMP session.

**[-ndmp-version <integer>] - NDMP Version**

This parameter refers to the NDMP protocol version being used in the session.

**[-session-authorized {true|false}] - Session Authorized**

This field indicates whether an NDMP session is authenticated or not.

**[-data-state <component state>] - Data State**

This field identifies the current state of the data server's state machine.

**[-data-operation <data operation>] - Data Operation**

This field identifies the data server's current operation.

**[-data-halt-reason <halt reason>] - Data Server Halt Reason**

This field identifies the event that caused the data server state machine to enter the HALTED state.

**[-data-con-addr-type <address type>] - Data Server Connect Type**

This field specifies the type of data connection established by the data server. The data connection can be established locally within a given system or between remote networked systems.

**[-data-con-addr <text>] - Data Server Connect Address**

This specifies the connection endpoint information for the data server's data connection.

**[-data-con-port <integer>] - Data Server Connect Port**

This specifies the TCP/IP port that the data server will use when establishing a data connection.

**[-data-bytes-processed <integer>] - Data Bytes Processed**

This field represents the cumulative number of data stream bytes transferred between the backup or recovery method and the data connection during the current data operation.

**[-mover-state <component state>] - Mover State**

This parameter identifies the current state of the NDMP tape server's mover state machine.

**[-mover-mode <mover mode>] - Mover Mode**

This parameter identifies the direction of the mover data transfer.

**[-mover-pause-reason <pause reason>] - Mover Pause Reason**

This parameter identifies the event that caused the mover state machine to enter the PAUSED state.

**[-mover-halt-reason <halt reason>] - Mover Halt Reason**

This integer field identifies the event that caused the mover state machine to enter the HALTED state.

**[-mover-record-size <integer>] - Mover Record Size**

This field represents the current mover record size in bytes.

**[-mover-record-num <integer>] - Mover Record Number**

This field represents the last tape record processed by the mover.

**[-mover-bytes-moved <integer>] - Mover Bytes Moved**

This field represents the cumulative number of data stream bytes written to the data connection or the number of data stream bytes read from the data connection and written to the tape subsystem, depending on the mode of mover operation.

**[-mover-seek-position <integer>] - Mover Seek Position**

This field represents the data stream offset of the first byte the DMA requested the mover to transfer to the data connection during a mover read operation.

**[-mover-bytes-left-to-read <integer>] - Mover Bytes Left to Read**

This field represents the number of data bytes remaining to be transferred to the data connection to satisfy the current NDMP\_MOVER\_READ request.

**[-mover-window-offset <integer>] - Mover Window Offset**

This field represents the absolute offset of the first byte of the mover window within the overall data stream.

**[-mover-window-length <integer>] - Mover Window Length**

This field represents the length of the current mover window in bytes.

**[-mover-position <integer>] - Mover Position**

This parameter can be used to list only those sessions, whose mover position matches a specific value. Mover-position should be an integer.

**[-mover-setrecordsize-flag {true|false}] - Mover SetRecordSize Flag**

This field is used by the DMA to establish the record size used for mover-initiated tape read and write operations.

**[-mover-setwindow-flag {true|false}] - Mover SetWindow Flag**

This flag represents whether a mover window has been set or not. A mover window represents the portion of the overall backup stream that is accessible to the mover without intervening DMA tape manipulation.

**[-mover-con-addr-type <address type>] - Mover Connect Type**

This field specifies the type of data connection established by the mover. The data connection can be established locally within a given system or between remote networked systems.

**[-mover-con-addr <text>] - Mover Connect Address**

This specifies the endpoint address or addresses that the mover will use when establishing a data connection.

**[-mover-con-port <integer>] - Mover Connect Port**

This specifies the TCP/IP port that the mover will use when establishing a data connection.

**[-eff-host <host type>] - Effective Host**

This field indicates the host context in which the NDMP session runs. The valid values are: PRIMARY or PARTNER.

**[-client-addr <text>] - NDMP Client Address**

This parameter specifies the client's IP address.

**[-client-port <integer>] - NDMP Client Port**

This parameter specifies the client's port number.

**[-spt-device-id <text>] - SCSI Device ID**

This parameter specifies the SCSI device ID.

**[-spt-ha <integer>] - SCSI Host Adapter**

This parameter specifies the SCSI host adapter.

**[-spt-scsi-id <integer>] - SCSI Target ID**

This parameter specifies the SCSI target.

**[-spt-scsi-lun <integer>] - SCSI LUN ID**

This parameter specifies the SCSI LUN ID.

**[-tape-device <text>] - Tape Device**

This parameter specifies the name to identify the tape device.

**[-tape-mode <mover mode>] - Tape Mode**

This parameter specifies the mode in which tapes are opened.

**[-is-secure-control-connection {true|false}] - Is Secure Control Connection**

This parameter specifies whether the control connection is secure or not.

**[-data-backup-mode <text>] - Data Backup Mode**

This parameter specifies whether the mode of data backup is Dump or SMTape.

**[-data-path <text>] - Data Path**

This parameter specifies the path of data being backed up.

**[-source-addr <text>] - NDMP Source Address**

This parameter specifies the control connection IP address of the NDMP session.

## Examples

The following example displays all the NDMP sessions on the cluster:

```
cluster1::> system services ndmp status
                        Session
Node                   Id
-----
      node-01      17479
      node-01      19769
      node-02      21118
3 entries were displayed.
```

The following example shows how to display only the sessions running on node-01:

```
cluster1::> system services ndmp status -node node-01
                        Session
Node                   Id
-----
      node-01      17479
      node-01      19769
2 entries were displayed.
```

## system services ndmp log start

(DEPRECATED)-Start logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp log start](#)" command.

This command is used to start logging on an active NDMP session on a node. You can start logging two different kinds of sessions. The NDMP *server* session manages all NDMP tasks on the node. If you want to log information regarding the NDMP server, use *server* with the `-session-id` parameter to enable logging. If you want to log information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the `-session-id` parameter to enable logging.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node.

**-session-id {<integer>|server} - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be started. The session-id is associated with a unique NDMP session. Specify *server* to start logging on the NDMP server session.

**-filter <text> - Level Filter (privilege: advanced)**

Use this parameter to specify the filter for a particular session ID. This parameter controls the NDMP modules for which logging is to be enabled. This parameter can take five values. They are as follow : *all* , *none* , *normal* , *backend* or "*filter-expression*". The default value for this is *none* .

- *all* turns on logging for all modules.
- *none* disables logging for all modules.
- *normal* is a short cut parameter that enables logging for all modules except *verbose* and *io\_loop* . The equivalent filter string is *all-verbose-io\_loop*
- *backend* is a short cut parameter that enables logging for all modules except *verbose* , *io\_loop* , *ndmps* and *ndmpd* . The equivalent filter string is *all-verbose-io\_loop-ndmps-ndmpp*
- (*filter-expression*) is a combination of one or more modules for which logs needs to be enabled. Multiple module names can be combined using following operators :
  - - to remove the given module from the list of specified modules in the filter string. For example the filter *all-ndmpp* will enable logging for all modules but not *ndmpp* .
  - ^ to add the given module or modules to the list of modules specified in the filter string. For example the filter *ndmpp<sup>mover</sup>data* will enable logging for *ndmpp* , *mover* and *data* .

The possible module names and a brief description is given below:

Modules	Description
verbose	verbose message
io	I/O process loop
io_loop	I/O process loop verbose messages
ndmps	NDMP service
ndmpp	NDMP Protocol
rpc	General RPC service
fdc_rpc	RPC to FC driver service
auth	Authentication
mover	NDMP MOVER (tape I/O)
data	NDMP DATA (backup/restore)
scsi	NDMP SCSI (robot/tape ops)
bkup_rpc	RPC to Backup service client
bkup_rpc_s	RPC to Backup service server
cleaner	Backup/Mover session cleaner
conf	Debug configure/reconfigure
dblade	Dblade specific messages
timer	NDMP server timeout messages
vldb	VLDB service
smf	SMF Gateway messages
vol	VOL OPS service
sv	SnapVault NDMP extension
common	NDMP common state
ext	NDMP extensions messages
sm	SnapMirror NDMP extension
ndmprpc	NDMP Mhost RPC server

## Examples

The following example shows how to start logging on a specific NDMP session 33522, running on the node cluster1-01 with filter normal.

```
cluster1::*> system services ndmp log start -node cluster1-01 -session-id
33522 -filter normal
```

The following example shows how to start logging on the NDMP server session, on the node cluster1-01 with filter all.

```
cluster1::*> system services ndmp log start -session-id server -filter all
-node cluster1-01
```

(DEPRECATED)-Stop logging for the specified NDMP session

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "[vserver services ndmp log stop](#)" command.

This command is used to stop logging on an active NDMP session on a node. The NDMP *server* session manages all NDMP tasks on the node. If you want to stop logging information regarding the NDMP server, use *server* with the `-session-id` parameter to disable logging. If you want to stop logging information about a particular NDMP session, for example a restore operation, then determine the session ID for the session using the "system services ndmp status" command and use that ID with the `-session-id` parameter to disable logging.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This parameter specifies the node.

**-session-id {<integer>|server} - Session Identifier (privilege: advanced)**

This parameter specifies the NDMP session-id on which logging needs to be stopped. The session-id is associated with a unique NDMP session. Specify *server* to stop logging on the NDMP server session.

### Examples

The following example shows how to stop logging on a specific NDMP session 35512, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id 35512 -node
cluster1-01
```

The following example shows how to stop logging on the NDMP server session, running on node cluster1-01.

```
cluster1::*> system services ndmp log stop -session-id server -node
cluster1-01
```

## system services ndmp node-scope-mode off

### (DEPRECATED)-Disable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command puts NDMP server in Vserver-aware mode. The Vserver-aware commands are available under `vserver services ndmp`.

#### Examples

The following example shows how to disable the node-scope-mode of NDMP server.

```
cluster1::> system services ndmp node-scope-mode off
NDMP node-scope-mode is disabled.
```

## system services ndmp node-scope-mode on

### (DEPRECATED)-Enable NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command puts the NDMP server in the node-scope-mode. In the node-scope-mode, NDMP server has the following behavior:

- All NDMP operations are restricted to resources on the node
- Vserver-aware NDMP commands are disabled
- NDMP authentication falls back to DATA ONTAP 8.1 NDMP authentication scheme

#### Examples

The following example enables node-scope-mode of operation :

```
cluster1::> system services ndmp node-scope-mode on
NDMP node-scope-mode is enabled.
```

## system services ndmp node-scope-mode status

(DEPRECATED)-Status of NDMP node-scope-mode

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This node-scoped NDMP command is deprecated. Node-scoped NDMP functionality may be removed in a future release of Data ONTAP. Use the Vserver-aware "`vserver services ndmp`" command.

This command displays whether the NDMP server is operating in node-scope-mode or not.

- NDMP node-scope-mode is disabled - NDMP server is Vserver-aware
- NDMP node-scope-mode is enabled - NDMP server is node scoped

### Parameters

### Examples

The following example shows how to check the status of NDMP server in a cluster

```
cluster1::> system services ndmp node-scope-mode status
NDMP node-scope-mode is disabled.
```

## system services ndmp service modify

Modify NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system services ndmp service modify` command allows you to modify the NDMP service configurations for a node in the cluster. The following configuration can be modified:

- NDMP Common Sessions

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

This specifies the node whose NDMP configuration is to be modified.

**[-common-sessions <integer>] - NDMP Common Sessions (privilege: advanced)**

This optional parameter specifies the number of extra common NDMP sessions supported, in addition to the number of backup and restore sessions supported for a platform. The default value is 4 for all platforms. The number of backup and restore sessions are platform dependent.

Increasing this parameter can make the storage system unresponsive.

## Examples

The following example modifies the NDMP configuration on a node named node1. The configuration sets the NDMP Common Sessions to 16:

```
cluster1::> system services ndmp modify -node node1
           -common-sessions 16
```

## system services ndmp service show

### Display NDMP service configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system services ndmp service show` command displays the following information about the NDMP service configuration across all the nodes in the cluster:

- Node name
- NDMP Common Sessions

A combination of parameters can be optionally supplied to filter the results based on specific criteria.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node (privilege: advanced)**

Selects information about the specified node.

**[-common-sessions <integer>] - NDMP Common Sessions (privilege: advanced)**

Selects information about the nodes that have the specified number of NDMP common sessions.

## Examples

The following example displays information about the NDMP configuration of all nodes in the cluster:

```
cluster1::> system services ndmp service show
Node          Common Sessions
-----
node0          16
node1          16
node2          16
node3          16
4 entries were displayed.
```

## system services ndmp service start

### Start the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system services ndmp service start` command starts the NDMP service daemon for a node. This is different from the [system services ndmp on](#) command. The [system services ndmp on](#) command enables the daemon to accept NDMP requests. The NDMP service daemon starts automatically on a node when it boots up. Use this command to start the NDMP service daemon that has been stopped by the [system services ndmp service stop](#) command.

### Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP service needs to be started.

### Examples

```
cluster1::*> system services ndmp service start -node node0
```

Starts the NDMP service on node0.

### Related Links

- [system services ndmp on](#)
- [system services ndmp service stop](#)

## system services ndmp service stop

### Stop the NDMP service

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service stop` command stops the NDMP service daemon on a node. This is a disruptive command and should not be used in normal scenarios. Processing of active sessions continues but the ability to view or kill sessions is lost. This is different from the [system services ndmp off](#) command. The [system services ndmp off](#) command disables new NDMP connections on the node but does not stop the NDMP service daemon.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP service needs to be stopped.

## Examples

```
cluster1::*> system services ndmp service stop -node node0
```

Stops the NDMP service on node0.

## Related Links

- [system services ndmp off](#)

## system services ndmp service terminate

Terminate all NDMP sessions

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `system services ndmp service terminate` command terminates all active sessions on the node. This command forcefully terminates all NDMP sessions without an opportunity for a graceful shutdown. Use [system services ndmp kill-all](#) for a clean termination of all active sessions on a node.

## Parameters

**-node {<nodename>|local} - Node (privilege: advanced)**

The node on which the NDMP sessions need to be terminated

## Examples

```
cluster1::*> system services ndmp service terminate -node node0
```

Terminates all active NDMP sessions on node0.

## Related Links

- [system services ndmp kill-all](#)

## system services web modify

Modify the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command modifies the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its scope applies to the local node.

### Parameters

#### **`[-external {true|false}]` - External Web Services**

Defines whether remote clients can access HTTP or HTTPS service content. Along with the `system services firewall` configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is 'true', which exports web protocols for remote access. If no value is provided during modification, its behavior does not change.

#### **`[-per-address-limit <integer>]` - Per Address Limit (privilege: advanced)**

Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit. The default value is 96.

#### **`[-http-enabled {true|false}]` - HTTP Enabled (privilege: advanced)**

Defines whether HTTP is enabled. The default value for this parameter is *false*.

### Examples

The following command changes the maximum size of the wait queue:

```
cluster1::> system services web modify -wait-queue-capacity 256
```

## system services web show

Display the cluster-level configuration of web protocols

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the overall availability of web services in the cluster, including the core protocol configurations for those services. In a pre-root or unclustered scenario, its output applies to the local node. The following information explains the `External Web Services` and `Status` attributes, two features of web services' availability.

The `External Web Services` field indicates whether remote clients are allowed to access the HTTP or HTTPS service content. Along with the `system services firewall` configuration, the `External Web Services` field indicates the visibility for client connections.

The `Status` field describes the aggregated operational state of cluster-level web services as retrieved from the `system services web node` command. The `Status` field does not reflect whether the protocols are externally visible, but whether the server processes are running correctly. For detailed information about individual servers, use the [system services web node show](#) command. The following are the possible values for the `Status` in node configuration or availability:

- `online`, all web services are consistently configured and working correctly.
- `partial`, one or more nodes' web services are unavailable due to an error condition.
- `mixed`, the nodes in the cluster do not share the same web services configuration. This situation might occur if individual nodes were reconfigured with the `system services web node` command.
- `offline`, all of the nodes' web services are unavailable due to an error condition.
- `unclustered`, the current node is not part of an active cluster.

The `HTTP Enabled` field indicates whether HTTP is enabled.

The `per-address-limit` field is the limit of the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

## Examples

The following example displays the availability of web services for the cluster.

```
cluster1::> system services web show
External Web Services: true
                    Status: online
    HTTP Protocol Port: 80
    HTTPS Protocol Port: 443
                HTTP Enabled: true
```

## Related Links

- [system services web node show](#)

## system services web node show

Display the status of the web servers at the node level

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command displays operational configuration for the web server processes on the nodes in the cluster. This output is aggregated to produce the content for the [system services web show](#) command.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node**

Selects the nodes that match this parameter value. Identifies the node where the web server process is being executed.

**[-external {true|false}] - External Web Services**

Selects the nodes that match this parameter value. Defines whether remote clients can access the HTTP or HTTPS service content. Along with the `system services firewall` command configuration, this parameter controls the visibility for client connections. The default value for this parameter after installation is `true`, which exports web protocols for remote access.

**[-http-port <integer>] - HTTP Port**

Selects the nodes that match this parameter value. Defines the HTTP port for the node-level web services.

**[-https-port <integer>] - HTTPS Port**

Selects the nodes that match this parameter value. Defines the encrypted HTTP (HTTPS) port for the node-level web services.

**[-http-enabled {true|false}] - HTTP Enabled**

Selects the nodes that match this parameter value. Defines whether HTTP is enabled.

**[-per-address-limit <integer>] - Per Address Limit (privilege: advanced)**

Selects the nodes that match this parameter value. Limits the number of connections that can be processed concurrently from the same remote address. If more connections are accepted, those in excess of the limit are delayed and processed after the number of connections being processed drops below the limit.

**[-status {offline|partial|mixed|online|unclustered}] - Protocol Status**

Selects the nodes that match this parameter value. Describes the operational state of node-level web services. This parameter does not reflect whether protocols are externally visible, but whether the server processes are running correctly. The following are the possible values that describe the service availability:

- `online`, indicates that web services are working correctly.
- `offline`, indicates that web services are unavailable due to an error condition.
- `unclustered`, indicates that the current node is not part of an active cluster.

**[-total-hits <integer>] - Total HTTP Requests**

Selects the nodes that match this parameter value. Indicates the total number of requests serviced by the web server.

**[-total-bytes <integer>] - Total Bytes Served**

Selects the nodes that match this parameter value. Indicates the total number of bytes returned by the web server.

### Examples

The following example displays the status of web servers for nodes in the cluster.

```
cluster1::system services web node> show
```

Node	External	HTTP enabled	HTTP Port	HTTPS Port	Status	Total HTTP Requests	Total Bytes
Served							
node1	true	true	80	443	online	5	
1362							
node2	true	true	80	443	online	5	
1362							

2 entries were displayed.

## system smtape commands

### system smtape abort

Abort an active SMTape session

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command aborts the backup or restore operations based on the session identifier. You can perform SMTape operations using the [system smtape backup](#) or [system smtape restore](#) commands. A unique session identifier is assigned for each new SMTape operation. This command aborts sessions that are in active and waiting states.

### Parameters

**-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for a backup or restore session.

### Examples

Abort the SMTape session with the session identifier 20

```
cluster1::> system smtape abort -session 20
Abort posted to session 20.
```

## Related Links

- [system smtape backup](#)
- [system smtape restore](#)

## system smtape backup

### Backup a volume to tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command performs a baseline backup of a specified volume path to a tape device. You can use the command `system hardware tape drive show` to view the list of tape devices in the cluster. You must specify a Snapshot copy name to perform an SMTape backup operation. The Snapshot copy name specified is used as the base Snapshot copy. A new unique session ID is assigned for this SMTape operation and the status of the session can be monitored using the command `system smtape status`. This session ID can be subsequently used to perform other operations such as to find the SMTape status, abort an SMTape operation, and continue an SMTape operation.

The volume and tape device must reside on the same node in the cluster. You must retain the base Snapshot copy created during this backup operation in order to use this Snapshot copy to re-establish a SnapMirror relationship upon a restore.

### Parameters

**-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

**-volume <volume name> - Volume Name**

Use this parameter to specify the name of the volume that needs to be backed up to tape.

**-backup-snapshot <snapshot name> - Snapshot Name**

Use this parameter to specify the name of the Snapshot copy while performing an SMTape backup operation.

**-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

**[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

### Examples

The following example will start the backup of a volume `datavol` in a Vserver `vserver0` to a tape `rst0a`. Both the volume and tape reside on the same node `cluster1-01`. The Snapshot copy to be backed up is

*datavol\_snapshot* and the tape record size has the value of 256KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
             -backup-snapshot datavol_snapshot -tape /cluster1-01/rst0a
             -tape-block-size 256
```

Session 21 created successfully

The following example will start the backup of a volume *datavol* in a Vserver *vserver0* to a tape *rst0a*. The volume *datavol* is in a Vserver *vserver0*. Both the volume and tape reside on the same node *cluster1-01*. The Snapshot copy to be backed up is *datavol\_snapshot* and the tape record size has the default value of 240KB.

```
cluster1::> system smtape backup -vserver vserver0 -volume datavol
             -backup-snapshot datavol_snapshot -tape /cluster1-01/nrst01
Session 22 created successfully
```

## system smtape break

Make a restored volume read-write

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command breaks the relationship between the tape backup of a volume and a restored volume, changing the restored volume from read-only to read/write.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

#### **-volume <volume name> - Volume Name**

Use this parameter to specify the name of the read-only volume that needs to be made read/writeable after a restore.

### Examples

Make the read-only volume *datavol* on Vserver *vserver0* writeable after a restore.

```
cluster1::> system smtape break -vserver vserver0 -volume datavol
[Job 84] Job succeeded: SnapMirror Break Succeeded
```

## system smtape continue

Continue SMTape session waiting at the end of tape

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command continues the SMTape backup and restore operations using the specified tape device. You can use this command when an SMTape operation has reached the end of current tape and is in the wait state to write to or read from a new tape.

If a tape device is not specified, the original tape device will be used.

User has to make sure that the correct tape media is inserted in the device and positioned appropriately before issuing this command.

### Parameters

#### **[-tape </node\_name/tape\_device>] - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name/tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

#### **-session <Sequence Number> - Session Identifier**

Use this parameter to specify the session identifier for the SMTape backup or restore operations.

### Examples

Continues an SMTape session having session ID *20* on tape device *rst0a* on the node *node1* in the cluster.

```
cluster1::> system smtape continue -session 20 -tape /node1/rst0a
continue on session 20 succeeded
```

The following example continues session *40* on the same tape device that was being used by the session.

```
cluster1::> system smtape continue -session 40
continue on session 40 succeeded
```

## system smtape restore

Restore a volume from tape devices

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command performs restore of a backup image created using the command [system smtape backup](#) in the specified tape device to a destination volume path. A new unique session ID is assigned for this operation; the

status of the session can be monitored using the command `system smtape status`. It is required that the volume and tape device reside in the same cluster node. The volume must be of type DP (Data Protection) and should be placed in the restricted mode prior to a restore.

Any existing data on the volume will get overwritten upon a restore. The volume will remain as read-only and of type DP after the restore. You can use the command [system smtape break](#) to get read/write permissions on the volume. Restore can be done to a non-root DP volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Use this parameter to specify the Vserver name on which the volume is located. You need not specify this parameter if only one cluster Vserver exists.

### **-volume <volume name> - Volume Name**

Use this parameter to specify the volume name on which the tape content will be restored.

### **-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified. Use the same record size which was used during the backup. If the tape record size is different from the tape record size that was used at the time of backup then `system smtape restore` will fail.

## Examples

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a -tape-block-size 256
Session 2 created successfully
```

The following example will start the restore to a volume `datavol` from a tape `rst0a`. The volume `datavol` is in a Vserver `vserver0`. Both `vserver0` and `rst0a` reside on the same node `cluster1-01`. The default tape record size of 240KB was used during backup.

```
cluster1::> system smtape restore -vserver vserver0 -volume datavol
           -tape /cluster1-01/rst0a
Session 5 created successfully
```

## Related Links

- [system smtape backup](#)

- [system smtape break](#)

## system smtape showheader

### Display SMTape header

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

This command displays the image header of a tape. The tape must have a valid backup of data. The following information about the backup is displayed:

- Tape Number - the tape number if the backup spans multiple tape devices.
- WAFL Version - WAFL version of the storage system when the volume was backed up on tape.
- Backup Set ID - a unique backup set ID for the baseline backup.
- Source Storage System - the source storage system where the volume resided when the backup was performed.
- Source Volume - the source volume that was backed up to tape.
- Source Volume Capacity - the capacity of the source volume that was backed up to tape.
- Source Volume Used Size - the used size of the source volume that was backed up to tape.
- Source Snapshot - name of the Snapshot copy used for the backup.
- Volume Type - type of the volume.
- Is SIS Volume - this field is true if the backed up volume was a SIS volume.
- Backup Version - the SMTape backup version.
- Backup Sequence No - the backup sequence number.
- Backup Mode - this field describes the backup mode.
- Time of Backup - the time at which the backup was performed.
- Time of Previous Backup - the time at which the previous backup was performed; this information is displayed only if the previous backup was an incremental backup.
- Volume Total Inodes - number of inodes of the backed up volume.
- Volume Used Inodes - number of used inodes of the backed up volume.
- Number of Snapshots - number of Snapshot copies present in this backup.
- Snapshot ID - is the Snapshot ID of the backup Snapshot.
- Snapshot Time - time at which the backup Snapshot copy was created.
- Snapshot Name - name of the Snapshot copy which was backed up to tape.

### Parameters

**-tape </node\_name/tape\_device> - Tape Name**

Use this parameter to specify the name of the tape device which is used for this SMTape operation. The format of the tape device name is `/node_name /tape_device`, where `node_name` is the name of the cluster node owning the tape and `tape_device` is the name of the tape device.

### **[-tape-block-size <integer>] - Tape Record Size in KB**

Use this parameter to specify the tape record size in KB for backup and restore operations. The tape record size is in multiples of 4KB, ranging from 4KB to 256KB. The default tape record size is 240KB unless it is specified.

### **Examples**

The following example reads the image header from the tape *nrst01* residing on the node *cluster1-01* and displays relevant tape header information.

```
cluster1:> system smtape showheader -tape /cluster1-01/nrst01
-tape-block-size 240
Tape record size in KB: 240
    Tape Number: 1
    WAFL Version: 23577
    Backup Set ID: 7d0c9a15-8e20-11e1-8741-123478563412
    Source Storage System: cluster1-01
    Source Volume: /vs1/srcvol
    Source Volume Capacity: 400.00MB
    Source Volume Used Size: 0.00
    Source Snapshot: mysnap
    Volume Type: Flex
    Is SISVolume: no
    Backup Version: 1:3
    Backup Sequence No: 0
    Backup Mode: dw-data
    Time of Backup: 4/24/2012 15:16:38
    Time of Previous Backup: 0/0/0 00:00:00
    Volume Total Inodes: 12789
    Volume Used Inodes: 100
    Number of Snapshots: 1
    Snapshot ID: 1
    Snapshot Time: 4/24/2012 15:16:10
    Snapshot Name: mysnap
```

## **system smtape status clear**

### **Clear SMTape sessions**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

This command clears SMTape sessions which are completed, failed or Unknown state.

## Parameters

### **[`-session` <Sequence Number>] - Session Identifier**

Use this parameter to clear the SMTape sessions with the specified session identifier.

### **[`-node` {<nodename>|local}] - Node Name**

Use this parameter to clear the SMTape sessions related to the specified node.

### **[`-type` {backup|restore}] - Operation Type**

Use this parameter to clear the SMTape sessions of the specified operation type. These can be either backup or restore sessions.

### **[`-status` {COMPLETED|FAILED|UNKNOWN}] - Session Status**

Use this parameter to clear the SMTape sessions which have the status as specified in the parameter.

### **[`-path` <text>] - Path Name**

Use this parameter to clear the SMTape sessions which have path as specified in the parameter.

### **[`-device` <text>] - Device Name**

Use this parameter to clear the SMTape sessions on a specific tape device.

### **[`-backup-snapshot` <snapshot name>] - Snapshot Name**

Use this parameter to clear the SMTape sessions using the Snapshot copy name as specified in the parameter.

### **[`-tape-block-size` <integer>] - Tape Block Size**

Use this parameter to clear the SMTape sessions with the tape block size as specified in the parameter.

## Examples

The following example clears all the completed SMTape sessions in the cluster:

```
cluster1::> system smtape status clear
5 sessions are purged.
```

The SMTape sessions on the node *node1* in the cluster are cleared.

```
cluster1::> system smtape status clear -node node1
3 sessions are purged.
```

## system smtape status show

Show status of SMTape sessions

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command lists the status of all SMTape sessions in the cluster. By default, this command lists the following information:

- Session
- Type
- Status
- Progress
- Path
- Device
- Node

## Parameters

**{ [-fields <fieldname>,...]**

Use this parameter to display additional fields about each session apart from the default entries. This parameter is optional. Any combination of the following fields is valid:

- Session
- Node
- Type
- Status
- Path
- Device
- Progress
- Start-time
- End-time
- Update-time
- Backup-snapshot
- Tape-block-size
- Error

**| [-instance ] }**

Displays detailed information about the specified sessions.

**[-session <Sequence Number>] - Session Identifier**

Selects information about a specific SMTape session. A Session Identifier is a number that is used to identify a particular SMTape session.

**[-node {<nodename>|local}] - Node Name**

Selects information about sessions related to the specified node.

**[-type {backup|restore}] - Operation Type**

Selects information about SMTape sessions of the specified operation type.

**[-status {COMPLETED|FAILED|ACTIVE|WAITING|ABORTING|UNKNOWN}] - Session Status**

Selects information about SMTape sessions having the specified status in the parameter.

**[-path <text>] - Path Name**

Selects information about SMTape sessions on a volume which is at the specified path name. This is the logical path of the volume and you must specify the path name in the following format: /vserver\_name /volume\_name .

**[-device <text>] - Device Name**

Selects information about the SMTape sessions on the specified tape device. You must specify the tape device name in the following format: /node\_name /tape\_device .

**[-progress {<integer>[KB|MB|GB|TB|PB]}] - Bytes Transferred**

Selects information about SMTape sessions in which the number of data bytes transferred in a particular session matches with the number specified in this parameter.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Selects information about SMTape sessions whose starting time matches the specified starting time.

**[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time**

Selects information about SMTape sessions whose ending time matches the specified ending time.

**[-backup-snapshot <snapshot name>] - Snapshot Name**

Selects information about SMTape sessions that use a particular Snapshot copy name which matches the specified Snapshot copy name in the parameter in backup or restore operations.

**[-tape-block-size <integer>] - Tape Block Size**

Selects information about SMTape sessions that use a particular tape block size which matches the specified tape block size parameter in backup or restore operations.

**[-error <text>] - Error Description**

Selects information about SMTape sessions that have a particular error description which matches the specified error description in the parameter.

## Examples

Displays default entries about the five SMTape sessions.

```
cluster1::> system smtape status show
```

Session	Type	Status	Progress	Path	Device	Node
5	Backup	COMPLETED	50MB	/vsrvr1/vol1	/cls1-01/nrst01	cluster1-01
4	Restore	FAILED	0B	/vsrvr1/vol3	/cls1-02/nrst21	cluster1-02
3	Backup	COMPLETED	50MB	/vsrvr1/vol3	/cls1-01/nrst01	cluster1-01
2	Backup	COMPLETED	50MB	/vsrvr1/vol2	/cls1-03/nrst0m	cluster1-03
1	Backup	COMPLETED	50KB	/vsrvr1/vol5	/cls1-01/nrst0n	cluster1-01

5 entries were displayed.

The following example shows the output with the `-instance` argument.

```
cluster1::> system smtape status show -instance
```

```
Session Identifier: 1
  Node Name: node1
  Operation Type: Backup
    Status: COMPLETED
    Path Name: /vs1/vol1
    Device Name: /node1/rst0a
Bytes Transferred: 2048
  Start Time: 1/4/2012 14:26:24
    End Time: 1/4/2012 14:29:45
  Last updated: 1/4/2012 14:29:45
  Snapshot Name: vol1.snapshot
  Tape Block Size: 240
Error Description: None
```

## system snmp commands

### system snmp authtrap

Enables or disables SNMP authentication traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Use this command to either enable or disable the standard SNMP authentication failure traps.

## Parameters

### **[-authtrap <integer>] - Enables SNMP Authentication Trap**

Enter the value of 1 to enable SNMP authentication failure traps. By default, SNMP authentication trap is disabled and the value is 0.

## Examples

The following example demonstrates how to set the SNMP authtrap. +

```
cluster1::> system snmp authtrap -authtrap 1
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp contact

Displays or modifies contact details

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Sets the contact name as the System.sysContact.0 MIB-II variable.

## Parameters

### **[-contact <text>] - Contact**

Specifies the contact name. Without any value specified, this command displays current setting of contact name.

## Examples

The following example sets the contact name for SNMP. +

```
cluster1::> system snmp contact -contact private
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    0
traphosts:
    -
community:
    - -
```

## system snmp enable-snmpv3

Enables SNMPv3 cluster-wide

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system snmp enable-snmpv3` command enables SNMPv3 server on the entire cluster. When this command is run, SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

### Examples

The following command enables SNMPv3 server on the entire cluster, within a cluster named cluster1:

```
cluster1::> set -privilege advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.  
Do you want to continue? {y|n}: y

```
cluster1::*> system snmp enable-snmpv3
```

Warning: If you enable SNMPv3 using this command, any SNMP users and SNMP traphosts that are non-compliant to FIPS will be deleted automatically, since cluster FIPS mode is enabled. Any SNMPv1 user, SNMPv2c user or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol or both) is non-compliant to FIPS. Any SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-compliant to FIPS) is non-compliant to FIPS.

Do you want to continue? {y|n}: y

1 entry was modified.

```
cluster1::*>
```

## system snmp init

Enables or disables SNMP traps

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Initializes or disables sending of traps by the SNMP daemon from the cluster.

### Parameters

#### **[-init <integer>] - Initialize Traps**

Use the value of 1 to initialize SNMP daemon to send traps or use a value of 0 to stop sending traps from the cluster. If no value is specified, this command displays the current setting of init. Traps are enabled by default.

### Examples

The following command initializes SNMP daemon to send traps. +

```
cluster1::> system snmp init -init 1
uster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    -
community:
    - -
```

## system snmp location

Displays or modifies location information

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Sets the location name as the System.sysLocation.0 MIB-II variable.

### Parameters

#### **[-location <text>] - Location**

Specifies the location details. If no value is specified, this command displays the current setting of location.

### Examples

This command sets the location name. +

```
cluster1::> system snmp location -location NB
cluster1::> system snmp show
  contact:
    private
  location:
    NB
  authtrap:
    1
  init:
    1
  traphosts:
    -
  community:
    - -
```

## system snmp prepare-to-downgrade

Change SNMP configuration to the default settings for releases earlier than Data ONTAP 9.3.0

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `system snmp prepare-to-downgrade` command prepares the SNMP subsystem for a downgrade or a revert. More specifically, it prepares the SNMPv3 client feature for a downgrade or a revert. It deletes all storage switches that were explicitly added for monitoring and are using SNMPv3 as the underlying protocol. It also deletes any cluster switches that are using SNMPv3 for monitoring. Finally, it deletes any remote switch SNMPv3 users configured in ONTAP.

### Examples

The following command prepares the SNMP subsystem for a downgrade or a revert, within a cluster named `cluster1`:

```
cluster1::*> system snmp prepare-to-downgrade
```

## system snmp show

Displays SNMP settings

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Lists the current values of all the SNMP parameters.

## Examples

The example below shows a typical command display.

```
cluster1::> system snmp show
contact:
    private
location:
    NB
authtrap:
    1
init:
    1
traphosts:
    xxx.example.com (xxx.example.com) (192.168.xxx.xxx)
community:
    - -
```

## system snmp community add

Adds a new community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system snmp community add` command adds communities with the specified access control type. Only read-only communities are supported. There is no limit for the number of communities supported.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver to which the community will be added. If no Vserver is specified, the community is added to the admin Vserver.

**-community-name <text> - Community**

This parameter specifies the name of the community.

**-type <ctype> - access type**

This parameter specifies 'ro' for read-only community.

## Examples

The following example adds the read-only community name 'private'.

```
cluster1::> system snmp community add -type ro
            -community-name private
cluster1::> system snmp community show
            ro private
```

## system snmp community delete

Deletes community with the specified access control type

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system snmp community delete` command deletes communities with the specified access control type. Only read-only communities are supported.

### Parameters

**-vserver <Vserver Name> - Vserver**

This parameter specifies the Vserver from which you wish to delete the community. If no Vserver is specified, the community is deleted from the admin Vserver.

**-community-name <text> - Community**

Specify the name of the community.

**-type <ctype> - access type**

Specify 'ro' for a read-only community.

### Examples

The following example deletes the read-only community 'private':

```
cluster1::> system snmp community delete -type ro
            -community-name private
cluster1::> system snmp community show
This table is currently empty.
```

## system snmp community show

Displays communities

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays the current list of SNMP communities.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <Vserver Name>] - Vserver**

Selects the Vserver to which the SNMP community belongs

**[-community-name <text>] - Community**

Selects the SNMP v1/v2c community string

**[-access <ctype>] - access**

Selects the access type of the SNMP v1/v2c community. Read-only (ro) is the only access type supported

## Examples

```
cluster1::> system snmp community show
cluster1
    ro private
```

## system snmp traphost add

### Add a new traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Adds the SNMP manager who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

## Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then the SNMPv3 traps are generated for this traphost using the associated USM user's authentication and privacy credentials. If no USM user is associated, then the SNMP v1/v2c traps are generated for this traphost. For the SNMP v1/v2c traps, the default community string is 'public', when no community is defined. When the community strings are defined, then the first community string is chosen for the SNMP v1/v2c traps.

**[-usm-username <text>] - USM User Name**

Specifies a predefined SNMPv3 USM user. The SNMPv3 traps are generated using this USM user's authentication and privacy credentials for the traphost identified by the peer-address parameter.

## Examples

In the following example, the command adds a hostname 'yyy.example.com' for the SNMPv3 traps: +

```
cluster1::> system snmp traphost add -peer-address yyy.example.com -usm
-username MyUsmUser
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com) (192.168.xxx.xxx)      USM
User: MyUsmUser
```

In the following example, the command adds a hostname 'xxx.example.com' for the SNMP v1/v2c traps: +

```
cluster1::> system snmp traphost add xxx.example.com
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com) (192.168.xxx.xxx)      USM
User: MyUsmUser
                xxx.example.com(xxx.example.com) (xxx.xxx.xxx.xxx)
Community: public
```

## system snmp traphost delete

### Delete a traphost

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Deletes the SNMP manager, who receives the SNMP trap PDUs. The SNMP manager can be a hostname or IP address. There is no limit on the number of traphosts supported.

### Parameters

**-peer-address <Remote InetAddress> - Remote IP Address**

Specifies the IP address or hostname of the traphost. If the USM user is associated, then specify the USM user to delete the traphost.

**[-usm-username <text>] - USM User Name**

Specifies the USM user associated with traphost.

## Examples

In the following example, the command deletes the SNMPv3 traphost 'yyy.example.com' associated with the USM user: +

```
cluster1::> system snmp traphost delete -peer-address yyy.example.com -usm
-username MyUsmUser
```

In the following example, the command deletes the SNMP v1/v2c traphost 'xxx.example.com' associated with a community string: +

```
cluster1::> system snmp traphost delete -peer-address xxx.example.com
```

## system snmp traphost show

Displays traphosts

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays list of the SNMP v1/v2c and SNMP v3 managers, that receive trap PDUs.

### Examples

In the following example, the command displays all the host names or IP addresses that have been added until now: +

```
cluster1::> system snmp traphost show
                yyy.example.com(yyy.example.com) (192.168.xxx.xxx)      USM
User: MyUsmUser
                xxx.example.com(xxx.example.com) (xxx.xxx.xxx.xxx)
Community: public
```

## system status commands

### system status show

Display System Status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `system status show` command displays information about the status of objects in Data ONTAP. You can limit output to specific types of information and specific status in Data ONTAP, or filter output by specific field values.

To see a list of values that are in use for a particular field, use the `-fields` parameter of this command with the list of field names you wish to view.

### Parameters

```
{ [-fields <fieldname>, ...]
```

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-internal-name <text>] - Internal Full Name**

Selects status of objects that match this parameter value.

**[-name <text>] - Name**

Selects status of objects that match this parameter value.

**[-vserver-id <text>] - Vserver ID**

Selects status of objects that match this parameter value.

**[-cluster-id <text>] - Cluster ID**

Selects status of objects that match this parameter value.

**[-is-cluster-scope {true|false}] - Cluster Scope**

Selects status of objects that match this parameter value.

**[-status <text>] - Status Value**

Use this parameter to display the status.

**[-update-time <MM/DD/YYYY HH:MM:SS>] - Update Time**

Use this parameter to display the status last update time.

## Examples

The following example displays information about system status in ONTAP:

```
cluster1::> system status show
Cluster:tfarrellnscluster-1
Node:tfarrell-vsim1
Hypervisor system name:vsimesxrtp060.gdl.englab.netapp.com

## system timeout commands

### system timeout modify

Set the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system timeout modify` command sets the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. The default value is 30 minutes. To prevent CLI sessions from timing out, specify a value of 0 (zero).

#### Parameters

**[-timeout <integer>] - Timeout (in minutes)**

Use this parameter to specify the timeout value, in minutes.

#### Examples

The following example shows how to modify the timeout value for CLI sessions to be 10 minutes:

```
cluster1::> system timeout modify -timeout 10
```

The following example shows how to prevent CLI sessions from timing out:

```
cluster1::> system timeout modify -timeout 0
```

### system timeout show

Display the CLI inactivity timeout value

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `system timeout show` command displays the timeout value for CLI sessions. If there is no CLI activity during the length of the timeout interval, the logged in user is logged out. A timeout value of 0 minutes means that the CLI sessions never time out.

## Examples

The following example displays the timeout value for CLI sessions:

```
cluster1::> system timeout show  
CLI session timeout: 15 minute(s)
```

# template commands

## template copy

Copy a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to copy an existing template. The copied template becomes a readwrite template and can be customized using template parameter family of commands.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-destination-name <template name> - Destination template**

This parameter specifies the name of the destination template.

### Examples

The following example copies template1 to template2. The template2 will be a readwrite template:

```
cluster1::> template copy -name template1 -destination-name template2
```

## template delete

Delete an existing template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to delete an existing template.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

### Examples

The following example deletes a template named template1 from the cluster:

```
cluster1::> template delete -name template1
```

## template download

Download a template

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

Use this command to download a template from an external server to the cluster.

### Parameters

**-uri { (ftp|http) :// (hostname|IPv4 Address | ' 'IPv6 Address' ' ) ... } - URI of the template (privilege: advanced)**

This parameter specifies the URI from which the template will be downloaded.

**[-name <template name>] - Name of the template (privilege: advanced)**

This parameter specifies the name that will be assigned to the template in the cluster.

### Examples

The following example downloads the template specified in the -uri parameter value and names the template as template1:

```
cluster1::> template download -uri http://www.example.com/netapp-  
templates/mysample -name template1
```

The following example downloads the template specified in the -uri parameter value:

```
cluster1::> template download -uri http://www.example.com/netapp-  
templates/template1
```

## template provision

Provision Data ONTAP resources using the template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The command `template provision` provisions ONTAP system based on the template that is passed as an input to the template parameter. A wizard is presented which will accept the required inputs.

## Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template

**[-simulate {true|false}] - Simulate**

If this parameter is specified, the provisioning is just simulated and there will be no changes done to the system.

## Examples

The following example provisions a vservers with required protocols using template.

```
cluster-1::> template provision -name VserverEnvironmentSetup
Press Ctrl+C to abort.
*****

## template rename

Rename a template

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Use this command to rename an existing template.

### Parameters

**-name <template name> - Name of the template**

This parameter specifies the name of the template.

**-new-name <template name> - New name of the template**

This parameter specifies the template's new name.

### Examples

The following example renames a template template1 as template2:

```
cluster1::> template rename -name template1 -new-name template2
```

## template show-permissions

Display Template Allowed and Disallowed System Objects

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The template show-permission command shows all the system objects that are allowed and disallowed for the current user.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-name <text>] - Name**

If you specify this parameter, only permissions that match the specified name are displayed.

**[-object-name <text>] - Object Name**

If you specify this parameter, only permissions that match the specified object-name are displayed.

**[-permission <text>] - Permission**

If you specify this parameter, only permissions that match the specified permission are displayed.

**[-command-name <text>] - Command Name**

If you specify this parameter, only permissions that match the specified command-name are displayed.

## Examples

The following example shows all the the allowed and disallowed system objects

```
cluster1::> template show-permissions
Template: VserverEnvironmentSetup
Object Name      Command Name
Permission
-----
access.dns      vservers services name-service dns create
allowed
network.interface network interface create
allowed
network.routes  network route create
allowed
protocols.CIFS   vservers cifs create
allowed
```

# template show

## Display templates

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `template show` command displays information about templates. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, then the command displays the following information about all the templates:

- Template Name
- Permission (*readonly* or *readwrite*)

To display detailed information about a single template, run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Parent Template Name
- Description
- Version
- UUID of the Template

To display detailed information about all templates, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about templates with *readonly* permissions, run the command with the `-permission readonly` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This parameter specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-name <template name>] - Name of the template**

If this parameter is specified, the command displays the detailed information about the template that matches the specified name.

**[-permission <template\_permission>] - Permission**

If this parameter is specified, the command displays information about the template or templates that matches the specified permission.

**[-parent-template <text>] - Parent template name**

If this parameter is specified, the command displays information about the template or templates that matches the specified parent template name.

### **[-description <text>] - Description**

If this parameter is specified, the command displays information about the template or templates that matches the specified description.

### **[-version <text>] - Version**

If this parameter is specified, the command displays information about the template or templates that matches the specified version.

### **[-uuid <UUID>] - UUID of the template**

If this parameter is specified, the command displays information about the template or templates that matches the specified uuid.

## **Examples**

The following example displays information about all templates in the cluster:

```
cluster1::> template show
Template                               Permission
-----
template1                             readonly
template2                             readwrite
```

The following example displays detailed information about a template named template1:

```
cluster1::> template show -name template1
Name of the Template: template1
      Permission: readonly
Parent Template Name: -
      Description: Template to configure Vserver Environment
      Version: 1.0
UUID of the Template: c8dfef58-b5c5-5697-a829-18d4ee0ba202
```

## **template upload**

Upload an existing template to an external server

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### **Description**

Use this command to upload an existing template on to an external server.

### **Parameters**

**-name <template name> - Name of the template (privilege: advanced)**

This parameter specifies the name of the template.

**-uri {(ftp|http)://(hostname|IPv4 Address|['IPv6 Address'])...} - URI to upload the template (privilege: advanced)**

This parameter specifies the URI to which the template will be uploaded.

## Examples

The following example uploads a template template1 on to an external server specified in the uri input parameter:

```
cluster1::*> template upload -name template1 -uri  
http://www.example.com/mytemplates/
```

## template parameter commands

### template parameter modify

Modify the template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

The `template parameter modify` command can be used to modify the following attributes of a template parameter:

- Default value of the parameter

#### Parameters

**-template <template name> - Name of the template**

Name of the template.

**-name <text> - Name of the parameter**

This parameter specifies the name of the parameter.

**[-default-value <text>] - Default value of the parameter**

This parameter specifies the default value of the parameter. This value is used by the [template provision](#) command when it provisions the system using this template.

## Examples

The following example modifies the default value of the parameter param1 in template template1 to value1:

```
cluster1::> template parameter modify -template template1 -parameter  
param1 -default-value value1
```

## Related Links

- [template provision](#)

## template parameter show

### Display template parameters

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `template parameter show` command displays information about the parameters of a template. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all the parameters of all the templates in the system:

- Name of the template
- Name of the parameter
- Permission (*readonly* or *readwrite*)
- Default Value for the parameter
- Readonly
- Description

To display detailed information about a single parameter of the template run the command with the `-name` parameter. The detailed view provides all of the information in the previous list with the following additional information:

- Recommended Value for the parameter
- Maximum Length
- Range Maximum
- Range Minimum
- Allowed Values

To display detailed information about all the parameters of the template, run the command with the `-instance` parameter

You can specify additional parameters to display information that matches only those parameters. For example, to display information about all the parameters of the templates with readonly permissions, run the command with the `-permission readonly` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This parameter specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-template <template name>] - Name of the template**

Name of the template.

**[-name <text>] - Name of the parameter**

If this parameter is specified, the command displays information about the parameter of all the templates that matches the specified parameter name.

**[-permission <text>] - Template permission**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified permission.

**[-type <text>] - Type of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified type.

**[-description <text>] - Parameter description**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified description.

**[-recommended-value <text>] - Recommended value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified recommended value.

**[-default-value <text>] - Default value of the parameter**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified default value.

**[-readonly {yes|no}] - Read-only parameter**

If this parameter is specified with a value of true, then all the parameters that cannot be modified of all templates are displayed. If the value specified is false, then all the parameters that can be modified of all templates are displayed.

**[-max-length <integer>] - Maximum length**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum length.

**[-range-max <integer>] - Maximum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified maximum range.

**[-range-min <integer>] - Minimum range**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified minimum range.

### **[-allowed-vals <text>] - Allowed values**

If this parameter is specified, the command displays information about the parameter or parameters of all the templates that matches the specified allowed values.

### **Examples**

The following example displays information about all the parameters of all the templates in the cluster:

```
cluster1::> template parameter show
```

```
Template: templatel
```

```
Permission: readonly
```

		Default	Read	
Parameter	Type	Value	Only	Description
parameter1	string	-	No	Parameter1
parameter2	IPAddress	-	No	Parameter2

# volume commands

## volume autosize

Set/Display the autosize settings of the flexible volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume autosize` command allows the user to specify the maximum size that a volume will automatically grow to when it is out of space or the minimum size that it will shrink to when the amount of used space is below a certain threshold. If only the volume/Vserver name is specified then the current settings are displayed. This command is not supported on Infinite Volumes.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter can be used to specify the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to set or display the autosize configuration.

**{ [-maximum-size {<integer>[KB|MB|GB|TB|PB] }] - Maximum Autosize**

This parameter allows the user to specify the maximum size to which a flexible volume can grow. The default for FlexVol volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume or is invalid when the autosize feature is enabled, the maximum size is reset to 120% of the volume size. The value for `-maximum-size` cannot be set larger than the platform-dependent maximum FlexVol volume size. If you specify a larger value, the value of `-maximum-size` is automatically reset to the supported maximum without returning an error.

**[-minimum-size {<integer>[KB|MB|GB|TB|PB] }] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-minimum-size` parameter is invalidated by a manual volume resize or is invalid when autosize is enabled, the minimum size is reset to the volume size. This parameter is not supported on Infinite Volumes.

**[-grow-threshold-percent <percent>] - Grow Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize. This parameter is not supported on Infinite Volumes.

**[-shrink-threshold-percent <percent>] - Shrink Threshold Used Space Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size. This parameter is not supported on Infinite Volumes.

### **[`-mode {off|grow|grow_shrink}`] - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- *off* - The volume will not grow or shrink in size in response to the amount of used space.
- *grow* - The volume will automatically grow when used space in the volume is above the grow threshold.
- *grow\_shrink* - The volume will grow or shrink in size in response to the amount of used space.

By default, `-mode` is *off* for new FlexVol volumes, except for DP mirrors, for which the default value is *grow\_shrink*. The *grow* and *grow\_shrink* modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt -try-first` controls the order in which these two space reclamation policies are attempted.

### **[`-reset <true>`] - Autosize Reset }**

This option allows the user to reset the values of autosize, max-autosize, min-autosize, autosize-grow-threshold-percent, autosize-shrink-threshold-percent and autosize-mode to their default values based on the current size of the volume. For example, the max-autosize value will be set to 120% of the current size of the volume.

## **Examples**

The following example sets the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1 -maximum-size 1t -mode grow
(volume autosize)
vol autosize: Flexible volume 'vs1:vol1' autosize settings UPDATED.
```

The following example shows the autosize settings on a volume named vol1. The maximum size to grow is 1TB and autogrow is enabled.

```
cluster1::> vol autosize vol1
(volume autosize)
Volume autosize is currently ON for volume 'vs1:vol1'.
The volume is set to grow to a maximum of 1t.
```

## **volume create**

Create a new volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume create` command creates a volume on a specified Vserver and storage aggregates. You can optionally specify the following attributes for the new volume:

- Size
- State (online, offline, or restricted)
- Type (read-write or data-protection)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Language
- Junction path
- Whether the junction path is active (advanced privilege level or higher only)
- Whether the volume is the root volume for its Vserver (advanced privilege level or higher only)
- Comment
- Whether autosizing is enabled for FlexVols
- Maximum size for autosizing FlexVols
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled for FlexVols
- Current mode of operation of volume autosize
- Maximum directory size (advanced privilege level or higher only)
- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Snapshot reserve percentage
- Use logical space reporting
- Use logical space enforcement
- Whether the volume create operation runs as a foreground or background process
- Caching policy
- Encrypt
- Cache retention priority
- Efficiency policy
- Tiering minimum cooling days

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be created. A volume's name must start with an alphabetic character (a to z or A to Z) and be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other volume types. Volume names must be unique within a Vserver.

### **{ -aggregate <aggregate name> - Aggregate Name**

This specifies the storage aggregate on which the volume is to be created. This parameter only applies to FlexVol volumes.

### **| -aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it. This parameter only applies to FlexGroups.

### **[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1* , *aggr2* , *aggr1* , *aggr2* .

+  
The default value is 4.

+  
This parameter only applies to FlexGroups

### **| -auto-provision-as <FlexGroup> - Automatically Provision as Volume of Type**

Use this parameter to automatically select existing aggregates for provisioning FlexGroup volumes. Note that the fastest aggregate type with at least one aggregate on each node of the cluster will be selected. When auto provisioning a FlexGroup volume, the size of the FlexGroup volume should be a minimum of 800 GB per node.

This parameter only applies to FlexGroups.

### **[-support-tiering {true|false}] - Automatically Provision FlexGroup on FabricPools**

This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup during the protection workflows using the `auto-provision-as` parameter. Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is *false*

This parameter only applies to FlexGroups created using the `-auto-provision-as` parameter.

### **[-nodes {<nodename>|local}] - List of Nodes Hosting the Volume }**

Specifies an array of node names to be used for provisioning the FlexGroup. If an array of node names is specified, only aggregates from the specified nodes will be considered for provisioning. If no value is specified, all nodes in the cluster will be used.

### **[`-size {<integer>[KB|MB|GB|TB|PB]}`] - Volume Size**

This optionally specifies the size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a FlexVol volume is 20 MB. The minimum size for a volume guaranteed FlexGroup is 20 MB per constituent. The minimum size for a none guaranteed FlexGroup is 200 MB per constituent. However, the recommended size for all FlexGroups is a minimum of 100 GB per constituent. For all volumes, the default size is set to the minimum size. The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregates. Volumes can be increased and decreased in size with the [volume modify](#) command. The maximum number of files a volume is configured for is listed under "Total Files" when running the command [volume show](#)-instance.

### **[`-state {online|restricted|offline|force-online|force-offline|mixed}`] - Volume State**

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

The *mixed* state applies to FlexGroups only and cannot be specified as a target state.

### **[`-policy <text>`] - Export Policy**

This optionally specifies the ID number of the export policy associated with the volume. For information on export policies, see the documentation for the [vserver export-policy create](#) command. FlexGroups do not support policies that allow NFSv4 protocol access.

### **[`-user <user name>`] - User ID**

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

### **[`-group <group name>`] - Group ID**

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

### **[`-security-style <security style>`] - Security Style**

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume.

### **[`-unix-permissions <unix perm>`] - UNIX Permissions**

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `---rwxr-xr-x`.

### **[`-junction-path <junction path>`] - Junction Path**

This optionally specifies the volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.

### **[`-junction-active {true|false}`] - Junction Active (privilege: advanced)**

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

**[`-vsroot {true|false}`] - Vserver Root Volume (privilege: advanced)**

This optionally specifies whether the volume is the root volume of its Vserver. The default setting is `false`. If this parameter is set to `true`, the default size of the newly created volume is 1GB. This parameter is not supported on FlexGroups.

**[`-comment <text>`] - Comment**

This optionally specifies a comment for the volume.

**[`-max-autosize {<integer>[KB|MB|GB|TB|PB]}`] - Maximum Autosize**

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error.

**[`-min-autosize {<integer>[KB|MB|GB|TB|PB]}`] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the `grow_shrink` autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-min-autosize` parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size.

**[`-autosize-grow-threshold-percent <percent>`] - Autosize Grow Threshold Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize.

**[`-autosize-shrink-threshold-percent <percent>`] - Autosize Shrink Threshold Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size.

**[`-autosize-mode {off|grow|grow_shrink}`] - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- `off` - The volume will not grow or shrink in size in response to the amount of used space.
- `grow` - The volume will automatically grow when used space in the volume is above the grow threshold.
- `grow_shrink` - The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is `off` for new volumes, except for data protection mirrors, for which the default value is `grow_shrink`. The `grow` and `grow_shrink` modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt-try-first` controls the order in which these two space reclamation policies are attempted.

**[`-maxdir-size {<integer>[KB|MB|GB|TB|PB]}`] - Maximum Directory Size (privilege: advanced)**

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent and optimized for the size of system memory.

## **{ [-space-slo {none|thick|semi-thick}] - Space SLO**

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. The default setting is *none*. There are three supported values: *none*, *thick* and *semi-thick*.

- *none*: The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick*: The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's fractional-reserve setting is not supported.
- *semi-thick*: The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's space-guarantee type is not supported.
  - Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's fractional-reserve setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
  - Snapshot Autodelete: *enabled* - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - *enabled*: *true*
    - *commitment*: *destroy*
    - *trigger*: *volume*
    - *defer-delete*: *none*
    - *destroy-list*: *vol\_clone, lun\_clone, file\_clone, cifs\_share*

In addition, with a value of ```semi-thick```, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of *autodelete* for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of *range* for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot

copies.

### **[`-s`, `-space-guarantee` {`none`|`volume`}] - Space Guarantee Style**

This optionally specifies the space guarantee style for the volume. A value of `volume` reserves space on the aggregates for the entire volume. A value of `none` reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value `none` if the volume is accessible to CIFS clients. The default setting for the volumes on All Flash FAS systems is `none`, otherwise the default setting is `volume`. The `file` setting is no longer supported.

### **[`-type` {`RW`|`DP`}] - Volume Type }**

This optionally specifies the volume's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

### **[`-percent-snapshot-space` <percent>] - Space Reserved for Snapshot Copies**

This optionally specifies the amount of space that is reserved in the volume for Snapshot copies. The default setting is 5 percent, except for data protection mirrors for which the default is 0 percent.

### **[`-snapshot-policy` <snapshot policy>] - Snapshot Policy**

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the `-snapshot-policy` parameter of the [vserver create](#) and [vserver modify](#) commands. The schedules associated with the `snapshot-policy` for a FlexGroup cannot have an interval shorter than 30 minutes.

### **[`-language` <Language code>] - Language**

This optionally specifies the language encoding setting for the volume. By default, the volume inherits the Vserver language encoding setting.

You cannot modify the language encoding setting of a volume.

### **[`-foreground` {`true`|`false`}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

### **[`-nvfail` {`on`|`off`}] - NVFAIL Option**

Setting this optional parameter to `true` causes the volume to set the in-nvfailed-state flag to `true`, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to `false`.

### **[`-constituent-role` <Constituent Roles>] - Constituent Volume Role**

This parameter is no longer supported.

### **{ [`-qos-policy-group` <text>] - QoS Policy Group Name**

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that do not adjust based on the volume allocated space or used space. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it.

### **| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space.

### **[-caching-policy <text>] - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules. If a caching policy is not assigned to this volume, the system uses *auto* as the default caching policy.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is *auto*.

### **[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)**

This optionally specifies the cache retention priority to apply to the volume. A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. If a cache retention priority is not assigned to this volume, the system uses the default policy. This parameter is available only at the advanced privilege level and higher.

The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

**`[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)`**

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to *true*, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is *true*.

**`[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)`**

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroups only.

**`[-efficiency-policy <efficiency policy>] - Storage Efficiency Policy (privilege: advanced)`**

This optionally specifies which storage efficiency policy to apply to the volume. This parameter is applicable only for All-Flash FAS. This parameter is not supported on data protection volumes on any platform. To disable compression on the volume in All-Flash FAS, use the value *none*. The default value is *inline-only*.

**`[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection`**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. The default value for a volume of type "RW" is *protected*.

**`[-encrypt <true>] - Enable Encryption`**

This parameter allows the user to create an encrypted volume. When it is set to *true*, a new key is generated, and the volume will be encrypted using the generated key. By default, volume created is not encrypted.

**`[-is-space-reporting-logical {true|false}] - Logical Space Reporting`**

This optionally specifies whether to report space logically on the volume. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. This parameter is not supported on FlexGroups. The default setting is *false*.

**`[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement`**

This optionally specifies whether to perform logical space accounting on the volume. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups. The default setting is *false*.

**`[-tiering-policy {snapshot-only|auto|none|backup}] - Volume Tiering Policy`**

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single

aggregate. The default tiering policy is 'snapshot-only' for a FlexVol and 'none' for a FlexGroup. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default minimum cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- auto - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

**`[-tiering-minimum-cooling-days <integer>]` - Volume Tiering Minimum Cooling Days (privilege: advanced)**

This optional parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. This parameter is only used for tiering purpose and does not affect the reporting of inactive data. The value specified should be greater than the frequency that applications in the volume shift between different sets of data. Valid values are between 2 and 63. You cannot set this parameter on 'none' or 'backup' volume tiering policy. The default value for this option is tied to the volume's tiering-policy. See the tiering-policy section of this man page for corresponding default values. If the tiering policy on the volume gets changed, then this option will be reset to the default value corresponding to the new tiering policy.

## Examples

The following example creates a new volume named `user_jdoe` on a Vserver named `vs0` and a storage aggregate named `aggr1`. Upon its creation, the volume is placed in the online state. It uses the export policy named `default_expolicy`. The owner of the volume's root is a user named `jdoe` whose primary group is named `dev`. The volume's junction path is `/user/jdoe`. The volume is 250 GB in size, space for the entire volume is reserved on the aggregate, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume user_jdoe -aggregate aggr1
               -state online -policy default_expolicy -user jdoe -group dev
               -junction-path /user/jdoe -size 250g -space-guarantee volume
               -percent-snapshot-space 20 -foreground false
```

The following example creates a new volume named `vol_cached` on a Vserver named `vs0` and a Flash Pool storage aggregate named `aggr1`. The newly created volume is placed online and uses `auto` as the caching policy.

```
cluster1::> volume create -vserver vs0 -volume vol_cached -aggregate aggr1
               -state online -caching-policy auto
```

The following example creates a new FlexGroup named `media_vol` on a Vserver named `vs0` with four constituents on aggregates `aggr1` and `aggr2`. Upon its creation, the volume is placed in the online state. The volume's junction path is `/media`. The volume is 200 TB in size, no space for the volume is reserved on the

aggregates, and the create operation runs in the background.

```
cluster1::> volume create -vserver vs0 -volume media_vol
                  -aggr-list aggr1,aggr1,aggr2,aggr2 -junction-path /media -size
200TB
                  -space-guarantee none -foreground false
```

The following example creates a new FlexGroup volume named fg on a Vserver named vs0 on aggregates selected by Data ONTAP.

```
cluster1::> volume create -vserver vs0 -volume fg -auto-provision-as
flexgroup
```

## volume delete

Delete an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume delete` command deletes the specified volumes. Before deleting a volume, the user is prompted to confirm the operation unless the `-force` flag is specified. If this volume was associated with a policy group the underlying qos workload is deleted.

NOTE:

- If there is a qtree or quota policy associated with a volume, it is deleted when you delete the volume.
- A volume must be offline (see [volume offline](#) ) to be deleted.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be deleted.

### **[-force <true>] - Force Delete (privilege: advanced)**

If this parameter is specified, the user is not prompted to confirm each deletion operation. In addition, the operation is run only on the local node, and several potential errors are ignored. By default, this setting is `false`. This parameter is available only at the advanced privilege level and higher.

### **[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes.

## **Examples**

The following example deletes a volume named `vol1_old` from a Vserver named `vs0`:

```
cluster1::> volume delete -vserver vs0 -volume vol1_old
```

# **volume expand**

Expand the size of a volume by adding constituents

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume expand` command allows the user to increase the size of a FlexGroup by adding constituents. The size of the new constituents is determined by the size of the smallest existing constituent. This command only applies to FlexGroups.

## **Parameters**

### **-vserver <vserver name> - Vserver Name**

This parameter can be used to specify the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to expand.

### **-aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for new FlexGroup constituents. Each entry in the list will create a constituent on the specified aggregate. An aggregate may be specified multiple times to have multiple constituents created on it.

### **[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when expanding a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1* , *aggr2* , *aggr1* , *aggr2* . The default value is 1.

### **[-foreground {true|false}] - Foreground Process**

If *false* is specified for this parameter, the command runs as a job in the background. If *true* is specified, the command will not return until the operation is complete. The default value is *true* .

## **Examples**

The following example increases the size of a FlexGroup by adding 3 constituents:

```
cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 180TB

cluster1::> volume expand -vserver vs1 -volume flexgroup -aggr-list
aggr1,aggr2,aggr3
Warning: The following number of constituents of size 20TB will be added
to
FlexGroup "flexgroup": 3. Expanding the FlexGroup will cause the
state of
all Snapshot copies to be set to "partial". Partial Snapshot copies
cannot be restored.
Do you want to continue? {y|n}: y
[Job 52] Job succeeded: Successful

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB
```

The following example increase the size of a FlexGroup by adding 6 constituents using the `-aggr-list` `-multiplier`:

```

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 240TB

cluster1::> volume expand -vserver vs1 -volume flexgroup -aggr-list
aggr1,aggr2 -aggr-list-multiplier 3
Warning: The following number of constituents of size 20TB will be added
to
FlexGroup "flexgroup": 6. Expanding the FlexGroup will cause the
state of
all Snapshot copies to be set to "partial". Partial Snapshot copies
cannot be restored.
Do you want to continue? {y|n}: y
[Job 53] Job succeeded: Successful

cluster1::> volume show -vserver vs1 -volume flexgroup -fields size
vserver volume      size
-----
vs1      flexgroup 360TB

```

## volume make-vsroot

Designate a non-root volume as a root volume of the Vserver

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume make-vsroot` command promotes a non-root volume of the Vserver to be the Vserver's root volume. The Vserver's root volume must be a FlexVol volume with a size of at least 1 GB.

For instance, if you run this command on a volume named *user* that is located on a Vserver named *vs0*, the volume *user* is made the root volume of the Vserver *vs0*.

This command is available only at the advanced privilege level and higher.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which a non-root volume is to be made the root volume.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the non-root volume that is to be made the root volume of its Vserver. This must be an existing FlexVol volume. Using a SnapLock volume as the root volume for a Vserver is not supported.

## Examples

The following example makes a volume named *root\_vs0\_backup* the root volume of its Vserver with FlexVol volumes, which is named *vs0*.

```
node::> volume make-vsroot -vserver vs0 -volume root_vs0_backup
```

The following example makes a volume named *root\_vs1* the root volume of the Vserver with Infinite Volume *vs1*.

```
node::> volume make-vsroot -vserver vs1 -volume root_vs1 -aggregate aggr1
```

## volume modify

### Modify volume attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume modify` command can be used to modify the following attributes of a volume:

- Size
- State (online, offline, restricted, force-online or force-offline)
- Export policy
- User ID
- Group ID
- Security style (All volume types: UNIX mode bits, CIFS ACLs, or mixed NFS and CIFS permissions.)
- Default UNIX permissions for files on the volume
- Whether the junction path is active
- Comment
- Volume nearly full threshold percent
- Volume full threshold percent
- Maximum size for autosizing
- Minimum size for autosize
- Grow used space threshold percentage for autosize
- Shrink used space threshold percentage for autosize
- Whether autosizing is enabled
- Current mode of operation of volume autosize
- Reset the autosize values to their defaults
- Total number of files for user-visible data permitted on the volume

- Space guarantee style (none or volume)
- Space SLO type (none, thick or semi-thick)
- Snapshot policy
- Use logical space reporting
- Use logical space enforcement
- Convert ucode
- Caching policy
- Cache retention priority
- Tiering minimum cooling days

You can use the `volume move` command to change a volume's aggregate or node. You can use the [volume rename](#) command to change a volume's name. You can use the [volume make-vsroot](#) command to make a volume the root volume of its Vserver.

You can change additional volume attributes by using this command at the advanced privilege level and higher.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter. Although node Vservers are not displayed when using <Tab> completion, this parameter supports node Vservers for modifying the root volume of the specified node Vserver.

### **-volume <volume name> - Volume Name**

This specifies the volume that is to be modified.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Volume Size**

This optionally specifies the new size of the volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. A relative rather than absolute size change can be specified by adding + or - before the given size: for example, specifying +30m adds 30 megabytes to the volume's current size. The minimum size for a volume is 20 MB (the default setting). The volume's maximum size is limited by the platform maximum. If the volume's guarantee is set to `volume`, the volume's maximum size can also be limited by the available space in the hosting aggregate. If the volume's guarantee is currently disabled, its size cannot be increased.

### **[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State**

This optionally specifies the volume's state. A restricted volume does not provide client access to data but is available for administrative operations.

The *mixed* state applies to FlexGroups only and cannot be specified as a target state.

### **[-policy <text>] - Export Policy**

This optionally specifies the ID number of the export policy associated with the volume. For information on export policy, see the documentation for the [vserver export-policy create](#) command. FlexGroups do not support export policies that allow NFSv4 protocol access.

**[`-user <user name>`] - User ID**

This optionally specifies the name or ID of the user that is set as the owner of the volume's root.

**[`-group <group name>`] - Group ID**

This optionally specifies the name or ID of the group that is set as the owner of the volume's root.

**[`-security-style <security style>`] - Security Style**

This optionally specifies the security style for the volume. Possible values include *unix* (for UNIX mode bits), *ntfs* (for CIFS ACLs), *mixed* (for mixed NFS and CIFS permissions) and *unified* (for mixed NFS and CIFS permissions with unified ACLs). Regardless of the security style, both NFS and CIFS clients can read from and write to the volume.

**[`-unix-permissions <unix perm>`] - UNIX Permissions**

This optionally specifies the default UNIX permissions for files on the volume. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. The default setting is 0755 or `-rwxr-xr-x`.

**[`-junction-active {true|false}`] - Junction Active (privilege: advanced)**

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction is inactive, the volume does not appear in the Vserver's namespace.

**[`-comment <text>`] - Comment**

This optionally specifies a comment for the volume.

**[`-space-nearly-full-threshold-percent <percent>`] - Volume Nearly Full Threshold Percent**

This optionally specifies the percentage at which the volume is considered nearly full, and above which an EMS warning will be generated. The default value is 95%. The maximum value for this option is 99%. Setting this threshold to 0 disables the volume nearly full space alerts.

**[`-space-full-threshold-percent <percent>`] - Volume Full Threshold Percent**

This optionally specifies the percentage at which the volume is considered full, and above which a critical EMS error will be generated. The default value is 98%. The maximum value for this option is 100%. Setting this threshold to 0 disables the volume full space alerts.

**{ [`-max-autosize {<integer>[KB|MB|GB|TB|PB]}`] } - Maximum Autosize**

This parameter allows the user to specify the maximum size to which a volume can grow. The default for volumes is 120% of the volume size. If the value of this parameter is invalidated by manually resizing the volume, the maximum size is reset to 120% of the volume size. The value for `-max-autosize` cannot be set larger than the platform-dependent maximum volume size. If you specify a larger value, the value of `-max-autosize` is automatically reset to the supported maximum without returning an error.

**[`-min-autosize {<integer>[KB|MB|GB|TB|PB]}`] - Minimum Autosize**

This parameter specifies the minimum size to which the volume can automatically shrink. If the volume was created with the *grow\_shrink* autosize mode enabled, then the default minimum size is equal to the initial volume size. If the value of the `-min-autosize` parameter is invalidated by a manual volume resize, the minimum size is reset to the volume size.

**[`-autosize-grow-threshold-percent <percent>`] - Autosize Grow Threshold Percentage**

This parameter specifies the used space threshold for the automatic growth of the volume. When the

volume's used space becomes greater than this threshold, the volume will automatically grow unless it has reached the maximum autosize.

**`[-autosize-shrink-threshold-percent <percent>]` - Autosize Shrink Threshold Percentage**

This parameter specifies the used space threshold for the automatic shrinking of the volume. When the amount of used space in the volume drops below this threshold, the volume will shrink unless it has reached the specified minimum size.

**`[-autosize-mode {off|grow|grow_shrink}]` - Autosize Mode**

This parameter specifies the autosize mode for the volume. The supported autosize modes are:

- *off* - The volume will not grow or shrink in size in response to the amount of used space.
- *grow* - The volume will automatically grow when used space in the volume is above the grow threshold.
- *grow\_shrink* - The volume will grow or shrink in size in response to the amount of used space.

By default, `-autosize-mode` is *off* for new volumes, except for DP mirrors, for which the default value is *grow\_shrink*. The *grow* and *grow\_shrink* modes work together with Snapshot autodelete to automatically reclaim space when a volume is about to become full. The volume parameter `-space-mgmt -try-first` controls the order in which these two space reclamation policies are attempted.

**`[-autosize-reset <true>]` - Autosize Reset }**

This allows the user to reset the values of `autosize`, `max-autosize`, `min-autosize`, `autosize-grow-threshold-percent`, `autosize-shrink-threshold-percent` and `autosize-mode` to their default values. For example, the `max-autosize` value will be set to 120% of the current size of the volume.

**`[-files <integer>]` - Total Files (for user-visible data)**

This optionally specifies the total number of files for user-visible data permitted on the volume. This value can be raised or lowered. Raising the total number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and the `files` value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume.

**`[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum Directory Size (privilege: advanced)**

This optionally specifies the maximum directory size. The default maximum directory size is model-dependent, and optimized for the size of system memory. You can increase it for a specific volume by using this option, but doing so could impact system performance. If you need to increase the maximum directory size, work with customer support.

**`{ [-space-slo {none|thick|semi-thick}] }` - Space SLO**

This optionally specifies the Service Level Objective for space management (the space SLO setting) for the volume. The space SLO value is used to enforce volume settings so that sufficient space is set aside to meet the space SLO. The default setting is *none*. There are three supported values: *none*, *thick* and *semi-thick*.

- *none* : The value of *none* does not provide any guarantee for overwrites or enforce any restrictions. It should be used if the admin plans to manually manage space consumption in the volume and aggregate, and out of space errors.
- *thick* : The value of *thick* guarantees that the hole fills and overwrites to space-reserved files in this volume will always succeed by reserving space. To meet this space SLO, the following volume-level

settings are automatically set and cannot be modified:

- Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
- Fractional Reserve: *100* - 100% of the space required for overwrites is reserved. Changing the volume's `fractional-reserve` setting is not supported.
- *semi-thick*: The value of *semi-thick* is a best-effort attempt to ensure that overwrites succeed by restricting the use of features that share blocks and auto-deleting backups and Snapshot copies in the volume. To meet this space SLO, the following volume-level settings are automatically set and cannot be modified:
  - Space Guarantee: *volume* - The entire size of the volume is preallocated in the aggregate. Changing the volume's `space-guarantee` type is not supported.
  - Fractional Reserve: *0* - No space will be reserved for overwrites by default. However, changing the volume's `fractional-reserve` setting is supported. Changing the setting to 100 means that 100% of the space required for overwrites is reserved.
  - Snapshot Autodelete: *enabled* - Automatic deletion of Snapshot copies is enabled to reclaim space. To ensure that the overwrites can be accommodated when the volume reaches threshold capacity, the following volume snapshot autodelete parameters are set automatically to the specified values and cannot be modified:
    - `enabled`: *true*
    - `commitment`: *destroy*
    - `trigger`: *volume*
    - `defer-delete`: *none*
    - `destroy-list`: *vol\_clone, lun\_clone, file\_clone, cifs\_share*

In addition, with a value of ```_semi-thick_```, the following technologies are not supported for the volume:

- File Clones with autodelete disabled: Only full file clones of files, LUNs or NVMe namespaces that can be autodeleted can be created in the volume. The use of `autodelete` for file clone create is required.
- Partial File Clones: Only full file clones of files or LUNs that can be autodeleted can be created in the volume. The use of `range` for file clone create is not supported.
- Volume Efficiency: Enabling volume efficiency is not supported to allow autodeletion of Snapshot copies.

### | [-s, -space-guarantee {none|volume}] - Space Guarantee Style

This option controls whether the volume is guaranteed some amount of space in the aggregate. The default setting for the volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*. The *file* setting is no longer supported. Volume guaranteed means that the entire size of the volume is preallocated. The *none* value means that no space is preallocated, even if the volume contains space-reserved files or LUNs; if the aggregate is full, space is not available even for space-reserved files and LUNs within the volume. Setting this parameter to *none* enables you to provision more storage than is physically present in the aggregate (thin provisioning). When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. For flexible root volumes, to

ensure that system files, log files, and cores can be saved, the space-guarantee must be *volume*. This is to ensure support of the appliance by customer support, if a problem occurs. Disk space is preallocated when the volume is brought online and, if not used, returned to the aggregate when the volume is brought offline. It is possible to bring a volume online even when the aggregate has insufficient free space to preallocate to the volume. In this case, no space is preallocated, just as if the *none* option had been selected. In this situation, the *vol options* and *vol status* command display the actual value of the space-guarantee option, but indicate that it is disabled.

#### **[*-fractional-reserve* <percent>] - Fractional Reserve }**

This option changes the amount of space reserved for overwrites of reserved objects (LUNs, files) in a volume. The option is set to 100 by default with *guarantee* set to *volume*. A setting of 100 means that 100% of the required reserved space is actually reserved so the objects are fully protected for overwrites. The value is set to 0 by default with *guarantee* set to *none*. The value can be either 0 or 100 when *guarantee* is set to *volume* or *none*. Using a value of 0 indicates that no space will be reserved for overwrites. This returns the extra space to the available space for the volume, decreasing the total amount of space used. However, this does leave the protected objects in the volume vulnerable to out of space errors. If the percentage is set to 0%, the administrator must monitor the space usage on the volume and take corrective action.

#### **[*-min-readahead* {*true*|*false*}] - Minimum Read Ahead (privilege: advanced)**

This optionally specifies whether minimum readahead is used on the volume. The default setting is *false*.

#### **[*-atime-update* {*true*|*false*}] - Access Time Update Enabled (privilege: advanced)**

This optionally specifies whether the access time on inodes is updated when a file is read. The default setting is *true*.

#### **[*-snapdir-access* {*true*|*false*}] - Snapshot Directory Access Enabled**

This optionally specifies whether clients have access to *.snapshot* directories. The default setting is *true*.

#### **[*-percent-snapshot-space* <percent>] - Space Reserved for Snapshot Copies**

This optionally specifies the amount of space that is reserved on the volume for Snapshot copies. The default setting is 5 percent.

#### **[*-snapshot-policy* <snapshot policy>] - Snapshot Policy**

This optionally specifies the Snapshot policy for the volume. The default is the Snapshot policy for all volumes on the Vserver, as specified by the *-snapshot-policy* parameter of the [vserver create](#) and [vserver modify](#) commands. When replacing a *snapshot-policy* on a volume, any existing Snapshot copies on the volume that do not match any of the prefixes of the new *snapshot-policy* will not be deleted. This is because the Snapshot scheduler will not clean up older Snapshot copies if the prefixes do not match. Once the new *snapshot-policy* takes effect, depending on the new retention count, any existing Snapshot copies that continue to use the same prefixes may be deleted. For example, if your existing *snapshot-policy* is setup to retain 150 weekly snapshot copies and you create a new *snapshot-policy* that uses the same prefixes but changes the retention count to 50 snapshot copies. Once the new *snapshot-policy* takes effect it will start deleting older snapshot copies until there are only 50 remaining.

#### **[*-foreground* {*true*|*false*}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

### **[`-nvfail {on|off}`] - NVFAIL Option**

Setting this optional parameter to true causes the volume to set the in-nvfailed-state flag to true, if committed writes to the volume are lost due to a failure. The in-nvfailed-state flag fences the volume from further data access and prevents possible corruption of the application data. Without specifying a value, this parameter is automatically set to false.

### **[`-in-nvfailed-state {true|false}`] - Volume's NVFAIL State (privilege: advanced)**

This field is automatically set to true on a volume when committed writes to the volume are possibly lost due to a failure, and the volume has the nvfail option enabled. With this field set, the client access to the volume is fenced to protect against possible corruptions that result from accessing stale data. The administrator needs to take appropriate recovery actions to recover the volume from the possible data loss. After the recovery is completed, the administrator can clear this field and restore the client access to the volume. This field can be cleared using the CLI but it cannot be set.

### **[`-dr-force-nvfail {on|off}`] - Force NVFAIL on MetroCluster Switchover**

Setting this optional parameter to true on a volume causes the MetroCluster switchover operation to set the in-nvfailed-state flag to true on that volume. The in-nvfailed-state flag prevents further data access to the volume. The default value is false. This parameter has no effect on a negotiated or an automatic switchover.

### **[`-filesystem-size-fixed {true|false}`] - Is File System Size Fixed**

This option causes the file system to remain the same size and not grow or shrink when a SnapMirrored volume relationship is broken, or when a volume add is performed on it. It is automatically set to true when a volume becomes a SnapMirrored volume. It stays set to true after the snapmirror break command is issued for the volume. This allows a volume to be SnapMirrored back to the source without needing to add disks to the source volume. If the volume is a traditional volume and the size is larger than the file system size, setting this option to false forces the file system to grow to the size of the volume. If the volume is a flexible volume and the volume size is larger than the file system size, setting this option to false forces the volume size to equal the file system size. The default setting is false.

### **[`-extent-enabled {off|on|space-optimized}`] - (DEPRECATED)-Extent Option**

This parameter has been deprecated and may be removed in a future release of Data ONTAP.

Setting this option to ``on`` or ``space-optimized`` enables extents in the volume. This causes application writes to be written in the volume as a write of a larger group of related data blocks called an extent. Using extents may help workloads that perform many small random writes followed by large sequential reads. However, using extents may increase the amount of disk operations performed on the controller, so this option should only be used where this trade-off is desired. If the option is set to ``space-optimized`` then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using ``space-optimized`` may be useful when the volume has Snapshot copies or is a SnapMirror source, when it can reduce the storage used in the volume and the amount of data that SnapMirror needs to move on the next update. The ``space-optimized`` value can result in degraded read performance of Snapshot copies. The default value is ``off`` ; extents are not used.

### **[`-space-mgmt-try-first {volume_grow|snap_delete}`] - Primary Space Management Strategy**

A flexible volume can be configured to automatically reclaim space in case the volume is about to run out of space, by either increasing the size of the volume using `autogrow` or deleting Snapshot copies in the volume using `Snapshot autodelete`. If this option is set to `volume_grow` the system will try to first increase the size of volume before deleting Snapshot copies to reclaim space. If the option is set to `snap_delete` the system will first automatically delete Snapshot copies and in case of failure to reclaim space will try to grow the volume.

### **[`-read-realloc {off|on|space-optimized}`] - Read Reallocation Option**

Setting this option to `on` or `space-optimized` enables read reallocation in the volume. This results in the optimization of file layout by writing some blocks to a new location on disk. The layout is updated only after the blocks have been read because of a user read operation, and only when updating their layout will provide better read performance in the future. Using read reallocation may help workloads that perform a mixture of random writes and large sequential reads. If the option is set to `space-optimized` then the reallocation update will not duplicate blocks from Snapshot copies into the active file system, and will result in conservative space utilization. Using `space-optimized` may be useful when the volume has Snapshot copies or is a `SnapMirror` source, when it can reduce the storage used in the volume and the amount of data that `snapmirror` needs to move on the next update. The `space-optimized` value can result in degraded read performance of Snapshot copies. The default value is `off`.

### **[`-sched-snap-name {create-time|ordinal}`] - Naming Scheme for Automatic Snapshot Copies**

This option specifies the naming convention for automatic Snapshot copies. If set to `create-time`, automatic Snapshot copies are named using the format `<schedule_name>.yyyy-mm-dd_hhmm`. Example: "hourly.2010-04-01\_0831". If set to `ordinal`, only the latest automatic Snapshot copy is named using the format `<schedule_name>.<n>`. Example: "hourly.0". Older automatic Snapshot copies are named using the format `<schedule_name>.yyyy-mm-dd_hhmm`. Example: "hourly.2010-04-01\_0831".

### **{ [`-qos-policy-group <text>`] - QoS Policy Group Name**

This optional parameter specifies which QoS policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a volume, the system will not monitor and control the traffic to it. To remove this volume from a policy group, enter the reserved keyword "none".

### **| [`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. To remove this volume from an adaptive policy group, enter the reserved keyword "none".

### **[`-caching-policy <text>`] - Caching Policy Name**

This parameter specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in a Flash Pool aggregate or Flash Cache modules.

Both metadata and user data are eligible for caching. Metadata consists of directories, indirect blocks and system metafiles. They are eligible for read caching only. When a random write pattern is detected on user data, the first such write is eligible for read caching while all subsequent overwrites are eligible for write caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.

- `meta` - Read caches only metadata blocks.
- `random_read` - Read caches all metadata and randomly read user data blocks.
- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.
- `noread-random_write` - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- `meta-random_write` - Read caches all metadata and write caches randomly overwritten user data blocks.
- `random_read_write-random_write` - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read-random_write` - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read_random_write-random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- `all-random_write` - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is `auto`.

**`[-is-autobalance-eligible {true|false}]` - Is Eligible for Auto Balance Aggregate (privilege: advanced)**

If the Auto Balance feature is enabled, this parameter specifies whether the volume might be considered for system workload balancing. When set to `true`, the Auto Balance Aggregate feature might recommend moving this volume to another aggregate. The default value is `true`.

**`[-max-constituent-size {<integer>[KB|MB|GB|TB|PB]}]` - Maximum size of a FlexGroup Constituent (privilege: advanced)**

This optionally specifies the maximum size of a FlexGroup constituent. The default value is determined by checking the maximum FlexVol size setting on all nodes used by the FlexGroup. The smallest value found is selected as the default for the `-max-constituent-size` for the FlexGroup. This parameter applies to FlexGroups only.

**`[-vserver-dr-protection {protected|unprotected}]` - Vserver DR Protection**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

**`[-is-space-reporting-logical {true|false}]` - Logical Space Reporting**

This optionally specifies whether to report space logically on the volume. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups. The default setting is `false`.

### **[`-is-space-enforcement-logical {true|false}`] - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on the volume. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups. The default setting is *false*.

### **[`-tiering-policy {snapshot-only|auto|none|backup}`] - Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the volume. This policy determines whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- `snapshot-only` - This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default cooling period is 2 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- `auto` - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The `-tiering-minimum-cooling-days` parameter can be used to override the default.
- `none` - Volume blocks will not be tiered to the capacity tier.
- `backup` - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

### **[`-tiering-minimum-cooling-days <integer>`] - Volume Tiering Minimum Cooling Days (privilege: advanced)**

The parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. This parameter is only used for tiering purpose and does not affect the reporting of inactive data. The value specified should be greater than the frequency that applications in the volume shift between different sets of data. Valid values are between 2 and 63. You cannot set this parameter on 'none' or 'backup' volume tiering policy.

## **Examples**

The following example modifies a volume named `vol4` on a Vserver named `vs0`. The volume's export policy is changed to `default_expolicy` and its size is changed to 500 GB.

```
cluster1::> volume modify -vserver vs0 -volume vol4 -policy
default_expolicy -size 500g
```

The following example modifies a volume named `vol2`. It enables autogrow and sets the maximum autosize to 500g

```
cluster1::> volume modify -volume vol2 -autosize-mode grow -max-autosize
500g
```

The following example modifies a volume named `vol2` to have a space guarantee of none.

```
cluster1::> volume modify -space-guarantee none -volume vol2
```

The following example modifies all volumes in Vserver vs0 to have a fractional reserve of 30%.

```
cluster1::> volume modify -fractional-reserve 30 -vserver vs0 *
```

The following example modifies a volume named vol2 to grow in size by 5 gigabytes

```
cluster1::> volume modify -volume vol2 -size +5g
```

The following example modifies a volume named vol2 to have a different caching policy. The volume must be on a Flash Pool aggregate.

```
cluster1::> volume modify -volume vol2 -caching-policy none
```

## volume mount

Mount a volume on another volume with a junction-path

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume mount` command mounts a volume at a specified junction path.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that is to be mounted.

### **-junction-path <junction path> - Junction Path Of The Mounting Volume**

This specifies the junction path of the mounted volume. The junction path name is case insensitive and must be unique within a Vserver's namespace.

### **[-active {true|false}] - Activate Junction Path**

This optionally specifies whether the mounted volume is accessible. The default setting is `false`. If the mounted path is not accessible, it does not appear in the Vserver's namespace.

### **[-policy-override {true|false}] - Override The Export Policy**

This optionally specifies whether the parent volume's export policy overrides the mounted volume's export policy. The default setting is `false`.

## **Examples**

The following example mounts a volume named `user_tsmith` on a Vserver named `vs0`. The junction path for the mounted volume is `/user/tsmith`. The mounted volume is accessible, and the mounted volume's export policy is not overridden by the parent volume's export policy.

```
node::> volume mount -vserver vs0 -volume user_tsmith
-junction-path /user/tsmith -active true -policy-override false
```

## **volume offline**

Take an existing volume offline

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume offline` command takes the volume offline. If the volume is already in restricted or `iron_restricted` state, then it is already unavailable for data access, and much of the following description does not apply. The current root volume may not be taken offline. A number of operations being performed on the volume in question can prevent volume offline from succeeding for various lengths of time. If such operations are required, the command may take additional time to complete. If they do not, the command is aborted. The `-force` flag can be used to forcibly offline a volume.

## **Parameters**

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be taken offline. If only one data Vserver exists, you do not need to specify this parameter.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be taken offline.

### **[-f, -force <true>] - Force Offline**

This specifies whether the offline operation is forced. Using this option to force a volume offline can potentially disrupt access to other volumes. The default setting is `false`.

### **[`-foreground {true|false}`] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

### **[`-disable-luns-check <true>`] - Disable Check for Existing LUNs**

Taking the volume offline will make all associated LUNs and NVMe namespaces unavailable, which normally requires a user confirmation. If this parameter is specified, the command proceeds without a confirmation. The default setting is `false`

## **Examples**

The following example takes the volume named `vol1` offline:

```
cluster1::> volume offline vol1
Volume 'vs1:vol1' is now offline.
```

## **volume online**

Bring an existing volume online

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The `volume online` command brings the volume online. A volume can only be brought online if it is offline or restricted. If the volume is inconsistent but has not lost data, the user will be cautioned and prompted before bringing it online. It is advisable to run `wafl-iron` (or do a `snapmirror initialize` in case of a replica volume) prior to bringing an inconsistent volume online. Bringing an inconsistent volume online increases the risk of further file system corruption. If the containing aggregate cannot honor the space guarantees required by this volume, the volume online operation will fail. It is not advisable to use volumes with their space guarantees disabled. Lack of free space can lead to failure of writes which in turn can appear as data loss to some applications.

## **Parameters**

### **`-vserver <vserver name>` - Vserver Name**

This parameter specifies the name of the Vserver from which the volume is to be brought online. If only one data Vserver exists, you do not need to specify this parameter.

### **`-volume <volume name>` - Volume Name**

This parameter specifies the name of the volume that is to be brought online.

### **[`-f, -force <true>`] - Force Online**

When this parameter is used, the volume will be brought online even if there is not enough space available in the aggregate to honor the volume's space guarantee.

### **[`-foreground {true|false}`] - Foreground Process**

This parameter specifies whether the operation runs in the foreground. The default setting is `true` (the

operation runs in the foreground). When set to true, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

## Examples

The following example brings a volume named vol1 online:

```
cluster1::> volume online vol1
Volume 'vs1:vol1' is now online.
```

## volume prepare-for-revert

Preparing the volume for revert

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume prepare-for-revert` command prepares volumes to be reverted to the previous version of ONTAP.

### Parameters

**[`-node {<nodename>|local}`]] - Node Name (privilege: advanced)**

This specifies the name of the node in which all the volumes will be prepared for revert. If unspecified, the command will execute on the local node.

## Examples

The following example prepares all volumes on node node1 to be reverted.

```
cluster1::*> volume prepare-for-revert -node node1
```

## volume rehost

Rehost a volume from one Vserver into another Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `volume rehost` command rehosts a volume from source Vserver onto destination Vserver. The volume name must be unique among the other volumes on the destination Vserver.

## Parameters

**-vserver <vserver name> - Source Vserver name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Target volume name**

This specifies the volume that is to be rehosted.

**-destination-vserver <vserver name> - Destination Vserver name**

This specifies the destination Vserver where the volume must be located post rehost operation.

**{ [-force-unmap-luns {true|false}] - Unmap LUNs in volume**

This specifies whether the rehost operation should unmap LUNs present on volume. The default setting is *false* (the rehost operation shall not unmap LUNs). When set to true, the command will unmap all mapped LUNs on the volume.

**| [-auto-remap-luns {true|false}] - Automatic Remap of LUNs }**

This specifies whether the rehost operation should perform LUN mapping operation at the destination Vserver for the LUNs mapped on the volume at the source Vserver. The default setting is *false* (the rehost operation shall not map LUNs at the destination Vserver). When set to true, at the destination Vserver the command will create initiators groups along with the initiators (if present) with same name as that of source Vserver. Then the LUNs on the volume are mapped to initiator groups at the destination Vserver as mapped in source Vserver.

## Examples

The following example rehosts a volume named vol3 on Vserver named vs1 to a destination Vserver named vs2:

```
cluster::> volume rehost -vserver vs1 -volume vol3 -destination-vserver vs2
```

## volume rename

Rename an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume rename` command renames a volume. The volume name must be unique among the other volumes on the same Vserver. The `volume rename` command is not supported for FlexGroups.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located. For a node's root volume, use the name of the node for this parameter.

**-volume <volume name> - Volume Name**

This specifies the volume that is to be renamed.

**-newname <volume name> - Volume New Name**

This specifies the volume's new name. A volume's name must start with an alphabetic character (a to z or A to Z) and be 203 or fewer characters in length.

**[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

## Examples

The following example renames a volume named `vol3_backup` as `vol3_save` on a Vserver named `vs0`:

```
node::> volume rename -vserver vs0 -volume vol3_backup -newname vol3_save
```

## volume restrict

### Restrict an existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume restrict` command puts the volume in restricted state. If the volume is online, then it will be made unavailable for data access as described under [volume offline](#) .

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver from which the volume is to be restricted. If only one data Vserver exists, you do not need to specify this parameter.

**-volume <volume name> - Volume Name**

This specifies the name of the volume that is to be restricted.

**[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes. This parameter applies only to FlexGroups. For FlexVol volumes, the command always runs in the foreground.

## Examples

The following example restricts a volume named `vol1`:

```
cluster1::> volume restrict voll
Volume 'vs1:voll' is now restricted.
```

## Related Links

- [volume offline](#)

## volume show-footprint

Display a list of volumes and their data and metadata footprints in their associated aggregate.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume show-footprint` command displays information about the space used in associated aggregates by volumes and features enabled in volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes. + + If the associated aggregates have an object-store attached to them, then the command displays a more detailed split up of the space used in each tier. This additional information is useful to show per-tier space usage which can be used to estimate the space requirements and transfer duration when moving a volume to a different tier with `volume move`.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-volume-msid <integer>] - Volume MSID**

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

**[-volume-dsid <integer>] - Volume DSID**

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

**[-vserver-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays information only about the volume on the vserver which has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name**

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

**[-hostname <text>] - Hostname**

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

**[-tape-backup-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Tape Backup Metadata Footprint**

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified amount of space in the aggregate.

**[-tape-backup-metafiles-footprint-percent <percent>] - Tape Backup Metadata Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose tape backup metafiles use the specified percentage of space in the aggregate.

**[-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified amount of space in the aggregate.

**[-dedupe-metafiles-footprint-percent <percent>] - Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose deduplication metafiles use the specified percentage of space in the aggregate.

**[-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified amount of space in the aggregate.

**[-dedupe-metafiles-temporary-footprint-percent <percent>] - Temporary Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose temporary deduplication metafiles use the specified percentage of space in the aggregate.

**[-cross-volume-dedupe-metafiles-footprint {<integer>[KB|MB|GB|TB|PB]}] - Cross Volume Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose cross

volume deduplication metafiles use the specified amount of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-footprint-percent <percent>]` - Cross Volume Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication metafiles use the specified percentage of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-temporary-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Cross Volume Temporary Deduplication Footprint**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified amount of space in the aggregate.

**`[-cross-volume-dedupe-metafiles-temporary-footprint-percent <percent>]` - Cross Volume Temporary Deduplication Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose cross volume deduplication temporary metafiles use the specified percentage of space in the aggregate.

**`[-volume-blocks-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Volume Data Footprint**

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified amount of space in the aggregate.

This field is the total amount of data written to the volume. It includes data in the active file system in the volume as well as data that is consumed by volume Snapshot copies. This row only includes data and not reserved space, so when volumes have reserved files, the volume's total used in the [volume show-space](#) command output can exceed the value in this row.

**`[-volume-blocks-footprint-percent <percent>]` - Volume Data Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose data blocks use the specified percentage of space in the aggregate.

**`[-flexvol-metadata-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Flexible Volume Metadata Footprint**

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified amount of space in the aggregate.

This field includes the space used or reserved in the aggregate for metadata associated with this volume.

**`[-flexvol-metadata-footprint-percent <percent>]` - Flexible Volume Metadata Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose file system metadata uses the specified percentage of space in the aggregate.

**`[-delayed-free-footprint {<integer>[KB|MB|GB|TB|PB]}]` - Delayed Free Blocks**

If this parameter is specified, the command displays information only about the volumes whose delayed free blocks use the specified amount of space in the aggregate.

When Data ONTAP frees space in a volume, this space is not always immediately shown as free in the aggregate. This is because the operations to free the space in the aggregate are batched for increased performance. Blocks that are declared free in the FlexVol volume but which are not yet free in the aggregate are called "delayed free blocks" until the associated delayed free blocks are processed. For SnapMirror destinations, this row will have a value of 0 and will not be displayed.

**[`-delayed-free-footprint-percent` <percent>] - Delayed Free Blocks Percent**

If this parameter is specified, the command displays information only about the volumes that have the specified amount of blocks waiting to be freed in the aggregate. This space is called "delayed free blocks".

**[`-snapmirror-destination-footprint` {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Destination Footprint**

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified amount of space in the aggregate.

During a SnapMirror transfer, this row will include incoming SnapMirror data and SnapMirror-triggered delayed free blocks from previous SnapMirror transfers.

**[`-snapmirror-destination-footprint-percent` <percent>] - SnapMirror Destination Footprint Percent**

If this parameter is specified, the command displays information only about the volumes whose SnapMirror transfer uses the specified percentage of space in the aggregate.

**[`-volume-guarantee-footprint` {<integer>[KB|MB|GB|TB|PB]}] - Volume Guarantee**

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified amount of space in the aggregate.

This field includes the amount of space reserved by this volume in the aggregate for future writes. The amount of space reserved depends on the guarantee type (the provisioning mode) of the volume. + For a "volume" guaranteed volume, this is the size of the volume minus the amount in the Volume Data Footprint row. + For a "file" guaranteed volume, this is the sum of all of the space reserved for hole fills and overwrites in all of the space reserved files in the volume.

**[`-volume-guarantee-footprint-percent` <percent>] - Volume Guarantee Percent**

If this parameter is specified, the command displays information only about the volumes whose guarantees use the specified percentage of space in the aggregate.

**[`-file-operation-metadata` {<integer>[KB|MB|GB|TB|PB]}] - File Operation Metadata**

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified amount of space in the aggregate.

This metadata is used by file move and copy operations. Although it is not returned as free space once the operations are complete, it can be reused by future file operations.

**[`-file-operation-metadata-percent` <percent>] - File Operation Metadata Percent**

If this parameter is specified, the command displays information only about the volumes that have file operation metadata using the specified percentage of space in the aggregate.

**[`-total-footprint` {<integer>[KB|MB|GB|TB|PB]}] - Total Footprint**

If this parameter is specified, the command displays information only about the volumes which use the specified amount of space in the aggregate. This field is the sum of the other rows in this table.

**[`-total-footprint-percent` <percent>] - Total Footprint Percent**

If this parameter is specified, the command displays information only about the volumes which use the specified percentage of space in the aggregate.

**`[-aggregate-size {<integer>[KB|MB|GB|TB|PB] }]` - Containing Aggregate Size**

If this parameter is specified, the command displays information only about the volumes that are associated with an aggregate of the specified size.

**`[-bin0-name <text>]` - Name for bin0**

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an object store attached to it with an active file system tier name matches the specified value.

**`[-volume-blocks-footprint-bin0 {<integer>[KB|MB|GB|TB|PB] }]` - Volume Footprint for bin0**

If this parameter is specified, the command displays information only about volumes whose space in use in the performance tier of the aggregate matches the specified value.

**`[-volume-blocks-footprint-bin0-percent <percent>]` - Volume Footprint bin0 Percent**

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the performance tier of the aggregate matches the specified value.

**`[-bin1-name <text>]` - Name for bin1**

If this parameter is specified, the command displays information only about volumes whose associated aggregate has an external capacity tier attached to it with a configuration name that matches the specified value.

**`[-volume-blocks-footprint-bin1 {<integer>[KB|MB|GB|TB|PB] }]` - Volume Footprint for bin1**

If this parameter is specified, the command displays information only about volumes whose space in use in the first external capacity tier bucket attached to the associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

**`[-volume-blocks-footprint-bin1-percent <percent>]` - Volume Footprint bin1 Percent**

If this parameter is specified, the command displays information only about volumes whose percentage space in use in the first external capacity tier bucket attached to associated aggregate matches the specified value. This includes the space used by the blocks in the volume that are staged before being moved to the capacity tier.

## Examples

The following example displays information about all volumes in the system.

```

cluster1::> volume show-footprint
Vserver : nodevs
  Volume : vol0

# volume show-space

Display space usage for volume(s)

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume show-space` command displays information about space usage within the volume. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

**[-volume-msid <integer>] - Volume MSID**

If this parameter is specified, the command displays information only about the volume that has the specified MSID.

**[-volume-dsid <integer>] - Volume DSID**

If this parameter is specified, the command displays information only about the volume that has the specified DSID.

**[-vserver-uuid <UUID>] - Vserver UUID**

If this parameter is specified, the command displays information only about the volume on the vservers which has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name**

If this parameter is specified, the command displays information only about the volumes that are associated with the specified aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID**

If this parameter is specified, the command displays information only about the volumes on the aggregate which have the specified UUID.

**[-hostname <text>] - Hostname**

If this parameter is specified, the command displays information only about the volumes that belong to the specified host.

**[-user-data {<integer>[KB|MB|GB|TB|PB]}] - User Data**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by user data in the volume.

This is the amount of data written to the volume via CIFS, NFS or SAN protocols plus the metadata (for example indirect blocks, directory blocks) directly associated with user files plus the space reserved in the volume for these files (hole and overwrite reserves). This is the same information displayed by running the Unix `du` command on the mount point.

**[-user-data-percent <percent\_no\_limit>] - User Data Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by user data in the volume.

**[-dedupe-metafiles {<integer>[KB|MB|GB|TB|PB]}] - Deduplication**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by deduplication metafiles in the volume.

**[-dedupe-metafiles-percent <percent>] - Deduplication Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by deduplication metafiles in the volume.

**[-dedupe-metafiles-temporary {<integer>[KB|MB|GB|TB|PB]}] - Temporary Deduplication**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by temporary deduplication metafiles in the volume.

**[-dedupe-metafiles-temporary-percent <percent>] - Temporary Deduplication Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by temporary deduplication metafiles in the volume.

**[-filesystem-metadata {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by file system metadata in the volume.

**[-filesystem-metadata-percent <percent>] - Filesystem Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by file system metadata in the volume.

**[-snapmirror-metadata {<integer>[KB|MB|GB|TB|PB]}] - SnapMirror Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by SnapMirror metafiles in the volume.

Between SnapMirror transfers, some metadata is maintained to support storage-efficient transfers. During transfers, some additional space is used temporarily. This space is used in all SnapMirror destination

volumes.

**[`-snapmirror-metadata-percent <percent>`] - SnapMirror Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by SnapMirror metafiles inside the volume.

**[`-tape-backup-metadata {<integer>[KB|MB|GB|TB|PB]}`] - Tape Backup Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by tape backup metafiles in the volume.

**[`-tape-backup-metadata-percent <percent>`] - Tape Backup Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by tape backup metafiles in the volume.

**[`-quota-metafiles {<integer>[KB|MB|GB|TB|PB]}`] - Quota Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by quota metafiles.

**[`-quota-metafiles-percent <percent>`] - Quota Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by quota metafiles.

**[`-inodes {<integer>[KB|MB|GB|TB|PB]}`] - Inodes**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode metafile in the volume.

This is the amount of space required to store inodes in the file system and is proportional to the maximum number of files ever created in the volume. The inode file is not compacted or truncated, so if a large number of files are created and then deleted, the inode file does not shrink.

**[`-inodes-percent <percent>`] - Inodes Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the inode metafile in the volume.

**[`-inodes-upgrade {<integer>[KB|MB|GB|TB|PB]}`] - Inodes Upgrade**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the inode subsystem for the purpose of upgrading.

This is the amount of space required to store upgrading inodes in the file system and is proportional to the size of the inode metafile. Once the upgrade is complete, the space used by 'inodes' will be replaced with the space used for upgrade.

**[`-inodes-upgrade-percent <percent>`] - Inodes Upgrade Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for upgrading the inode metafile in the volume.

**[`-snapshot-reserve {<integer>[KB|MB|GB|TB|PB]}`] - Snapshot Reserve**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the Snapshot reserve in the volume.

**`[-snapshot-reserve-percent <percent>]` - Snapshot Reserve Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot reserve in the volume.

**`[-snapshot-reserve-unusable {<integer>[KB|MB|GB|TB|PB]}]` - Snapshot Reserve Unusable**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space reserved but unusable in the volume.

Snapshot reserve can be diminished under certain conditions to accomodate volume metadata. Creating space in the volume will make this space available.

**`[-snapshot-reserve-unusable-percent <integer>]` - Snapshot Reserve Unusable Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved but unusable.

**`[-snapshot-spill {<integer>[KB|MB|GB|TB|PB]}]` - Snapshot Spill**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by their Snapshot spill.

If Snapshot used space exceeds the Snapshot reserve it is considered to spill out of the reserve. This space cannot be used by the active file system until Snapshots are deleted.

**`[-snapshot-spill-percent <percent>]` - Snapshot Spill Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the Snapshot spill.

**`[-performance-metadata {<integer>[KB|MB|GB|TB|PB]}]` - Performance Metadata**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use for performance optimization in the volume.

**`[-performance-metadata-percent <percent>]` - Performance Metadata Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use for performance optimization in the volume.

**`[-total-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Used**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of space in use by the volume, including the space used by the Snapshot reserve.

This is equivalent to the used field in the output of the [volume show](#) command.

**`[-total-used-percent <percent_no_limit>]` - Total Used Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space in use by the volume, including the space used by the Snapshot reserve.

**`[-physical-used {<integer>[KB|MB|GB|TB|PB]}]` - Total Physical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of physical space in use by the volume.

This differs from *total-used* space by the space that is reserved for future writes. The value includes

blocks in use by Snapshot copies.

**`[-physical-used-percent <percent_no_limit>]` - Physical Used Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of physical space in use in the volume based on volume size including the space reserved for Snapshot copies.

**`[-logical-used {<integer>[KB|MB|GB|TB|PB]}]` - Logical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical space in use by the volume. This includes space saved by all the storage efficiency features along with physical used space. This does not include Snapshot reserve but does consider Snapshot spill.

**`[-logical-used-percent <percent_no_limit>]` - Logical Used Percent**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of logical space used in the volume.

**`[-logical-available {<integer>[KB|MB|GB|TB|PB]}]` - Logical Available**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified amount of logical available space in the volume.

## Examples

The following example shows how to display details for all volumes.

```

cluster1::> volume show-space
Vserver : nodevs
  Volume : vol0
Feature                                     Used      Used%
-----
User Data                                 163.4MB    3%
Filesystem Metadata                       172KB     0%
Inodes                                   2.93MB    0%
Snapshot Reserve                         292.9MB    5%
Total Used                               459.4MB    8%
Total Physical Used                      166.4MB    3%
Vserver : thevs
  Volume : rootvol
Feature                                     Used      Used%
-----

## Related Links

- [volume show](#)

# volume show

Display a list of volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume show` command displays information about volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Aggregate name
- State (online, offline, restricted, or mixed)
- Type (RW for read-write or DP for data-protection)
- Size

- Available size
- Percentage of space used

To display detailed information about a single volume, run the command with the `-vserver` and `-volume` parameters. The detailed view provides all of the information in the previous list and the following additional information:

- Name ordinal
- Volume data set ID
- Volume master data set ID
- Volume style (trad or flex)
- FlexCache Endpoint Type (none or cache or origin)
- Whether the volume is a Cluster volume or Node volume
- Export policy name
- User ID
- Group ID
- Security style (unix, ntfs, mixed or unified)
- UNIX permissions
- Junction path
- Junction path source
- Whether the junction path is active
- Parent volume name
- Vserver root volume
- Comment
- Filesystem size
- Total user-visible size
- Used size
- Used percentage
- Volume nearly full threshold percent
- Volume full threshold percent
- Autosize enabled
- Maximum autosize
- Minimum autosize
- Autosize grow threshold percent
- Autosize shrink threshold percent
- Autosize mode
- Total files
- Files used
- Expected available size

- Over provisioned size
- Snapshot reserve available size
- Logical used size
- Logical used percent
- Logical available size
- Active filesystem logical used size
- Snapshot copy logical used size
- Use logical space reporting
- Use logical space enforcement
- Maximum directory size
- Space guarantee style
- Whether a space guarantee is in effect
- Space SLO type (none, thick or semi-thick)
- Whether space SLO is in effect
- Whether minimum readahead is enabled
- Whether access time update is enabled
- Whether Snapshot directory access is enabled
- Percentage of space reserved for Snapshot Copies
- Percentage of Snapshot copy space used
- Snapshot policy name
- Creation time
- If the filesystem size is fixed
- Overwrite reserve
- Fractional reserve
- Which space management strategy to try first
- Language
- Whether there's one data volume per member aggregate
- Concurrency level
- Optimization policy
- Whether the volume is a clone
- Volume UUID
- Whether failover is enabled
- Failover state
- (DEPRECATED)-Extent option
- Read reallocation option
- Consistency state
- Whether volume is quiesced on disk

- Whether volume is quiesced in memory
- Whether volume contains shared or compressed data
- Space saved by storage efficiency
- Percentage of space saved by storage efficiency
- Space saved by deduplication
- Percentage of space saved by deduplication
- Space shared by deduplication
- Space saved by compression
- Percentage of space saved by compression
- Volume Size Used by Snapshot Copies
- Caching policy
- FlexGroup master data set ID
- FlexGroup index
- FlexGroup UUID
- Maximum size of the FlexGroup constituent
- Whether the volume has FlexGroup enabled
- Whether a FlexGroup is Qtree enabled
- Whether the volume is the destination of a move that is currently in cutover
- List of the aggregates used by the FlexGroup
- List of the nodes used by the FlexGroup
- SnapLock Type
- Is in pre-commit phase of Copy-Free Transition
- Application that the volume belongs to
- Application UUID

To display detailed information about all volumes, run the command with the `-instance` parameter.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about data-protection volumes, run the command with the `-type DP` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The fields `Vserver` and `policy` are the default fields (see example).

**| [-encryption ]**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name

- Aggregate name
- Volume state
- Encryption state

#### | **[-junction ]**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether the volume's junction is active
- Junction path
- Junction path source (if the volume is a mirror)

#### | **[-settings ] (privilege: advanced)**

If this parameter is specified, the command displays the following information:

- Vserver name
- Volume name
- Whether minimum readahead is enabled on the volume
- Whether the access time is updated on inodes when a file on the volume is read
- Whether clients have access to .snapshot directories
- Whether automatic Snapshot copies are enabled on the volume

#### | **[-instance ] }**

If this parameter is specified, the command displays information about all entries.

#### **[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

#### **[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes matching the specified name.

#### **[-aggregate <aggregate name>] - Aggregate Name**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate. This field is displayed as "-" for FlexGroups.

#### **[-aggr-list <aggregate name>,...] - List of Aggregates for FlexGroup Constituents**

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage aggregates. This parameter applies to FlexGroups only.

#### **[-nodes {<nodename>|local}] - List of Nodes Hosting the Volume**

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that are located on the specified list of storage systems. This parameter applies to FlexGroups only.

**[-size {<integer>[KB|MB|GB|TB|PB] }] - Volume Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, Snapshot copies, and Snapshot reserve. Note that for volumes without a `-space-guarantee` of *volume*, the ability to fill the volume to this maximum size depends on the space available in the associated aggregate or aggregates.

**[-name-ordinal <text>] - Name Ordinal (privilege: advanced)**

If this parameter is specified, it denotes the ordinal assignment used in relation to this volume's name. Ordinals are used to disambiguate volumes that have the same base name on the same controller. A value of "0" indicates that the base volume name is unique on the controller. A value greater than zero indicates that the volume's base name is used by two or more volumes on the same controller, and that appending "(n)" to this volume's name uniquely identifies it on this controller.

**[-dsid <integer>] - Volume Data Set ID**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID. This field is displayed as "-" for FlexGroups.

**[-msid <integer>] - Volume Master Data Set ID**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

**[-state {online|restricted|offline|force-online|force-offline|mixed}] - Volume State**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified state. The *mixed* state only applies to FlexGroups. If the state of a FlexGroup is *mixed*, that indicates that not all of the constituents are in the same state. If this is the case use the "volume show -is-constituent true" command to find out which constituents are not in the proper state.

**[-volume-style <flex>] - Volume Style**

If this parameter is specified, the command displays information only about the volumes that have the specified style. Possible values are *flex* for FlexVol volumes.

**[-volume-style-extended {flexvol|flexgroup|flexgroup-constituent}] - Extended Volume Style**

If this parameter is specified, the command displays information only about the volumes that are configured with the specified extended style. Possible values are *flexvol* for FlexVol volumes, *flexgroup* for FlexGroups and *flexgroup-constituent* for FlexGroup constituents.

**[-flexcache-endpoint-type {none|cache|origin}] - FlexCache Endpoint Type**

If this parameter is specified, the command displays information only about the volumes that are of the specified flexcache-endpoint-type. Possible values are *none* for volumes that are not part of a FlexCache relationship, *cache* for FlexCache volumes and *origin* for origin of FlexCache volumes.

**[-is-cluster-volume {true|false}] - Is Cluster-Mode Volume**

If this parameter is specified, the command displays information only about cluster volumes (true) or node root volumes and other node scoped volumes (false).

**[-is-constituent {true|false}] - Is Constituent Volume**

If this parameter is specified, the command displays information only about volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

**[-policy <text>] - Export Policy**

If this parameter is specified, the command displays information only about the volume or volumes that use the specified export policy.

**[-user <user name>] - User ID**

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified user.

**[-group <group name>] - Group ID**

If this parameter is specified, the command displays information only about the volume or volumes whose root is owned by the specified group.

**[-security-style <security style>] - Security Style**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both styles or *unified* for Unified UNIX, NFS and CIFS permissions).

**[-unix-permissions <unix perm>] - UNIX Permissions**

If this parameter is specified, the command displays information only about the volume or volumes whose default UNIX permissions match the specified permissions. Specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX ls command (for example, -rwxr-x---). For information on UNIX permissions, see the UNIX or Linux documentation.

**[-junction-path <junction path>] - Junction Path**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path.

**[-junction-path-source {RW\_volume|LS\_mirror}] - Junction Path Source**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified junction path source.

**[-junction-active {true|false}] - Junction Active**

If this parameter is specified, the command displays information only about the volume or volumes whose junction paths have the specified status.

**[-junction-parent <volume name>] - Junction Parent Volume**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified parent volume.

**[-vsroot {true|false}] - Vserver Root Volume (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified setting; that is, whether they are the root volumes for their Vservers.

**[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified comment text.

**[-available {<integer>[KB|MB|GB|TB|PB]}] - Available Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified available size. Available is the amount of free space currently available to be used by

this volume. For a volume with a `-space-guarantee` of type *volume*, `available` is always `-total` minus `-used`. For volumes that do not have a `-space-guarantee` of type *volume*, `available` could be reduced if the volume's associated aggregate or aggregates are space constrained.

**`[-filesystem-size {<integer>[KB|MB|GB|TB|PB]}] - Filesystem Size`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified filesystem size. Filesystem size is the same as the volume's `-size` unless the volume is or was a physical replica destination. In this case, the file system size corresponds to the `-size` of the source volume, until `-filesys-size-fixed` is set to *false*.

**`[-total {<integer>[KB|MB|GB|TB|PB]}] - Total User-Visible Size`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified total size. Total is the total space available for user data and file system metadata. It does not include the Snapshot reserve.

**`[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used size. Used is the amount of space occupied by user data and file system metadata. It includes Snapshot spill (the amount of space by which Snapshot copies exceed Snapshot reserve). It does not include the Snapshot reserve.

**`[-percent-used <percent>] - Used Percentage`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of used space. This row is based on a value of used space that includes the space used by Snapshot copies or the Snapshot reserve (whichever is greater) in relation to the current volume size.

**`[-space-nearly-full-threshold-percent <percent>] - Volume Nearly Full Threshold Percent`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified nearly full threshold percent.

**`[-space-full-threshold-percent <percent>] - Volume Full Threshold Percent`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified full threshold percent.

**`[-max-autosize {<integer>[KB|MB|GB|TB|PB]}] - Maximum Autosize`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum automatic size.

**`[-min-autosize {<integer>[KB|MB|GB|TB|PB]}] - Minimum Autosize`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum automatic size. This field is displayed as "-" for FlexGroups.

**`[-autosize-grow-threshold-percent <percent>] - Autosize Grow Threshold Percentage`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic grow used space threshold percentage. This field is displayed as "-" for FlexGroups.

**`[-autosize-shrink-threshold-percent <percent>] - Autosize Shrink Threshold Percentage`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic shrink used space threshold percentage. This field is displayed as "-" for

FlexGroups.

**[-autosize-mode {off|grow|grow\_shrink}] - Autosize Mode**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic sizing mode setting. This field is displayed as "-" for FlexGroups.

**[-files <integer>] - Total Files (for user-visible data)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files.

**[-files-used <integer>] - Files Used (for user-visible data)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified number of files used.

**[-maxdir-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Directory Size (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified maximum directory size.

**[-space-guarantee-enabled {true|false}] - Space Guarantee in Effect**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space-guarantee setting. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

**[-is-space-slo-enabled {true|false}] - Space SLO in Effect**

If this parameter is specified, the command displays information only about the volume or volumes that have their `space-slo` setting in effect or not, depending on the value specified for this parameter. If the value of `space-slo` is *none*, the space SLO is always considered to be in effect. If the value of `space-slo` is *semi-thick* or *thick*, the space SLO may be in effect depending on whether the required amount of space was available when the volume was mounted.

**[-space-slo {none|thick|semi-thick}] - Space SLO**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-slo` setting. The space SLO setting is the Service Level Objective for space management for the volume.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified space guarantee style. If the value of `-space-guarantee` is *none*, the value of `-space-guarantee-enabled` is always *true*. In other words, because there is no guarantee, the guarantee is always in effect. If the value of `-space-guarantee` is *volume*, the value of `-space-guarantee-enabled` can be *true* or *false*, depending on whether the guaranteed amount of space was available when the volume was mounted.

**[-fractional-reserve <percent>] - Fractional Reserve**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `fractional-reserve` setting.

**[`-type {RW|DP}`] - Volume Type**

If this parameter is specified, the command displays information only about the volume or volumes of the specified volume type (RW for read-write or DP for data-protection).

**[`-min-readahead {true|false}`] - Minimum Read Ahead (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified minimum-readahead setting.

**[`-atime-update {true|false}`] - Access Time Update Enabled (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified access-time update setting.

**[`-snapdir-access {true|false}`] - Snapshot Directory Access Enabled**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified Snapshot-copy access setting.

**[`-percent-snapshot-space <percent>`] - Space Reserved for Snapshot Copies**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified percentage of space reserved for Snapshot copies.

**[`-snapshot-space-used <percent_no_limit>`] - Snapshot Reserve Used**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified used percentage of the reserve for Snapshot copies.

**[`-snapshot-policy <snapshot policy>`] - Snapshot Policy**

If this parameter is specified, the command displays information only about the volume or volumes that use the specified Snapshot policy.

**[`-create-time <Date>`] - Creation Time**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified creation time.

**[`-language <Language code>`] - Language**

If this parameter is specified, the command displays information only about the volume or volumes that store data in the specified language. To determine the available languages, enter `volume show -language` ?`` at the clustershell command prompt.

**[`-clone-volume {true|false}`] - Clone Volume**

If this parameter is specified, the command displays information only about volumes that are clones (true) or not clones (false).

**[`-node {<nodename>|local}`] - Node name**

If this parameter is specified, the command displays information only the volume or volumes that are located on the specified storage system. This field is displayed as "-" for FlexGroups.

**[`-clone-parent-vserver <vserver name>`] - Clone Parent Vserver Name**

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent Vserver name.

**[-clone-parent-name <volume name>] - FlexClone Parent Volume**

If this parameter is specified, the command displays information only about the volumes with a matching FlexClone parent volume name.

**[-uuid <UUID>] - UUID of the Volume (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

**[-nvfail {on|off}] - NVFAIL Option**

If this parameter is specified, the command displays information only about volumes for which failover is enabled (on) or disabled (off).

**[-in-nvfailed-state {true|false}] - Volume's NVFAIL State**

If this parameter is specified, the command displays information only about volumes which are in the failed over state (true) or not (false).

**[-dr-force-nvfail {on|off}] - Force NVFAIL on MetroCluster Switchover**

If this parameter is specified, the command displays information only about volumes for which dr-force-nvfail is enabled (on) or disabled (off).

**[-filesystem-size-fixed {true|false}] - Is File System Size Fixed**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `filesystem-size-fixed` setting.

**[-extent-enabled {off|on|space-optimized}] - (DEPRECATED)-Extent Option**

This parameter has been deprecated and may be removed in a future release of Data ONTAP.

If this parameter is specified, the command displays information only about volumes that have extents enabled (on), not enabled (off) or space optimized (space-optimized).

**[-overwrite-reserve {<integer>[KB|MB|GB|TB|PB]}] - Reserved Space for Overwrites**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `overwrite-reserve` setting.

**[-space-mgmt-try-first {volume\_grow|snap\_delete}] - Primary Space Management Strategy**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified `space-mgmt-try-first` setting. Possible values are `volume_grow` and `snap_delete`. This field is displayed as "-" for FlexGroups.

**[-read-realloc {off|on|space-optimized}] - Read Reallocation Option**

If this parameter is specified, the command displays information only about volumes that have read reallocation enabled (on), not enabled (off) or space optimized (space-optimized).

**[-sched-snap-name {create-time|ordinal}] - Naming Scheme for Automatic Snapshot Copies**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified automatic Snapshot-copy naming convention.

**`[-is-inconsistent {true|false}] - Inconsistency in the File System`**

If this parameter is specified, the command displays information only about volumes that are inconsistent (true) or consistent (false) in the file system.

**`[-is-quieted-on-disk {true|false}] - Is Volume Quiesced (On-Disk)`**

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) on disk.

**`[-is-quieted-in-memory {true|false}] - Is Volume Quiesced (In-Memory)`**

If this parameter is specified, the command displays information only about volumes that are quiesced (true) or not quiesced (false) in memory.

**`[-transition-state <state>] - Transition Operation State (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition state.

**`[-transition-behavior {data-move|data-protection|none}] - Transition Behavior (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified transition behavior. Possible values are:

- data-move: Volumes that are being moved from a system operating in 7-Mode.
- data-protection: Volumes that are being replicated from a system operating in 7-Mode for disaster recovery.
- none: Volumes that are not part of transition.

**`[-is-copied-for-transition {true|false}] - Copied for Transition (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is copied for transition or not.

**`[-is-transitioned {true|false}] - Transitioned (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified value based on whether the volume is transitioned or not.

**`[-is-sis-volume {true|false}] - Volume Contains Shared or Compressed Data`**

If this parameter is specified, the command displays information only about those volumes that match the specified storage efficiency setting.

**`[-sis-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Storage Efficiency`**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved by the storage efficiency technology.

**`[-sis-space-saved-percent <percent>] - Percentage Saved by Storage Efficiency`**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved by the storage efficiency technology.

**`[-dedupe-space-saved {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Deduplication`**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to deduplication.

**[`-dedupe-space-saved-percent` <percent>] - Percentage Saved by Deduplication**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to deduplication.

**[`-dedupe-space-shared` {<integer>[KB|MB|GB|TB|PB]}] - Space Shared by Deduplication**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of shared space due to deduplication.

**[`-compression-space-saved` {<integer>[KB|MB|GB|TB|PB]}] - Space Saved by Compression**

If this parameter is specified, the command displays information only about those volumes that have the specified amount of space saved due to compression.

**[`-compression-space-saved-percent` <percent>] - Percentage Space Saved by Compression**

If this parameter is specified, the command displays information only about those volumes that have the specified percentage of space saved due to compression.

**[`-size-used-by-snapshots` {<integer>[KB|MB|GB|TB|PB]}] - Volume Size Used by Snapshot Copies**

If this parameter is specified, the command displays information about those volumes that have the specified volume size used by Snapshot copies.

**[`-block-type` {64-bit|extent|32-bit}] - Block Type**

If this parameter is specified, the command displays information about only the volumes with the specified indirect block format. Possible values are *32-bit* to display 32-bit volumes and *64-bit* to display 64-bit volumes.

**[`-is-moving` {true|false}] - Is Volume Moving**

If this parameter is specified, the command displays information only about volumes that are moving (true) or not moving (false).

**[`-hybrid-cache-eligibility` {read|read-write|none}] - Flash Pool Caching Eligibility**

If this parameter is specified, the command displays information only about the volume or volumes with the specified Flash Pool caching attributes. Possible caching attributes are:

- 'read' ... Indicates that the volume cannot participate in write caching.
- 'read-write' ... Indicates that the volume can participate in read and write caching.

**[`-hybrid-cache-write-caching-ineligibility-reason` <text>] - Flash Pool Write Caching Ineligibility Reason**

If this parameter is specified, the command displays information only about the volume or volumes which are ineligible to participate in write caching due to the specified reason.

**[`-constituent-role` <Constituent Roles>] - Constituent Volume Role**

If this parameter is specified, the command displays information only about the constituent volume or volumes that are of the specified role. This parameter applies to FlexGroups only.

**[`-is-cft-precommit` {true|false}] - Is in the precommit phase of Copy-Free Transition (privilege: advanced)**

If this parameter is specified with the true value, it displays information only about the volumes that are in the precommit phase of a Copy-Free Transition workflow.

### **[-qos-policy-group <text>] - QoS Policy Group Name**

If this parameter is specified, the command displays information only about volumes that match the specified QoS policy group.

### **[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name**

If this parameter is specified, the command displays information only about volumes that match the specified QoS adaptive policy group.

### **[-caching-policy <text>] - Caching Policy Name**

If this parameter is specified, the command displays the volumes that match the specified caching policy.

A caching policy defines how the system caches a volume's data in a Flash Pool aggregate. Both metadata and user data are eligible for caching. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

### **[-cache-retention-priority {normal|low|high}] - Cache Retention Priority (privilege: advanced)**

If this parameter is specified, the command displays the volumes that match the specified cache retention priority policy.

A cache retention priority defines how long the blocks of a volume will be cached in flash pool once they become cold. The available cache retention priority are:

- low - Cache the cold blocks for the lowest time.
- normal - Cache the cold blocks for the default time.
- high - Cache the cold blocks for the highest time.

**`[-is-volume-in-cutover {true|false}] - Is Volume Move in Cutover Phase`**

If this parameter is specified, the command displays information only about volumes that are in the cutover phase (true) or not in the cutover phase (false) of a volume move. This field is displayed as "-" for FlexGroups.

**`[-snapshot-count <integer>] - Number of Snapshot Copies in the Volume`**

If this parameter is specified, the command displays information only about the volumes that have the specified number of Snapshot copies.

**`[-vbn-bad-present {true|false}] - VBN_BAD may be present in the active filesystem`**

If this parameter is specified, the command displays information only about volumes that may have VBN\_BAD present in its active filesystem (true) or do not have VBN\_BAD present in its active filesystem (false).

**`[-is-autobalance-eligible {true|false}] - Is Eligible for Auto Balance Aggregate (privilege: advanced)`**

If this parameter is specified, the command displays information only about the volume or volumes that are eligible for consideration by the Auto Balance Aggregate feature.

**`[-is-vol-on-hybrid-aggr {true|false}] - Is Volume on a hybrid aggregate`**

If this parameter is specified, the command displays information only about volumes associated with a Flash Pool aggregate (true) or not (false). This field is displayed as "-" for FlexGroups.

**`[-physical-used {<integer>[KB|MB|GB|TB|PB]}] - Total Physical Used Size`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used size. This differs from *total-used* space by the space that is reserved for future writes. The value includes blocks in use by Snapshot copies.

**`[-physical-used-percent <percent_no_limit>] - Physical Used Percentage`**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified physical used percent based on volume size including the space reserved for Snapshot copies.

**`[-flexgroup-msid <integer>] - FlexGroup Master Data Set ID (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup master data-set ID. This parameter applies to FlexGroups and FlexGroup constituents only.

**`[-flexgroup-index <integer>] - FlexGroup Index (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup constituents that have the specified FlexGroup index. This parameter applies to FlexGroup constituents only.

**`[-flexgroup-uuid <UUID>] - UUID of the FlexGroup (privilege: advanced)`**

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroup constituents that have the specified FlexGroup UUID. This parameter applies to FlexGroups and FlexGroup constituents only.

**[`-max-constituent-size` {<integer>[KB|MB|GB|TB|PB]}] - Maximum size of a FlexGroup Constituent (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexGroup or FlexGroups that have the specified maximum constituent size. This parameter applies to FlexGroups only.

**[`-inofile-version` <integer>] - Inofile Version (privilege: advanced)**

If this parameter is specified, the command displays information only about the volumes whose inode files are at the specified version.

**[`-is-flexgroup` {true|false}] - Is Volume a FlexGroup**

If this parameter is specified, the command displays information only about the volume or volumes that are either FlexGroups or not, depending on the value provided.

**[`-is-flexgroup-qtree-enabled` {true|false}] - Is FlexGroup Qtree Support Enabled (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexGroups with Qtrees enabled or disabled, depending on the value provided.

**[`-is-move-destination-in-cutover` {true|false}] - Is the Volume a Target of a Move Which Is Currently in Cutover (privilege: advanced)**

If this parameter is specified, the command displays whether or not the volume is a move destination that is currently in cutover.

**[`-snaplock-type` {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays information only about volumes that match the specified snaplock-type.

**[`-vserver-dr-protection` {protected|unprotected}] - Vserver DR Protection**

If this parameter is specified, the command displays information only about the volumes having the specified Vserver Snapmirror protection.

**[`-has-optimized-sparse-directories` {true|false}] - Volume Has Sparse Directories in an Optimized Format (privilege: advanced)**

If this parameter is specified, the command displays information only about volumes that have sparse directories in an optimized format.

**[`-encrypt` <true>] - Enable Encryption**

If this parameter is specified, the command displays information only about the volumes that are encrypted.

**[`-is-encrypted` {true|false}] - Is Volume Encrypted**

If this parameter is specified, the command displays information only about the volumes that are encrypted (true) or not encrypted (false).

**[`-encryption-state`**

**{none|full|partial|converting\_to\_encrypted|converting\_to\_plaintext|rekeying}] - Volume Encryption State**

If this parameter is specified, the command displays information only about the volumes that have the specified encryption state. The possible values are *none*, *full*, and *partial*. The value *partial* is used for FlexGroups, which indicates that some constituents are encrypted and some are not.

**[-key-id <text>] - Encryption Key ID**

If this parameter is specified, the command displays information only about the volume whose encryption key-id matches the specified key-id.

**[-application <text>] - Application**

Selects the volumes that are part of an application that matches the parameter value.

**[-is-protocol-access-fenced {true|false}] - Is Fenced for Protocol Access**

If this parameter is specified, the command displays information only about the volumes that are fenced for protocol access. Only FlexGroup constituents and volumes in SnapMirror Synchronous relationships can be fenced for protocol access.

**[-protocol-access-fenced-by {none|coordinated\_snaprestore|coordinated\_redirection|snapmirror\_synchronous\_strict\_sync}] - Protocol Access Fence Owner**

This field indicates the owner of the protocol access fence when the volume's protocol access is fenced. Only FlexGroup constituents and volumes in SnapMirror Synchronous relationships can be fenced for protocol access.

**[-single-instance-data-logging {off|on}] - Is SIDL enabled**

If this parameter is specified, the command displays whether Single Instance Data Logging feature is enabled on the specified volume.

**[-over-provisioned {<integer>[KB|MB|GB|TB|PB]}] - Over Provisioned Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size not available in the aggregate. This applies only for a 'none' guaranteed volume when it's unused size exceeds available space in the aggregate. This value is always zero for 'volume' guaranteed volumes.

**[-snapshot-reserve-available {<integer>[KB|MB|GB|TB|PB]}] - Available Snapshot Reserve Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified size available for Snapshot copies within the Snapshot reserve. This value is zero if Snapshot spill is present. For 'none' guaranteed volumes, this may get reduced due to less available space in the aggregate.

**[-logical-used {<integer>[KB|MB|GB|TB|PB]}] - Logical Used Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used size. This value includes all the space saved by the storage efficiency features along with the physically used space. This does not include Snapshot reserve but does consider Snapshot spill.

**[-logical-used-percent <percent\_no\_limit>] - Logical Used Percentage**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical used percentage.

**[-logical-available {<integer>[KB|MB|GB|TB|PB]}] - Logical Available Size**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical available size. This value is the amount of free space currently available considering space saved by the storage efficiency features as being used. This does not include Snapshot reserve.

**`[-logical-used-by-afs {<integer>[KB|MB|GB|TB|PB] }]` - Logical Size Used by Active Filesystem**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used by the active file system. This value differs from *logical-used* by the amount of Snapshot spill that exceeds Snapshot reserve. This parameter is not supported on FlexGroups.

**`[-logical-used-by-snapshots {<integer>[KB|MB|GB|TB|PB] }]` - Logical Size Used by All Snapshots**

If this parameter is specified, the command displays information only about the volume or volumes that have the specified logical size used across all Snapshot copies. This value differs from *size-used-by-snapshots* by the space saved by the storage efficiency features across the Snapshot copies. This parameter is not supported on FlexGroups.

**`[-is-space-reporting-logical {true|false}]` - Logical Space Reporting**

If this parameter is specified, the command displays information only about the volumes that have logical space reporting enabled or disabled as specified. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups.

**`[-is-space-enforcement-logical {true|false}]` - Logical Space Enforcement**

If this parameter is specified, the command displays information only about the volumes that have logical space enforcement enabled or disabled as specified. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

**`[-tiering-policy {snapshot-only|auto|none|backup}]` - Volume Tiering Policy**

If this parameter is specified, the command displays information only about the volumes whose tiering policy matches the specified value. Tiering policies determine whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- snapshot-only - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- auto - This policy allows tiering of both snapshot and active file system user data to the capacity tier.
- none - Volume blocks will not be tiered to the capacity tier.
- backup - On DP volumes this policy allows all transferred user data blocks to start in the capacity tier.

**`[-tiering-minimum-cooling-days <integer>]` - Volume Tiering Minimum Cooling Days (privilege: advanced)**

This parameter displays the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the capacity tier. If a value is not displayed then the system default is still being used and has not been overridden with this option. The default minimum cooling period for snapshot-only policy is 2 days and for auto policy is 31 days.

**`[-performance-tier-inactive-user-data {<integer>[KB|MB|GB|TB|PB] }]` - Performance Tier Inactive User Data**

If this parameter is specified, the command displays the amount of inactive user data stored in the performance tier that could be tiered out to a capacity tier if the volume is in a FabricPool and has the auto

tiering policy. For more information see the tiering-policy parameter.

## **[~~-performance-tier-inactive-user-data-percent~~ <percent>] - Performance Tier Inactive User Data Percent**

If this parameter is specified, the command displays the percentage of inactive user data in the performance tier.

## **Examples**

The following example displays information about all volumes on the Vserver named vs1:

```
cluster1::> volume show -vserver vs1
```

Vserver	Volume	Aggregate	State	Type	Size	Available
Used%						
vs1	vol1	aggr1	online	RW	2GB	1.9GB

## volume size

Set/Display the size of the volume.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume size` command allows the user to set or display the volume size. If *new-size* is not specified then the current volume size is displayed.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter can be used to specify the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This parameter specifies the volume for which the user wants to set or display the size.

### **[-new-size <text>] - [+|-]<New Size>**

This optional parameter specifies the size of the volume. It can be used to set the volume size to a particular number or grow/shrink the size by a particular amount. The size is specified as a number (preceded with a sign for relative growth/shrinkage) followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. The minimum size for a flexible volume is 20 MB, and the maximum size depends on hardware platform and free space in the containing aggregate. If the volume's space guarantee is currently disabled, its size cannot be increased.

## **Examples**

The following example shows the size of a volume called vol1.

```
cluster1::> vol size vol1
(volume size)
vol size: Flexible volume 'vs1:vol1' has size 2g.
```

The following example sets the size of a volume called vol1 to 1GB.

```
cluster1::> vol size vol1 1g
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1g.
```

The following example increases the size of a volume called vol1 by 500MB.

```
cluster1::> vol size vol1 +500m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.49g.
```

The following example decreases the size of a volume called vol1 by 250MB.

```
cluster1::> vol size vol1 -250m
(volume size)
vol size: Flexible volume 'vs1:vol1' size set to 1.24g.
```

## **volume transition-prepare-to-downgrade**

Verifies that there are no volumes actively transitioning from 7-mode to clustered Data ONTAP, and configures the transition feature for downgrade.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `volume transition-prepare-to-downgrade` command is used to verify that a volume is not currently being transitioned from 7-Mode to clustered Data ONTAP. This check must be done before reverting or downgrading a node.

## Parameters

## Examples

The following example executes the `volume transition-inactive-verify` command during active volume transitions.

```
cluster1::*> volume transition-prepare-to-downgrade
```

Error: command failed: Downgrade cannot proceed because one or more volumes are transitioning from 7-Mode to clustered Data ONTAP.

You must complete or cancel all transitions. View the transitioning volumes that are preventing the downgrade by using the (privilege: advanced) command `"lun transition show -status active -fields vservers, volume"`.

To complete a transition, break the SnapMirror transition relationship using the command `"snapmirror break -destination-path <destination-path>"`.

For detailed information about transitioning, refer to the "7-Mode Data Transition Using SnapMirror" guide.

To cancel a transition, contact technical support.

# volume unmount

Unmount a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume unmount` command unmounts a volume from its parent volume. The volume can be remounted at the same or a different location by using the [volume mount](#) command.

## Parameters

**-vservers <vservers name> - Vservers Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that is to be unmounted.

## Examples

The following example unmounts a volume named vol2 on a Vserver named vs0:

```
node::> volume unmount -vserver vs0 -volume vol2
```

# volume clone commands

## volume clone create

Create a FlexClone volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume clone create` command creates a FlexClone volume on the aggregate containing the specified parent volume. This command is only supported for flexible volumes. The maximum volume clone hierarchy depth is 500 and the default depth is 60. You can optionally specify the following attributes for the new FlexClone volume:

- Vserver on which the parent volume resides
- Name of the FlexClone parent snapshot
- Junction path where FlexClone volume should be mounted
- State of the junction path
- Space guarantee style (none, volume or file)
- Comment
- Whether the `volume clone create` command runs as a foreground or background process

## Parameters

### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the FlexClone volume is to be created. If only one data Vserver exists, you do not need to specify this parameter.

### **-flexclone <volume name> - FlexClone Volume**

This parameter specifies the name of the FlexClone volume. The name must be unique within the hosting Vserver.

### **[-type {RW|DP}] - FlexClone Type**

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the *type* as DP; otherwise a read-write FlexClone volume is created.

### **[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

This parameter specifies the name of the Vserver to which the FlexClone parent volume belongs. If it is different from the Vserver on which the FlexClone volume is to be created, then the FlexClone volume inherits the export policies from the residing Vserver, and not from the FlexClone parent volume.

**-b, -parent-volume <volume name> - FlexClone Parent Volume**

This parameter specifies the name of parent volume from which the FlexClone clone volume is derived.

**[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

This specifies the name of the parent snapshot from which the FlexClone clone volume is derived.

**[-junction-path <junction path>] - Junction Path**

This specifies the junction path at which the new FlexClone clone volume should be mounted.

**[-junction-active {true|false}] - Junction Active**

This optionally specifies whether the volume's junction path is active. The default setting is `true`. If the junction path is inactive, the volume does not appear in the Vserver's namespace. This parameter is available only at the advanced privilege level and higher.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

This optionally specifies the space guarantee style for the FlexClone volume. A value of `volume` reserves space on the aggregate for the entire volume. A value of `none` reserves no space on the aggregate, meaning that writes can fail if the aggregate runs out of space. The default setting is inherited from the parent volume.

**[-comment <text>] - Comment**

This optionally specifies a comment for the FlexClone volume.

**[-foreground {true|false}] - Foreground Process**

This optionally specifies whether the FlexClone volume create operation runs as a foreground process. The default setting is `true` (that is, the operation runs in the foreground).

**{ [-qos-policy-group <text>] - QoS Policy Group Name**

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

**| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }**

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups.

**[-caching-policy <text>] - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- `none` - Does not cache any user data or metadata blocks.
- `auto` - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- `meta` - Read caches only metadata blocks.

- `random_read` - Read caches all metadata and randomly read user data blocks.
- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read, and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.
- `noread-random_write` - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- `meta-random_write` - Read caches all metadata and write caches randomly overwritten user data blocks.
- `random_read_write-random_write` - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read-random_write` - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- `all_read_random_write-random_write` - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- `all-random_write` - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is `auto`.

#### **`[-vserver-dr-protection {protected|unprotected}]` - Vserver DR Protection**

This optionally specifies whether the volume should be protected by Vserver level SnapMirror. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship. By default the clone volume will inherit this value from the parent volume.

#### **`[-uid <integer>]` - Volume-Level UID**

This parameter optionally specifies a volume-level user ID (UID). All files and directories in a FlexClone volume will inherit this UID.

#### **`[-gid <integer>]` - Volume-Level GID**

This parameter optionally specifies a volume-level group ID (GID). All files and directories in a FlexClone volume will inherit this GID.

### **Examples**

The following command creates a FlexClone volume `fc_vol_1` from parent volume `fv2` on Vserver `vs1` and the job runs as a foreground process.

```

cluster1::> volume clone create -vserver vs1 -flexclone fc_vol_1
-parent-volume fv2 -junction-active true -foreground true -comment
"Testing FlexClone creation"
cluster1::> volume clone show fc_vol_1 -vserver vs1

## volume clone show

Display a list of FlexClones

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone show` command displays information about FlexClone clone volumes. This command is only supported for flexible volumes. By default, the command displays the following information about all FlexClone volume clones:

- Vserver name
- FlexClone volume name
- Parent volume name
- Parent snapshot name
- Whether a FlexClone volume is online or offline

To display detailed information about all FlexClone volumes, run the command with the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields to be displayed.

**| [-estimate ]**

Displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported may differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed.

**| [-instance ] }**

Displays detailed information about FlexClone volumes. If `-flexclone` is also specified, the command displays detailed information about the FlexClone volume.

**[-vserver <vserver name>] - Vserver Name**

Selects summary information for the FlexClone volumes on the specified Vserver. If `-flexclone` is also specified, the command displays detailed information about the specified FlexClone volume.

**[-flexclone <volume name>] - FlexClone Volume**

Selects summary information for the specified FlexClone volume. If `-vserver` is also specified, the command displays detailed information about the specified FlexClone volume.

**[-type {RW|DP}] - FlexClone Type**

Selects information for the specified type of FlexClone volume. The type can be specified as either read-only (DP) or read-write (RW).

**[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

Selects summary information for the FlexClone volumes that are clone volumes in the specified parent Vserver.

**[-b, -parent-volume <volume name>] - FlexClone Parent Volume**

Selects summary information for the FlexClone volumes that are clones of the specified parent volume.

**[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

Selects summary information for the FlexClone volumes that are clones of the parent volume to which the specified snapshot belongs.

**[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State**

Selects summary information for the FlexClone volumes that are in the specified state.

**[-junction-path <junction path>] - Junction Path**

Selects summary information for the FlexClone volumes that have the specified junction path.

**[-junction-active {true|false}] - Junction Active**

Selects summary information for the FlexClone volumes that have the specified junction path status.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

If this parameter is specified, the command displays information only about the volumes that have the specified space guarantee style.

**[`-space-guarantee-enabled {true|false}`] - Space Guarantee In Effect**

Selects summary information for the FlexClone volumes that have the specified space-guarantee setting.

**[`-aggregate <aggregate name>`] - FlexClone Aggregate**

Selects summary information for the FlexClone volumes that reside on the specified storage aggregate.

**[`-dsid <integer>`] - FlexClone Data Set ID**

Selects summary information for the FlexClone volumes that have the specified Data Set ID.

**[`-msid <integer>`] - FlexClone Master Data Set ID**

Selects summary information for the FlexClone volumes that have the specified Master Data Set ID.

**[`-size {<integer>[KB|MB|GB|TB|PB]}`] - FlexClone Size**

Selects summary information for the FlexClone volumes that have the specified size.

**[`-used {<integer>[KB|MB|GB|TB|PB]}`] - Used Size**

Selects summary information for the FlexClone volumes that have the specified amount of used space.

**[`-split-estimate {<integer>[KB|MB|GB|TB|PB]}`] - Split Estimate**

Selects summary information for the FlexClone volumes that require the specified amount of free disk space for splitting from the parent.

**[`-blocks-scanned <integer>`] - Blocks Scanned**

Selects summary information for the FlexClone volumes that have the specified number of blocks scanned for splitting the FlexClone volume from its parent volume.

**[`-blocks-updated <integer>`] - Blocks Updated**

Selects summary information for the FlexClone volumes that have the specified number of blocks updated for after splitting the FlexClone volume from its parent volume.

**[`-comment <text>`] - Comment**

Selects summary information for the FlexClone volumes that have the specified comment.

**[`-qos-policy-group <text>`] - QoS Policy Group Name**

Selects summary information for the FlexClone volumes that have the specified QoS policy group.

**[`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name**

Selects summary information for the FlexClone volumes that have the specified QoS adaptive policy group.

**[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the volume. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.

- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.
- noread-random\_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- meta-random\_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- random\_read\_write-random\_write - Read caches all metadata, randomly read and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read-random\_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all\_read\_random\_write-random\_write - Read caches all metadata, randomly read, sequentially read and randomly written user data. It also write caches randomly overwritten user data blocks.
- all-random\_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write policies. Default caching-policy is auto.

**[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)**

Selects summary information for the FlexClone volumes that are clones of the parent volumes with the specified type.

**[-flexclone-used-percent <percent>] - FlexClone Used Percentage**

Selects summary information for the FlexClone volumes that have the specified percentage of used space.

**[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection**

Selects summary information for the FlexClone volumes that have the specified type of Vserver SnapMirror protection. This parameter is applicable only if the Vserver is the source of a Vserver level SnapMirror relationship.

**[-block-percentage-complete <integer>] - Percentage Complete**

Selects summary information for the FlexClone volumes that have specified percentage of Blocks processed for splitting the FlexClone volume from its parent volume.

**[-uid <integer>] - Volume-Level UID**

Selects summary information for the FlexClone volumes that are created with the specified volume-level UID.

**[-gid <integer>] - Volume-Level GID**

Selects summary information for the FlexClone volumes that are created with the specified volume-level GID.

## Examples

The following example displays detailed information about all FlexClone volumes on Vserver vs0:

```
cluster1::> volume clone show -vserver vs0
(volume clone show)
Vserver    FlexClone    Parent-Volume    Parent-Snapshot
-----
vs0        fc_vol_1     test_vol         clone_fc_vol_1.0
          fc_vol_2     test_vol2        clone_fc_vol_2.0
          fc_vol_3     tv9              clone_fc_vol_3.0
          tv8        tv7              clone_tv8.0
          tv9        test_vol2        clone_tv9.0
5 entries were displayed.
```

The following example displays detailed information about FlexClone volume fc\_vol\_2 on Vserver vs0:

```
cluster1::> volume clone show -vserver vs0 -flexclone fc_vol_2

Vserver Name: vs0
FlexClone Volume: fc_vol_2
FlexClone Parent Volume: test_vol2
FlexClone Parent Snapshot: clone_fc_vol_2.0
Junction Path: -
Junction Active: -
Space Guarantee Style: volume
Space Guarantee In Effect: true
FlexClone Aggregate: test_aggr
FlexClone Data Set ID: 1038
FlexClone Master Data Set ID: 2147484686
FlexClone Size: 47.50MB
Used Size: 128KB
Split Estimate: 0.00B
Inodes processed: -
Total Inodes: -
Inode Percentage complete: -
Blocks Scanned: -
Blocks Updated: -
Comment:
Qos Policy Group Name: pg1
FlexClone Parent Volume Type: RW
Block Percentage complete: -
```

The following example displays summary information about all FlexClone volumes residing on Vserver vs0 along with the fields msid, dsid, state and parent-volume.

```
cluster1::> volume clone show -vserver vs0 -fields msid, dsid, state,
parent-volume
vserver flexclone parent-volume state dsid msid
-----
vs0      fc_vol_1  test_vol      online 1037 2147484685
vs0      fc_vol_3  tv9           online 1039 2147484687
vs0      flex_clone1
                fc_vol_1      online 1041 2147484689
vs0      fv_2      fc_vol_1      online 1043 2147484691
vs0      tv9      test_vol2     online 1036 2147484684
5 entries were displayed.
```

The following example displays summary information about all FlexClone volumes residing on Vserver `vs0` along with space-guarantee-enabled and space-guarantee information about each FlexClone volume.

```
cluster1::> vol clone show -vserver vs0 -fields space-guarantee-enabled,
space-guarantee
(volume clone show)
vserver flexclone space-guarantee space-guarantee-enabled
-----
vs0      fc_vol_1  volume      true
vs0      fc_vol_3  volume      true
vs0      flex_clone1
                volume      true
vs0      fv_2      volume      true
vs0      tv9      volume      true
5 entries were displayed.
```

## volume clone sharing-by-split show

Show the split flexclone volumes with shared physical blocks

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split show` command displays the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, this command displays the following information:

- Node Name
- Vserver Name
- Volume Name
- Aggregate Name

- Volume State

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name (privilege: advanced)**

This parameter selects information about the split volumes with shared physical blocks on this node.

**[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)**

This parameter selects information about the split volumes with shared physical blocks on this Vserver.

**[-volume <volume name>] - Volume Name (privilege: advanced)**

This parameter selects information about shared physical blocks for this volume.

**[-aggregate <aggregate name>] - Aggregate Name (privilege: advanced)**

This parameter specifies the aggregate associated with the given volume.

## Examples

The following example displays the split volumes with shared physical blocks in the node:

```
cluster1::> volume clone sharing-by-split show -node node1
Node           Vserver    Volume      Aggregate
-----
node1          vs1        vol_clone1  aggr1
```

The following example displays information about volume `vol_clone1` residing on vservers `vs1`:

```
cluster1::> volume clone sharing-by-split show -node node1 -vserver vs1
-volume vol_clone1 -instance
Node Name: node1
      Vserver Name: vs1
      Volume Name: vol_clone1
      Aggregate Name: aggr1
```

## volume clone sharing-by-split undo show

Show the status of volume clone undo-sharing operations in-progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `volume clone sharing-by-split undo show` command displays the progress information of undo-sharing in the split volumes with shared physical blocks. This command is only supported for flexible volumes. By default, the command displays the following information:

- Vserver name
- Volume name
- Total number of blocks scanned for undo sharing
- Total number of blocks present
- Percentage of blocks processed

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)`

This parameter selects information about the ongoing undo-sharing scan for all volumes on this Vserver.

`[-volume <volume name>] - Volume Name (privilege: advanced)`

This parameter selects information about the ongoing undo-sharing scan on this volume.

`[-blocks-scanned <integer>] - Scanned Blocks (privilege: advanced)`

This parameter selects information about the total number of blocks scanned by undo-sharing in the given volume.

`[-blocks-total <integer>] - Total Blocks (privilege: advanced)`

This parameter selects information about the total number of blocks for the undo-sharing to scan in the given volume.

`[-blocks-percentage-complete <integer>] - Blocks Percentage Complete (privilege: advanced)`

This parameter selects information about the percentage of block processing completed by undo-sharing in the given volume.

Examples

The following example displays information about all the ongoing undo-sharing scan in the cluster:

```
cluster1::> volume clone sharing-by-split undo show
```

Vserver	Volume	Blocks Scanned	Blocks Total	Blocks % Complete
vs1	vol_clone1	0	1260	0

The following example displays information about volume `vol_clone1` residing on vservers `vs1`:

```
cluster1::> volume clone sharing-by-split undo show -vservers vs1 -volume
vol_clone1 -instance
Vserver Name: vs1
    Volume Name: vol_clone1
        Blocks Scanned: 0
        Blocks Total: 1260
    Block Percentage complete: 0
```

## volume clone sharing-by-split undo start-all

Undo the physical block sharing in split FlexClone volumes across the cluster

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split undo start-all` command starts a scan to undo the shared physical blocks in all the relevant volumes across the cluster. The volumes will be available for the duration of the undo-sharing operation. You can monitor the current progress of the scan using the [volume clone sharing-by-split undo show](#) command. This command is supported for flexible volumes that were split from their parent volumes.

### Examples

The following example starts the scan to undo the physical block sharing in all volumes across the cluster:

```
cluster1::> volume clone sharing-by-split undo start-all
```

- [volume clone sharing-by-split undo show](#)

## volume clone sharing-by-split undo start

Undo the physical block sharing in split FlexClone volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume clone sharing-by-split undo start` command starts a scan to undo the shared physical blocks in the given volume. The volume will be available for the duration of the undo-sharing operation. After the scan starts, you can stop it using the [volume clone sharing-by-split undo stop](#) command. You can monitor the current progress of the scan using the [volume clone sharing-by-split undo show](#) command. This command is supported for flexible volumes that were split from their parent volumes.

## Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the vservers that the volume exists on.

**-volume <volume name> - Volume Name (privilege: advanced)**

This parameter specifies the split volume with shared physical blocks, in which the sharing will be undone.

## Examples

The following example starts the scan to undo the physical block sharing in volume *vol\_clone1* on vservers *vs1*:

```
cluster1::> volume clone sharing-by-split undo start -vserver vs1 -volume vol_clone1
```

## Related Links

- [volume clone sharing-by-split undo stop](#)
- [volume clone sharing-by-split undo show](#)

## volume clone sharing-by-split undo stop

Stop an ongoing undo-sharing operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume clone sharing-by-split undo stop` command stops the process of reverting the shared physical blocks from the split volume. If you restart the undo-sharing operation, scan begins from the beginning because no information about previously achieved progress is saved, but previously unshared blocks are not processed again. This command is only supported for flexible volumes.

## Parameters

**-vserver <Vserver Name> - Vserver Name (privilege: advanced)**

This parameter specifies the vservers that the volume exists on.

**-volume <volume name> - Volume Name (privilege: advanced)**

This parameter specifies the volume whose unsharing of blocks will be stopped.

## Examples

The following example stops an ongoing undo-sharing scan for volume *vol\_clone1* on vservers *vs1*:

```
cluster1::> volume clone sharing-by-split undo stop -vserver vs1 -volume vol_clone1
```

## volume clone split estimate

Estimates the space required by the containing-aggregate to split the FlexClone volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone split estimate` command displays an estimate of the free disk space required in the aggregate to split the indicated clone volume from its underlying parent volume. The value reported might differ from the space actually required to perform the split, especially if the clone volume is changing when the split is being performed. This command is only supported for flexible volumes.

### Parameters

#### **[-vserver <vserver name>] - Vserver Name**

This specifies the estimates for free disk space required for splitting FlexClone volumes residing on this Vserver. If the `-flexclone` option is also specified, then the command displays the free disk space estimate only for the specified FlexClone volume residing on the specified Vserver.

#### **[-flexclone <volume name>] - FlexClone Volume**

This specifies the free disk space estimate for splitting this FlexClone volume.

#### **[-type {RW|DP}] - FlexClone Type**

This parameter specifies the type of FlexClone volume. A read-only FlexClone volume is created if you specify the *type* as *DP*; otherwise a read-write FlexClone volume is created.

#### **[-parent-vserver <vserver name>] - FlexClone Parent Vserver**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones in the specified parent Vserver.

#### **[-b, -parent-volume <volume name>] - FlexClone Parent Volume**

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent volume.

#### **[-parent-snapshot <snapshot name>] - FlexClone Parent Snapshot**

This specifies the free disk space estimates for splitting the FlexClone volumes cloned off this parent snapshot.

#### **[-state {online|restricted|offline|force-online|force-offline|mixed}] - FlexClone Volume State**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state.

#### **[-junction-path <junction path>] - Junction Path**

This specifies the free disk space estimates for splitting the FlexClone volumes mounted at this junction path.

#### **[-junction-active {true|false}] - Junction Active**

If this specified, the command displays the free disk space estimate for splitting the FlexClone volumes with the specified junction path status.

**[-s, -space-guarantee {none|volume}] - Space Guarantee Style**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified type of space guarantee.

**[-space-guarantee-enabled {true|false}] - Space Guarantee In Effect**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified state of space guarantee.

**[-aggregate <aggregate name>] - FlexClone Aggregate**

This specifies the free disk space estimates for splitting the FlexClone volumes residing on the specified aggregate.

**[-dsid <integer>] - FlexClone Data Set ID**

This specifies the free disk space estimates for splitting the FlexClone volume with the specified DSID (data set ID).

**[-msid <integer>] - FlexClone Master Data Set ID**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified MSID (master data set ID).

**[-size {<integer>[KB|MB|GB|TB|PB]}] - FlexClone Size**

This specifies the free disk space estimates for splitting FlexClone volumes with the specified size.

**[-used {<integer>[KB|MB|GB|TB|PB]}] - Used Size**

This specifies the free disk space estimates for splitting the FlexClone volumes with the specified amount of used disk space.

**[-split-estimate {<integer>[KB|MB|GB|TB|PB]}] - Split Estimate**

This specifies the free disk space estimates for splitting the FlexClone volumes which match with the specified free disk space estimate for splitting.

**[-blocks-scanned <integer>] - Blocks Scanned**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been scanned.

**[-blocks-updated <integer>] - Blocks Updated**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified number of blocks have been updated.

**[-comment <text>] - Comment**

This specifies the free disk space estimates for splitting the FlexClone volumes that have the specified value for the comment field.

**[-qos-policy-group <text>] - QoS Policy Group Name**

This parameter optionally specifies which QoS policy group to apply to the FlexClone volume. The policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to the FlexClone volume, the system does not monitor and control the traffic to the volume.

**[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name**

This optionally specifies which QoS adaptive policy group to apply to the volume. This policy group defines measurable service level objectives (SLOs) and Service Level agreements (SLAs) that adjust based on the volume allocated space or used space. This parameter is not supported on FlexGroups.

**[-caching-policy <text>] - Caching Policy Name**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified caching policy.

**[-parent-vol-type <volAccessType>] - Parent volume type (privilege: advanced)**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones of the parent volumes with the specified type.

**[-flexclone-used-percent <percent>] - FlexClone Used Percentage**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified percentage of used space.

**[-vserver-dr-protection {protected|unprotected}] - Vserver DR Protection**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified Vserver SnapMirror protection.

**[-block-percentage-complete <integer>] - Percentage Complete**

This specifies the free disk space estimates for splitting the FlexClone volumes for which the specified percentage of Block processing has been completed.

**[-uid <integer>] - Volume-Level UID**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level UID.

**[-gid <integer>] - Volume-Level GID**

This specifies the free disk space estimates for splitting the FlexClone volumes that are clones with the specified volume-level GID.

## Examples

The following example displays the FlexClone split free disk space estimates for the FlexClone volumes residing on Vserver vs0 .

```
cluster1::> volume clone split estimate -vserver vs0
(volume clone split estimate)
      Split
Vserver  FlexClone  Estimate
-----  -
vs0      fc_vol_1    851.5MB
          fc_vol_3    0.00B
          flex_clone1 350.3MB
          fv_2        47.00MB
          tv9         0.00B
5 entries were displayed.
```

## volume clone split show

Show the status of FlexClone split operations in-progress

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume clone split show` command displays the progress information of all the active FlexClone volume splitting jobs. This command is only supported for flexible volumes. By default, this command displays the following information:

- Vserver name
- FlexClone volume name
- Percentage of blocks processed
- Total number of blocks scanned for clone splitting
- Total number of blocks updated for clone splitting

If the `-instance` option is also specified, detailed information about all splitting jobs is displayed.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields to be displayed, for all the ongoing FlexClone splitting jobs.

**| [-instance ] }**

This specifies the command to display detailed information about the ongoing FlexClone volume splitting jobs.

**[-vserver <vserver name>] - Vserver Name**

Selects information about the ongoing FlexClone volume splitting jobs for all FlexClone volumes on this Vserver.

**[-flexclone <volume name>] - FlexClone Volume**

Selects information about ongoing FlexClone volume splitting jobs for this FlexClone volume.

### **[-block-percentage-complete <integer>] - Percentage Complete**

Selects information about all the ongoing FlexClone splitting jobs that have the specified percentage of Block processing completed.

### **[-blocks-scanned <integer>] - Blocks Scanned**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks scanned.

### **[-blocks-updated <integer>] - Blocks Updated**

Selects information about all the ongoing FlexClone splitting jobs that have the specified number of blocks updated.

## **Examples**

The following example displays information about all the ongoing FlexClone splitting jobs in the cluster.

```
cluster1::> volume clone split show
(volume clone split show)

                                Blocks
                                -----
Vserver    FlexClone           Scanned  Updated    % Complete
-----
vs1         fc_vol_1           229      2          0
```

The following example displays information about FlexClone volume `fc_vol_2` residing on Vserver `vs0`.

```
cluster1::> volume clone split show -vserver vs0 -flexclone fc_vol_2
-instance
(volume clone split show)

Vserver Name: vs0
FlexClone Volume: fc_vol_2
Percentage Complete: 0
Blocks Scanned: 229
Blocks Updated: 2
```

## **volume clone split start**

Split a FlexClone from the parent volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume clone split start` command starts a job to separate the FlexClone volume from the

underlying parent volume. Both, the parent and the FlexClone volumes will be available for the duration of the split operation. After the job starts, you can stop it using the [volume clone split stop](#) command. You can also stop the job using the [job stop](#) command. You can monitor the current progress of the job using the [volume clone split show](#) and [job show](#) commands. This command is only supported for flexible volumes. This command is not supported on volumes that are being protected as part of a Vserver level SnapMirror.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver that the FlexClone volume exists on.

### **-flexclone <volume name> - FlexClone Volume**

This specifies the FlexClone volume that will be split from its parent volume.

### **[-foreground <true>] - Foreground Process**

This specifies whether the clone splitting job will run as a foreground job. The default value of this option is `true`.

## Examples

The following example starts splitting FlexClone volume `fc_vol_1` on Vserver `vs1` as a foreground job.

```
cluster1::> volume clone split start -vserver vs1 -flexclone fc_vol_1
-foreground true
```

- [volume clone split show](#)
- [job show](#)

## volume clone split stop

Stop an ongoing FlexClone split job

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume clone split stop` command stops the process of separating the FlexClone volume from its underlying parent volume, but does not lose any of the progress achieved while the split process was active. That is, all the clone volume blocks already separated from the parent volume remain separated. If you restart the split operation, splitting process begins from the beginning because no information about previously achieved progress is saved, but previously split blocks are not re-split. This command is only supported for flexible volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver that the FlexClone volume exists on.

### **-flexclone <volume name> - FlexClone Volume**

This specifies the FlexClone volume whose separation from the parent volume will be stopped.

## Examples

The following example stops an ongoing clone splitting job for FlexClone volume `fc_vol_1` on Vserver `vs1`.

```
cluster1::> volume clone split stop -vserver vs1 -flexclone fc_vol_1
```

# volume efficiency commands

## volume efficiency check

Scrub efficiency metadata of a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

This command verifies and updates the fingerprint database for the specified volume. This command is not supported on FlexGroups or Infinite Volumes that are managed by storage services.

## Parameters

### **-vserver <vserver name> - Vserver Name (privilege: advanced)**

Specifies the Vserver on which the volume is located.

### **{ -volume <volume name> - Volume Name (privilege: advanced)**

Specifies the volume on which the verify operation needs to be started.

### **| -path </vol/volume> - Volume Path (privilege: advanced) }**

Specifies the volume path on which the verify operation needs to be started.

### **[-d, -delete-checkpoint {true|false}] - Delete Checkpoint (privilege: advanced)**

Deletes existing checkpoint.

## Examples

The following example runs `volume efficiency check` with delete checkpoint option turned on.

```
cluster1::> volume efficiency check -vserver vs1 -volume voll -delete  
-checkpoint true
```

## volume efficiency modify

Modify the efficiency configuration of a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command is used to set or modify the schedule, policy and various other efficiency configuration options on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

This specifies the volume on which efficiency options need to be modified.

**| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency options need to be modified.

**{ [-schedule <text>] - Schedule**

This option is used to set and modify the schedule.

schedule is [day\_list][@hour\_list] or [hour\_list][@day\_list] or - or auto or manual

The day\_list specifies the days of the week that an efficiency operation should run. It is a list of the first three letters of the day (sun, mon, tue, wed, thu, fri, sat), separated by a comma. Day ranges such as mon-fri can also be used. The default day\_list is sun-sat. The names are not case sensitive.

The hour\_list specifies the hours of each scheduled day that an efficiency operation should run. The hour\_list is from 0 to 23, separated by a comma. Hour ranges such as 8-17 are allowed. Step values can be used in conjunction with ranges (For example, 0-23/2 means every two hours in a day). The default hour\_list is 0, i.e. at midnight of each scheduled day.

When efficiency is enabled on a volume for the first time, an initial schedule is assigned to the volume. This initial schedule is sun-sat@0, which means run once every day at midnight.

If "-" is specified, no schedule is set on the volume. The auto schedule string triggers an efficiency operation depending on the amount of new data written to the volume. The manual schedule string prevents SIS from automatically triggering any operations and disables change-logging. This schedule string can only be used on SnapVault destination volumes. The use of this schedule is mainly desirable when inline compression is enabled on a SnapVault destination volume and background processing is not necessary.

Note that schedule and policy are mutually exclusive options.

**| [-policy <text>] - Efficiency Policy Name }**

This option is used to set an efficiency policy. The policy cannot be changed to the predefined *inline-only* policy when there is an active background operation on the volume.

Note that schedule and policy are mutually exclusive options.

**[`-compression-type {none|secondary|adaptive}`] - Compression Type (privilege: advanced)**

This option is used to specify the size of compression group on the volume. The default value is determined based on the platform.

**[`-compression {true|false}`] - Compression**

This option is used to enable and disable compression. The default value is false.

**[`-inline-compression {true|false}`] - Inline Compression**

This option is used to enable and disable inline compression. Inline compression can be enabled only if compression is enabled. The default value is false.

You can use the *inline-only* predefined efficiency policy to run inline compression without the need of any background efficiency operations.

**[`-inline-dedupe {true|false}`] - Inline Dedupe**

This option is used to enable and disable inline deduplication. The default value is false.

You can use the *inline-only* predefined efficiency policy to run inline deduplication without the need of any background efficiency operations.

**[`-data-compaction {true|false}`] - Data Compaction**

This option is used to enable and disable data compaction. The default value is false.

**[`-cross-volume-inline-dedupe {true|false}`] - Cross Volume Inline Deduplication**

This option is used to enable and disable cross volume inline deduplication. The default value is false.

**[`-cross-volume-background-dedupe {true|false}`] - Cross Volume Background Deduplication**

This option is used to enable and disable cross volume background deduplication. The default value is false.

## Examples

The following examples modify efficiency options on a volume.

```
cluster1:> volume efficiency modify -vserver vs1 -volume vol1 -schedule
sun-sat@12
```

```
cluster1:> volume efficiency modify -vserver vs1 -volume vol1 -policy
policy1
```

```
cluster1:> volume efficiency modify -vserver vs1 -volume vol1
-compression true -inline-compression true -inline-dedupe true -data
-compaction true -cross-volume-inline-dedupe true -cross-volume-background
-dedupe true
```

## volume efficiency off

Disables efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency off` command disables efficiency on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

Specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

Specifies the name of the volume on which efficiency needs to be disabled.

**| -path </vol/volume> - Volume Path }**

Specifies the volume path on which efficiency needs to be disabled.

### Examples

The following examples disable efficiency on a volume:

```
cluster1::> volume efficiency off -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency off -vserver vs1 -path /vol/vol1
```

## volume efficiency on

Enable efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency on` command enables efficiency on a volume. The specified volume must be online. Efficiency operations will be started periodically according to a per volume schedule or policy. The [volume efficiency modify](#) command can be used to modify schedule and the [volume efficiency policy modify](#) command can be used to modify policy. You can also manually start an efficiency operation with the [volume efficiency start](#) command.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume on which efficiency needs to be enabled.

**| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency needs to be enabled.

## Examples

The following examples enable efficiency on a volume.

```
cluster1::> volume efficiency on -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1
```

```
cluster1::> volume efficiency on -vserver vs1 -volume vol1 -needs-upgrade  
true
```

```
cluster1::> volume efficiency on -vserver vs1 -path /vol/vol1 -needs  
-upgrade true
```

## volume efficiency prepare-to-downgrade

Identify any incompatible volumes or Snapshot copies before downgrade

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume efficiency prepare-to-downgrade` command updates efficiency configurations and metadata to be compatible with releases prior to ONTAP 9. This command also disables the use of incompatible efficiency features. This command is not supported on FlexGroups.

## Parameters

**[ -disable-feature-set <downgrade version> ] - Data ONTAP Version (privilege: advanced)**

This parameter specifies the Data ONTAP version that introduced new volume efficiency feature set.

## Examples

The following example disables the the features introduced in Data ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set
8.3.1
```

The following example disables the the features introduced in Data ONTAP 8.3.2.

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set
8.3.2
```

The following example ignores offline volumes while disabling the the features introduced in Data ONTAP 8.3.2

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set
8.3.2 -skip-offline-volumes true
```

The following example ignores offline volumes while disabling the the features introduced in Data ONTAP 8.3.1

```
cluster1::*> volume efficiency prepare-to-downgrade -disable-feature-set
8.3.1 -skip-offline-volumes true
```

## volume efficiency promote

Add a volume to the preferred set of volumes for efficiency processing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

Use the `volume efficiency promote` command to promote a volume from deprioritized state back to auto state.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced) }**

This specifies the name of the volume on which auto scheduling needs to be restarted.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path on which auto scheduling needs to be restarted.

## Examples

The following examples promote a volume from deprioritized state back to auto state.

```
cluster1::> volume efficiency promote -vserver vs1 -volume vol1
```

## volume efficiency revert-to

Reverts volume efficiency metadata

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume efficiency revert-to` command reverts the format of volume efficiency metadata for the volume to the given version of Data ONTAP. This command is not supported on FlexGroups.

### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the volume for which volume efficiency metadata needs to be reverted.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path for which volume efficiency metadata needs to be reverted.

**[-version <revert version>] - Revert to Version (privilege: advanced)**

Specifies the version of Data ONTAP to which the volume efficiency metadata needs to be formatted.

**[-d, -delete {true|false}] - Delete Existing Metafile on Revert (privilege: advanced)**

If set to `true`, this parameter specifies that the volume efficiency metadata be deleted instead of reverting its format. By default this parameter is set to `false`.

**[-c, -clean-up {true|false}] - Delete Previously Downgraded Metafiles (privilege: advanced)**

If set to `true`, this parameter specifies that the volume efficiency metadata already reverted using `volume efficiency revert-to` be deleted. By default this parameter is set to `false`.

**[-revert-adaptive-compression {true|false}] - Downgrade to minor version (privilege: advanced)**

If set to `true`, this parameter Specifies that the volume efficiency metadata needs to be reverted to minor version of Data ONTAP. By default this parameter is set to `false`.

**[-check-snapshot {true|false}] - Revert ignore snapshots (privilege: advanced)**

If set to `false`, this parameter specifies that the volume efficiency revert will not check for Snapshot copies created by previous releases of Data ONTAP. By default this parameter is set to `true`.

## Examples

The following examples revert volume efficiency metadata on a volume named vol1 located in vserver vs1 to version 8.3.

```
cluster1::> volume efficiency revert-to -vserver vs1 -volume vol1 -version 8.3
```

```
cluster1::> volume efficiency revert-to -vserver vs1 -path /vol/vol1 -version 8.3
```

## volume efficiency show

Display a list of volumes with efficiency

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency show` command displays the information about storage efficiency of volumes. The command output depends on the parameter or parameters specified. If no parameters are specified, the command displays the following information for all volumes with efficiency:

- **Vserver:** Vserver the volume belongs to.
- **Volume:** Name of the volume.
- **State:** Current state of efficiency on the volume (Enabled, Disabled, or Mixed).
- **Status:** Status of the efficiency on the volume. Following are the possible values:
  - *Active*: An efficiency operation is currently running.
  - *Idle*: There are no efficiency operations running.
  - *Initializing*: An efficiency operation is being initialized.
  - *Undoing*: Efficiency is being undone on the volume.
  - *Pending*: An efficiency operation is queued.
  - *Downgrading*: An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is active.
  - *Disabled*: Efficiency is disabled on the volume.
- **Progress:** The progress of the current efficiency operation with information as to which stage of the efficiency process is currently in progress and how much data is processed for that stage. For example: "25 MB Scanned", "20 MB Searched", "500 KB (2%) Compressed", "40 MB (20%) Done", "30 MB Verified".

To display detailed information, run the command with the `-l`` or `-instance` parameter. The detailed view provides all information in the previous list and the following additional information:

- **Path:** Volume Path.

- Compression: Current state of compression on the volume (Enabled or Disabled).
- Inline Compression: Current state of inline compression on the volume (Enabled or Disabled).
- Type: Type of volume (Regular or SnapVault).
- Schedule: The schedule of efficiency operation for the volume.
- Policy: Efficiency policy for the volume.
- Minimum Blocks Shared: The minimum number of adjacent blocks in a file that can be shared.
- Blocks Skipped Sharing: Blocks skipped sharing because of the minimum block share value.
- Last Operation State: Status of the last operation (Success or Failure).
- Last Successful Operation Begin: The time and date at which the last successful operation began.
- Last Successful Operation End: The time and date at which the last successful operation ended.
- Last Operation Begin: The time and date at which the last operation began.
- Last Operation End: The time and date at which the last operation ended.
- Last Operation Size: The size of the last operation.
- Last Operation Error: The error encountered by the last operation.
- Change Log Usage: The percentage of the change log that is used.
- Logical Data: The total logical data in the volume, and how much is reached compared to the deduplication logical data limit.
- Queued Job: The job that is queued. Following are the possible values:
  - – : There are no queued jobs.
  - *scan* : A job to process existing data is queued.
  - *start* : A job to process newly added data is queued.
  - *check* : A job to eliminate stale data from the fingerprint database is queued.
  - *downgrading* : An efficiency operation necessary to downgrade the efficiency metafiles to a previous Data ONTAP release is queued.
- Stale Fingerprints: The percentage of stale entries in the fingerprint database. If this is greater than 20 percent a subsequent [volume efficiency start](#) operation triggers the verify operation, which might take a long time to complete.
- Inline Dedupe: Current state of inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Inline Deduplication: Current state of cross volume inline deduplication on the volume (Enabled or Disabled).
- Cross Volume Background Deduplication: Current state of cross volume background deduplication on the volume (Enabled or Disabled).
- Extended Compressed Data: Is there extended compressed data present on the volume.
- Inline Adaptive Data Compaction: Whether Inline Adaptive Data Compaction is enabled or disabled on the volume. When enabled, Data ONTAP combines data fragments to reduce on-disk block consumption.

You can specify additional parameters to display information that matches only those parameters. For example, to display information only about volumes with efficiency in Vserver vs1, run the command with the `-vserver vs1` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The fields Vserver and volume name are the default fields.

**| [-l ]**

This option displays detailed information about the volumes with efficiency.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Displays information only for those volumes that match the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Displays information only for those volumes that match the specified volume.

**| [-path </vol/volume>] - Volume Path }**

Displays information only for those volumes that match the specified volume path.

**[-state {Disabled|Enabled|Mixed}] - State**

Displays information only for those volumes that match the specified state.

**[-op-status <Efficiency status>] - Status**

Displays information only for those volumes that match the specified operation status.

**[-progress <text>] - Progress**

Displays information only for those volumes that match the specified progress.

**[-type {Regular|SnapVault}] - Type**

Displays information only for those volumes that match the specified type of volume.

**[-schedule <text>] - Schedule**

Displays information only for those volumes that match the specified schedule.

**[-policy <text>] - Efficiency Policy Name**

Displays information only for those volumes that match the specified policy.

**[-compression-type {none|secondary|adaptive}] - Compression Type (privilege: advanced)**

Displays information about the type of compression on the volume[adaptive or secondary].

**[-blks-skipped-sharing <integer>] - Blocks Skipped Sharing**

Displays information only for those volumes that match the specified blocks skipped sharing.

**[-last-op-state <text>] - Last Operation State**

Displays information only for those volumes that match the specified last operation state.

**`[-last-success-op-begin <Date>]` - Last Success Operation Begin**

Displays information only for those volumes that match the specified last successful operation begin time.

**`[-last-success-op-end <Date>]` - Last Success Operation End**

Displays information only for those volumes that match the specified last successful operation end time.

**`[-last-op-begin <Date>]` - Last Operation Begin**

Displays information only for those volumes that match the specified last operation begin time.

**`[-last-op-end <Date>]` - Last Operation End**

Displays information only for those volumes that match the specified last operation end time.

**`[-last-op-size {<integer>[KB|MB|GB|TB|PB]}]` - Last Operation Size**

Displays information only for those volumes that match the specified last operation size.

**`[-last-op-error <text>]` - Last Operation Error**

Displays information only for those volumes that match the specified last operation error.

**`[-changelog-usage <percent_no_limit>]` - Changelog Usage**

Displays information only for those volumes that match the specified change log usage.

**`[-logical-data-size {<integer>[KB|MB|GB|TB|PB]}]` - Logical Data Size**

Displays information only for those volumes that match the specified logical data size.

**`[-logical-data-limit {<integer>[KB|MB|GB|TB|PB]}]` - Logical Data Limit**

Displays information only for those volumes that match the specified logical data limit.

**`[-logical-data-percent <percent_no_limit>]` - Logical Data Percent**

Displays information only for those volumes that match the specified logical data percentage.

**`[-queued-job <text>]` - Queued Job**

Displays information only for those volumes that match the specified number of queued jobs.

**`[-stale-fingerprint-percentage <integer>]` - Stale Fingerprint Percentage**

Displays information only for those volumes that match the specified stale fingerprint percentage.

**`[-compression {true|false}]` - Compression**

Displays information only for those volumes that match the specified compression setting.

**`[-inline-compression {true|false}]` - Inline Compression**

Displays information only for those volumes that match the specified inline compression setting.

**`[-is-constituent {true|false}]` - Constituent Volume**

Displays information only for those volumes that either are or are not constituents of a FlexGroup, depending on the value provided.

**`[-inline-dedupe {true|false}]` - Inline Dedupe**

Displays information only for those volumes that match the specified inline deduplication setting.

### **[`-data-compaction {true|false}`] - Data Compaction**

Displays information only for those volumes that match the specified data compaction setting.

### **[`-cross-volume-inline-dedupe {true|false}`] - Cross Volume Inline Deduplication**

Displays information only for those volumes that match the specified cross volume inline deduplication setting.

### **[`-cross-volume-background-dedupe {true|false}`] - Cross Volume Background Deduplication**

Displays information only for those volumes that match the specified cross volume background deduplication setting.

### **[`-extended-compressed-data {true|false}`] - Extended Compressed Data**

Displays information only for those volumes that match the specified extended compressed data value. Extended compressed data is enabled on a volume when both adaptive compression configured with application IO size 8K and data compaction are enabled. Once enabled, extended compressed data can only be disabled by using the `volume efficiency revert-to` command.

## **Examples**

The following example displays information about all volumes with efficiency on the Vserver named vs1:

```
cluster1::> volume efficiency show -vserver vs1
```

Vserver	Volume	State	Status	Progress
vs1	vol1	Enabled	Idle	Idle for 22:37:53
vs1	vol2	Enabled	Idle	Idle for 22:37:53
vs1	vol3	Enabled	Idle	Idle for 22:37:49
vs1	vol4	Enabled	Idle	Idle for 22:37:53
vs1	vol5	Enabled	Idle	Idle for 22:37:53
vs1	volham	Enabled	Idle	Idle for 22:37:53
vs1	volham1	Enabled	Idle	Idle for 22:37:53

7 entries were displayed.

The following example displays detailed information about a volume named vol1 on a Vserver named vs1:

```

cluster1::> volume efficiency show -vserver vs1 -volume vol1
      Vserver Name: vs1
      Volume Name: vol1
      Volume Path: /vol/vol1
      State: Enabled
      Status: Idle
      Progress: Idle for 00:00:14
      Type: Regular
      Schedule: sun-sat@0
      Efficiency Policy Name: -
      Blocks Skipped Sharing: 0
      Last Operation State: Success
      Last Success Operation Begin: Mon Nov 15 20:13:26 UTC 2010
      Last Success Operation End: Mon Nov 15 20:13:26 UTC 2010
      Last Operation Begin: Mon Nov 15 20:13:26 UTC 2010
      Last Operation End: Mon Nov 15 20:13:26 UTC 2010
      Last Operation Size: 0.00B
      Last Operation Error: -
      Change Log Usage: 0%
      Logical Data Size: 156KB
      Logical Data Limit: 50.00TB
      Logical Data Percent: 0%
      Queued Job: -
      Stale Fingerprint Percentage: 0
      Compression: false
      Inline Compression: false
      Constituent Volume: false
      Inline Dedupe: false
      Data Compaction: false
      Cross Volume Inline Deduplication: false
      Cross Volume Background Deduplication: false

```

## Related Links

- [volume efficiency start](#)

## volume efficiency start

Starts efficiency operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Use the `volume efficiency start` command to start an efficiency operation. The volume must be online and have efficiency enabled. If there is an efficiency operation already active on the volume, this command fails.

When the `volume efficiency start` command is issued, a checkpoint is created at the end of each stage or sub-stage, or on an hourly basis in the gathering phase. If at any point the `volume efficiency start` operation is stopped, the system can restart the efficiency operation from the execution state saved in the checkpoint. The `delete-checkpoint` parameter can be used to delete the existing checkpoint and restart a fresh efficiency operation. The checkpoint corresponding to gathering has a validity period of 24 hours. If the user knows that significant changes have not been made on the volume, then such a gathering checkpoint whose validity has expired can be used with the help of the `use-checkpoint` parameter. There is no time restriction for checkpoints of other stages.

When the volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for the purpose of running background efficiency operations. The background deduplication operations will be disabled. The user can still execute compression specific efficiency operation with `-scan-old-data` and `-compression` parameters to compress the existing data on the volume.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver on which the volume is located.

### **{ -volume <volume name> - Volume Name**

Specifies the name of the volume.

### **| -path </vol/volume> - Volume Path }**

Specifies the complete path of the volume.

### **[-s, -scan-old-data <true>] - Scan Old Data**

This option scans the file system and processes all existing data. It prompts for user confirmation before proceeding. Use the force option to suppress this confirmation.

### **{ [-p, -use-checkpoint <true>] - Use Checkpoint (if scanning old data)**

Use the checkpoint when scanning existing data. Valid only if `scan-old-data` parameter is true.

### **| [-d, -delete-checkpoint <true>] - Delete Checkpoint }**

Deletes the existing checkpoint and restarts a new `volume efficiency start` operation.

### **[-qos-policy <sis\_qos>] - QoS Policy**

Specifies the qos-policy, which indicates how the efficiency operations are throttled. This option can be configured to be `background` or `best-effort`. Default value is `best-effort`. If `background` is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If `best-effort` is specified, the efficiency operations might have some impact on the data serving client operations.

### **[-C, -compression <true>] - Start Compression (if scanning old data) (privilege: advanced)**

Compresses existing data. Deduplication is not run unless the dedupe option is also specified. Valid only if `scan-old-data` parameter is true.

### **[-D, -dedupe <true>] - Start Deduplication (if scanning old data) (privilege: advanced)**

Deduplicates existing data on disk. Similarly, compression is not run unless the compression option is also specified. Valid only if `scan-old-data` parameter is true.

**[-P, -compaction <true>] - Start Compaction (if scanning old data) (privilege: advanced)**

Compacts existing data on disk. Valid only if `scan-old-data` parameter is true.

**[-m, -build-metadata <true>] - Build metadata without sharing(if scanning old data)**

Builds deduplication metadata by scanning the entire file system. You will not achieve any space savings with this option. Once the metadata is built, existing data can be shared with newly written data on subsequent deduplication runs.

**[-o, -scan-all <true>] - Scan all the data without shared block optimization(if scanning old data)**

Scans the entire file system and processes the shared blocks also. You may be able to achieve additional space savings using this option. Where as, by default the option `-scan-old-data` saves some time by skipping the shared blocks.

**[-a, -shared-blocks <true>] - Compress Shared Blocks (if scanning old data) (privilege: advanced)**

Compresses the Compression Groups that have shared blocks created by deduplication or cloning data. Valid only if `scan-old-data` parameter is true.

**[-b, -snapshot-blocks <true>] - Compress Blocks In Snapshots (if scanning old data) (privilege: advanced)**

Compresses data blocks locked in a Snapshot copy. Valid only if `scan-old-data` parameter is true.

**[-q, -queue <true>] - Operation Should Be Queued**

Queues an efficiency operation. It will be queued only if an operation is already in progress. Valid only if `scan-old-data` is false.

**[-f, -force <true>] - Force Operation**

Suppresses all confirmation messages.

**[-z, -skip-zero-replacement <true>] - Skip Zero block detection and replacement (privilege: advanced)**

Skip the zero block detection and replacement during the gatherer scan. Valid only if `scan-old-data` parameter is true.

## Examples

The following examples start efficiency on a volume:

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -scan-old-data -volume vol1 -vserver vs1
```

```
cluster1::> volume efficiency start -volume vol1 -vserver vs1 -queue -delete-checkpoint
```

## volume efficiency stat

Show volume efficiency statistics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume efficiency stat` command displays efficiency statistics. The output depends on the parameters specified with the command. If no parameters are specified, the command displays the following efficiency statistics fields for all the volumes:

- Vserver: The Vserver that the volume belongs to.
- Volume Name: Name of the volume.
- Inline Compression Attempts: Number of inline compression attempts done.
- Inline Incompressible CGs: Number of compression groups that cannot be compressed by inline compression.

To display detailed information, run the command with `-instance` parameter.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed. The Vserver and volume name are the default fields.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Displays statistics only for those volume(s) that match the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Displays statistics only for those volume(s) that match the specified volume name.

**| [-path </vol/volume>] - Volume Path }**

Displays statistics only for those volume(s) that match the specified volume path.

**[-b <true>] - Display In Blocks**

Displays usage size in 4k block counts.

**[-num-compressed-inline <integer>] - Inline Compression Attempts**

Displays statistics only for those volume(s) that match the specified number of Compression Groups attempted inline.

### Examples

The following example displays default efficiency statistics for all the volumes.

```
cluster1::> volume efficiency stat
Vserver:                vs1
Volume:                 vol2
Inline Compression Attempts: 0
Inline Incompressible CGs: 0

Vserver:                vs1
Volume:                 vol3
Inline Compression Attempts: 0
Inline Incompressible CGs: 0
```

## volume efficiency stop

Stop efficiency operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

Use the `volume efficiency stop` command to stop an efficiency operation.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume on which efficiency operation needs to be stopped.

**| -path </vol/volume> - Volume Path }**

This specifies the volume path on which efficiency operation needs to be stopped.

**[-a, -all <true>] - Stop All Operations**

This specifies both active and queued efficiency operations to be aborted.

### Examples

The following examples stop efficiency on a volume.

```
cluster1::> volume efficiency stop -vserver vs1 -volume vol1
```

```
cluster1::> volume efficiency stop -vserver vs1 -volume vol1 -all
```

## volume efficiency undo

### Undo efficiency on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The command `volume efficiency undo` removes volume efficiency on a volume by undoing compression, undoing compaction and removing all the block sharing relationships, and cleaning up any volume efficiency specific data structures. Any efficiency operations on the volume must be disabled before issuing this command. The volume efficiency configuration is deleted when the undo process completes. The command is used to revert a volume to an earlier version of Data ONTAP where some of the efficiency features are not supported. During this revert not all efficiencies needs to be undone but only those gained by that particular feature (for example, compaction), which is not supported in the earlier version.

#### Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**{ -volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume name.

**| -path </vol/volume> - Volume Path (privilege: advanced) }**

This specifies the volume path.

**[-C, -compression <true>] - Decompress Data in the Volume (privilege: advanced)**

Undo the effects of compression. This requires efficiency to be disabled (by performing [volume efficiency off](#) ).

**[-D, -dedupe <true>] - Undo Block Sharing in the Volume (privilege: advanced)**

Undo the effects of deduplication. This requires efficiency to be disabled (by performing [volume efficiency off](#) ).

**[-i, -inode <integer>] - Inode Number to Undo Sharing (privilege: advanced)**

Remove the block sharings from a specified inode.

**[-t, -undo-type {all|wrong}] - Selective Undo (privilege: advanced)**

This specifies to remove either all or only invalid block sharing. When *all* is used, all block sharings are removed. When *wrong* is used, only invalid sharings present in the volume are removed. When used along with *log* option, it logs information about all or wrong block sharings without sharing removal.

**[-d, -log <true>] - Only Log Incorrect Savings (privilege: advanced)**

If specified, information about invalid block sharing relationships will only be logged. Invalid sharings will not be removed. This parameter is only valid when the parameter `-undo-type` is specified as *wrong* .

**[-P, -data-compaction <true>] - Undo Data Compaction in the Volume (privilege: advanced)**

Undo the effects of data compaction.

**[-A, -cross-volume-dedupe <true>] - Undo Cross Volume Deduplication (privilege: advanced)**

Undo the effects of cross volume deduplication.

**[-X, -extended-compression <true>] - Extended compression (privilege: advanced)**

Undo the effects of extended compression. This removes the compression savings for data that requires more resources to compress.

## Examples

The following are examples of how to use efficiency undo.

To undo deduplication and compression savings, but not compaction savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1
```

To rewrite compressed blocks and undo compression savings in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -compression
```

To rewrite compressed and deduped blocks without any efficiency in a volume name vol1 on a Vserver named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -dedup  
-compression
```

To rewrite compacted blocks in a volume name vol1 on an SVM named vs1:

```
cluster1::> volume efficiency undo -vserver vs1 -volume vol1 -data  
-compaction
```

## volume efficiency policy create

Create an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume efficiency policy create` creates an efficiency policy.

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the Vserver on which the volume is located.

### **-policy <text> - Efficiency Policy Name**

This specifies the policy name.

### **[-type <Efficiency policy type>] - Policy Type**

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

### **[-schedule <text>] - Job Schedule Name**

This specifies the job schedule. Use `job schedule` commands to manage job schedules. Only cron job schedules are supported.

### **[-duration <text>] - Duration**

This specifies the duration that an efficiency operation can run (in hours). The possible values are "-" or a number between 1 and 999 inclusive. Default value is "-", which means no duration.

### **[-start-threshold-percent <percent>] - Threshold Percentage**

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as *threshold*.

### **[-qos-policy <Efficiency QoS policy>] - QoS Policy**

This specifies how the efficiency operations are throttled. This option can be configured to be *background* or *best-effort*. Default value is *best-effort*. If *background* is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If *best-effort* is specified, the efficiency operations might have some impact on the data serving client operations.

### **[-enabled {true|false}] - Enabled**

This specifies whether the policy is enabled or not. The policy is enabled by default.

### **[-comment <text>] - Comment**

User specified comment.

## Examples

The following example creates an efficiency policy.

```
cluster1::> volume efficiency policy create -vserver vs1 -policy policy1
-schedule daily -duration 100
```

## volume efficiency policy delete

### Delete an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume efficiency policy delete` command deletes an efficiency policy. An efficiency policy can be deleted only when it is not associated with any volume. The pre-defined policies *default* and *inline-only* cannot be deleted.

#### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver on which the volume is located.

**-policy <text> - Efficiency Policy Name**

This specifies the policy name.

#### Examples

The following example deletes an efficiency policy:

```
cluster1::> volume efficiency policy delete -vserver vs1 -policy policy1
```

## volume efficiency policy modify

### Modify an efficiency policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume efficiency policy modify` command can be used to modify the policy attributes.

The attributes of the *inline-only* predefined policy cannot be modified.

#### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver on which the volume is located.

**-policy <text> - Efficiency Policy Name**

This specifies the policy name.

**[-type <Efficiency policy type>] - Policy Type**

This specifies the policy type. The policy type defines when the volume using this policy will start processing a changelog. There are two possible values:

- *threshold* means changelog processing occurs when the changelog reaches a certain percentage.
- *scheduled* means changelog processing will be triggered by time.

The default value is *scheduled*.

#### **[-schedule <text>] - Job Schedule Name**

This specifies the job schedule. Use [job schedule show](#) to show all the jobs.

#### **[-duration <text>] - Duration**

This specifies the duration that an efficiency operation can run in hours. The possible value is between 1 and 999 inclusive.

#### **[-start-threshold-percent <percent>] - Threshold Percentage**

The percentage at which the changelog will be processed. The percentage is checked on an hourly basis. The default value is 20. Valid only if `-type` parameter is set as *threshold*.

#### **[-qos-policy <Efficiency QoS policy>] - QoS Policy**

This specifies how the efficiency operations are throttled. This option can be configured to be *background* or *best-effort*. Default value is *best-effort*. If *background* is specified, the efficiency operations are run with minimum or no impact on the data serving client operations. If *best-effort* is specified, the efficiency operations might have some impact on the data serving client operations.

#### **[-enabled {true|false}] - Enabled**

This specifies whether the policy is enabled or not. Default value is true.

#### **[-comment <text>] - Comment**

User specified comment.

### **Examples**

The following example modifies efficiency policy.

```
cluster1::> volume efficiency policy modify -policy policy1 -schedule hourly
```

### **Related Links**

- [job schedule show](#)

## **volume efficiency policy show**

Show efficiency policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume efficiency policy show` command displays information about efficiency policies. By default, the command displays the following information about all policies:

- Vserver: Name of the Vserver that the policy belongs to.
- Policy Name: Efficiency policy name.
- Job Schedule: Job schedule name.
- Duration (Hours): The duration in hours that the efficiency operation can run.
- Enable: Whether the policy is enabled or not.
- Comment: User specified comment.

You can specify additional parameters to select the displayed information. For example, to display efficiency policies only with duration 5 hours, run the command with the `-duration 5` parameter.

The pre-defined policies *default* and *inline-only* are available when all the nodes in the cluster are running Data ONTAP version 8.3 or later.

The *inline-only* pre-defined policy must be used when the user wants to use the inline compression feature without any regularly scheduled or manually started background storage efficiency operations. When a volume is configured to use the *inline-only* efficiency policy, the system will stop monitoring changes to the data for running the background efficiency operations on the volume. Volumes cannot be configured with the *inline-only* policy if there is a currently active background efficiency operation.

## Parameters

**{ [-fields <fieldname>,...]**

Selects the fields to be displayed. Vserver and policy are the default fields (see example).

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-vserver <vserver name>] - Vserver**

Selects information about the policies that match the specified Vserver.

**[-policy <text>] - Efficiency Policy Name**

Selects information about the policies that match the specified policy name.

**[-type <Efficiency policy type>] - Policy Type**

Selects information about the policies that match the specified policy type. There are two possible values - *threshold* and *scheduled*.

**[-schedule <text>] - Job Schedule Name**

Selects information about the policies that match the specified schedule.

**[-duration <text>] - Duration**

Selects information about the policies that match the specified duration hours.

**[-start-threshold-percent <percent>] - Threshold Percentage**

Selects information about the policies that match the specified start-threshold-percent. Valid only if `-type` parameter is set as *threshold*.

### **[-qos-policy <Efficiency QoS policy>] - QoS Policy**

Selects information about the policies that match the specified throttling method. The values can be background or best-effort .

### **[-enabled {true|false}] - Enabled**

Selects information about the policies that have the specified enabled setting.

### **[-comment <text>] - Comment**

Selects information about the policies that match the specified comment.

### **[-policy-owner {cluster-admin|vserver-admin}] - Owner of the Policy**

Selects information about the policies that match the specified owner. The values can be cluster-admin or vserver-admin .

## **Examples**

The following example shows all the efficiency policies with the matching Vserver vs1.

```
cluster1::> volume efficiency policy show -vserver vs1
```

Vserver	Policy	Job	Duration	QoS Policy	Enabled	Comment
Name	Schedule	(Hours)				
vs1	default	daily	-	best_effort	true	Default
vs1	inline-only	-	-	-	-	Inline-Only
vs1	policy1	daily	-	best_effort	true	user-

3 entries were displayed.

The following example shows all the policies with the following fields - Vserver (default), policy (default) and duration.

```
cluster1::> volume efficiency policy show -fields duration
```

vserver	policy	duration
vs1	default	-
vs1	inline-only	-
vs1	policy1	-

3 entries were displayed.

## **volume encryption commands**

## volume encryption conversion pause

Pause a running volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume encryption conversion pause` command pauses the running encryption conversion operation on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being encrypted.

**[-ignore-warning {true|false}] - Ignore Warning for Conversion Pause**

If this parameter is set, the command ignores the confirmation message.

### Examples

## volume encryption conversion resume

Resume a paused volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume encryption conversion resume` command resumes the paused encryption conversion operation on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being encrypted.

### Examples

## volume encryption conversion show

Show status of a volume encryption conversion

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption conversion show` command displays information about volume encryption conversion in the cluster. By default, with no parameters, it only shows volume encryption operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- **Vserver Name:** The Vserver on which the volume is located.
- **Volume Name:** The volume that is part of a completed or running volume move operation.
- **Start Time:** The date and time when the volume encryption operation was started.
- **Status of Operation:** The status of the operation.
- **Percentage Completed:** The amount of work to encrypt the volume completed thus far in terms of percentage.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**[-volume <volume name>] - Volume Name**

This parameter specifies the name of the volume being encrypted.

**[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

**[-status <text>] - Status**

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

## Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption conversion show
```

Vserver	Volume	Start Time	Status
vs1	p2	9/18/2017 17:44:36	Phase 2 of 2 is in progress.

## volume encryption conversion start

Start a volume encryption conversion operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume encryption conversion start` command converts a non-encrypted volume to encrypted volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being encrypted.

**[-ignore-warning {true|false}] - Ignore Warning for Conversion Start**

If this parameter is set, the command ignores the confirmation message.

### Examples

## volume encryption rekey pause

Pause a running volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume encryption rekey pause` command pauses the running encryption rekey operation on a volume.

### Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being encrypted.

**[-ignore-warning {true|false}] - Ignore Warning for Rekey Pause**

If this parameter is set, the command ignores the confirmation message.

### Examples

## volume encryption rekey resume

Resume a paused volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption rekey resume` command resumes the paused encryption rekey operation on a volume.

## Parameters

**-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being encrypted.

## Examples

### volume encryption rekey show

Show status of a volume encryption rekey

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume encryption rekey show` command displays information about volume encryption rekey in the cluster. By default, with no parameters, it only shows volume encryption rekey operations that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume that is part of a completed or running volume move operation.
- Start Time: The date and time when the volume encryption operation was started.
- Status of Operation: The status of the operation.
- Percentage Completed: The amount of work to encrypt the volume completed thus far in terms of percentage.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

### **[-volume <volume name>] - Volume Name**

This parameter specifies the name of the volume being encrypted.

### **[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

If this parameter is specified, the command displays encryption operations that match the specified date and time in the cluster time zone when the volume move operation started.

### **[-status <text>] - Status**

If this parameter is specified, the command displays encryption operations that match the specified status of the encryption operation.

## **Examples**

The following example shows a sample output for this command:

```
cluster1::> volume encryption rekey show
```

Vserver	Volume	Start Time	Status
vs1	vol2	9/18/2017 17:51:41	Phase 2 of 2 is in progress.

## **volume encryption rekey start**

Start a volume encryption rekey operation

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume encryption rekey start` command changes the encryption key of a volume.

### **Parameters**

#### **-vserver <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

#### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume being rekeyed.

#### **[-ignore-warning {true|false}] - Ignore Warning for Rekey Start**

If this parameter is set, the command ignores the confirmation message.

## **Examples**

## **volume encryption secure-purge abort**

Abort secure deletion of trash in existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume encryption secure-purge abort` command aborts the secure purge operation on a volume.

## Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume (privilege: advanced)**

This parameter specifies the name of the volume being encrypted.

## Examples

### volume encryption secure-purge show

Show status of secure-purge operation on a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## Description

The `volume encryption secure-purge show` command displays information about volume encryption securepurge operation in the cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

**[-volume <volume name>] - Volume (privilege: advanced)**

This parameter specifies the name of the volume being secure purged.

**[-status {invalid|initializing|snapshots-deleting|snapshots-deleted|zombies-draining|zombies-drained|batched-free-log-draining|batched-free-log-drained|finishing-trash-purge|finished-trash-purge|reencrypting|aborting|aborted|success|failure}] - Status (privilege: advanced)**

This parameter displays the status of the secure purge operation.

## Examples

The following example shows a sample output for this command:

```
cluster1::> volume encryption secure-purge show
Vserver          Volume          Secure Purge Phase
-----
vs1              vol1            reencrypting
```

## volume encryption secure-purge start

Start secure deletion of trash in existing volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume encryption secure-purge start` command performs secure purge of encrypted volume.

### Parameters

**-vserver <vserver name> - Vserver (privilege: advanced)**

This parameter specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume (privilege: advanced)**

This parameter specifies the name of the volume being encrypted.

## Examples

## volume file commands

### volume file compact-data

Apply Adaptive Data Compaction to a Snapshot copy of a file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `volume file compact-data` command applies the Adaptive Data Compaction feature to the Snapshot copy of a file such that partially filled blocks from that file will merge and consume less storage space.

### Parameters

**-node <nodename> - Node**

This parameter indicates the node name that the AWA instance runs on.

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the target file is located.

**-file </vol/<volume name>/<file path>> - File Path**

This specifies the complete file path. The Snapshot copy name can be specified as part of the path or by specifying the `-snapshot` parameter.

**[-volume <volume name>] - Volume Name**

This specifies the volume in which the targeted file is located.

**[-snapshot <snapshot name>] - Snapshot Copy Name**

This specifies the Snapshot copy name in which the file will be compacted.

**Examples**

The following command applies the Adaptive Data Compaction feature to the Snapshot copy *snap1* of the file */file1* in volume *vol1*:

```
cluster1::> volume file compact-data -vserver vs1 -volume vol1 -file
/vol/vol1/file1 -snapshot snap1
```

**volume file modify**

Manage the association of a QoS policy group with a file

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

**Description**

This command adds and removes files from QoS policy groups. QoS policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. A QoS policy group associated with this file can be created, modified, and deleted. You cannot associate a file to a QoS policy group if a LUN was created from the file.

**Parameters****-vserver <vserver name> - Vserver Managing Volume**

This specifies the Vserver on which the volume (containing the file) resides.

**-volume <volume name> - Volume Name**

This specifies the name of the volume. The name must be unique within the hosting Vserver.

**-file <text> - File Path**

This specifies the actual path of the file with respect to the volume.

**{ [-qos-policy-group <text>] - QoS Policy Group Name**

This option associates the file with a QoS policy group. This policy group manages storage system resources to deliver your desired level of service. If you do not assign a policy to a file, the system will not monitor and control the traffic to it. To remove this file from a QoS policy group, enter the reserved keyword

"none".

### **[`-qos-adaptive-policy-group <text>`] - QoS Adaptive Policy Group Name }**

This optional parameter specifies which QoS adaptive policy group to apply to the file. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file's allocated space or used space. To remove this file from an adaptive policy group, enter the reserved keyword "none".

### **[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

## **Examples**

```
cluster1::> vol file modify -vserver vs0 -volume vs0_vol56 -file 1.txt  
-qos-policy-group fast -cache all-read
```

Associates the file `1.txt` with the `fast` QoS policy group and `all-read` caching policy.

## **volume file privileged-delete**

Perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

The ``volume file privileged-delete`` command is used to perform a privileged-delete operation on unexpired WORM files on a SnapLock enterprise volume. The only built-in role that has access to the command is `"vsadmin-snaplock"`.

## Parameters

### **-vserver <vserver name> - Vserver**

Specifies the Vserver which hosts the SnapLock enterprise volume.

### **-file </vol/<volume name>/<file path>> - File Path**

Specifies the absolute path of the file to be deleted. The value begins with /vol/<volumename>.

## Examples

The following example deletes the unexpired WORM file `"/vol/vol1/wormfile"`. The file wormfile is stored in volume vol1 under Vserver `vserver1`.

```
vserver1::> volume file privileged-delete -file /vol/vol1/wormfile
[Job 76] Job succeeded: Privileged-delete of File
"vs1:/vol/sle_vol1/wormfile" Completed.
```

## volume file reservation

Get/Set the space reservation info for the named file.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file reservation` command can be used to query the space reservation settings for the named file, or to modify those settings. With no further modifiers, the command will report the current setting of the space reservation flag for a file. This tells whether or not space is reserved to fill holes in the file and to overwrite existing portions of the file that are also stored in a snapshot. For symlinks, the link is followed and the command operates on the link target.

## Parameters

### **-vserver <vserver name> - Vserver Name**

Specifies the Vserver on which the volume is located. If only one data Vserver exists, you do not need to specify this parameter.

### **-path </vol/<volume name>/<file path>> - File Name**

Specifies the complete file path for which we want to get/set the space reservation settings.

### **[-is-enabled <text>] - enable | disable**

Specifying enable or disable will turn the reservation setting on or off accordingly for the file.

## Examples

The following example enables the file reservation setting for the file named file1. The file file1 is stored in volume testvol on Vserver vs0.

```
node::> file reservation -vserver vs0 /vol/testvol/file1 enable
space reservations for file /vol/testvol/file1: on.
```

## volume file show-disk-usage

### Show disk usage of file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command requires a path to a file in a volume and displays the following information:

- Vserver name
- Total bytes used by the file in kilobytes
- Full Path to the file

If not logged in as Vserver administrator, the command also requires a Vserver name.

The "-instance" option provides the same result as the default as there are no extra fields to display.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-h ]**

If this parameter is specified, the command displays total bytes used by the file in human readable form.

**| [-k ]**

If this parameter is specified, the command displays total bytes used by the file in kilobytes.

**| [-m ]**

If this parameter is specified, the command displays total bytes used by the file in megabytes.

**| [-u ]**

If this parameter is specified, the command displays the unique bytes used by the file (bytes that are not shared with any other file in the volume due to deduplication or FlexClone files) in kilobytes.

**| [-uh ]**

If this parameter is specified, the command displays the unique bytes used by the file in human readable form.

**| [-uk ]**

If this parameter is specified, the command displays the unique bytes used by the file in kilobytes.

| [-um ]

If this parameter is specified, the command displays the unique bytes used by the file in megabytes.

| [-instance ] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> -Vserver**

This parameter is used to specify the Vserver that contains the file for which the command displays the total bytes used. It is required if not logged in as Vserver administrator.

**-path </vol/<volume name>/<file path>> - Full Path**

This required parameter is used to specify the path of the file for which the command displays the total bytes used.

**[-r, -range [start offset>:<end offset]] - Block Range**

If this parameter is specified, the command displays the total bytes used by the file in the specified block range.

## Examples

The following example displays the disk-usage of the file `file1.txt` in volume `/vol/root_vs0`.

```
cluster1::> volume file show-disk-usage -vserver vs0 -path
/vol/root_vs0/file1.txt

Vserver          Total          Path
-----
vs0              1408KB          /vol/root_vs0/file1.txt
cluster1::> volume file show-disk-usage -m -vserver vs0 -path
/vol/root_vs0/file1.txt

Vserver          Total          Path
-----
vs0              1MB          /vol/root_vs0/file1.txt
vs0::> volume file show-disk-usage -um -path /vol/root_vs0/file1.txt

Vserver          Total          Unique          Path
-----
vs0              1MB          1MB          /vol/root_vs0/file1.txt
```

## volume file show-filehandle

Show the file handle of a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command requires a path to a file in a volume and displays the file handle information described below:

- Vserver name
- Path to the file
- File handle flags
- Snapshot ID of the file (snapid)
- File ID
- File handle generation number
- File system ID (fsid)
- Master data set ID (msid)
- Data set ID (dsid)

If not logged in as a Vserver administrator, the command also requires a Vserver name.

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] }

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Managing Volume (privilege: advanced)

This specifies the Vserver where the file resides.

[-path <text>] - Path to File (privilege: advanced)

This specifies the path to the file.

Examples

The following example displays the file handle information of a file named *file1.txt* in the volume */vol/vol1*.

```
cluster1::> volume file show-filehandle -vserver vs0 -path
/vol/vol1/file1.txt
```

	Vserver			Path		
	-----			-----		
	vs0			/vol/vol1/file1.txt		
flags	snapid	fileid	generation	fsid	msid	dsid
	-----	-----	-----	-----	-----	
-----						
	0x0	0	0x60	0x206b6	0x402	0x80000402
0x402						

## volume file show-inode

Display file paths for a given inode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays information about all the files having a given inode in a volume of a Vserver. If the `-snapshot-id` or `-snapshot-name` parameter is specified, the command displays file information from the Snapshot copy; otherwise, it displays the information from the active file system. The `-vserver`, `-volume` and `-inode-number` are mandatory parameters.

If no optional parameter is specified, the command displays the following fields for all the files having the given inode:

- Vserver Name
- Volume Name
- Inode Number
- File Path

The `volume file show-inode` command is only supported on flexible volumes and FlexGroup constituents.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields` parameter, the command output also includes the specified field or fields.

**| [-snapshot ]**

If this parameter is specified, the command displays the following information:

- Vserver Name
- Volume Name
- Inode Number
- Snapshot Name
- Snapshot ID
- File Path

**| [-instance ] }**

If this parameter is specified, the command displays detailed information about the files matching the specified inode number. The following information is displayed:

- Vserver Name
- Volume Name
- Inode Number
- File Path

- Snapshot Name
- Snapshot ID
- File Name
- Parent Inode Number
- Parent Directory Cookie

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the volume or Snapshot copy is located.

**-volume <volume name> - Volume Name**

This specifies the volume in which the inode number is located.

**-inode-number <integer> - Inode Number**

This specifies the inode number whose information has to be retrieved.

**{ [-snapshot-name <snapshot name>] - Snapshot Name**

If this parameter or `-snapshot-id` is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

**| [-snapshot-id <integer>] - Physical Snapshot ID }**

If this parameter or `-snapshot-name` is specified, information about the files is retrieved from the Snapshot copy instead of the active file system.

**[-file-path <text>] - File Path**

If this parameter is specified, the command displays information only about the files that match the specified file path.

**[-file-name <text>] - File Name**

If this parameter is specified, the command displays information only about the files that match the specified file name.

**[-parent-inode-number <integer>] - Parent Inode Number**

The inode number of the parent directory of the file associated with the inode. If this parameter is specified, the command displays information only about the files that match the specified parent inode number.

**[-parent-dir-cookie <integer>] - Parent Directory Cookie**

The index of the directory entry of the file in its parent directory tree. If this parameter is specified, the command displays information only about the files that match the specified parent directory cookie.

## Examples

The following example displays information about all the files having the inode number 96 in the active file system of a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96
```

Vserver	Volume	Inode Number	File Path
vs1	vol1	96	/vol/vol1/file1
vs1	vol1	96	/vol/vol1/file2
vs1	vol1	96	/vol/vol1/A/file2

3 entries were displayed.

The following example displays information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```
cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number 96 -snapshot-name mysnap -snapshot
```

Vserver	Volume	Inode Number	Snapshot Name	Snapshot ID	File Path
vs1	vol1	96	mysnap	131	/vol/vol1/.snapshot/mysnap/file1
vs1	vol1	96	mysnap	131	/vol/vol1/.snapshot/mysnap/file2

2 entries were displayed.

The following example displays detailed information about all the files with inode number 96 in a Snapshot copy named mysnap. The Snapshot copy is present in a volume named vol1 on a Vserver named vs1:

```

cluster1::> volume file show-inode -vserver vs1 -volume vol1 -inode-number
96 -snapshot-name mysnap -instance
Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mysnap/file1
    Snapshot Name: mysnap
    Physical Snapshot ID: 131
    File Name: file1
    Parent Inode Number: 64
    Parent Directory Cookie: 2
Vserver Name: vs1
    Volume Name: vol1
    Inode number: 96
    File Path: /vol/vol1/.snapshot/mysnap/file2
    Snapshot Name: mysnap
    Physical Snapshot ID: 131
    File Name: file2
    Parent Inode Number: 64
    Parent Directory Cookie: 3
    2 entries were displayed.

```

## volume file clone autodelete

### Enable/Disable autodelete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file clone autodelete` command enables or disables the automatic deletion of file, LUN or NVMe namespace clones. Newly created file, LUN and NVMe namespace clones are disabled for automatic deletion by default.

### Parameters

#### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume resides. If only one data Vserver exists, you do not need to specify this parameter.

#### **[-volume <volume name>] - Volume Name**

This specifies the name of the volume in which the file, LUN or NVMe namespace is present.

#### **-clone-path <text> - Clone Path**

This specifies the path where clone resides. If you use the volume parameter, then specify the relative path to the file, LUN or NVMe namespace clone. Otherwise, specify the absolute path.

### **-enable {true|false} - Enable or Disable Autodelete**

This parameter enables or disables the autodelete feature for the file, LUN or NVMe namespace clones in a specified volume if the clones are already added for automatic deletion. If you set the parameter to *true*, the specified file, LUN or NVMe namespace clones get automatically deleted in the 'try' or 'disrupt' mode. If the value is *false*, the clones get automatically deleted only in the 'destroy' mode.

### **[-force <true>] - Force Enable or Disable Autodelete**

If *-enable* is *true* then this parameter forces automatic deletion of a specified file, LUN or NVMe namespace, or a file, LUN or NVMe namespace clone. If *-enable* is *false* then specifying this parameter disables autodeletion on a file, LUN or NVMe namespace - or a file, LUN or NVMe namespace clone - even if *-commitment`destroy`* is specified.

## **Examples**

The following command enables for automatic deletion a LUN Clone named *lun\_clone* contained in a volume named *volume1*. This volume is present on a Vserver named *vs1*.

```
cluster1::> volume file clone autodelete /vol/volume1/lun_clone -enable
true -vserver vs1
```

The following command specifies the relative clone path when the volume parameter is specified in the command.

```
cluster1::> volume file clone autodelete lun_clone -enable true
-vserver vs1 -volume volume1
```

## **volume file clone create**

### **Create file or LUN full or sub file clone**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The *volume file clone create* command creates a clone of a file, a LUN or an NVMe namespace. You can optionally specify the following parameters for the clone file creation process:

- Vserver in which the volume resides
- Name of the parent snapshot
- The range of blocks to be cloned
- The option to avoid space reservations for the new file or LUN clone
- The option to assign a QoS policy group to the new file or LUN clone
- The option to assign a caching policy to the new file or LUN clone
- The option to mark the new file, LUN or NVMe namespace clone created for auto deletion
- The option to overwrite an existing file, LUN or NVMe namespace clone

File, LUN or NVMe namespace clones create a duplicate copy of another file, LUN or NVMe namespace, but don't require copying the data itself. This allows the clone operation to occur in constant time, taking the same amount of time to complete no matter the size of the file being cloned. This also means that clones require only a small amount of additional storage space because the clone shares the data with the source file, LUN or NVMe namespace.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver in which the parent volume resides. If only one data Vserver exists, you do not need to specify this parameter.

### **[-volume <volume name>] - Volume**

This specifies the name of volume in which a file, LUN or NVMe namespace is going to be cloned.

### **-source-path <text> - Source Path**

This specifies the path to the file, LUN or NVMe namespace to be cloned relative to the specified volume.

### **-destination-path <text> - Destination Path**

This specifies the path for the newly-created cloned file, LUN or NVMe namespace relative to the specified volume. If the file, LUN or NVMe namespace clone to be created is a whole file, LUN or NVMe namespace, the destination file, LUN or NVMe namespace must not exist. If the `range` parameter is specified, the destination file or LUN must exist. If the `snapshot-name` parameter is specified, this option is mandatory.

### **[-s, -snapshot-name <snapshot name>] - Source Snapshot**

The name of the Snapshot copy to use as the source for the clone operation. If this value is not specified, the active filesystem will be used instead.

### **{ [-r, -range [source start block]:<destination start block>:<block length> ,...] - Block Range**

This specifies the block range to be cloned. If the range is not specified, the entire file, LUN, or NVMe namespace is cloned. The block range should be specified in the format `s:d:n` where `s` is the source start block number, `d` is the destination start block number, and `n` is the length in blocks to be cloned. The range of `n` should be from 1 to 32768 or 1 to 16777216 in case of clone from Active File System or Snapshot copy respectively. If this parameter is used in the path provided by the `destination-path`, the parameter must refer to a file, LUN, or NVMe namespace which already exists. If either the source or destination is a LUN or NVMe namespace, then the block size is measured in LBA blocks. The source object block size and destination block size must be equal. If neither the source nor destination is a LUN or NVMe namespace, then the block size will be 4KB. If 512-byte sectors are used, the source and destination offsets must have the same offset within 4KB blocks. + This option is most likely to be used by external automated systems in managing virtual disk configurations and not by human administrators.

### **| [-o, -no-reserve <true>] - Do not reserve clone }**

If this option is used, the clone file or LUN will not be guaranteed space in the underlying aggregate. While this out-of-space condition persists, writes to the clone file or LUN would fail. This option may be useful if few writes to the clone are expected to be needed, or to allow a file or LUN clone to be created under space-constrained conditions for recovery purposes. If this option is not specified the clone will inherit the space reservation properties from the source.

### **[-i, -ignore-streams <true>] - Ignore streams**

This parameter specifies whether streams should be ignored during cloning of files, LUNs, or NVMe namespaces. If you set this parameter to false, the streams are ignored; otherwise, they are included in the

clones. The default value is false.

**[-k, -ignore-locks <true>] - Ignore locks**

This parameter specifies whether byte-range locks and shared-mode locks on files, LUNs or NVMe namespaces should be ignored during cloning. If you set this parameter to true, the locks are ignored; otherwise, clone operation fails if locks are present on files, LUNs or NVMe namespaces. The default value is false.

**[-d, -overwrite-destination <true>] - Overwrite Destination**

Specify this parameter to overwrite the destination file, LUN, or NVMe namespace, if it exists. The default is not to overwrite the destination file. The command will fail if the destination file exists.

**{ [-qos-policy-group <text>] - QoS Policy Group Name**

This optionally specifies which QoS policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a file or LUN, the system will not monitor and control the traffic to it. You cannot associate a file to a QoS policy group if a LUN was created from the file.

**| [-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group Name }**

This optionally specifies which QoS adaptive policy group to apply to the file or LUN. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the file or LUN's allocated space or used space.

**[-caching-policy <text>] - Caching Policy Name**

This optionally specifies the caching policy to apply to the file. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this file, the system uses the caching policy that is assigned to the containing volume. If a caching policy is not assigned to the containing volume, the system uses the caching policy that is assigned to the containing Vserver. If a caching policy is not assigned to the containing Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

**[-autodelete {true|false}] - Mark Clone for Autodeletion**

This parameter marks the file, LUN or NVMe namespace clones created for auto deletion. When set to true, the file, LUN or NVMe namespace clones get automatically deleted when the volume runs out of space. The default value is false.

### **`[-bypass-throttle {true|false}]` - Bypass Throttle Checks (privilege: advanced)**

This parameter specifies whether clone throttle checks should be skipped during clone creation. When set to true, clones are created without enforcing any clone throttle checks. The default value is false.

### **`[-is-backup {true|false}]` - Is a Clone for Backup**

This parameter is used to mark the destination file as a backup clone, where divergence is expected on the source file and no divergence is expected on the destination file. It is applicable only for full-file clones created from Active File System volumes. The default value is *false*.

### **`[-destination-volume <volume name>]` - Destination Volume**

This specifies the name of the volume where the destination file resides. This can be different from `volume`, whereas parameter `volume` specifies the volume on which source file resides. This is an optional argument that applies only to a MetaWAFL volume where the source and destination volumes for the clone operation can be different. If this parameter is not given, the destination file will be created in the volume where `source_file` resides.

## **Examples**

The following command creates a FlexClone file of the file named *myfile* contained in a volume named *vol*. The file *myfile* is located in the root directory of that volume. The cloned file *myfile\_copy* resides in the root directory same volume.

```
cluster1:> volume file clone create -volume vol -source-path /myfile
-destination-path /myfile_copy
```

The following command optionally associates the FlexClone file named *myfile\_copy* with the *fast* QoS policy group and the caching policy named random-read.

```
cluster1:> volume file clone create -volume vol -source-path /myfile
-destination-path /myfile_copy -qos-policy-group fast -caching-policy
random-read
```

## **volume file clone show-autodelete**

Show the autodelete status for a file or LUN clone

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume file clone show-autodelete` command displays the autodelete details of a file, LUN or NVMe namespace clone. The command displays the following information about a file, LUN or NVMe namespace clone:

- Vserver Name
- Clone Path
- Whether auto deletion of file, LUN or NVMe namespace clone is enabled

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver to which the file, LUN or NVMe namespace clone belongs.

**-clone-path <text> - Clone Path**

This specifies the path of the file, LUN or NVMe namespace clone.

**[-autodelete-enabled {true|false}] - Autodelete Enabled**

If this parameter is true, the file, LUN or NVMe namespace clone gets automatically deleted in the 'try' or 'disrupt' mode. If the value is false, the clones get automatically deleted only in the 'destroy' mode.

## Examples

The following example displays the autodelete information about a file, LUN or NVMe namespace clone.

```
cluster1::> volume file clone show-autodelete -vserver vs1 -clone-path
/vol/v1/f1
Vserver Name: vs1
      Clone Path: /vol/v1/f1
Autodelete Enabled: true
```

## volume file clone deletion add-extension

Add new supported file extensions to be deleted with clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone deletion add-extension` command can be used to add new supported file extensions for clone delete.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the vservers.

**-volume <volume name> - Volume Name**

Name of the volume.

### **-extensions <text> - Supported Extensions for Clone Delete**

List of supported file extensions for clone delete.

### **Examples**

The following example adds the new supported *vmdk*, *vhd* file extensions to volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion add-extension -vserver vs1 -volume  
vol1 -extensions vmdk,vhd
```

## **volume file clone deletion modify**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume file clone deletion modify` command can be used to change the required minimum clone file size of a volume for clone delete.

### **Parameters**

#### **-vserver <vserver name> - Vserver Name**

Name of the vservers.

#### **-volume <volume name> - Volume Name**

Name of the volume.

#### **[-minimum-size {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete**

Minimum clone file size required for clone delete.

### **Examples**

The following example changes the required minimum file size to 100M for volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion modify -volume vol1 -vserver vs1  
-minimum-size 100M
```

## **volume file clone deletion remove-extension**

Remove unsupported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The ``volume file clone deletion remove-extension`` command can be used to remove the existing file

extensions that are no longer supported for clone delete.

## Parameters

**-vserver <vserver name> - Vserver Name**

Name of the vservers.

**-volume <volume name> - Volume Name**

Name of the volume.

**[-extensions <text>] - Unsupported Extensions for Clone Delete**

List of unsupported file extensions for clone delete.

## Examples

The following example removes the existing unsupported *vmrk*, *vhd* file extensions to volume *vol1* of vservers *vs1*.

```
cluster1::> volume file clone deletion remove-extension -vserver vs1  
-volume vol1 -extensions vmrk,vhd
```

## volume file clone deletion show

Show the supported file extensions for clone delete

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone deletion show` command displays the following information for clone delete:

- Vserver Name
- Volume Name
- Minimum File Size Required for Clone Delete
- List of Supported File Extensions for Clone Delete

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Name of the vservers.

**[*-volume* <volume name>] - Volume Name**

Name of the volume.

**[*-extensions* <text>,...] - Supported Extensions for Clone Delete**

List of supported file extensions for Clone Delete.

**[*-minimum-size* {<integer>[KB|MB|GB|TB|PB]}] - Minimum Size Required for Clone delete**

Minimum file size required for Clone Delete.

## Examples

The following example displays the clone deletion information for all volumes of all vservers.

```
cluster1::> volume file clone deletion show
```

Vserver	Volume	Minimum Size	Extensions
-----	-----	-----	
vs0	testvol	100B	vmdk, vhd,
vhd, vswp	vs0_root	0B	-
vs1	testvol	100G	vmdk, vhd,
vhd, vswp	vs1_root	0B	-

The following example displays the clone deletion information for volume *vol1* of vserver *vs1*.

```
cluster1::> volume file clone deletion show -vserver vs0 -volume testvol
Vserver Name: vs0
Volume Name: testvol
Supported Extensions for Clone Delete: vmdk, vhd, vhd, vswp
Minimum Size Required for Clone delete: 100B
```

## volume file clone split load modify

Modify maximum split load on a node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume file clone split load modify` command can be used to change the maximum split load (file, LUN or NVMe namespace clones) of a node.

## Parameters

### **-node {<nodename>|local} - Node Name**

Node name on which the new maximum split load is being applied.

### **[-max-split-load {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load**

This specifies the new maximum split load of a node. This is the amount of clone create load, the node can take at any point of time. If it crosses this limit, then the clone create requests will not be allowed, till the split load is less than maximum split load

## Examples

The following example changes the new maximum limit to 10TB on node1.

```
cluster1::*> volume file clone split load*> modify -node clone-01 -max  
-split-load 100KB
```

## volume file clone split load show

Show split load on a node

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file clone split load show` command displays the corresponding file, LUN or NVMe namespace clone split loads on nodes. If no parameters are specified, the command displays the following information:

- Node
- Max Split Load
- Current Split Load
- Token Reserved Load
- Allowable Split Load

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-node {<nodename>|local}] - Node Name**

Node on which the file, LUN or NVMe namespace clone split load is displayed.

### **[`-max-split-load` {<integer>[KB|MB|GB|TB|PB]}] - Maximum Clone Split Load**

This specifies the maximum allowable split load on the node.

### **[`-current-split-load` {<integer>[KB|MB|GB|TB|PB]}] - Current Clone Split Load**

This specifies the current on going split load on the node.

### **[`-token-reserved-load` {<integer>[KB|MB|GB|TB|PB]}] - Load Reserved for Clone Creation**

This specifies the reserved split load of the node using the tokens.

### **[`-allowable-split-load` {<integer>[KB|MB|GB|TB|PB]}] - Allowable Clone Split Load**

This specifies the available split load of the node.

## **Examples**

The following example displays the current and allowable file, LUN or NVMe namespace clone split load on a node.

```
cluster1::> volume file clone split load show
Node
Allowable
Split Load
-----
clone-01
15.97TB
clone-02
15.97TB
2 entries were displayed.
cluster1::> volume file clone split load show -node clone-01 -instance
Node Name: clone-01
Maximum Clone Split Load: 15.97TB

## **volume file fingerprint abort**

### **Abort a file fingerprint operation**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume file fingerprint abort` command aborts an in-progress fingerprint operation. This command only aborts the fingerprint operations that have not yet completed. This command takes session-id as input and aborts the fingerprint operation that is associated with that particular session-id.

## Parameters

### **-session-id <integer> - Session ID of Fingerprint Operation**

Specifies the session-id of the fingerprint operation that needs to be aborted. It is a unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

## Examples

The following example aborts the fingerprint operation identified by *17039361* :

```
cluster1::> volume file fingerprint abort -session-id 17039361
```

## volume file fingerprint dump

### Display fingerprint of a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint dump` command displays the following information given the `-session-id` of the fingerprint operation:

- Vserver:

The Vserver on which the file exists.

\* Session-ID:

A unique identifier for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file. The session-id of the fingerprint operation can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

\* Volume:

The name of the volume on which the file resides.

\* Path:

The absolute path of the file on which the fingerprint is calculated. The value begins with `/vol/<volumename>`.

\* Data Fingerprint:

The digest value of data of the file. The fingerprint is base64 encoded. This field is not included if the scope is `metadata-only`.

\* Metadata Fingerprint:

The digest value of metadata of the file. The metadata fingerprint is calculated for file size, file ctime, file mtime, file crtime, file retention time, file uid, file gid, and file type. The fingerprint is base64 encoded. This field is not included if the scope is `data-only`.

\* Fingerprint Algorithm:

The digest algorithm which is used for the fingerprint computation. Fingerprint is computed using `md5` or `sha-256` digest algorithm.

\* Fingerprint Scope:

The scope of the file which is used for the fingerprint computation. Fingerprint is computed over *data-only*, *metadata-only*, or *data-and-metadata*.

\* Fingerprint Start Time:

The start time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Fingerprint Start Time:

The start time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Fingerprint Version:

The version of the fingerprint output format.

\* SnapLock License:

The status of the SnapLock license.

\* Vserver UUID:

A universal unique identifier for the Vserver on which the file exists.

\* Volume MSID:

The mirror set identifier of the volume where the file resides.

\* Volume DSID:

The data set identifier of the volume where the file resides.

\* Hostname:

The name of the storage system where the fingerprint operation is performed.

\* Filer ID:

The NVRAM identifier of the storage system.

\* Volume Containing Aggregate:

The name of the aggregate in which the volume resides.

\* Aggregate ID:

A universal unique identifier for the aggregate containing the volume.

\* SnapLock System ComplianceClock:

The System ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone if it is initialized.

\* Formatted SnapLock System ComplianceClock:

The System ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone if it is initialized.

\* Volume SnapLock Type:

The type of the SnapLock volume. This value is only given for SnapLock volumes. Possible values are *compliance* and *enterprise*.

\* Volume ComplianceClock:

The volume ComplianceClock time in seconds since 1 January 1970 00:00:00 in GMT timezone. This has a value only for SnapLock volumes.

\* Formatted Volume ComplianceClock:

The volume ComplianceClock time in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. This has a value only for SnapLock volumes.

\* Volume Expiry Date:

The expiry date of the SnapLock volume in seconds since 1 January 1970 00:00:00 in GMT timezone. The volume expiry date can be in wraparound format.

\* Is Volume Expiry Date Wraparound:

The value is *true* if the volume expiry date is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Volume Expiry Date:

The expiry date of the SnapLock volume in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The volume expiry date can be in wraparound format.

\* Filesystem ID:

The filesystem identifier of the volume on which the file resides.

\* File ID:

A unique number within the filesystem identifying the file.

\* File Type:

The type of the file. Possible values include: *worm*, *worm\_appendable*, *worm\_active\_log*, *worm\_log*, and *regular*.

\* File Size:

The size of the file in bytes.

\* Creation Time:

The creation time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Creation Time:

The creation time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Modification Time:

The last modification time of the file in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Modification Time:

The last modification time of the file in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Changed Time:

The last changed time of the file attributes in seconds since 1 January 1970 00:00:00 in GMT timezone. Time is taken from the system clock for regular files and from the volume ComplianceClock for WORM files when they are committed. The changed time can be in wraparound format.

\* Is Changed Time Wraparound:

The value is *true* if the last changed time of the file attributes is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Changed Time:

The last changed time of the file attributes in a human-readable format <day> <month> <day of month>

<hour>:<min>:<sec><year> in GMT timezone. The changed time can be in wraparound format.

\* Retention Time:

The retention time of the files committed to WORM on SnapLock volumes in seconds since 1 January 1970 00:00:00 in GMT timezone. The retention time can be in wraparound format.

\* Is Retention Time Wraparound:

The value is *true* if the retention time of the file is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

\* Formatted Retention Time:

The retention time of the files protected by SnapLock in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone. The retention time can be in wraparound format.

\* Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Access Time:

The last access time of the regular files on SnapLock volumes and files on non-SnapLock volumes attributes in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Owner ID:

The integer identifier of the owner of the file.

\* Group ID:

The integer identifier of the group owning the file.

\* Owner SID:

The security identifier of the owner of the file when it has NTFS security style.

\* Fingerprint End Time:

The end time of the fingerprint computation in seconds since 1 January 1970 00:00:00 in GMT timezone.

\* Formatted Fingerprint End Time:

The end time of the fingerprint computation in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec><year> in GMT timezone.

\* Litigation Count:

The number of litigations on the file.

## Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance ] }

If you specify the -instance parameter, the command displays detailed information about all fields.

**-session-id <integer> - Session ID of Fingerprint Operation**

Specifies the session-id of the fingerprint operation whose output is to be displayed. It is a unique identifier

for the fingerprint operation. This session-id is returned when the fingerprint operation is started on a file.

## Examples

The following example displays the fingerprint information of the fingerprint session identified by session-id 17039367:

```
cluster1::> volume file fingerprint dump -session-id 17039367
Vserver:vs1
                                Session-ID:17039367
                                Volume:nfs_slc
                                Path:/vol/nfs_slc/worm

## volume file fingerprint show

Display fingerprint operation status

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume file fingerprint show` command returns information for one or several fingerprint operations. This command requires either `-session-id` or `-vserver` and `-volume`.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-session-id <integer>] - Session ID of Fingerprint Operation**

If this parameter is specified, the command returns the progress of the fingerprint operation of the specified session-id. The session-id is a unique identifier for the fingerprint operation that is returned when the fingerprint operation is started on a file.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, `-volume` must also be specified. When queried with `-vserver` and `-volume`, the command returns the progress of all the fingerprint operations running on that particular volume.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, `-vserver` must also be specified. When queried with `-vserver` and

`-volume` , the command returns the progress of all the fingerprint operations running on that particular volume.

**[`-file </vol/<volume name>/<file path>>`] - File Path**

If this parameter is specified, the command returns the progress of all fingerprint operations on the specified file.

**[`-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}`] - Operation Status**

If this parameter is specified, the command returns the progress of all fingerprint operations with matching status value.

**[`-progress-percentage <integer>`] - Progress Percentage**

If this parameter is specified, the command returns the progress of all fingerprint operations with matching progress percentage value.

**Examples**

The following example displays the progress of all the fingerprint operations running on volume `nfs_slc`:

```
cluster1::> volume file fingerprint show -vserver vs0 -volume nfs_slc

Progress
File-Path                               Session-ID      Status
Percentage
-----
/vol/nfs_slc/worm                        17104897        Completed
100
/vol/nfs_slc/worm_appedable              17104898        Completed
100
/vol/nfs_slc/regular                     17104899        In-Progress
30
3 entries were displayed.
```

**volume file fingerprint start**

Start a file fingerprint computation on a file

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

The `volume file fingerprint start` command starts the fingerprint computation on a file. The fingerprint computation is started on the file, and a session-id is returned. This session-id is a unique identifier for the fingerprint operation and can be used to get the progress of an ongoing fingerprint operation as well as the complete fingerprint output for the file once the operation is completed.

## Parameters

### **-vserver <vserver name> -Vserver**

Specifies the name of the vservers which owns the volume on which the file resides.

### **-file </vol/<volume name>/<file path>> -Path**

Specifies the absolute path of the file on which fingerprint needs to be calculated. The value begins with /vol/<volumename>.

### **[-algorithm {MD5|SHA256}] - Fingerprint Algorithm**

Specifies the digest algorithm which is used for the fingerprint computation.

Fingerprint can be computed using one of the following digest algorithms:

- md5
- sha-256

### **[-scope {data-and-metadata|data-only|metadata-only}] - Fingerprint Scope**

Specifies the scope of the file which is used for the fingerprint computation.

Fingerprint can be computed using one of the following scope:

- data-only
- metadata-only
- data-and-metadata

## Examples

The following example starts computing fingerprint over data and metadata for file `/vol/nfs_slc/worm` using `md5` hash algorithm. The file `/vol/nfs_slc/worm` is stored in volume `nfs_slc` on Vserver `vs0`.

```
cluster1::> volume file fingerprint start -vserver vs0 -scope data-and-  
metadata -algorithm md5 -file /vol/nfs_slc/worm  
File fingerprint operation is queued. Run "volume file fingerprint show  
-session-id 16973825" to view the fingerprint session status.
```

## volume file retention show

Display retention time of a file protected by SnapLock.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume file retention show` command displays the retention time of a file protected by SnapLock given `-vserver` and `-file`.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Specifies the name of the Vserver which has the file.

**[-file </vol/<volume name>/<file path>>] - File path**

Specifies the absolute path of the file. The value begins with `/vol/<volumename>`.

**[-retention-time <integer>] - Retention Time of the File**

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its retention time in seconds since 1 January 1970 00:00:00 matches the specified value.

**[-formatted-retention-time <text>] - Formatted Retention Period**

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if its expiry date matches the specified value. The expiry date format is `<day> <month> <day of month> <hour>:<min>:<sec><year>` in GMT timezone taking care of wraparound. A value of *infinite* indicates that this file has infinite retention time. A value of *indefinite* indicates that this file has indefinite retention time.

**[-is-wraparound {true|false}] - Is Retention Time Wraparound**

If this parameter is specified, the command returns the retention time of the file protected by SnapLock if it has a matching `-is-wraparound` value. The value is `true` if the date represented in retention time is in wraparound format. The wraparound format indicates that dates after 19 January 2038 are mapped from 1 January 1970 through 31 December 2002 to 19 January 2038 through 19 January 2071.

## Examples

The following example displays the retention time of the file `/vol/nfs_sle/f12`:

```
cluster1::> volume file retention show -vserver vs0 -file /vol/nfs_sle/f12
Vserver : vs0
Path : /vol/nfs_sle/f12
Retention Time (Secs from Epoch) : 1439111404
Formatted Retention Time : Sun Aug 9 09:10:04 GMT 2015
Is Retention Time Wraparound : false
```

## volume flexcache commands

### volume flexcache config-refresh

Refresh FlexCache configuration for a peer volume

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The ``volume flexcache config-refresh`` command is used to refresh the FlexCache configuration. It can be used to update the configuration on either the FlexCache or origin of a FlexCache cluster. This command only needs to be run if the automatic refresh failed and the corresponding EMS was generated.

This command must be run on the peer cluster. For example, refresh of origin of a FlexCache volume must be run from the FlexCache cluster. Refresh a FlexCache volume must be run from the of an origin of a FlexCache cluster.

## Parameters

**-peer-vserver <vserver name> - Peer Vserver (privilege: advanced)**

Name of the Vserver for which the configuration is being refreshed.

**-peer-volume <volume name> - Peer Volume (privilege: advanced)**

Name of the volume for which the configuration is being refreshed.

**-peer-endpoint-type {cache|origin} - Origin/Cache Volume (privilege: advanced)**

The peer-endpoint-type specifies the FlexCache endpoint type of the peer volume. Possible values are *cache* for FlexCache volumes and *origin* for origin of a FlexCache volumes.

## Examples

The following example triggers config-refresh on origin of a FlexCache volume "origin1".

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume  
origin1 -peer-endpoint-type origin  
          (volume flexcache config-refresh)
```

The following example triggers config-refresh on FlexCache volume "fc1".

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume fc1  
-peer-endpoint-type cache  
          (volume flexcache config-refresh)
```

The following example triggers config-refresh on FlexCache volume "fc1" with an incorrect peer-endpoint-type.

```
cluster1::> flexcache config-refresh -peer-vserver vs34 -peer-volume fc1
-peer-endpoint-type origin
          (volume flexcache config-refresh)
Error: command failed: Failed to store the configuration for peer volume
"fc1"
          in Vserver "vs34" on cluster "cluster1". Check the
FlexCache
          configuration on the local cluster and retry the
operation.
```

## volume flexcache create

Create a new cache relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The ``volume flexcache create`` command is used to create a FlexCache volume. It also creates the relationship between the FlexCache volume and the specified origin volume.

If the `vserver` and `origin-vserver` are different, the Vservers must be in a peer relationship.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver on which the FlexCache volume is to be created.

**-volume <volume name> - Cache Volume Name**

This specifies the name of the FlexCache volume that is to be created.

**{ -aggr-list <aggregate name>, ... - List of Aggregates for FlexGroup Constituents**

Specifies an array of names of aggregates to be used for creating the FlexCache volume.

**[-aggr-list-multiplier <integer>] - Aggregate List Repeat Count**

Specifies the number of times to iterate over the aggregates listed with the `-aggr-list` parameter when creating a FlexGroup. The aggregate list will be repeated the specified number of times. Example:

```
-aggr-list aggr1,aggr2 -aggr-list-multiplier 2
```

will cause four constituents to be created in the order *aggr1* , *aggr2* , *aggr1* , *aggr2* .

+

The default value is 4.

**| -auto-provision-as <FlexGroup> - Automatically Provision as Volume of Type }**

Use this parameter to automatically select existing aggregates for provisioning the FlexCache volume.

**[-size {<integer>[KB|MB|GB|TB|PB] }] - Volume Size**

This optionally specifies the size of the FlexCache volume. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit designation is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB.

**[-origin-vserver <vserver name>] - Origin Vserver Name**

This specifies the name of the Vserver where the origin volume is located.

**-origin-volume <volume name> - Origin Volume Name**

This specifies the name of the origin volume.

**[-junction-path <junction path>] - Cache Junction Path**

This optionally specifies the FlexCache volume's junction path. The junction path name is case insensitive and must be unique within a Vserver's namespace.

**[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the operation completes.

## Examples

The following example triggers FlexCache volume create:

```
cluster1::> flexcache create -vserver vs34 -volume fc1 -aggr-list
aggr34,aggr43 -origin-volume origin1 -size 400m
(volume flexcache create)
[Job 894] Job succeeded: Successful
```

```
cluster1::> flexcache create -vserver vs34 -volume fc3 -auto-provision-as
flexgroup -origin-volume origin1 -size 400m
(volume flexcache create)
[Job 898] Job succeeded: Successful
```

```
cluster1::> flexcache create -vserver vs34 -volume fc4 -aggr-list
aggr34,aggr43 -origin-volume origin1 -size 400m -junction-path /fc4
(volume flexcache create)
[Job 903] Job succeeded: Successful
```

## volume flexcache delete

Delete a cache relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume flexcache delete` command deletes the specified FlexCache volumes and their relationships.

NOTE:

- FlexCache volumes must be offline (see [volume offline](#)) to be deleted.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the name of the Vserver from which the FlexCache volume is to be deleted.

**-volume <volume name> - Cache Volume Name**

This specifies the name of the FlexCache volume that is to be deleted.

**[-foreground {true|false}] - Foreground Process**

This specifies whether the operation runs in the foreground. The default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the operation completes.

### Examples

The following example deletes FlexCache volume "fc1":

```
cluster1::> flexcache delete -volume fc1 -vserver vs34
(volume flexcache delete)
```

```
Error: command failed: Volume fc1 in Vserver vs34 must be offline to be
deleted. Use "volume offline -vserver vs34 -volume fc1" command to
offline the volume
```

```
cluster1::> volume offline -vserver vs34 -volume fc1
Volume "vs34:fc1" is now offline.
```

```
cluster1::> flexcache delete -volume fc1 -vserver vs34
(volume flexcache delete)
[Job 891] Job succeeded: Successful
```

```
cluster1::> flexcache delete -volume fc1 -vserver vs34 -foreground false
(volume flexcache delete)
```

## volume flexcache show

### Display cache relationships

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume flexcache show` command displays information about FlexCache volumes. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the following information about all FlexCache volumes:

- Vserver name
- Volume name
- Size
- Origin Vserver
- Origin volume
- Origin cluster

To display detailed information about all FlexCache volumes, run the command with the `-instance` parameter.

## Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all values.

**[-vserver <vserver name>] - Vserver**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about FlexCache volumes on the specified Vserver.

**[-volume <volume name>] - Cache Volume Name**

If this parameter is specified, the command displays detailed information about the specified FlexCache volume.

### **[-aggr-list <aggregate name>,...] - List of Aggregates for FlexGroup Constituents**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that are located on the specified list of storage aggregates.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Volume Size**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified size. Size is the maximum amount of space a volume can consume from its associated aggregate(s), including user data, metadata, Snapshot copies, and Snapshot reserve.

### **[-flexgroup-msid <integer>] - Cache Flexgroup MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified FlexGroup master data-set ID.

### **[-origin-vserver <vserver name>] - Origin Vserver Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes which have a relationship with the specified origin-vserver.

### **[-origin-vserver-uuid <UUID>] - Origin Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes which have a relationship with the origin-vserver UUID.

### **[-origin-volume <volume name>] - Origin Volume Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin-volume.

### **[-origin-volume-msid <integer>] - Origin Volume MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin master data set ID.

### **[-origin-cluster <Cluster name>] - Origin Cluster Name**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have a relationship with the specified origin-cluster.

### **[-junction-path <junction path>] - Cache Junction Path**

If this parameter is specified, the command displays information only about the FlexCache volume or volumes that have the specified junction path.

### **[-create-time <Date>] - FlexCache Create Time**

If you specify this parameter, the command displays information only about the FlexCache volume or volumes for which the `create-time` option matches the specified input.

## **Examples**

The following example displays information about all FlexCache volumes on the Vserver named "vs34":

```
cluster1::> flexcache show -vserver vs34
(volume flexcache show)
Vserver Volume      Size      Origin-Vserver Origin-Volume
Origin-Cluster
-----
vs34      fc1        800MB     vs34        origin1
cluster-2
vs34      fc2        800MB     vs34        origin1
cluster-2
2 entries were displayed.
```

The following example displays detailed information about a FlexCache volume named fc1 on an SVM named vs34:

```
cluster1::> flexcache show -vserver vs34 -volume fc1 -instance
(volume flexcache show)
Vserver: vs34
Cache Volume Name: fc1
List of Aggregates for FlexGroup Constituents: aggr34
Volume Size: 800MB
Cache Flexgroup MSID: 2155934574
Origin Vserver Name: vs34
Origin Vserver UUID: a8717aeb-2826-11e8-bf56-
00505695f37a
Origin Volume Name: origin1
Origin Volume MSID: 2155934545
Origin Cluster Name: cluster-2
Cache Junction Path: -
FlexCache Create Time: Thu Aug 23 04:36:19 2018
```

## volume flexcache sync-properties

Sync FlexCache volume properties with its origin

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume flexcache sync-properties` command is used to sync a FlexCache volumes properties with its origin volume.

This command only needs to be used when there was a failure to sync properties from the origin of a FlexCache volume to the FlexCache volume.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

This specifies the Vserver on which the FlexCache volume is located.

**-volume <volume name> - FlexCache Volume Name (privilege: advanced)**

This specifies the FlexCache volume whose properties need to be synced with its origin of a FlexCache volume.

## Examples

```
cluster1::> flexcache sync-properties -volume fc1 -vserver vs34
(volume flexcache sync-properties)
```

## volume flexcache origin cleanup-cache-relationship

Cleanup the cache relationship

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume flexcache origin cleanup-cache-relationship` command is used to cleanup the cache relationship on the origin of a FlexCache cluster.

This command only needs to be run if [volume flexcache delete](#) fails on the FlexCache cluster and prompts you to run this command.

## Parameters

**-origin-vserver <vserver name> - Origin Vserver (privilege: advanced)**

This specifies the name of the Vserver hosting the origin of a FlexCache volume.

**-origin-volume <volume name> - Origin Volume (privilege: advanced)**

This specifies the name of the origin of a FlexCache volume.

**-cache-vserver <vserver name> - Cache Vserver (privilege: advanced)**

This specifies the name of the Vserver hosting the FlexCache volume.

**-cache-volume <volume name> - Cache Volume (privilege: advanced)**

This specifies the name of the FlexCache volume.

**[-force-retry <true>] - Force Origin Cleanup Retry (privilege: advanced)**

This specifies whether the origin cleanup operation can be retried if it has previously failed. The default setting is *false*.

When the last FlexCache relationship is deleted, the origin cleanup operation needs to remove metadata from the filesystem. This can take a long time, and it's possible the operation will take too long and fail. In that case, the operation can be retried by running the cleanup command again and setting `force-retry` to true.

## Examples

The following example cleans up the FlexCache relationship for the specified FlexCache and origin of a FlexCache volume:

```
cluster1::> flexcache origin cleanup-cache-relationship -origin-volume
origin1 -origin-vserver vs34 -cache-vserver vs56 -cache-volume fc1
(volume flexcache origin cleanup-cache-relationship)

Warning: The cache configuration will be deleted for Origin-Vserver: vs34,
Origin-Volume: origin1, Cache-Vserver: vs56, Cache-Volume:
fc1.
Do you want to continue? {y|n}: y
```

## Related Links

- [volume flexcache delete](#)

## volume flexcache origin show-caches

Display all the caches connected to origin

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume flexcache origin show-caches` command displays FlexCache relationships for origin of a FlexCache volumes on the origin cluster.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-origin-vserver <vserver name>] - Vserver**

If this parameter and the `origin-volume` parameter are specified, the command displays the FlexCache relationship for the specified origin of a FlexCache volume. If this parameter is specified by itself, the command displays all the FlexCache relationships for all origin of a FlexCache volumes in the specified Vserver.

**[-origin-volume <volume name>] - Origin Volume**

If this parameter is specified, the command displays all the FlexCache relationships for the specified origin of a FlexCache volume.

**[-cache-vserver <vserver name>] - Cache Vserver**

If this parameter is specified then the command displays FlexCache relationships for the specified Vserver hosting FlexCache volumes.

**[-cache-volume <volume name>] - Cache Volume**

If this parameter is specified then the command displays FlexCache relationships for the specified FlexCache volume.

**[-cache-cluster <Cluster name>] - Cache Cluster**

If this parameter is specified then the command displays FlexCache relationships for the specified cluster hosting FlexCache volumes.

**[-cache-volume-msid <integer>] - Cache Volume MSID**

If this parameter is specified then the command displays FlexCache relationships for the specified FlexCache volume's FlexGroup master data-set ID.

**[-relationship-create-time <Date>] - Relationship Create Time**

If you specify this parameter, the command displays FlexCache relationships for which the relationship-create-time option matches the specified input.

**Examples**

The following example displays information about all origin of a FlexCache volumes on the Vserver named vs34:

```
cluster1::> flexcache origin show-caches -origin-vserver vs34
(volume flexcache origin show-caches)
Origin-Vserver Origin-Volume  Cache-Vserver  Cache-Volume  Cache-Cluster
-----
vs34            origin1         vs56           fc1_c3_origin1
                                     cluster-3
vs34            origin1         vs34           fc1            cluster-2
vs34            origin1         vs34           fc2            cluster-2
vs34            origin2_new     vs56           fc1_c3_origin2
                                     cluster-3

4 entries were displayed.
```

```
cluster1::> flexcache origin show-caches -origin-vserver vs56 -instance
(volume flexcache origin show-caches)
Vserver: vs56
    Origin Volume: origin
    Cache Vserver: vs56
    Cache Volume: fc1
    Cache Cluster: cluster-3
    Cache Volume MSID: 2156002002
Relationship Create Time: Thu Aug 23 04:36:24 2018
```

## volume flexgroup commands

### volume flexgroup deploy

(DEPRECATED)-Deploy a FlexGroup on the cluster

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume flexgroup deploy` command deploys a FlexGroup on the cluster.

The FlexGroup is created with 8 constituents on each node in the cluster. The constituents are split equally between the two largest aggregates on each node. If using two aggregates per node is not possible, all of the constituents are created on the largest aggregate on each node.

The `volume flexgroup deploy` command is only supported on clusters with 4 nodes or less. On clusters with more than 4 nodes, use the [volume create](#) command to create FlexGroups.

This command is deprecated and may be removed in a future release of ONTAP. Use the 'volume create -auto-provision-as flexgroup' command instead.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the FlexGroup will be located.

**-size {<integer>[KB|MB|GB|TB|PB]} - Size of the FlexGroup**

This specifies the size of the FlexGroup. The size is specified as a number followed by a unit designation: k (kilobytes), m (megabytes), g (gigabytes), t (terabytes), or p (petabytes). If the unit designation is not specified, bytes are used as the unit and the specified number is rounded up to the nearest 4 KB. The minimum size is 160 MB multiplied by the number of nodes in the cluster. The maximum size of the FlexGroup is limited by the platform maximum FlexVol size multiplied by 8 and multiplied by the number of nodes in the cluster. The size of the FlexGroup is also limited by the available space in the hosting aggregates. FlexGroups can be increased in size with the [volume modify](#) command and more constituents can be added with the [volume expand](#) command.

### **[`-volume <volume name>`] - Name of the FlexGroup to Create**

This specifies the name of the FlexGroup. The name of the FlexGroup must start with an alphabetic character (a to z or A to Z) and must have 197 or fewer characters. The default value for the FlexGroup name is "fg".

### **[`-type {RW|DP}`] - Volume Type**

This optionally specifies the FlexGroup's type, either read-write (RW) or data-protection (DP). If you do not specify a value for this parameter, a RW volume is created by default.

### **[`-space-guarantee {none|volume}`] - Space Guarantee Style**

This optionally specifies the space guarantee style for the FlexGroup. A value of *volume* reserves space on the aggregates for the entire volume. A value of *none* reserves no space on the aggregates, meaning that writes can fail if an aggregate runs out of space. Because CIFS does not handle out-of-space conditions, do not use the value *none* if the volume is accessible to CIFS clients. The default setting for volumes on All Flash FAS systems is *none*, otherwise the default setting is *volume*.

### **[`-foreground {true|false}`] - Foreground Process**

If this parameter is specified with *false*, the command runs in the background as a job. Otherwise, the command does not return until the operation is complete. The default value is *true*.

## **Examples**

The following example deploys a FlexGroup named "flexgroup" in the Vserver named "vs1.example.com":

```
cluster::> volume flexgroup deploy -size 400TB -vserver vs1.example.com
-volume flexgroup
```

- [volume modify](#)
- [volume expand](#)

## **volume flexgroup qtree-disable**

Disable qtree support on a FlexGroup

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

## **Description**

The `volume flexgroup qtree-disable` command disables qtree support on a FlexGroup.

## **Parameters**

### **`-vserver <vserver name>` - Vserver Name (privilege: advanced)**

This specifies the Vserver in which the FlexGroup is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the name of the FlexGroup.

## Examples

The following example disables the qtree support on a FlexVol named "fg" in Vserver "vs0":

```
cluster::*> volume flexgroup qtree-disable -vserver vs0 -volume fg
```

# volume inode-upgrade commands

## volume inode-upgrade prepare-to-downgrade

Prepare volume to downgrade to a release earlier than Data ONTAP 9.0.0

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume inode-upgrade prepare-to-downgrade` command prepares volumes to downgrade to a release earlier than Data ONTAP 9.0.0. It is used when there are still volumes in the middle of the inode upgrade process when revert is issued.

### Parameters

**-node {<nodename>|local} - Node Name (privilege: advanced)**

This specifies the node on which the command will run. Default is the local node.

## Examples

The following example prepares volumes to revert to an earlier release.

```
cluster1::> volume inode-upgrade prepare-to-downgrade -node node1
```

## volume inode-upgrade resume

Resume suspended inode upgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume inode-upgrade resume` command resumes suspended inode upgrade process. The inode upgrade process may be suspended earlier due to performance reasons.

### Parameters

**-vserver <vserver name> - VServer Name (privilege: advanced)**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

This specifies the volume for which the inode upgrade process is to be resumed.

## Examples

The following example resumes a volume upgrade process.

```
cluster1::> volume inode-upgrade resume -vserver vs0 -volume vol1
```

## volume inode-upgrade show

### Display Inode Upgrade Progress

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume inode-upgrade show` command displays information about volumes in the middle of the inode upgrade process. The command output depends on the parameter or parameters specified with the command. If no parameters are specified, the command displays the default fields about all volumes in the middle of the inode upgrade process. Default fields are `vserver`, `volume`, `aggregate`, `status`, `scan-percent`, `remaining-time`, `space-needed`, and `scanner-progress`.

### Parameters

**{ [-fields <fieldname>,...]**

This specifies the fields that need to be displayed.

**| [-instance ] }**

If this parameter is specified, the command displays information about all entries.

**[-vserver <vserver name>] - Vserver (privilege: advanced)**

If this parameter and the `-volume` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume (privilege: advanced)**

If this parameter and the `-vserver` parameter are specified, the command displays detailed information about the specified volume. If this parameter is specified by itself, the command displays information about all volumes that match the specified name.

**[-node <nodename>] - Node Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage system.

**[-vol-dsid <integer>] - Volume DSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified data set ID.

**[-vol-uuid <UUID>] - Volume UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified UUID.

**[-volume-msid <integer>] - Volume MSID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified master data set ID.

**[-vserver-uuid <UUID>] - Vserver UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume on the Vserver that has the specified UUID.

**[-aggregate <aggregate name>] - Aggregate Name (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the specified storage aggregate.

**[-aggregate-uuid <UUID>] - Aggregate UUID (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that are located on the storage aggregate with the specified UUID.

**[-status {pending|scanning|suspended-initializing|suspended|cleanup-pending|cleanup|cleanup-done|suspended-aborting|suspended-removing|suspended-while-removing|suspended-ironing}] - Upgrade Status (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade status.

**[-scan-percent <percent>] - Upgrade Scan Percent Complete (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes that match the specified inode upgrade progress percentage.

**[-space-needed {<integer>[KB|MB|GB|TB|PB]}] - Space Needed to Complete Upgrade (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the space needed to complete the upgrade process match the specified size.

**[-remaining-time [<integer>h][<integer>m][<integer>s]>] - Remaining Upgrade Time (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the remaining time to complete the inode upgrade process match the specified time.

**[-scanner-progress <text>] - Scanner Progress (privilege: advanced)**

If this parameter is specified, the command displays information only about the volume or volumes where the progress of the inode upgrade process match the input.

## Examples

The following example displays information about all volumes in the middle of the inode upgrade process on the Vserver named vs0:

```
cluster1::> volume inode-upgrade show -vserver vs0
Vserver Volume Aggregate Status %Complete Time      Space   Inode
          Remaining Needed Progress
-----
vs0      vol1    aggr1    pending    0%      -      3.07MB Public : Inode
0 out of 3822
```

## volume move commands

### volume move abort

Stop a running volume move operation

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The "volume move abort" command sends an abort message to the volume move operation and returns immediately. The volume move operation might not abort immediately depending on the stage it is in. For example, if the volume move operation is in a cut-over or clean-up phase, the abort is ignored. You invoke the "volume move show" command to view the list of running volume move operations and monitor the progress of the abort operation. This command has the same behavior as the `job stop -id`<job-id>` command where the job-id is the identifier of the volume move job.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume being moved.

## Examples

The following example aborts running volume move operation on volume *vol1*

```
cluster1::> volume move show
      Vserver   Volume   State   Move Phase Percent-Complete Time-To-
Complete
-----
vs0      vol1      alert   cutover_hard_deferred 0%   -
vs0      vol2      failed   failed           -           -
2 entries were displayed.
cluster1::> volume move abort -vserver vs0 -volume vol1
cluster1::> volume move show -vserver vs0 -volume vol1 -fields completion-
status
      vserver volume completion-status
-----
vs0      vol1      "Volume move job stopped."
```

The following example shows command failed to abort on *vol2* as volume move operation is completed.

```
cluster1::> volume move show
      Vserver   Volume   State   Move Phase Percent-Complete Time-To-
Complete
-----
vs0      vol1      alert   cutover_hard_deferred 0%   -
vs0      vol2      failed   failed           -           -
2 entries were displayed.
cluster1::> volume move abort -vserver vs0 -volume vol2
Error: command failed: There is no volume move operation running on the
specified volume.
```

## Related Links

- [job stop](#)

## volume move modify

Modify parameters for a running volume move operation

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `volume move modify` command modifies the parameters used by the volume move operation in progress. These modified values can be verified by invoking the [volume move show](#) command. The volume move operation will use the modified cutover parameters in its next cutover attempt. Note that the modifications to the job are not applied if the move is in the "finishing" state.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume being moved.

### **[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}] - Specified Action For Cutover (privilege: advanced)**

Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is *retry\_on\_failure*; otherwise the default is *defer\_on\_failure*. If the *abort\_on\_failure* action is specified, the job will try to cutover until cutover attempts are exhausted. If it fails to cutover, it will cleanup and end the operation. If the *defer\_on\_failure* action is specified, the job will try to cutover until the cutover attempts are exhausted. If it fails to cutover, it will move into the "cutover\_hard\_deferred" state. The volume move job waits for a [volume move trigger-cutover](#) command to restart the cutover process. If the *force* action is specified, the job will try to cutover until the cutover attempts are exhausted and force the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it will not go into cutover automatically, instead it will wait for a [volume move trigger-cutover](#) command as the signal to try the cutover.

### **[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)**

This specifies the time interval in seconds to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

## Examples

The following example modifies the parameters for volume move operation on volume vol2.

```
cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2

## volume move show

Show status of a volume moving from one aggregate to another aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `volume move show` command displays information about volume moves in the cluster. By default, with

no parameters, it only shows volume moves that have failed or are currently running. The command display output depends on the parameters passed. If `-vserver` and `-volume` are specified, the following information is displayed:

- **Vserver Name:** The Vserver on which the volume is located.
- **Volume Name:** The volume that is part of a completed or running volume move operation.
- **Actual Completion Time:** The date and time in the cluster time zone when the volume move completed.
- **Bytes Remaining:** The number of bytes remaining to be sent during volume move. This is an approximate number and lags the current status by a few minutes while the volume move is in operation.
- **Specified Action for Cutover:** The action to be taken for cutover or during cutover failure. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Specified Cutover Time Window:** The time window in seconds given as an input for the cutover phase of volume move. This is the input given during the start of volume move or the value specified during a volume move modification.
- **Job ID:** The Job-ID of move job.
- **Destination Node:** The name of the node where the destination aggregate is present.
- **Source Node:** The name of the node where the source aggregate is present.
- **Prior Issues Encountered:** The latest issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.
- **Move Initiated by Auto Balance Aggregate:** The value "true" indicates the move is initiated by Auto Balance Aggregate feature.
- **Destination Aggregate:** The name of the aggregate to which the volume is moved.
- **Detailed Status:** The detail about any warnings, errors, and state of the move operation.
- **Estimated Time of Completion:** The approximate date and time in the cluster time zone when the entire volume move operation is expected to complete. Note that this time may keep increasing when the move goes into cutover-deferred mode. In those cases where the input for cutover-action is wait, during the data copy phase, the estimated time of completion will approximate the time to reach the cutover point and wait for user intervention.
- **Managing Node:** The node in the cluster on which the move job is or was running. This is usually on the node hosting the volume to be moved.
- **Percentage Complete:** The amount of work to move the volume completed thus far in terms of percentage.
- **Move Phase:** The phase of the move operation.
- **Estimated Remaining Duration:** The approximate amount of time in terms of days, hours, minutes and seconds remaining to complete the volume move.
- **Replication Throughput:** The current replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.
- **Duration of Move:** The duration in days, hours and minutes for which the volume move was or is in progress.
- **Source Aggregate:** The name of the aggregate where the volume being moved originally resides or resided.
- **Start Time of Move:** The date and time in the cluster time zone when the volume move operation started.
- **Move State:** The state of the volume move at the time of issuing the command and the system gathering up the information about the move.
- **Original Job ID:** The job-id assigned when the job was first created. This value will only be populated when

the original job-id differs from the current job-id.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

This specifies the Vserver on which the volume is located. If this parameter and the `-volume` parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about latest moves performed on volumes of the specified Vserver.

**[-volume <volume name>] - Volume Name**

This specifies the volume that is part of a completed or running volume move operation. If this parameter and the `-vserver` parameter are specified, the command displays detailed information about latest move performed on the specified volume. If this parameter is specified by itself, the command displays information about the latest move on all volumes matching the specified name.

**[-actual-completion-time <Date>] - Actual Completion Time**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move completed.

**[-bytes-remaining {<integer>[KB|MB|GB|TB|PB]}] - Bytes Remaining**

If this parameter is specified, the command displays move operations that match the specified number of bytes remaining to be sent during volume move.

**[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}]  
- Specified Action For Cutover (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified action to be taken for cutover or during cutover failure.

**[-cutover-window <integer>] - Specified Cutover Time Window (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified time window in seconds for the cutover phase of volume move.

**[-destination-aggregate <aggregate name>] - Destination Aggregate**

If this parameter is specified, the command displays move operations that match the specified name of the aggregate to which the volume is being moved.

**[-destination-node <nodename>] - Destination Node (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified name of the node where the destination aggregate is present.

**[-details <text>] - Detailed Status**

If this parameter is specified, the command displays move operations that match the specified detail about any warnings, errors and state of the move operation.

**[-estimated-completion-time <Date>] - Estimated Time of Completion**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the entire volume move operation is expected to complete.

**[-job-id <integer>] - Job ID (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified Job-ID of the move job.

**[-managing-node <nodename>] - Managing Node**

If this parameter is specified, the command displays move operations that match the specified node in the cluster on which the move job is or was running.

**[-percent-complete <percent>] - Percentage Complete**

If this parameter is specified, the command displays move operations that match the specified amount of work to move the volume completed thus far in terms of percentage.

**[-phase**

**{queued|initializing|replicating|cutover|cutover\_hard\_deferred|cutover\_soft\_deferred|aborting|completed|cleaning\_up|failed|restarting|finishing}] - Move Phase**

If this parameter is specified, the command displays move operations that match the specified phase of the move operation.

**[-prior-issues <text>] - Prior Issues Encountered (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified issues or transient errors encountered causing the move operation to retry the data copy phase or the cutover phase.

**[-estimated-remaining-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Estimated Remaining Duration**

If this parameter is specified, the command displays move operations that match the specified time.

**[-replication-throughput <text>] - Replication Throughput**

If this parameter is specified, the command displays move operations that match the specified replication throughput of the move operation in terms of Kb/s, Mb/s or Gb/s.

**[-actual-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Duration of Move**

If this parameter is specified, the command displays move operations that match the specified duration for which the volume move was or is in progress.

**[-source-aggregate <aggregate name>] - Source Aggregate**

If this parameter is specified, the command displays move operations that match the specified name of the aggregate where the volume being moved originally resides or resided.

**[-source-node <nodename>] - Source Node (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified name of the node where the source aggregate is present.

**[-start-time <Date>] - Start Time of Move**

If this parameter is specified, the command displays move operations that match the specified date and time in the cluster time zone when the volume move operation started.

**[-state {healthy|warning|alert|failed|done}] - Move State**

If this parameter is specified, the command displays move operations that match the specified state of the volume move operation.

**[-moved-by-autobalance {true|false}] - Move Initiated by Auto Balance Aggregate (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[-original-job-id <integer>] - Original Job ID (privilege: advanced)**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[-is-source-encrypted {true|false}] - Is Source Volume Encrypted**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[-source-key-id <text>] - Encryption Key ID of Source Volume**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[-is-destination-encrypted {true|false}] - Is Destination Volume Encrypted**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

**[-destination-key-id <text>] - Encryption Key ID of Destination Volume**

If this parameter is specified, the command displays move operations that match the specified value of this parameter.

## Examples

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0

```
cluster1::> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2
Actual Completion Time: -
    Bytes Remaining: 6.37GB
Destination Aggregate: cluster1_aggr2
    Detailed Status: Transferring data: 3.67GB sent.
Estimated Time of Completion: Sat Jul 16 20:25:50 2011
    Managing Node: node1
    Percentage Complete: 36%
        Move Phase: replicating
Estimated Remaining Duration: 00:01
    Replication Throughput: 61.08MB/s
        Duration of Move: 00:02
        Source Aggregate: cluster1_aggr1
    Start Time of Move: Sat Jul 16 20:22:01 2011
        Move State: healthy
```

The following example lists status of volume move operation for a volume vol2 on a Vserver vs0 in advanced mode

```

cluster1::*> volume move show -vserver vs0 -volume vol2
Vserver Name: vs0
                Volume Name: vol2
        Actual Completion Time: -
                Bytes Remaining: 156KB
        Specified Action For Cutover: wait
        Specified Cutover Time Window: 30
                Destination Aggregate: cluster1_aggr2
                Destination Node: node2
                Detailed Status: Cutover Deferred, Waiting for
user intervention (2.04MB Sent)::Volume move job preparing transfer.
        Estimated Time of Completion: -
                Job ID: 265
                Managing Node: node1
        Percentage Complete: -
                Move Phase: cutover_hard_deferred
        Prior Issues Encountered: -
        Estimated Remaining Duration: -
        Replication Throughput: -
                Duration of Move: 00:24:59
                Source Aggregate: cluster1_aggr1
                Source Node: node1
                Start Time of Move: Tue Mar 17 22:31:32 2011
                Move State: alert
Move Initiated by Auto Balance Aggregate: false
                Original Job ID: -

```

The following example lists status of running and failed volume move operations in the cluster.

```

cluster1::> volume move show

```

Complete Time-To-Complete	Vserver	Volume	State	Move Phase	Percent-
-----	-----	-----	-----	-----	
-----	vs0	s1	alert	cutover_hard_deferred	98%
-	vs0	vol2	failed	failed	-
-					

2 entries were displayed.

The following example lists status of all the volume move operations in the cluster.

```
cluster1::> vol move show -phase *
              (volume move show)
              Vserver  Volume  State  Move Phase Percent-
Complete Time-To-Complete
-----
-----
              vs0      s1      alert  cutover_hard_deferred
              98%
-
              vs0      s2      done   completed  100%
-
              vs0      vol1     failed failed      -
-
              3 entries were displayed.
```

## volume move start

Start moving a volume from one aggregate to another aggregate

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `volume move start` command moves a flexible volume from one storage aggregate to another. The destination aggregate can be located on the same node as the original aggregate or on a different node. The move occurs within the context of the same Vserver.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the volume that will be moved.

**-destination-aggregate <aggregate name> - Destination Aggregate**

This specifies the aggregate to which the volume will be moved.

**[-cutover-window <integer>] - Cutover time window in seconds (privilege: advanced)**

This specifies the time interval to completely cutover operations from the original volume to the moved volume. The default value is 30 seconds. The range for valid input is from 30 to 300 seconds, inclusive.

**[-cutover-action {abort\_on\_failure|defer\_on\_failure|force|wait|retry\_on\_failure}]  
- Action for Cutover (privilege: advanced)**

Specifies the action to be taken for cutover. If the effective cluster version is Data ONTAP 8.3 and later, the default is `retry_on_failure`; otherwise the default is `defer_on_failure`. If the `abort_on_failure` action is specified, the job tries to cutover until cutover attempts are exhausted. If it fails to cutover, it cleans up and ends the operation. If the `defer_on_failure` action is specified, the job

tries to cutover until the cutover attempts are exhausted. If it fails to cutover, it moves into the "cutover deferred" state. The volume move job waits to issue a [volume move trigger-cutover](#) command to restart the cutover process. If the *force* action is specified, the job tries to cutover until the cutover attempts are exhausted and forces the cutover at the expense of disrupting the clients. If the *wait* action is specified, when the job hits the decision point, it does not go into cutover automatically, instead it waits to issue a [volume move trigger-cutover](#) command as the signal to try the cutover. Once cutover is manually triggered, the cutover action changes to *defer\_on\_failure*. If the *retry\_on\_failure* action is specified, the job retries to cutover indefinitely and it never enters a "hard-deferred" state. After exhausting cutover attempts, the move job waits one hour before trying to cutover again. Issue a [volume move trigger-cutover](#) command at any time to restart the cutover process.

**`[-perform-validation-only <true>]` - Performs validation checks only**

This is a boolean option allowing to perform pre-move validation checks for the intended volume. When set to *true*, the command only performs the checks without creating a move job. The default value is *false*.

**`[-foreground {true|false}]` - Foreground Process**

This specifies whether the volume move operation runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). Note that using this parameter will not affect how long it takes for the operation to complete.

**`[-encrypt-destination {true|false}]` - Encrypt Destination Volume**

This specifies whether the move operation should result in creating an encrypted volume on the destination aggregate. When this option is set to *true*, the destination volume will be encrypted. When it is set to *false*, the destination volume will be a plain-text volume. When this parameter is not specified, then destination will be same as the source type.

**`[-generate-destination-key {true|false}]` - Generate New Encryption Key for Destination Volume**

This option is specified along with `-encrypt-destination`, a new key will be generated, and that new key will be used for encrypting the destination volume.

**`[-tiering-policy {snapshot-only|auto|none|backup}]` - Volume Tiering Policy**

This optional parameter specifies the tiering policy to apply to the destination volume. Tiering policies decide whether the user data blocks of a volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not.

The available tiering-policies are:

- *snapshot-only* - This policy allows tiering of only the volume Snapshot copies not associated with the active file system.
- *auto* - This policy allows tiering of both snapshot and active file system user data to the capacity tier.
- *none* - Volume blocks will not be tiered to the capacity tier.
- *backup* - This policy transfers all user data blocks directly to the capacity tier. In the case of DP volumes, the tiering policy is retained as backup after the move. For non-DP volumes, the policy is switched back to *snapshot-only*.

**`[-allow-mixed-aggr-types {true|false}]` - Allow Mixing FabricPool and non-FabricPool**

If set to *true*, moving a FlexGroup constituent from a FabricPool to a non-FabricPool, or vice versa, is allowed. The default value is *false*. This parameter is only supported for FlexGroup constituents.

## Examples

The following examples perform a validation-check for a volume named `volume_test` on a Vserver named `vs0` to determine if it can be moved to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr -perform-validation-only true
    Error: command failed: There is 2.54GB of available space on the
aggregate
    dest_aggr which is not enough to accommodate a volume.
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr -perform-validation-only true
    Validation succeeded.
```

The following example performs a volume move start operation to move a volume named `volume_test` on a Vserver name `vs0` to a destination-aggregate named `dest_aggr`.

```
cluster1::> volume move start -vserver vs0 -volume volume_test
-destination-aggregate dest_aggr
    [Job 267] Job is queued: Move "volume_test" in Vserver
"vs0" to aggregate "dest_aggr".
    Use the "volume move show -vserver vs0 -volume
volume_test" command to view the status of this operation.
```

The following example performs a volume move start operation to move a plain-text volume named `vol1` to an encrypted volume on destination-aggregate `aggr1`.

```
cluster1::> volume move start -volume vol1 -destination-aggregate aggr1
-encrypt-destination true
    [Job 267] Job is queued: Move "vol1" in Vserver "vs1" to aggregate
"aggr1".
    Use the "volume move show -vserver vs1 -volume vol1" command to
view the status of this operation.
```

## Related Links

- [volume move trigger-cutover](#)

## volume move trigger-cutover

Trigger cutover of a move job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

This command causes a replicating or deferred volume move job to attempt cutover. Unless the force option is set, cutover entry is not guaranteed.

## Parameters

**-vserver <vserver name> - Vserver Name**

The Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

The volume that is being moved.

**[-force <true>] - Force Cutover**

If this parameter is specified, the cutover is done without confirming the operation - even if the operation could cause client I/O disruptions.

## Examples

```
cluster1::> volume move trigger-cutover -vserver vs0 -volume testvol_1 -force
```

## volume move recommend show

### Display Move Recommendations

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `volume move recommend show` command displays moves that were recommended by the Auto Balance Aggregate feature.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a Vserver that matches the specified value.

**[-volume <volume name>] - Volume Name (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a volume that matches the specified value.

**[-creation-time <MM/DD/YYYY HH:MM:SS>] - Time Stamp of Recommendation (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a creation-time that matches the specified value.

**[-source-aggregate <aggregate name>] - Unbalanced Aggregate Name (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a source-aggregate that matches the specified value.

**[-source-space-after <percent>] - Space Free After Move (%) (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a source-space-after that matches the specified value.

**[-destination-aggregate <aggregate name>] - Destination Aggregate Name (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a destination-aggregate that matches the specified value.

**[-destination-space-after <percent>] - Space Bump After Move (%) (privilege: advanced)**

If this parameter is specified, the display will be limited to only those recommendations with a destination-space-after that matches the specified value.

## Examples

The following example displays information about the recommendations made by the Auto Balance Aggregate feature.

```
cluster1::*> volume move recommend show -instance
                Vserver Name: vs0.example.com
                Volume Name: ro10
Time Stamp of Recommendation: 3/13/2014 16:26:39
    Unbalanced Aggregate Name: aggr_1
    Space Free After Move (%): 36%
    Destination Aggregate Name: aggr_3
    Space Bump After Move (%): 36%
```

## volume move target-aggr show

List target aggregates compatible for volume move

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The volume move target-aggr show displays information about compatible target aggregates for the specified volume to be moved to.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name (Required field)**

Selects information about compatible target aggregates for volumes of the specified Vserver.

**[-volume <volume name>] - Volume Name (Required field)**

Selects information about compatible target aggregates that have enough space for the specified volume.

**[-aggregate <aggregate name>] - Aggregate Name**

Selects information about compatible target aggregates with the specified aggregate name (to which the volume might be moved).

**[-tiering-policy {snapshot-only|auto|none|backup}] - Volume Tiering Policy**

Selects information about compatible target aggregates with the specified destination tiering policy.

**[-availsize {<integer>[KB|MB|GB|TB|PB]}] - Available size**

Selects information about compatible target aggregates that have the specified available size.

**[-storagetype <text>] - Storage Type**

Selects information about compatible target aggregates with the specified storage type. Examples of storage types are "ATA", "BSAS", "FCAL", "LUN", "SATA", "SAS" and "SSD".

**[-allow-mixed-aggr-types {true|false}] - Allow Mixing FabricPool and non-FabricPool**

If set to true, moving a FlexGroup constituent from a FabricPool to a non-FabricPool, or vice versa, is allowed. The default value is false. This parameter is only supported for FlexGroup constituents.

## Examples

The following example lists target aggregates compatible for moving a volume vol1 on a Vserver vs1.

```
cluster1::> volume move target-aggr show -vserver vs1 -volume vol1
Aggregate Name    Available Size    Storage Type
-----
aggr1             113.5GB          FCAL
aggr2             113.5GB          FCAL
2 entries were displayed.
```

## volume qtree commands

## volume qtree create

Create a new qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command creates a qtree in the Vserver and volume you specify. You can create up to 4,994 qtrees per volume.

You can optionally specify the following attributes when creating a new qtree:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export Policy

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume that will contain the qtree you are creating.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree you are creating.

A qtree name cannot contain a forward slash (/). The qtree name cannot be more than 64 characters long.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments.

**[-security-style <security style>] - Security Style**

This optionally specifies the security style for the qtree, which determines how access to the qtree is controlled. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). If you do not specify a security style for the qtree, it inherits the security style of its containing volume.

**[-oplock-mode {enable|disable}] - Oplock Mode**

This optionally specifies whether oplocks are enabled for the qtree. If you do not specify a value for this parameter, it inherits the oplock mode of its containing volume.

**[-m, -unix-permissions <unix perm>] - Unix Permissions**

This optionally specifies the UNIX permissions for the qtree when the `-security-style` is set to *unix* or *mixed*. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation. If you do not specify UNIX permissions for the qtree, it inherits the UNIX permissions of its containing volume.

## **[`-export-policy <text>`] - Export Policy**

This optional parameter specifies the name of the export policy associated with the qtree. For information on export policies, see the documentation for the [vserver export-policy create](#) command. If you do not specify a value for this parameter, it inherits the export policy of its containing volume.

## **Examples**

The following example creates a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree has a mixed security style. Its other attributes are inherited from volume vol1.

```
cluster1::> volume qtree create -vserver vs0 -volume vol1 -qtree qtree1
-security-style mixed
```

The following example uses a 7G-compatible command to create the qtree.

```
cluster1::> vserver context vs0
vs0::> qtree create /vol/vol1/qtree1
```

## **volume qtree delete**

Delete a qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command deletes a qtree. The length of time that it takes to delete a qtree depends on the number of directories and files it contains. You can monitor the progress of the delete operation by using the [job show](#) and [job watch-progress](#) commands, respectively.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be deleted.

Quota rules associated with this qtree in all the quota policies will be deleted when you delete this qtree. Qtree deletion will not be allowed if Storage-level Access Guard (SLAG) is configured.

## **Parameters**

### **`-vserver <vserver name>` - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

### **`{ -volume <volume name>` - Volume Name**

This specifies the name of the volume containing the qtree to be deleted.

### **-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be deleted.

### **| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

### **[-force <true>] - Force Delete (privilege: advanced)**

This optionally forces the qtree delete operation to proceed when the qtree contains files. The default setting is false (that is, the qtree will not be deleted if it contains files). This parameter is available only at the advanced privilege and higher.

### **[-foreground <true>] - Foreground Process**

This optionally specifies whether the qtree delete operation runs as a foreground process. The default setting is false (that is, the operation runs in the background).

## **Examples**

The following example deletes a qtree named qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree delete -vserver vs0 -volume vol1 -qtree qtree4
WARNING: Are you sure you want to delete qtree qtree4 in volume vol1
vserver vs0? {y|n}: y
[Job 38] Job is queued: Delete qtree qtree4 in volume vol1 vserver vs0.
```

## **volume qtree modify**

### **Modify qtree attributes**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command allows you to modify the following attributes of an existing qtree in the given Vserver and volume:

- Security style
- Opportunistic lock mode
- UNIX permissions
- Export policy

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

### **{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree to be modified.

### **-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be modified. You can modify the attributes of qtree0 (represented as "" in the CLI) by omitting the `-qtree` parameter from the command or by specifying the value "" for the `-qtree` parameter.

### **| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

### **[-security-style <security style>] - Security Style**

This optionally modifies the security style for the qtree. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

### **[-oplock-mode {enable|disable}] - Oplock Mode**

This optionally modifies whether oplocks are enabled for the qtree.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

### **[-unix-permissions <unix perm>] - Unix Permissions**

This optionally modifies the UNIX permissions for the qtree. You can specify UNIX permissions either as a four-digit octal value (for example, 0700) or in the style of the UNIX `ls` command (for example, `-rwxr-x---`). For information on UNIX permissions, see the UNIX or Linux documentation.

The unix permissions can be modified only for qtrees with *unix* or *mixed* security style.

### **[-export-policy <text>] - Export Policy**

This optional parameter modifies the export policy associated with the qtree. If you do not specify an export policy name, the qtree inherits the export policy of the containing volume. For information on export policy, see the documentation for the [vserver export-policy create](#) command.

## Examples

The following example modifies a qtree named qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1. The qtree now has a UNIX security style and oplocks are enabled.

```
cluster1::> volume qtree modify -vserver vs0 -volume vol1 -qtree qtree1
-security-style unix -oplocks enabled
```

## Related Links

- [vserver export-policy create](#)

## volume qtree oplocks

### Modify qtree oplock mode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command allows you to display or modify the opportunistic lock mode of a qtree.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree for which the oplock mode is being displayed or modified.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

**[-oplock-mode {enable|disable}] - Oplock Mode**

This specifies the new oplock mode of the qtree. If this parameter is not specified, then the current oplock mode of the qtree is displayed.

Modifying qtree0's oplock mode will not affect any of the files in the other qtrees of this volume.

### Examples

The following example displays the oplock mode of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the oplock mode of a qtree called qtree2 to enabled. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree oplocks -vserver vs0 -volume vol1 -qtree qtree2
-oplock-mode enable
```

The following example uses a 7G-compatible command to display and modify the oplock mode of a qtree.

```
cluster1::> vserver context vs0
vs0::> qtree oplocks /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree oplocks /vol/vol1/qtree2 enable
```

## volume qtree rename

### Rename an existing qtree

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command allows you to rename an existing qtree.

The automatically created qtree in the volume - qtree0, listed in CLI output as "" - cannot be renamed.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree to be renamed.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree to be renamed.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format /vol/<volume name>/<qtree name> can be specified instead of specifying volume and qtree as separate arguments.

**-newname <qtree name> - Qtree New Name**

This specifies the new name of the qtree. The new qtree name cannot contain a forward slash (/) and cannot be more than 64 characters long.

#### Examples

The following example renames a qtree named qtree3 to qtree4. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree rename -vserver vs0 -volume vol1 -qtree qtree3
-newname qtree4
```

## volume qtree security

### Modify qtree security style

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command allows you to display or modify the security style of a qtree.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

**{ -volume <volume name> - Volume Name**

This specifies the name of the volume containing the qtree.

**-qtree <qtree name> - Qtree Name**

This specifies the name of the qtree for which the security style is being displayed or modified.

**| -qtree-path <qtree path> - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

**[-security-style <security style>] - Security Style**

This specifies the new security style of the qtree. If this parameter is not specified, then the current security style of the qtree is displayed. The supported values are *unix* (for UNIX uid, gid and mode bits), *ntfs* (for CIFS ACLs), and *mixed* (for NFS and CIFS access). Modifying a qtree's security style will not affect any of the files in the other qtrees of this volume.

#### Examples

The following example displays the security style of a qtree called qtree1. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
```

The following example modifies the security style of a qtree called qtree2 to unix. The Vserver name is vs0 and the volume containing the qtree is named vol1.

```
cluster1::> volume qtree security -vserver vs0 -volume vol1 -qtree qtree2
-security-style unix
```

The following example uses a 7G-compatible command to display and modify the security style of a qtree.

```
cluster1::> vserver context vs0
vs0::> qtree security /vol/vol1/qtree1
/vol/vol1/qtree1 has mixed security style and oplocks are disabled.
vs0::> qtree security /vol/vol1/qtree2 unix
```

## volume qtree show

### Display a list of qtrees

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command displays information about qtrees for online volumes. By default, the command displays the following information about all qtrees in the cluster:

- Vserver name
- Volume name
- Qtree name
- Security style (unix, ntfs, mixed or unified)
- Whether oplocks is enabled
- Status (normal or readonly)

The display will also include information about Qtree 0. When you create a volume, a special qtree referred to as "qtree0", also called the default qtree is automatically created for the volume. It represents all of the data stored in a volume that is not contained in a qtree. In the CLI output, qtree0 is denoted by empty quotation marks ("" ) and has the ID zero (0). The qtree called qtree0 cannot be manually created or deleted.

The qtree status indicates readonly for data protection and load sharing volumes.

To display detailed information about a single qtree, run the command with the *-instance* and *-qtree* parameters. The detailed view adds the following information:

- UNIX permissions
- Qtree ID
- Export policy
- Is Export Policy Inherited

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-exports ]**

Displays the following information about qtree exports:

- Vserver - The name of the Vserver the qtree belongs to
- Volume - The name of the volume the qtree resides on
- Qtree name - The name of the qtree
- Policy Name - The name of the export policy assigned to the qtree
- Is Export Policy Inherited - Whether the export policy assigned to the qtree is inherited

**| [-id ]**

Displays qtree IDs in addition to the default output.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

Selects information about the qtrees in the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

Selects information about the qtrees in the specified volume.

**[-qtree <qtree name>] - Qtree Name**

Selects information about the qtrees that have the specified name.

**| [-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path }**

Selects information about the qtrees that have the specified path.

**[-security-style <security style>] - Security Style**

Selects information about the qtrees that have the specified security style.

**[-oplock-mode {enable|disable}] - Oplock Mode**

Selects information about the qtrees that have the specified oplock mode.

**[-m, -unix-permissions <unix perm>] - Unix Permissions**

Selects information about the qtrees that have the specified UNIX permissions.

**[-qtree-id <integer>] - Qtree Id**

Selects information about the qtrees that have the specified ID. A valid qtree ID is an integer from 0 to 4994. All qtree0 (automatically created) qtrees have an ID of zero (0).

**[-status {normal|readonly}] - Qtree Status**

Selects information about the qtrees that have the specified status.

### **[`-export-policy <text>`] - Export Policy**

Selects information about the qtrees that use the specified export policy.

### **[`-is-export-policy-inherited {true|false}`] - Is Export Policy Inherited**

Selects information about the qtrees that inherit (true) or not inherit (false) the export policy of containing volume.

## **Examples**

The following example displays default information about all qtrees along with each qtree ID. Note that on vs0, no qtrees have been manually created, so only the automatically created qtrees referred to as qtree 0 are shown. On vs1, the volume named vs1\_vol1 contains qtree 0 and two manually created qtrees, qtree1 and qtree2.

```
cluster1::> volume qtree show -id
```

Vserver	Volume	Qtree	Style	Oplocks	Status	Id
vs0	vs0_vol1	""	unix	enable	readonly	0
vs0	vs0_vol2	""	unix	enable	normal	0
vs0	vs0_vol3	""	unix	enable	readonly	0
vs0	vs0_vol4	""	unix	enable	readonly	0
vs0	root_vs_vs0	""	unix	enable	normal	0
vs1	vs1_vol1	""	unix	enable	normal	0
vs1	vs1_vol1	qtree1	unix	disable	normal	1
vs1	vs1_vol1	qtree2	unix	enable	normal	2
vs1	root_vs_vs1	""	unix	enable	normal	0

9 entries were displayed.

## **volume qtree statistics-reset**

(DEPRECATED)-Reset qtree statistics in a volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

Note: This command does not support FlexGroups and will be deprecated in a future release of Data ONTAP. Use the [statistics qtree show](#) command to view qtree statistics.

This command resets qtree statistics for all qtrees in a volume.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver Name**

This specifies the name of the Vserver on which the volume containing the qtree belongs.

#### **`-volume <volume name>` - Volume Name**

This specifies the name of the volume containing the qtrees whose statistics you want to reset.

## Examples

The following example resets statistics for all qtrees on the volume named vol1 on the Vserver named vs0.

```
cluster1::> volume qtree statistics-reset -vserver vs0 -volume vol1
```

## Related Links

- [statistics qtree show](#)

## volume qtree statistics

(DEPRECATED)-Display qtree statistics

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

Note: This command does not support FlexGroups and will be deprecated in a future release of Data ONTAP. Use the [statistics qtree show](#) command to view qtree statistics.

This command displays NFS and CIFS operations statistics for qtrees. Note that qtree statistics are available only when the volume containing the qtree is online.

Statistics are cumulative values from the time the volume is brought online or when the statistics have been reset by using the "[volume qtree statistics-reset](#) " command.

The command output depends on the parameters specified with the command. If no parameters are specified, the command displays the following statistics information about all qtrees:

- Vserver name
- Volume name
- Qtree name
- NFS operations
- CIFS operations

Qtree statistics are not persistent. If you restart a node, if a storage takeover and giveback occurs, or if the containing volume is set to offline and then online, qtree statistics are set to zero.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-internal ] (privilege: advanced)**

If this parameter is specified, the output will also include the internal operation statistics. Internal operation is any operation on the qtree that originated within Data ONTAP software.

**| [-no-reset ] (privilege: advanced)**

If this parameter is specified, the output will display the NFS and CIFS op statistics since the time the volume was online.

**| [-no-reset-internal ] (privilege: advanced)**

If this parameter is specified, the output will also include the internal op statistics since the time the volume was online.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays information about the qtrees on the specified Vserver.

**{ [-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays information about the qtrees on the specified volume.

**[-qtree <qtree name>] - Qtree Name**

If this parameter is specified, the command displays information about the specified qtree.

**| [-qtree-path <qtree path>] - Actual (Non-Junction) Qtree Path }**

The qtree path argument in the format `/vol/<volume name>/<qtree name>` can be specified instead of specifying volume and qtree as separate arguments. The automatically created qtree0 can be represented as `/vol/<volume name>`.

**[-nfs-ops <Counter64>] - NFS operations since reset**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of NFS operations since the statistics was zeroed.

**[-cifs-ops <Counter64>] - CIFS operations since reset**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of CIFS operations since the statistics was zeroed.

**[-internal-ops <Counter64>] - Internal operations since reset (privilege: advanced)**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of internal operations since the statistics was zeroed.

**[-no-reset-nfs-ops <Counter64>] - NFS operations since online (privilege: advanced)**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of NFS operations since the volume was online.

**[-no-reset-cifs-ops <Counter64>] - CIFS operations since online (privilege: advanced)**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of CIFS operations since the volume was online.

**[-no-reset-internal-ops <Counter64>] - Internal operations since online (privilege: advanced)**

If this parameter is specified, the command displays information about qtrees that have the corresponding cumulative number of internal operations since the volume was online.

## Examples

The following example displays statistics information for all qtrees on the Vserver named vs0.

```
cluster1::> volume qtree statistics -vserver vs0
Vserver      Volume      Qtree      NFS Ops      CIFS Ops
-----
vs0          vol0        qtree1      10876        2678
vs0          vol1        qtree1a     16543        0
vs0          vol2        qtree2      0            0
vs0          vol2        qtree2a     0            0
4 entries were displayed.
```

The following example displays statistics information for qtrees on Vserver vs0 that have NFS ops more than 15000.

```
cluster1::> volume qtree statistics -vserver vs0 -nfs-ops >15000
Vserver      Volume      Qtree      NFS Ops      CIFS Ops
-----
vs0          vol1        qtree1a     16543        0
```

# volume quota commands

## volume quota modify

Modify quota state for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command allows you to modify the following quota attributes for one or more volumes:

- Quota state
- Whether quota exceeded messages are logged or not
- Frequency with which quota exceeded messages are logged

Modifications to the quota state for a volume creates a job to perform the quota state changes for that volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume whose quota attributes you are modifying is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume whose quota attributes you are modifying.

### **[-state <quota\_state>] - Quota State**

This parameter optionally modifies the quota state to one of the following:

- `off` - This indicates that quotas be deactivated for the specified volume.
- `on` - This indicates that quotas be activated for the specified volume.
- `resize` - This indicates that the quota limits be resized according to the values specified in the quota policy assigned to the Vserver. Note that quotas must be activated first for a volume before a resize operation can be performed.

Both quota activation and quota resize operations apply the quota rules configured for the volume within the quota policy that is currently assigned to the Vserver. These quota rules are managed by using the commands in the `volume quota policy rule` menu. Quotas, when activated for a volume, go through an initialization process. As part of the quota initialization all the quota rules are applied to the volume. In addition, a filesystem scanner is started to scan the entire filesystem within the volume to bring the quota accounting and reporting up to date. The quota job finishes after the filesystem scanner is started on the volume. The quota state for the volume is `initializing` until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on`.

When quotas are resized, the quota state is `resizing` until the resizing operation finishes. As part of this operation, the quota limits for quotas currently in effect are resized to the limits currently configured for the volume. After the quota resize operation finishes, the quota state will be `on`.

Quota state changes can also be performed using the commands `volume quota on`, `volume quota off` and `volume quota resize`.

### **[-logging {on|off}] - Logging Messages**

This parameter optionally specifies whether quota exceeded syslog/EMS messages are logged in the system log messages. When it is set to `on`, quota exceeded messages are generated when the user exceeds the quota's disk limit or the file limit through a NFS/CIFS operation or any operation within the Data ONTAP software. When set to `off` no quota exceeded messages are generated. This parameter can be changed only after quotas are activated for a volume.

### **[-logging-interval <text>] - Logging Interval**

This parameter optionally specifies a logging interval, which indicates the frequency with which quota exceeded messages are generated. You can specify a logging interval in the `<integer><suffix>` format, where suffix can be minutes (`m`), hours (`h`), or days (`d`), but not combinations thereof (in other words, `90m` is a valid logging interval, but `1h30m` is not a valid logging interval). You can modify the logging interval only when the logging is `on`. When quotas are first activated, the logging parameter is automatically set to `on`, and the logging interval set to `1h`. If continuous logging is required, an interval of `0m` should be specified. This parameter can be changed only after quotas are activated for a volume.

quota message logging may not occur at exactly the same interval rate as specified by the user, especially for very small intervals. This is due to the behavior of the logging system that buffers messages instead of outputting them immediately. Setting the logging interval to 0m can cause lots of quota exceeded messages to be logged in the system log messages.

### **[`-foreground <true>`] - Foreground Process**

This parameter optionally specifies whether the job created by quota state modify operation runs as a foreground process. The default setting is `false` (that is, the quota state modify operation runs in the background). When set to `true`, the command will not return until the job completes.

### **Examples**

The following example activates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state on
[Job 24] Job is queued: Quota ON Operation on vs0 volume vol1.
```

The following example turns on quota message logging and sets the logging interval to 4 hours.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -logging on
-logging-interval 4h
```

The following example resizes quota limits on a volume.

```
cluster1::> volume quota modify -vserver vs0 -volume vol1 -state resize
-foreground true
[Job 80] Job succeeded: Successful
```

### **Related Links**

- [job watch-progress](#)
- [volume quota on](#)
- [volume quota off](#)
- [volume quota resize](#)

### **volume quota off**

Turn off quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command creates a job to deactivate quotas for the specified volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are deactivating quotas.

### **[-foreground <true>] - Foreground Process**

This optionally specifies whether the job created for deactivating quotas runs as a foreground process. The default setting is `false` (that is, the operation runs in the background). When set to `true`, the command will not return until the job completes.

## Examples

The following example deactivates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota off -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota OFF Operation on vs0 volume vol1.
```

The following example uses a 7G-compatible command to deactivate quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> vs0 context vs0
vs0::> volume quota off vol1
[Job 25] Job is queued: Quota OFF Operation on vs0 volume vol1.
```

## volume quota on

Turn on quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command creates a job to activate quotas for the specified volume. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are activating quotas.

### **[-w, -foreground <true>] - Foreground Process**

This optionally specifies whether the job created for activating quotas runs as a foreground process. The default setting is `false` (that is, the operation runs in the background). When set to `true`, the command will not return until the job completes. The quota job finishes after the filesystem scanner is started. The quota state for the volume is `initializing` until the filesystem scanner finishes scanning the entire filesystem. After the scanning is complete, the quota state will be `on`.

## Examples

The following example activates quotas on the volume named `vol1`, which exists on Vserver `vs0`.

```
cluster1::> volume quota on -vserver vs0 -volume vol1
[Job 23] Job is queued: Quota ON Operation on vs0 volume vol1.
```

The following example uses a 7G-compatible command to activate quotas on the volume named `vol1` which exists on Vserver `vs0`.

```
cluster1::> vsenter context vs0
vs0::> quota on -w vol1
[Job 25] Job is queued: Quota ON Operation on vs0 volume vol1.

[Job 25] Job succeeded: Successful
```

## volume quota report

Display the quota report for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays the quota report for all volumes in each Vserver that are online and for which quotas are activated. Quota report includes the quota rules (default, explicit, and derived) in effect and the associated resource usage (disk space and files). If quotas are still initializing for a specific volume, that volume is not included.

This command displays the following information:

- Vserver name
- Volume name
- Index - This is a unique number within a volume assigned to each quota rule displayed in the quota report.
- Tree name - This field gives the name of the qtree if the quota rule is at the qtree level. It is empty if the quota rule is at the volume level.
- Quota type - Type of quota rule (`tree` or `user` or `group` ).
- Quota target - This field gives the name of the target of the quota rule. For tree quota rules, it will be the qtree ID of the qtree. For user quota rules, it will be the UNIX user name or the Windows user name. For group quota rules, it will be the UNIX group name. For default rules (`tree` or `user` or `group`), this will display `"*"` . If the UNIX user identifier, UNIX group identifier, or Windows security identifier no longer exists or if the identifier-to-name conversion fails, the target appears in numeric form.
- Quota target ID - This field gives the target of the quota rule in numeric form. For tree quota rules, it will be the qtree ID of the qtree. For group quota rules, it will be the UNIX group identifier. For UNIX user quota rules, it will be the UNIX user identifier. For Windows user quota rules, it will be the Windows security identifier in its native format. For default rules (`tree` or `user` or `group`), `"*"` will be displayed.
- Disk space used - For a default quota, the value is 0.
- Disk space limit
- Soft disk space limit
- Threshold for disk space limit
- Files used - For a default quota, the value is 0.
- File limit
- Soft file limit
- Quota specifier - For an explicit quota, this field shows how the quota target was configured by the administrator using the volume quota policy rule command. For a default quota, the field shows `" "` . For a derived tree quota, this field shows the qtree path. For a derived user and group quota, the field is either blank or `" "` .

The following parameters: `-soft` , `-soft-limit-thresholds` , `-target-id` , `-thresholds` , `-fields` and `-instance` display different set of fields listed above. For example, `-soft` will display the soft disk space limit and soft file limit apart from other information. Similarly `-target-id` will display the target in the numeric form.

A quota report is a resource intensive operation. If you run it on many volumes in the cluster, it might take a long time to complete. A more efficient way would be to view the quota report for a particular volume in a Vserver.

Depending upon the quota rules configured for a volume, the quota report for a single volume can be large. If you want to monitor the quota report entry for a particular tree/user/group repeatedly, find the index of that quota report entry and use the `-index` field to view only that quota report entry. See the examples section for an illustration.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-soft ]**

If this parameter is specified, the command display will include the soft disk space limit and the soft file limit.

**| [-soft-limit-thresholds ]**

If this parameter is specified, the command display will include the soft disk space limit, threshold for disk space limit and soft file limit.

**| [-target-id ]**

If this parameter is specified, the command will display the target of a user or group quota rule in numeric form.

**| [-thresholds ]**

If this parameter is specified, the command display will include the threshold for disk space limit.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays the quota report for volumes in the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays the quota report for the specified volume.

**[-index <integer>] - Index**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified index.

**[-tree <qtree name>] - Qtree Name**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified qtree name.

**[-quota-type <text>] - Quota Type**

If this parameter is specified, the command displays the quota report for the quota rules of the given type.

**[-quota-target <text>,...] - Quota Target**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target.

**[-quota-target-id <text>,...] - Quota Target ID**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota target identifier.

**[-disk-used {<integer>[KB|MB|GB|TB|PB] } ] - Disk Space Used**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space used value.

**`[-disk-limit {<integer>[KB|MB|GB|TB|PB] }]` - Disk Space Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified disk space limit.

**`[-files-used <integer>]` - Files Used**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified files used value.

**`[-file-limit <integer>]` - Files Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified file limit.

**`[-threshold {<integer>[KB|MB|GB|TB|PB] }]` - Disk Space Threshold**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified threshold for disk space limit.

**`[-soft-disk-limit {<integer>[KB|MB|GB|TB|PB] }]` - Soft Disk Space Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft disk space limit.

**`[-soft-file-limit <integer>]` - Soft Files Limit**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified soft file limit.

**`[-quota-specifier <text>]` - Quota Specifier**

If this parameter is specified, the command displays the quota report for the quota rules that have the specified quota specifier.

**`[-path <text>]` - Path**

If this parameter is specified, the command will display the quota report for the quota rules that are applicable for the file in the specified path. The format of the path to the file should begin with `/vol/<volume name>/`. The quota rules that are applicable typically consists of the tree quota rule corresponding to the qtree in which the file resides within the volume, user quota rule at the volume and qtree level corresponding to the UNIX user identifier or the Windows security identifier associated with the file and the group quota rule at the volume and qtree level corresponding to the UNIX group identifier associated with the file.

**`[-disk-used-pct-soft-disk-limit <percent_no_limit>]` - Disk Space Used % Soft Disk Space Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `soft-disk-limit`.

**`[-disk-used-pct-threshold <percent_no_limit>]` - Disk Space Used % Disk Space Threshold**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `threshold`.

**`[-disk-used-pct-disk-limit <percent_no_limit>]` - Disk Space Used % Disk Space Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `disk-used` and `disk-limit`.

**`[-files-used-pct-soft-file-limit <percent_no_limit>]` - Files Used % Soft File Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `files-used` and `soft-file-limit`.

**`[-files-used-pct-file-limit <percent_no_limit>]` - Files Used % File Limit**

If this parameter is specified, the command displays the quota report for entries that have the specified percent utilization. The attribute value is computed from `files-used` and `file-limit`.

**Examples**

The following example displays the quota report for all the volumes.

```
cluster1::> volume quota report
```

```
Vserver: vs0
```

----Disk----		----Files-----		Quota			
Volume	Tree	Type	ID	Used	Limit	Used	Limit
Specifier

vol2	vxw03	user	root,Engr\root	0.00B	-	1	-
vol2		user	root,Engr\root	0.00B	-	5	-
vol2		user	john,Engr\John	1MB	50MB	1	-
vol2	q1	user	john,Engr\John	1MB	50MB	1	-

```
28 entries were displayed.
```

The following example displays the quota report for the quota rules that are applicable for the given path to a file.

```
cluster1::> volume quota report -path /vol/vol2/q1/file1
Vserver: vs0
----Disk----  ----Files-----  Quota
Volume  Tree      Type    ID          Used  Limit    Used  Limit
Specifier
-----
vol2     q1         tree    1           1MB  100MB     2    10000   q1
vol2     q1         group   root        1MB   -         2     -
vol2         group   root        1MB   -         6     -
vol2         user    john,Engr\John  1MB  50MB     1     -    *
vol2     q1         user    john,Engr\John  1MB  50MB     1     -
5 entries were displayed.
```

The following example displays the quota report with the target in the numeric form for the given path to a file.

```
cluster1::> volume quota report -path /vol/vol2/q1/file1 -target-id
Vserver: vs0
----Disk----  ----Files-----  Quota
Volume  Tree      Type    ID          Used  Limit    Used  Limit
Specifier
-----
vol2     q1         tree    1           1MB  100MB     2    10000   q1
vol2     q1         group   0           1MB   -         2     -
vol2         group   0           1MB   -         6     -
vol2         user    8017,S-1-5-21-3567637-1906459281-1427260136-60871  1MB  50MB     1     -    *
vol2     q1         user    8017,S-1-5-21-3567637-1906459281-1427260136-60871  1MB  50MB     1     -
5 entries were displayed.
```

The following example shows how to monitor the quota report for a particular user/tree/group. First, the quota report command is issued with -instance to see the index field for the quota report entry we are interested in. Next, the quota report is issued with the -index field specified to fetch only that particular quota report entry repeatedly to view the usage over time.

```
cluster1::> volume quota report -vserver vs0 -volume vol1 -quota-type user
```

```

-quota-target john -tree q1 -instance
Vserver Name: vs0

        Volume Name: voll
            Index: 10
            Qtree Name: q1
            Quota Type: user
            Quota Target: john
            Quota Target ID: 5433
            Disk Space Used: 50.5MB
            Disk Space Limit: 100MB
            Files Used: 205
            Files Limit: -
            Disk Space Threshold: 95MB
            Soft Disk Space Limit: 80MB
            Soft Files Limit: -
            Quota Specifier: john
Disk Space Used % Soft Disk Space Limit: 63%
Disk Space Used % Disk Space Threshold: 53%
Disk Space Used % Disk Space Limit: 51%

## volume quota resize

### Resize quotas for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

This command resizes the quota limits for the quotas currently in effect for the specified volume. It creates a job to resize quotas. You can monitor the progress of the job by using the [job show](#) and [job watch-progress](#) commands.

Quotas must be activated before quota limits can be resized.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the name of the Vserver on which the volume is located.

**-volume <volume name> - Volume Name**

This specifies the name of the volume on which you are resizing the quota limits and threshold.

**[-foreground <true>] - Foreground Process**

This optionally specifies whether the job created for resizing quotas runs as a foreground process. The default setting is *false* (that is, the operation runs in the background). When set to *true*, the command will not return until the job completes.

## Examples

The following example resizes quotas on the volume named `vol1` , which exists on Vserver `vs0` .

```
cluster1::> volume quota resize -vserver vs0 -volume vol1
[Job 34] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

The following example uses a 7G-compatible command to resize quotas on the volume named `vol1` which exists on Vserver `vs0` .

```
cluster1::> vserver context vs0
vs0::> quota resize vol1
[Job 35] Job is queued: Quota RESIZE Operation on vserver vs0 volume vol1.
```

## volume quota show

Display quota state for volumes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command displays information about quotas for online volumes. The command output depends on the parameters specified with the command. Quotas can only be administered on FlexVol volumes. If no parameters are specified, the command displays the following information for all volumes:

- Vserver name
- Volume name
- Quota state - quota state for this volume. The possible values are as follows:
  - `off` - this state indicates that quotas are deactivated for the volume.
  - `on` - this state indicates that quotas are activated for the volume.
  - `initializing` - this state indicates that quotas are being initialized for the volume.
  - `resizing` - this state indicates that quota limits are being resized for the volume.
  - `corrupt` - this state indicates that quotas are corrupt for this volume.
  - `mixed` - this state may only occur for FlexGroups, and indicates that the constituent volumes are not all in the same state.
- Scan status - percentage of the files in the volume scanned by the quota scanner that runs as part of activating quotas.
- Last error - most recently generated error message as part of the last quota operation (`on` or `resize` ).

Present only if an error has been generated.

To display detailed information about all volumes, run the command with the `-instance` parameter. The detailed view provides all of the information in the previous list and the following additional information:

- Logging messages - whether quota exceeded syslog/EMS messages are logged or not. For volumes where the quota logging parameter is set to `on`, quota exceeded messages are generated when a NFS/CIFS operation or any internal Data ONTAP operation is being prevented because the quota disk usage is exceeding the disk limit or the quota file usage is exceeding the file limit. For quotas where the logging parameter is set to `off`, no quota exceeded messages are generated.
- Logging interval - frequency with which quota exceeded messages are logged. This parameter only applies to volumes that have the logging parameter set to `on`.
- Sub status - additional status about quotas for this volume. Following are the possible values reported:
  - `upgrading` - this indicates that the quota metadata format is being upgraded from an older version to a newer version for the volume.
  - `setup` - this indicates that the quotas are being setup on the volume.
  - `transferring rules` - this indicates that the quota rules are being transferred to the volume.
  - `scanning` - this indicates that the quota filesystem scanner is currently running on the volume.
  - `finishing` - this indicates that the quota `on` or `resize` operation is in the final stage of the operation.
  - `done` - this indicates that the quota operation is finished.
  - `none` - this indicates that there is no additional status.
- All errors - collection of all the error messages generated as part of the last quota operation (`on` or `resize`) since the volume was online.
- User quota enforced (advanced privilege only) - indicates whether there are user quota rules being enforced.
- Group quota enforced (advanced privilege only)- indicates whether there are group quota rules being enforced.
- Tree quota enforced (advanced privilege only) - indicates whether there are tree quota rules being enforced.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-logmsg ]**

If this parameter is specified, the command displays whether quota exceeded messages are logged and the logging interval for the quota messages.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays information for the volumes in the specified Vserver.

**[`-volume <volume name>`] - Volume Name**

If this parameter is specified, the command displays information for the specified volume.

**[`-state <quota_state>`] - Quota State**

If this parameter is specified, the command displays information for the volumes that have the specified quota state.

**[`-scan-status <percent>`] - Scan Status**

If this parameter is specified, the command displays information about the volumes whose scan-status matches the specified percentage value. The scan status is displayed in the format [0-100]%.

**[`-logging {on|off}`] - Logging Messages**

If this parameter is specified, the command displays information about the volumes that have the specified logging setting.

**[`-logging-interval <text>`] - Logging Interval**

If this parameter is specified, the command displays information about the volumes that have the specified quota logging interval.

**[`-sub-status <text>`] - Sub Quota Status**

If this parameter is specified, the command displays information about the volumes that have the specified quota sub-status.

**[`-last-error <text>`] - Last Quota Error Message**

If this parameter is specified, the command displays information about the volumes whose last error matches the specified error message.

**[`-errors <text>`] - Collection of Quota Errors**

If this parameter is specified, the command displays information about the volumes whose collection of errors match the specified error message.

**[`-is-user-quota-enforced {true|false}`] - User Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

**[`-is-group-quota-enforced {true|false}`] - Group Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

**[`-is-tree-quota-enforced {true|false}`] - Tree Quota enforced (privilege: advanced)**

If this parameter is specified, the command displays information about the volumes that have the specified value for this field.

## Examples

The following example displays information about all volumes on the Vserver named `vs0`.

```
cluster1::> volume quota show -vserver vs0
```

Vserver	Volume	State	Scan Status
-----	-----	-----	-----
vs0	root_vs0	off	-
vs0	vol1	off	-
Last Error: Volume vol1 has no valid quota rules			
vs0	vol2	on	-
vs0	vol3	initializing	30%

4 entries were displayed.

The following example displays the logging information for all the volumes.

```
cluster1::> volume quota show -logmsg
```

Vserver	Volume	State	Logging Message	Logging Interval
-----	-----	-----	-----	-----
vs0	root_vs0	off	-	-
vs0	vol1	off	-	-
vs0	vol2	on	on	1h
vs0	vol3	on	on	1h

4 entries were displayed.

The following example displays detailed information in advanced privilege for a volume `vol1` , which exists on Vserver `vs0`

```
cluster1::> set advanced
```

Warning: These advanced commands are potentially dangerous; use them only when

directed to do so by NetApp personnel.

Do you want to continue? {y|n}: y

```
cluster1::*> volume quota show -instance -vserver vs0 -volume vol1
```

Vserver Name: vs0

Volume Name: vol1

Quota State: on

Scan Status: -

Logging Messages: on

Logging Interval: 1h

Sub Quota Status: none

Last Quota Error Message: -

Collection of Quota Errors: -

User Quota enforced: true

Group Quota enforced: false

Tree Quota enforced: false

The following example displays the detailed information when quotas are upgrading for volume `vol1` , which exists on Vserver `vs0` .

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
```

Vserver Name: vs0

Volume Name: vol1

Quota State: initializing

Scan Status: 3%

Logging Messages: -

Logging Interval: -

Sub Quota Status: upgrading

Last Quota Error Message: -

Collection of Quota Errors: -

The following example displays the "Last Quota Error Message" and the "Collection of Quota Errors" for volume `vol1` , which exists on Vserver `vs0`

```
cluster1::> volume quota show -instance -vserver vs0 -volume vol1
Vserver Name: vs0
Volume Name: vol1
Quota State: on
Scan Status: -
Logging Messages: on
Logging Interval: 1h
Sub Quota Status: none
Last Quota Error Message: second definition for user2 (type:user
target:user2,user4 qtree:"").
Collection of Quota Errors: second definition for user1 (type:user
target:user1,user3 qtree:"").
                                second definition for user2 (type:user
target:user2,user4 qtree:"").
```

## volume quota policy copy

### Copy a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command copies a quota policy and the rules it contains. You must enter the following information to copy a quota policy:

- Vserver name
- Policy name
- New policy name

### Parameters

#### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver from which you are copying the quota policy.

#### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are copying.

#### **-new-policy-name <text> - New Policy Name**

This parameter specifies the name of the new quota policy you are copying to. The new name cannot have more than 32 characters.

### Examples

The following example copies a quota policy named `quota_policy_0` on Vserver `vs0`. It is copied to `quota_policy_1`.

```
cluster1::> volume quota policy copy -vserver vs0 -policy-name  
quota_policy_0 -new-policy-name quota_policy_1
```

## volume quota policy create

### Create a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

A quota policy is collection of quota rules for all the volumes in a specific Vserver. This command creates a quota policy for a specific Vserver. Multiple quota policies can be created for a Vserver, but only one of them can be assigned to the Vserver. A Vserver can have a maximum of five quota policies. If five quota policies already exist, the command fails and a quota policy must be deleted before another quota policy can be created.

When you turn on quotas for a volume, the quota rules to be enforced on that volume will be picked from the quota policy that is assigned to the Vserver containing that volume. The quota policy for clustered volumes is equivalent to the `/etc/quotas` file in 7G.

You must enter the following information to create a quota policy:

- Vserver name
- Policy name

#### Parameters

##### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver for which you are creating the quota policy. You can create a quota policy only for a data Vserver. Quota policies cannot be created for a node or admin Vserver.

##### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are creating. The quota policy name cannot be more than 32 characters long and must be unique within the Vserver.

#### Examples

The following example creates a quota policy named `quota_policy_0` on Vserver `vs0`.

```
cluster1::> volume quota policy create -vserver vs0 -policy-name  
quota_policy_0
```

## volume quota policy delete

### Delete a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command deletes a quota policy and all the rules it contains. The policy can be deleted only when it is not assigned to the Vserver. You must enter the following information to delete a quota policy:

- Vserver name
- Policy name

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy you want to delete.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you want to delete.

## Examples

The following example deletes a quota policy named quota\_policy\_5 on Vserver vs0.

```
cluster1::> volume quota policy delete -vserver vs0 -policy-name  
quota_policy_5
```

## volume quota policy rename

### Rename a quota policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

This command renames a quota policy. You must enter the following information to rename a quota policy:

- Vserver name
- Policy name
- New policy name

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy you want to rename.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy you are renaming.

### **-new-policy-name <text> - New Policy Name**

This parameter specifies the new name of the quota policy. The new name cannot be more than 32 characters long.

## Examples

The following example renames a quota policy named `quota_policy_0` on Vserver `vs0`. The policy's new name is `quota_policy_1`.

```
cluster1::> volume quota policy rename -vserver vs0 -policy-name  
quota_policy_0 -new-policy-name quota_policy_1
```

## volume quota policy show

Display the quota policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command displays information about quota policies. The command displays the following information about all quota policies:

- Vserver name
- Policy name
- When the policy was last modified

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information about the quota policies for the specified Vserver.

**[-policy-name <text>] - Policy Name**

If this optional parameter is specified, the command displays information about quota policies that match the specified name.

**[-last-modified <MM/DD/YYYY HH:MM:SS>] - Last Modified**

If this optional parameter is specified, the command displays information about quota policies with the last modified time that match the given time.

## Examples

The following example displays information about all quota policies.

```
cluster1::> volume quota policy show
Vserver                Policy Name                Last Modified
-----
vs0                    quota_policy_vs0          10/16/2008 17:40:05
vs1                    quota_policy_vs1          10/16/2008 17:47:45
vs2                    quota_policy_vs2          10/16/2008 17:44:13
vs3                    quota_policy_vs3          10/16/2008 17:44:13
4 entries were displayed.
```

## volume quota policy rule create

### Create a new quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

This command creates a quota policy rule. You must enter the following information to create a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

You can optionally specify the following additional attributes for the quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

For a new quota policy rule to get enforced on the volume, you should create the rule in the quota policy assigned to the Vserver. Additionally, a quota off and on or a quota resize operation must be done using the "[volume quota modify](#)" command.

### Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are creating a rule.

**-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are creating a rule.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are creating a rule.

**-type {tree|user|group} - Type**

This parameter specifies the quota target type of the rule you are creating.

**-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies. For default quota rules, this parameter should be specified as "". For explicit tree quotas rules, this parameter should indicate the qtree name. For explicit user quota rules, this parameter can contain UNIX user name, UNIX user identifier, Windows user name, Windows Security Identifier or a path to an existing object within the volume. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash (\) or an @ sign; user names with these characters are treated as Windows names. For multi-user quotas, this parameter can contain multiple user targets separated by a comma. For explicit group quota rules, this parameter can contain UNIX group name or UNIX group identifier or a path to an existing object within the volume. When a path is specified as the target, it should be of the format /vol/<vol-name>/<path to file from volume root> where the volume matches that of the -volume parameter.

**-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree to which the quota rule applies. This parameter is not applicable for tree type rules. For user or group type rules at the volume level, this parameter should contain "".

**[-user-mapping {on|off}] - User Mapping**

This parameter optionally specifies if user mapping needs to be performed for a user quota rule. If this parameter is "on", the UNIX user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together. The mapping will be obtained as configured in "vserver name-mapping".

Note that this parameter can be specified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a UNIX user name or a Windows user name and cannot be specified for multi-user quota targets.

**[-disk-limit {<size>|-}] - Disk Limit**

This parameter optionally specifies a hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. When the hard disk space limit is reached, no additional disk space can be consumed by the specified target. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks. The value can be larger than the amount of disk space available in the volume.

**[-file-limit {<integer>|-}] - Files Limit**

This parameter optionally specifies a hard limit for the number of files permitted on the quota target. When the hard number of files limit is reached, no additional files can be created by the specified target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of

unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

#### **`[-threshold {<size>|-}] - Threshold for Disk Limit`**

This parameter optionally specifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. When the disk limit threshold is exceeded, a console message, EMS events, and SNMP traps are generated. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

#### **`[-soft-disk-limit {<size>|-}] - Soft Disk Limit`**

This parameter optionally specifies a soft limit for the disk space that can be consumed by the quota target. The soft disk limit indicates that the hard limit for the disk space will soon be exceeded. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. When the soft limit for the disk space is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the disk space used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 1,125,899,906,842,620 KB, which is approximately 1,023 PB. The value should be a multiple of 4 KB. If it is not, this field can appear incorrect in quota reports. This happens because the field is always rounded up to the nearest multiple of 4 KB to match disk space limits, which are translated into 4-KB disk blocks.

#### **`[-soft-file-limit {<integer>|-}] - Soft Files Limit`**

This parameter optionally specifies a soft limit for the number of files permitted on the quota target. The soft file limit indicates that the hard limit for the number of files will soon be exceeded. When the soft limit for the number of files is exceeded, a console message, EMS events and SNMP traps are generated. The same happens when the files used goes below the specified limit. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter or by not specifying this parameter and will be indicated by a "-". The maximum value is 4,294,967,295.

### **Examples**

The following example creates a default tree quota rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to all qtrees on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target ""
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX user *myuser* for a qtree named *qtree1* on volume *vol0* with a disk limit of 20 Gigabytes, soft disk limit of 15.4 Gigabytes and threshold limit of 15.4 Gigabytes. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtrees qtrees1 -user-mapping on -disk-limit 20GB -soft-disk-limit 15.4GB
-threshold 15.4GB
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the Windows user *DOMXYZ\myuser* for a qtrees named *qtrees1* on volume *vol0* with a file limit of *40000* and a soft file limit of *26500*. User mapping is turned on for this rule.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target DOMXYZ\myuser
-qtrees qtrees1 -user-mapping on -file-limit 40000 -soft-file-limit 26500
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX user identifier *12345* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target 12345
-qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the Windows Security Identifier *S-123-456-789* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target S-123-456-789 -qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the UNIX group *engr* for a qtrees named *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type group -target engr
-qtrees qtrees1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the user who is the owner of the file */vol/vol0/qtrees1/file1.txt* for qtrees *qtrees1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0 -policy-name
quota_policy_0 -volume vol0 -type user -target /vol/vol0/qtree1/file1.txt
-qtree qtree1
```

The following example creates a quota policy rule for volume *vol0* in Vserver *vs0* and in the quota policy named *quota\_policy\_0*. This quota policy applies to the users specified in the target for qtree *qtree1* on volume *vol0*.

```
cluster1::> volume quota policy rule create -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user
-target user1,DOMXYZ\user2,23457,S-126-098-567,/vol/vol0/qtree1/file2.txt
-qtree qtree1
```

## Related Links

- [volume quota modify](#)

## volume quota policy rule delete

Delete an existing quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume quota policy rule delete` command deletes a quota policy rule. You must enter the following information to delete a quota policy rule:

- Vserver name
- Quota policy name
- Volume name
- Quota target type
- Target to which the rule applies
- Qtree to which the rule applies

If the rule being deleted belongs to the quota policy that is currently assigned to the Vserver, enforcement of the rule on the volume must be terminated by performing a quota off and on or a quota resize operation using the "[volume quota modify](#)" command.

## Parameters

**-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are deleting a rule.

**-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are deleting a rule.

**-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are deleting a rule.

**-type {tree|user|group} - Type**

This parameter specifies the quota target type for the rule.

**-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies.

**-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree for which you are deleting a rule.

**Examples**

The following example deletes a quota policy rule on Vserver vs1 for the quota policy named quota\_policy\_1. This quota policy applies to the group named engr for the qtree named qtree1 on volume vol1.

```
cluster1::> volume quota policy rule delete -vserver vs1  
-policy-name quota_policy_1 -volume vol1 -type group -target engr  
-qtree qtree1
```

**Related Links**

- [volume quota modify](#)

**volume quota policy rule modify**

Modify an existing quota rule

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

This command can be used to modify the following attributes of a quota policy rule:

- User mapping
- Hard disk limit
- Hard file limit
- Threshold for disk limit
- Soft disk limit
- Soft file limit

If the rule being modified belongs to the quota policy that is currently assigned to the Vserver, rule enforcement on the volume must be enabled by performing a quota off and on or a quota resize operation using the "[volume quota modify](#)" command.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the Vserver containing the quota policy for which you are modifying a rule.

### **-policy-name <text> - Policy Name**

This parameter specifies the name of the quota policy in which you are modifying a rule.

### **-volume <volume name> - Volume Name**

This parameter specifies the name of the volume for which you are modifying a rule.

### **-type {tree|user|group} - Type**

This parameter specifies the quota target type for the rule you are modifying.

### **-target <text> - Target**

This parameter specifies the target to which the quota policy rule applies. If the target is a user, the user ID or username must be the same one that was used to create the quota. The same restriction is there for both group ID or groupname and Windows SID or Windows account name.

### **-qtree <qtree name> - Qtree Name**

This parameter specifies the name of the qtree to which the quota policy rule applies.

### **[-user-mapping {on|off}] - User Mapping**

This parameter optionally modifies the user mapping for a user quota rule. The value for this parameter can be modified only for quota policy rules of type user. A value of "on" can be specified for this parameter only if the quota target is a unix user name or a Windows user name and cannot be specified for multi-user quota targets. If this parameter is "on", the unix user name specified as the quota target will be mapped to the corresponding Windows user name or vice-versa and quota accounting will be performed for the users together.

### **[-disk-limit {<size>|-}] - Disk Limit**

This parameter optionally modifies the hard limit for the disk space that can be consumed by the quota target. The default unit for the disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the threshold and soft disk limit. A disk limit of unlimited can be specified with a "-" for this parameter.

### **[-file-limit {<integer>|-}] - Files Limit**

This parameter optionally modifies the hard limit for the number of files permitted on the quota target. The value that you specify for this parameter should be greater than or equal to the soft file limit. A file limit of unlimited can be specified with a "-" for this parameter.

### **[-threshold {<size>|-}] - Threshold for Disk Limit**

This parameter optionally modifies the disk limit threshold for the quota target. The default unit for the disk limit threshold is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be greater than or equal to the soft disk limit and equal to or less than the disk limit. A threshold limit of unlimited can be specified with a "-" for this parameter.

### **[`-soft-disk-limit` {<size>|-}] - Soft Disk Limit**

This parameter optionally modifies the soft limit for the disk space that can be consumed by the quota target. The default unit for the soft disk limit is assumed to be Kilobytes if no units are specified. The value that you specify for this parameter should be equal to or less than the threshold and the disk limit. A soft disk limit of unlimited can be specified with a "-" for this parameter.

### **[`-soft-file-limit` {<integer>|-}] - Soft Files Limit**

This parameter optionally modifies the soft limit for the number of files permitted on the quota target. The value that you specify for this parameter should be equal to or less than the file limit. A soft file limit of unlimited can be specified with a "-" for this parameter.

## **Examples**

The following example modifies a quota policy rule for the quota policy named `quota_policy_0`. This quota policy exists on Vserver `vs0` and applies to the user named `myuser` for qtree named `qtree1` on volume `vol0`. The user mapping is turned on, the hard disk limit is set to 20 GB and the hard file limit is set to 100,000 files.

```
cluster1::> volume quota policy rule modify -vserver vs0
-policy-name quota_policy_0 -volume vol0 -type user -target myuser
-qtree qtree1 -user-mapping on -disk-limit 20GB -file-limit 100000
```

## **Related Links**

- [volume quota modify](#)

## **volume quota policy rule show**

Display the quota rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command displays the following information about quota policy rules by default.

- Vserver name
- Quota policy name
- Volume name
- Type of quota policy rule
- Target of the quota policy rule
- Qtree name
- User mapping
- Hard disk limit
- Soft disk limit
- Hard file limit
- Soft file limit

- Threshold for disk limit

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information about quota rules for the quotas contained on volumes on the specified Vserver.

**[-policy-name <text>] - Policy Name**

If this parameter is specified, the command displays information about quota rules for the specified quota policy.

**[-volume <volume name>] - Volume Name**

If this parameter is specified, the command displays information about quota rules for the quota policy associated with the specified volume.

**[-type {tree|user|group}] - Type**

If this parameter is specified, the command displays information about quota rules for the specified quota type.

**[-target <text>] - Target**

If this parameter is specified, the command displays information about quota rules for the specified target.

**[-qtree <qtree name>] - Qtree Name**

If this parameter is specified, the command displays information about quota rules for the specified qtree.

**[-user-mapping {on|off}] - User Mapping**

If this parameter is specified, the command displays information about quota rules having the specified user-mapping value.

**[-disk-limit {<size>|-}] - Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified hard disk limit.

**[-file-limit {<integer>|-}] - Files Limit**

If this parameter is specified, the command displays information about quota rules having the specified hard file limit.

**[-threshold {<size>|-}] - Threshold for Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified disk limit threshold.

### **[`-soft-disk-limit` {<size>|-}] - Soft Disk Limit**

If this parameter is specified, the command displays information about quota rules having the specified soft disk limit.

### **[`-soft-file-limit` {<integer>|-}] - Soft Files Limit**

If this parameter is specified, the command displays information about quota rules having the specified soft file limit.

## **Examples**

The following example displays information about all the quota policy rules in a cluster. There is one user rule that exists on Vserver vs0 for the quota policy named quota\_policy\_0. This quota policy applies to the user named myuser for qtree named qtree0 on volume vol0.

```
cluster1::> volume quota policy rule show
Vserver: vs0      Policy: quota_policy_0      Volume: vol0
Soft      Soft
Type      Target  Qtree  User      Disk      Disk      Files      Files
-----  -----  -----  -----  -----  -----  -----  -----  -----
tree     myuser  qtree0  on        20GB      18GB      100000     80000     16GB
```

## **volume quota policy rule count show**

Display count of quota rules

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## **Description**

This command displays various counts of quota policy rules defined within a quota policy. By default, the subtotal for each volume is displayed. Optionally, the command can provide the total rule count across the entire quota policy or detailed subtotals organized by qtree and quota rule type.

## **Parameters**

**{ [`-fields` <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [`-detail` ]**

Displays rule count subtotals for each quota rule type. The subtotals for each type are computed for a specific volume and qtree.

**| [-hierarchy ]**

Displays rule count subtotals in hierarchical format with subtotals at the quota policy, volume, qtree, and quota rule type levels.

**| [-total ]**

Displays the total rule count for each Vserver and quota policy.

**| [-instance ] }**

Displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Displays quota rule counts for the specified Vserver.

**[-policy-name <text>] - Policy Name**

Displays quota rule counts for the specified quota policy.

**[-volume <volume name>] - Volume Name**

Displays quota rule counts for the specified volume.

**[-qtree <qtree name>] - Qtree Name**

Displays quota rule counts for the specified qtree.

**[-type {tree|user|group}] - Type**

Displays quota rule counts for the specified quota rule type.

**[-count-where-policy-volume-qtree-type <integer>] - Qtree/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, qtree, and quota rule type. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume-qtree <integer>] - Qtree Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, and qtree. All quota rule types are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume-type <integer>] - Volume/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, volume, and quota rule type. All qtrees are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-volume <integer>] - Volume Subtotal**

Subtotal of rules matching the given Vserver, quota policy, and volume. All qtrees and quota rule types are included. If specified as input, only matching totals are displayed.

**[-count-where-policy-type <integer>] - Policy/Type Subtotal**

Subtotal of rules matching the given Vserver, quota policy, and quota rule type. All volumes and qtrees are included. If specified as input, only matching totals are displayed.

**[-count-where-policy <integer>] - Policy Total**

Total rule count matching the given Vserver and quota policy. All volumes, qtrees, and quota rule types are included. If specified as input, only matching totals are displayed.

### Examples

The following example shows quota rule counts for Vserver *vs0* , quota policy *default* . The total number of rules in quota policy *default* is 7500. There are two volumes with quota rules configured. Volume *volume0* has a total of 1000 rules, and *volume1* has a total of 6500 rules.

```
cluster1::> volume quota policy rule count show -vserver vs0 -policy-name
default

Vserver: vs0                Policy: default
Rule
Volume                      Count
-----
volume0                     1000
volume1                     6500
2 entries were displayed.
```

## volume reallocation commands

### volume reallocation measure

Start reallocate measure job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

#### Description

Performs a measure-only reallocation check on a LUN, NVMe namespace, file, or volume. At the end of each check, the system logs the optimization results in the Event Message System (EMS). If you use the `logfile` , the system records detailed information about the LUN, NVMe namespace, file, or volume layout in the log file. To view previous measure-only reallocation checks, use the [volume reallocation show](#) command.

This command is not supported for FlexGroups or FlexGroup constituents.

#### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**{ [-i, -interval <text>] - Interval Schedule**

Specifies the reallocation scan interval in

- m for minutes
- h for hours

- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

#### **[ -o, -once <true>] - Once }**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

#### **[ -l, -logpath <text>] - Log Path**

Specifies the path for reallocation logs.

#### **[ -t, -threshold <integer>] - Threshold**

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

### **Examples**

```
cluster1::> volume reallocation measure -path /vol/vol2 -once
[Job 167] Job is queued: Reallocate Job.
```

Performs a one-time, measure-only reallocation scan on volume vol2.

### **Related Links**

- [volume reallocation show](#)

## **volume reallocation off**

### **Disable reallocate jobs**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

Disables all reallocation jobs globally in a cluster. After you use this command, you cannot start or restart any reallocation jobs. All jobs that are executing when you use this command are stopped. You must use the `reallocate on` command to enable or restart reallocation jobs globally in a cluster.

This command is not supported for FlexGroups or FlexGroup constituents.

## Examples

```
cluster1::> volume reallocation off
```

Disables all reallocation jobs globally in a cluster.

## volume reallocation on

### Enable reallocate jobs

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Globally enables all reallocation jobs in a cluster. You must globally enable reallocation scans in the cluster before you can run a scan or schedule regular scans. Reallocation scans are disabled by default.

This command is not supported for FlexGroups or FlexGroup constituents.

## Examples

```
cluster1::> volume reallocation on
```

Globally enables all reallocation jobs on a cluster.

## volume reallocation quiesce

### Quiesce reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Temporarily stops any reallocation jobs that are in progress. When you use this command, the persistent state is saved. You can use the [volume reallocation restart](#) command to restart a job that is quiesced.

There is no limit to how long a job can remain in the quiesced state.

This command is not supported for FlexGroups or FlexGroup constituents.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the file path of the LUN, NVMe namespace, file, or volume that you want to stop temporarily.

## Examples

```
cluster1::> volume reallocation quiesce /vol/vol2
2 entries were acted on.
```

Temporarily stops all reallocation jobs on volume vol2.

## Related Links

- [volume reallocation restart](#)

## volume reallocation restart

### Restart reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Starts a reallocation job. Use this command to start a quiesced (temporarily stopped) job or a scheduled scan that is idle.

This command is not supported for FlexGroups or FlexGroup constituents.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the file path of the LUN, NVMe namespace, file, or volume on which you want to restart reallocation scans.

**[-i, -ignore-checkpoint <true>] - Ignore Checkpoint**

Restarts the job at the beginning when set to true. If you use this command without specifying this parameter, its effective value is false and the job starts the scan at the point where it stopped. If you specify this parameter without a value, it is set to true and the scan restarts at the beginning.

## Examples

```
cluster1::> volume reallocation restart /vol/vol2
2 entries were acted on.
```

Restarts two reallocation jobs on volume vol2.

## volume reallocation schedule

### Modify schedule of reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

Schedules a reallocation scan for an existing reallocation job. If the reallocation job does not exist, use the [volume reallocation start](#) command to define a reallocation job.

You can delete an existing reallocation scan schedule. However, if you do this, the job's scan interval reverts to the schedule that was defined for it when the job was created with the [volume reallocation start](#) command.

This command is not supported for FlexGroups or FlexGroup constituents.

## Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**[-d, -del <true>] - Delete**

Deletes an existing reallocation schedule when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation schedule is not deleted. If you specify this parameter without a value, it is set to true and the reallocation schedule is deleted.

**[-s, -cron <text>] - Cron Schedule**

Specifies the schedule with the following four fields in sequence. Use a space between field values. Enclose the values in double quotes.

- minute is a value from 0 to 59.
- hour is a value from 0 (midnight) to 23 (11:00 p.m.).
- day of week is a value from 0 (Sunday) to 6 (Saturday).
- day of month is a value from 1 to 31.

If you specify 31 as the value for the day of month, reallocation scans will not run in any months with fewer than 31 days.

Use an asterisk "\*" as a wildcard to indicate every value for that field. For example, an \* in the day of month field means every day of the month. You cannot use the wildcard in the minute field.

You can enter a number, a range, or a comma-separated list of values for a field.

## Examples

```
cluster1::> volume reallocation schedule -s "0 23 6 *" /vol/db/lun1
```

Schedules a reallocation job to run at 11 pm every Saturday on lun1.

## Related Links

- [volume reallocation start](#)

## volume reallocation show

Show reallocate job status

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Displays the status of a reallocation scan, including the state, schedule, interval, optimization, and log files. If you do not specify the `path` for a particular reallocation scan, then the command displays all the reallocation scans.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-v ]**

Specify this parameter to display the output in a verbose format.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

Specify this parameter to display reallocation scans that match the Vserver that you specify.

**[-path <text>] - Path**

Specify this parameter to display reallocation scans that match the path that you specify.

**[-t, -threshold <integer>] - Threshold**

Specify this parameter to display reallocation scans that match the threshold that you specify.

**[-id <integer>] - Job ID**

Specify this parameter to display reallocation scans that match the reallocation job ID that you specify.

**[-description <text>] - Job Description**

Specify this parameter to display reallocation scans that match the text description that you specify.

**[-state**

**{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - Job State**

Specify this parameter to display reallocation jobs that match the state that you specify.

**[-progress <text>] - Execution Progress**

Specify this parameter to list the running reallocation jobs whose progress indicator matches the text that you provide. For example, if you specify `"Starting ..."` as the text string for the progress option, then the

system lists all of the jobs that are starting.

### **[`-schedule <job_schedule>`] - Schedule Name**

Specify this parameter to display reallocation scans that match the schedule name that you specify. If you want a list of all job schedules, use the [job schedule show](#) command.

### **[`-global-status <text>`] - Global State of Scans**

Specify this parameter to indicate if reallocation scans are on or off globally. You must type either of the following text strings:

- "Reallocation scans are on"
- "Reallocation scans are off"

## **Examples**

```
cluster1:> volume reallocation show
Vserver      Description      Schedule      State
-----
Reallocation scans are on
vs0          /vol/vol2,space-optimized  reallocate_1d  Queued
```

Displays the Vserver, description, schedule, and state for the reallocation scans on the local node.

## **Related Links**

- [job schedule show](#)

## **volume reallocation start**

Start reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## **Description**

Begins a reallocation scan on a LUN, NVMe namespace, file, or volume when you specify the path. If a volume has several small files that would benefit from periodic optimization, specify the /vol/volname.

Before performing a reallocation scan, the reallocation job normally performs a check of the current layout optimization. If the current layout optimization is less than the threshold, then the system does not perform a reallocation on the LUN, NVMe namespace, file, or volume.

You can define the reallocation scan job so that it runs at a specific interval, or you can use the [volume reallocation schedule](#) command to schedule reallocation jobs.

This command is not supported for FlexGroups or FlexGroup constituents.

## **Parameters**

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

**{ [-i, -interval <text>] - Interval Schedule**

Specifies the reallocation scan interval in

- m for minutes
- h for hours
- d for days

For example, 30m is a 30 minute interval. The countdown to the next scan begins after the first scan is complete.

The default interval is 24 hours.

**| [-o, -once <true>] - Once**

Specifies that the job runs once and then is automatically removed from the system when set to true. If you use this command without specifying this parameter, its effective value is false and the reallocation scan runs as scheduled. If you enter this parameter without a value, it is set to true and a reallocation scan runs once.

**| [-f, -force <true>] - Force }**

Performs a one-time full reallocation on a LUN, file, or volume when set to true. A forced reallocation rewrites blocks on a LUN, file, or volume unless the reallocation would result in worse performance. If you use this command without specifying this parameter, its effective value is false and a forced reallocation is not performed. If you specify this parameter without a value, it is set to true, and a forced reallocation is performed.

**{ [-p, -space-optimized <true>] - Space Optimized**

Specifies that snapshot blocks are not copied to save space when set to true. If you use this command without specifying this parameter, its effective value is false and snapshot blocks are copied. However, reads from snapshots might have a slightly higher latency. If you specify this parameter without a value, it is set to true and snapshot blocks are not copied. You cannot use the `space-optimized` option with the `unshare` option.

**| [-u, -unshare <true>] - Unshare Deduplicated Blocks }**

Specifies that blocks that are shared by deduplication will be unshared. This option can help remove fragmentation caused on dense volumes. This may result in increased disk usage, especially for full reallocation. You cannot use the `unshare` option with the `space-optimized` option.

**{ [-t, -threshold <integer>] - Threshold**

Specifies the threshold when a LUN, NVMe namespace, file, or volume is considered unoptimized and a reallocation should be performed. Once the threshold is reached, the system creates a diagnostic message that indicates that a reallocation might improve performance.

The threshold range is from 3 (the layout is moderately optimized) to 10 (the layout is not optimal). The threshold default is 4.

### | [-n, -no-check <true>] - No Threshold Check }

Does not check the current layout to determine if a reallocation is needed when set to true. If you use this command without specifying this parameter, its effective value is false and the system does check the current layout to determine if a reallocation is needed. If you specify this parameter without a value, it is set to true and the system does not check the current layout to determine if a reallocation is needed.

### Examples

```
cluster1::> volume reallocation start -path /vol/vol2 -interval 30m
[Job 165] Job is queued: Reallocate Job.
```

Starts a reallocation job on volume vol2 every 30 minutes.

### Related Links

- [volume reallocation schedule](#)

## volume reallocation stop

Stop reallocate job

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Stops and deletes any reallocation scans on a LUN, NVMe namespace, file, or volume. This command stops and deletes in-progress, scheduled, and quiesced scans.

This command is not supported for FlexGroups or FlexGroup constituents.

### Parameters

**-vserver <vserver name> - Vserver**

Specifies the Vserver.

**-path <text> - Path**

Specifies the path of the reallocation for a LUN, NVMe namespace, file, or volume.

### Examples

```
cluster1::> volume reallocation stop /vol/vol2
1 entry was deleted.
```

Stops and deletes one reallocation scan on volume vol2.

# volume schedule-style commands

## volume schedule-style prepare-to-downgrade

Disables volume schedule style feature and sets schedule style to default (create-time)

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

This command will disable the volume schedule style feature and set schedule style to default (create-time).

### Examples

The following example prepares the schedule-style on all volumes for revert/downgrade.

```
cluster1::*> volume schedule-style prepare-to-downgrade
```

# volume snaplock commands

## volume snaplock modify

Modify SnapLock attributes of a SnapLock volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snaplock modify` command modifies one or more SnapLock attributes of a SnapLock volume.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the vservers which owns the required SnapLock volume.

**-volume <volume name> - Volume**

This specifies the SnapLock volume whose attribute needs to be modified.

**{ [-minimum-retention-period {(<integer> seconds|minutes|hours|days|months|years) | infinite}] - Minimum Retention Period**

Specifies the minimum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period shorter than this minimum value, is assigned this minimum value.

If this option value is *infinite*, then every file committed to the volume will have a retention period that never expires.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

**`[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite}}` - Default Retention Period**

Specifies the default retention period that is applied to files while committing to WORM state without an associated retention period.

If this option value is *min*, then minimum-retention-period is used as the default retention period. If this option value is *max*, then maximum-retention-period is used as the default retention period. If this option value is *infinite*, then a retention period that never expires will be used as the default retention period.

The retention period can also be explicitly specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum valid retention period is 70 years.

**`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}}` - Maximum Retention Period**

Specifies the maximum allowed retention period for files committed to WORM state on the volume. Any files committed with a retention period longer than this maximum value, is assigned this maximum value.

If this option value is *infinite*, then files that have retention period that never expires might be committed to the volume.

Otherwise, the retention period is specified as a number followed by a suffix. The valid suffixes are seconds, minutes, hours, days, months, and years. For example, a value of 6months represents a retention period of 6 months. The maximum allowed retention period is 70 years. This option is not applicable while extending retention period of an already committed WORM file.

**`[-autocommit-period {{<integer> minutes|hours|days|months|years} | none}}` - Autocommit Period**

Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater the autocommit period of the volume are committed to WORM state.

The autocommit period option is specified as a number followed by a suffix. The valid suffixes for autocommit period are hours, minutes, days, months and years. For example, a value of 2hours represents an autocommit period of 2 hours. The minimum allowed autocommit period is 5 minutes and the maximum allowed autocommit period is 10 years.

If this option value is *none*, then autocommit is disabled on the SnapLock volume.

**`[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled`**

Specifies if the volume append mode is enabled or disabled.

It can be modified only when the volume is not mounted and does not have any data or Snapshot copies.

The volume append mode is not supported on SnapLock audit log volumes.

When it is enabled, all the files created with write permissions on the volume are WORM appendable files by default. All the WORM appendable files that are not modified for a period greater than the autocommit period of the volume are also committed to the WORM read-only state.

If it is set to *true* , then the volume append mode is enabled.

If it is set to *false* , then the volume append mode is disabled.

Volume append mode is disabled by default when the volume is created.

#### | [-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete }

Specifies the privileged-delete attribute of a SnapLock volume. This parameter must be specified alone.

If it is set to *enabled* then the privileged-delete operation can be performed using the [volume file privileged-delete](#) command.

If it is set to *disabled* , then the privileged-delete operation is not supported.

Once it is set to *permanently-disabled* , then neither the privileged-delete operation nor any change in the volume privileged-delete attribute is permitted.

### Examples

The following command sets `-default-retention-period` of a given SnapLock volume:

```
cluster1::> volume snaplock modify -volume vol_slc -default-retention
-period 2years

cluster1::>
```

The following command sets `-maximum-retention-period` of a given SnapLock volume to *infinite*:

```
cluster1::> volume snaplock modify -volume vol_slc -maximum-retention
-period infinite

cluster1::>
```

The following command enables the privileged-delete operation on a SnapLock volume.

```
cluster1::> volume snaplock modify -vserver vs1 -volume vol_sle
-privileged-delete enabled
[Job 38] Job succeeded: Privileged-delete Attribute Change for Volume
"vs1:vol_sle" Completed.
cluster1::>
cluster1::>volume snaplock show -vserver vs1 -volume vol_sle -fields
privileged-delete
vserver volume    privileged-delete
-----
vs1      vol_sle  enabled

cluster1::>
```

## Related Links

- [volume file privileged-delete](#)

## volume snaplock prepare-to-downgrade

Prepares the system for downgrade

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `volume snaplock prepare-to-downgrade` command prepares nodes to downgrade to a release without SnapLock volume append mode feature. Prior to disabling the feature, the command disables volume append mode on all SnapLock volumes in the cluster.

### Examples

The following example disables the SnapLock volume append mode feature in the local cluster:

```
cluster1::> volume snaplock prepare-to-downgrade
```

## volume snaplock show

Display SnapLock attributes of a SnapLock volume

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `` volume snaplock show `` command displays following information :

- Vserver name

- Volume name
- SnapLock Type of the volume
- Minimum retention period applicable of the volume
- Default retention period applicable of the volume
- Maximum retention period applicable of the volume
- Autocommit period of the volume
- Volume Append Mode attribute of the volume
- Privileged Delete attribute of the volume
- Litigation count on the volume
- Volume expiry time of the volume
- Volume ComplianceClock
- SnapLock audit log volume

This command is applicable only for SnapLock volumes.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If this parameter is specified, the command displays information for all the SnapLock volumes that match the specified `-vserver` value.

**[-volume <volume name>] - Volume**

If this parameter is specified, the command displays information for the specified `-volume` value.

**[-type {non-snaplock|compliance|enterprise}] - SnapLock Type**

If this parameter is specified, the command displays all the volumes that match the specified `-type` value.

**[-minimum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Minimum Retention Period**

If this parameter is specified, the command displays all the volumes that match the specified `-minimum-retention-period` value.

**[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | min | max | infinite}] - Default Retention Period**

If this parameter is specified, the command displays all the volumes that match the specified `-default-retention-period` value.

**`[-maximum-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Maximum Retention Period`**

If this parameter is specified, the command displays all the volumes that match the specified `-maximum-retention-period` value.

**`[-autocommit-period {{<integer> minutes|hours|days|months|years} | none}] - Autocommit Period`**

If this parameter is specified, the command displays all the volumes that match the specified `-autocommit-period` value.

**`[-is-volume-append-mode-enabled {true|false}] - Is Volume Append Mode Enabled`**

If this parameter is specified, the command displays all the volumes that match the specified `-is-volume-append-mode-enabled` value.

**`[-privileged-delete {disabled|enabled|permanently-disabled}] - Privileged Delete`**

If this parameter is specified, the command displays all the volumes that match the specified `-privileged-delete` value.

**`[-expiry-time <text>] - Expiry Time`**

If this parameter is specified, the command displays all the volumes that match the specified `-expiry-time` value.

**`[-compliance-clock-time <text>] - ComplianceClock Time`**

If this parameter is specified, the command displays all the volumes that match the specified `-compliance-clock-time` value.

**`[-litigation-count <integer>] - Litigation Count`**

If this parameter is specified, the command displays all the volumes that match the specified `-litigation-count` value.

**`[-is-audit-log-volume {true|false}] - Is SnapLock Audit Log Volume`**

If this parameter is specified, the command displays all the volumes that match the specified `-is-audit-log-volume` value.

## Examples

The following command shows summary of SnapLock volumes on a vserver:

```

cluster1::> volume snaplock show
Vserver          Volume          SnapLock Type ComplianceClock Time
-----
vs1              vol_slc         compliance      Mon Jan 19 14:12:34 IST 2015
+05:30
vs1              vol_sle         enterprise      Mon Jan 19 14:12:34 IST 2015
+05:30
2 entries were displayed.

cluster1::>

```

The following commands lists the complete SnapLock attributes of two given SnapLock volumes:

```

cluster1::> volume snaplock show -vserver vs1 -volume vol_slc
Vserver Name: vs1
    Volume Name: vol_slc
    SnapLock Type: compliance
    Minimum Retention Period: 1 years
    Default Retention Period: max
    Maximum Retention Period: 30 years
    Autocommit Period: 12 hours
Is Volume Append Mode Enabled: false
    Privileged Delete: permanently-disabled
        Expiry Time: Thu May 11 14:37:21 GMT 2017
    ComplianceClock Time: Wed May 11 20:08:41 IST 2016 +05:30
    Litigation Count: 0
Is SnapLock Audit Log Volume: false

cluster1::>

cluster1::> volume snaplock show -vserver vs1 -volume vol_sle
Vserver Name: vs1
    Volume Name: vol_sle
    SnapLock Type: enterprise
    Minimum Retention Period: 6 months
    Default Retention Period: min
    Maximum Retention Period: infinite
    Autocommit Period: none
Is Volume Append Mode Enabled: false
    Privileged Delete: enabled
        Expiry Time: infinite
    ComplianceClock Time: Wed May 11 20:08:44 IST 2016 +05:30
    Litigation Count: 0
Is SnapLock Audit Log Volume: false

```

## volume snapshot commands

### volume snapshot compute-reclaimable

Calculate the reclaimable space if specified snapshots are deleted

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume snapshot compute-reclaimable` command calculates the volume space that can be reclaimed if one or more specified Snapshot copies are deleted.

The command heavily uses system's computational resources so it can reduce the performance for client

requests and other system processes. Therefore, the queries that use queries that use query operators (\* , | , etc.), are disabled for this command. You should not specify more than three Snapshot copies per query. Snapshot copies must be specified as a comma-separated list with no spaces after the commas.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the volume for which reclaimable space is to be calculated.

### **-snapshots <snapshot name>,... - List of Snapshots**

This specifies one or more than one Snapshot copies that are to be considered for deletion. If you list more than one Snapshot copy, specify a comma-separated list with no spaces after the commas.

## Examples

The following example calculates the space that can be reclaimed if the Snapshot copy named hourly.2008-01-10\_1505 is deleted on a volume named vol3, which is a part of the Vserver named vs0:

```
cluster1:> volume snapshot compute-reclaimable -vserver vs0
-volume vol3 -snapshots hourly.2008-01-10_1505
```

## volume snapshot create

### Create a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot create` command creates a Snapshot copy of a specified volume.

### Parameters

#### **-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the snapshot is to be created.

#### **-volume <volume name> - Volume**

This specifies the volume where a Snapshot copy is to be created.

#### **-snapshot <snapshot name> - Snapshot**

This specifies the name of the Snapshot copy that is to be created.

#### **[-comment <text>] - Comment**

This optionally specifies a comment for the Snapshot copy.

### **[*-foreground* {*true*|*false*}] - Foreground Process**

If you use this option and select *false* , the Snapshot copy creation process runs in the background. If you use this option and select *true* , the Snapshot copy creation process runs in the foreground. The default is *true* .

### **[*-snapmirror-label* <text>] - Label for SnapMirror Operations**

If you specify this option, the Snapshot copy is created with the SnapMirror Label that you specify. If this option is not specified, the Snapshot copy is created with no SnapMirror Label. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

### **[*-expiry-time* <MM/DD/YYYY HH:MM:SS>] - Expiry Time**

If you specify this option, the Snapshot copy is created with the expiry time that you specify. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion.

## **Examples**

The following example creates a Snapshot copy named `vol3_snap` on a volume named `vol3` on a Vserver named `vs0`. The Snapshot copy is given the comment "Single snapshot" and the operation runs in the background.

```
cluster1::> volume snapshot create -vserver vs0 -volume vol3 -snapshot  
vol3_snapshot -comment "Single snapshot" -foreground false
```

## **volume snapshot delete**

### **Delete a snapshot**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot delete` command deletes a Snapshot copy from a specified volume.

### **Parameters**

#### ***-vserver* <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.

#### ***-volume* <volume name> - Volume**

This specifies the volume from which a Snapshot copy is to be deleted.

#### ***-snapshot* <snapshot name> - Snapshot**

This specifies the Snapshot copy that is to be deleted.

### **[*-foreground* {*true*|*false*}] - Foreground Process**

If you use this option and set it to *false* , the delete operation runs as a background process. If you specify this option and set it to *true* , the operation runs as a foreground process. The default is *true* .

### **[`-force <true>`] - Force Delete (privilege: advanced)**

If you use this switch, the Snapshot copy is immediately deleted without generating any confirmation messages. If you do not use this option the operation generates confirmation messages and the operation is disallowed on application tagged volumes. Passing in a value of *true* is supported, but not required. The *force* switch is typically used for scripting applications where users cannot directly confirm the delete operation.

### **[`-ignore-owners <true>`] - Ignore Snapshot Owners (privilege: advanced)**

If you use this switch, the command ignores other processes that might be accessing the Snapshot copy. If you do not use this option the operation exhibits default behavior and checks the owners tags before allowing the deletion to occur. Passing in a value of *true* is supported, but not required.

## **Examples**

The following example deletes a Snapshot copy named `vol3_daily` from a volume named `vol3` on a Vserver named `vs0`:

```
cluster1:> volume snapshot delete -vserver vs0 -volume vol3 -snapshot  
vol3_daily
```

## **volume snapshot modify-snaplock-expiry-time**

Modify expiry time of a SnapLock Snapshot copy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot modify-snapshot-expiry-time` extends snaplock expiry time of an existing Snapshot copy.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver**

This specifies the Vserver that contains the volume on which the Snapshot copy is located.

#### **`-volume <volume name>` - Volume**

This specifies the volume where a Snapshot copy is to be located.

#### **`-snapshot <text>` - Snapshot**

This specifies the name of the Snapshot copy locked by SnapLock whose snaplock expiry time needs to be modified.

#### **[`-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}`] - SnapLock Expiry Time**

Specifies the new snaplock expiry that is applied to Snapshot copy locked by SnapLock.

If this option value is *infinite*, then a retention period that never expires is applied to the Snapshot copy.

## Examples

The following example extends the retention period of a Snapshot copy *snap1* to "03/03/2020 00:00:00":

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1
              -volume vol1 -snapshot snap1 -expiry-time "03/03/2020 00:00:00"
cluster1::>
```

The following example extends the retention period of a Snapshot copy *snap2* to *infinite*:

```
cluster1::> volume snapshot modify-snaplock-expiry-time -vserver vs1
              -volume vol1 -snapshot snap2 -expiry-time infinite
cluster1::>
```

```
cluster1::> volume snapshot show -vserver vs1 -fields snaplock-expiry-time
vserver volume snapshot snaplock-expiry-time
-----
vs1      vol1      snap1      3/3/2020 00:00:00 +05:30
vs1      vol1      snap2      infinite
```

## volume snapshot modify

### Modify snapshot attributes

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot modify` command enables you to change the text comment associated with a Snapshot copy.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified Snapshot copy is saved.

**-volume <volume name> - Volume**

This specifies the volume whose Snapshot copy is to be modified.

**-snapshot <snapshot name> - Snapshot**

This specifies the Snapshot copy whose text comment is to be modified.

**[-comment <text>] - Comment**

This specifies the new comment for the Snapshot copy.

### **`[-snapmirror-label <text>]` - Label for SnapMirror Operations**

This specifies the SnapMirror Label for the Snapshot copy. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("" ) is specified, the existing label will be deleted.

### **`[-expiry-time <MM/DD/YYYY HH:MM:SS>]` - Expiry Time**

This specifies the expiry time for the Snapshot copy. The expiry time indicates the time at which the Snapshot copy becomes eligible for deletion. If an expiry time of ("0") is specified, the existing expiry time will be deleted.

## **Examples**

The following example modifies the comment of a Snapshot copy named vol3\_snapshot of a volume named vol3 on a Vserver named vs0. The comment is changed to "Pre-upgrade snapshot".

```
cluster1::> volume snapshot modify -vserver vs0 -volume vol3
-snapshot vol3_snapshot -comment "Pre-upgrade snapshot"
```

## **volume snapshot partial-restore-file**

### **Restore part of a file from a snapshot**

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot partial-restore-file` command enables you to restore a range of bytes in a file from the version of the file saved in the Snapshot copy. This command is intended to be used to restore particular pieces of LUNs, NVMe namespaces, and NFS or CIFS container files that are used by a host to store multiple sources of data. For example, a host might be storing multiple user databases in the same LUN. A partial file restore can be used to restore one of those databases in the LUN without touching other databases stored in the LUN. This command is not intended for restoring parts of normal user-level files that are stored in the volume. You should use [volume snapshot restore-file](#) command to restore normal user-level files. The volume for the partial-restore should be online during this operation.

For LUNs and NVMe namespaces, this command is supported across all LUN and NVMe namespace source and destination objects with equal logical block sizes.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver which contains the volume.

#### **`[-volume <volume name>]` - Volume Name**

This specifies the volume in which the Snapshot copy is saved.

#### **`-s, -snapshot <snapshot name>` - Snapshot Name**

This specifies the Snapshot copy which contains the version of file from which a range of bytes is restored. The source file, LUN, or NVMe namespace must be present in the Snapshot copy.

### **-path <text> - Filepath**

This specifies the relative path to the file, LUN, or NVMe namespace which is partially restored from the Snapshot copy. You should specify the `-volume` option so that the file, LUN, or NVMe namespace is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `-volume` then the file, LUN, or NVMe namespace is searched and restored from the Snapshot copy of the root volume. The destination file, LUN, or NVMe namespace must be present in the active file system.

### **-start-byte <integer> - Starting Byte Offset (Multiple of 4096)**

This specifies the starting byte offset in the file to partially restore. The first byte of the file is byte zero. The start byte must be a multiple of 4096. In addition, the start byte must not exceed the size of the source or destination file.

### **-byte-count <integer> - Number of Bytes to Restore (Multiple of 4096)**

This specifies the total number of bytes to restore, beginning at the `-start-byte` value. The `-byte-count` option must be a multiple of 4096. The maximum number of bytes that can be restored is 16 MB. The byte count must not exceed the range of the source or destination file.

## **Examples**

The following example restores first 4096 bytes in the file `foo.txt` inside the volume `vol3` from the Snapshot copy `vol3_snap`:

```
cluster1::> volume snapshot partial-restore-file -vserver vs0 -volume vol3
```

```
-snapshot vol3_snap -volume vol3 -path /foo.txt -start-byte 0 -byte-count 4096
```

## **Related Links**

- [volume snapshot restore-file](#)

## **volume snapshot prepare-for-revert**

Deletes multiple Snapshot copies of the current File System version.

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## **Description**

This command will delete all Snapshot copies that have the format used by the current version of Data ONTAP. It will fail if any Snapshot copy polices are enabled, or if any Snapshot copies have an owner.

Snapshot policies must be disabled prior to running this command.

## **Parameters**

**-node <nodename> - Node (privilege: advanced)**

The name of the node.

## Examples

The following example prepares the Snapshot copies for revert.

```
cluster1::*> volume snapshot prepare-for-revert -node node1
```

## volume snapshot rename

### Rename a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot rename` command renames a Snapshot copy.

You cannot rename a Snapshot copy that is created as a reference copy during the execution of the `volume move` command.

### Parameters

**-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified Snapshot copy is to be renamed

**-volume <volume name> - Volume**

This specifies the volume that contains the Snapshot copy to be renamed.

**-snapshot <snapshot name> - Snapshot**

This specifies the Snapshot copy that is to be renamed.

**-new-name <snapshot name> - Snapshot New Name**

This specifies the new name for the Snapshot copy.

**[-force <true>] - Force Rename (privilege: advanced)**

If this parameter is specified, the Snapshot copy rename operation is allowed on application tagged volumes. Otherwise, the operation is disallowed on application tagged volumes.

## Examples

The following example renames a Snapshot copy named `vol3_snap` on a volume named `vol3` and a Vserver named `vs0`. The Snapshot copy is renamed to `vol3_snap_archive`.

```
cluster1:::> volume snapshot rename -vserver vs0 -volume vol3  
-snapshot vol3_snap -new-name vol3_snap_archive
```

## volume snapshot restore-file

### Restore a file from a snapshot

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The `volume snapshot restore-file` command enables you to restore a single file to a version saved in the Snapshot copy. You can restore a file over an existing copy of the file in the parent read-write volume or to a different location within the same parent read-write volume. If the destination file for the restore operation does not exist, a new file is created with the same version as the one saved in the Snapshot copy. If the destination file for the restore operation exists, then it is overwritten by the version from the Snapshot copy. This operation is used to restore normal user-level files, LUNs and NVMe namespaces. The command also supports restoring normal user-level files with streams. The command fails if you try to restore directories (and their contents). During the restore operation the parent read-write volume should remain online. The command fails if the destination path for the restore operation is in a different volume than the source volume.

#### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver which contains the volume.

**[-volume <volume name>] - Volume Name**

This specifies the volume which contains the specified Snapshot copy.

**-s, -snapshot <snapshot name> - Snapshot Name**

This specifies the Snapshot copy from which the file is restored.

**-path <text> - Filepath**

This specifies the relative path to the file which is restored from the Snapshot copy. You should specify the `-volume` option so that the file is searched and restored from the Snapshot copy of the specified volume. If you do not specify the `-volume` then the file is searched and restored from the Snapshot copy of the root volume.

**[-r, -restore-path <text>] - Restore Filepath**

This option specifies the destination location inside the volume where the file is restored. If you do not specify this option, the file is restored at the same location referred by `-path` option. If you specify `-restore-path` option, then it should refer to a relative path location within the same volume which contains the source file. If you do not specify `-volume` along with the relative path, the file is restored in the root volume.

**[-split-disabled <true>] - Disable Space Efficient LUN Splitting**

If you use this option and set it to `true`, space efficient LUN or NVMe namespace clone split is not allowed during the restore operation. If you use this option and set it to `false` or do not use this option, then space efficient LUN or NVMe namespace clone split is allowed during the restore operation.

**[-ignore-streams <true>] - Ignore Streams**

If you use this parameter, the file is restored without its streams. By default, the streams are restored.

## Examples

The following example restores a file `foo.txt` from the Snapshot copy `vol3_snap` inside the volume `vol3` contained in a Vserver `vs0`:

```
cluster1:> volume snapshot restore-file -vserver vs0 -volume vol3
-snapshot vol3_snap -path /foo.txt
```

## volume snapshot restore

Restore the volume to a snapshot.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot restore` command restores a Snapshot copy to be the read-write parent volume for the volume family. This replaces the current working copy of the volume with the Snapshot copy that results in a loss of all changes made since the Snapshot copy was created.

You should manually update all the SnapMirror relationships of a volume immediately after you restore its Snapshot copy. Not doing so can result in unusable SnapMirror relationships that must be deleted and re-created.

After the restore is complete, the size of the flexible volume will be set to either the current volume size or the snapshot size - whichever is greater.

### Parameters

#### **-vserver <vserver name> - Vserver**

This specifies the Vserver that contains the volume on which the specified Snapshot copy to be restored is saved.

#### **-volume <volume name> - Volume**

This specifies the parent read-write volume whose Snapshot copy is to be restored to take its place.

#### **-snapshot <snapshot name> - Snapshot**

This specifies the Snapshot copy that is to be restored to be the read-write parent volume.

#### **[-force <true>] - Force Restore**

If you use this parameter, the Snapshot copy is restored even if the volume has one or more newer Snapshot copies which are currently used as reference Snapshot copy by SnapMirror. If a restore is done in this situation, this will cause future SnapMirror transfers to fail. The SnapMirror relationship may be repaired using [snapmirror resync](#) command if a common Snapshot copy is found between the source and destination volume. If there is no common Snapshot copy between the source and the destination volume, a baseline SnapMirror copy would be required. If you use this parameter, the operation is also allowed on application tagged volumes.

### **[`-preserve-lun-ids {true|false}`] - Preserve LUN Identifiers**

This option enables you to select whether the Snapshot copy restore needs to be non-disruptive to clients due to LUN or NVMe namespace identifiers changing. If you use this option and set it to `true`, or choose to not use this option at all, the `volume snapshot restore` command fails if the system determines that it cannot be non-disruptive with regards to LUN or NVMe namespace identifiers. If you use this option and set it to `false`, the restore operation proceeds even if this might cause client-visible effects. In this case, administrators should take the LUNs or NVMe namespaces offline before proceeding.

### **Examples**

The following example restores a Snapshot copy named `vol3_snap_archive` to be the parent read-write volume for the volume family. The existing read-write volume is named `vol3` and is located on a Vserver named `vs0`:

```
cluster1::> volume snapshot restore -vserver vs0 -volume vol3
-snapshot vol3_snap_archive
```

### **Related Links**

- [snapmirror resync](#)

## **volume snapshot show-delta**

Computes delta between two Snapshot copies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `volume snapshot show-delta` command returns the number of bytes that changed between two Snapshot copies or a Snapshot copy and the active filesystem. This is calculated from the number of blocks that differ multiplied by the block size. The command also shows the time elapsed between the Snapshot copies in seconds.

Queries that use query operators (`*`, `|`, etc.) are disabled for this command to avoid performance degradation for client requests.

### **Parameters**

#### **`-vserver <vserver name>` - Vserver Name**

This specifies the Vserver on which the volume is located.

#### **`-volume <volume name>` - Volume Name**

This specifies the volume for which the delta is to be calculated.

#### **`-snapshot1 <snapshot name>` - First Snapshot Name**

This specifies the first Snapshot copy for the comparison.

#### **`[-snapshot2 <snapshot name>]` - Second Snapshot Name**

This specifies the second Snapshot copy for the comparison. If the field is not specified, it is assumed to be the Active File System.

## Examples

The following example shows the bytes changed and the time separating the two Snapshots copies:

```
cluster1::> volume snapshot show-delta -vserver vs0 -volume vol2
-snapshot1 one snapshot2 two
A total of 139264 bytes (34 blocks) are different. Elapsed time between
the Snapshot copies: 1s.
```

## volume snapshot show

Display a list of snapshots

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot show` command displays information about Snapshot copies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot copies:

- Vserver name
- Volume name
- Snapshot copy name
- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

To display a detailed list view with additional information, run the command and select the `-instance` view. In addition to the above mentioned information about the Snapshot copies, the detailed list view provides the following additional information:

- Creation time
- Snapshot busy
- List of the Snapshot copy's owners
- Comment associated with the Snapshot copy
- SnapMirror Label associated with the Snapshot copy
- 7-Mode Snapshot
- Constituent Snapshot
- Expiry Time
- SnapLock Expiry Time

At the advanced or higher privilege level the detailed view provides the following additional information:

- Snapshot copy's Dataset ID
- Snapshot copy's master Dataset ID
- Number of consistency points in the Snapshot copy
- Internal status of the Snapshot copy
- File system version
- File system block format
- Physical Snap ID
- Logical Snap ID
- Database record owner
- Snapshot tags
- Instance UUID
- Version UUID
- Node
- AFS used size
- Compression savings size
- Deduplication savings size
- Vbn0 savings size
- Status of FlexGroup Qtree support in the Snapshot copy

For Snapshot copies whose parent volume is a FlexGroup, some information is not available and empty values will be displayed. This information includes:

- State
- Size
- Percentage of total blocks in the parent volume
- Percentage of used blocks in the parent volume

All information is available for Snapshot copies whose parent volume is a FlexGroup Constituent.

At the admin and advanced privilege level, Snapshot copies whose parent volume is a FlexGroup Constituent are not displayed by default. To display these, run the command and set the `is-constituent` to `true`. At the diagnostic or higher privilege level, all Snapshot copies are displayed by default.

The list view is automatically enabled if a single Snapshot copy is specified by using the `-vserver`, `-volume` and `-snapshot` options together.

A preformatted query for displaying the time-related information is available by specifying the `-time` format specifier. This displays a table that contains the following fields for all the available Snapshot copies:

- Vserver name

- Volume name
- Snapshot copy name
- Creation time

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot copies of the load-sharing volumes, run the command with the `-volume-type LS` parameter. If you specify multiple filtering parameters, only those Snapshot copies that match all the specified parameters are displayed.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-time ]**

If the `-time` format is specified, the command displays time related information about all entries.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver**

If you use this parameter, the Snapshot copies located only on the specified Vserver will be displayed.

**[-volume <volume name>] - Volume**

If you use this parameter only Snapshot copies located on the specified volume will be displayed.

**[-snapshot <snapshot name>] - Snapshot**

If you use this parameter only Snapshot copies matching the specified name will be displayed.

**[-dsid <integer>] - Snapshot Data Set ID (privilege: advanced)**

If this parameter is specified, the command displays information only about the Snapshot copy that has the specified data set ID.

**[-msid <integer>] - Snapshot Master Data Set ID (privilege: advanced)**

If this parameter is specified, the command displays information only about the Snapshot copy that has the specified master data set ID.

**[-create-time <Date>] - Creation Time**

If this parameter is specified, the command displays information only about the Snapshot copies that match the specified creation time.

**[-busy {true|false}] - Snapshot Busy**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified busy status.

### **[-owners <text>,...] - List of Owners**

If this parameter is specified, the command displays information only about the Snapshot copies that are owned by the specified list of owners.

### **[-size {<integer>[KB|MB|GB|TB|PB]}] - Snapshot Size**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified size. The size is specified as a character specifying the unit of measurement followed by a number specifying the size in the mentioned unit of measurement: k (kilobytes), m (megabytes), g (gigabytes), or t (terabytes). If the unit of measurement is not specified, bytes are used as the unit, and the specified number is rounded up to the nearest 4 KB. You may also use an inequality such as *>10 MB* as input.

### **[-blocks <percent>] - Percentage of Total Blocks**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified percentage of total blocks on their parent volumes. You may also use an inequality such as *>10* as input.

### **[-usedblocks <percent>] - Percentage of Used Blocks**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified percentage of used blocks on their parent volumes. You may also use an inequality such as *>10* as input.

### **[-cpcount <integer>] - Consistency Point Count (privilege: advanced)**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified number of consistency points. You may also use an inequality such as *<100* as input.

### **[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the Snapshot copies that have the specified comment text. You may also specify an inequality such as *! "-"* as input.

### **[-fs-version <text>] - File System Version (privilege: advanced)**

If you use this parameter the only Snapshot copies displayed are those that were created when the file system was of a specific release. This parameter is helpful especially when you need to upgrade to newer software release and want to know the Snapshot copies that will be impacted by the upgrade process.

### **[-is-7-mode {true|false}] - 7-Mode Snapshot**

If you use this parameter only those Snapshot copies which have the specified value are shown. This value is *true* for the Snapshot copies that exist on the volume that was in 7-mode configuration and then transitioned to a clustered configuration. In such a scenario, the volume is in a clustered configuration and the existing Snapshot copies are still in the 7-mode configuration.

### **[-snapmirror-label <text>] - Label for SnapMirror Operations**

If you use this parameter, only those Snapshot copies that have the specified SnapMirror Label value are shown.

### **[-state {valid|invalid|partial}] - Snapshot State**

If you use this parameter only those Snapshot copies which have the specified state will be shown.

### **[-is-constituent {true|false}] - Constituent Snapshot**

If you use this parameter, only those Snapshot copies whose parent volume is a constituent volume of a

FlexGroup will be shown.

**[`-node <nodename>`] - Node (privilege: advanced)**

If you use this parameter only those Snapshot copies that are located on the specified storage system are shown.

**[`-inofile-version <integer>`] - Snapshot Inofile Version (privilege: advanced)**

If this parameter is specified, the command displays information only about the Snapshot copies whose inode files are at the specified version.

**[`-expiry-time <MM/DD/YYYY HH:MM:SS>`] - Expiry Time**

If you use this parameter only those Snapshot copies that have the specified expiry time are shown.

**[`-compression-type {none|secondary|adaptive}`] - Compression Type (privilege: advanced)**

If you use this parameter only those Snapshot copies that have the specified compression type are shown.

**[`-snaplock-expiry-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm] | infinite}`] - SnapLock Expiry Time**

If you use this parameter only those Snapshot copies that have the specified snaplock expiry time are shown.

**[`-application-io-size {default|8K|16K|32K}`] - Application IO Size (privilege: advanced)**

If you use this parameter only those Snapshot copies that have the specified application IO size are shown.

**[`-is-flexgroup-qtree-enabled {true|false}`] - Is FlexGroup Qtree Support Enabled (privilege: advanced)**

If you use this parameter only those Snapshot copies that have the specified FlexGroup Qtree support status are shown.

## Examples

The following example displays default information about all Snapshot copies of a volume named vol1:

```
cluster1::> volume snapshot show -volume vol1

---Blocks
---
Vserver  Volume  Snapshot              Size Total%
Used%
-----
-----
cluster1 vol1
              one              68KB      0%
33%
              two              72KB      0%
34%
2 entries were displayed.
```

The following example displays Snapshot copies which are older than 1 hour, limiting the output to wanted fields:

```
cluster1::> volume snapshot show -create-time <1h -fields create-time,
size
vserver  volume snapshot create-time          size
-----  -
cluster1 vol1    one      Mon Nov 17 10:23:42 2014 68KB
cluster1 vol1    two      Mon Nov 17 10:23:44 2014 72KB
2 entries were displayed.
```

The following example displays detailed information about a specific Snapshot copy, using the 'snap' alias:

```
cluster1::> snap show -volume vol1 -snapshot one -instance
Vserver: cluster1

                        Volume: vol1
                        Snapshot: one
                        Snapshot Data Set ID: 4294968322
                        Snapshot Master Data Set ID: 6442451970
                        Creation Time: Mon Nov 17 10:23:42 2014
                        Snapshot Busy: false
                        List of Owners: -
                        Snapshot Size: 68KB
                        Percentage of Total Blocks: 0%
                        Percentage of Used Blocks: 33%
                        Consistency Point Count: 4
                        Comment: -
                        File System Version: 9.0
                        7-Mode Snapshot: false
Label for SnapMirror Operations: -
                        Constituent Snapshot: false
                        Node: node1
                        Snapshot Inofile Version: 3
                        Expiry Time: -
                        SnapLock Expiry Time: -
```

## volume snapshot autodelete modify

### Modify autodelete settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot autodelete modify` command enables you to modify Snapshot autodelete and LUN, NVMe namespace or file clone autodelete policy settings. Based on the defined policy, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is triggered. Automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is useful when you want to automatically reclaim space

consumed by the Snapshot copies and LUN, NVMe namespace or file clones from the volume when it is low in available space. LUN, NVMe namespace or file clone autodelete follows Snapshot copy autodelete. This command works only on a read-write parent volume. You cannot setup automatic Snapshot copy deletion and automatic LUN, NVMe namespace or file clone deletion for read-only volumes.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the volume is located.

### **-volume <volume name> - Volume Name**

This specifies the volume whose autodelete policy has to be modified.

### **[-enabled {true|false}] - Enabled**

This option specifies whether automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is enabled or disabled. If set to *true*, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is enabled. If set to *false*, automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones is disabled.

### **[-commitment {try|disrupt|destroy}] - Commitment**

This option specifies which Snapshot copies and LUN, NVMe namespace or file clones can be automatically deleted to reclaim back space. + When set to *try*, the Snapshot copies which are not locked by any application and the LUN, NVMe namespace or file clones which are not configured as preserved are deleted. + When set to *disrupt*, the Snapshot copies which are not locked by data backing functionalities (such as volume clones, LUN clones, NVMe namespace clones and file clones) and LUN, NVMe namespace or file clones which are not configured as preserved are deleted. In the *disrupt* mode, the Snapshot copies locked by data protection utilities such as Snapmirror and Volume Move can be deleted. If such a locked Snapshot copy is deleted during the data transfer, the transfer is aborted. + When set to *destroy*, the Snapshot copies locked by the data backing functionalities are deleted. In addition, all the LUN, NVMe namespace or file clones in the volume are deleted.

### **[-defer-delete {scheduled|user\_created|prefix|none}] - Defer Delete**

This option determines the order in which Snapshot copies can be deleted. + Possible values are as follows:

- When set to *scheduled*, scheduled Snapshot copies are the last to be deleted.
- When set to *user\_created*, user Snapshot copies are the last to be deleted.
- When set to *prefix*, Snapshot copies matching a certain prefix are the last to be deleted.
- When set to *none*, no defer deletion order is honored.

This option is not applicable for LUN, NVMe namespace or file clones.

### **[-delete-order {newest\_first|oldest\_first}] - Delete Order**

This option specifies if the oldest Snapshot copy and the oldest LUN, NVMe namespace or file clone or the newest Snapshot copy and the newest LUN, NVMe namespace or file clone are deleted first.

### **[`-defer-delete-prefix <text>`] - Defer Delete Prefix**

This option specifies the prefix string for the `-defer-delete prefix` parameter. The option is not applicable for LUN, NVMe namespace or file clones.

### **[`-target-free-space <percent>`] - Target Free Space**

This option specifies the free space percentage at which the automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones must stop. Depending on the `-trigger` Snapshot copies and LUN, NVMe namespace or file clones are deleted until you reach the target free space percentage.

### **[`-trigger {volume|snap_reserve| (DEPRECATED) -space_reserve}`] - Trigger**

This option specifies the condition which starts the automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones. + Setting this option to *volume* triggers automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones when the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded. + Setting the option to *snap\_reserve* triggers automatic deletion of Snapshot copies and LUN, NVMe namespace or file clones when the space reserved for Snapshot copies reaches threshold capacity. + Setting the option to (DEPRECATED)-*space\_reserve* triggers automatic deletion of Snapshot copies when reserved space in the volume reaches threshold capacity and the volume space reserved for Snapshot copies is exceeded. +

The option *space\_reserve* is deprecated.

The threshold capacity is determined by the size of the volume as follows:

- If the volume size is less than 20 GB, the autodelete threshold is 85%.
- If the volume size is equal to or greater than 20 GB and less than 100 GB, the autodelete threshold is 90%.
- If the volume size is equal to or greater than 100 GB and less than 500 GB, the autodelete threshold is 92%.
- If the volume size is equal to or greater than 500 GB and less than 1 TB, the autodelete threshold is 95%.
- If the volume size is equal to or greater than 1 TB, the autodelete threshold is 98%.

### **[`-destroy-list <text>`] - Destroy List**

This option specifies a comma separated list of data backing functions which are affected if the automatic deletion of the Snapshot copy backing that service is triggered. The possible values for this option are *lun\_clone*, *fileclone*, *lun\_clone,sfsr*, *vol\_clone*, *cifs\_share*, or *none*. Except *none*, all the other options can be combined as a comma separated list. Note that "lun\_clone", "file\_clone" and "sfsr" individually are not valid values. Only pairs "lun\_clone,file\_clone" and "lun\_clone,sfsr" are supported.

For the purposes of autodelete, *lun\_clone* includes both LUNs and NVMe namespaces.

If you specify *vol\_clone*, the cloned volume backed by the Snapshot copy is deleted. + If you specify *lun\_clone*, and a LUN or NVMe namespace is in the process of being cloned when autodelete is triggered, the cloning operation is aborted. Any access to this LUN or NVMe namespace will result in an error being reported to the client. + If you specify *file\_clone*, and the file cloning operation is in progress when autodelete is triggered, the cloning operation is aborted. Any access to this file will result in an error being reported to the client. + If you specify *sfsr*, and the file restore is in progress when autodelete is triggered, the restore operation is aborted. + If the Snapshot copy is locked either by a *lun\_clone* or *file\_clone* or both, the `-destroy-list` must be set to *lun\_clone,file\_clone*. + If the Snapshot

copy is locked either by a *lun\_clone* or *sfsr* operation or both, the `-destroy-list` must be set to *lun\_clone,file\_clone*. The options *file\_clone* and *sfsr* are equivalent to each other. + If you set `-destroy-list` to *lun\_clone,file\_clone* and the Snapshot copy is backing a file clone or *sfsr* operation, both the operations are aborted. This is also the case when you set `-destroy-list` to *lun\_clone,sfsr*. + LUN, NVMe namespace or file clone autodelete is applicable only if `-destroy-list` contains *lun\_clone* and *file\_clone*

## Examples

The following example enables Snapshot autodelete and sets the trigger to *snap\_reserve* for volume *vol3* which is part of the Vserver *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3
-enabled true -trigger snap_reserve
```

The following example enables Snapshot autodelete and LUN, NVMe namespace or file clone autodelete for volume *vol3* which is part of the Vserve *vs0*:

```
cluster1::> volume snapshot autodelete modify -vserver vs0 -volume vol3
-enabled true -trigger volume -commitment try -delete-order oldest_first
-destroy-list lun_clone,file_clone
```

## volume snapshot autodelete show

### Display autodelete settings

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot autodelete show` command displays information about Snapshot autodelete policies. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays a table with the following information about all the available Snapshot autodelete policies:

- Vserver name
- Volume name
- Option name
- Option value

To display a detailed list view with additional information, run the command and select the `-instance` view. The detailed list view provides the following information:

- Vserver name
- Volume name
- Enabled

- Commitment
- Defer Delete
- Delete Order
- Defer Delete Prefix
- Target Free Space
- Trigger
- Destroy List
- Is Constituent Volume

By using the `-fields` option you can choose to print only the certain fields in the output. This presents the selected fields in a table view. This is ideal when you want additional information to be different from the information that is provided by the default table view, but would like it in a format which is visually easy to compare.

You can specify additional parameters to display the information that matches only those parameters. For example, to display information only about Snapshot autodelete policies which are enabled, run the command with `-enabled true` parameter. If you specify multiple filtering parameters, only those policies that match all the specified parameters are displayed.

## Parameters

**{ [-fields <fieldname>,...]**

This option allows you to print only certain fields in the output.

**| [-instance ] }**

This option allows you to print a detailed list view.

**[-vserver <vserver name>] - Vserver Name**

If this parameter and the `-volume` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about volumes on the specified Vserver.

**[-volume <volume name>] - Volume Name**

If this parameter and the `-vserver` parameter are specified, the command displays detailed autodelete policy information about the specified volume. If this parameter is specified by itself, the command displays autodelete policy information about all volumes matching the specified name.

**[-enabled {true|false}] - Enabled**

If this parameter is specified, the command displays information about autodelete policies that match the specified parameter value.

**[-commitment {try|disrupt|destroy}] - Commitment**

If this parameter is specified, the command displays information about autodelete policies that match the specified commitment value.

**[-defer-delete {scheduled|user\_created|prefix|none}] - Defer Delete**

If this parameter is specified, the command displays information about autodelete policies that match the specified defer deletion criterion.

### **`[-delete-order {newest_first|oldest_first}] - Delete Order`**

If this parameter is specified, the command displays information about autodelete policies that match the specified deletion order.

### **`[-defer-delete-prefix <text>] - Defer Delete Prefix`**

If this parameter is specified, the command displays information about autodelete policies that match the prefix used for deferring deletion.

### **`[-target-free-space <percent>] - Target Free Space`**

If this parameter is specified, the command displays information about autodelete policies that match the specified target free space.

### **`[-trigger {volume|snap_reserve| (DEPRECATED) -space_reserve}] - Trigger`**

If this parameter is specified, the command displays information about autodelete policies that match the specified trigger condition.

### **`[-destroy-list <text>] - Destroy List`**

If this parameter is specified, the command displays information about autodelete policies that match the specified value.

### **`[-is-constituent {true|false}] - Is Constituent Volume`**

If this parameter is specified, the command displays information about autodelete policies for the constituent volumes of FlexGroups.

## **Examples**

The following example displays Snapshot autodelete policy settings for volume vol3 which is inside the Vserver vs0:

```
cluster1::> volume snapshot autodelete show -vserver vs0 -volume vol3
```

Vserver	Volume	Option Name	Option Value
-----	-----	-----	-----
vs0	vol3		
		Enabled	false
		Commitment	try
		Trigger	volume
		Target Free Space	20%
		Delete Order	oldest_first
		Defer Delete	user_created
		Defer Delete Prefix	(not specified)
		Destroy List	none

## **volume snapshot policy add-schedule**

Add a schedule to snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot policy add-schedule` command adds a schedule to a Snapshot policy. You can create a schedule by using the [job schedule cron create](#) or [job schedule interval create](#) commands.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which a Snapshot policy schedule is to be added.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy to which a schedule is to be added.

### **-schedule <text> - Schedule Name**

This specifies the schedule that is to be added to the Snapshot policy.

### **-count <integer> - Maximum Snapshot Copies for Schedule**

This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

### **[-prefix <text>] - Snapshot Copy Name Prefix for Schedule**

This option specifies the prefix with which Snapshot copies will be created for the added schedule. Every schedule has only one prefix. Once a prefix gets associated with a schedule, you cannot update the prefix. If some prefix is already associated with the schedule and you do not specify this parameter, then the previously defined prefix is used. The command fails if you try to update an existing prefix for a schedule. If no prefix is associated with the schedule and you do not specify this parameter, then schedule name is be used as the prefix.

### **[-snapmirror-label <text>] - Label for SnapMirror Operations**

This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the added schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

## Examples

The following example adds a schedule named `midnight` to the Snapshot policy named `snappolicy_nightly` on Vserver `vs0`. The schedule can take a maximum of five Snapshot copies.

```
cluster1::> volume snapshot policy add-schedule -vserver vs0 -policy
snappolicy_nightly -schedule midnight -count 5
```

## volume snapshot policy create

Create a new snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot policy create` command creates a Snapshot policy. A Snapshot policy includes at least one schedule, up to a maximum of five schedules, and a maximum number of Snapshot copies per schedule. You can create a schedule by using the [job schedule cron create](#) or [job schedule interval create](#) commands. When applied to a volume, the Snapshot policy specifies the schedule on which Snapshot copies are taken and the maximum number of Snapshot copies that each schedule can take. The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

## Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the Snapshot policy is to be created.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy that is to be created.

**-enabled {true|false} - Snapshot Policy Enabled**

This specifies whether the Snapshot policy is enabled.

**[-comment <text>] - Comment**

This option specifies a text comment for the Snapshot policy.

**-schedule1 <text> - Schedule1 Name**

This specifies the name of the first schedule associated with the Snapshot policy.

**-count1 <integer> - Maximum Snapshot Copies for Schedule1**

This specifies the maximum number of Snapshot copies that can be taken by the first schedule.

**[-prefix1 <text>] - Snapshot Copy Name Prefix for Schedule1**

This option specifies the prefix associated with the first schedule. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

**[-snapmirror-label1 <text>] - Label for SnapMirror Operations for Schedule1**

This specifies the SnapMirror Label of the first schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

**[-schedule2 <text>] - Schedule2 Name**

This option specifies the name of the second schedule associated with the Snapshot policy. If this parameter is specified, the `-count2` parameter must also be specified.

**[-count2 <integer>] - Maximum Snapshot Copies for Schedule2**

This option specifies the maximum number of Snapshot copies that can be taken by the second schedule. If this parameter is specified, the `-schedule2` parameter must also be specified.

### **[`-prefix2 <text>`] - Snapshot Copy Name Prefix for Schedule2**

This option specifies the prefix associated with the second schedule. If this parameter is specified, `-schedule2` and `-count2` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

### **[`-snapmirror-label2 <text>`] - Label for SnapMirror Operations for Schedule2**

This specifies the SnapMirror Label of the second schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

### **[`-schedule3 <text>`] - Schedule3 Name**

This option specifies the name of the third schedule associated with the Snapshot policy. If this parameter is specified, the `-count3` parameter must also be specified.

### **[`-count3 <integer>`] - Maximum Snapshot Copies for Schedule3**

This option specifies the maximum number of Snapshot copies that can be taken by the third schedule. If this parameter is specified, the `-schedule3` parameter must also be specified.

### **[`-prefix3 <text>`] - Snapshot Copy Name Prefix for Schedule3**

This option specifies the prefix associated with the third schedule. If this parameter is specified, `-schedule3` and `-count3` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

### **[`-snapmirror-label3 <text>`] - Label for SnapMirror Operations for Schedule3**

This specifies the SnapMirror Label of the third schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

### **[`-schedule4 <text>`] - Schedule4 Name**

This option specifies the name of the fourth schedule associated with the Snapshot policy. If this parameter is specified, the `-count4` parameter must also be specified.

### **[`-count4 <integer>`] - Maximum Snapshot Copies for Schedule4**

This option specifies the maximum number of Snapshot copies that can be taken by the fourth schedule. If this parameter is specified, the `-schedule4` parameter must also be specified.

### **[`-prefix4 <text>`] - Snapshot Copy Name Prefix for Schedule4**

This option specifies the prefix associated with the fourth schedule. If this parameter is specified, `-schedule4` and `-count4` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

#### **[`-snapmirror-label4 <text>`] - Label for SnapMirror Operations for Schedule4**

This specifies the SnapMirror Label of the fourth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

#### **[`-schedule5 <text>`] - Schedule5 Name**

This option specifies the name of the fifth schedule associated with the Snapshot policy. If this parameter is specified, the `-count5` parameter must also be specified.

#### **[`-count5 <integer>`] - Maximum Snapshot Copies for Schedule5**

This option specifies the maximum number of Snapshot copies that can be taken by the fifth schedule. If this parameter is specified, the `-schedule5` parameter must also be specified.

#### **[`-prefix5 <text>`] - Snapshot Copy Name Prefix for Schedule5**

This option specifies the prefix associated with the fifth schedule. If this parameter is specified, `-schedule5` and `-count5` parameters must also be specified. Every schedule has only one prefix. The command fails if you try to update an existing prefix. If you do not specify this parameter and there is no prefix associated with the schedule, the schedule name is used as the prefix. If you do not specify this parameter and there is already a prefix associated with the schedule from a previous invocation of the command, then that prefix is used.

#### **[`-snapmirror-label5 <text>`] - Label for SnapMirror Operations for Schedule5**

This specifies the SnapMirror Label of the fifth schedule associated with the Snapshot policy. Once specified, all Snapshot copies created for that schedule have the SnapMirror Label assigned to them. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination.

### **Examples**

The following example creates a Snapshot policy named `snappolicy_4hrs` on a Vserver named `vs0`. The policy runs on a single schedule named `4hrs` with a prefix `every_4_hour` and has a maximum number of five Snapshot copies.

```
cluster1::> volume snapshot policy create -vserver vs0 -policy
snappolicy_4hrs
-schedule1 4hrs -count1 5 -prefix1 every_4_hour
```

### **Related Links**

- [job schedule cron create](#)
- [job schedule interval create](#)

## **volume snapshot policy delete**

Delete a snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot policy delete` command deletes a Snapshot policy.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the Snapshot policy is to be deleted.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy that is to be deleted.

## Examples

The following example deletes a Snapshot policy named `snappolicy_hourly` on Vserver `vs0`:

```
cluster1::> volume snapshot policy delete -vserver vs0 -policy
snappolicy_hourly
```

## volume snapshot policy modify-schedule

Modify a schedule within snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `volume snapshot policy modify-schedule` command modifies the maximum number of Snapshot copies that can be taken by a Snapshot policy's schedule.

## Parameters

### **-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which a Snapshot policy schedule is to be modified.

### **-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy whose schedule is to be modified.

### **-schedule <text> - Schedule Name**

This specifies the schedule that is to be modified.

### **[-newcount <integer>] - Maximum Snapshot Copies for Schedule**

This specifies the maximum number of Snapshot copies that can be taken by the specified schedule. The total count of all the Snapshot copies to be retained for the policy cannot be more than 1023.

### **[-newsnapmirror-label <text>] - Label for SnapMirror Operations**

This specifies the SnapMirror Label identified with a Snapshot copy when it is created for the specified schedule. The SnapMirror Label is used by the Vaulting subsystem when you back up Snapshot copies to the Vault Destination. If an empty label ("" ) is specified, the existing label will be deleted.

## Examples

The following example changes the maximum number of Snapshot copies from five to four for a schedule named midnight on a Snapshot policy named snappolicy\_nightly on Vserver vs0:

```
cluster1::> volume snapshot policy modify-schedule -vserver vs0 -policy
snappolicy_nightly -schedule midnight -newcount 4
```

## volume snapshot policy modify

### Modify a snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy modify` command enables you to modify the description associated with a Snapshot policy and whether the policy is enabled or disabled.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which the Snapshot policy is to be modified.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy that is to be modified.

**[-enabled {true|false}] - Snapshot Policy Enabled**

This optionally specifies whether the Snapshot policy is enabled.

**[-comment <text>] - Comment**

This specifies the comment text for the Snapshot policy.

**[-snapmirror-labels <text>,...] - Label for SnapMirror Operations**

This optionally specifies a comma separated list of SnapMirror labels that are applied to the schedules in the Snapshot policy. Each label in the list applies to only one schedule in the Snapshot policy (maximum of 5 SnapMirror labels), the first label applying to the first schedule, the second label applying to the second schedule, and so on. You can have a maximum of five SnapMirror labels, which corresponds to the maximum number of schedules a Snapshot policy can have. If an empty string ("" ) is specified, the existing labels will be deleted from all the schedules.

## Examples

The following example changes the description of a Snapshot policy named snappolicy\_wknd on Vserver vs0 to "Runs only on weekends":

```
cluster1::> volume snapshot policy modify -vserver vs0 -policy
snappolicy_wknd -comment "Runs only on weekends"
```

## volume snapshot policy remove-schedule

Remove a schedule from snapshot policy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy remove-schedule` command removes a schedule from a Snapshot policy.

### Parameters

**-vserver <vserver name> - Vserver Name**

This specifies the Vserver on which a Snapshot policy schedule is to be removed.

**-policy <snapshot policy> - Snapshot Policy Name**

This specifies the Snapshot policy from which a schedule is to be removed.

**-schedule <text> - Schedule Name**

This specifies the schedule that is to be removed from the Snapshot policy.

### Examples

The following example removes a schedule named `hourly` from a Snapshot policy named `snappolicy_daily` on Vserver `vs0`:

```
cluster1::> volume snapshot policy remove-schedule -vserver vs0 -policy  
snappolicy_daily -schedule hourly
```

## volume snapshot policy show

Show snapshot policies

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `volume snapshot policy show` command displays the following information about Snapshot policies:

- Vserver name
- Snapshot policy name
- Number of schedules in the policy
- Comment for the policy
- Individual schedule names
- Maximum number of Snapshot copies associated with each schedule
- Snapshot copy name prefixes for the schedules

- SnapMirror Labels associated with the schedules

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-revert-incompatible ] (privilege: advanced)**

If this parameter is specified, the command displays Snapshot policies that are not supported in Data ONTAP 8.2. The total Snapshot copy count in the policy needs to be reduced to be equal to or less than the supported count for the revert operation to succeed.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name**

If this parameter is specified, the command displays Snapshot policies on the specified Vserver.

**[-policy <snapshot policy>] - Snapshot Policy Name**

If this parameter is specified, the command displays detailed information about the specified Snapshot policy.

**[-enabled {true|false}] - Snapshot Policy Enabled**

If this parameter is specified, the command displays detailed information only about the Snapshot policy or policies that have the specified enabled value.

**[-comment <text>] - Comment**

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified comment.

**[-total-schedules <integer>] - Total Number of Schedules in This Policy**

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified total number of schedules.

**[-schedules <text>,...] - Schedule Name**

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of schedules.

**[-counts <integer>,...] - Maximum Snapshots for the Schedule**

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of maximum numbers of Snapshot copies per schedule.

**[-prefixes <text>,...] - Prefix Name**

If this parameter is specified, the command displays information only about the Snapshot policy or policies that have the specified list of prefixes.

**[-snapmirror-labels <text>,...] - Label for SnapMirror Operations**

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified SnapMirror Label. When you specify a list of SnapMirror labels, the command displays all the

Snapshot policies that contain any of the SnapMirror Labels specified in the list.

**[-policy-owner <text>] - Owner of the policy**

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified policy owner.

**[-total-count <integer>] - Total Number of Snapshots in This Policy**

If this parameter is specified, the command displays information only about the Snapshot policies that have the specified total number of Snapshot copies.

**Examples**

The following example displays information about all Snapshot policies:

```
cluster1::> volume snapshot policy show
Vserver: cm

Policy Name          Number of Is
                    Schedules Enabled Comment

## volume transition-convert-dir commands

### volume transition-convert-dir show

Display 7-Mode directories being converted

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

#### Description

The `volume transition-convert-dir show` command displays information about ongoing directory copy conversion operations.

#### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver name>] - Vserver Name (privilege: advanced)**

Displays summary information about the ongoing copy conversions of directories for the volumes in the

specified Vserver.

**[`-volume <volume name>`] - Volume Name (privilege: advanced)**

Displays summary information about the ongoing copy conversions of directories that are occurring on the specified volume.

**[`-path <text>`] - Directory Being Converted (privilege: advanced)**

Displays summary information for the ongoing copy conversions of directories that have the specified directory path to convert.

**[`-job-id <integer>`] - Convert Job ID (privilege: advanced)**

Displays summary information for the ongoing copy conversions of directories that have the specified job ID.

**[`-state`**

**{`Initial`|`Queued`|`Running`|`Waiting`|`Pausing`|`Paused`|`Quitting`|`Success`|`Failure`|`Reschedule`|`Error`|`Quit`|`Dead`|`Unknown`|`Restart`|`Dormant`}] - Operation State (privilege: advanced)**

Displays summary information for the copy conversions of directories that have the specified job state.

**[`-bytes-total <integer>`] - Bytes Total (privilege: advanced)**

Displays summary information for copy conversions which have the estimated number of bytes of directory content to convert.

**[`-bytes-completed <integer>`] - Bytes Completed (privilege: advanced)**

Displays summary information for copy conversions which have the estimated number of bytes of directory content that have completed conversion. The value of this field will be updated approximately once per minute.

## Examples

The following example illustrates how to show directory conversions for a volume:

```
cluster1::*> volume transition-convert-dir show -volume voll
Vserver      Volume      Convert Job ID  Directory-path  State
-----
vs0          voll              151 /data/large_dir  Running
```

## volume transition-convert-dir start

Start converting a 7-Mode directory to Cluster-mode

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

### Description

The `volume transition-convert-dir start` command moves the directory entries in an existing directory to a new temporary directory and then replaces the existing directory with the temporary directory. This command only has a use for directories that were created in a non-Unicode format on a 7-Mode storage system and then transitioned to clustered Data ONTAP by using a SnapMirror relationship of type TDP. This command converts the directories to the Unicode format in a way that is less likely to disrupt the operation of

the Data ONTAP systems than the existing directory conversion mechanisms. The temporary directory is visible from clients. Attempting to manipulate the directory being copied or the temporary directory might result in expected side-effects and should be avoided.

## Parameters

**-vserver <vserver name> - Vserver Name (privilege: advanced)**

Specifies the Vserver on which the volume is located.

**-volume <volume name> - Volume Name (privilege: advanced)**

Specifies the volume in which the directory to be converted is located.

**-path <file path> - Directory Path (privilege: advanced)**

Specifies the path to the directory to be converted from the root of the volume specified with the `-volume` parameter. The root directory of a volume might not be converted using this command. Also, the path must not have a symbolic link as the last component in the path.

## Examples

The following example shows how to start a 7-mode directory conversion for a given path in a volume:

```
cluster1::*> volume transition-convert-dir start -vserver vs0 -volume  
vol1 -path /data/large_dir
```

# vserver commands

## vserver add-aggregates

Add aggregates to the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver add-aggregates` command adds aggregates to the Vserver.

### Parameters

**-vserver <vserver> - Vserver**

Specifies the Vserver for which aggregates have to be added.

**-aggregates <aggregate name>, ... - List of Aggregates to Be Added**

Specifies the list of aggregates to add to the Vserver. The root aggregates should not be specified in this list because though the command will return success, volumes cannot be created on root aggregates. In a MetroCluster configuration, this command does not honor the remote cluster's aggregates.

### Examples

The following example illustrates how to add aggregates *aggr1* and *aggr2* to a Vserver named *vs.example.com*:

```
cluster1::> vserver add-aggregates -vserver vs.example.com -aggregates  
aggr1,aggr2
```

## vserver add-protocols

Add protocols to the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vserver add-protocols` command adds given protocols to a specified Vserver.

### Parameters

**-vserver <vserver> - Vserver**

This specifies the Vserver that is to be modified.

### **-protocols {nfs|cifs|fc|iscsi|ndmp|nvme} - Protocols**

This parameter specifies the list of protocols to be allowed to run on the Vserver. Possible values include *nfs*, *cifs*, *fc*, *iscsi*, *ndmp* and *nvme*.

## Examples

The following example shows adding protocol 'cifs' to a vservers named vs0.example.com.

```
cluster1::> vservers add-protocols -vservers vs0.example.com -protocols cifs
```

## vserver context

### Set Vserver context

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

Cluster administrators can use the `vserver context` command to login to a specified Vserver with a specified Vserver user name. All subsequent commands will be issued in the context of that Vserver. The role of the cluster administrator will be the same as that of the user name with which the Vserver context was set. The context is valid for the duration of the CLI or Web UI session in which it is specified. The [exit](#) command can be used to return to the original context.

### Parameters

#### **-vservers <servers> - Vservers**

Use this parameter to specify the Vservers.

#### **[-username <text>] - Vserver Administrator User Name**

Use this parameter to specify a Vserver administrator user name for the context. The default value *vsadmin* is used if one is not specified.

## Examples

The following example sets the CLI context to Vserver *vs0.example.com*. All subsequently issued commands will be executed in the context of that Vserver:

```
cluster1::> vservers context -vservers vs0.example.com
Info: Use 'exit' command to return.
vs0.example.com::>
```

# vserver create

## Create a Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver create` command creates a Vserver.

## Parameters

### **-vserver <vserver> - Vserver**

This specifies the name of the Vserver that is to be created. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver to ensure unique Vserver names across cluster leagues.

Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

### **[-subtype <vserver subtype>] - Vserver Subtype**

This specifies the subtype of the Vserver being created. Possible values are:

- default - For default data Vservers
- dp-destination - For Data Protection destination Vservers
- sync-source - For MetroCluster source Vservers
- sync-destination - For MetroCluster destination Vservers

### **[-rootvolume <volume name>] - Root Volume**

This parameter optionally specifies the name of the Vserver's root volume, which is created when the Vserver is created. The default name is `svm_root`. The size of the Vserver's root volume is 1GB

### **[-aggregate <aggregate name>] - Aggregate**

This parameter optionally specifies the storage aggregate that holds the Vserver's root volume. Selection of the aggregate is based on the Vserver setup algorithm.

- Creating a root volume on the SnapLock aggregate is not supported.
- Creating a root volume of sync-source Vserver on the unmirrored aggregate is not supported.

### **[-rootvolume-security-style <security style>] - Root Volume Security Style**

This parameter optionally specifies the security style for the Vserver's root volume. Possible values include `unix` (for UNIX mode bits), `ntfs` (for CIFS ACLs), and `mixed` (for mixed NFS and CIFS access). The default value is `unix`. Regardless of the security style, both NFS and CIFS clients can read from and write to the root volume.

### **[-language <Language code>] - Default Volume Language Code**

This optionally specifies the default language encoding setting for the Vserver and its volumes. The recommended format is to append `.UTF-8` for the language encoding values. For example, for the `en_US` language, the recommended format is `en_US.UTF-8`. The default setting is `C.UTF-8`.

### **[`-snapshot-policy <snapshot policy>`] - Snapshot Policy**

This optionally specifies the Snapshot policy for new volumes created on the Vserver. If no value is specified, the default Snapshot policy is used. You can use the `-snapshot-policy` parameter on the [volume create](#) or [volume modify](#) commands to set the Snapshot policy on a specific volume, regardless of its Vserver's Snapshot policy setting.

### **[`-comment <text>`] - Comment**

This optionally specifies a comment for the Vserver.

### **[`-quota-policy <text>`] - Quota Policy**

This optionally specifies a quota policy for the Vserver.

### **[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

### **[`-ipspace <IPspace>`] - IPspace Name**

This optionally specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace.

### **[`-foreground {true|false}`] - Foreground Process**

This parameter optionally specifies whether the Vserver create operation can be executed in the background. If nothing is specified, by default the Vserver create operation is executed in the foreground.

### **[`-is-space-reporting-logical {true|false}`] - Logical Space Reporting**

This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. This parameter is not supported on FlexGroups.

### **[`-is-space-enforcement-logical {true|false}`] - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

## Examples

The following example creates a Vserver named *vs0.example.com* in the IPspace *ipspace123*. The Vserver's root volume is named *root\_vs0* and is located on aggregate *aggr0*. The Vserver uses NIS for network information, a file for name mapping information, and the language is U.S. English:

```
cluster1::> vsriver create -vsriver vs0.example.com -ipspace ipspace123
-rootvolume root_vs0 -aggregate aggr0
-language en_US.UTF-8 -rootvolume-security-style mixed
```

The following example creates a Vserver named *vs1* using default values. The default name for the Vserver's root volume is *svm\_root* and the Vserver is located on an aggregate selected on the basis of the Vserver setup algorithm. The default root volume's security style is set to *unix*.

```
cluster1::> vsriver create -vsriver vs1
cluster1::> vsriver show -vsriver vs1 -fields rootvolume, rootvolume-
security-style, aggregate
vsriver rootvolume aggregate rootvolume-security-style
-----
vs1      svm_root    aggr1      unix
```

- [volume modify](#)

## vsvriver delete

Delete an existing Vsvriver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vsvriver delete` command deletes a specified Vsvriver. If the Vsvriver is associated with one or more volumes, you must manually delete volumes (including root and mirror volumes) before you delete the Vsvriver. If the Vsvriver subtype is *dp-destination*, change the Vsvriver subtype to *default* by specifying the Vsvriver as the destination in the [snapmirror break](#) command before deleting the objects owned by the Vsvriver.

## Parameters

**-vsriver <vsriver> - Vsvriver**

This specifies the Vsvriver that is to be deleted.

**[-foreground {true|false}] - Foreground Process**

This optionally specifies the Vsvriver delete operation can be executed in the background. If nothing is

specified, by default the Vserver delete operation is executed in the foreground.

## Examples

The following example deletes a Vserver named *vs2.example.com*:

```
cluster1::> vsriver delete -vsriver vs2.example.com
```

## Related Links

- [snapmirror break](#)

## vsvriver modify

Modify a Vsvriver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vsvriver modify` command modifies the attributes of a specified Vsvriver. If the Vsvriver subtype is of type *dp-destination*, then only the `-aggr-list` parameter can be modified.

## Parameters

### **-vsriver <vsriver> - Vsvriver**

This specifies the Vsvriver that is to be modified.

### **[-language <Language code>] - Default Volume Language Code**

This optional parameter specifies the default language encoding setting for the Vsvriver and its volumes. The recommended format is to append `.UTF-8` for the language encoding values. For example, for the `en_US` language, the recommended format is `en_US.UTF-8`. The default setting is `C.UTF-8`.

### **[-snapshot-policy <snapshot policy>] - Snapshot Policy**

This optional parameter specifies the Snapshot policy for a Vsvriver being modified.

### **[-comment <text>] - Comment**

This optional parameter specifies a comment for the Vsvriver.

### **[-quota-policy <text>] - Quota Policy**

This optional parameter specifies a quota policy to be used for all volumes associated with a Vsvriver. You can create and configure multiple, different quota policies, but each Vsvriver must have one and only one associated quota policy.

### **[-aggr-list <aggregate name>,...] - List of Aggregates Assigned**

This optional parameter specifies a confined list of aggregates on which volumes can be created for a Vsvriver by the Vsvriver administrator. But these aggregates do not become exclusive property of the Vsvriver, i.e. they might be assigned for use to other Vservers. If the value of this parameter is specified as "-", then the Vsvriver administrator cannot create any volumes for that Vsvriver. Note that the cluster

administrator will still be able to create volumes on any aggregate and assign them to this Vserver.

**[`-max-volumes <unsigned32_or_unlimited>`] - Limit on Maximum Number of Volumes allowed**

This optional parameter specifies the maximum number of volumes that can be created for the Vserver, including the root volume.

**[`-admin-state {running|stopped|starting|stopping}`] - Vserver Admin State (privilege: advanced)**

Use this parameter to set the admin state of the Vserver if the Vserver start or stop job fails. Possible values include `running` and `stopped`.

**[`-allowed-protocols {nfs|cifs|fcg|iscsi|ndmp|nvme}`] - Allowed Protocols**

This optional parameter specifies the list of protocols to be allowed to run on the Vserver. When part of `vserver-modify`, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include `nfs`, `cifs`, `fcg`, `iscsi`, `ndmp` and `nvme`.

**[`-disallowed-protocols {nfs|cifs|fcg|iscsi|ndmp|nvme}`] - Disallowed Protocols**

This optional parameter specifies the list of protocols to be disallowed to run on the Vserver. When part of `vserver-modify`, this field should include the existing list along with the new protocol list to be added to prevent data disruptions. Possible values include `nfs`, `cifs`, `fcg`, `iscsi`, `ndmp` and `nvme`.

**[`-qos-policy-group <text>`] - QoS Policy Group**

This optionally specifies which QoS policy group to apply to the Vserver. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it. To remove this Vserver from a policy group, enter the reserved keyword "none".

**[`-caching-policy <text>`] - Caching Policy Name**

This optionally specifies the caching policy to apply to the Vserver. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- `none` - Does not cache any user data or metadata blocks.
- `auto` - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- `meta` - Read caches only metadata blocks.
- `random_read` - Read caches all metadata and randomly read user data blocks.
- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read, and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is `auto`.

**[`-foreground {true|false}`] - Foreground Process**

This optionally specifies whether the Vserver modify operation can be executed in the background. If nothing is specified, by default the Vserver modify operation is executed in the foreground.

### **`[-is-space-reporting-logical {true|false}] - Logical Space Reporting`**

This optionally specifies whether to report space logically on residing volumes which are created after this operation. Existing volumes will not be affected by modifying this value on an existing Vserver. To change whether space is reported logically for existing volumes, you will have to modify the setting on those volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also reported as used. This parameter is not supported on FlexGroups.

### **`[-is-space-enforcement-logical {true|false}] - Logical Space Enforcement`**

This optionally specifies whether to perform logical space accounting on residing volumes which are created after this operation. Older volumes will continue to have old value. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

## **Examples**

The following example modifies the quota policy for a Vserver named `vs0.example.com` to `pol1`, specifies a Snapshot policy named `daily`, adds the comment "Sales team access".

```
cluster1::> vsriver modify -vsriver vs0.example.com -snapshot-policy daily
               -comment "Sales team access" -quota-policy pol1
```

## **vsvrrvr prrvrrrr-for-rvrrt**

Prvrrrr Vsrrrrs to br rvrrrrd

**Avrrrrrrrr:** This rvrrrr is avrrrrrr to *rvrrrr* rvrrrrrrrrs at the *rvrrrrrr* prrvrrrr lvrr.

### **Description**

The `vsvrrvr prrvrrrr-for-rvrrt` rvrrrr prrvrrrr Vsrrrrs to br rvrrrrd to the prrvrrrr rvrrrr of Data ONTAP. It rvrrrrs any rvrrrrs that rvrrrr br rvrrrrrrd rvrrrrrv rvrrt.

### **Examples**

The following rvrrrr prrvrrrrs all Vsrrrrs to br rvrrrrd.

```
cluster1::*> vsvrrvr prrvrrrr-for-rvrrt
```

## **vsvrrvr rvrrrr-rvrrrrrrs**

Rvrrrr rvrrrrrrs from the Vsrrvr

**Avrrrrrrrr:** This rvrrrr is avrrrrrr to *rvrrrr* rvrrrrrrrrs at the *rvrrrr* prrvrrrr lvrr.

## Description

The `vserver remove-aggregates` command removes aggregates from the Vserver.

## Parameters

### **-vserver <vserver> - Vserver**

Specifies the Vserver from which aggregates have to be removed.

### **-aggregates <aggregate name>, ... - List of Aggregates to Be Removed**

Specifies the list of aggregates to remove from the Vserver.

## Examples

The following example illustrates how to remove aggregates *aggr1* and *aggr2* from a Vserver named *vs.example.com*:

```
cluster1::> vserver remove-aggregates -vserver vs.example.com -aggregates
aggr1,aggr2
```

## vserver remove-protocols

Remove protocols from the Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

## Description

The `vserver remove-protocols` command removes the specified protocols from the specified Vserver. When you remove the protocols from a Vserver, the data access with respect to the removed protocols is disrupted.

## Parameters

### **-vserver <vserver> - Vserver**

Specifies the Vserver that is to be modified.

### **-protocols {nfs|cifs|fc|iscsi|ndmp|nvme} - Protocols**

This parameter specifies the list of protocols to be removed. on the Vserver. Possible values include *nfs* , *cifs* , *fc* , *iscsi* , *ndmp* and *nvme* .

## Examples

The following example shows removing protocol 'cifs' from a Vserver named *vs0.example.com*.

```
cluster1::> vsriver remove-protocols -vsriver vs0.example.com -protocols  
cifs
```

## vsriver rename

### Rename a Vserver

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vsriver rename` command renames the Vserver. If the vsriver being renamed is participating in an Inter-cluster Vserver peer relationship, all the corresponding remote clusters will be updated with the new peer Vserver name.

### Parameters

#### **-vsriver <text> - Vserver**

This specifies the Vserver that is to be renamed.

#### **-newname <vsriver> - New Vserver name (Use Fully Qualified Domain Name, For example: data.example.com)**

This specifies the Vserver's new name. The name must be a unique Vserver name in the cluster. Use a fully qualified domain name (FQDN) - for example, "data.example.com" - for the Vserver name to reduce name collisions in cluster leagues.

Maximum number of characters supported is 47, and 41 for a Vserver with subtype "sync-source". "all" is a reserved name and must not be used as a Vserver name.

#### **[-foreground {true|false}] - Foreground Process**

This specifies whether the rename job will be run in foreground or background. By default, the job runs in foreground.

### Examples

The following examples rename a Vserver named `vs1.example.com` as `vs2.example.com`, and then finally back to its original name:

```
(When there is no intercluster Vserver peer relationship with the vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname
vs2.example.com
(When there is at least one intercluster peer relationship with the
Vserver)
cluster1::> vserver rename -vserver vs1.example.com -newname
vs2.example.com
[Job 277] Job succeeded: Vserver rename completed successfully
cluster1::> vserver rename -vserver vs2.example.com -newname
vs1.example.com -foreground false
[Job 278] Job is queued: Rename Vserver vs2.example.com to
vs1.example.com.
```

## vserver restamp-msid

Restamp the MSIDs of all the volumes in a Vserver to match or be different from the source Vserver

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver restamp-msid` command restamps MSIDs of all volumes in a dp-destination Vserver to make them either identical to the VserverDR source Vserver. The command is run on secondary VserverDR site and automatically updates the MSID preserve behavior for the Vserver. A [snapmirror resync](#) must be run after this command completes.

### Parameters

**-vserver <vserver name> - Vserver name (privilege: advanced)**

The name of the dp-destination Vserver.

**-preserve-msid {true|false} - Make MSID same as that of source Vserver. False sets the values as different. (privilege: advanced)**

Boolean value through which the user can specify whether to make the MSIDs of the volumes same as that of Source Vserver. Specifying true will make the MSIDs same and specifying false will make them different.

### Examples

This example will stamp all the volumes of Vserver vs1dp with the same MSID as the source Vserver.

```
cluster1::>vserver restamp-msid -vserver vs1dp -preserve-msid true
```

### Related Links

# vserver show-aggregates

Show details of aggregates in a Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver show-aggregates` command displays the details of all the aggregates that are associated with Vservers. The aggregate details displayed are the aggregate name, state, available size, the type of aggregate and the SnapLock type.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If this optional parameter is specified, the command displays the details of aggregates that are associated with the specified Vserver.

**[-aggregate <aggregate name>] - Aggregate**

If this optional parameter is specified, the command displays all of the Vservers configured with the specified aggregate.

## Examples

The following example displays the aggregates configured for Vserver `vs`.

```
cluster1::> vserver show-aggregates -vserver vs
                                     Available
Vserver      Aggregate      State      Size Type      SnapLock-Type
-----
vs           aggr1         online    795.2MB hdd      non-snaplock
vs           aggr2         online    795.2MB hdd      non-snaplock
2 entries were displayed.
```

# vserver show-protocols

Show protocols for Vserver

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver show-protocols` command displays the running protocols on a given Vserver.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If this parameter is specified, the command displays the allowed set of protocols for the specified Vserver.

**[-protocol {nfs|cifs|fc|iscsi|ndmp|nvme}] - Protocols**

If this optional parameter is specified, the command displays all the Vservers configured with the specified protocols.

## Examples

The following example displays the protocols configured for Vserver `vs1`.

```
cluster1::> vserver show-protocols -vserver vs1
Vserver: vs1
Protocols: nfs, cifs
```

## vserver show

### Display Vservers

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver show` command displays the following information:

- Vserver name
- Vserver type (*data*, *admin*, *node* or *system* - detailed view only)
- Vserver subtype (*default*, *dp-destination*, *sync-source*, and *sync-destination* - detailed view only)
- Vserver universal unique identifier (detailed view only)
- Root volume name
- Aggregate on which the root volume is located
- Associated NIS domain

- Root volume security style (*unix* for UNIX mode bits, *ntfs* for CIFS ACLs, *mixed* for both (detailed view only)
- LDAP client
- Language (detailed view only)
- Snapshot policy (detailed view only)
- Comment text (detailed view only)
- Quota policy (detailed view only)
- Aggregate list (detailed view only)
- Maximum Volumes (detailed view only)
- Qos-policy-group (detailed view only)
- Config-lock (detailed view only)
- Admin state (*running*, *stopped*, *starting*, *stopping*, *initializing*, or *deleting*)
- Operational state (*running*, or *stopped*)
- Operational state stopped reason (*sync-destination-and-switchover-not-done*, or *cluster-reboot-done*, or *admin-state-stopped*)
- Allowed Protocols (*nfs*, *cifs*, *fc*, *iscsi*, *nvme*, *ndmp* - detailed view only)
- Disallowed Protocols (*nfs*, *cifs*, *fc*, *iscsi*, *nvme*, *ndmp* - detailed view only)
- IPspace to which the Vserver belongs (detailed view only)
- Caching policy

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

**| [-protocols ]**

If this optional parameter is specified, the command displays the allowed and disallowed set of protocols for the Vserver(s).

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

If this parameter is specified, the command displays detailed information about the specified Vserver.

**[-type <vserver type>] - Vserver Type**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver type. Types include *admin* for the cluster-wide management Vserver, *system* for cluster-level communications in an IPspace, *data* for data serving Vserver, and *node* for node management Vserver.

### **[`-subtype <vserver subtype>`] - Vserver Subtype**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Vserver subtype. Types include:

- *default* for default data Vserver  
\*  
and
- *dp-destination* for Data Protection destination Vserver.
- *sync-source* for MetroCluster source Vserver,
- *sync-destination* for MetroCluster destination Vserver.

### **[`-uuid <UUID>`] - Vserver UUID**

If this parameter is specified, the command displays information only about the Vserver that match the specified UUID.

### **[`-rootvolume <volume name>`] - Root Volume**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root volume.

### **[`-aggregate <aggregate name>`] - Aggregate**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have their root volumes contained by the specified aggregate.

### **[`-nisdomain <nis domain>`] - NIS Domain**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified NIS domain.

### **[`-rootvolume-security-style <security style>`] - Root Volume Security Style**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified root-volume security style.

### **[`-ldap-client <text>`] - LDAP Client**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified LDAP client.

### **[`-language <Language code>`] - Default Volume Language Code**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified language. To determine the available languages, enter "`vserver show-language?``" at the `clustershell` command prompt and at the Vserver prompt.

### **[`-snapshot-policy <snapshot policy>`] - Snapshot Policy**

If this parameter is specified, the command displays information only about the Vserver or Vservers that have the specified Snapshot policy.

### **[`-comment <text>`] - Comment**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified comment.

### **[-quota-policy <text>] - Quota Policy**

If this parameter is specified, the command displays information only about the Vserver or Vservers that use the specified quota policy.

### **[-aggr-list <aggregate name>,...] - List of Aggregates Assigned**

If this parameter is specified, the command displays information only about the Vserver or Vservers to which the specified aggregate(s) are assigned for use.

### **[-max-volumes <unsigned32\_or\_unlimited>] - Limit on Maximum Number of Volumes allowed**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified maximum volume count is configured.

### **[-admin-state {running|stopped|starting|stopping}] - Vserver Admin State**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified admin-state.

### **[-operational-state {running|stopped}] - Vserver Operational State**

If this parameter is specified, the command displays information only about the Vserver or Vservers that match the specified operational-state. This field determines the state of the Vserver LIFs. New LIFs created on a Vserver, which is in running state, will be operationally up and the LIFs created on a Vserver, which is in stopped state, will be operationally down.

### **[-operational-state-stopped-reason {sync destination and switchover is not done|cluster reboot is done|admin state stopped| dp destination not started}] - Vserver Operational State Stopped Reason**

If this parameter is specified, the command displays information only about the Vserver or Vservers that are operationally stopped due to the specified reason. This field indicates the reason for the operational-state of the Vserver being stopped

### **[-allowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}] - Allowed Protocols**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are allowed to run.

### **[-disallowed-protocols {nfs|cifs|fc|iscsi|ndmp|nvme}] - Disallowed Protocols**

If this parameter is specified, the command displays information only about the Vserver or Vservers on which the specified protocols are disallowed to run.

### **[-is-repository {true|false}] - Is Vserver with Infinite Volume**

If this parameter is no longer supported.

### **[-qos-policy-group <text>] - QoS Policy Group**

Display the Vservers that match the specified qos-policy-group.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a Vserver, the system will not monitor and control the traffic to it.

### **[-caching-policy <text>] - Caching Policy Name**

Display the Vservers that match the specified caching-policy.

A caching policy defines the caching behavior of this Vserver at the Flash Cache level. If a caching policy is

not assigned to this Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random\_read - Read caches all metadata and randomly read user data blocks.
- random\_read\_write - Read caches all metadata, randomly read, and randomly written user data blocks.
- all\_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all\_read\_random\_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

#### **[`-config-lock {true|false}`] - Config Lock**

This parameter specifies if the Vserver is locked or unlocked for modification. If the config-lock is set to true, then modifying the Vserver's configuration is not allowed.

#### **[`-ipspace <IPspace>`] - IPspace Name**

If this parameter is specified, the command displays information only about the Vservers that are assigned to the specified IPspace.

#### **[`-foreground {true|false}`] - Foreground Process**

This optionally specifies whether the Vserver show operation can be executed in the background. If nothing is specified, by default the Vserver show operation is executed in the foreground.

#### **[`-is-space-reporting-logical {true|false}`] - Logical Space Reporting**

This optionally specifies whether to report space logically on residing volumes. When space is reported logically, ONTAP reports the volume space such that all the physical space saved by the storage efficiency features are also as reported as used. This parameter is not supported on FlexGroups.

#### **[`-is-space-enforcement-logical {true|false}`] - Logical Space Enforcement**

This optionally specifies whether to perform logical space accounting on residing volumes. When space is enforced logically, ONTAP enforces volume settings such that all the physical space saved by the storage efficiency features will be calculated as used. This parameter is not supported on FlexGroups.

## **Examples**

The following example displays information about all Vservers.

```
cluster1::> vsriver show
```

```
non mcc setup:
```

Vserver	Type	Admin Subtype	Operational state	Root state	Volume	Aggregate
cluster	admin	-	-	-	-	-
node1	node	-	-	-	-	-
vs0	data	default	running	running	root_vs1	aggr0
vs1	data	dp-destination	stopped	stopped	-	-

```
4 entries were displayed.
```

```
mcc setup:
```

```
cluster1::> vsriver show
```

Vserver	Type	Admin Subtype	Operational state	Root state	Volume	Aggregate
cluster	admin	-	-	-	-	-
node1	node	-	-	-	-	-
vs2	data	sync-source	running	running	rv	
data_aggr						
vs3-mc	data	sync-destination	running	stopped	-	-

```
4 entries were displayed.
```

## vsvrr start

### Start a Vsvrr

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### Description

The `vsvrr start` command starts data access on a Vsvrr.

### Parameters

**-vsvrr <vsvrr> - Vsvrr**

This specifies the name of the Vsvrr on which the data access is to be started. This operation is only supported on a data Vsvrr.

The name must be of 47 characters length or less.

### **`[-foreground {true|false}] - Foreground Process`**

This specifies if the `vserver start` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver start` command is executed in the foreground.

### **`[-force <true>] - Force Vserver Start`**

In case of a MetroCluster configuration or Vserver disaster recovery, by using this parameter you can start the Vserver that is either locked (which prevents any configuration changes) or its partner Vserver is operationally running. If you do not enter this parameter, it is set to `false`.

## **Examples**

The following example starts data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver start -vserver vs0.example.com -foreground false
```

## **vserver stop**

### **Stop a Vserver**

**Availability:** This command is available to *cluster* administrators at the *admin* privilege level.

### **Description**

The `vserver stop` command stops data access on a Vserver.

### **Parameters**

#### **`-vserver <vserver> - Vserver`**

This specifies the name of the Vserver on which the data access is to be stopped. This operation is only supported on a data Vserver.

The name must be of 47 characters length or less.

### **`[-foreground {true|false}] - Foreground Process`**

This specifies if `vserver stop` command should be executed in the foreground or background. If you do not enter this parameter, it is set to `true`, and the `vserver stop` command is executed in the foreground.

## **Examples**

The following example stops data access on Vserver `vs0.example.com` in the background.

```
cluster1::> vserver stop -vserver vs0.example.com -foreground false
```

# vserver unlock

## Unlock Vserver configuration

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

### Description

The `vserver unlock` command revokes the administrative lock on the Vserver configuration. When a Vserver is unlocked, changes to the configuration are permitted. The unlock operation fails if the Vserver is not locked by the administrator or if it is locked by internal applications. If the Vserver fails to unlock due to an error condition, you can use the `-force` option.

### Parameters

**-vserver <vserver> - Vserver (privilege: advanced)**

The name of the Vserver that has to be unlocked.

**[-force <true>] - Force Unlock (privilege: advanced)**

This option is specified to unlock the Vserver when the Vserver fails to unlock due to an error condition.

### Examples

The following example illustrates how to unlock the Vserver named `vs123.example.com`, *forcefully*:

```
cluster1::> vserver unlock -vserver vs1.example.com -force true
```

## vserver active-directory commands

### vserver active-directory create

Create an Active Directory account. If joining a domain, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver active-directory create` command creates an Active Directory account for a Vserver. When you create the Active Directory account, you must add it to an existing Windows Active Directory domain. When you enter this command, you are prompted to provide the credentials of a user account that has sufficient privileges to add computers to the `-ou` container within the `-domain` domain. The user account must have a password that cannot be empty. When joining a domain, this command may take several minutes to complete.

Each Vserver can have only one Active Directory account.

## Parameters

### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver for which you want to create the Active Directory account. The Vserver must already exist.

### **-account-name <NetBIOS> - Active Directory NetBIOS Name**

This parameter specifies the name of the Active Directory account (up to 15 characters).

### **-domain <TextNoCase> - Fully Qualified Domain Name**

This parameter specifies the name of the Active Directory domain.

### **[-ou <text>] - Organizational Unit**

This parameter specifies the organizational unit within the Active Directory domain. By default, this parameter is set to *CN=Computers*. When specifying this parameter, specify only the organizational unit portion of the distinguished name. Data ONTAP appends the value provided for the required `-domain` parameter onto the value provided for `-ou` parameter to produce the Active Directory distinguished name, which is used when creating the Vserver's Active Directory account in the domain.

## Examples

The following example creates an Active Directory account *ADSERVER1* for Vserver *vs1* and domain *example.com*.

```
cluster1::> vsriver active-directory create -vserver vs1 -account-name  
ADSERVER1 -domain example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

The following example creates an Active Directory account *ADSERVER2* for Vserver *vs2*, domain *example.com* and organizational unit *sample\_ou*.

```
cluster1::> vsriver active-directory create -vsriver vs2 -account-name  
ADSERVER2 -domain example.com -ou OU=sample_ou
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "OU=sample\_ou" container within the "example.com" domain.

Enter the user name: Administrator

Enter the password:

## **vsriver active-directory delete**

### **Delete an Active Directory account**

**Availability:** This command is available to *cluster* and *Vsriver* administrators at the *admin* privilege level.

#### **Description**

The `vsriver active-directory delete` command deletes the Active Directory account for a specified Vsriver.

#### **Parameters**

**-vsriver <vsriver> - Vsriver**

This parameter specifies the Vsriver for the Active Directory account you want to delete.

#### **Examples**

The following example deletes the Active Directory account for a Vsriver named *vs1* :

```
cluster1::> vsriver active-directory delete -vsriver vs1  
In order to delete an Active Directory machine account, you must supply  
the  
name and password of a Windows account with sufficient privileges to  
remove  
computers from the "example.com" domain.
```

Enter the user name: Administrator

Enter the password:

## **vsriver active-directory modify**

Modify the domain of an Active Directory account. If re-joining the current domain or

joining a new one, this command may take several minutes to complete.

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver active-directory modify` command modifies the domain of an Active Directory account. You can also re-join the current domain or join a new one. When joining a domain, this command may take several minutes to complete.

## Parameters

### **-vserver <vserver> - Vserver**

This parameter specifies the Vserver for the Active Directory account whose associated domain you want to modify.

### **[-domain <TextNoCase>] - Fully Qualified Domain Name**

This parameter specifies the fully qualified name of the Active Directory domain to associate with the Active Directory account.

## Examples

The following example modifies the Active Directory domain associated with Vserver `vs1`.

```
cluster1::> vserver active-directory modify -vserver vs1 -domain
example.com
```

In order to create an Active Directory machine account, you must supply the name and password of a Windows account with sufficient privileges to add computers to the "CN=Computers" container within the "example.com" domain.

Enter the user name: administrator

Enter the password:

## **vserver active-directory password-change**

Change the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver active-directory password-change` command changes the domain account password for the specified Vserver's Active Directory account.

## Parameters

### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to change.

## Examples

The following example changes the password for the Active Directory account for a Vserver named *vs1* .

```
cluster1::> vserver active-directory password-change -vserver vs1
```

## **vserver active-directory password-reset**

Reset the domain account password for an Active Directory account

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver active-directory password-reset` command resets the domain account password for the Active Directory account. This may be required if the password stored along with the machine account in the Windows Active Directory domain is changed or reset without the Vserver's knowledge. The operation requires the credentials for a user with permission to reset the password in the organizational unit (OU) that contains the machine account.

## Parameters

### **-vserver <vserver> - Vserver**

This parameter specifies the name of the Vserver associated with the Active Directory account whose domain account password you want to reset.

## Examples

The following example resets the password for the Active Directory account for a Vserver named *vs1* .

```
cluster1::> vserver active-directory password-reset -vserver vs1
```

```
Enter your user ID: Administrator
```

```
Enter your password:
```

## **vserver active-directory show**

Display Active Directory accounts

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver active-directory show` command displays information about Active Directory accounts. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all Active Directory accounts:

- Vserver name
- Active Directory account NetBIOS name
- Domain or workgroup name

You can specify the `-fields` parameter to specify which fields of information to display about Active Directory accounts. You can use `-fields`?` to display the valid values for the ``-fields` parameter. In addition to the fields above, you can display the following fields:

- Fully-qualified domain name
- Organizational unit

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about Active Directory accounts that are in the Windows Active Directory domain named *RUBY*, run the command with the value of the `-domain-workgroup` parameter set to *RUBY*.

You can specify the `-instance` parameter to display all information for all Active Directory accounts in list form.

## Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver>] - Vserver**

If you specify this parameter, the command displays information only about the Active Directory account for the specified Vserver.

**[-account-name <NetBIOS>] - Active Directory NetBIOS Name**

If you specify this parameter, the command displays information only for the Active Directory accounts that match the specified NetBIOS account name.

**[-domain-workgroup <CIFS domain>] - NetBIOS Domain/Workgroup Name**

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified NetBIOS domain or workgroup.

Workgroups are not supported in this release.

**[-domain <TextNoCase>] - Fully Qualified Domain Name**

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified domain.

### **[-ou <text>] - Organizational Unit**

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified organizational unit.

### **[-auth-style {domain|workgroup|realm}] - Authentication Style**

If you specify this parameter, the command displays information only for the Active Directory accounts that are in the specified authentication style.

## **Examples**

The following example displays a subset of the information about all Active Directory accounts.

```
cluster1::> vsriver active-directory show
Account      Domain/Workgroup
Vserver      Name          Name
-----
vs1          ADSERVER1     EXAMPLE
```

The following example displays all information about all Active Directory Vservers in list form.

```
cluster1::> vsriver active-directory show -instance
Vserver: vs1
      Active Directory account NetBIOS Name: ADSERVER1
      NetBIOS Domain/Workgroup Name: EXAMPLE
      Fully Qualified Domain Name: EXAMPLE.COM
      Organizational Unit: CN=Computers
```

## **vsriver audit commands**

### **vsriver audit create**

Create an audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### **Description**

The `vsriver audit create` command creates an audit configuration for a Vserver.

When you create an audit configuration, you can also specify the rotation method. By default, the audit log is rotated based on size.

You can use the time-based rotation parameters in any combination (`-rotate-schedule-month`, `-rotate-schedule-dayofweek`, `-rotate-schedule-day`, `-rotate-schedule-hour`, and `-rotate-schedule-minute`). The `-rotate-schedule-minute` parameter is mandatory. All other time-based rotation parameters are optional.

The rotation schedule is calculated by using all the time-related values. For example, if you specify only the `-rotate-schedule-minute` parameter, the audit log files are rotated based on the minutes specified on all days of the week, during all hours on all months of the year. If you specify only one or two time-based rotation parameters (say `-rotate-schedule-month` and `-rotate-schedule-minutes`), the log files are rotated based on the minute values that you specified on all days of the week, during all hours, but only during the specified months. For example, you can specify that the audit log is to be rotated during the months January, March, and August on all Mondays, Wednesdays, and Saturdays at 10:30.

If you specify values for both `-rotate-schedule-dayofweek` and `-rotate-schedule-day`, they are considered independently. For example if you specify `-rotate-schedule-dayofweek` as Friday and `-rotate-schedule-day` as 13 then the audit logs would be rotated on every Friday and on the 13th day of the specified month, not just on every Friday the 13th.

## Parameters

### **`-vserver <vserver name> -Vserver`**

This parameter specifies the name of the Vserver on which to create the audit configuration. The Vserver must already exist.

### **`-destination <text> - Log Destination Path`**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

### **`[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}] - Categories of Events to Audit`**

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. By default, *file-ops*, *cifs-logon-logoff* and *audit-policy-change* events are enabled. The support for *audit-policy-change* event can be modified from diag prompt using [vserver audit modify](#) command.

### **`[-format {xml|evt}] - Log Format`**

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVT log format. By default, the output format is EVT.

### **`{ [-rotate-size {<integer>[KB|MB|GB|TB|PB]}] - Log File Size Limit`**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

### **`[-rotate-schedule-month <cron_month>,...] - Log Rotation Schedule: Month`**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

### **`[-rotate-schedule-dayofweek <cron_dayofweek>,...]` - Log Rotation Schedule: Day of Week**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

### **`[-rotate-schedule-day <cron_dayofmonth>,...]` - Log Rotation Schedule: Day**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

### **`[-rotate-schedule-hour <cron_hour>,...]` - Log Rotation Schedule: Hour**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

### **`-rotate-schedule-minute <cron_minute>,...` - Log Rotation Schedule: Minute }**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

### **`{ [-rotate-limit <integer>]` - Log Files Rotation Limit**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0. For example, if you enter a value of 5, the last five audit logs are retained.

### **`| [-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Log Retention Duration }**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. The default value is 0s. For example, if you enter a value of 5d0h0m, logs more than 5 days old are deleted.

## **Examples**

The following examples create an audit configuration for Vserver vs1 using size-based rotation.

```
cluster1::> vsriver audit create -vsriver vs1 -destination /audit_log
-rotate-size 10MB -rotate-limit 5
```

+ +

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsriver audit create -vsriver vs1 -destination /audit_log
-rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule
-hour 12 -rotate-schedule-minute 30
```

The following example creates an audit configuration for Vserver vs1 using time-based rotation. The audit logs

are rotated in January, March, May, July, September, and November on Monday, Wednesday, and Friday, at 6:15, 6:30, 6:45, 12:15, 12:30, 12:45, 18:15, 18:30, and 18:45. The last 6 audit logs are retained.

```
cluster1::> vsserver audit create -vsserver vs1 -destination /audit_log
-rotate-schedule-month January, March, May, July, September, November -rotate
-schedule-dayofweek Monday, Wednesday, Friday -rotate-schedule-hour 6, 12, 18
-rotate-schedule-minute 15, 30, 45 -rotate-limit 6
```

The following example creates an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVT\_X.

```
cluster1::> vsserver audit create -vsserver vs1 -destination /audit_log
-format evt_x -events file-ops
```

## Related Links

- [vsserver audit modify](#)

## vsserver audit delete

### Delete audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vsserver audit delete` command deletes the audit configuration for a Vserver.

### Parameters

**-vsserver <vsserver name> - Vserver**

This parameter specifies the name of the Vserver associated with the audit configuration to be deleted.

**[-force <true>] - Force Delete (privilege: advanced)**

This parameter is used to forcibly delete the audit configuration. By default the setting is `false`.

### Examples

The following example deletes the audit configuration for Vserver vs1.

```
cluster1::> vsserver audit delete -vsserver vs1
```

## vsserver audit disable

### Disable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit disable` command disables auditing for a Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be disabled. The Vserver audit configuration must already exist.

## Examples

The following example disables auditing for Vserver vs1.

```
cluster1::> vserver audit disable -vserver vs1
```

## vserver audit enable

### Enable auditing

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit enable` command enables auditing for a Vserver.

Events on FlexGroup volumes are not emitted to the audit log.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which auditing is to be enabled. The Vserver audit configuration must already exist.

### **[-force <true>] - Force Enable (privilege: advanced)**

This parameter is used to ignore errors while enabling auditing.

## Examples

The following example enables auditing for Vserver vs1:

```
cluster1::> vserver audit enable -vserver vs1
```

## vserver audit modify

### Modify the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit modify` command modifies an audit configuration for a Vserver.

## Parameters

### **`-vserver <vserver name>` - Vserver**

This parameter specifies the name of the Vserver for which the audit configuration is to be modified. The Vserver audit configuration must already exist.

If you have configured time-based rotation, modifying one parameter of time-based rotation schedule does not affect the other parameters. For example, if the rotation schedule is set to run at Monday 12:30 a.m., and you modify the `-rotate-schedule-dayofweek` parameter to Monday,Wednesday,Friday, the new rotation-schedule rotates the audit logs on Monday, Wednesday, and Friday at 12:30 a.m. To clear time-based rotation parameters, you must explicitly set that portion to "-". Some time-based parameters can also be set to "all".

### **`[-destination <text>]` - Log Destination Path**

This parameter specifies the audit log destination path where consolidated audit logs are stored. If the path is not valid, the command fails. The path can be up to 864 characters in length and must have read-write permissions.

### **`[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}]` - Categories of Events to Audit**

This parameter specifies the categories of events to be audited. Supported event categories are: file access events (both CIFS and NFS), CIFS logon and logoff events, Central Access Policy(CAP) staging events, File share events, Audit policy change events, Local User Account Management Events, Local Security Group Management Events and Authorization Policy Change Events. The corresponding parameter values are: *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. By default, *file-ops*, *cifs-logon-logoff* and *audit-policy-change* events are enabled

### **`[-format {xml|evtx}]` - Log Format**

This parameter specifies the output format of the audit logs. The output format can be either Data ONTAP-specific XML or Microsoft Windows EVTX log format. By default, the output format is EVTX.

### **`{ [-rotate-size {<integer>[KB|MB|GB|TB|PB]}]}` - Log File Size Limit**

This parameter specifies the audit log file size limit. By default, the audit log is rotated based on size. The default audit log size is 100 MB.

### **`[-rotate-schedule-month <cron_month>,...]` - Log Rotation Schedule: Month**

This parameter specifies the monthly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated during the months January, March, and August, or during all the months. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to rotate the audit logs every month.

### **`[-rotate-schedule-dayofweek <cron_dayofweek>,...]` - Log Rotation Schedule: Day of Week**

This parameter specifies the daily (day of the week) schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on Tuesdays and Fridays, or during all the days of a week. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, and all. Specify "all" to rotate the audit logs every day.

### **`[-rotate-schedule-day <cron_dayofmonth>,...]` - Log Rotation Schedule: Day**

This parameter specifies the day of the month schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated on the 10th and 20th days of a month, or all days of a month. Valid values range from 1 to 31.

### **`[-rotate-schedule-hour <cron_hour>,...]` - Log Rotation Schedule: Hour**

This parameter specifies the hourly schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at 6 a.m and 10 a.m. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to rotate the audit logs every hour.

### **`[-rotate-schedule-minute <cron_minute>,...]` - Log Rotation Schedule: Minute }**

This parameter specifies the minute schedule for rotating the audit log. For example, you can specify that the audit log is to be rotated at the 30th minute. Valid values range from 0 to 59.

### **`{ [-rotate-limit <integer>]}` - Log Files Rotation Limit**

This parameter specifies the audit log files rotation limit. A value of 0 indicates that all the log files are retained. The default value is 0.

### **`| [-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Log Retention Duration }**

This parameter specifies the audit log files retention duration. A value of 0s indicates that all the log files are retained. For example, if you enter a value of 5d0h0m0s, logs more than 5 days old are deleted.

## **Examples**

The following example modifies the rotate-size and rotate-limit field for Vserver vs1.

```
cluster1::> vsserver audit modify -vserver vs1 -rotate-size 10MB -rotate
-limit 3
```

The following example modifies an audit configuration for Vserver vs1 using the time-based rotation method. The audit logs are rotated monthly, all days of the week, at 12:30.

```
cluster1::> vsserver audit modify -vserver vs1 -destination /audit_log
-rotate-schedule-month all -rotate-schedule-dayofweek all -rotate-schedule
-hour 12 -rotate-schedule-minute 30
```

The following example modifies an audit configuration for Vserver vs1 for auditing CIFS and NFS file access events in the output log format EVTX.

```
cluster1::> vsserver audit modify -vserver vs1 -format evtx -events file-
ops
```

## **vserver audit prepare-to-downgrade**

Restore the Audit configuration to Earlier Release of Data ONTAP

**Availability:** This command is available to *cluster* administrators at the *advanced* privilege level.

## Description

The `vserver audit prepare-to-downgrade` command restores the Audit configurations for ONTAP based on the input parameter `disable-feature-set`.

## Parameters

### **-disable-feature-set <downgrade version> - Data ONTAP Version (privilege: advanced)**

This parameter specifies the ONTAP version that introduced the new Audit features and needs to be removed. The value can be one of the following:

- 9.0.0 - Disables the Audit features introduced in the ONTAP release 9.0.0. The following events are removed from the event list:
- File share event. The corresponding parameter value is `file-share`.
- Audit policy change event. The corresponding parameter value is `audit-policy-change`.
- Local user account management event. The corresponding parameter value is `user-account`.
- Local security group management event. The corresponding parameter value is `security-group`.
- Authorization policy change event. The corresponding parameter value is `authorization-policy-change`.

## Examples

```
cluster1::*> vserver audit prepare-to-downgrade -disable-feature-set 9.0.0
```

## vserver audit rotate-log

### Rotate audit log

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

## Description

The `vserver audit rotate-log` command rotates audit logs for a Vserver.

## Parameters

### **-vserver <vserver name> - Vserver**

This parameter specifies the name of the Vserver for which audit logs are to be rotated. The Vserver audit configuration must already exist. Auditing must be enabled for the Vserver.

## Examples

The following example rotates audit logs for Vserver vs1.

```
cluster1::> vserver audit rotate-log -vserver vs1
```

## vserver audit show

Display the audit configuration

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The `vserver audit show` command displays audit configuration information about Vservers. The command output depends on the parameter or parameters specified with the command. If you do not specify any parameters, the command displays the following information about all the Vservers:

- Vserver name
- Audit state
- Target directory

You can specify the `-fields` parameter to specify which audit configuration information to display about Vservers. + You can specify additional parameters to display only information that matches those parameters. For instance, to display information about the log file rotation size of a Vserver whose value matches 10 MB, run the command with the `-rotate-size 10MB` parameter.

You can specify the `-instance` parameter to display audit configuration information for all Vservers in list form.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>, ...` parameter, the command only displays the fields that you specify.

**| [-log-save-details ]**

You can specify the `-log-save-details` parameter to display the following information about all the Vservers:

- Vserver name
- Rotation file size
- Rotation schedules
- Rotation limit

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all entries.

**[-vserver <vserver name>] - Vserver**

If you specify this parameter, the command displays information about the specified Vserver.

### **[-state {true|false}] - Auditing State**

If you specify this parameter, the command displays information about the Vservers that use the specified audit state value.

### **[-destination <text>] - Log Destination Path**

If you specify this parameter, the command displays information about the Vservers that use the specified destination path.

### **[-events {file-ops|cifs-logon-logoff|cap-staging|file-share|audit-policy-change|user-account|authorization-policy-change|security-group}] - Categories of Events to Audit**

If you specify this parameter, the command displays information about the Vservers that use the specified category of events that are audited. Valid values are *file-ops*, *cifs-logon-logoff*, *cap-staging*, *file-share*, *audit-policy-change*, *user-account*, *security-group* and *authorization-policy-change*. *audit-policy-change* will appear only in diag mode.

### **[-format {xml|evtx}] - Log Format**

If you specify this parameter, the command displays information about the Vservers that use the specified log format.

### **[-rotate-size {<integer>[KB|MB|GB|TB|PB]}] - Log File Size Limit**

If you specify this parameter, the command displays information about the Vservers that use the specified log file rotation size.

### **[-rotate-schedule-month <cron\_month>,...] - Log Rotation Schedule: Month**

If you specify this parameter, the command displays information about the Vservers that use the specified month of the time-based log rotation scheme. Valid values are January, February, March, April, May, June, July, August, September, October, November, and December.

### **[-rotate-schedule-dayofweek <cron\_dayofweek>,...] - Log Rotation Schedule: Day of Week**

If you specify this parameter, the command displays information about the Vservers that use the specified day of the week of the time-based log rotation scheme. Valid values are Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, and Saturday.

### **[-rotate-schedule-day <cron\_dayofmonth>,...] - Log Rotation Schedule: Day**

If you specify this parameter, the command displays information about the Vservers that use the specified day of the month of the time-based log rotation scheme. Valid values range from 1 to 31.

### **[-rotate-schedule-hour <cron\_hour>,...] - Log Rotation Schedule: Hour**

If you specify this parameter, the command displays information about the Vservers that use the specified hour of the time-based log rotation scheme. Valid values range from 0 (midnight) to 23 (11:00 p.m.).

### **[-rotate-schedule-minute <cron\_minute>,...] - Log Rotation Schedule: Minute**

If you specify this parameter, the command displays information about the Vservers that use the specified minute of the time-based log rotation scheme. Valid values range from 0 to 59.

### **[-rotate-schedule-description <text>] - Rotation Schedules**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation schedules. This field is derived from the rotate-time fields.

### **[-rotate-limit <integer>] - Log Files Rotation Limit**

If you specify this parameter, the command displays information about the Vservers that use the specified rotation limit value.

### **[-retention-duration <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>] - Log Retention Duration**

If you specify this parameter, the command displays information about the Vservers audit logs retention duration.

### **Examples**

The following example displays the name, audit state, event types, log format, and target directory for all Vservers.

```
cluster1::> vserver audit show
Vserver      State  Event Types  Log Format  Target Directory
-----
vs1          false  file-ops    evtx       /audit_log
```

The following example displays the Vserver names and details about the audit log for all Vservers.

```
cluster1::> vserver audit show -log-save-details
Rotation
Vserver      File Size  Rotation Schedule  Limit
-----
vs1          100MB     -                  0
```

The following example displays in list form all audit configuration information about all Vservers.

```
cluster1::> vserver audit show -instance
Vserver: vs1
      Auditing state: true
      Log Destination Path: /audit_log
      Categories of Events to Audit: file-ops
      Log Format: evtx
      Log File Size Limit: 100MB
      Log Rotation Schedule: Month: -
      Log Rotation Schedule: Day of Week: -
      Log Rotation Schedule: Day: -
      Log Rotation Schedule: Hour: -
      Log Rotation Schedule: Minute: -
      Rotation Schedules: -
      Log Files Rotation Limit: 0
      Log Retention Time: 0s
```

# vserver check commands

## vserver check lif-multitenancy run

Run check for LIF multitenancy

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

The run command checks the specified Vserver to verify that it has connectivity to the configured external servers providing services such as Active Directory, NIS, and DNS. The output can consist of three types of messages. Failure messages indicate that a Vserver does not have the connectivity required to a server exporting a service. Warning messages indicate configuration or operational issues that are possible causes of the failures. A success message is displayed if the Vserver has network connectivity to each of the configured servers for each service.

You can use this command to verify configuration changes such as creating a Vserver or changing the configured servers for one or more services. It is also useful for diagnosing operational problems that result from failures that could be caused by the inability to make network connections to configured servers.

The services that are checked are DNS, NIS, CIFS preferred domain controllers, CIFS discovered domain controllers, KDC, Active Directory, Admin, Password, LDAP, and LDAP preferred Active Directory.

Only a single run for a Vserver is allowed to run in a cluster. If multiple runs are attempted for a Vserver, a message will be displayed indicating that a run is already in progress.

For each service, this command will ping each configured server until a successful ping is completed. In certain circumstances where a subnet is offline or LIFs are operationally down, this command may take a long time to run. In order to show that forward progress is being made, an activity indicator of a '.' is displayed for each ping sent.

The following fields are reported in table format. Some fields may not be relevant to a type of message and will consist of the text "-".

- Vserver name
- Service external server is exporting
- Address of external server
- Connectivity to that external server
- More information describing the problem
- Suggestions to remediate the problems
- Success when there are no problems

### Parameters

**-vserver <vserver> - Vserver**

Use this parameter to specify the Vserver to check.

**[-verbose {true|false}] - Show Positive and Negative Result (privilege: advanced)**

When this parameter is specified the results of all connectivity tests will be displayed in the success and

failure cases.

Examples

This is an example of a successful run:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
..
SUCCESS: All external servers are reachable.
```

This is an example of a run with warnings and failures that need to be corrected:

```
cluster1::> vserver check lif-multitenancy run -vserver vs0
      Vserver      Severity Service      Address      LIF
Connected Details
-----
vs0      warning  -      -      vs0_lif1
-      operationally down
vs0      warning  -      -      vs0_lif2
-      operationally down
...
vs0      failure  DNS      10.98.200.20  -
no      cache
...
vs0      failure  NIS domain  10.98.13.53  -
no      cache
Error : command failed:  FAILURES FOUND.
      You must correct these failures to avoid service disruptions
      in DOT 8.3 and above.
      Corrective actions may include:
      - removing decommissioned external servers from the vserver
configuration
      - restoring network interfaces that are down
      - adding network interfaces or routes
      - modifying the locations where network interfaces may
reside
      (through
      adjusting failover groups/policies or changing the home-
node or
      auto-revert settings).
      For assistance, please consult the 8.3 Upgrade Document,
      or contact support personnel.
```

At advanced privilege, additional information for messages at all severities is displayed.

```
cluster1::*> vserver check lif-multitenancy run -vserver vs0 -verbose true
....
Vserver      Severity Service      Address      LIF
Connected  Details
-----
vs0          info    DNS          10.98.200.20  vs0_lif1
yes         ping
....
vs0          info    NIS domain   10.98.13.53   vs0_lif1
yes         ping
SUCCESS: All external servers are reachable.
```

**vserver check lif-multitenancy show-results**

Show the results of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

**Description**

You can view detailed information about the latest completed run, or the run for a Vserver.

- Vserver - name of vserver run was for
- Severity - severity of the message which is failure, warning, or info.  
\*  
Failures are problems that need fixed. Warnings are potential problems that may need to be fixed. Values are "failure", "warning" or "info".
- Service - name of service that is being checked for connectivity
- Address - address of server configured for the above service that is being  
\*  
checked for connectivity.
- LIF - the LIF a successful connectivity check to the above server was made from
- Connected - true of there is connectivity, false if there is not
- Status - additional information useful for resolving issues

**Parameters**

**{ [-fields <fieldname>,...]**  
If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

**| [-instance ] }**  
If you specify the -instance parameter, the command displays detailed information about all fields.

**[-vserver <vserver>] - Vserver**

Selects the messages matching the specified Vserver

**[-severity <text>] - Severity**

Selects the messages matching the specified severity of failure, warning, and info.

**[-service <text>] - Service Name**

Selects the messages matching the specified service.

**[-address <text>] - Address of Server**

Selects the messages matching the specified address.

**[-lif <lif-name>] - Logical Interface**

Selects the messages matching the specified LIF.

**[-connected {yes|no}] - Vserver Connectivity**

Selects the messages matching the specified connectivity.

**[-status <text>] - Additional Information**

Selects the messages matching the specified search criteria.

**Examples**

Runs that are successful will not have any content.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
This table is currently empty.
```

Successful runs made with -verbose true will show the LIF used to Ping the network address from.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0

      Vserver      Severity  Service      Network      Logical      Connected
Status              Address      Interface
-----
vs0
      info      DNS      10.98.200.20      vs0_lif1      yes
ping
      info      NIS domain  10.98.13.53      vs0_lif1      yes
ping
2 entries were displayed.
```

Runs that fail display each failure that needs to be fixed.

```
cluster1::> vserver check lif-multitenancy show-results -vserver vs0
```

Vserver Status	Severity	Service	Network Address	Logical Interface	Connected
vs0	warning	-	-	vs0_lif1	-
operationally down	warning	-	-	vs0_lif2	-
operationally down	failure	DNS	10.98.200.20	-	no
cache	failure	NIS domain	10.98.13.53	-	no
cache					

4 entries were displayed.

## vserver check lif-multitenancy show

Show the summary of the latest multitenancy network run

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

### Description

You can view summary information about the latest completed run, or the run in progress for a Vserver. It will show the following fields:

- Vserver - Name of Vserver that was checked for LIF connectivity
- Start Time - Date And Time the run was started
- Status - Not Started, In Progress, Complete, or Aborted
- Success - Yes if the run has a Status of Complete with no failures. No if the run has a status of Complete with one or more failures.
- Updated - The date and time the scan was last updated.

### Parameters

**{ [-fields <fieldname>,...]**

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

**| [-instance ] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

### **[-vserver <vserver>] - Vserver**

Selects the summary information matching the specified Vserver.

### **[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time**

Selects the summary information matching the specified date and time the run was started

### **[-status {not started|in progress|complete|aborted}] - Run Status**

Selects the summary information matching the specified status of the run.

### **[-success {yes|no}] - Successful Run**

Selects the summary information matching the specified success or failure of the run.

### **[-updated <MM/DD/YYYY HH:MM:SS>] - Run Updated**

Selects the summary information matching the last time the run was still in progress.

## **Examples**

This is what a successful run looks like:

```
cluster1::> vsriver check lif-multitenancy show
  Vserver          Start Time          Status          Success
  -----          -
  vs0
                    7/16/2014 14:28:35    complete         yes
```

This is what a failed run looks like:

```
cluster1::> vsriver check lif-multitenancy show
  Vserver          Start Time          Status          Success
  -----          -
  vs0
                    7/16/2014 14:40:55    complete         no
```

This is what specifying the Vserver looks like:

```
cluster1::> vsriver check lif-multitenancy show -vserver vs0
Vserver: vs0
  Start Time: 7/16/2014 14:40:55
  Run Status: complete
  Successful Run: no
```

Advanced privilege adds in the Updated field.

```
cluster1::*> vservers check lif-multitenancy show
```

Vserver	Start Time	Status	Success	Updated
vs0	7/16/2014 14:40:55	complete	no	7/16/2014

14:40:56

## vserver cifs commands

### vserver cifs add-netbios-aliases

Add NetBIOS aliases for the CIFS server name

**Availability:** This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

#### Description

The ``vserver cifs add-netbios-aliases`` command creates or adds a list of NetBIOS aliases for the CIFS server name.

#### Parameters
